War Executive

THE Minister of Information has done well to point out that the successes of the Army of the Nile are due more to British skill than to Italian ineptitude. General Wavell's victories have been a triumph of co-ordination between the different arms, brought swiftly to the point of decisive action when the time was ripe. There is a lesson here for the organisers of the home front, upon whose efforts the ability of the three fighting forces to strike similar blows against the more formidable German foe must depend; and the need for "more rapid and decisive action" in the fields of war production and essential trade has now been recognised in the highest quarter. The conviction that output still lags far behind full capacity; the knowledge that shipping losses, damage at sea, port delays and congestion have appreciably narrowed our freedom to trade abroad; the realisation that, so far from our being able to lean upon American aid until the effort in our own factories has been laboriously brought up to its due scale, we must continue to hold and supply the fortress with only moderate help until American industry can, with no less pain and labour, be placed on a near-war footing—these have become general; and the announcement on Monday evening that the Prime Minister had set up a series of new "executives," or Ministerial committees, to direct economic policy came to meet widespread anxiety and doubt.

The machinery for co-ordinating the economic war effort, reconstructed when Mr Churchill made his National Government last year, is once more remodelled. The failure in practice of the Production Council, which was to have been the pivot of the country's industrial mobilisation, has at last been recognised. It has been abolished, and with it has

gone Mr Greenwood, whose tenure of responsibility for the economic aspects of administration had been neither happy nor fruitful. In the Council's stead, there is to be a Production Executive, consisting of the Minister of Labour, as chairman, the Minister of Aircraft Production, the First Lord of the Admiralty, the President of the Board of Trade and the Minister of Supply. Like its predecessor, this body will have the task of allocating resources of materials, plant and labour to meet war needs in order of urgency; while Mr Greenwood takes over what may possibly be the more congenial task of studying the problems of post-war reconstruction in preparation for the establishment of a new Ministry "when the end can be more clearly foreseen." A second "executive" will "animate and regulate the whole business of importation," the most vital and vulnerable point in the nation's armoury, and this Import Executive is to consist of the Minister of Supply, as chairman, the Minister of Aircraft Production, the First Lord of the Admiralty, the President of the Board of Trade, and the Minister of Food. Finally, the work of these two "executives" and of the existing Cabinet committees on civil defence, home policy and food policy will "continue to be concerted and directed" by the Ministerial committee which has the Lord President of the Council as chairman.

It is impossible to make any final comment on these rearrangements until some evidence is forthcoming of the results of the new committees' work. At first glance there is no fundamental change. The dubious principle of making policy in committees of hard-pressed and over-burdened heads of departments has been preserved, and when it is considered that Mr Bevin and Lord Beaverbrook have also to sit in

Efficiency of Transport

THE cardinal vice of British campaigning on the economic front is inability to see ahead and to see things as a whole. We hardly ever prepare to meet the difficulties that lie ahead; we wait until they are right on top of us and then solve them as best we can. We hardly ever take a broad view of our problems; we allow each of the departments to take its own decisions and these frequently clash. We are still "muddling through," with a consequent loss of drive, efficiency and sense of direction.

This vice can be admirably illustrated by the way in which we run our transport industries. Broadly, we have three major facilities for moving things about in this country: the railways, the roads, the coastal shipping services; and one minor resource, the canals. Even before the war it was quite clear that, individually as well as collectively, these facilities would be subjected to considerable strain. But nothing was done to prepare for their operation as a single system. Each of the three major transport facilities is efficient if judged by its individual performance in the face of considerable difficulties. But transport as a whole may nevertheless be—and in fact is—inefficient. Valiant efforts are made by each of the services to solve its difficulties as they arise, though even at this stage transport is scarcely thought of as such, but as three separate entities.

The result is that we are not moving things about as efficiently as we should, or as we could if transport were treated as a single service with three major, and one minor, branches. The munition factories often cannot get their raw materials in time to maintain a balanced flow of production; finished munitions are not moved to their destinations on schedule; cargoes discharged at ports are not distributed quickly enough inland; and, as consumers in Southern England have discovered to their dismay, coal, though plentiful at the pits, is not delivered in adequate quantities to them. Indeed, transport is becoming the great bottleneck in the production of munitions, and the Government's efforts to set up priorities for the most urgent work are frequently nullified by the fact that all goods are subject to transport delays. Yet it is literally true that the result of the war depends on our transport being better than Hitler's.

What are the remedies? First, the transport problem must be seen as a whole, and the facilities at the disposal of the country should be treated as a single system with various branches. Within limits, the volume and the relative urgency of the things that must be moved about can be estimated in advance. Similarly, it is possible roughly to estimate the capacity of the various facilities. When it comes to distributing the traffic to the best advantage the various forms of transport must be regarded as so much carrying capacity, rather than in terms of railway, road and coastal shipping capacity. Only thus can we hope to move the maximum volume of goods.

Secondly, the transport problem should be approached quantitatively instead of financially—in physical, not in monetary terms. This need follows logically from the first, for so long as earnings are a major consideration in the case of each service, they are unlikely to be operated as one system. The chief defect of the railway agreement, for example, is that it stresses the need for making the railways pay rather than the need for utilising them in the national interest. As a result, the railways, whose spokesmen have the strongest voice at the Ministry of Transport, are not encouraged to forget that alternative forms of transport are their competitors; they naturally continue to regard any transfer of traffic—especially of the lighter and more remunerative classes of goods—

as an encroachment upon their rights, to be resisted by all the means in their power.

If transport were organised and treated as one entity instead of being operated, in a large measure, with reference to the financial interest of each separate service, it would be possible to make headway against many of the present difficulties. Fuller use could undoubtedly be made of existing capacity, for so long as there is competition between the various services, and between various undertakers within each section of the industry, there will automatically be margins of unused capacity, a luxury that cannot be afforded in present conditions. It would enable traffic managers to choose the means of transport that happens to be most convenient for the purpose at any given moment. It would also enable them to introduce greater flexibility in the supply of transport by quickly substituting one form of conveyance for another that may suddenly have been put out of use, by enemy action, for example. At present, when a railway line is blocked, urgent goods can be sent on by lorry only at a financial loss to the railway company. Again, unification would remove the practice, fostered by competition, of encouraging unremunerative traffic by cut rates—such as tempting passenger traffic by cheap fares.

These are the chief needs of the moment—to see the transport problem as a whole and to think of it in real, rather than in financial, terms; but there are other ways in which the present bottleneck in the movement of goods could be widened. One of these is to work out the first elements of a rationing system for transport. There is no reason, indeed, why transport, like raw materials and shipping space, should not be allocated in accordance with a well-thought-out system of priorities. So far the Government, with its deep-seated horror of drastic action, has shrunk from introducing a priority system in inland transport. It still relies largely on exhortation, with the result that production in munition factories is held up for lack of materials, because transport facilities are being used for less essential, or even unnecessary, purposes. The public is repeatedly told not to make unnecessary journeys by rail and to use private cars only for essential purposes; yet who is prepared to deny that if all the travellers by rail and road were stopped on any one day to prove the need of their journey, a substantial proportion would fail to pass the test. Transport is so scarce that we can no longer rely on exhortation, but must allocate it, like all other scarce commodities, by reference to a scale of priorities.

There is also a need to improve the internal efficiency of the road transport industry. As many lorries have been requisitioned by the Services, the total number available for ordinary transport is not appreciably smaller than at the outbreak of war. There is therefore all the more reason why the existing fleet should be operated at capacity and the adequate repair facilities should be made available. True, the lorries are all in use. But are they all doing a full day's work; are they all loaded to capacity; are all those that need repair made fit for service as quickly as possible? He would be a bold man who answered these queries in the affirmative, for anyone in London can see that each separate newspaper and each separate department store still runs its own fleet of half-empty delivery vans, that many lorries pass empty through the streets, that others stand idly in the owners' sheds for days. The solution, at least in part, lies in pooling. An elaborate pooling system was drawn up before the war. What is preventing use?

The bottleneck in transport could also be wider

to some extent by the greater use of the canal system. We cannot neglect these facilities simply because they do not pay in peace time. Canal traffic, true, is slow. But it is quite suitable for the conveyance of bulky goods whose delivery is not very urgent. Indeed, if used to the full where possible the canals might relieve in some measure the present congestion on the railways.

Finally, there is room for improvement in the traffic in ports. In view of the reduction in our import capacity it is quite inexcusable if ships are held up unnecessarily in ports, either because the goods they were arranged to carry do not arrive, or are not loaded in time, or because their discharge is delayed by insufficient or unwilling labour, by the non-arrival of railway wagons, or by the absence of forwarding instructions. In any case, the risk of damage through air raids should dictate the swift distribution of imports to safer storage places or to their final destination.

Unfortunately the emphasis on bigger production has had the effect of distracting public attention from

Middle Eastern Neutrality

SINCE the war began, the states of the Middle East have been passive spectators of the great struggle. To speak of their reactions is like describing the emotions which sway the audience of an absorbing play. The fact that their future depends upon the outcome of the drama only adds to the intensity of their attention. It does not compel them to spring on to the stage and play a part.

In the months before the collapse of France this passivity was largely due to the confidence that the Allies would keep the war out of the Mediterranean. Italy was not a belligerent. Turkey, allied with Britain and France, acted as a barrier to any Nazi advance on Baghdad. The colonial armies of France were massed in Tunis and Syria, and the arrival of Empire troops to reinforce the British garrison in Egypt received great publicity. The Allies gave an impression of overwhelming strength.

But the detachment of the various states also sprang from their feeling that, so long as the Axis Powers were held off, they had nothing to gain by joining in the struggle. During the last war the Arabs were under Turkish sovereignty and Lawrence found in their desire for independence a lever to bring them into the war. To-day, although there are a hundred unsettled disputes and unsatisfied claims within the area of the Middle East, they are not serious enough for any of the Powers to risk the uncertainties and sufferings of war and the dangers of foreign intervention, in the hope of securing some slight economic concession or frontier rectification. Saudi Arabia may not admit the loss of Akaba; Iran and Iraq may dispute the Shatt-el-Arab; the oilfields of Iraq may be coveted by all her neighbours; but the fate in Europe of Hitler's clients and victims alike is a warning against rides on the back of the Nazi tiger.

Britain, as a Power whose attitude is predictable, gains by this comparison with the unknown. For the duration, the Middle Eastern states are for the status quo and thus they are—negatively—for Britain. In some parts there are warmer feelings. And to the negative attitude there has until recently been one exception—Iran. For the Iranians the danger is in the north with Russia and in the south on the Gulf with Britain. Germany has always been welcomed as a counterweight. However, every evidence of closer relations between Germany and Russia is greeted with increasing gloom in Teheran, and something near a panic swept the country when Molotov's visit to Berlin was accompanied by rumours that, in return for a free hand in the Dardanelles, Germany was offering Russia an equally free hand in Iran. Such diplomacy brings Iran more into line with her neigh-

the equally important need of moving things about more quickly. If our factories are to work at full speed, they must be able to get their raw materials and to deliver their products without having to wait unnecessarily for transport. The importance of transport in the war effort must be more fully recognised; the problem must be seen as a whole in order to enable us to make the fullest use of our facilities; all unnecessary movement, whether of persons and goods, by rail or by road, must be cut out in order to make room for essential transport. In fact, we must widen the channels of transport and allow only essential traffic to pass through them. Otherwise our whole war effort will be stifled through congestion.

There is a Ministry of Transport. It has never yet been given its proper importance as one of the vital Departments, but has rather been treated as a proving ground for promising politicians. The Ministry now has, however, a Minister at its head who combines ability and energy in better proportions than any of his predecessors for ten years past. He has an enormous task and an enormous opportunity.

bours, who prefer Britain at least as the lesser evil. The calm of the ring of interested spectators was shattered in June when in a fortnight Italy entered the war, France collapsed, the Syrian and Tunisian armies abandoned the fight and Britain was left an apparently beleaguered garrison in Egypt. The Italians made no secret of their intentions in the Near East. Was not the Duce Protector of Islam? "British tyranny" should be brought to an end in Egypt. "An Italo-Palestine Union," wrote the *Tribuna*, "must be established under the King of Italy, Albania and Jerusalem, Emperor of Ethiopia." Italian propaganda worked at high pressure. Iraq had broken off relations with Germany in September, 1939, but the Italian declaration of war was ignored and Gabrielli, Italian Minister in Baghdad, is still at his post, while his Legation is a centre of propaganda and intrigue among the disaffected elements in Iraqi political life. To give only one example of Italian methods, a persistent rumour has been circulating that Britain, hard pressed by the Axis, is trying to compel Iraq into giving more assistance than the Anglo-Iraqi Treaty warrants. In Egypt, too, a difficult situation arose. Diplomatic relations were broken off after some hesitation, but the Italian Ambassador delayed his departure, and it was not until the equivocal policy of the Ali Maher Ministry was replaced by the loyal collaboration of a new Prime Minister that the position became satisfactory to Egypt's ally.

In spite of the obvious aggressiveness of the Axis, the only positive Middle Eastern reaction to the crisis of the summer was the journey of the Foreign Minister of Iraq, Nuri-es-Said, to Ankara at the end of June to consult with the Turkish Government over Axis intentions in Syria, a journey whose practical result is perhaps to be seen in the British Government's Declaration of July 1st that Britain was concerned in the future status of the Syrian Mandate. Otherwise, the Middle Eastern states awaited the outcome of the Mediterranean crisis in apprehension, doubt—and inactivity. However much they may have considered their position endangered by a possible Axis victory, there was no impulse to rally to Britain's side. It is a reaction which we have already met in Europe and shall probably meet again. It springs from the knowledge that one side is ruthless, the other accommodating. The argument runs: "If Britain wins we shall be safe anyway. If the Nazis are going to win our only hope is to do nothing to offend them now." Thus, so long as the issue is undecided, the Axis is the benefit of the doubt. And Britain must accept this unfortunate result of her past generosity.

With the spectacular turning of the tables this autumn in Albania and the Western Desert, culminating in the crushing defeat of Graziani's Libyan armies, the Middle Eastern states have returned with relief to the attitude of undisturbed confidence in Britain's ability to hold the Middle East which was theirs before the French collapse in June. It is perhaps a more enthusiastic confidence this time. There is more admiration in it and probably a good measure of gratitude, particularly in Egypt. In Aden and the Hadramaut, the sheiks speak delightedly of "our air force"; in Palestine local defence corps and pioneer corps find recruiting brisker—both among Jews and Arabs; in Egypt there have been demonstrations and congratulations on all sides; and Iraq has taken the opportunity of reaffirming her "traditional policy of friendship" and her recognition of the "nobility and political wisdom" of Britain's dealings with her. But this wave of warm enthusiasm is no more active than the previous mood of uneasiness. The Middle Eastern states are grateful because we have removed the possibility of war, not because we have offered them a chance of fighting victoriously on our side.

Is this passivity due to any lack on our part? Have we neglected any policy which in this war could have

repeated Lawrence's success? The educated Arabs have after all a passionate detestation of Nazism which amounts to an intellectual Jihad, and Graziani has left memories of his brutal régime in Libya which have brought the desert Bedouins to our side. While it is possible that the unsettled Palestinian dispute remains an obstacle to more active Arab backing, it is nearer the truth to say that, in this struggle of the Titans, no smaller Power will allow itself to be drawn into the war until it is definitely attacked, and even then it may prefer surrender. The cause of democracy could not unite Western Europe in its defence. Arab nationalism, however strong it may be as a force in internal politics, is even less likely to act as a rallying cry among the Middle Eastern states. Such schemes as there are for an Arab confederation are nebulous and are rendered impracticable by strong local, inter-Arab jealousies. The strength of Pan-Islam is no stronger than the appeal of Christianity in Europe. It can be an additional spur to fighting once fighting is inevitable. It cannot of itself create the desire to fight. The lesson for us is obvious. In the Middle East, as in Europe, we have to depend upon our own resources. We shall be applauded when we win. Millions will most devoutly hope for our victory. But we shall fight alone.

NOTES OF THE WEEK

The Fall of Bardia

The fall of Bardia is encouraging from every point of view. It is the British Army's first important victory upon enemy territory. The manner of its winning was a model of careful preparation, tactical brilliance and enthusiastic fighting. The three weeks which were taken to lead up to the assault insured that our own losses were ludicrously slight—under 600—in comparison with the number of prisoners taken. Again, Bardia provides further evidence that the mass of Italians are indifferent to the outcome of the war and can see no reason to risk their lives in a cause which means nothing to them. Best of all, Bardia provides us with a useful base for further operations. Reinforcements and supplies can be brought by sea; advance headquarters have already been moved up to the neighbourhood of the town; and the R.A.F. is busy reconditioning airfields abandoned by the Italian air force. It is, perhaps, this possibility of establishing a base at Bardia that has encouraged General Wavell to move on immediately to the attack on Tobruk. Our motorised patrols are now familiar with the 70 miles which lie in between, and within three days of the final surrender at Bardia our advance units had cut the Derna road west of Tobruk. The town is not so well defended as Bardia, although it is far more important as a base, and the Italians, who have already abandoned El Adem, the big aerodrome to the south, may not be prepared to make a stand. It is significant that Rome is preparing its people for further retreats. Nevertheless, the Italians claim that we are not yet in contact with their main forces under Graziani, and before Tobruk can be fully invested there must obviously be some reorganisation on our side before our armies are ready for the next offensive. Tobruk may fall like Jericho, but if a stand is made General Wavell can afford to take the time necessary to repeat the bloodless victory of Bardia.

The repercussions in Italy and Albania of the surrender of Bardia can only be disastrous. The Fascists have made matters worse by incredibly clumsy propaganda. A week ago the defence of Bardia was still "the defence of Fascism." Popular memory is notoriously short. Even so the couple of days during which Bardia descended from her proud post of "bastion of Fascism" to the status of an unnamed and unimportant frontier post, whose possession can only hinder Britain's chances of success is rather a strain on credulity. In the first bitter moments of defeat, Signor Ansaldo gave in a series of denunciations a very telling picture of the state of mind inside Italy. He cried woe to the in-

difference of the Italians who go to cinemas and football matches, or prefer the privacy of their own homes while deathless acts are being performed abroad. He urged them to rouse themselves from their apathy and not to delude themselves "in their petty arrogance and egoism that they can go on living like this... while others are fighting a war to which they do not even give a thought." Signor Ansaldo claimed that he was issuing "a terrible warning" to the Italian people. Indirectly, he also delivered a warning to the "early-collapse-of-Italy" school of thought over here. The trouble in Italy is not that the war is violently unpopular, but that the people prefer not to think about it at all. And they can still do so because the mainland of Italy has not been really touched by the war. Sporadic raids on a few towns are not enough to produce a passionate desire for peace. Increased rationing is not yet heavy enough to lead the Italians, who are used to short commons, into active revolt. There are few reports of unrest, none of sabotage. A great mass of the Italian people are peasants and they have been even less disturbed than the townspeople. The propaganda drive which the Fascist Party is staging all over Italy may well be concerned to increase enthusiasm rather than to crush resistance. The Duce complained of "universal pacifism" in his November speech. But the pacifism holds good for internal struggle as well as for foreign wars. Besides, even if a flicker of revolt were abroad in Italy, Mussolini has the means to extinguish it. He may be worsted abroad, but he can still get the better of his own people either unaided or with German assistance. The German air force is now officially helping the *Regia Aeronautica*; more German officers are at Italian headquarters; and some reports put the number of German divisions which have crossed the Brenner in recent weeks as high as 18 divisions. The Germans may well be obliged to take command in Italy as completely as they did in Austria during the last war. In any case, the chances of effective resistance by the Italian people are nil.

Trade With America

Current discussion about purchases from the United States is mainly concerned with ways and means of postponing payment when Britain's immediately available financial resources, heavily strained by the cash-down basis of the transactions, begin to run out. There is some danger of a false perspective being given. It is too easily forgotten that an appreciable part of British imports from the United States is covered by British exports to America, and the recent broadcast of the

President of the Board of Trade appealing to Americans to buy more of the British goods which they are already accustomed to purchase was a timely reminder of this aspect of the position. The common belief that, in commercial exchanges with British countries, the United States will sell but not buy has always been fallacious. America consistently sells more to Great Britain than she buys; but she buys more than three times as much from British colonies as she sells. The overall balance in normal times showed little marked advantage to either side; and even in trade with Great Britain American purchases of whisky, woollen and worsted goods, linen goods, pottery and glass have usually been considerable. It is true that vast war orders must make the large import surplus in Britain's trade with the United States very big indeed, but it will still be an incomplete view to suppose that Britain must depend entirely on credit, charity or capital resources to foot the bill. It is more urgent than ever that goods should be sold to the United States to create dollar balances; and the particular British goods which Americans favour, just as the tea, cotton, skins, jute, flax and wool of British India, and the rubber and tin of Malaya, have an important part to play in financing the material aid which the American people are selling to Britain. We cannot match goods with goods, but we can hold down the large deficiency to the smallest possible; and at a time when, owing to changes in Europe, the United States is more dependent than ever on Britain for sales of her minerals and foodstuffs, as well as war manufactures, it will repay American buyers to reduce to a minimum the heavy strain on financial ingenuity.

The Export Arm

It would be tragic and silly if the necessity to export more and more were to be lost from sight in the flood of imports and special payment problems. It is not possible to export any commodities essential to the war, except to Allies for war needs, and a number of characteristic British exports of machinery and the like are thereby excluded. But it is imperative that all non-essential commodities, which have suitable markets abroad for ready payment and which do not use labour or plant indispensable for war output, should be made and sold freely. It is so urgent that it should not be bounded by merely economic considerations. There is no question here of paying for American help by trying to dump goods there below cost of production; but there is no doubt that the positive side of exchange control policy, as a means of expanding the export of goods, has so far been a notable lack in British war economics.

Wartime Administration

Nothing has been so clearly marked in the four months of air raids as the distinction between the two aspects of the Government's civil defence policy: the fighting side and the social and welfare side. The former has in most cases exceeded expectations; in London it has been excellent. But evacuation, billeting, education, rehabilitating the bombed, shelters—all these problems seem, surprisingly enough, to have taken the central government quite unawares and have shown up local government at its very worst. In recent weeks, attention has been concentrated on shelter conditions because they are the blackest spot of all; even now, after four months, though there are undoubtedly improvements, the prevailing impression is that the conditions are still scandalous. For this, most of the blame is to be placed on the local authorities concerned. The Government has accepted the recommendations of Lord Horder's Committee wholesale, and instructions have been sent to the local authorities that they should be carried out; but the borough councils, especially in the poorer districts of London where conditions are naturally worst, have generally shown themselves quite incapable of dealing with the situation, even though they have been relieved of the financial burden. Now, however, they have been relieved of the executive responsibility as well. Henceforward, though the Ministry of Home Security will continue to be responsible for the number, position and construction of shelters, the Ministry of Health alone will be responsible for running them, that is, for sanitation, public order, bunking, lighting, heating, and so on. But, in addition, the Ministry of Health will delegate its duties and powers to the Regional Commissioners, as the

Ministry of Home Security, in providing shelter accommodation as in other A.R.P. matters, has always done. There are some consequential changes among the London Regional Commissioners. Captain Euan Wallace has resigned on grounds of ill-health, and his place has been filled by Alderman Charles Key, who will take over the responsibility for shelters, Admiral Evans, who since last autumn has had special shelter duties, resuming the general duties of a Regional Commissioner. Thus, though there is still a duality of responsibility for shelter policy, the execution of the policy is in one pair of hands—the Regional Commissioner's, the local authorities acting as his agents—and no longer should it be possible for reforms to be shelved because nobody knows whose job it is.

But the delegation of powers and functions to the Regional Commissioners by the Ministry of Health has a longer-term interest than the improvement of shelter welfare. Hitherto, their direct contact with the central Government has been through the Ministry of Home Security only. The Ministry of Health has its representatives in each region, so have the Ministry of Food and other Departments as well; but they are not members of the Regional Commissioner's office, and they have to work through the local authorities. It is true that virtually complete governing powers can be given to the Regional Commissioners, if communications with the central government break down, or if central government itself becomes impossible. This has not happened; instead, as Mr. Kenneth Lindsay recently said in Parliament, it is local government that has broken down, and surely the time has come for the Commissioners to assume wider powers. Billeting, the welfare of the bombed and the evacuated, communal feeding—these have been muffed by most local authorities, through indolence, incompetence or merely ignorance; where the regional machinery has been used, it has been far more successful. It is not suggested that the Regional Commissioners are the perfect substitute for local authorities, or that in each region the perfect choice has been made to fill the office; but at least they are free from the parochialism and self-interest that are the bane of modern local government.

The Nation's Health

Some anxiety will be relieved by the report of the nation's health in 1940, given by Sir Wilson Jameson, Chief Medical Officer of the Ministry of Health. In the crowded deep shelters there are at present only stray cases of infectious disease, and no report of an outbreak of typhoid, even in the worst raided places, has yet been notified. With one exception, moreover, there has been little increase in the number of cases of the chief infectious diseases during last year. Cases of scarlet fever and diphtheria are actually down compared with 1938 and 1939; pneumonia and enteric fever—of the paratyphoid, not typhoid, type—are slightly up; and dysentery is up on 1939 but down on 1938. The one exception is cerebro-spinal fever, the notorious war disease, cases of which amounted to approximately

Import
Banking
on
Sweden

SKANDINAVISKA BANKEN

12,500 in 1940, compared with 1,500 in 1939 and 1,288 in 1938. It is quite true that the tremendous advance in chemo-therapy in the last few years has robbed cerebro-spinal fever of its old terrors—the death rate among cases has been reduced from 60 per cent. to 5 per cent., provided that there is early diagnosis and early treatment with special drugs. But the reduction in mortality does not mean that it is not still a severe enough illness for the increase last year to be regarded with some anxiety, and, with a huge army at home this winter, it would have been interesting to learn what proportion of the cases fell among the armed forces and civilian population respectively. And though it is reassuring to learn of the absence of epidemics in the shelters, it must be remembered that the epidemic season is only due to start now; the escape so far is due to good luck rather than good management—indeed, Sir Wilson summed up the position by saying that we had been very fortunate. His report must not be regarded as an excuse for any slackening in the efforts to make the public shelters healthier places to live in.

* * *

Rumour Campaign in the Balkans

It is still uncertain whether Germany is doing more than poking the Balkans out of the unusual quiet of the last month. In a war in which nerves are a military factor it is not good to allow any potential victim the chance of restoring its morale by a period of quiet. Bulgaria, an obvious choice, has been on the rack for a week. Both King Boris and M. Filov, the Prime Minister, are said to have been to Germany, and it is certain that the Prime Minister has paid a long visit to Vienna. There were also rumours that he would resign in favour of some more pro-Nazi politician. But with his return to Sofia, the part which Germany had played in spreading the rumours became more obvious. M. Filov strenuously denied either that he had seen Ribbentrop or that he had visited Vienna for any other reason than for his health. There is evidence, too, that Russia is keeping a wary eye on developments in Bulgaria. The reported arrival as Counsellor in Sofia of M. Alexandrov, an expert of the Soviet Foreign Office and former head of the Soviet delegation on the frontier-fixing Commission in Poland, has been accompanied by rumours that terms submitted by Germany and covering such matters as the passage of troops have been passed on to Moscow with a request for advice and, if possible, assistance. Nothing can be substantiated, but the existence of these reports at least suggests that Russia is taking a hand in the rumour campaign. In the meantime Field Marshal List, one of Germany's experts in mechanized warfare, has arrived in Roumania with a staff of five generals, and the number of troops under his command is increasing steadily. Nevertheless, it does not seem likely that a campaign will be launched before the spring. The Italians may be hard pressed, but winter is doing the work of Mussolini for the time being and delaying any serious Greek advance. The week's news from the Albanian front is of an advance so slow that it can only be called a "nibbling" at the enemy line, and the advance is likely to remain so for at least some weeks. Hitler is not likely, therefore, to launch a blow while his Roumanian base is torn by civil war, and before him lie flooded Bulgarian plains and frozen Balkan mountains.

Bombs on Eire

The only possible explanation of the bombs dropped by Germany on neutral Eire on the nights of January 1st and 2nd is that the Nazis were anxious to test the reaction of the Eire Government to further breaches of their neutrality. There could have been no possibility of mistake, for some of the bombs were dropped by night on Dublin, whose lights for months now have guided German raiders to our industrial centres in the North-West. Nor obviously was it part of any immediate plan of campaign. Reconnaissance flights are probably going on fairly regularly, but their value is not enhanced by punctuating them with a discharge of bombs. The only other explanation is that a Nazi airman in pure exhilaration at the sight of such a target dropped his bombs for the joy of it—but this is unlikely; not more

unlikely, however, than the explanations which the Germans are finding in answer to Eire's protest to Berlin and demand for compensation. The Nazis are apparently prepared to admit that the bombs of January 1st might have fallen from a German plane, but the bombs of January 2nd were "British bombs," and "as in the case of the *Athenia* there is very great suspicion" that they were "dropped with provocative intent in accordance with Churchill methods." The Germans are not likely to retreat from this position, although they have promised to make investigations. In the meantime, the bombs cannot fail to remind Eire how frail a protection is a one-sided neutrality.

* * *

Supplies to France

The necessities of war make it imperative to treat unoccupied France, as well as the unfortunate conquered countries of Europe, as too much under the sway of German demands to be permitted to import vital supplies through the blockade. Mr Jan Masaryk, speaking on behalf of Czechs everywhere, has "put himself on record" as supporting this stern decision. The fact that a cargo of vitamin concentrates and clothing from the United States is to be allowed to enter unoccupied France indicates no change in Allied policy. This is a special case and was done on humanitarian grounds in response to the personal appeal of President Roosevelt. The argument is that control over the distribution of these goods by the American Red Cross will be sufficiently close to prevent any benefit accruing to the Germans. As total supplies in German Europe will be increased, however, by these imports, it is not at all sure that a disguised advantage will not inevitably be given to the enemy. But supplies restricted to the sick and ailing, and for children, are regarded as coming outside the strict bounds of blockade; and it can reasonably be hoped that this act of mercy will not be the thin end of the wedge in the abatement of our economic offensive.

* * *

Plans against Fire

Mr Morrison's appeal for fire-watching and fire-fighting parties in business and residential districts has received a satisfactory response. Individual offers of service have been numerous, and blocks of flats, hotels, and neighbouring houses have established their own patrols. The real problem is one of organisation and enforcement. There are plenty of people willing to help now that the recent German raids have shown the increasingly grave menace of destruction by fire; but, to take just one example, the long-standing Order for the compulsory clearance of inflammable material from lofts and attics is still more honoured in the breach than in the observance. It is hard to escape the view that this new force of amateurs will only meet the grave need it is intended to satisfy if its members can be put under some definite obligation to persevere with their work. Mr Morrison spoke menacingly of compulsion. Fire patrollers cannot very well be treated differently in their terms of service from unpaid wardens and other part-time personnel. They are not forced to join up, and when they have enlisted their only obligation is the contractual one of giving notice before they leave. Most of the recruits, being recruits, are willing; and in any case, it is scarcely possible to command the services of volunteers, while those who do not volunteer go scot free. Moreover, part-time workers do owe allegiance to their employers, their business, their work and their families. But when the familiar sense of boredom and frustration enters in, there is plainly the danger, in the slovenliness, irregular attendance and resignation. That is why it is all-important that the new unbound service of fire-watching should be efficiently planned, so that in a useful way; and a central Fire Prevention Executive, under the Postmaster-General, has been set up to ensure effective measures of fire protection. The A.R.P. services have done extremely well under fire. If occasion arises the Home Guard will do

the same. So probably will the fire patrols. But the difficulties and the deficiencies of present voluntary methods in civil defence must from time to time bring up the view that the only effective, reliable and fair way of using the nation's men and women would be to place every citizen under compulsion (as binding as conscription) to do some part-time defence work; to exempt all those plainly excluded for reasons of health or business or exceptionally long hours of work or other ties; and to insist in the first instance upon the services of those who are patently most able and most free to do the work—calling up others as required to fill gaps. It is an anomaly which cannot be argued away that one section of the population (males between 20 and the early thirties) is already compelled to serve in the armed forces, while home defence duties are done on a purely voluntary basis, which, in spite of the undeniably great achievements of the voluntary services, has two consequences: some of the volunteers do their work halfheartedly, and cannot be rebuked; and, secondly, a large part of the population just does nothing whatsoever. It would catch the spirit of the hour and the nation if the Government's already existing powers over persons were to be applied in this way—but it is doubtful whether Mr Morrison meant anything like this when he "threatened" compulsion.

* * *

Shipping—Assistance from America

In recent weeks the rate of shipping losses has shown a timely decline; during the week ended December 28th, for example, British and Allied losses were only 18,208 tons and 19,348 tons respectively. But this lull in sinkings does not mean that the problem has been solved, or even that it is necessarily nearing solution, though defence measures are almost certainly increasing again in potency. It is as urgent as ever; and there are transitory reasons of weather and enemy dispositions which may account for the fall. The need to augment and economise our merchant shipping resources, where capacity has been sharply narrowed by the loss, damage and delay caused by the enemy's attacks, is still the first charge on public policy; and the setting up of a new Ministerial committee as an Import Executive is a welcome step. An effort is now being made in the United States to expand shipbuilding capacity at a faster rate than hitherto. On January 3rd, President Roosevelt announced his Government's decision to build 200 merchant ships of 7,500 tons each, at a cost of between \$300 and \$350 millions, in the new shipyards that are to be provided and that he hoped that deliveries would begin within a year. But the expansion of production in America will take time and we cannot expect many new American ships this year. On the other hand, the existing American merchant fleet is quite substantial. Before the war, United States steam and motor tonnage (excluding lake vessels) was in the neighbourhood of nine million tons, or about one-half as large as Britain's, and America's immediate assistance need not be confined to selling us vessels from this fleet. American ships can help by taking over some part of British trade between overseas countries, thus releasing British vessels for Britain's direct use. Negotiations are already taking place with the United States Maritime Board for the taking over by America of some of the British shipping routes in the Pacific. In view of the keen Anglo-American competition on these routes before the war, this seems a startling change of policy. But there is no satisfactory alternative. The ships are needed for more vital purposes.

Less Meat and More Arms

The public was warned to expect further reductions in the meat ration, and is not disposed to grumble at the reduction from 1s. 10d. to between 1s. and 1s. 6d., according to weekly supplies. To many the inclusion in the ration of pork, and nearly all the more familiar kinds of offal, such as liver, kidneys, oxtail, sweetbreads and heart, will make more difference than the reduction in the total value allowed, since it was usually possible for those who could afford it to secure enough of these to provide at least one or two substantial meals in the week. Now that the purely practical reason for unrationing pork has ceased to be operative, it is much fairer

that people who can afford this more expensive form of meat should have to forgo a corresponding portion of their beef and mutton ration. It is possible, however, that some of the very expensive offals, as, for example, sheep's kidneys, will prove unsaleable as part of a small ration, and unless their price is very much reduced, they may have once more to be freed. However, the whole matter is, for the moment, largely of academic interest, since in many districts during the last week of the old ration, butchers were scarcely able to secure enough meat to supply even half the full ration at the new rate. If the shortage is likely to be prolonged, everything should be done to secure greater evenness of distribution. If there is not enough to go round at the present ration, the ration will be correspondingly smaller. The butchers have done their best to be fair, but in doing so they incur a certain amount of odium from their customers. As so much of their tangible stock in trade has gone from them, it is hard that they should also be deprived of goodwill.

* * *

Food Control and the Nation

The attention of the Food Minister has been drawn to the share, which has seemed to many people excessive, received by the catering industry of foods, especially meat, which are temporarily in short supply. Lord Woolton, though he pointed out that only 7½ per cent. of the total consumption of meat goes to hotels, restaurants, boarding houses, cafés and canteens, has now consulted the industry with a view to keeping it "in harmony with public opinion." The Minister has formulated further restrictions. Quantitatively, the large portions still being served in expensive eating-places are admittedly insignificant in relation to total consumption. Qualitatively they are not insignificant. By the side of scarcity elsewhere, they constitute a social scandal; and to say that it is only a "little" scandal is shortsighted and unimaginative. Lord Woolton is anxious to leave people free to eat in canteens and other communal places; but this is no reason why "high-class" menus should not be brought into line with the national diet. Meanwhile, in order to stop speculation in a large number of other foods, an order has been issued making it an offence for a manufacturer, wholesaler or retailer to charge more for these goods than he charged on December 2nd. The list covers: coffee, including coffee essence and "coffee and chicory"; cocoa powder; cocoa butter; chocolate sold for use as a beverage; canned and bottled vegetables; canned pork and beans; honey; meat, fish and poultry pastes; meat and other edible extracts; shredded suet; dead poultry (other than turkeys); rice, tapioca and sago; macaroni, spaghetti and vermicelli; biscuits, rusks, and crisp breads; soups, tinned, bottled and powdered; processed (or wrapped) cheese; pickles, sauces and relishes; custard and blancmange powders; table jellies; edible nuts. This order is only to cover the period during which maximum price orders are in preparation. Orders

are also to be made almost immediately to fix the maximum prices of syrup, treacle, marmalades, canned and bottled fruits and canned fish. Other foods are also under consideration. The policy of fixing food prices over the whole field of those in general use which are liable to be scarce in the coming straitened months has been accepted. The Minister's hand, as it happened, was forced by the petty speculators who have batted on the nation's food difficulties ever since they started. But there are sound social and economic reasons for fixing these prices, apart from the profiteers, and Lord Woolton may find that more still has to be done. Price-control cannot by itself ensure fair distribution. It only makes fair distribution possible; and the extended use of direct rationing, registration and other means of deliberately eking out supplies will inevitably have to be considered.

* * *

Back to the Directory?

There will be many who will smile when they remember that one of the advantages claimed for the new Vichy regime was that it would at last provide some stability of government. True, there is a constant element in the person of Marshal Pétain, who has final authority where President Lebrun had none. But under his leadership, Vichy has now undergone its seventh transformation in six months. Baudouin has gone and control of affairs is vested in Pétain, assisted by a triumvirate of Admiral Darlan, General Huntziger and Flandin. On the whole, the change appears to be an expression of the Marshal's tenacious hold on the small measure of authority and independence conferred on him by the armistice. Germany was not informed of the changes, Laval has not been reinstated and the offending Ministers—Alibert and Peyrouton—who were largely responsible for Laval's disgrace, remain at their posts. Another sign of independence is the fact that when the Consultative Assembly meets, Alsace and Lorraine will be represented, although Germany has already incorporated parts of these territories into the Reich as a Westmark. The Nazis are silent, but they cannot be pleased at Vichy's manoeuvres, especially as the apparent strengthening of the Government has coincided with the arrival in Vichy of America's new Ambassador, Admiral Leahy. The Admiral is noted in the United States for his opposition to appeasement, both in Europe and the Far East, and in his first official pronouncement on French soil he reminded his hearers of the United States' intention to give Britain all aid in its power. His presence may have a tonic effect on the fearful and discouraged men at Vichy, and it may prove to be a guarantee that if and when Hitler violates the terms of the armistice, the Pétain Government will not merely retire into passivity in Algeria, but actively re-enter the struggle at the side of Britain and the United States.

* * *

Historians and the Invasion

The students and professors of history are seldom hard to press into service in time of war. There has never

been anything like the wholesale conscription of history into the service of the State in this country as has happened so often in Germany, where, long before the Nazis, the test of historicity had tended to be Germanism rather than fact. But some of the ancillary work done by British historians, in pamphlets and books, during the last war, seemed very odd history to readers during the less partial years of peace that followed. So far as can be seen through the spectacles of wartime, the similar publications of this war have up to now treated scholastic integrity much less contemptuously. At any rate there can presumably be no doubt that the authors of the work that the Historical Association now proposes to do on the failures of former enemies to invade these islands will show themselves scholars and gentlemen no less than patriots. Sir Charles Grant Robertson, the Association's president, has sponsored the scheme to provide the Ministry of Information and the British Council with facts about these abortive attempts—the two assaults on Ireland and the foray into Pembroke-shire have been mentioned—and Admiral Sir Herbert Richmond, Master of Downing College, will superintend the work. It is not said that the decision of Napoleon to desist from his invasion plans will be included in the work, and although it is hardly likely that anything at all new or unknown will emerge from these researches, which can have no more relevance to our present peril than the flowers in spring, they should at least show that the attempt which is now threatened is quite different in scale and character from these puny and insignificant forerunners. It would perhaps be otiose to ask the historians to survey the ways and means by which the Romans and our Saxon and Danish ancestors forced their entry on to English soil, though there are precedents worth marking in the Danish invasions. But the landing and march on London of the bastard Duke of Normandy might furnish some interesting, if wholly inapposite, comparisons for contemplating Hitler and his present illegitimate designs.

* * *

Shorter Notes

Shipping losses for the week ended December 29th amounted to three British ships of an aggregate tonnage of 18,208 and four Allied of 19,348 tons. The total tonnage, 37,556, is well below the weekly average for 1940, which excluding Dunkirk losses was 69,666 tons and including Dunkirk 71,911 tons. The provisional figure of total losses for 1940 is 3,522,632 tons, compared with 5,660,000 tons in 1917.

*

By a neat piece of timing, the Japanese were ready with a counter-protest when Sir Robert Craigie came to deliver Britain's protest against the use by German raiders of Japanese flags in the Pacific. Mr. Matsuoka complained of the detention and search of Japanese travellers at Bermuda. It is not reported that the British authorities struck the travellers or compelled them to strip in public, but apparently the Japanese find no difficulty in forgetting Tientsin.

resorted to the creation of secondary industries. This process, carried out in a haphazard way and, inevitably, behind the wall of protective duties and import restrictions, was bound to result in higher industrial prices in terms of agricultural products. This meant, in its turn, a still further deterioration in the standard of living of the agricultural community, which accounts for about 80 per cent. of Roumania's total population.

To this phenomenon, not altogether unfamiliar in the "slump economics" of other countries, must be added two Roumanian evils of a more specific kind. One is the absence of political leadership throughout the country's most critical years. The handful of real statesmen, with a full grasp of the realities, some of them with a true European vision, were unheeded by public opinion and overpowered by reckless, opportunist politicians.

The other evil of the Roumanian State has been its consistently bad record of internal administration. This, too, had its special reasons. Roumania has no permanent Civil Service, the major part of the administrative apparatus being replaced with every new Government. The not unnatural result was that incompetence, deepened by corruption, became a permanent feature.

It is in this atmosphere of economic strain, political strife and administrative failure that extremist currents found a hotbed and could work slowly but relentlessly into the very core of the state. It would be unfair and wrong to put the blame for having failed to stem their advance on any one Roumanian Government or statesman. The extremist elements held two formidable weapons: a strong anti-Semitic policy, always popular in Roumania; and the more or less—or rather more and more—open support from powerful friends, themselves daily growing in strength. Since 1933, the whole Roumanian scene must be viewed against the background of Germany's growing power, coupled with a deliberate and skilful policy of economic expansion. The occupation of Vienna in March, 1938, gave Germany the rail-head of Roumania's communication system, and deprived Roumania of her economic and financial gateway to Western Europe. What happened after this and led up to the bewildering climax of recent weeks is in fresh memory and shows the forces, set in motion long before, concluding their disintegrating action.

The nominal rulers of the "rejuvenated" Roumania should not be looked upon as a homogeneous element, or anything like the Nazis or Italy's Fascists even in their early days of power. They are a motley crowd, composed of the young Iron Guard fanatics, attracted by the myth of the "Legionary State," of some well-intentioned but misguided patriots, who after seeing only the mistakes of the old system now see nothing but the sweeping slogans of the new, and finally—and most dangerous of all for being without illusions—a swarm of political adventurers and other opportunist elements. The country is heading towards economic anarchy. Industrial output is dwindling, commerce nearing standstill, with the cost of living rising rapidly.

The Real Masters

Meanwhile, the real masters of the country, in the guise of military instructors, are watching the situation carefully. They, too, have no illusions, being well aware of the incapacities of the new regime. Nevertheless, it suits their book to allow the situation to drift to a point where they must be asked to take complete control, in order to restore order. In the economic field, this is achieved in two steps. First, official controllers are appointed to all industrial concerns and banks of some importance, with the task of disorganising by obstruction. In the second stage, after this activity has been driven far enough, German interests come forward and offer to buy up the enterprises, mostly Jewish-owned, at their own prices and terms. The alternative is confiscation, imprisonment, or both. It is a scheme well tried and perfected by experience.

The recent trade agreement with Germany constitutes no major development. It is along the lines established in conquered countries; it provides for a higher rate of exchange in favour of the Reichsmark, "compensated" by guaranteed agricultural prices and wide economic collaboration. The figure of 8 million metric tons fixed for oil exports in 1941 appears at first sight rather modest, having in view Germany's requirements and the Roumanian output; but, in reality, it exceeds substantially the quantity that can be dealt with by existing transport facilities.

In this, as in other respects, it is not the letter of

any agreement but the facts of the situation which will determine Germany's economic gains. The only certainty is Roumania's loss; a free hand for German exploitation means complete economic subjugation.

December 20th.

Eire's Agricultural Grievances

[FROM AN IRISH CORRESPONDENT]

It is generally believed that America's neutrality is just as helpful to Britain now as her belligerency could be, precisely because she is disposed to make available her immense industrial resources for the common cause. Eire's neutrality was accompanied by a similar disposition which would have been helpful in the same kind of way, though doubtless not to the same degree. In this case there are no "cash and carry" limits, for we are quite content to be paid by the increase of our sterling balances, which is one of the most convenient ways in which Britain can borrow from the outside world.

About a year ago we introduced compulsory tillage, and compelled our farmers, who were not unwilling, to increase considerably their output of oats, barley, potatoes, and wheat. There seemed an assured market then for oats, most of which are used as feed for live-stock, and for barley, about half of which is similarly used for feed. Last March, oats were about 13s. 6d. per cwt. Last winter, the price of Eire's export eggs was kept down by the British import control well below the price of British and Northern Irish eggs. Consequently, poultry stocks were very much reduced over here, and much of last season's crop of oats was carried over unused. After the new season's crop came in, the price fell to about 8s. per cwt., and the crop is largely unsaleable even at that price. Farmers who specialise in oat production have therefore found themselves financially "let down," and unable to devote themselves wholeheartedly to the business of maintaining and expanding production. Owing to scarcity at home and in Britain, and to the (temporary) low price of feed over here, the margin of profit in egg production is now wide, but unless the tillage campaign is maintained, there will be a scarcity of home grown feed over here next season, and a consequent inability to expand the production of eggs. If Britain wants to derive the maximum advantage for herself from our neutrality, export prices for our produce should be fixed which would give our farmers a sense of security.

The present situation with regard to bacon is ludicrous and quite unintelligible. Britain has lost the major sources of her former bacon supply, and bacon is rigorously rationed to the British consumer. Bacon production constitutes one of the directions in which our agriculture could have been considerably expanded even under war conditions. A quota limit is imposed on our export to Britain which restricts its volume below the amount which would otherwise take place at the prevailing price. Our home market is relatively over-supplied, and our farmers are seriously advised by our Minister of Agriculture not to increase their stocks of pigs.

In the matter of fat cattle a price policy is still persisted in by Great Britain which makes it impossible for us this winter to co-operate in the preservation of home produced sources of beef supply to the extent that we would like. For a number of years before the war, a subsidy of 5s. or 7s. 6d. per cwt., live weight, was payable in respect of all home produced fat cattle

THE WORLD OVERSEAS

Disorder in Roumania

(By a Correspondent)

TO understand the underlying reasons of the territorial dismemberment, politico-economic disruption and social anarchy, truly totalitarian in their completeness, which have marked Roumania's adherence to Germany's "New Order," one must go much farther back than to the immediate events leading up to the present situation.

The real causes must be sought in other deeper-rooted weaknesses of the Roumanian State. Economically, the inherent defect in its structure has been its unsolved—and, within the own means of the country, insoluble—

agricultural problem. Put bluntly, it is a problem of poverty. Neither the redistribution of land through the Agrarian Reform, nor the consolidation of the agricultural debts by the Conversion Act carried out ten years later—incidentally, at the expense of the immobilisation of the better part of the banking system—could do anything but bring momentary relief. They could not remove the fundamental weakness, which is a lack of capital.

When this acute lack began to assume alarming proportions following the world crisis of 1929, Roumania, in company with most primary producing countries,

slaughtered for consumption in Britain. The subsidy payable in respect of fat cattle which had been imported as "stores" from Eire was 2s. 6d. or 5s. per cwt. according to quality, but such cattle had to be at least three months in the United Kingdom before they qualified for the subsidy. The subsidy is now embodied in the ordinary price fixed by the Ministry of Food for cattle, and that normally is about 7s. 6d. per cwt. more than the price of fat cattle ready for slaughter in Eire. On the other hand, Irish stores which have spent three months in the United Kingdom are priced, when they reach the slaughter stage, only 2s. 6d. per cwt. cheaper than British reared animals of the same grade. The effect of this long continued policy is to make it uneconomic for an Irish cattle fattener to keep an animal here for the last three months of its fattening life. It would lose in the price differential the value it would otherwise gain by its increasing weight. Consequently, whereas we used to export 300,000 fat cattle and 300,000 store cattle annually, we now export about 450,000 store cattle and 150,000 fat cattle.

There is plenty of grass and other feed over here, and no bombs—yet. It is to Britain's wartime interest that we should feed and fatten as many cattle as possible this winter, and send them over ready for slaughter during the first four months of 1941. But the price differential makes it unprofitable to feed any fattening cattle at all over here much later than December, 1940. That price policy compels us to unload on Britain cattle requiring three months more feeding, even if our barns are bursting with unused and unsaleable home-grown oats and barley, and your barns are bursting with high-explosive bombs. The three months factor operates at all times throughout the year, but it is particularly important and unfortunate for both countries during the first three months of the year, when cattle must be stalled if they are to continue the fattening process.

December 28th.

[Since this article was written, the Ministry of Food has decided to increase the price paid for fat cattle from Eire by 1d. per lb., which will enable the Irish farmers to resume stall feeding.—EDITOR.]

Food for Greece

[BY A CORRESPONDENT]

TURKEY has volunteered to release food supplies for Greece. This she can well afford, having a record wheat harvest of over 21,000,000 quarters. This is the third good crop in succession, and much above the average for 1933 to 1937, so that Turkey has acquired a large reserve; but exports will only be permitted to Greece. Turkish supplies of other cereals are also large, yields being abundant this season; all are above the average, by the following percentages:—barley 16 per cent., oats 51 per cent., and maize 50 per cent. Furthermore, Greece recently bought 500,000 quarters of Australian wheat.

Though other goods are also on the way, Turkey is obviously the most convenient source of supply for Greece. There is a shortage of maize and wheat in Yugoslavia, and though Bulgaria possesses a moderate surplus, there is a desire to conserve existing stocks pending fresh international developments. On the other hand, Russia, having had a satisfactory harvest, has contracted to send 100,000 tons of wheat (and possibly other grain) to Greece. It should be remembered, too, that Greece is normally self-sufficing in barley and oats.

Turkey, moreover, has not only grain to spare, but also a certain amount of dairy produce, eggs and meat, as well as olive oil, fruit, coffee and a super-abundance of hazel nuts—one of the most nutritive and sustaining of foods. Egypt is another source of supply, though this entails the use of valuable shipping.

While Greece usually imports about a third of its wheat requirements, this year's harvest was above average—although below that of the previous season. Greece also maintains far more pigs per head than, say, Britain, as well as a large number of sheep. With prudence, foresight and a little economy, the country should manage sufficiently well. Petrol is Greece's chief need; but Britain can probably assure adequate supplies.

January 4th.

The New Federal Reserve Index

[FROM OUR NEW YORK CORRESPONDENT]

THE revision of the Federal Reserve Indices of Production has given a sharp reminder of two facts often forgotten—that, in America at any rate, what is called descriptive economics or economic interpretation is predominantly the analysis of statistics, and that actually there is a world of difference between the two. There is an honest reason for this confusion. The statistical series are invariably more comprehensive than the individual's own observations; and, when there is a conflict between the two, the reason is that the evidences observed by the individual are local and limited. The inevitable result is that the observer comes to rely upon the statistics and to rationalise his comments to fit the statistics. The consequence of this result is a habit of mind that makes the commentator forget his reservations except at odd moments, and renders him content to take the indices, not "for what they are worth" but as absolute expressions of value. In month-to-month comparisons, this does little harm; but practices developed in the month-to-month routine are carried over into discussion of longer periods.

The composition of an index of production is a serious undertaking; and this fact, together with the statistical urge for continuity of series, argues against frequent and extensive revisions. The Federal Reserve index of production which appeared in the middle 'twenties was recognised well before the middle 'thirties as having become seriously obsolete, in that it omitted several industries of recent rapid growth in importance. For example, this index included no reference to alcoholic beverages, whose manufacture was limited legally at the time the index was composed; nor to rayon, which had been insignificant in 1923-25. But, because it was the standard index, comparisons of current activity with that, let us say, of 1932 or 1929 continued to rest on it; and estimates or forecasts were based on it.

The present index is a much more satisfactory statement of the economy; and its interpretation permits a clearer understanding of the nature of the past decade than could be gained from conjecture.

The outstanding feature of this decade, especially of the period from about 1932 to the outbreak of war, was the alteration of the relation of durable to non-durable goods. This Correspondence often, in that period, referred to the "consumer goods economy," but was never able to support the comment with much statistical evidence.

OLD FEDERAL RESERVE INDEX (1923-25 = 100)		
	Durable goods	Non-durable goods
1923	102	100
1929	122	117
1932	33	88
1939	95	112
NEW FEDERAL RESERVE INDEX (1935-39 = 100)		
	Durable goods	Non-durable goods
1923	104	72
1929	138	98
1932	41	70
1939	108	108
October, 1940	150	115

Between 1923 and 1929 the old index showed an increase of 20 per cent. in durable goods and 17 per cent. in non-durable goods; that is, the increase, while parallel was slightly more pronounced in durable goods.

BRITISH MALAYA

The Malayan Information Agency exists to provide authentic information on all aspects of trade and travel in British Malaya, agriculture, mining, commerce, transport—illustrated handbooks, etc., on request.

THE MALAYAN INFORMATION AGENCY
MALAYA HOUSE, TRAFALGAR SQUARE, LONDON, W.C.2

This index formed the basis of a good deal of economic comment, proving that the depression after 1929 was caused by consumer purchase (as evidenced by non-durable goods production) not keeping in step with durable goods production; and many a solemn argument on over-saving rested on data of this type. The new index records that, between these years, both rose by nearly 30 per cent., the rise in consumer goods being a shade the stronger. The greater disparity, of course, comes later, in comparison with 1929. The old and new indices alike show 1939 durable goods production as under 1929; but where the old index showed non-durable goods production in 1939 as about 4 per cent. under 1929, the new index shows it about 16 per cent. over 1929. The disparity is even more marked by comparison with 1923, the earliest year for which both series are available. The old index showed 1939 durable goods production about 7 per cent. lower than in 1923, the new index shows it about 3 per cent. higher. For non-durable goods, the direction is in agreement, but not the extent; the old index shows 1939 non-durable goods production 12 per cent. above 1923, the new index 50 per cent. From the old index one could infer the common non-statistical impression that the emphasis in the economy had been shifting towards non-durable goods. The new index shows that this common impression was more accurate than the official index; but no commentator would have had the temerity to pit his impressions against the index in any emphatic manner.

Changes like those introduced into the index of production always give rise to questions; and one wonders whether or not an equally thorough revision of the unemployment statistics would produce comparable alterations. Many times, in these letters, your Correspondent has laboriously undertaken to "relate" the employment data to the production index. With the appearance of the new index, it appears that this was an effort to relate the unrelated. It was interpretation of statistics masquerading as economic interpretation.

BUSINESS INDICES

1935-39 = 100 for Industrial Production
1923-25 = 100 for all other series

(Unadjusted for seasonal variation)

	Oct., 1939	Sept., 1940	Oct., 1940*
Industrial production (total)	126	129	133
Manufactures (total)	125	130	135
Durable	131	143	154
Non-durable	120	119	120
Minerals	129	124	122
Construction contracts (total) ..	72	98	88
Residential	66	82	78
All other	77	102	96
Factory employment (total) ..	103.6	107.7	...
Durable goods	96.1	105.5	...
Non-durable goods	110.8	109.7	...
Factory payrolls (total) ..	101.6	109.6	...
Durable goods	99.6	113.2	...
Non-durable goods	103.9	105.5	...
Freight car loadings (total) ..	89	86	86
Miscellaneous	97	94	100
Department store sales	99	105	101
Department store stocks	77	72	...

* Preliminary.

The series "unadjusted for seasonal variation" is given, as the idea of adjusting a war boom for seasonal variation seems to belong to the realm of pure statistics.

Herr von Neurath Admits Failure

[BY A CZECH CORRESPONDENT]

IN an article which all Czech newspapers had to publish on Christmas Eve, Herr von Neurath, the Protector, admitted the complete failure so far of the attempt to win over the Czechs to the principle of Hitler's "New Order" and threatened to abolish the local autonomy left to them. He complained that although every right-thinking Czech should have recognised by now that the political situation in Europe is unalterable, it was impossible to convince the people that German domination alone will bring them prosperity. He also admits the failure of the German-sponsored special organisations

which were created to nazify the country. All these, led by Czechs who claim to be willing to serve the Germans, did nothing, Herr von Neurath alleges, to enamour the Czechs of the Third Reich, except publishing manifestoes and plans; their activities mainly consist in excluding from collaboration ambitious young people who would willingly work for the German ideal.

The Czech authorities, he goes on, are not fulfilling their duty towards Germany. There is still a lack of understanding of the need for food rationing. People do not realise that the Protectorate depends on food imports from the Reich, and the Protector hints at the possibility of a food blockade if the Czechs do not surrender completely. He ends on a conciliatory note, advising the Czechs to feel happy and trust in the German garrisons and Nazi units—a significant concession of the uneasiness felt by the Germans there.

The Nazis are doing their utmost to calm the growing unrest. The transmitting stations of the Protectorate now administer sedatives over the ether. The wireless stations of Prague and Melnik openly admit that the "whispering" propaganda has assumed "ridiculous" proportions, and that people express their distrust in the German regime more frankly every day. "These rumours," state the German-controlled stations, "are circulated by Jews, Freemasons and other slaves of Benes. Do not believe them. They told you the workers would not have their Christmas holidays. They had them, nevertheless." The unrest, however, is increasing, and the whispering campaign is reliably spreading the news from the Czech radio in London. Jokes are even spread about the Nazi pundits, and Hitler's journeys are called the "Diplomatic Winterhilfe."

Australian Labour Conditions

[FROM OUR SYDNEY CORRESPONDENT]

ALTHOUGH the elections have brought no sweeping changes, the new Cabinet is undoubtedly stronger for the formation of a Ministry of Labour. The absence of any Government Department responsible for the direction of labour and working conditions has been noticeable for some time; the disturbance to labour caused by the curtailment of some fields of employment, together with the rapid expansion of war industries, has recently been reflected in a number of strikes. The new Minister for Labour and National Service stated that the work of the Department would be:—

- To deal with questions of general labour policy and manpower priorities.
- To investigate labour supply and demand and its placement.
- To solve problems associated with technical training, and with industrial relations and conditions.

Hitherto a number of different authorities have dealt with problems of this type, and in future the Ministry

of Labour and National Service will include within its scope: the Man Power Committee; the National Register Board; the Commonwealth Director of Training and his Advisory Committees; the Director of Labour Supply and Regulations; the Trade Union Advisory Panel.

It is worth noting that the inclusion of the Trades Union Advisory Panel gives Labour interests direct representation in the Ministry of Labour, although the Cabinet remains a United Australian Party-United Country Party administration.

Although the Advisory War Council can act in an advisory capacity only, it has already made a declaration on fundamental matters concerning the labour position. In a statement approved by the Council and issued this week jointly by the Prime Minister and the Leader of the Opposition, it was declared that stoppages in industry hindering the industrial side of Australia's war effort should be prevented by an overhaul of the Australian arbitration system. By introducing improved arbitration machinery to enable grievances to be considered by the Court and settled without delay, Labour would be assured that its rights were receiving just consideration.

It remains to be seen whether means exist of translating recommendations of this kind into effective action. The reduction in the size of the War Cabinet is an important step towards this end, and if it can be done the establishment of the Advisory War Council will greatly strengthen Australia's war organisation.

Algeria Faces Economic Disaster

[BY A CORRESPONDENT]

THE decisions faced by the French colonial possessions are not only of a political nature. The economic fate of these territories is also at stake. The fear of falling under the control of the Axis Powers has created a strong trend towards De Gaulle's cause in the French colonies. If, however, these sympathies have led to only a part of the French colonies openly joining it, it is because the fear of economic disturbances is stronger than the political incentive. On the other hand, the accession of New Caledonia and Oceania—the most important part of which is Tahiti—was decided mainly by economic considerations, for these groups of islands are entirely surrounded by British possessions, and are economically absolutely dependent on Australia and New Zealand.

The economic life of New Caledonia and Oceania is still little developed. On the other hand, the North African possessions of France are heavily handicapped by the present uncertain conditions. Only scanty news on this question is obtainable. Information from Algeria, however, shows the beginning of an economic catastrophe in Northern Africa, which is increased by the adherence to Vichy.

Algeria is facing transport reduced to the extreme; exports almost entirely seized; lack of coal; and unemployment. The colony had already suffered heavily by the war, even before the French collapse. For this country, rich in treasures of the soil, lives on the export of its surplus of soil products; incidentally, this is true for all the other French colonies in Northern Africa.

Algiers and the other ports live by trade. This had already suffered from the beginning of the war; it was decreased further since Italy's entry into the war in June, and has now ceased entirely since the extension of the British blockade to the Empire of Vichy France. Many almond merchants, who had enjoyed a considerable turnover only last year, now find themselves in liquidation. The rest will follow if there is no change in the situation very soon. Either the countries with which they used to trade have ceased to exist, or all the approaches are practically cut off.

The famous vine cultivation of Algeria faces ruin. Lately, when the vine harvest was brought in, last year's harvest was still unsold. Even if transport were possible, it would be useless to send vines to Bordeaux. And France is the only real market. A plan under consideration to ease the problem shows the difficulties in the

broadest light. It provides for using nearly the whole harvest for the production of sugar. This is no easy matter; it would entail the entire reorganisation of the whole system of vine planting, as well as of the entire system of sugar production.

Another difficulty is imports. Hardly any coal can be brought in, and it is necessary, therefore, to exploit some mines which are very far in the interior and have been abandoned as they are nearly exhausted. Transport facilities are in any case very scanty.

Algeria is nowadays just as concerned with the question of unemployment as is France herself. The economic difficulties have led to mass dismissals of labourers and employees by agriculture, industry and trade. Into this labour market crisis have returned the many demobilised soldiers, who are demanding employment after having been torn from their professions to serve their country. In such circumstances, the situation of the European has become especially disagreeable. Of about 7,000,000 inhabitants nearly 1,000,000 are European. Their claims for employment penetrate only with difficulty; they are considered as aliens, and feel uneasy as they have to decide much quicker than the natives whether they are for Vichy or De Gaulle.

December 30th.

Portugal: A Glut of Colonial Produce

[FROM OUR LISBON CORRESPONDENT]

DOUBLE the usual quantity of produce from Portugal's colonial possessions now fills the warehouses of the port of Lisbon. Some 22,000 tons of valuable tropical materials, oilseeds, coffee and cocoa, fibres, are lying here awaiting a buyer; and overseas, in S. Tomé and Príncipe, in Angola and Mozambique, further stocks are mounting up, with no inducement to ship.

Recently, the Ministry of Colonies estimated the value of Lisbon stocks alone at 150,000 contos (£1,500,000) a heavy charge on the financial and mercantile resources of a none too wealthy country. Some few shipments to the U.S.A. there have been, but this is a mere drop in the bucket, and unless England can come to the aid of her oldest ally the outlook is sombre. Portugal fully realises the stern necessity of the British blockade and has never protested against its application. At the same time, remembering her many lost markets, she does feel that the present situation deserves prompt and careful consideration by the authorities in London.

THE BUSINESS WORLD

The Commonwealth Mining Affair

THE tumult and the shouting have died; the captains and the kings have departed—from Winchester House for Westralia House. Still, one is tempted to add, stands the ancient sacrifice—the shareholders of the singularly inaptly named Commonwealth Mining and Finance group of companies. For it can hardly be pretended that to leave the affairs of the group in their present state is satisfactory for any of the parties concerned, least of all for those who invested their money in the group. Recent events have been summarised in the weekly Investment Notes of *The Economist*: here it is sufficient to state that the latest annual reports of the companies concerned afford only confirmatory evidence of the poor financial health of the group; and that the scheme for amalgamating constituents of the group both here and in Australia is of the genus red herring—by itself such a scheme will not increase earning power by one iota. The crux of the matter clearly lies in the reports of Sir William McLintock, as Board of Trade Inspector, on the history and affairs of the group. Shareholders may well feel that the recent general meetings have served the purpose of the board rather than their own. Few will consider that the space of time allowed to them for the digestion of Sir William's detailed reports was adequate. The contrast between the period of months during which the reports were available to the directors and the period of a few days during which shareholders were able to give them careful study is certainly striking. If the directors plead, as they have done, that publication and distribution of the reports was delayed for months, partly because the reports needed detailed study and comment, how much more necessary was an adequate interval to shareholders, with their less intimate knowledge of the group's complicated structure and history.

That, however, is crying over spilt milk. The directors have carried the day at the general meetings. It remains, therefore, for those shareholders who are still dissatisfied with the prospect of a continuance of the present state of affairs to reconsider Sir William McLintock's reports to see whether any further remedy is still possible. From the mass of those reports, certain passages may be selected as the most striking. For example, dealing with Great Boulder Mining and Finance, Ltd., Sir William, after detailing the history of five subsidiaries, says:—

The story begins by Australian Machinery and Investment, a company of which de Bernales is the guiding influence, buying at comparatively negligible cost mines which had been unworked for a number of years. Australian Machinery and Investment spent nothing in exploring and developing the mines with a view to ascertaining their chances of becoming reasonable financial propositions, but mining engineers in the employ of Australian Machinery and Investment collated historical and geological information regarding the properties, details of old mine workings, and second-hand views of past operations, and on that data wrote reports which invariably held out the mines as good ventures. In some cases there are indications that the engineers could not make even superficial examinations of the mines; underground investigation was, of course, precluded by the water-logged state of the workings. The mines were then sold by Australian Machinery and Investment to Mining and Finance at greatly inflated prices, and the profit made by Australian Machinery and Investment on the transaction was not disclosed to the prospective shareholders of Mining and Finance. Mining and Finance issued a prospectus containing the favourable reports of Australian Machinery and Investment's engineers and statistics of past mine outputs, which, if maintained in the future, would no doubt have made the mines very attractive propositions, as in all cases an unusually high average grade of ore was shown. No indication was given as to the period covered by the production records. Favourable reports on the

developments proceeding at the mines were given by de Bernales at successive annual meetings, and it was not until work had been curtailed or abandoned that shareholders were allowed to realise the doubtful nature of their company's assets.

It was disclosed in the prospectuses of Australian Mining and Finance, which was buying the properties from Australian Machinery and Investment, that Mr de Bernales was governing director for life of the latter company, and a holder of 500 shares therein out of 194,780 issued. But it was not disclosed that substantially the whole of the company's shares was held by members of his family, and that he was entitled to two-thirds of any dividend declared by the company. Lest there be any doubt as to Mr de Bernales' interest in Australian Machinery and Investment, it may be worth recalling Sir William McLintock's remarks earlier in his report on Great Boulder Mining and Finance that a statement by Mr de Bernales on the giving of shares and options without monetary consideration "identifies de Bernales completely with Australian Machinery and Investment." This identification of interests is the more significant in view of the repeated references by Sir William to the large vendor's profits made by Australian Machinery and Investment on that company's various share transactions, and his questionings as to the extent to which the actions of Mr de Bernales may have been dictated by a regard for the interests of Australian Machinery and Investment and certain other "family companies" rather than for the interests of the public companies of which he is the managing director.

It may be argued that in the case of a transaction involving unquoted shares, the fixing of a purchase price is a matter of opinion and not fact. But in the case of the assets acquired by Great Boulder Mining and Finance from Associated Northern Blocks (W.A.) these comprised cash (£583) and investments of an approximate market value of £56,886. Practically all of the investments had a free market in London, and could have been purchased on the market for £56,886. Instead, a consideration of £87,500 was given by Great Boulder Mining and Finance, payable in shares. Although stating that it is not immediately apparent why this premium should have been paid, Sir William points to one fact, which was not disclosed in the Great Boulder Mining and Finance prospectus, which he considers may provide the reason. This was the holding by Australian Machinery and Investment of shares of Associated Northern Blocks acquired at a cost of just under 5s. a share. The amount which Associated Northern Blocks had to realise from the sale of its assets, in order to give its shareholders a return of 5s. a share (and thus to recoup the price paid by Australian Machinery and Investment for the shares) was £87,500—the price which was in fact paid by Great Boulder Mining and Finance. No attempt is made by the directors in their comments upon Sir William McLintock's report to rebut this suggestion.

Again, in his reports on Commonwealth Mining and Finance, Ltd., and Beryl Gold Corporation, Ltd., Sir William McLintock declares that in some cases the circumstances are such as to suggest that the investments in companies which are members of the de Bernales group were made chiefly because the other companies urgently required finance rather than that they offered the lending companies satisfactory avenues for investment. And in the case of the Beryl Gold Corporation, Sir William states that the "question must arise whether Beryl Corporation was formed because mine developments justified it or whether it was done to inspire confidence in the minds of Anglo-Australian (another de Bernales company) share and option holders. . . . The latter motive was apparently responsible in some degree for Beryl Corporation's formation."

With such a background (and similarly disturbing extracts could be taken from virtually every page of Sir William's reports) it is not surprising that some shareholders at least are unwilling to support any reorganisation proposals while the present management continues in office. It is true, of course, that Mr de Bernales and his co-directors have issued replies to Sir William's reports. They maintain that Sir William has "jobbed backwards"; that people who invested in the mines were indulging in a speculation, and that because the speculation has failed the whole matter has been considered by Sir William as if it concerned flotations of ordinary industrial concerns; that the particulars given in the prospectus were obtained from an official Western Australian Government source, and that it was not reasonable or practicable to obtain further information; that as the prospectuses did not disclose what the vendors had paid for the properties, subscribers who purchased their holdings on the strength of them must be presumed to have been content to accept the vendor's profits, whatever they were; and finally they plead (the question is, of course, irrelevant to original subscribers) that the subsequent acquisition of more profitable assets has improved the lot of shareholders. The replies, frankly, are not convincing. Did the directors make every reasonable effort to satisfy themselves that the properties had the favourable expectations held out in the prospectuses? Can the charge of reporting "in the spirit of the knowledge of 1940 applied to criticise statements and decisions made in 1934 and 1935" be levelled against Sir William McLintock when, in the case of

Merchison Gold Development, Ltd., Sir William is criticising glowing descriptions of prospects made as late as December, 1936, when shareholders were being urged to exercise their options? Or when he is pointing out that Sir W. R. Campion had to admit, in October, 1939, that dividends received by Commonwealth Mining from Yellowdine had been used for purposes other than the payment of Commonwealth dividends he foreshadowed in October, 1937?

Sir William McLintock had no power to require evidence on oath, and his reports are not judicial findings. Moreover, there is evidence in the reports that Mr de Bernales has been fortified by Counsel's opinion on such nice points as the need for disclosure of certain details as to the interests of the "family companies" in the various flotations. Coupled with the natural disinclination of shareholders to incur further expense in connection with ventures that have turned out disastrously, the temptation to write *finis* to the whole business may well be strong. But it would at least appear to be worth the while of original allottees in the companies who have suffered loss to obtain advice as to whether any action would lie for rescission of contract. Meanwhile, the Committee of the London Stock Exchange may consider that its action of July, 1939, in banning dealings in the shares of all Commonwealth group companies (with the exception of Southern Cross Gold Development, Ltd., in liquidation) finds ample justification in Sir William's reports. And Mr de Bernales's chances of raising further funds in the London capital market must be rated thin indeed.

Finance and Banking

Fall in the Circulation

Although the superabundance of credit which marked the turn of the year has in part disappeared, there has been no lack of loanable resources in the money market during the past week. The return of notes from circulation has fed the banks' cash, the past week's reflux amounting to £5,403,000. The deflation of additional bank cash created during December by the growth in the Bank of England's holding of Government securities, though proceeding at a particularly abrupt pace, is by no means completed. During the past week there was a reduction of £51,830,000 in this item, as compared with the expansion of £75,019,000 which took place in the last three weeks of the calendar year. While the Ways and Means Advances have been repaid, the additional securities acquired to neutralise the influence of the expanding circulation on the volume of bank cash still remain in the Banking Department. The level of bankers' deposits, shown in the latest Bank return at £130,315,000, is thus being maintained at a comparatively high level. As the banks were only called upon to pay £15,000,000 in Treasury deposits this week—£5,000,000 less than the maturities—they have been avid buyers of bills. The market for its part obtained only a 38 per cent. allotment at last week's Treasury bill tender and has thus been a somewhat diffident seller. Its sales have certainly failed to satisfy the banks' potential demand, especially as the usual outside applicants for bills have scarcely participated in recent tenders and have not therefore been able to make their customary sales of bills to the banks.

The Fight for Bills

Although the turn of the year has passed and with it the need for building up bill portfolios in preparation for end-of-year balance sheets, the competition for bills continues at "cut throat" rates. From December 6th the discount market syndicate has increased its tender price for 90-day Treasury bills (which since the beginning of December have been the normal currency) to £99 15s. No attempt is apparently being made to lower the price to the former traditional figure of £99 14s. 11d. even though the profit on turning over bills at the price now being tendered for them is a mere ½d. per £100 or, expressed in terms of annual percentages, rather less than 1/64. As this excessive cutting of rates is being main-

tained after balance-sheet considerations have lost their force, it must be assumed that another and more permanent objective was in view when the policy of "going for the bills," by sacrificing the rate, was launched a few weeks ago. There can be only one such objective, the discouragement and ultimate removal from the competition for Treasury bills of the many non-market houses whose applications have for many years played an important part in the weekly tenders. These "outsiders" are a varied collection of firms and banks. Some of them are houses on the fringe of the discount market (few were, until recently, members of the syndicate), but the most important element is provided by the Colonial, foreign and merchant banks which have sterling resources to employ. The attempt to repel these applicants from the tenders will not have any effect on the semi-official applications for bills made through the Bank of England on behalf of central banks and other authorities in the sterling area. Those applications are independent of the profit motive and must be satisfied.

The week-to-week distribution of Treasury bills issued as between the market, the outsiders and the semi-official applicants varies considerably, especially as the last named category of tenders is far from evenly spread over the year. The average allotment which the discount market syndicate received during 1940 was 38 per cent. which, on the basis of the now customary offer of £65,000,000, would give the market an allotment of about £25,000,000 of bills each week. Of the remaining £40,000,000, it would not be far wrong to assume that on the average the "outsiders" and the tenderers for whom the Bank acts as agents, divide it about equally. If, therefore, the "outsiders" can be effectively discouraged from tendering, the discount market's share in the weekly offering of bills should increase appreciably. As yet the results of this rate cutting have not been particularly striking. Apart from the first week's welcome allocation of 54 per cent. of its applications, the discount market's percentage has ranged between 31 and 38 per cent. For this, however, the specially heavy incidence of semi-official tenders may be responsible. The next few weeks should show whether the discount market will in fact reap an appropriate return from its latest initiative in the fight for bills.

Treasury Deposit Repayment

The past week has witnessed the first net repayment of Treasury deposits since this new form of floating indebtedness was created last July. This is the second week during which maturities of these deposits had to be met, and the £20,000,000 of these was only offset to the extent of £15,000,000 by demands for fresh six-months' deposits from the banks. Assuming, therefore, that none of the deposits maturing during the past week were in fact recalled during their currency for re-investment in War Bonds, there should have been a net repayment of £5,000,000 during this period. Being the really elastic element in the floating debt, it must reflect the seasonal variations in the Exchequer position. During the past week this has been powerfully helped by the incidence of revenue payments which normally occurs in the early days of the calendar year. At the same time there is an element of conscious policy in the past week's net repayment of Treasury deposits. It reflects the intention of the authorities to keep the basis of credit particularly broad at this particular time. Otherwise one would have seen a much more rapid cancellation of Government debt at the Bank of England than has in fact occurred in the first week of January. And the obvious means for repaying Ways and Means Advances and other Government debt held by the Bank would have been a larger call on the banks for Treasury deposits. There will be no maturities of Treasury deposits for the next seven weeks.

Bank Clearings in 1940

There was an increase of £3,376,910,000, or 9.2 per cent., in the total of bills and cheques which passed through the Bankers' Clearing House last year compared with 1939. The total of £40,018,783,000 was slightly exceeded in 1936 and 1937 and by appreciably larger margins prior to 1931, when the totals were swollen by

	1st quarter	2nd quarter	3rd quarter	4th quarter	Total
Bankers' Clearing House:					
1940 £ million	11,261	10,559	9,211	8,989	40,019
Change on 1939	+19.5%	+22%	+2.4%	-6.2%	+9.2%
Provincial Clearings:					
1940 £ million	368	351	344	345	1,408
Change on 1939	+11.5%	+15.2%	+11.6%	+5.4%	+10.8%

new issue activity and a Stock Exchange turnover which has not been seen since. The expansion in last year's figures was largely due to the diversion to the clearing of a large number of cheques which formerly passed through other channels. The year's total of provincial clearings shows an increase of £138,259,000, or 10.8 per cent., on 1939. The details of these provincial clearings were discussed in an article last week.

Fairfax and Company

The news that Fairfax and Company had withdrawn from the discount market as from the end of 1940 would in itself call for little comment apart from the inevitable reflections on the dwindling scope for discount business and the need to deflate the existing structure of the market. The firm is among the youngest in the market, having been established in 1925, and the death of Lord Fairfax little more than a year ago had obviously provided the opportunity for furthering the process of concentration in the discount market, an objective which the authorities have for many years past pursued with great persistence. But what gives this particular retirement exceptional interest is the expressed intention of those in control of the firm to continue its bond business while discontinuing the bill discounting activities. If all that is implied by this is that the existing capital and reserves of the firm will continue to be invested in the gilt-edged securities in which they are no doubt already employed, nothing more need be said. The company will in fact become a private family trust and will completely disappear from the market. But there are reasons to believe that the intention is quite other than this and that the firm hopes in its bond operations to have access to the banking facilities which it commanded as a fully fledged member of the discount market. It should be evident that the facility with which a bill

broker or discount house can run a bond position on bank loans that cost at present no more than 1½ per cent. is not altogether unconnected with its claims to liquidity based on a substantial holding of bills and the right to rediscount at the Bank of England. If bill business has of recent years been the bread in the discount market's fare, the jam has undoubtedly been provided by bonds. The case of Fairfax and Company is the first in which an attempt is being made to restrict the diet to jam alone and the course of the experiment will no doubt be watched with the greatest interest.

Canadian Sterling Accounts

An interesting innovation in the control and operation of sterling accounts held here on behalf of Canadian and Newfoundland residents has been announced this week. Its main result is to shift from the Bank of England to the Canadian exchange authorities the onus of sanctioning all payments out of Canadian and Newfoundland sterling accounts. Ever since last July it has been possible for Canadian authorised banks to settle trade debts outside the sterling area by transfers from their sterling accounts without the specific sanction of the Bank of England being required for each such payment. Most of these payments were in fact made to U.S. registered accounts. The same treatment is henceforth to be meted out to other payments, such as financial obligations, insurance premia, etc. The Canadian control's will now be the only necessary authorisation. This development is important, because, by simplifying the procedure under which these sterling accounts are operated, it will encourage the use of sterling in operations where its position might have been usurped by the dollar. Anything which helps to keep alive the memory of sterling as an international currency is welcome.

Money Rates in 1940

The most momentous year in English history has gone completely unnoticed so far as money rates are concerned:—

AVERAGE MONEY RATES

Year	Bank Rate	Market Rate 3 Months' Bills	London Deposit Rate, Banks	Short Loans

ROYAL EXCHANGE ASSURANCE

BONUS ANNOUNCEMENT

The Royal Exchange Assurance has declared a Reversionary Bonus on Participating Life Policies at the rate of 11% of the Sum Assured for each full year's premium due and paid in the five years ending on the 31st December, 1940.

The Interim Bonus for Participating Policies becoming claims by death or maturity during the following five years ending on the 31st December, 1945, will be at the rate of 11% of the Sum Assured in respect of each full year's premium due and paid after the 31st December, 1940. It has also been decided to pay in respect of such policies a special additional Interim Bonus at the rate of 10% of the Sum Assured for each full year's premium due and paid in the five years 1936-1940. The Interim Bonus of 11% and the special additional Interim Bonus of 10% are subject to alteration at any time if the Directors of the Corporation consider that such a course is prudent.

In view of the Government's appeal for economy in paper the notification of the Bonus distribution on this occasion is being limited to public announcements in the Press, and the customary individual bonus notices are not being despatched to policy-holders.

The Corporation was a pioneer in offering both Participating and Non-Participating Policies covering War Risk for civilians within the United Kingdom and Eire without extra charge.

Investment

The Funds to the Fore

A favourable background of war news, in which the ultimate capture of Bardia was confidently discounted, provided a cheerful start for the New Year even before the reduction of the fortress was completed. Subscriptions to the new tap issues came forward satisfactorily to the tune of £8,939,500 for the new issue of 2½ per cent. War Bonds and £6,853,700 for 3 per cent. Savings Bonds during the first week in which they were on sale. Leading investment stocks in the gilt-edged market enjoyed substantial gains as a result of the pressure of money-seeking investment after January 1st interest payments and gains would in all probability have been even more substantial had it not been for the continued difficulties of transport and communications which are the legacy of the second Great Fire. Consequently, turnover was on a small scale, and when on Tuesday a revival of daylight alerts restricted dealing time by one hour, further advances in the funds were temporarily checked, although there was no reaction until midweek from the high levels, including a figure of 103½ for 3½ per cent. War Loan, which had been previously reached. With Government payments for requisitioned dollar stocks due from January 14th, there is every prospect that the pressure to invest in gilt-edged will be maintained during the next few weeks. Prices of industrial equities have remained firm on the whole, and the home rail market has enjoyed something like a boom under the influence of forthcoming dividend announcements. In short, the markets have permitted physical difficulties of trading only to induce a pause in the recent buoyant rise in long-dated funds and the movement appears still to contain plenty of vitality.

Recovery Continued

The steady improvement in prices of all classes of shares, which has been in progress since investors recovered from the shock of the French collapse last June, continued up to the very end of 1940. In December, as in November, gilt-edged retained the leadership and after the progress of the last two months, the recovery made by these classes of stocks up to the end of the year continued to be more complete than that made by equities. In the following table, the monthly figures of the *Actuaries' Investment Index* show that the price index of 2½ per cent. Consols for December, 1940 (December 31, 1928=100), reached 136.9, against only 132.0 in February of the same year, before markets were disturbed by the advent of the spring campaign. The price of all classes of industrial equities at 49.5, against 60.6, is still more than 10 points below the level of the early spring. But despite the relatively better demand for the funds during December, the price of all classes of industrials continued its advance from 49.1 to 49.5, at which level it stands nearly 10 points above the low level of 38.9 to which the index of all industrial equities fell in June last.

During the past month, the yield on 2½ per cent. Consols has been further reduced from 3.31 to 3.26 per cent. and compares with a yield of 3.66 per cent. for December, 1939. Few sections of industry closed the year with yields above those for end-1939, but notable exceptions included coal at 8.82, against 6.0 per cent., cotton, despite the rise of recent weeks, at 3.41 against 2.74 per cent. and iron and steel at 7.36 against 7.14 per cent. The most striking drop in yield is that realised by the building materials section, which has gained notably in market esteem since the intensification of bombing, with a consequent fall in the yield per cent. from 7.26 to 4.99 over the year. At the opening of the dividend season, home rail ordinary shares offer a yield of 9.6 per cent, against 0.34 per cent. in December, 1939.

Chinese Customs

Although it is highly improbable that any direct benefit can accrue to bondholders until the conclusion of the Sino-Japanese War, investors in Chinese securities secured on the revenue of the Chinese Maritime Customs should be encouraged by the satisfactory improvement in the 1940 total. Despite all interruptions to trade during the past year, total revenue rose approximately from Chinese \$331,320,000 to Chinese \$475,740,000, or from £20,017,250 to £28,742,625 at the official rate of exchange of 1s. 2½d. to \$1. No payment has been made during 1940 on the loans secured on customs revenue, which include the 4½ per cent. Gold Loan of 1898; the Boxer indemnity and the 5 per cent. Reorganisation Gold Loan of 1913, which is, however, primarily secured on the revenues of the Salt Administration, the last year in which the service on foreign loans secured on the customs revenue was fully met being 1938. As far as the Chinese Government is concerned, the estimated share of the service on foreign obligations represented by the revenue of ports still in Chinese hands, amounting to \$8,929,413 for 1940, has been duly transferred to the Central Bank of China, where it is held in trust. No transfer has, however, been made on account of the high proportion of revenue accruing to the Japanese authorities in respect of ports now in their occupation. The default is occasioned purely by the political situation in the Far East, and prospects of the resumption of payment depend wholly on the possibility of making suitable terms with the Japanese authorities or of their expulsion by the Chinese Government. As far as the loans secured on the Chinese railways are concerned, the outlook is more complex. It is probable that these sources of revenue have suffered considerably more damage both to installations, rolling stock, and to earning capacity than have Chinese ports, shipping or trade. The latter has certainly displayed considerable resilience.

The Year's Failures

For the eighth year in succession, the number of business failures in the United Kingdom shows a reduction. In 1940, the total declined sharply from 4,648 to 2,983, whereas in the previous year the reduction was only from 5,448 to 4,648. The increased stability of industrial enterprise, which has been growing ever since the trough of the depression of the early 'thirties, has been accentuated by the rising proportion of businesses that during the war have become suppliers to H.M. Government. A parallel movement is shown by *The Economist* profits figures for the past year which will be discussed in detail at a later stage. In brief, total profits of industrial companies are shown to have risen from £376,147,000 to £410,410,000. Rising taxation has, of course, prevented this improvement from being passed on, in the main, to shareholders, and net profits have actually declined from £216,713,000 to £208,223,000. But the variable element in equity holdings owes its *raison d'être* to the risk bearing service which owners perform. The bankruptcy statistics for the past year indicate that industrial risk is reduced to a minimum for the duration and, con-

sequently, the present relative stability of industrial dividends appears to have sound economic justification. Present "prosperity," such as it is, is not a normal boom from which the investor may expect to make good the lean times of former slumps. In the existing state of national emergency, the nation is working for its life. Bankruptcies may be yet further reduced, but net profits as a whole are unlikely to show any upward movement during the war.

Company Notes

Tobacco Company Results

The reduction in the final tax-free dividend for 1939-40 and of the first interim payment for 1940-41 of British and American Tobacco has been somewhat gloomily received by the market. Yet the cut in the total tax-free payment for the past year amounts only to 1.25 per cent., leaving a tax-free dividend for the year to September 30, 1940, of 17.92 per cent. The first interim for the current year amounts to 3.75, against the customary 4.167 per cent., tax free. The total payment for 1939-40 absorbs £4,254,307 against £4,543,029, thus effecting a small reduction in the tax-free rate of dividend. As usual, profits are struck after deduction of tax and all other charges. Thus, the reduction in total net earnings from £5,165,453 to £4,865,442 provides little clue to the trend of total revenue. In the absence of any allocation to contingencies, the total payment of 17.92 per cent., tax free, is narrowly covered by earnings at a rate of 18.03, against 19.3 per cent., tax free; and the carry-forward is increased from £2,274,131 to £2,800,266. Three years' trend of profits is analysed in the following table:—

	Years ended September 30		
	1938	1939	1940
	£	£	£
Profit after tax	5,590,886	5,165,453	4,865,442
Prof. dividends	585,000	585,000	585,000
Ordinary stock (tax free):—			
Earned	5,005,886	4,580,453	4,280,442
Paid	4,739,510	4,543,029	4,254,307
Earned %	21.1	19.3	18.03
Paid %	20	19.17	17.92
To contingencies.....	...	500,000	...
Carry forward	2,736,707	2,274,131	2,800,266

After the initial disappointment at the halving of the final payment, shareholders derived some encouragement from the directors' announcement that the reduction in the first of the 1940-41 interim dividends did not necessarily portend a reduction in the total distribution below that for 1939-40. Clearly, the ability of the company to procure adequate stocks of leaf tobacco as well as the future of the standard rate of tax are the decisive factors. The B.A.T. balance sheet shows that stocks have been increased during the past year from £4,778,302 to £5,143,665, while cash holdings have declined from £5,399,298 to £3,891,920. For the first time for a number of years, total assets declined by some £2 millions to £50,881,637, mainly on account of a reduction in loans to associated companies. At the same time, a Contingencies Reserve of £1,000,000 has been created on the debtor side of the statement. Net fixed assets appreciated by some £2 millions to £35,221,659 on account of a decline in deposits by associated and subsidiary companies. The report of United Tobacco Companies (South) for the year to September 30th shows a reduction in total earnings from £1,170,135 to £1,100,336. The reduction in trading profit after tax from £976,159 to £834,960 is more considerable, but the decline is cushioned by a rise in income from dividends received. Distributions on the company's ordinary and deferred capital to a total of £2,699,995 are cut from 40.35 to 37.5 per cent., free of South African income tax. The balance sheet shows a normal appreciation in debtors and creditors and a welcome rise in stocks from £1,461,948 to £1,919,222. Consequently, cash holdings are rather lower at £507,317 against £686,400. The £1 are rather lower at 88s. 9d. ex dividend, offers ordinary stock of B.A.T., at 88s. 10d. per cent. equivalent to a tax-free yield of 4 0s. 10d. per cent. United Tobacco 10s. 7d. 0s. 7d. per cent., less tax. United Tobacco 10s. ordinary shares at 90s. yield 4 3s. 5d. per cent., free of normal South African income tax.

First Bank and Discount Dividends

The first banking announcements, those of Barclays, Martins and the District Bank, show mixed results. Total earnings for Barclays Bank, at £1,525,666, before addition of £38,145 unappropriated by the Union Bank of Manchester, have fallen to the lowest level of the past decade, not excepting the trough of the depression. Equity earnings at £1,324,921 are higher than the distributable surplus in 1931-32 or 1932-33, but they compare with a figure of £1,549,043 for the previous year. Equity earnings of the District Bank have also been sharply reduced from £398,365 to £347,843, the worst total since 1934-35. On the other hand, Martins Bank has realised a rise in total earnings from £876,025 to £891,029 and in the amount earned for equity capital from £776,025 to £791,029. It is to be expected that the decline over the past year in such profitable sources of bank income as advances, the rise in expenditure on A.R.P. and higher taxation will give rise to generally lower net earnings for 1940. For the present, however, these declines are not being passed on to the public.

	Total Profits	Earned for Equity†		Dividends	
		Amount £	Rate %	Final %	Total %
Barclays Bank ("B" and "C" shares):	£	£			
1939	1,784,880	1,549,042	18.1	7	14

1940	...	...	...	6½	10

† Before bank premises allocation.

‡ Total profits shown after fees.

Preliminary indications of the results of the three discount companies suggest that they have little cause to regret the year 1940. Union Discount pays the same dividend as for 1939, namely, 10 per cent. on net profits, which on the basis of changes in the carry forward appear to have been about £21,000 smaller than the £274,000 earned in 1939. National Discount also repeats the previous year's dividends on "A" and "B" shares, but allowing for changes in the carry forward and for the £100,000 allocation to reserves, as compared with £50,000 the previous year, and the net profit for 1940 would seem to have amounted to about £202,000 as compared with £191,000 for 1939. Alexanders again pay 17½ per cent. out of a net profit of some £10,000 lower at about £162,000. The first comment that must be made on these figures is that they must not serve as the basis for generalisations on the experience of the discount market as a whole. It is unlikely that the smaller firms, with their comparatively weaker capital structures and their consequent inability to maintain substantial gilt-edged positions, have done as well as this. From the point of view of money and discount business, the past year has been an exceptionally stable period. The turn on reselling and running bills has seldom departed from the figure of 1/32 per cent., and though the modesty of this figure has to some extent been neutralized by a larger turnover in bills it should be reasonable to assume that the discount side of the business has just about paid for overhead costs. On the bond side the market is now mainly interested into Conversion 2's, into which they were so effectively jockeyed when Conversion 4½'s were called for redemption. With money available against bonds at 1 to 1½ per cent., the new bonds have not provided much margin of profit, but, such as it is, it has been easily earned. Opportunities for successful jobbing in bonds have been fewer than in former years, but the few that have occurred have been duly pressed into service by highly expert dealers which the market musters.

Further Cotton Progress

The full report of the Lancashire Cotton Corporation for the year to October 31, 1940, shows a rise in total profits after tax from £586,582 to £681,595, the best earnings for more than a decade. This highly satis-

factory result has been realised after writing off out of profits all outstanding debts on the continent of Europe. After the usual £155,000 has been placed to depreciation, thus bringing the total of depreciation reserve account to £783,011, and after prior charges have been met, equity earnings are up from £283,932 to £329,390, compared with £5,550 in 1937-38. Thus, the 7½ per cent. dividend on ordinary stock, which is repeated, is covered by earnings at a rate of 28.4 against 22.2 per cent. The company is able to transfer £150,000 to general reserve as in the previous year and to place £100,000 to stock reserve with a reduction in the carry forward only from £249,280 to £203,023. The following table analyses the improvement in earnings since the setback of 1937-38:—

	Years to October 31		
	1938	1939	1940
Trading profit	289,208	557,825	599,241
Total income.....	308,200	586,582	631,595
Fees	3,775	3,775	3,775
Depreciation	155,000	155,000	155,000

Carried forward	240,328	249,280	203,023

* Of which £100,000 to Stock Reserve.

The bulk of the company's employment during the past year has come from orders for the equipment of the armed forces and has necessitated an important change over from the manufacture of fine counts to the manufacture of coarse and medium counts. Installation of new machinery is responsible for the rise in the balance sheet valuation of fixed assets by £510,572 to £4,177,384. Wise purchases of cotton early in the industrial year account for a rise in stocks from £919,744 to £1,586,295. These increases have been financed partly by the realisation of investments which stand in the balance sheet at cost—market value shows a small appreciation—at £584,380, against £821,228, and partly by a substantial rise in creditors, including tax provision, from £170,798 to £863,307. For the duration of the war, the company is assured of a considerable income from Government contracts and is, of course, operating under a system of controlled prices and margins. It can, therefore, afford to give special attention to the supply of that portion of the export market which is still open. In his speech, Mr William James Orr, the chairman, made a strong plea for regulation of the industry by some form of trade association after the war to avoid undercutting in foreign markets. While it is fully recognised that some form of central action to eliminate surplus plant will probably be necessary, there is no doubt that the most effective undercutting in foreign trade will come, not from the Lancashire competitors of the Lancashire Cotton Corporation, but from foreign countries. At present, there is an opportunity for the industry to adapt itself to the price levels of foreign markets. There is little possibility that any appreciable

revival in exports can be secured by any system of domestic price fixing. Meanwhile, earning prospects should remain satisfactory during the current year. The company's £1 ordinary stock is quoted at 18s., ex dividend, yielding £8 6s. 8d. per cent.

Turner and Newall Report

As was indicated in the preliminary statement, the Turner and Newall trading profits for the year to September 30, 1940, at £2,136,726 have reached a record high level. The full accounts show that depreciation provision increased from £145,250 to £188,796 and that, as was estimated on the basis of the preliminary figures in *The Economist* of December 28, 1940, equity earnings rose from £849,517 to £904,116, representing a rate of 18.4 against 16.4 per cent., thus amply covering the 15 per cent. ordinary dividend. The directors state that profits for the past year have been estimated on a conservative basis and that provision for the estimated liability of the whole group for Excess Profits Tax has been made in the accounts. The company and its main subsidiaries are, of course, now controlled undertakings under the terms of the Defence Regulations. The following table shows the improvement in the profit position which has taken place over the past three years:—

	Years to September 30		
	1938	1939	1940
Trading profits*	1,650,386	1,727,453	2,186,726
Depreciation	180,603	145,250	188,796
Fees	3,250	2,762	2,750
Taxation	238,749	618,826	929,966
Staff funds.....	10,000	10,000	10,000
Preference dividend..	101,098	101,098	101,098
Ordinary stock:—			
<i>Earned</i>	1,166,596	849,517	904,116
<i>Paid</i>	1,065,756	799,364	799,364
<i>Earned (%)</i>	22.6	16.4	18.4
<i>Paid (%)</i>	20	15	15
To reserve.....	100,000	100,000	100,000
Carried forward	116,610	66,768	71,515

* After charging mines amortisation.

The consolidated balance sheet indicates that the group is working to capacity. Total stocks have risen from £2,361,258 to £3,286,863. Debtors are up from £1,888,176 to £2,146,299 and creditors from £2,669,795 to £3,534,995. After depreciation, the total fixed assets of the group are reduced from £6,307,092 to £5,964,377, against which special and general reserves amount to £2,600,000. The company's balance sheet shows the acquisition of £500,000 2½ per cent. National War Bonds and a consequent decrease in cash holdings from £2,002,466 to £1,512,300. In his speech circulated with the report, Sir Samuel Turner, the chairman, states that although the company's mines in Rhodesia and Swaziland were operating to capacity throughout the year under review, but that the closing of European markets after the collapse of France has necessitated a slowing down of production in these areas. Future prosperity of the group undoubtedly depends on the success which attends the efforts of the management to replace those lost markets by exploiting demand in the Empire and the United States. The company's £1 ordinary stock at 67s. 6d. ex dividend yields £4 8s. 10d. per cent.

THE STOCK EXCHANGES

London

Note: All dealings are for cash.

MARKETS in all sections provided a cheerful opening to the New Year, although once again demand was concentrated on high-class investment issues in the gilt-edged market. Both before and after the week-end, difficulties of communications held down the volume of business, and on Tuesday turnover was still further reduced by the number of daylight alerts. Subscriptions for the new tap issues made a good start, and sentiment generally was encouraged by news of the fall of Bardia to the British forces in the Western desert, a development which provided especial interest for the oil market. The week has been character-

ised by a steady improvement in the demand for home rails.

Apart from the general encouragement provided by news of the past week's military successes, a number of technical features combined to stimulate interest in the gilt-edged market, among which were the January 1st interest payments and the prospect of payment in mid-January for the latest batch of requisitioned dollar stocks. Irredeemable issues attracted most attention, and 8½ per cent. War Loan rose almost daily to new high levels since 1938, reaching 103½ on Monday after a gain of ½. Two and a-half per cent. Consols were also well supported, but 4 per cent. Funding lost ½ before the week-end. In the foreign bond market, French railways returned to favour, and

the Belgian 4 per cent. issue of 1936 improved 3½ points on Monday, followed by a further gain of 4 points the next day. Chinese bonds were consistently in demand, and support was once more forthcoming for Egyptian Unified.

In the Home rail market, the prospect of approaching dividend announcements raised interest to the highest level for some weeks. Before the week-end, buying was concentrated on the senior issues and resulted in a long list of gains in the order of ½ point. After the week-end, ordinary stocks also returned to favour. Great Western ordinary gained ½ followed by 1 point on Monday and Tuesday, while on the same days Southern preferred put on ½ followed by 1 point. Among foreign rails bargain

hunting continued in Argentine issues and the easier tendency of Canadian Pacific ordinary before the week-end gave place to renewed buying on Monday.

The market in industrial shares continued to show a certain restraint, and few important gains were realised. Coal, iron and steel shares have attracted a regular but small demand, and minor gains were recorded by Vickers, Hadfields, Thornycroft and William Cory. Tobacco shares have encouraged little interest. B.A.T. reacted to 87s. 6d. on the reduction in the dividend, but later improved and closed firm. Imps. and Carreras also lost fractionally on the week. In the brewery section, there has been a steady demand for South African Breweries, and Courage, Benskins and Guinness all improved. Among miscellaneous industrial leaders, Turner and Newall rose on the improved results, and London Brick attracted considerable attention.

In the Kaffir market, the recent subdued tone continued, only a small amount of buying being in evidence in which Western Reefs and West Wits have attracted attention. West Africans remained exceptionally quiet. Among copper shares, Rhokana regained the ground lost last week. The oil market was well supported, following the inspiring news from the Middle East. Shell and Anglo-Iranian both gained ground, and Mexican Eagles improved fractionally. In the rubber market business remained virtually at a standstill.

New York

THE New Year opened quietly on Wall Street with a steady trend and quiet trading, which later gave way on account of political fears and reacted with the loss of the few earlier fractional gains, steels losing up to one point. The expectation of record business returns, the ready absorption of blocks of British-owned stocks and the impressive war news from the Middle East appear to have had little effect in encouraging a dull market.

In midweek, the budget news caused business to fall away still further, although interest in commodities was maintained. Steel mill activity, estimated by the Iron Age, was at 97.5 per cent. of capacity last week, against 97 per cent. in the previous week.

This Week's Company Results.—Following the trend of generally improved results for rubber companies last year, BRITISH RUBBER ESTATES OF JAVA earned a satisfactory increase in gross profits from £21,711 to £74,133 and in net profits from only £41 to £21,883. A 3 per cent. dividend is paid against nil. R. A. LISTER is repeating the 16 per cent. ordinary payment. Total earnings improved from £119,133 to £139,393, but net earnings suffered a setback from £122,591 to £97,077. With an increase in both gross and net income, the latter from £16,101 to £20,013, DICTOGRAPH TELEPHONES is able to raise the dividend from 7 to 7½ per cent. HOULDER LINE is maintaining the 7½ per cent. dividend. Net profits increased from £23,505 to £48,281, despite a moderate decline in total earnings from £213,975 to £206,906.

A REPLY TO HITLER

THE TIMES recently declared:

"There is no formula, no specific, for the abolition of unemployment."

Can this be true?

Must Britain for ever be burdened with what has been described as one of the "Twin Scourges"?

Emphatically NO

There does exist a very definite formula for the abolition of unemployment as well as for the elimination of the much-feared post-war slump.

A momentous pronouncement on these two vital problems will be published in the next issue (Wednesday, Jan. 15) of

CAVALCADE

The British News-Magazine

It should be read by everyone who has a stake in the nation's welfare. This is no journalistic "stunt." It is a revolutionary but practical thesis that may profoundly affect the course of the war—and the peace. It demands the attention of economists and thinking people of all classes.

Here is Britain's real answer to Hitler's "new order." By putting its economic house in order, Britain can solve its problems and set an example to the whole world. It is your duty to study these proposals.

An order for CAVALCADE must be placed with a newsagent. There are no casual sales.

Industry and Trade

Fall in Unemployment

The reduction in unemployment between November 11th and December 9th was more marked than in preceding months. The total number of persons registered at the employment exchanges in Great Britain on December 9th was 703,000, a reduction of 86,000 from the figure for November 11th. The decline was not due to seasonal influences, for our index of unemployment (given on page 55) which takes account of these factors fell from 38.8 (1935=100) on November 11th to 35.3 on December 9th. Again, the number of wholly unemployed which had remained virtually unchanged since June, has now at last fallen below the 600,000 mark; the figure fell from 603,000 on November 11th to 542,000 on December 9th. The number of wholly unemployed men, moreover, was only 248,000 on December 9th, against 286,000 on November 11th. There was also a decline in the number of wholly unemployed women, from 255,000 to 244,000. With the exception of the South Western and the Midlands divisions, every district registered a reduction in unemployment; in London, for example, there were 31,595 fewer unemployed on December 9th than on November 11th. The fall in unemployment last month is encouraging, for the spectacle of a large army of unemployed in present conditions had become intolerable. But the unemployment returns are no longer an indication of the progress in our war effort which depends increasingly on the rate of transfer of workers from less essential to vital occupations.

* * *

Retail Sales in November

The retail trade returns for November, published in this week's *Board of Trade Journal*, bear evidence of a contraction in sales. The percentage changes in the average daily value of sales of food and other merchandise between August-November, 1939, and the corresponding period last year is shown below:—

	Percentage Change from 1939	
	Food and Perishables	Other Merchandise
1940, August	+ 5.4	+21.0
September	-11.5	+ 6.7
October	- 5.2	+20.9
November	- 0.3	+ 1.3

While the average daily value of food sales has been below the previous year's level in September-November, 1940, in spite of the rise in prices, the turnover in other merchandise has continued in excess of the 1939 figures. In October, the value of non-food sales was as much as

BANK OF LONDON & SOUTH AMERICA LIMITED

20.9 per cent. above the previous year's level; but the sharp drop in November confirms the impression that the spurt in the previous month was due to the anxiety of consumers to forestall the purchase tax which came into force on October 21st. Another feature of the latest returns is the sharp decline in stocks of non-food merchandise; at the end of October their value (at cost) was still 14.6 per cent. higher than a year earlier, but at the end of November it was actually 0.2 per cent. smaller than twelve months previously. In part, the reduction was no doubt due to the fact that November was the last month of the quota period under the Limitation of Supplies (Miscellaneous) Order. The heavy stocks accumulated by the shops which allowed us to maintain our purchases at a comparatively high level last year have now been substantially reduced; we must now bring our purchases into line with current production.

* * *

Co-operative Trade

During the nine months ended October 12, 1940, the sales of the Co-operative Wholesale Society amounted to £105,785,876. Sales of grocery and provisions alone amounted to £75,715,597, and of these £1,924,691 was for the export and contracts department and £2,996,716 for the Ministry of Food. The increase of 15 per cent. (£13,807,070) from the corresponding period of 1939 was entirely due to the rise in prices. The output of the Society's various productive works in the first 39 weeks of 1940 was £33,741,577, an increase of 7 per cent. The registrations for rationed commodities at the retail co-operative stores are 13,291,820, or 29 per cent. of the civil population, for sugar; 11,713,388, or 26 per cent., for butter and margarine; and 10,714,170, or 24 per cent. of the civil population, for bacon and ham. Higher prices and lessened output are the feature in all the productive works of the C.W.S. At the nine flour mills output was 10 per cent. less by weight, while the value only dropped by 4 per cent. to £5,998,033. The boot and shoe output of 3,552,842 pairs was 14 per cent. less than in the corresponding period of 1939, but the value advanced 11 per cent. Margarine output rose 19 per cent. in value, but decreased 4 per cent. in quantity. There was a similar decline in the output of soap, but values increased by 11 per cent. The deposits and withdrawals in the C.W.S. bank for the same 39 weeks were a record—£703,812,202.

* * *

Economy in Lubricants

Lubricating oils are perhaps the most indispensable of all petroleum products, for without their aid the wheels of industry and commerce would, quite literally, cease to turn. Although over half a million tons of mineral lubricants are used in this country every year, it is only in the economic sense that this oil can be said to be consumed. What happens, for example, in the case of an internal combustion engine is that the lubricating oil becomes so contaminated with particles of carbon and other abrasives, with acid products, water and motor fuel, that, although not used up, it is no longer capable of discharging its proper function and must consequently be discarded. But would it not be possible to purify the oil and use it again? Though the question is not a new one, it assumes an enhanced significance in time of war, and there is no doubt that it may now be answered with a qualified affirmative. Several British and American firms have, in fact, produced devices for this purpose. The simplest and cheapest consist essentially of a filtering mechanism, the main function of which is to remove solid impurities from the lubricating oil. They are intended to be connected directly to the lubricating system of a car and to keep the oil and the engine clean. Recent tests leave no doubt that it is possible by this means not only to economise oil but also to effect a very substantial reduction in engine wear. An example of the economies which may thus be achieved in practice was recently given in a paper read to the Institution of Automobile Engineers. Replies to a questionnaire sent by the author to operators of over

33,000 road vehicles of various types showed that vehicles without an efficient system of filtration had to have their oil changed every 1,405 miles, on the average, whereas units with such devices were able to cover 4,820 miles between changes. There are also more expensive devices which will not only remove carbon, asphalt, ash, and other impurities from sump oil, but which will neutralise acidity and dispose of moisture and fuel dilution at the same time. While it may not be possible to use lubricating oil indefinitely, the Germans have shown what can be done in this direction. And in view of the need for economising imported products, the reclamation of lubricating oil should be encouraged, especially in the case of large consumers.

* * *

Cotton and Wool Prices

The comparative movements of the prices of wool and cotton since the beginning of the war is illustrated by the figures in the accompanying table. The indices of wool prices are taken from *The Weekly Wool Chart* and those of cotton from Mr Frederick W. Tattersall's *Cotton Trade Review*; all are based on August, 1939 = 100, though the wool figures are monthly averages and the cotton ones end-of-the-month quotations.

		Wool			American Cotton		
		Wool	Tops	Yarns	Raw	Yarn	Cloth
1939	September	100	100	113	123	138	135
	October	111	110	128	116	134	129
	November	121	121	138	137	149	138
	December	121	121	145	158	170	149
1940	January	121	121	162	151	158	139
	February	121	121	167	146	128	144
	March	163	163	177	140	146	150
	April	163	163	178	147	154	159
	May	163	163	178	135	146	154
	June	163	163	179	138	146	150
	July	163	163	179	145	145	150
	August	163	163	170	150	151	150
	September	163	163	167	161	161	150
	October	163	163	173	150	152	146
	November	169	173	175	153	161	147

The price at which the Government will buy raw wool from Australasia was fixed at the outbreak of war, but the prices at which the Wool Control releases wool and tops have been increased by four steps, in October and November, 1939, and March and November, 1940. Woollen yarns have increased more rapidly and more regularly, and reached their peak in June and July when they were 79 per cent. above the pre-war level; although they afterwards fell the upward movement was resumed. Cotton, on the other hand, has not been subject to Government control and the immediate advance was much more marked. It is interesting to note that while raw cotton prices have fluctuated with market influences, their general trend over the period is not greatly dissimilar from the controlled movements of wool.

COMMODITY AND INDUSTRY NEWS

Cotton.—Although the Exchange has not been available, a well attended street market has been held during the past week and in certain quarters a tolerably

encouraging business has been done. Some buyers have only been replacing lost stocks, but fresh demand has been reported in several directions. The recent

advance in raw cotton prices has been maintained. A steady demand has been dealt with in yarns and buyers are pressing. (Continued on page 55)

COMPANY MEETINGS

BANK OF MONTREAL

CUSTOMARY STRONG POSITION

REVIEW OF CONDITIONS IN CANADA

The one hundred and twenty-third annual general meeting of the Bank of Montreal was held on December 2nd in Montreal.

Mr Huntly R. Drummond (president of the bank), in the course of his address, said: It is with satisfaction I report that, notwithstanding the unusual times through which we are passing, your bank continues in its customary strong position.

At this time last year business was only just beginning to feel the impact of war conditions. To-day the usual economic indices no longer forecast the ebb and flow of business, because an overriding factor governs them all, namely, the mobilisation and the progressive utilisation of every asset the country possesses for the most intensive prosecution of the war of which this country is capable. We fully recognise the stake which is at issue. We know we are fighting for all we have and are, and our whole national economy is geared to that realisation. Of business generally it is sufficient to say that practically every phase of industrial and commercial activity is reflecting the intensity of our war programme.

In Canada, 1940, upon the whole, has been a year of good crops. What in the final accounting may prove, perhaps, the largest crop of wheat in the history of the Dominion has been safely garnered. It is one of the very best we have ever had in weight and quality.

Among the many changes of the past fifteen months has been the practically complete disappearance of Canada's trade with Continental Europe, but, notwithstanding this, the total of our exports has shown a remarkable increase, largely, of course, through war orders, but partly because we are now trading in markets from which not only Germany but other European nations are excluded. Taking the figures for the twelve months ending September last, the latest available, in comparison with the same period a year earlier, our exports to all countries, excluding gold, have increased by 30 per cent. to \$1,150,000,000, while our imports have risen by 46 per cent. to \$1,005,000,000. Canada's gold production, which in the past twelve months has amounted to approximately \$200,000,000, is not included in these figures and should be added to our favourable balance of trade.

So far as estimates are at present applicable to our expanding programme of production, it appears that the Dominion Government will spend close to \$1,000,000,000 for war purposes alone during the current fiscal year. To this figure must be added non-war expenditures of \$448,000,000, as provided for in the Budget. This formidable total is nearly three times the normal peace-time expenditure.

While at the present time from the business standpoint Canada is on the crest of a wave, with employment higher than in any previous period and industrial output on a rising scale, we must not forget that there will be an aftermath, and it behoves us all, while contributing to the utmost in the prosecution of the war, to keep in mind the adjustments which will later become necessary. Economy in private and public expenditure should be practised to the utmost, and projects not relating to the war effort should be postponed to a time when they will not interfere with that effort and when the employment they afford will be needed.

THE GENERAL MANAGERS' ADDRESS

Mr G. W. Spinney, as joint general manager, speaking on behalf of himself and Mr Jackson Dodds, said, in part: Important changes in the balance-sheet are as follows: Our total assets amount to \$961,300,000, compared with \$1,025,500,000 a year ago. The decrease is represented in the main by a reduction in our investment portfolio, as a result principally of redemptions at maturity of Dominion and Provincial Government securities.

Quick assets total \$663,200,000, or 75 per cent. of all liabilities to the public.

Investments not exceeding market value carried at \$462,000,000 show a reduction in the year of over \$55,000,000.

Current loans and discounts in Canada at \$217,600,000 are \$16,200,000 higher. This increase as at October 31st does not properly indicate the maintained improvement in this department. During the past twelve months the monthly average of our commercial loans has been \$38,000,000 higher than in the corresponding period of the previous financial year. This expansion in our loaning figures comes chiefly under the headings of loans to manufacturers, reflecting the higher levels of business activity, and agricultural loans arising out of the large carry-over of wheat.

Deposits by the public at \$749,800,000 are \$52,000,000 lower than a year ago.

HIGH VOLUME OF INDUSTRIAL PRODUCTION

Business conditions are now, of course, dominated by the demand for war supplies. The volume of industrial production is already higher than ever before and activity is widely spread throughout the country. The output of supplies is due to expand much further, and it is clear that we are rapidly approaching a position in which, by contrast with the past ten years, our principal problem will be the adequacy of the means of production.

A large crop of high-quality wheat was harvested and substantial sums are required to carry the crop until it finds a market. The Dominion Bureau of Statistics estimates the yield of wheat for all Canada at 547,000,000 bushels, which, if realised, will make this the second largest crop on record since wheat growing started in Canada.

The circumstances in which we meet this year do not favour a discussion of the business outlook. Canada's resources are devoted to the single objective of winning the war, and are already engaged on an unprecedented scale. As the bank enters its one hundred and twenty-fourth year of operation we are determined to play our full part in this national effort, and we look forward with confidence to the achievement of victory, which is now the primary and all-important consideration.

The report was unanimously adopted.

THE FINANCIAL NEWS, LIMITED

The forty-third ordinary general meeting of The Financial News, Limited, was held at the offices of the company, 20 Bishopsgate, London, E.C.2, on Tuesday, December 31, 1940.

The chairman, the Rt. Hon. Brendan Bracken, P.C., M.P., said: We meet in a City scarred by Nazi arsonists.

Their senseless bombings have damaged or destroyed some of the loveliest buildings in this old City. In coming to this meeting you have a good opportunity of witnessing the contempt of the people of London for Nazi terrorism. Savagery cannot break their spirit. It increases their sense of duty and their will to victory.

A DIFFICULT YEAR

Our company has weathered the storm and is ready for fouler weather. May I say, without a trace of complaint, that the year through which we have passed was crowded by difficulties. Many members of our staff who were serving in the Territorial Army went off before war began. Others swiftly joined the Armed Forces of the Crown. We could not hope to replace these young men. All we could do was to supplement their sharply reduced incomes. In a complex business such as ours there is no way of quickly training substitutes. Those who are left behind solved our problems by shouldering a heavier burden of work. We are grateful to them.

THE ACCOUNTS

There are no significant changes in our balance-sheet.

The reserve account stands at £100,000, and we propose to carry forward the sizeable sum of £93,231 17s. 6d. If our recommendations for dividends appear to you to be over-modest, please remember the truism that no business has ever been injured by having large reserves.

The report and accounts were adopted.

OROVILLE DREDGING COMPANY, LIMITED

THE COMPANY'S INTERESTS

OPERATIONS CONTINUING SATISFACTORILY

The twenty-ninth ordinary general meeting of Oroville Dredging Company, Limited, was held, on the 7th instant, at Motcombe, Dorset.

Mr F. W. Baker, chairman of the company, said: Turning to the accounts, investments which stood in last year's accounts at £418,340 now stand at £369,778, representing a reduction of £48,562, made up as follows:

£8,309—the book value of Bulolo shares sold during the period.

£35,578—the cost price of debentures in the Golden Queen Mining Company which, by agreement, have been converted into a note and is now shown under the heading of "Loans to Mining Companies."

£4,675—being a payment received from Golden Queen during the period under review.

The loan to Pato Consolidated Gold Dredging, Limited, which stood in last year's balance-sheet at £35,811, has been reduced by repayments to £26,310. Asnazu Gold Dredging, Limited, loan has been increased by £1,378 by further accrued interest and now stands at £42,197. Golden Queen Mining Company stands at £35,578. The total outstanding at September 30, 1940, on loans represents a sum of £104,087.

You will notice from the accounts that we have purchased and hold £25,000 worth of National War Bonds, and cash at bank and in hand now stands at £56,674, as against £48,709 in last year's accounts.

PROFIT AND DIVIDEND

Dividends received from the company's various holdings amounted to £56,557. Profit on shares realised and other credits in the profit and loss account amounted to £22,586. From the total credits of £79,143, after debiting all charges in London amounting to £6,824 and after making provision for income

Continued from page 53

ing for the delivery of coarse counts. There have been indications of rather more activity in medium numbers in both American and Egyptian qualities. Trade in cloth for export has been of a miscellaneous character and useful orders have been secured in printed and dyed fabrics for Java, light bleachers for Egypt and finishing styles for South America. Standard makes have been in demand for the Dominions.

Grains.—The market has been firmer on indications that the Canadian wheat production may be smaller than the official estimate. There are rumours that the damage done by rains may make necessary a revised estimate of the Argentine wheat crop.

Rubber.—The demand for rubber was more active after the holidays, and prices showed a firmer tendency. Malayan shipments in December were 69,565 tons, an increase of 17,000 over the figure for November. Total shipments in 1940, at 773,614 tons, were the highest on record.

Oils and Oilseeds.—Supplies generally are good, and enable substantial allocations to be made to the food and other oil-using industries. The outlook for the future supplies of linseed is satisfactory in view of the very large crop in Argentina, from which the British Control is reported to be contemplating purchases. The Argentine Ministry of Agriculture report the exportable surplus to be 1,862,000 tons, compared with 1,881,000 tons on December 14th and 1,073,000 tons a year ago. In the past twelve months Plate shipments consisted of

and excess profits tax amounting to £28,488, the balance to the credit of profit and loss is £43,831. Adding the balance from the previous year of £150,534 and deducting the dividends paid in December, 1939, and the interim dividend paid in April, 1940, amounting to net £54,687, a balance of £139,678 is carried forward as at September 30, 1940. The directors recommend a final dividend for the year to September 30, 1940, of sixpence per share, less income tax at 7s. 6d. in the £, making, with the interim dividend of sixpence per share, 25 per cent. for the year. A reduction from 31½ per cent. paid in the previous year to 25 per cent. for the period under review: this reduction being entirely due to increased taxation.

Last year I pointed out that war conditions were likely to affect net profits in the future owing to the obligations that would fall upon us resulting from the war, and that we had set aside £14,000 as a provision to cover national defence contribution and excess profits tax, and that this provision only covered a six months' period for excess profits tax. Whereas in this year's accounts a provision of £20,000 has been made to the item of excess profits tax alone, and this amount only covers six months at the higher rate of 100 per cent., no national defence contribution being payable.

SATISFACTORY OPERATIONS

The directors' report gives full information of our interests in Pato Mines (Colombia) Limited, Pato Consolidated, Nechi Consolidated, Asnazu Gold Dredging, Limited, Bulolo Gold Dredging Limited, Australian Deep Leads and Golden Queen Mining Company, with which I am sure shareholders will be well satisfied. The operations of our several interests are continuing very satisfactorily for the current year, particularly at Pato Consolidated, where higher average values per cubic yard show a substantial increase in earnings based upon the results secured for the first six months of the coming financial year, and I am in a position to report that the new hydro-electric plant at Asnazu will be completed by the end of this month, and the new dredge, capable of digging four million cubic yards per annum, will be completed during 1941.

The report was unanimously adopted.

IMPERIAL JAPANESE GOVERNMENT

FIVE AND A HALF PER CENT. CONVERSION LOAN OF 1930

The Imperial Japanese Government announce that the operation of the Sinking Fund for the half-year ended 1st January, 1941, has been carried out by way of purchases on the market, and that BONDS value £162,190 (nominal) were so purchased and are now CANCELLED.
3rd January, 1941.

CITY OF TOKYO

FIVE AND A HALF PER CENT. STERLING LOAN OF 1926.

The City of Tokyo announce that the operation of the Sinking Fund for the half-year ended 31st December, 1940, was carried out by way of purchases on the market, and that BONDS value £63,900 (nominal) were so purchased and are now CANCELLED.
3rd January, 1941.

ECONOMIST BINDING CASES

Attractive binders to hold three months' issues of *The Economist* are still available.

These binders have no wires, clips or metal contrivances so that each issue can be bound in an instant for permanent reference.

Reading Cases to hold two issues, and made on similar lines, are also available.

Both are bound in full cloth (blue) and lettered in gilt.

The price of the Binder is 5s. 6d. post free (Overseas 6s. 6d.) and of the Reading Case 4s. 6d. post free (Overseas 4s. 6d.)

Eire Trifles

MUCH as the people of Eire try to keep their skirts out of the mud of war, they cannot avoid being splashed by some of the martial traffic that passes all round them and through the skies above their heads. Discussion about the use that Irish bases could be put to by the Royal Navy has died down with the more favourable figures of shipping losses in recent weeks, but when the submarines come out again it will revive, in the Press not only of Great Britain but of the United States, too, where there is as much indignant incredulity—shared by very many Irish-Americans—over Mr De Valera's attitude as in the United Kingdom. There is also, as spring approaches and Hitler faces the necessity of doing something, the ever-present temptation of an unguarded country, where every field is an aerodrome, on England's rear flank. The bombs recently dropped by German aircraft on Dublin and—with supreme impudence—on the Curragh can hardly have been other than deliberate—German airmen know that cities lighted at night are not British. The only purpose the bombs can possibly have served was to test the Irish Government's reaction to violence. If the reaction was (as it turned out to be) merely a virginal protest to Berlin, then plans for invasion could proceed. If, on the other hand, Mr De Valera drew the ordinary common-sense conclusions and started talking mutual defence to London, then Hitler would have to think again. And if neither disgust in America nor bombs on Dublin could awaken the Irish people to their position, the shortage of all forms of imported supplies has suddenly come to teach them that they cannot, in 1941, live alone in a bee-loud glade.

The Irish attitude possibly arouses even more astonishment than anger in England. Is it really possible that the Irish cannot see the plain facts of the case? That their fate is wrapped up in the issue of the war, can be proved by merely enquiring, in suc-

cession, what would happen to them in the event of the victory of the two sides. What has Eire to fear from a British victory? Not even the most fervid Anglophobe has begun to hint at an answer that makes a semblance of sense. After a British victory, Eire will be left exactly as she is now. But what would happen after a German victory? President Roosevelt himself has given the answer, Ireland would certainly not be allowed, as an "amazing exception," to retain her freedom. It is not merely that Hitler cannot tolerate the existence of anything free in his vicinity; he would insist on taking possession of a country whose harbours and landing fields are the nearest to North America. Partition, it is true, might in a formal sense be abolished and Belfast might once again be ruled from Dublin; but the ruler in Dublin would not be Mr De Valera, it would be The O'Goering himself. Is the picture over-drawn? Who but an escapist can believe it?

This is Ireland's interest in the war. But her actions are very different. With all her future tied up with the victory of one side, she prefers to help the other. The help, it is true, is passive rather than active; but it is none the less real. Ireland's neutrality is certainly no help to Britain, and it is a powerful assistance to Hitler. This is in no way contradicted by the Nazi plans for invasion; the fact that an Ireland in German occupation would be of still greater value is no disproof that a neutral Ireland is already of considerable assistance to the Germans. Nor does the old argument of the weak little neutral hold water in this case. The Nazis will not be deterred from invasion by any considerations of neutrality; they would be deterred if a strong navy held the Irish ports and a strong army was camped on the landing fields. Eire is not even properly attending to her self-defence. She would be safer, not in greater danger, in the war than out of it. She would, it is true, get a few air-raids; but

Goering is not likely to spare many machines for such an unrewarding target. And the penalty of clinging to neutrality—a penalty which every day makes more probable—is to have a total war rage over every one of the Four Green Fields.

It is, indeed, incredible that the Irish will not see their danger—and that they do not see how they are compromising their whole moral position in the world. Was it for this, every English Liberal is asking, that Ireland's English friends fought so many bitter battles? Were they wrong, after all, in maintaining so stoutly that the Irish were fit to govern themselves? And on the other side of the Atlantic many who have always taken Ireland's wrongs and England's enormity as proven are beginning to wonder whether there is not a great deal to be said on the other side.

It would be wrong to lay the sole blame for the Irish attitude on Mr De Valera. It is tempting to draw a picture of the fanatical England-hater imposing his policy on an unwilling country. But it would be false. Mr De Valera's policy is not unpopular; any attempt to depart from it would evoke opposition. Seven distinct trends of opinion in Eire can be distinguished, and it is illuminating to particularise them:—

1. The positively pro-Nazi faction—not to be completely identified with any of the pre-war "pressure-groups" such as the I.R.A., but naturally drawing its adherents chiefly from that quarter. This faction is small, but not without power of a sinister kind.

2. The actively anti-British faction, which is prepared to acquiesce in a German victory and allows its hatred of Britain to blind it to the impossibility of its hope of being left undisturbed by the victorious Nazis. It is mainly this faction which seeks to confuse the issue (and does succeed in confusing many otherwise clear-headed people) by constant talk of "Partition."

3. The clerical faction, which is acutely divided in mind. The Axis smoke-screen over the Spanish war was peculiarly successful among the Irish hierarchy, and the delusion that it was a war of religion against Communism is dying hard. This *idée fixe* was curiously little affected by the Nazi persecutions in Germany or by the Russo-German Pact. Open or unconscious sympathy with the Axis has been strengthened by the Vatican's vacillation since Italy's entry into the war and by propaganda about the "Catholic regeneration" of Pétain's France.

4. The neutrals by conviction, in whom dislike of the Nazis and the British is balanced and who escape from the irreconcilable conflict in their own minds by hoping for the best of both worlds—that is, for undisturbed neutrality at best and, at worst, for protection by the hated British against the feared Nazis. It is in this faction that Mr De Valera himself should probably be placed.

5. The neutrals by policy, who believe that any taking of sides would precipitate a civil war in Ireland, and who, while fearing the worst from outside, prefer it to civil strife.

6. Those who hope that Britain will win, recognising clearly how much their own country depends on a British victory, but who, under the pressure of all the preceding factors, do nothing about it.

7. The survivors of the old Nationalist and Unionist tradition, who recognise no fundamental distinction between the Irish and the other peoples of the Commonwealth, who volunteer in large numbers for the British Army, who go over to England for munition work, who subscribe to British War Loans and Spitfire funds—but who are helpless in Eire.

It is impossible to say what the numerical strength of these different factions is. It is fairly certain that the number of persons in Nos. 6 and 7 is far greater than appears on the surface, as they have been deprived for years of any public spokesmen. The first two factions are numerically weak, but they have the power of terror. The Government cannot take any

strong ground of principle in opposing them and suppressing their violence, having come into existence with identically the same objects and struggled for power with identically the same weapons. There are too many professional politicians who have edged themselves into power on the anti-English band-wagon and fear they may lose that power if they stop singing, à tout ventre, the song they have been singing for thirty years; and this political bias gives an anti-British twist to the real or induced befuddlement of the majority in the three middle factions. A democracy will normally wriggle itself out of a dilemma such as this by the educative process of argument and controversy. The real indictment against Mr De Valera is not that he has failed to enunciate any plain and decisive policy—he cannot do so with opinion split as it is—but that he has stifled discussion and controversy. Eire has a censorship almost as tight as is in force in any neutral country in the world—far tighter than in belligerent Britain. Common-sense is starved of facts; logic is deprived of a forum.

What, then, can we do? There is no possibility of striking a bargain. Mr De Valera would not be content with anything less than the complete ending of "Partition"—which, in present circumstances, would involve the coercion of Ulster. And he has himself declared that he demands this as a right, not as a concession in a bargaining match. A united Ireland would be as stubbornly neutral as "partitioned" Eire. Threats will accomplish as little as blandishments. It is right and proper that Eire should be rationed for imported goods as severely as Great Britain herself; it is only common prudence to see that there are no stocks of petrol in a country that invites an invasion; but any attempt to go further and to try to starve the Irish into reason has no prospect at all of success. If the ports question becomes a matter of life and death, the only thing to do, as *The Economist* has remarked before, is to seize them. There will be plenty of moral justification for the act. A policeman in pursuit of a criminal can call on the "neutral" bystander for assistance; and the whole free world, together with at least half the Irish people, acknowledges that there is a criminal at large in the world and that Britain is the policeman. Those who would condemn such action on moral grounds can be asked whether they seriously hold that Britain would be right, in the circumstances here postulated—namely, that possession of the ports becomes a matter of life and death for Britain and Ireland together—to throw away her chance of winning the war and deliver the world over to the Gestapo rather than force the Irish to take their blinkers off? But a seizure of the ports is not an action that any British Government would take willingly; it could only be contemplated as a last resort, and we are a very long way yet from last resorts.

In default of this, there is nothing that we in England can do about the latest phase of the Irish problem but wait and hope, rather against hope, that time, the course of events, and the American example—powerfully assisted by German bombs—will convert the central mass of Irish opinion to a realisation of how much interest they have in a British victory. The time spent in hopeful patience might well be devoted to enquiring whether Anglo-Irish relations have not, for a hundred years past, been based on the false premise that it is England that should desire, and Ireland that should resist, closer relations between the two islands—with its corollary that it is always Ireland that makes the demands and England that offers the concessions. What faint advantage does England get, to-day, out of the fact that Eire is formally a member of the Commonwealth? And how much disadvantage would not Eire draw from a severance of the last tie, from the treatment of her goods as foreign goods, from the application to her sons and daughters of the Aliens Acts? Perhaps we have been making a mistake, all these years, in acting the defendant in Anglo-Irish affairs.

Power to Act

THE so-called People's Convention which was held in London last week-end merits no more notice than any other gathering of a minute knot of peculiar people. It is, of course, remarkable—and American commentators have not been slow to mark it—that a meeting called to support an offer of peace to the enemy should have gone unhindered in wartime. There is practical wisdom in tolerance and unfettered speech; and it is not possible that the views of these bogus claimants to the British radical tradition should go on record as representing the opinions of any significant fraction of the nation. What slender interest the meeting may have had outside its ranks arises from the repeated allegation, disproved by the mere fact of the meeting's own convening, that Britain is moving towards a "Fascist pattern of compulsion."

Many people would indeed be glad to learn of any evidence that the present Government was willing, outside the sphere of conscription for military service, to employ compulsory means, where necessary, for the securing of victory. The great bulk of the people would welcome the news that Ministers were at last prepared to use the wide powers of ordering which have been freely and deliberately accorded to them—not plotted for and seized by violence on the Fascist or Nazi model, but granted by the popular voice on the democratic principle that *salus populi is suprema lex*. The charges made at the People's Convention gain their interest, not because they reflect any popular sentiment or because they have any foundations in fact, but because they have something curiously in common with the grounds on which Ministers themselves have shrunk from executing their full mandate. The reasons which cause one Minister to decline to get on with his job because he "prefers being a leader to being a dictator," and lead others to explain away inaction on the plea that "the fullest opportunity must be given to free individual enterprise"—regardless of the fact that no number of individuals in isolation can construct a war economy to fit themselves into—these professed reasons spring from precisely the same confusion of thought as marked the peculiar proceedings at the Convention.

In the first instance, the confusion is verbal. When, alike, Communists (with the dupes who parade with them) and conservative Ministers of all parties speak of "compulsion," what they really mean is "authority." Authority, or *imperium* as the Roman legists called it, is an essential quality of government, and in itself it has nothing whatsoever to do with oppression—or with "tyranny" in the modern derogatory sense of the term. If the People's Convention had shared in the British radical tradition as much as its name, harking back at least to the Chartists, would imply, its members would have known, from Locke and Burke—and from Paine and Jefferson—that authority only becomes oppressive and tyrannical when its use is arbitrary and capricious and beyond popular control. Ministers, who know how clearly the popular will has been voiced for all means to victory, should know this even more plainly, by virtue of the direct responsibility they owe to the people's representatives in Parliament. Without authority there is anarchy.

It makes nonsense to claim that to require Ministers to use their authority is to accept the *Fuehrer-prinzip*. In the familiar annals of English government, *imperium* passed from King and barons to Parliament and the people; the opposite to the constitutional authority of Ministers in the Parliamentary system is the divine right of Kings to rule at will; and the *Fuehrer-prinzip* is no more than the divine right of Kings transposed to the nether regions. Nor have the attempts of Left-wing doctrinaires to identify the

authority of Mr. Churchill's government with the privileged tyrannies of a feudal baronage any weightier substance. It would be foolish to deny that there is a new baronage of vested interests embedded in our present social structure; industries, trade associations, and labour unions, all hold fiefs; and, in their new-style courts leet, their disposition is to set a term to economic expansion in peacetime and to the maximum effort in war. But it is not to support the "liberties" of these interests that strong government is called for, but to break them.

The way of the war effort which the people have willed is plain enough: to maximise production for the war without any qualification of private interest; to organise trade at home and overseas solely for the nation's welfare and security; to restrain all manner of prices, including that of labour, in the service of financial stability and social fairness; to direct the distribution of essential commodities in the cause of the common weal and in defiance of all sectional claims; and to mobilise and train manpower for all vital purposes with the utmost impartiality. If any necessary authority exercised in these directions can be called Fascist or feudal or imperialist—or undemocratic—then words have lost their meaning, on the lips of Cabinet Ministers no less than in the mouths of Communists.

To deny to Ministers the desire to do these things—or considerable success in approaching their achievement—would be utterly wrong. The creation of a fair and efficient war economy is their declared aim; and it is obviously the objective of their policies. They know what to do and, presumably to the best of their abilities, they are trying to do it. But, willing the end, they will not will the means. Because they, too, are bogged in the confusion between "compulsion" and "authority", their best intentions and devoted labours achieve much less than the best results. In the working of their controls, they rely on goodwill where goodwill is most the prisoner of narrow interest; in the mobilisation of men, money and machines alike, they rely on free choice where free choice, necessarily and through no fault, must be most short-sighted or blind. Willingness and hard work, in every sector of society and in every branch of administration, have done marvels. They have brought one enemy to the point of defeat; and they have contained and wounded the other. Under fire they have excited the admiration of the world, and they have given a promise that the greatest trials of the war will be withstood. But the war effort is still only a "scratch" effort. It holds together in default of, rather than because of, firm direction; and the war has not only to be not lost; it has also to be won.

Compulsion is a boggy. The demands of authority are part and parcel of our system of government already, as they are of every system of government, free or bound, popular or capricious. Conscription, taxation and the whole penumbra of enactments to secure health and safety at work, at home and in the streets—all these are "compulsory." The obligation upon all citizens to refrain from theft, murder and all forms of violence is "compulsorily" enforced. There is nothing in the enforcement of the requirements of war economy which need add a single new principle to the way in which authority is already exercised to maintain law and order and social justice. Indeed, justice, no less than victory, requires that men put out of work by the war shall be placed in employment for the war; that inflation shall not be permitted to run far enough to threaten ordinary people with distress and ruin; that the unmarshalled organisation of trade and distribution shall not menace the diets of poor families; that the stupidity of the few shall not

been decided that broadcasting must, in the last resort, be a mouthpiece for the Government in wartime—a tenable proposition—then the best way to make the change is openly—accepting the consequences.

* * *

Fire Bomb Fighters

A tour of the City of London or of the centre of Southampton might suggest that Mr Morrison's new fire-watching and fire-fighting plans represent the usual belated locking of the stable door, for it is very unlikely that, with proper precautions, such destruction could be done again by fire-bombs. Unfortunately, however, it appears that the lock is still being haltingly and clumsily put on. In design, it is an excellent, stout lock—especially when it is considered that, from all appearances, there was no design at all six weeks ago when the bad fire raids happened, and the plans had to be hurriedly devised after it had been announced that they were due. First of all, there are three defence regulations: one giving power to conscript persons aged 16 to 60 for civil defence duties; another giving power to require occupiers of business premises to make adequate arrangements against fire—and workers there to take turns of duty; and a third giving power to require local authorities to make arrangements for all premises in their area other than business premises. Then there are two Orders: one, the Fire Prevention (Business Premises) Order obliging occupiers of business premises to make individual or joint arrangements; and another, the Civil Defence Duties (Compulsory Enrolment) Order, enabling local authorities to register and enrol men of prescribed ages if the number of volunteers in their area is insufficient. In addition—and very important, because the definition of what exactly constitutes adequate arrangements for fire-watching is the kernel of the whole scheme—instructions have been put out by the Ministry of Home Security giving, not only details about equipment and compensation, but also guidance about the number of watchers required for watching and spotting in areas of a specified size—two to cover a street of 150 yards (or an area with a radius of 200 yards if they can mount a roof 20 feet above the other roofs around), with three for each stirrup pump party. This looks, and indeed is, very comprehensive. The question is: how is it being applied? Sample inquiries suggest that the answer is not yet very encouraging—much less encouraging, at any rate, than might be inferred from the enthusiastic Press accounts of fire-fighters leaping in half-dozens upon single incendiaries.

* * *

"Ca' Canny"

When Mr Morrison announced a fire-watching scheme on New Year's Day, he was the first Minister to threaten compulsion for civilian duties. But the dominant theme of the work that has been done since has been a desperate insistence on voluntary effort until it is absolutely proved insufficient—presumably by further successful fire-raids. The Fire Prevention (Business Premises) Order has been applied to most vulnerable areas. The Compulsory Enrolment Order has not been applied at all; the trouble, in fact, is with streets and houses. In London, it is reported that an appreciable large number of firms have been unable to collect sufficient volunteers—even though the Fire Prevention Order lays a duty upon men working on business premises to take turns of duty; in several districts there are streets which have failed to produce sufficient volunteers to patrol; and a heavy burden is inevitably being laid on the thousands of public-spirited people who have come forward. Nor is the worst fault that of reluctant employees or residents. In very many areas the situation is satisfactory; but, where any lack of personnel does exist, the local authorities surely have the solution for it in their own hands; if they do not compel service at once they can at least make it plain to every individual that the obligation to serve is inescapable. Actually, too many authorities have not even made it plain what the obligation or the character of the duties is. In some places, voluntary enlistment has already failed; in more it has not even been properly tried. The excuse is that the "voluntary method" is being "fully explored"

first. As a result, not only is the stable door still open; there may also be a Trojan horse inside, an animal of our own making.

* * *

Shelter Policy

There are signs and statistics that shelter conditions have improved considerably in recent weeks. In the whole of the London region, shelter accommodation has now been provided for 80 per cent. of the population, of which 19 per cent. were provided for by public shelters and 61 per cent. by domestic shelters. On the other hand, a census of shelter-users taken on the first Sunday night in January, a raidless night, revealed only 4 per cent. of the population in public shelters and 14 per cent. in domestic ones, compared with 5 per cent. and 19 per cent. respectively a month earlier. In 149 out of the 154 shelters that accommodate 500 persons or more, medical aid posts have been established; 65 other shelters are being given similar posts in groups; while in seven very large shelters there are whole-time doctors. There are now bunks for 462,000 persons, and the number of canteens, excluding those in the Tubes, is 1,980. It is expected that, by the end of this month, all the 80 Tube shelters will be fitted with improved sanitation and bunks. These statistics are most encouraging, and show that a real and successful attempt has been made to make the public shelters tolerably habitable. But the Government has very wisely not surrendered its principle that dispersal is the better part of sheltering. This week Mr Morrison announced that a new indoor shelter has been designed and will be given to all homes up to an income limit of £350 a year. This will presumably supplant the Anderson, for which the income limit was £250, and will be much more satisfactory, since for homes without gardens an Anderson was useless—and in any case it was extremely difficult to keep dry. To begin with, the new shelter will only be distributed in priority areas, based on presumed vulnerability, but it is to be hoped that, in these areas, every effort will be made to persuade the recipients to use them, thereby relieving the congestion in the public shelters.

* * *

An Unreal Vote

The South African Parliament is still out of line with the movement of public opinion in the Union. A vote of no confidence in General Smuts at the week-end was only defeated by 78 votes to 59, a majority of 19 for the Government compared with majorities on similar votes of 13 in September, 1939, 22 in January, 1940, and 17 last August. Yet the situation has changed enormously in these eighteen months of war. The first peace and neutrality motions of General Hertzog were based on the argument that the Union was being forced into "England's war"—which was amply disproved by popular support for the war effort and the results of by-elections. In the debate of last August, in which Dr Malan rather than General Hertzog was the Opposition's most convincing figure, the argument was that Britain was already beaten; and that contention has since gone the same discredited way as its predecessor, well aided by the successes of South African arms. The Opposition to General Smuts still musters nearly sixty votes, but it has no leg to stand on. What is more, it is torn by dissension. The chief feature of the latest debate was the virulence with which the supporters of Dr Malan, who moved the motion, were criticised by the followers of General Hertzog, who has now retired, for their narrow racial outlook; and even among the Malanites the gulf between the calculating Republicanism of their leader and the blood-and-soil blindness of the extremists—whose actual leader is rather Dr Van Rensburg—was very evident. The Opposition vote was a hotch-potch—ranging from the Hertzogites' formal plea for neutrality, through the "anti-Imperialist" sentiments of the new "Afrikaner" party and Malanite separatism, to the active disloyalty of the Ox-wagon group. In the Union Parliament, there is an overwhelming majority for co-operation between Afrikaner and British, just as there is an overwhelming majority for the war among the South African people.

Politicians at Play

Indian politics continue to be surprisingly unreal. Congress, in the main strongly anti-Nazi, opposes the war vocally and demands a National Government at once and immediate independence for India. Mr Jinnah of the Moslem League has restated his demand for Indian independence, which includes a scheme for partition to set up a separate "Pakistan" consisting of Moslem States. The Christmas meeting of the Hindu Mahasabha put out a call for support for the war, but demanded a definite date for Dominion Status—not later than one year after the end of the war; while the conference of the Liberal Federation put the time limit for Dominion Status at two years after the war. Thus the demand for further self-government in the near future is common to all groups; and every section but Congress supports the war. But by self-government very different things are meant. To Congress it means the Congress rule. To the Moslem League it means the government of Moslems by Moslems. To the Mahasabha and the Liberals it means representative government on a broader basis—and the partition plans of the League are anathema. Mr. Gandhi has committed Congress to the anti-war campaign which has so far resulted in the imprisonment of many of the best brains and characters in India. But, although his stand is ostensibly the moral ground of pacifism, the Mahatma has now implicitly admitted the political character of his programme by stating that "We are resisting an authority that is itself struggling in a fight for life against a stubborn foe—our struggle must be coterminous at least with the European"—though reports that he may still be a little unsure of his ground. The Mahasabha, too, has threatened direct action if its constitutional demands are not satisfied. In detail, then, the politicians are presenting, with no will to compromise or even discussion, demands, in no way compatible, for constitutional changes which, in any case, are impracticable now while the war is on. As a result, the public is becoming less and less interested in what appears to be no more than a series of interested and opportunist manoeuvres. This is the chief feature at the moment. Indian troops are now in the front line, and the war effort in India is perceptibly growing. Congress membership is markedly falling off; and it is probable that the attitude of most unsectarian Indians is best reflected by the demand of the Liberals and of the moderates of all the communal factions for a broader and more national Central Government now and for Dominion Status at a specified date later on. The jockeying of the political groups may be largely irrelevant, but it would be a great mistake for the British authorities to allow the fact that the politicians cancel each other out to obscure the general wish for greater control by Indians over Indian affairs.

* * *

Lines of Communication

The first lesson of modern warfare is that power to produce counts more than manpower. The second, which has hardly yet been learned, is that power to transport may count most of all. The British blockade of German Europe will only be a decisive factor if transport difficulties, intensified by bombing, reduce the enemy's scarce supplies in his vast territories below what Mr. Dalton has called the "distributional minimum." Just as Hitler's greatest weakness is the distances over which his men, materials and machines have to be transported, so does his highest hope reside in the thousands of sea-miles across which the necessities of life and the sinews of war have to travel to Britain. Invasion is only the of war have to travel to Britain. Invasion is only the third and most speculative prong in the German offensive; at sea, in the ports and inland, transport is the target of a double assault by submarines and air-craft; and the Achilles heel in Britain's defences is not so much the vulnerability of transport to these attacks as its ill-organisation. In the spring, the ability to move and distribute goods through the ports and overland will be the key to the battle. If the final coup of invasion is attempted, its success or failure will depend, not merely on fire power in the air, at sea or on land, but on mobility—of war goods and essential supplies no less than of fighting men. A bulletin of the Vigilance-for-Victory Group* makes three points: first, that the in-

* "The Organisation of Transport for War." Bulletin 5 of the Vigilance-for-Victory Group. 10 Hertford Street, London, W.1.

ability of existing transport facilities, even under non-Blitz and pre-invasion conditions, to clear the ports and distribute supplies when and where they are needed is due to lack of ways, not lack of means; secondly, that this absence of efficiency is due to the fact that, whereas the demand for transport is organised and concentrated in the war Ministries, the supply of transport, apart from shipping, is not organised at all; and, thirdly, that a prime cause of the absence of organisation is the persistent assessment of transport operations by their financial results and not by their service to national requirements. This is familiar ground. The suggestion that the problem of moving traffic through the ports should be solved as it was in 1916-18 in the overburdened ports of France, when all forms of transport were amalgamated under a Director-General and armies of millions were supplied under fire, goes to the heart of the matter. Britain is in the front line now. Recent port delays and the chronic breakdown of coal transport only foreshadow how the German invasion of Britain might be favoured, or the British invasion of Europe frustrated, by a system in which, apart from petrol rationing and war demand, transport—as usual—limited by commercial considerations and working in watertight compartments, is the rule. The work of the pool of refrigerated road motor vehicles under the auspices of the Wholesale Meat Transport Association—often criticised for its quasi-monopolistic position—can be cited as an example of the efficiency—and cheapness—of new communal methods; and now the Ministry of Transport itself is to operate hired lorries in a single pool. Only when the entire transport capacity of the country—rail, road and canal—is pooled under a single direction and used as nationally required, regardless of financial or other considerations, will the country be really ready, first, to repel the invader, then to plot his defeat.

Trinidad's Constitution

The appointment of Lord Moyne as Secretary of State for the Colonies is welcome, for he is associated with the new colonial system, announced a year ago, when it was decided to establish a Colonial Development and Welfare Fund. The recognition that colonies ought to be given economic help from Great Britain sprang directly from the report and recommendations of the West India Royal Commission, of which Lord Moyne was chairman. Unfortunately, the course of the war has meant that the new system was stillborn, or at least has been considerably dwarfed. But there has been some attempt to implement the Commission's recommendations on the constitutions of the West Indies. Discussions are at present taking place with the Governor of Jamaica on a new constitution for Jamaica, and Trinidad received a new constitution last December. The latter does not appear, however, to fulfil the recommendations of Lord Moyne's Commission, except in the

Exports & Imports

While the war has increased the already vital need for exports and imports, it has, at the same time, necessitated the introduction of numerous regulations and restrictions which add considerably to the trader's difficulties.

The Westminster Bank maintains specialized departments where its customers may obtain expert advice and assistance in dealing with such problems as arise, and it strongly advises those who are exporting or importing to consult it as soon as their intentions are known. Information is also available regarding Documentary Credits—so necessary to the financing of war-time trade.

Further particulars may be obtained from the Manager of any branch or from

Total.....	6 5	Total.....	25 7

This is a close etching of the employed worker's life before the war. Among foodstuffs, expenditure on bread (including flour), meat (including bacon), milk, butter, tea and sugar was 20s. 4d., or 60 per cent. of the total, while purchases of vegetables and fruit were only 3s. 2d., or less than 10 per cent. of the total. In clothing, the enquiry discloses the somewhat surprising fact that men spent only 3½d. per week less than women; and of particular interest is the way in

which the income left over after payment for rent, food, clothing, and fuel and light was spent. The amount spent on tobacco was equivalent to nearly one-quarter of the rent, more than three times as much as the drink bill, and it exceeded the expenditure on butter. Newspapers and periodicals and the cinema each account for a slightly bigger weekly expenditure than drink. But have the investigators been told the whole truth? On the basis of the data obtained, the average annual expenditure on drinks of the 8,905 households was £2; but the average amount spent each year on beer alone in this country exceeds £3 per head, while the total drink bill per head is above £5 per annum.

In housing, the enquiry showed that only 17.8 per cent. of the 8,905 families were owning or buying their dwellings. No less than 80.0 per cent. of them were renting their dwellings, while, in the case of the remaining 2.2 per cent., the dwellings were supplied rent-free by employers. The weekly expenditure of the families who owned or were purchasing their dwellings was 12s. 9d., while those who rented them only paid 10s. 8d.

These results bring out the far-reaching changes in the habits of the working classes that have taken place during the past twenty-five years. They spring from the rise in real incomes, the reduction in the size of the average household, the introduction of new commodities and services, and other influences; and they will provide the Government with a useful yardstick for reducing consumption in wartime. But the construction of a new cost of living index based on pre-war expenditure is now not pressing, for we must temporarily return to a simpler way of living and cut out of our budgets many of the items that were added to them after 1914. On the other hand, the results obtained from this enquiry should facilitate the task of calculating a wartime index of the cost of maintaining the people in good health, which now seems much more urgent than an index showing changes in the cost of maintaining a standard of life that we cannot afford.

NOTES OF THE WEEK

Air and Water

For some weeks, shipping losses have been below the perilous levels of the months since June, and in the week ended January 5th the loss of 14,687 tons, all British, was the lowest since last May. In the air, night raids on this country have been fewer and of shorter duration, apart from the recent intensive attack on Portsmouth, though the damage done in several of the latest type of sharp fire-raising raids has been considerable. Both at sea and in the air, in fact, there have been signs of increased thriftiness in the enemy's use of his resources. While it would be premature to suppose that this caution is due to any current shortage of material, personnel or fuel, it is likely that the Germans are finding it very necessary to husband their supplies with great care to make possible the major campaign against the subsistence and independent being of these islands which it seems certain they have in mind. The same economy in tactical operations was witnessed twelve months ago when the drive by land to the North Sea, the Channel and the Atlantic was being prepared. Moreover, on this occasion, the defenders are far from passive. Frequent air attacks by the R.A.F. on submarine bases and the German bombers' airfields; the increase in the number of escorts for Atlantic convoys; the activities of the first few night fighters in the defence of Britain—all these have conspired with continuous bad weather (which has almost surely been the chief external deterrent both on sea and over the land) to emphasise the enemy's disposition to limit his activities. The preparations for his "push" are going on on both sides of the front, here and at sea, by the equivalent of the patrols and searching barrages of trench warfare, and in Europe by the deploying of men, machines and material for the attack—always under the vigilance of the R.A.F.

Attack and Defence

The limitation of enemy activity is in sharp contrast to the growing boldness of our own forces, which are using the tactics of counter-patrol to attack and reconnoitre with a new confidence. Only a few days ago British bombers, with a fighter escort, swept in force for the first time by day over the enemy's air and Army bases in the Pas de Calais, while the incessant forays by night against ports, airfields, factories and communications, from Norway to Italy, have increased in vigour. It is too soon to say that we have taken the offensive. These are the obvious ripostes of an audacious defender against a hanging menace. But it is being made very clear that, unless the enemy can set his greatest offensive in train very soon, he will be faced with the danger of our counter-offensive being in fact the first blow. Nor can the difficulties of supply and transport over the large area of all Europe be anything but steadily worsened by the combination of blockade and intensified bombing. Hitler has to go carefully now, and he must strike his heaviest blows in the West soon. Moreover, if he has not yet lost the initiative in the West, it has been thrown away by the Italians in the South and South-East. Italy and the Balkan Peninsula are no longer springboards for Hitler's grand designs upon the world beyond Europe. They are of the dramatic changes that General Wavell and the Fleet are making in the Mediterranean scene, it is that Hitler must dispose his forces to guard against an inroad bringing the Allies closer to his flanks. He need not and cannot save the Italian Empire in Africa. He must save Italy, just as he must have his forces in the Balkans arrayed to counter-attack or defend. The Italian Navy is still mainly intact and characteristically safe, and it appears that Hitler has decided to take up his stand first

on the Mediterranean. Between January 10th and 13th German bombers—probably from Sicilian bases—dived again and again with skill and daring upon a heavily escorted convoy for Greece passing from west to east through the Sicilian Channel. An aircraft-carrier, a cruiser and a destroyer were hit, but none was sunk, and the convoy got through. Twelve German and Italian planes were lost. Early this week a protracted raid on Malta was carried out by the Italians; and it seems that the Germans have decided that, if the back doors to German Europe are to be kept bolted, while the offensive in the West develops, it is necessary to induce the Italians not just to allow command of the Mediterranean to go by discreet default.

* * *

The Aid for Britain Bill

There were many complaints in the United States six weeks ago about lack of action at Washington. The election had given Mr Roosevelt a complete mandate for his avowed foreign policy but, it was said, no progress was being made. Those complaints are not being repeated now. Indeed, the pace of advance is electrifying and the terms of House Bill No. 1776—a Declaration of Interdependence—go much further than would have been believed possible even as recently as two months ago. The Bill authorises the President to manufacture or purchase munitions and to "sell, transfer, exchange, lease, lend or otherwise dispose of" them to the Government "of any country whose defence the President deems vital to the defence of the United States," in return for "payment or repayment in kind or property, or any other direct or indirect benefit which the President deems satisfactory." This obviously places very large powers of discretion in the President's hands and though Mr Roosevelt has disclaimed any desire to have more powers than are necessary, the Bill is being attacked on the "dictatorship" as well as on the "entanglement" issue. But it has received the blessing of such old and new enemies of the President's as Mr Al Smith and Mr Wendell Willkie (whose promised visit to England is a fine example of that meeting of minds between the two countries which is the surest guarantee of understanding and co-operation). There is no doubt of the Bill's passing, though it may have some restrictive amendments tacked on to it. Those that have been mentioned include a time limit of two years and a requirement that Army and Navy officials must consent to the export of any munitions. Another proposal, sponsored by Senator George, Chairman of the Senate Foreign Relations Committee, is that Britain should give a lien over her rubber and tin interests as a guarantee of repayment. This looks less pleasant on the surface, but it would be a mistake to take it too tragically, since America is clearly entering on her new course in the mood of a partner rather than that of a pawnbroker.

*

The new aspect of relations between the two countries obviously requires a renewal and broadening of the channels of communication, and have here too the appropriate conclusions are being drawn. Lord Halifax will very shortly be leaving for his new post, where he will be a member of the War Cabinet seconded for special duty. To fill the interval before the appointment of a new American Ambassador to London, Mr Harry Hopkins, perhaps Mr Roosevelt's closest political friend, is in London. The work of the British Supply Missions in America will clearly become increasingly one of treating with the American Government instead of placing direct contracts, and this fact has been recognised by the creation of a new British Supply Council in North America, with Mr Arthur Purvis as Chairman. The Council will co-ordinate the work of the naval, military and air missions and Mr Howe, the Canadian Minister of Munitions and Supply, will also be a member of it. In this general improvement of communications it is to be hoped that the actual physical means will not be overlooked. The American newspapers—such few copies as reach this island—steadily complain about the delays and uncertainties of the mails. Surely we do not have to wait until we reach full supremacy in the air before enough long-distance machines are assigned to the North Atlantic route to keep the channels between the two halves of the democratic world wide open?

After Klisura

The fall of Klisura comes at the end of three weeks of bitter fighting. The weather is probably responsible for the time it has taken the Greeks to conquer the heights surrounding Klisura. Snowdrifts lie across the mountain tracks, the muleteers have to scramble with their supplies over rocks and hillsides slippery with ice and at least a part of the hand to hand fighting which preceded the taking of the town took place in blinding snowstorms. But the results are worth the agony. Tepe-lini must fall soon; the Greeks are pushing forward along the road to Berat and along the coast beyond Himara. If these advances are sustained Valona is lost. The chaos existing behind the Italian lines is illustrated by the third change of command in three months. General Soddu resigns, pleading an understandable state of ill-health, and he is to be replaced by General Cavallero. The Duce's choice is certainly remarkable. Cavallero was only recently appointed to be Commander-in-Chief of all the Italian forces. If he is now to go to Albania, it is questionable whether he can maintain the necessary oversight of the military affairs of a nation which is fighting a desperate fight on three land fronts, in the air and on the sea. It is possible that his departure is the price Italy is paying for the Stukas which are dive bombing the British fleet off the coasts of Sicily. With Cavallero away, the tacit assumption of supreme command by Germany could perhaps be accomplished with less personal friction and animosity.

* * *

The Abyssinian Front

While the patient investment of Tobruk continues, supplies are brought up, the men rested and the almost embarrassing host of prisoners disposed of, the focus of interest in Africa has shifted to the frontiers of Abyssinia. To the south the storming of El Wak on December 17th has been followed by the occupation of Buna, which was found already abandoned by the Italians. Round Kassala and Gallabat our patrols give

the enemy no rest, and in the Abyssinian interior the situation is beginning to deteriorate. Haile Selassie is at Khartoum awaiting the moment to cross the frontier, and each week brings new reports of the Abyssinians' growing confidence and better equipment. Ras Mengasha is apparently the Abyssinian Commander-in-Chief, and now that the news of the Emperor's presence has spread inside the country, desert warriors are making their way across the frontier to declare their allegiance and to return with arms and supplies. The Italians' withdrawal in Northern Kenya is probably due to a growing fear for their bases. The fear is understandable. The Abyssinians have a long score to pay off and they are not pretty fighters. Unarmed and disorganised they took a constant toll of Italian life. Well-armed, the result must certainly be massacre. For the Italian soldier this is a hazard of war, even if it is the consequence of Mussolini's deplorable folly and ambition. But for the wives and children of the Italian colonists, it is a disaster for which they are not remotely responsible, and it is to be hoped that the Italian Government will take advantage of Britain's willingness to allow non-combatants safe passage back to Italy.

* * *

The Price of Food

The issue by Lord Woolton of an Order fixing the prices of a long list of foodstuffs at the price charged on December 2nd, 1940, has carried the development of food policy in the present war an important step further. The Order, which came into force last Monday, covers coffee, biscuits, honey, meat pastes and a number of other commodities whose prices have been rising steadily during the past few months. The most significant omission from the list, apart from foodstuffs, whose price is already controlled, is the whole range of fresh and dried fish—a source of nourishment which becomes relatively more important with the rationing of edible offals. The price fixing Order is stated by the Minister to be an "interim measure," to take effect until the local and competitive differences in prices which existed on December 2nd can be "ironed out" by the issue of maximum price Orders. This is by no means the first time during the present war that the Ministry of Food, in a praiseworthy attempt to fight inflation and combat the exploitation of the average Briton by speculators and option buyers, has controlled the price of an unrationed commodity. Nor has it been wholly the result of control that the articles controlled, lemons, oranges, onions and eggs, either disappeared entirely from the shops or made an appearance in more restricted quantities. The institution of price control coincided with the further curtailment of imports.

*

But, for several good and long-established reasons, price control without rationing is always liable to provide a strong deterrent to the sale of the controlled goods in the open market. In all cases where the cost of transport is an important factor in distribution there is a tendency for the goods to be sold at the point of production or initial distribution. Moreover, as prices in the first week of January tended to be above those of December 2nd, there is presumptive evidence that demand at the controlled prices will be heavily in excess of supply, and shopkeepers will be encouraged either to withhold goods from sale and exert pressure for the raising of the controlled prices before the maximum is announced or to sell only to the "best" customers. The attainment of most-favoured customer status is, unfortunately, not determined by need, but, all too frequently, by ability to spend lavishly. Apart from the fact that large-scale price control without rationing demands a system of informers to ensure that it is enforced, it must both accelerate the demand and curtail the supply of goods which are already relatively scarce. The problem—the control of rising prices when higher money incomes are spent on smaller supplies—requires a more rigorous solution. If order and plan is to be introduced into the distribution of food, the maximum practicable extension of rationing must be accompanied by some form of limitation of private expenditure on all unrationed foods, either by group and "point" rationing or by the limitation of total weekly expenditure in terms of money.

Peace Talk about Italy

The American Ambassador to Italy, Mr. W. Phillips, is on his way back to Rome, and his return is an interesting illustration of President Roosevelt's desire to keep open his avenues of communication and information in Europe—and perhaps of his determination to restrict the present hostility and potential belligerency of the United States to the German Reich. All the nations of Europe, whether they are nominally friends or acknowledged enemies of the Nazis, have been consistently fooled and exploited by them, and if American influence can at any point be brought to bear upon the non-German Governments of Europe, it will all be in the direction of encouraging their desire for peace and weaning them from their German masters. The presence of American Ambassadors in Europe may indeed prove a serious embarrassment to Germany, particularly in Italy, where the country, if not entirely disintegrated, is at least in a dangerously unstable state. Mr. Phillips' return, together with the President's recent message to the King of Italy, conveying his hopes that the Italian people would soon enjoy "a righteous peace," has naturally given rise to a spate of rumours covering everything from American offers of mediation to an imminent Italian collapse. It is probable that influential Italian opinion is sharply divided. But it is a long step from divided counsels and influential discontent to the negotiation of a separate peace under the nose—the extremely sensitive nose—of the Germans. And peace offers would mean the eclipse of Mussolini, and there is no evidence to suggest that he is an exception to the rule that dictators prefer to betray their country rather than to lose power.

* * *

Regionalism for Hospitals

In December, 1939, Lord Nuffield established a trust of about £1½ millions with the object of co-ordinating the hospital services and ancillary medical services in the provinces, in much the same way as the King Edward's Hospital Fund does for the London hospitals. He envisaged regional boards throughout the country which would co-ordinate hospital finance and policy, and the trust would be used principally to make grants to the boards when they were established. The trustees have now reported to the Minister of Health on their first year's work, most of which has been concerned with setting up the administration; even now, regional committees are only in process of being formed—it is interesting to note that the regions will probably coincide with the Civil Defence regions in accordance with the recent rapid growth of regionalism generally. The regionalism envisaged, besides helping the voluntary hospitals through a particularly awkward financial period, will attempt to define the relations between them and the public health authorities, a relationship which the war has thrown into prominence through the establishment of the Emergency Medical Service, and on which the whole future of the voluntary hospital system in this country may ultimately depend. In reply to the report of the Nuffield Trustees, Mr. MacDonald has given his blessing to the scheme and pronounced his conviction that a regional unit is necessary for avoiding duplication and waste. The voluntary hospitals already receive grants out of public funds for any services they perform for the local authorities, but too often they have cherished their independence too dearly for any co-operation with the local authorities to be possible, with the result that the latter have in some cases set up their own specialist service, which merely repeats that of the voluntary hospital. What is wanted is the best service for all, irrespective of whether it is provided on the voluntary or the State principle. The experience of the King Edward Fund in London does not point to the complete achievement of this aim by the Nuffield Trust. But, if it is properly worked out, it should remedy many of the most obvious faults; and it provides a great opportunity for taking the hospital service to the patient instead of the patient to the service. Few small districts can do more than provide a cottage hospital; for specialist treatment their patients have to visit hospitals sometimes many miles from their homes. But through the Nuffield Trust it should be possible for a certain number of hospitals in each region to be centres from which doctors, nurses and equipment can cover with local clinics all the districts included in the region. Cure, rehabilitation, and, best of all, prevention would thus be within easy reach of all.

A Use for Engineers

The chief reaction to the announcement last week that the Ministry of Labour had set up a separate section to deal with engineering was utter astonishment that such a section did not already exist. This war is *par excellence* a war of precise engineering, much more so even than the last one, and it will be won by engineers. The Ministry of Labour, however, denies that there is anything important in the change. The Ministry's job of registering, placing and moving workers has grown enormously because of the war; the work is subdivided into sections dealing with the different aspects of labour supply; and it has now been found advisable to have a separate one for engineering. That is all. But, since the object of this piece of internal reorganisation is also said to be to secure expert advice for the Government on problems of engineering labour, it seems abundantly clear—to the lay observer at least—that, if this advice and these experts are needed now, they have surely been needed ever since the problem of using and expanding the engineering industries for war purposes first arose. What appears to have happened is that the task of recruiting and training engineers has perforce and belatedly been recognised to be too big and too difficult for the standing organisation of the Ministry to manage, and it is perhaps characteristic that the change was apparently not conceded until it was quite impossible to escape it.

* * *

Transport Problems

There is a danger that transport will become the great bottleneck in the production of munitions. Last week the Ministry of Transport announced that Mr. J. Gibson-Jarvie, chairman of the United Dominions Trust, and Mr. Robert Letch, assistant general manager of the Port of London Authority, had been appointed regional port directors for the north-western region and for the Clyde region respectively. The object of these appointments is to secure a more rapid clearance through ports of goods, whether inward or outward bound, a quickening in the turn-round of ships and a better utilisation of existing transport facilities. The two directors have been authorised to exercise the Minister of Transport's powers of issuing instructions to the port emergency committees set up at the principal commercial ports for the purpose of securing efficiency in port traffic. Further, in order to speed up the repair of roads and public utility services in London, Sir Warren Fisher, Special Commissioner in the London Region, has asked local authorities to submit proposals for strengthening their road repair organisations by securing additional men and equipment. On the other hand, there has been further evidence, derived from a special investigation made by the British Road Federation, for example, of the still inadequate use made of our road transport facilities, of the shortage of lorries and drivers, and of the difficulties and delay in securing spare parts and in repair work. Arrangements have been made for the use of Army transport to relieve congestion in certain cases, but this contribution to the solution of the transport problem must be limited. Again, there have once more been complaints of the insufficient use made of canals. It would seem that many barges are lying idle, but one of the difficulties in the way of a rapid expansion in canal traffic is the shortage of men to man them. A scheme for the training of bargees reposes in the pigeon holes. Fortunately, there are some signs that the transport problem is being tackled more vigorously; but speed is of the essence.

* * *

A Servant of France

M. Eboué has been appointed Governor-General of French Equatorial Africa, and arrived in Brazzaville a few days ago to take up his duties. He is the first black man to hold so high a post in the French, or, indeed, in any, colonial service. There were only five Governor-Generals in the French Empire, and in the Free French Empire of to-day this is the only one. M. Eboué was born in French Guiana about 50 years ago. He studied law at Paris University, and also attended the

Colonial School in Paris. He then went into the Colonial Civil Service. His great ability and intelligence earned him steady promotion until, in 1936, he was appointed by the Blum Government to be Governor of Guadeloupe. This appointment was strongly approved by the French Chamber. As Governor of Guadeloupe, M. Eboué proved so good a friend of the native labourers in the formation of trade unions and in the improvement of working-class conditions that he aroused the opposition of the French planters, and he was finally transferred to the Governorship of Chad, part of French Equatorial Africa. After the collapse of France, he was the first to resist Vichy and to come over wholeheartedly to General de Gaulle. At that time the Governor-Generalship of French Equatorial Africa was in the hands of a French soldier, General de Larminat, but it was decided to replace him by a civilian, and the honour fell to M. Eboué. In these days of intransigent racialism and economic "new orders," it would perhaps have been a worthy gesture to have included M. Eboué's name in the New Year's Honours in the special list devoted to distinguished officers of Britain's allies. Both his work and his career are admirable illustrations of the cause for which we fight.

* * *

Education—Now and Post-War

Recently, for the first time since the beginning of air-raids, the President of the Board of Education gave his official thoughts on the present state of education in this country. He agreed that the outbreak of war had caused a "serious dislocation" of our educational system and that a number of problems of "exceptional difficulty" had arisen; but he believed that the survey of the present position now in progress would show that the general structure of education was "bearing the strain remarkably well." The publication of the survey—if it is published—will be awaited with interest, for if it really proves Mr. Ramsbotham's assertion, it will be in sharp contradiction, not only to the opinion formed by most anxious observers, but also to the specific reports published by the National Union of Teachers and the Workers' Educational Association. The most obvious evil is the large number of children—they still number 20-30,000 in the L.C.C. area alone—who are not going to school at all. Mr. Ramsbotham "hopes" that the parents of these children will be proceeded against with the utmost vigour and severity, but he gave no indication that the Board was attempting to cope with the troubles of the neutral and reception areas. Perhaps, however, the most gloomy part of his address was that which gave his aspirations for the future. After saying that as soon as possible after the war the school-leaving age will be raised to 15, he said that it was his "personal belief and ultimate goal" to adopt a minimum leaving age of 16, provided that varied types of post-primary education have been devised for varying tastes and capacities. Mr. Ramsbotham did not explain why no attempt to provide such education was made before the war or why the report of the Spens Committee, which proposed different types of secondary schools, all of equal standing, was promptly shelved. The recent past, like the present dislocations, augurs ill for the post-war future. If there has been a radical change in the outlook of politicians and administrators towards education—and it is out of the test and trial

THE COMMERCIAL BANK OF SCOTLAND LIMITED

of wartime that such conversions should come—more than the usual platitudes are needed in authoritative speeches, even though conditions now will not permit of active reforms. At least more effort is required to see that education does not sink into a serious decline because of war-time maladministration. And if the “deep and careful thought” which Mr. Ramsbotham and his advisers are now giving to reforms in post-primary education is really concerned with the ultimate goal of a school-leaving age of 16, it can only be said that their thoughts are extremely limited. If, as Mr Ramsbotham states, post-war changes in our social and economic conditions will have a profound effect on young people, surely the corollary is a complete change in the social aspect of education. Tinkering with the school-leaving age is, from this point of view, a mere nostrum.

* * *

Youth on the Wing

Perhaps, after all, the exigencies of war will loosen some of the shackles round our educational system. A few months ago it was announced that special courses would be started at certain universities for training selected candidates from secondary schools for technical branches of the Army. Now a similar but much wider scheme has been adopted for the R.A.F. An Air Training Corps is to be established to provide pre-entry training for candidates for air crew and technical duties. At the universities a six months' course will be arranged for selected boys between the ages of 17½ and 18½ years, from secondary or public schools, who are potentially of commissioned rank and wish to serve as pilots or navigators. They will be full members of the university and will join the university air squadron, in which they will be given instruction similar to that given at the initial training wings of the R.A.F. At the same time they will pursue a course of study in such R.A.F. subjects as mathematics, mechanics, electricity, engineering, meteorology and navigation, mathematics and one of the other subjects being obligatory. Outside the universities the already existing Air Defence Cadet Corps and the air sections of the Junior Training Corps at schools will be amalgamated with the Air Training Corps, the Government henceforward bearing the cost of the organisation and instruction. The machinery of the Air Defence Cadet Corps will be used to extend the recruiting of local units, and the local authorities will arrange for instruction in mathematics and English for young men suitable for air crew duties. At schools, boys between the ages of 16, or even younger, and 18 will be eligible for a course of instruction similar to that given at an initial training wing of the R.A.F. This three-fold scheme is an unusual, but interesting, development of the modern aim of varying post-primary education to meet varying tastes. But it is, of course, chiefly of importance to the future recruitment for the R.A.F. The Service's high standard of selection is not being lowered, and those who undergo the university or local authority training will still have to complete further training tests in the Service itself before they are finally accepted, while many of the schoolboys who do the school syllabus may be ineligible when the time comes for them to be called up. But those who are accepted will have their initial training behind them, and there will henceforward be a large pool of young men, which, together with the pool formed by the Empire scheme, will mean that the limits of the R.A.F. will continue to be fixed by the number of machines, not men.

* * *

We Were Splendid

The New Year was not unnaturally marked by a mood of mutual congratulation among the people of the English-speaking world. Messages flocked in from the Dominions paying tribute to the way in which the people of this island had borne their trials and tribulations. Articles were written and films—very good films—were shown in the United States to record the gallantry and fortitude of the British people in their ordeal by Blitz. On all sides, we were told that we were splendid, and the admiration of the American people for the way in which we are able to carry on, bombed and on shortening commons, is an appreciable element in the movement of opinion in the United States at this critical juncture. Actually, now that the tributes have been accepted with a fitting modesty, it is probably time that our sense of humour—and of proportion—reasserted itself. The truth is that, for the vast majority

of the population—even in the towns and even in the London area—the ordeal in its grimmer aspects has been largely confined to the newspapers. The much-heralded bogey of bombardment from the air has so far been a flop, and to deny this possibly undramatic conclusion is to pay the *Luftwaffe* a tribute that it has not earned. For it is ultimately to the *Luftwaffe* that some part at least of these congratulations on our survival through a reign of terror must inevitably pass. There has been no reign of terror. The surprisingly small part of the population which has suffered direct bombing has suffered cruelly—and with a gallantry that deserves every praise. There has undoubtedly been a great deal of damage to property. Some people have lost their livelihoods, and the nation has lost many treasures. But most of us in the bombed areas have only been sometimes very frightened, and very often considerably inconvenienced. The really important thing about the so-called *Blitzkrieg* so far has been its failure. It has failed to upset the ordinary, normal routine of existence in the towns attacked for any appreciable length of time—except for the few bombed-out or bereaved, mass-sheltering, except for the fact that in many cases the shelterers' homes are scarcely more comfortable than the tube shelters, is a habit rather than a necessity; and the majority of us would be wanting in honesty if we allowed ourselves to be acclaimed *en bloc* as heroes, when neither bombing nor the Atlantic blockade has imposed any great burden or sacrifice upon most of us yet. Let the praise go generously to the few courageous and unfortunate victims—but for the rest, let it be reserved for the time in the future when possibly worse may befall.

* * *

Shorter Notes

At last Saturday's registration of the 36's, men were, for the first time, allowed to apply to be posted to certain of the civil defence services instead of one of the three fighting services. In addition, as the number of men giving a preference for the Navy has been much greater than the service can absorb, volunteers will be given the chance of being trained for the Merchant Navy instead of being automatically posted to the Army.

*

Lord Lloyd, Secretary of State for the Colonies, is to be the Leader of the House of Lords in place of Lord Halifax.

* *

Sir William Beveridge, who since last spring has been chairman of the manpower survey of the Ministry of Labour, has now been appointed an under-secretary in the Ministry. He will, therefore, have administrative instead of purely advisory functions, and will *inter alia* be responsible for the revision of the schedule of Reserved Occupations.

*

A Cultural Convention, the first of its kind ever signed between Great Britain and a foreign country, has been concluded with Greece. Its aim is to ensure that in time of peace the friendly collaboration bred of the war will be continued, and it is particularly concerned with encouraging the work of the British Institute in Athens, where 3,000 students are already studying.

*

It seems likely that Thailand is going to offer Japan a first-class excuse for intervening in Indo-China. In this week's fighting, Thai troops have broken into Cambodia and the advance continues.

*

Two Orders have been made under the defence regulations authorising the General Medical Council to include in the Medical Register, first, doctors of United States or British nationality, qualified to practise in the United States or Canada, and, secondly, doctors qualified to practise in any part of the British Empire, the countries of our Allies, or in Germany or Italy. The object of the Orders is to enable the doctors to be employed in the Emergency Medical Service, the fighting Services and in civil hospitals, and the second Order precludes doctors covered by it from undertaking private practice.

*

Mr. Menzies, Prime Minister of Australia, is to visit England for personal consultations with the British Government.

THE WORLD OVERSEAS

America's Hopes and Fears

(From Our Washington Correspondent)

THE past month has been spent in the doldrums. Through the last weeks of partisan fervour, every one accepted the necessity of postponing almost any kind of action until after the election. As soon as the results of the vote were known citizens called on each other to close the ranks of national unity so that the nation might move forward. But to date a positive direction is lacking.

There will have to be some plain speaking before such a direction is found. The re-election of Mr Roosevelt was a vote for the party which the people generally believed would take a more active part in the war than its opponent. Obviously, domestic issues were to the fore as well as world issues, and there were those who felt that the party more likely to take action was not the party best equipped for what is primarily a large-scale industrial effort. But the mandate given was as clear a mandate as is likely to be received from a vote which combines expression of hopes and fears for the future with judgment on the accumulated grievances of the past. But how to phrase the mandate thus given? The current national confusion is, ironically enough, chiefly a matter of phraseology. Mr Churchill's plain speaking was an anticipated outcome of a change based on popular feeling that too little was being done. Mr Churchill could break with the past. In the American election, the government already in power was felt to be the administration that would do more than the alternative administration. Mr Roosevelt is therefore faced with a mandate to do more, and yet with a necessity of doing it so as to protect the previous record.

At three points in the recent past, stop-gap action has been taken under pressure, and the line of least resistance, adopted to effect the action in time, is now a cordon across the nation's path.

The first of these was the amendment of the neutrality legislation. The majority of the American people was restive under the restrictions the law imposed. At the same time, the country as a whole was—and is—psychopathically sensitive to the slogans which have grown up these last twenty years around our “involvement” in the last war and our determination not to be “drawn in” again. Congress is even more sensitive than the country. The politically expedient way of satisfying both the requirement that current slogans be maintained, and the requirement that materials be released in support of our interests abroad, was to present the amendment to the neutrality legislation as something which would make us still more neutral than in the past—to show how hardship had been worked by the previous operation of the law and how an even break could be offered under the revised conditions. This tactic secured quick revision, and action under the new rules. But it left a record of subscribing to the slogans.

This past summer highly important immediate action was obtained, and the future record confused, by the William Allen White Committee. This Committee grew out of a non-partisan citizens' group formed at the time of the neutrality law revision. Its appeal was based on the reality of American interest in the defeat of the totalitarian powers, and the desirability of aid to the Allies—later, aid to Britain—as a means of supporting that interest. With a transcontinental speed that was spectacular, state and local sub-groups of the Committee sprang up across the country. The backing provided for the President by this Committee was a major factor in making the destroyer-base deal a political possibility in the midst of a campaign. In less spectacular matters as well, in literature for distribution, in radio and platform speeches, the Committee has helped the country hammer out, over these months, a concept of what its vital interests are.

But the White Committee was set up for aid to Britain “short of war.” To part of its membership the Committee, like the neutrality legislation, seemed to be offering a substitute for war which therefore satisfied the old slogans about involvement. But the inadequacy of the substitute is now becoming apparent. As the war moves from land to sea, sending the kind of aid needed by Britain becomes more and more difficult to distinguish from participation—specifically in such matters as ships and convoys. So, the short-term objective of the Committee having been accomplished, confusion arises as to whether henceforth to sponsor only aid to Britain short of war or aid to Britain come what may.

And while this confusion is weakening the White Committee, a rival committee is getting under way. One of the disquieting facts of the last weeks of the campaign was the collection around the Republican candidate of the extremes of both right and left, industrial appeasers, social reactionaries and left wing labour, in a manner banefully reminiscent of past history in other democracies. Now that the election is over, representatives of these factions are maintaining contact through the America First Committee, whose announced purpose is “Let's defend America . . . first. Let's not get into somebody else's war by default. Let us act.”

The nucleus of this group is in the wealthy Republican suburbs of Chicago's North Shore. Among its first collateral members was Charles Lindbergh; his name has since been removed from the executive committee, but he is being used by the committee to address college groups. Another collateral member is Kathryn Lewis, daughter of John L. Lewis. A third is Mrs Burton K. Wheeler, wife of the isolationist Senator. Most important figure outside the Middle-western nucleus is William R. Castle, former Secretary of State under President Hoover and one of the sponsors of the latter's plan for feeding Europe, and strategist-in-chief of the movement in the country against support of Britain.

Fresh on the scene and very clear as to its current direction, the America First Committee is taking the field against the White Committee, which it is calling, through the Chicago Tribune, the America Second Committee.

Arming Not to Fight

The third source of current confusion is the language in which the present American armament effort has been stated to the country. Someone has said that the country has been preparing about as vigorously as a prize-fighter trains for a fight that he fully expects to be called off. True, we have voted our first peace-time selective service, but did not both parties make campaign pledges to keep the boys at home? And we do not really think any one is going to come and get us over here.

The defence programme has so far been presented to the people as a substitute for war. Given adequate armament, the argument has run, the United States can keep out of war since she will not be a tempting prospect for attack. An armament effort on a certain scale and of a certain degree of intensity can be conducted on such a basis. But a larger effort cannot. Moreover, the question is being raised as to whether the attack is in prospect or whether it has not already taken place.

These are the reasons why some plain speaking is now in order. Too much of what has so far been done has been carried through by means of tactics that are successful in producing quick action for limited ends, but which are of little use in preparing the country for a long haul.

In this country, as elsewhere, the search for a sub-

stitute for war has to give way to a search for a substitute for defeat. The country feels it. A sense of urgency is accumulating, a sense of living on borrowed time, pressing the administration to shake off these verbal confusions, and cease to be a prisoner of words in time to avoid becoming a prisoner of events. The effort which the American people has so far been asked to make is negligible in comparison with the effort it is ready to muster.

The country is in the doldrums. But the President is in the Caribbean. Perhaps on his return he will announce the finding of a trade wind there.

December 13th.

Industrialisation in Hungary

[BY A CORRESPONDENT]

HUNGARY'S successive territorial acquisitions since the first Vienna award in November, 1938, have brought her also considerable economic gains. To mention only the most direct, they make her virtually self-sufficient in timber, previously the main item of imports, supply her with a variety of mineral resources, and at the same time provide bigger markets for her industry.

However, this is only one side of the picture. The almost continuous state of military mobilisation during the last two years has placed a heavy burden on the country's finances and whole economy. The intensified blockade is depriving her of various essential raw materials, textiles and metallurgy, the two leading industries, being the main sufferers in this respect. Meanwhile, the economic "co-operation" imposed by Germany, which makes the whole production system a subordinate part of the German war machine, is beginning to show its devastating effects. Even these losses, serious as they are, might be considered as of a passing character, to be made good in the course of time, and probably at a not too exacting price for the fulfilment of the greater part of Hungary's revisionist ambitions without bloodshed—were they to be the whole price.

More menacing and deeper in its implications, however, than the immediate economic devastation is the long-term prospect for Hungary's economy under the New Order. In fact, it is not so much the present situation that points to the true dangers as a clash of interests long apparent—and long perceived by many Hungarian statesmen.

After 1919, Hungary's agrarian problem became an increasingly acute one. Not only did she lose a preferential market of some 50 million inhabitants for her produce, but the world-wide restrictions imposed on mass immigration deprived her of an important former channel of relieving pressure on the land. In addition, the land distribution carried out in neighbouring agrarian states, and the reluctance of her Government to follow suit, not unnaturally increased further social discontent and became the main force behind the extremist current in Hungarian politics.

Among the various measures designed to counteract this growing menace to economic and social stability, by far the most important, though perhaps the least spectacular, has been Hungary's persevering policy of economic readaptation by industrialisation, coupled later with an expansion of exports. The industrialisation policy was put in hand long before, and independently of, the world agricultural crisis of 1931; this may account for its more solid foundation as compared with "hothouse industries" in some other agricultural countries. It was ably assisted by the Hungarian banking system, which has been signally successful, not only in canalising the national savings, but also in securing foreign loans, in particular short-term credits, to finance the execution of the programme.

The 1931 crisis slowed up the process, partly by its repercussions on the banking position and partly by diverting the administration's attention to the more pressing immediate aspects of the agricultural situation. Nevertheless, after a short setback, industrial production has continued to rise: the index of industrial output, after dropping to 77 in 1931, rose to a peak of 144.6 in the third quarter of 1937, subsequently falling around 130 (1929=100). The number of workers employed

in industry has nearly doubled between 1921 and 1938, and in the latter year industry earned about one quarter of the national income. In 1938 industry accounted for nearly 40 per cent. of Hungary's exports—an even more significant figure.

Progress of Exports

When Hungary embarked on a centrally directed export policy, largely as a counter-measure to the crisis of 1931, particular attention was given right from the beginning to the development of industrial exports. These were encouraged, at first, by an ingenious system of special exchange premiums, but gradually became self-paying; and an increasingly wide market has been found for a variety of industrial products, with electrical machinery and apparatus, other machinery, iron semi-manufactures and iron goods heading the list. The main markets for industrial products were, naturally, the adjacent Balkan countries, and as these were being looked upon by Germany increasingly as her exclusive trading territory, especially for manufactured goods, a conflict of interests was bound to arise sooner or later in these markets. In due course, German manufacturing interests were beginning to look askance on Hungarian trade activities and went so far even as to use open pressure to restrict them, through Hungarian agricultural interests, and with the use of German imports as a leverage.

It should be borne in mind that direct trade relations between the two countries, though long-standing and cordial, had not been at all exclusive until fairly recently. In fact, it was the creation of the Axis in 1937 and the subsequent events in Central Europe, notably the incorporation of Austria in the Reich, that have changed the situation rapidly and radically, increasing Germany's share in Hungary's exports from 28 per cent. in 1936 to 50 per cent. in 1938 and at least 80 per cent. (estimated) in 1939.

That this spectacular expansion was not to the liking of at least some of Hungary's political leaders, aware of the price to be paid ultimately for complying with Germany's terms, became evident when official attempts were initiated by Hungary, as far back as in 1937, to draw closer together the neighbouring countries of South Eastern Europe, by composing outstanding political differences and forming an economic bloc. It is, of course, past history now that, owing to reciprocal lack of understanding, the diplomatic negotiations came to nothing, except perhaps for the reflection that they might have decisively influenced the course of present happenings, and for the possible teaching they may contain for the more distant future in that unsettled part of the world.

As for the future of Hungary in particular, there can be little doubt in the minds of her more clear-sighted statesmen that Germany's New Order is, in the long run, diametrically opposed to Hungary's vital interests. The German *Grosswirtschaftsraum* contains no room for competitive industries. Hungary, who has been trying, and not unsuccessfully as some of the figures quoted above suggest, to relieve pressure on the land by industrialisation, would therefore be faced with the prospect of her industries being scrapped and the town population driven back to the already overpopulated land.

Shanghai's Commercial Importance

[FROM OUR SHANGHAI CORRESPONDENT]

WHAT remains of China's foreign trade continues to concentrate upon Shanghai. The reopening of the Burma Road somewhat revived foreign commercial intercourse with Free China, but everywhere along the South China coast trade is still deteriorating. In North China, Japanese trade control has become so tight as to reduce to unprecedented low levels that part of the country's imports and exports. Yet Shanghai, however much harassed by Japanese commodity regulations in the hinterland, still retains free access to the sea, an uncontrolled exchange market, and the most important

manufacturing industries in all China. These three factors, against the background of extraordinary trade obstacles everywhere else in China, to-day bestow upon Shanghai a larger share in Chinese trade than for a long time past. This autumn, Shanghai alone turned over 66 per cent. of the value of China's total foreign commerce. The following details are based upon the Chinese Maritime Customs reports, with due adjustment made on account of the artificial threefold over-valuation of North China's trade figures.

Exports from China in the autumn of this year averaged £2,500,000 a month, whereof Shanghai shipped £2,000,000—that is, four-fifths. North and South China share in equal proportions in the remaining fifth. North China is ahead of Shanghai in shipments of furs, skins and egg products to Anglo-Saxon countries, and in exports of coal to Japan, but Shanghai has the lead in all other products, including textiles, bristles, vegetable oils, seeds, tea, and even metals and ores. The backbone of Shanghai's exports (amounting to over £1 million a month) is textiles (about half silk and half all cotton fibres and goods), which form 95 per cent. of all exports, and 44 per cent. of all exports from China. Shanghai's all-important customers are the two Anglo-Saxon powers with a combined share of 85 per cent. (United States 45, British Empire 40 per cent.) in local sales abroad, while Shanghai shipments to the Japanese Empire accounted for but 8.5 per cent. of all local exports.

China's imports this autumn maintained a level of £7,000,000 a month, whereof slightly more than 50 per cent. entered the country via Shanghai. North China and South China each shared with a little less than 25 per cent. in the remainder of these imports. Some 17,000 tons of raw cotton worth over £1,000,000 a month, imported on account of the local cotton mills, form the most important single item of current Chinese imports, and almost one-third of Shanghai's imports. Other large shares in local imports are as follows:—cereals, other foodstuffs, and tobacco leaf—17 per cent.; metals, chiefly iron and steel—16 per cent.; paper—6.5 per cent.; wool and woollen goods—6.5 per cent. Most of the remainder consists of mineral oils, chemicals and pharmaceuticals, as well as dyes. In North China, foodstuffs account for 30 per cent. of current imports, and metals for another 20 per cent. There, the Japanese now reserve for Japan proper and her colonies a dominating import share of 80 per cent., but in Shanghai's imports the Anglo-Saxon Powers continue to lead with a share of 70 per cent. (United States—36; British Empire—34 per cent.). In South China imports (mostly transacted via Ningpo, Kowloon and Luichow), Japanese goods are of little or no consequence.

November 6th.

Agriculture and Trade in Eire

[FROM OUR DUBLIN CORRESPONDENT]

At the annual general meeting of the Agricultural Credit Corporation, the Chairman stated that the amount borrowed by farmers during the year was less than last year. Although agricultural prices have risen, the prevailing uncertainty makes borrowers hesitate to undertake new commitments and the demand for long period loans for permanent improvements has diminished. This reluctance to borrow is partly the result of the shortage of materials on which the proceeds of loans would normally be spent. The Irish farmer's position has improved in strength and liquidity, and this improvement is shown in the repayment of the Corporation's advances. The season has been a good one for mixed dairy farming. Weather conditions favoured an abundant yield and a successful harvest, and those farmers who produced their own supplies of feeding stuffs have enjoyed a prosperous year. The area to be compulsorily tilled in 1941 on all holdings of more than ten acres has been raised to one-fifth of the arable land.

The guaranteed prices of wheat and beet have been increased and there has been a general rise of agricultural prices. The index number of agricultural prices (1911-13=100) rose from 126.8 in September, 1939, to

152.2 in October, 1940. This rise is one of the principal factors that have converted the passive balance of trade into an active balance for the first time in the history of Eire. In October exports exceeded imports by £45,641 and in November by £513,813. While this development is naturally regarded as favourable by all those who appreciate the importance of conserving the country's sterling resources, it is less welcome to the extent that it reflects a reduction of imports caused by the circumstances of the war at sea. Indeed the possibility of an acute shortage of imports of many essential commodities was mentioned by Mr. de Valera in his Christmas broadcast message, in which he described Eire as "the most effectively blockaded country in Europe."

Electricity from Peat

Considerable attention has been directed recently to the problem of generating electricity from peat, and a large-scale experiment is to be undertaken. The desirability of utilising the vast deposits of peat is a matter on which there is no difference of opinion, but there is prevalent a certain degree of scepticism regarding the possibility of success. The failure of previous schemes is, however, no reason for neglecting further research, and the conditions of the proposed experiment are quite different from those that existed in the past. New methods of saving and drying the peat by means of mechanical appliances are to be tried, and transport charges will be minimised by locating the generating station on the bog. There will thus be realised the engineer's ideal of generating "at the pit's mouth." The technical problems involved are relatively simple, the real difficulty being one of cost.

Figures have been published by the Government which suggest that the cost of generation from peat compares favourably with that of generation from coal, but less favourably with that of generation at the Shannon plant. Small differences in cost are no reason for not developing every type of generating plant. The hydro-electric stations are, to some extent, at the mercy of the weather, while the coal-driven plants necessitate large imports of coal. The proposed peat scheme avoids both these difficulties, and it certainly deserves the most careful and extended trial. It must not be overlooked that, with the stripping of the bogs, new arable land will appear and a double advantage will thus be secured. The problem of peat utilisation can never be studied apart from the closely allied problem of land reclamation.

December 27th.

The Egyptian Stock Markets Recover

[FROM OUR ALEXANDRIA CORRESPONDENT]

THE market recovery has been carried a stage further in recent weeks, and although the present situation cannot bear comparison with the conditions ruling at the height of the war boom towards the end of 1939, striking progress has been achieved since August. The slowness of the Italian campaigns against Egypt and Greece, together with the strengthening of the British forces in the Middle East, have gone far to dispel fears of invasion. On the other hand, the rapid implementing of the Anglo-Egyptian cotton agreement has restored life to an economic system based chiefly on cotton production.

BANK OF MONTREAL

(Incorporated in Canada in 1817 with Limited Liability)
Financial Agents of the Government of the Dominion of Canada in London
CAPITAL \$36,000,000
RESERVE \$39,000,000
TOTAL ASSETS IN EXCESS OF \$950,000,000
Head Office: MONTREAL
H. R. Drummond, Esq., President.
Major-General The Hon. S. C. Mewburn, C.M.G., V.A. Bog, Esq., Vice-Presidents.
Jackson Dods, G. W. Spinney, Gen. Managers.
The Most Honourable The Marquess of Willington, P.C.,
G.C.S.I., G.C.M.G., G.C.I.E., G.B.E. (Chairman).
F. R. S. Balfour, Esq., Sir Hardman Lever, Bart., K.C.B.,
Sir Frederick Williams-Taylor.
London Offices: 7 Threadneedle Street, E.C.2 (Edward Pope, Manager)
9 Waterloo Place, Pall Mall, S.W.1 (J. H. Pangman, Manager)
The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

Almost one-third of the whole crop has already been received and paid by the British buying commission within the past ten weeks. Nevertheless, in view of future uncertainties, the authorities have advised growers voluntarily to curtail next season's acreage inasmuch as Egyptian wheat is in increasing demand by the Near East.

The stock market has now completely thawed, and prices in many cases have advanced appreciably beyond last April's official limits, which, incidentally, were considerably above the minimum prices introduced at the outbreak of war. Were it not for the fear of damage from the recently intensified air attacks, industrials would be quoted still higher. With the prospect of a protracted struggle it is now fully realised how much Egypt is losing for having failed, prior to hostilities, to carry through some important and long debated projects such as the utilisation of the Aswan dam waterfalls, which would have relieved the problems of fuel and fertilisers (a major consideration with an agricultural country) and allowed the exploitation of the Aswan iron ore deposits.

The policy of budget economies at the expense of productive public works is evoking much criticism, not only because of the resulting unemployment, but also because land reclamation would lessen the great pressure of population. It is pointed out that, in consequence of Egypt's non-belligerency, expenditure for national defence is not of such a size as to hold up progress in the civil sphere, and with the recent accession to the premiership of Hussein Sirry Pasha, an engineer who made his career in the Ministry of Public Works, this criticism may well bear fruit.

December 2nd.

Money and Production in the United States

[FROM OUR NEW YORK CORRESPONDENT]

THIS correspondence has already several times referred to the basic revisions of thinking necessitated by the revision of the Federal Reserve index of production. It is the habit of statisticians to expect conventional, if somewhat loose, similarity among the four common types of statistical series—those relating to production, to employment, to prices and to money.

It had for some years been increasingly difficult to relate the money and credit series to the production index. Over the past, there had been a noticeable relation between the volume of money and the volume of production, and its price level. But as the quantity of money (deposits and currency) increased without anything that could be termed a corresponding increase in production and prices, commentators were hard put to it to rationalise the divergence. Happily for the commentators, this problem has been solved by the new production index, which seems to exhibit the conventional behaviourism. The "curve" of money and the "curve" of production now "fit" quite well, bringing peace of mind to the statistician.

The following tables show some elements of the money position over the last six months:—

RESERVE BANK ITEMS (\$000,000)			
	May 29	Aug. 28	Nov. 27
Gold stock	19,162	20,871	21,755
Gold certificates	16,935	18,562	19,546
Government securities	2,477	2,442	2,204
Member bank reserves	13,215	13,516	14,292
Treasury deposits	378	813	199
Non-member deposits	1,203	1,759	1,963
F.R. notes in circulation	5,038	5,334	5,703
Total money in circulation	7,685	8,006	8,465

The increase in the gold stock in the three months ended November was only about half that of the previous three months. Enormous as it was, it represented the first major diminution of the gold flow for a long time. In its major outlines, however, the last three months have not deviated from the familiar pattern. The gold inflow has been large; it has been monetised in the form of gold certificates; and the bulk of the monetised gold has gone to an increase in member bank cash.

Full Employment Approaching?

The duration of this movement has blunted the edge of concern with which it was initially considered. It became so familiar from month to month and from year to year that comment became first repetitious, then monotonous, and then, to the listener, trite. Only the "professional worriers" occupied themselves with it. Indeed, as long as the economy provided less than full employment of men and material, this expansion could be justified on the familiar argument that it "tended" to increase production and employment. It is, of course, difficult to determine when an economy has arrived at full employment of men and material; full employment of material is an elastic expression, and full employment of manpower is difficult to determine from our sketchy employment data. One acceptable criterion is the time when the impact of demand on capacity begins to be widely felt in prices. Of this, there is little evidence yet in the price indices, except in specific instances. Indeed, in the current boom, price has figured less than in the 1936-37 boomlet. But the growing reports of difficulty in securing deliveries, and the growing demand for the establishment of a system of priorities, together with an increased frequency of reference to an imminent need of price controls, may be accepted as evidence that the supply-demand relation is quite different from that of recent years. It is against this background that one should read the remarks of Mr Eccles, Chairman of the Board of Governors of the Federal Reserve System. In the past week he made a number of proposals, looking in the direction of resisting an indefinite and unlimited expansion of credit. These proposals are presumably to be taken as suggestions rather than as a programme; but they are significant as evidence of a development of concern over problems long recognised, whose solution could justifiably be defined up to a certain time, but which cannot be indefinitely ignored.

December 7th.

Chilean Foreign Debt

[FROM OUR SANTIAGO CORRESPONDENT]

A DECREE has just been issued suspending the amortisation and purchase of depreciated bonds in the open market until such time as the President of the Republic considers justified. Interest on the debt will however, continue to be paid according to existing arrangements. This step is not unforeseen, since there has been a marked scarcity of dollar exchange in Chile for some months past, and the country was rapidly heading towards inflation and economic collapse. The sum of six million dollars will be transferred immediately from the Amortisation Bank to the market, and will have a tonic effect on the general well-being of the country. These funds will eventually be returned to the Mortgage Bank when Chile can obtain foreign loans as outlined in the law relating to reconstruction and development dated April 28, 1939, and with the approval and consent of the President of the Republic.

While regretting the step taken, the Government bases its decision on the pertinent part of the 1925 report of the American Debt Funding Commission, which relates to a country's capacity to pay, stating that such payments should only be made after a country's budget, finances, etc., are placed in a strong position, and, if possible, after improving the standard of living of the country's inhabitants. Though the step now taken will be detrimental to the country's financial prestige, bondholders should bear in mind that Chile has suffered many and varied vicissitudes during the past few years, and it is not lack of willingness to comply, but rather inability to do so, that has caused the Government to take such an important decision. In fact, it is surprising that, in a country where the standard of living is so low, the decision has not been taken sooner.

The earthquake of January, 1939, was a great strain on the country's resources, and taxation was raised to the limit but proved to be insufficient to create order out of chaos. After this, the war closed European markets to Chile, and it will take some more months before a complete redistribution of markets is found. Meantime, Chile must purchase from abroad, and the suspension of amortisation and purchase of bonds will have a tonic effect on the economic life of the country.

December 5th.

Germany at War

Stock Exchange Boom.—The German stock exchanges have been extremely firm for several months, owing to the abundance of ready money. Credit expansion, on the one hand, and shortage of goods and investment restrictions, on the other, have produced a steady large demand from the public. Official sources are anxious to deny inflation, and claim that there is merely some disproportion between investment demands and the stocks available. They also say that German investors are ready to pay ever-rising prices for shares in anticipation of the tremendous boom that will follow Germany's victory. The Government is anxious, however, to mop up the surplus funds. In 1940, two series of 4 per cent. medium-dated Treasury bonds were issued, subscriptions amounting to Rm.6 milliards. Apart from Government borrowing there is a strict limitation or even embargo of new issues, and new share issues amounted to only Rm.300 millions during the first half of 1940. The Treasury also endeavoured by other means to keep investors away from the share market. The number of shares in which dealings are permitted is steadily diminishing.

Recently published figures show that 448 shares with a nominal capital of 7.6 milliards were quoted on the Berlin stock exchange at the end of the first half of 1940, their actual market value then being 11.3 milliards, which represents 148 per cent. of their face value, against 123 per cent. a year ago. Compared with the highest prices in 1939, 25 leading shares rose from 137 to 185, and 15 gilt-edged from 102 to 105 in December last. The improvement was moderate during the first half of the year, but later a formidable boom took place. In a few months iron and coal shares, as well as textiles, rose 20 per cent., cars 25 per cent., and shipping shares, which had jumped by about 40 per cent. in the first six months, a further 10 per cent. There was a special boom in colonial shares—apparently in anticipation of getting colonies after the war—and the price of these shares roughly doubled. There are still 44 colonial companies in Germany, of which the Otavi Mines and Railways Company is the most important.

European Cellulose Cartel.—The new cartel includes the chief European cellulose producers and exporters, Germany, and Slovakia, as well as the Scandinavian countries, Sweden, Norway and Finland. As a consequence of the war, Scandinavian cellulose exports, which went mainly to Great Britain and U.S.A., have virtually ceased. Germany has stepped in as a customer in their place. The cartel is destined for peace-time conditions and will not start to function until then. Intermediate arrangements mainly concern Scandinavian deliveries to France, Belgium, Holland and Italy. The final cartel is intended to be less for the regulation of production than for the control of exports, prices and sales.

The Housing Shortage.—According to official estimates, there is at present a shortage of 1.4 million dwellings in Germany (quoted from the *Kölnischer Zeitung*, November 20th). The scientific institute of the German Labour Front has recently stated that this figure must be added to the two million dwellings needed to rehouse people who are now living in slums; the replacement demand for houses during the next 20 years is estimated at 1.1 million; and another 1.6 million dwellings will have to be provided to house the natural increase of families. Thus, on the basis of this estimate there will be a housing need during the next 20 years of 6.1 million dwellings.

Rationing.—The administration for textiles (*Sonderbeauftragter für die Spinnstoffwirtschaft*) issued a decree some time ago suspending, from December 1st, the arrangement whereby men's winter overcoats could be bought against clothing ration cards. Efforts are again being made to direct consumers' demands away from leather shoes. Ladies' shoes with flexible wooden soles and leather uppers are described as the latest winter

fashion. Walking shoes obtainable without a permit now include types with soles of used or waste leather, rubber or synthetic fibre, and uppers of fish or rabbit skins. Previously this exemption from permit had only applied to shoes with wooden soles. An association for promoting the use of pigskin has been founded, pigskin having proved suitable for both, for the soles and uppers of shoes. The Price Commission has announced that owing to changes in fashions and raw materials the retail price of shoes will no longer be calculated on the basis of the 1934 price. Instead, retail profit margins varying from 27 per cent. to 60 per cent. of wholesale prices have been fixed. The change will not alter the average retail price level, but will cause prices to fall slightly for cheaper shoes and to increase for ladies' luxury shoes.

Deutsche Bank.—The Deutsche Bank (formerly Deutsche Bank-Diskontogesellschaft), first among the big German banks since the crisis of 1931, is raising its capital from 130 to 160 million marks. It is believed that the Dresdner Bank, the capital of which amounts to 130 millions at present, will follow with a similar step. The need for new capital is explained by the extension of activities in the occupied territories. The Deutsche Bank recently acquired most of the shares of the Boehmische Unionbank (stock capital 100 million Kr.) and of the Amsterdam Bank De Bary and Company (15 million fl.) Ordinary business scarcely requires more capital. According to an announcement of the board of the Deutsche Bank normal business has fallen in recent months, and an increasing percentage of deposits can only be invested in Treasury bills.

Damage and Compensation in Norway.—War damage to movable property (cattle, tools, machinery, materials) in Norway, is now estimated to have been 95 million Kr. It is expected to be covered partly by a premium of 1 per cent. which has to be paid by the proprietors of such property who are insured against fire. This will cover 30 millions, the remainder to be paid by the State. The damage done to buildings is said to amount to 200 million Kr. comprising 13,000 cases, about 3,000 of which, to the value of 60 million Kr., have been dealt with, though only 4 million Kr. was actually granted. Those insured against damage to buildings must pay a premium of 1 per cent. for a period of 5 years, the first instalment being due on February 1, 1941. Those who pay the full amount immediately will be entitled to 10 per cent. rebate. This is expected to yield 115 millions, as the rest will have to be paid by the State. This 295 million Kr. (1 Kr. was equal to about a shilling before the occupation) is not the entire war damage. This is estimated to be half a milliard Kroner, including the damage inflicted upon railways, bridges, municipal property, and losses due to Army requisitions.

PROVISION FOR DEPENDANTS

There is no better way of providing for those dependent upon you than by effecting a Whole Life Assurance under *The Distinctive System* of this Institution, which combines Low Premiums with the right to share in the Surplus.

The Premiums may be paid throughout life or limited to a specified number, thus relieving the Assured in the later years when, owing to retirement, income may be reduced.

Founded for Mutual Life Assurance in 1837

of the clearing banks were something over £2 millions higher last year than in 1939. But every institution, except Martins, has reported net figures which are lower than those of the preceding year, and bring the total for all the banks to the lowest figure since the slump of the early 30's.

The discrepancy between the computed gross figures and the published net profit returns is doubtless of merely academic interest to holders of bank shares, whose dividends are unchanged in every case and have been earned with a satisfactory margin. But it demands explanation, in view of the probability that the explanatory factors will have some continued bearing on the banks' experience under war-time conditions. Expenses, beyond doubt, have sharply increased. A.R.P. costs fall particularly heavily on institutions which have thousands of buildings throughout the country, and in the banks' case air-raid precautions have included the duplication and re-distribution of records on a large scale, involving much extra clerical labour. The banks also have shown an enlightened policy in their treatment of the many members of their staff now with the Services, whose departure has itself entailed much rearrangement of duties and the training of temporary substitutes. But the most serious factor in reduced published earnings has been higher taxation, and it is regrettable, in view of recent changes in the income tax rate, that the absence of any indication in the published returns of the actual rate at which the latest tax deductions have been made precludes, on this occasion, the possibility of "grossing up" to obtain a reliable net profits figure before tax. All that can safely be said is that earnings after deducting working expenses, but before deducting tax, must have been not far removed, one way or the other, from those of the preceding year, which included nine months of peace-cum-rearmament.

The banks, like all other business concerns, are subject to 100 per cent. E.P.T., which means that whatever the Government pays them for their part in financing its war effort will automatically return to the Treasury. In fact, the banks' E.P.T. years were prosperous, by the standard of the last decade, and true net earnings may have a little way to go still before any E.P.T. payment exceeds the amount the banks are already paying in N.D.C. As a limiting factor on future earnings, however, E.P.T. would assume particular importance if interest rates, and the costs of war finance generally, were to rise, as a result of the development of inflationary conditions, or for any other reason. At the moment there is no sign of any hardening in the rates paid for Government borrowing—the tendency, indeed, is rather the other way. Of greater significance, is the probability that the average level of the more important types of banking assets during 1941

will vary materially from that of 1940. The banks' holdings of Treasury bills, whose rise was the most conspicuous feature of their average experience in 1940, have already begun to fall, as a result of the Treasury's decision, last July, largely to disregard that method of finance in favour of the Treasury deposit system. Under this system, the banks are informed each Friday of the amount the Treasury expects to require from them during the next week. Already the total holdings of the banks in Treasury deposits run into hundreds of millions, and the increase in that item during 1941 is bound to be substantial and continuous. From the viewpoint of bank earnings, the difference between a "portfolio" of Treasury bills or of Treasury deposits is largely academic, for the interest return is much the same on both. There is bound, also, to be a further increase in the banks' holdings of Government securities, as they take up their fair share of the new National War Bonds and Savings Bonds.

For the rest, the banks' experience will be governed by the incalculable factor of the general price level. For the most part, the decline in advances has been due to the repayment of loans for Stock Exchange and "finance" purposes generally, and though the accommodation given to producers under the war programme has been kept down to a satisfactory working level by close co-operation between the banks and the Government Supply Departments, the attainment of peak war production may well involve some further call on the banks' resources. More generally, there is a good deal of evidence that in 1940 the average turnover of bank deposits was appreciably reduced, mainly on account of various restraints on spending, some psychological and some, like the effects of business provisions for air-raid damage (actual or prospective), essentially physical. These restraining causes may not operate in the same degree in 1941.

Thus the omens favour a further rise in the banks' gross profits in the coming year, but that will be a matter of purely platonic interest to shareholders so long as 100 per cent. E.P.T. enables the Government to take away with one hand what it gives with the other. The result of a war fought and financed under the conditions obtaining to-day, indeed, is likely to be, not the battening of a sinister financial interest on the community which publicists of a certain political complexion profess to discover in our banking system, but rather a still closer identification of that system with the policy of the Government. In war-time, the rôle of finance, though essential, is subordinate to the main task of directing a maximum part of the national income to the purposes of victory. And the banks' status as an executive arm of the authorities is clearly defined for the war's duration, and possibly for a long time afterwards.

Finance and Banking

Big Money Turnover

The turnover in the money market has been somewhat greater than is normally the case at around the middle of the month. It has been fed by Treasury payments for the dollar securities included in the last but one vesting order and by the dividends on Government debt due on January 15th. On the other hand, the banks have found themselves called upon to make substantial tax payments to the Exchequer, while this week they have had to pay £15,000,000 in Treasury deposits, no part of which was compensated by maturities. This increased activity has occurred on the basis of an abundant supply of credit and at no time has it caused the slightest strain on the money position. The banks have been ready buyers of bills at 1 per cent. while bond money—now in greater supply since some "outside" banks are longer interested in the Treasury bill tender—has been available at $\frac{3}{4}$ per cent. The discount market is still waiting for the reward of its penance in applying for the 90-day bills at the high price of £99 15s. On Friday of last week it obtained an allotment of 36 per cent. on this basis, and the average rate of discount for the £65,000,000 bills issued worked out at £1 0s. 2.01d. per cent. The rate should improve slightly next month when the normal currency of the bills to be tendered for will be 89 days. Assuming the syndicate

does not increase its price for these to £99 15s. 1d. the turn should become rather more worth while than it is now. But with this development may come a recrudescence of "outside" competition for the bills.

* * *

Empire Assets in U.S.A.

Cabled reports of an article in the latest Federal Reserve Board Bulletin give the first official estimates hitherto made of the total Empire assets invested in gold and in the United States at the outbreak of the war. These are placed at £1,778,750,000 (taking the £ at \$4) of which £684,000,000 represented gold holdings, £394,000,000 accounted for the investments in marketable dollar securities, a further £332,000,000 represented the direct investment in British controlled enterprises in the United States, while £212,000,000 was the total of dollar balances, leaving a balance of £156,000,000 for miscellaneous unclassifiable investments. According to the Federal Reserve Board drafts on these resources for goods actually delivered amount to only £650,000,000. These figures must, of course, be read in the light of the formidable liabilities which have been and are being incurred for goods to be delivered over the coming months. But making the fullest allowance for this fact, they

repeat the warning that recent suggestions about the exhaustion of our available dollar balances must not be confused with the idea that we are coming to the end of the assets which should ultimately be convertible into dollars. The Federal Reserve Bulletin points out that the sales of marketable securities in the American stock markets have proved very modest. Confirmation of this is provided by the U.S. Treasury's statement that negotiations are under way between the British authorities and an important group of American investment trusts for the acquisition by the latter of substantial holdings of British-owned American securities. The group of trusts is, according to other reports, headed by the Tri-Continental Corporation and is negotiating for a deal which would run to about \$600,000,000.

* * *

The Investment of Non-Resident Funds

Certain modifications of the foreign exchange regulations have been made this week with a view to encouraging the investment in sterling securities of funds accumulating here in the accounts of non-residents. If a non-resident wishes to invest his own sterling funds in any sterling security purchased on a Stock Exchange in the United Kingdom, the Bank of England will be prepared to issue at the time of the purchase a licence to sell these securities provided the sale takes place on a Stock Exchange. This licence, which will be given on Form "M," will be valid for an unlimited period. It will provide that the proceeds of the sales of such securities may be credited to the same type of sterling account as that which was debited with the amount required to finance the original purchase. The concession applies to any sterling account in the name of non-residents, other than blocked accounts. The facilities for investing blocked account sterling in certain specified trustee securities have already been defined and are not altered by this latest move. The instructions sent to banks concerning this concession stress that the funds thus invested must belong to the non-residents for whom purchases of sterling securities are made. In no circumstances may funds be advanced to non-residents without the consent of the Bank of England, whether for the purchase of securities or for any other purpose. This new development may go a little way towards solving the problem of sterling balances accumulating here on non-resident account. It will hardly affect balances in registered accounts which, being convertible into dollars or Swiss francs, are in fact remaining at exceptionally low levels. For the rest, it must be evident that income tax levied at the present rate on the income yielded by non-resident sterling investments must be another powerful handicap to the more permanent investment of bank balances. The volume of investment prompted by this latest concession is not therefore likely to prove

considerable. It will certainly not be sufficient to create fears of massive realisation of sterling investments on non-resident account in the event of bad military or political news.

* * *

Discount Company Balance Sheets

The three discount companies have this week published their balance sheets for the end of 1940. They conform fairly closely to one pattern. They show a reduction in the net holding of bills, which for the three companies as a whole is more than offset by an increase in investments. In each case the item of liability in respect of bills rediscounted is well down, indicating the considerable reduction in the turnover of commercial paper. The principal factor at work in the reduction of the bills holding, however, is not to be found in the supply of commercial paper, but in the conversion of Conversion $4\frac{1}{2}$ per cents. which occurred during the past year. The market's substantial holdings of the maturing stock figured in the bill portfolios in the end of 1939 balance sheets. The Conversion 2 per cents. which have taken the place of the $4\frac{1}{2}$'s must be ranked among the

(In £000's)

End of Year	Investments		Bills Discounted		Rediscounts		Net Bill Holding		Net Profits	
	1939	1940	1939	1940	1939	1940	1939	1940	1939	1940
Union Disc.	6,498	19,439	71,230	52,796	10,031	6,336	61,199	46,460	275	230
National Disc.	5,678	18,563	46,378	35,907	7,348	3,848	39,030	32,059	196	188

Aggregate	18,011	51,639	145,412	114,747	18,416	10,720	126,996	104,028	648	585
	+33,655		-30,665		-7,696		-22,968		-62	

investments. Allowing for this important shift from the bill to the investment item and for the continued decline in commercial bills, the much increased holding of Treasury bills in the hands of the discount market becomes clearly evident. The comparison of the essential balance sheet items and net profit figures for the past year is given in the accompanying table. The balance sheet of Alexanders Discount Company has been sent to shareholders together with a statement by the Chairman which is to be regarded as taking the place of the speech which would, under normal circumstances, have been delivered at the coming general meeting. In this statement Mr. Colin Campbell points to the trading activities of the Government as one of the principal causes of the decline in commercial bills. He admits that "the bulk of the profits earned has once again been derived from our holding a considerable volume of short dated Government securities" and anticipates that this will continue to be the main source of profit in the current year.

Investment

Re-investment Effects

Although the factors affecting the Stock Exchange in recent weeks are very different from those normally influencing New Year markets, the effect on prices is surprisingly familiar. The rise which is usual at this time is commonly attributed to New Year optimism. Actually, it arises largely from re-investment demand. This time, the strength of this particular factor has been greatly increased by a series of vesting orders, whose effects will be felt until well into March, even if there is no further taking over of securities by the Treasury during the coming month. While it is quite impossible to estimate the amount of money involved in the various calls, it certainly runs into some tens of millions spread over the past quarter, and this, added to the normal re-investment demand, is quite sufficient to account for the general strength of markets. In this rise, the Funds no longer give the lead, and it is quite clear that, although the new "tap" issues of bonds are meeting with a fair response, as is shown by the demand of £20,769,347, for the new National War Bonds and £17,527,563, for the 3 per cent. Savings Bonds in a fortnight, they are by no means sweeping the board. Purchases of Government stocks have perhaps been concentrated on the tap issues on some days, but

recently there has been a revival of interest in existing issues and the *Financial News* index for fixed interest securities has once more started to rise. It remains to be seen whether the passing of the lead to equities during the week has been due to a change in outlook or to the popularity of the new 3 per cent. Savings Bonds. What is quite certain is that, of the very restricted business passing, a fair proportion is going into the industrial market, and there is a growing tendency to split re-investment money between the Funds and industrial equities which promise a rather better yield with, possibly, some hope of eventual capital appreciation. The market continues to be hampered to some extent by physical disabilities, which are, however, gradually being reduced in importance.

* * *

Another Vesting Order

Last Saturday brought yet another Vesting Order, the fourth within twelve weeks and the second, in that period, relating to United States stocks. On this occasion, over a hundred securities are included, of which well over half are bonds, and relatively few are stocks in which the public is largely interested. About one-

third of the list, given in detail below, consists of bonds and notes of the U.S.A. Treasury. The conditions of purchase are identical with those previously issued, and there is the now usual provision for payment, in whole or in part, in Government securities, which this time include the new issues, through the tap, of National War and Savings Bonds as well as the 3 per cent. Defence Bonds. The one difference between this issue

* Ex dividend due in January or February. † Cum dividend due in February.

and its predecessors is that payment is not to be effected until a minimum period of six weeks after the announcement, instead of four weeks as in recent cases. Once again the announcement of a new vesting order coincides with the commencement of payments on the previous one, but there is no reason to suppose that this practice will be continued. It is clear, if statements from New York have any meaning, that the British Treasury is only now commencing to organise the sale of securities in the U.S.A., although the first vesting took place eleven months ago. So far as can be

gathered, U.S. dollar securities are to be sold outright and considerable progress is understood to have been made in arranging for the purchase, at least of the more marketable stocks and bonds, by market syndicates. This is the fourth order relative to U.S. dollar stocks in addition to the "mopping-up" order of November 16th last, and in all some 350 securities are covered.

The Argentine Debt

In the issue of November 16, 1940, *The Economist* has already drawn attention to the revival of interest in the Congress of Argentina in the suggestion that the Argentine external debt, including the railway capital, should be repatriated. This proposal has now been carried a stage further by its inclusion in the Pinedo Plan, designed to counteract the economic dislocation which is resulting from the war and the consequent closing of export markets. The Pinedo Plan, which is reported to have already obtained the approval of the Cabinet, is stated to be under the consideration of a committee of the Senate. Since the greater part of the Argentine external debt and the control of the main Argentine railways are held in Great Britain, the details of any scheme of repatriation is a matter of supreme interest to the investing public in this country. It is believed that British controlled railway companies have been asked to present their views to the Senate Committee, and it is known from the statements of chairmen in the recently issued annual reports of the main railways that the companies have no objection in principle to nationalisation. While it can hardly be a favourable moment from the stockholders' point of view to discuss questions of compensation, for prices of securities in the past two years have fallen to bargain levels and the closing of export markets has had an increasingly disastrous effect on traffic figures, there is no doubt that repatriation would provide a valuable addition to British purchasing power in Argentina during the present emergency. The latest report of the details of the Pinedo Plan suggests that the proceeds of Argentine exports to the sterling bloc would be used to purchase on behalf of the Argentine Government the outstanding sterling securities. The suitability or otherwise of the scheme from the point of view of the investor in this country clearly turns wholly on the question of the purchase price which could be agreed.

Company Notes

Selfridge Reconstruction

Despite spasmodic recoveries in earnings from time to time, the general position of Selfridge and Company has for long been so precarious that the collapse in purchasing power in London's West End, caused by the war, has done little more than complicate the circumstances in which an inevitable reconstruction has had to be presented. The Oxford Street venture has never quite achieved what was expected of it and the guarantee of the 25 per cent. ordinary dividend to William Whiteley has proved a severe drain. Other ventures in the suburbs and provinces have added nothing to revenue and it has long been evident that a drastic capital reconstruction was inevitable. Had cash reserves been larger, this measure would have been deferred until the outlook was less cloudy, but the point has now been reached where further finance would be required to meet the Whiteley guarantee, and for other purposes, and this is not forthcoming. In consequence, a general sacrifice is demanded from the debenture holders in Selfridge and Company and from the holders of ordinary capital in Whiteleys, while the position of the various classes of share capital in the former concern is left for later treatment. In addition to the three years' unexpired portion of the guarantee of a 25 per cent. dividend on £450,000 ordinary capital of Whiteley, Selfridge and Company owed that company, at the end of January last, some £197,000. There is a further sum of £109,000 required in cash to meet tax payments, while approximately £100,000 is required for working capital. The very moderate total of £300,000 to be raised in cash is explained by the fact that secured creditors on loans and overdrafts, to a total of some £687,000, are making no claim for immediate repayment.

The scheme evolved for meeting this situation is, in essence, simple. The assets of the existing Selfridge company, with the corresponding liabilities, are to be split between an operating and a holding company. The former will have a share capital of £1,000,000, to be held solely by the latter. In order to raise the cash mentioned above, the operating company will issue £300,000, 4½ per cent. prior lien debenture stock. This will rank in front of the existing 4 per cent. debenture of the Selfridge company, the holders of which will be compensated by receiving in exchange 5 per cent. debenture stock in the operating company in respect both of capital and interest accrued at 4 per cent. The operating company will hold all the trading assets and the relevant liabilities. The holding company will issue £100,000 series "A" secured income redemption stock in satisfaction of the portion of the debt to William Whiteley not satisfied in cash, and £225,000 similar "B" stock in satisfaction of the guarantee of the ordinary dividend. These stocks will carry no interest, but will be repaid out of 40 per cent. and 12 per cent. respectively of the income received from the operating company after meeting ground rents, interest and other essential outgoings, up to a total available for distribution for all purposes of some £83,000. This limit, in effect, means that, on the most optimistic supposition, the "A" stock would be paid off in three and the "B" in 20 years. After meeting these annual charges, 18 per cent. goes to pay off other debtors of the holding company, while the remaining 30 per cent. is available for reserves and dividends. The scheme limits the liability of Selfridge and provides a minimum of working capital. There has already been a change of management and it remains to be seen whether any earnings will be achieved during the war period, beyond possibly the debenture service. The arrangement also restores to the holders of William Whiteley ordinary stock the control of that business. Here again the new management takes over at a critical moment. The scheme has the most influential backing and will presumably be adopted. It can do no more than free the two managements from financial anxieties and each will have a long struggle to rehabilitate their respective concerns. The senior Selfridge security, the 6 per cent. cumulative preference stock, tax free up to 6s. in the pound, stands at 8s. 3d., including almost two years of accrued dividend. The £1 ordinary stock of William Whiteley are quoted at around 3s. 4½d.

John Lewis Progress

The report issued by John Lewis Partnership on the trading results of the group for the first nine months of the financial year to end-October last is the second quarterly report to be issued since the loss of the Oxford Street premises. It is, however, the first occasion since the loss that comparative figures for turnover and profits have been provided. The Partnership is unfortunate in having suffered, in the meanwhile, the total destruction of its Southampton subsidiary, whose profits are consequently included in the statement only up to August 24th. Turnover for the London businesses was 24.4 per cent. below that of 1939, but it is satisfactory that the turnover of the three provincial branches, excluding that in Southampton, rose by 12.4 per cent. The profit for nine months for the parent and subsidiaries before deduction of preference dividends amounts to only £1,815 against £31,596 in the previous year and £93,049 in 1938. The directors state frankly that there is little possibility that a profit balance will be available for the payment of preference dividends to the stockholders of John Lewis and Co., but extend the hope that post-war conditions and compensation under the Government's War Damage Bill will speedily enable preference charges to be covered once more. The report on nine months' trading issued by the directors of Suburban and Provincial Stores, controlled since the end of January, 1940, by John Lewis Partnership, but not included in the statement given above, is much more encouraging than that issued after the first six months of trading. A special interest now attaches to these results in view of the destruction suffered by a large part of the John Lewis premises and the Southampton subsidiary and also on account of the recently announced reconstruction of the Selfridge group, which formerly controlled Suburban and Provincial Stores. During the past three months, the company has profited

by the general revival of retail trade in the provinces, which has more than balanced the continued decline of turnover in suburban stores. Thus, despite a net loss for the whole concern of £29,369 on the first six months' trading, the statement reports a net profit of £5,976 for the nine months under review. The considerable improvement in earnings as compared with 1939 is due to the fact that hire-purchase trading from which the group has, in time of peace, drawn a considerable income, was only restricted as from August, 1939. Consequently, for the last three months of the nine-month period earnings were on a comparable basis showing an improvement of net profits over the whole period of £2,504 against a deterioration of £32,019 for the first six months. As the directors state, the nine months' results show that the Brixton, Peckham and Liverpool businesses, the first two of which show higher losses than in 1939, are the company's least productive assets. None the less, it does now appear probable that the company will end the financial year at January 31, 1941, with a modest net profit. The last dividend on ordinary stock was the 2½ per cent. paid in 1938/39, but in the following year the concern realised equity earnings of 0.9 per cent. The £1 ordinary stock stands at no more than 1s. 3d. Both the 5 per cent. 1st cumulative preference stock and the 7 per cent. cumulative preference stock of John Lewis and Company are now quoted at 6s. 8d.

Gas Light and Coke Dividends

On receipt of the news that the Gas Light and Coke Company is to postpone the declaration of final preference dividends for the year ending December 31, 1940, until the completion of accounts, the market in gas stocks turned decidedly weak. The £1 ordinary stock of Gas Light and Coke lost 1s. 9d. to 18s. and quotations generally widened. On the face of it, there is nothing to the announcement of the directors to indicate that the postponement is more than a precaution. After several months of severe bombing in the London area, it is not surprising that the issue of last year's accounts should be delayed, or that the announcement of dividends should be withheld until the estimate of net profits is reasonably accurate. After meeting preference dividends for 1939, the company retained a surplus of £894,612, which indicates that a considerable margin of surplus earnings exists to cover preference stock. Last year, ordinary stock received a total payment of 4½ per cent., which was followed by an interim payment for the first half of 1940 of 2½ against 2.8 per cent. Having covered the ordinary dividend for 1939 and allocated £20,000, against the normal £40,000, to redemption fund, a deficit in the carry forward was, however, only avoided by bringing in £25,210 from reserve fund. Thus, there is every probability that ordinary stockholders must accept a considerable cut. It is common knowledge that gas companies operating in London have suffered serious losses last year, both on account of the lower consumption of gas, for which evacuation and the use of communal shelters is responsible, and on account of damage to plant and equipment, while costs have also risen. But there is a reasonable prospect that the income will suffice to meet the claims of preference stockholders. The 4 per cent. consolidated preference stock now stands at 70, at which price it yields £5 14s. 8½d. per cent.

Oil Dividend Contrast

The full report of Apex (Trinidad) for the year to September 30th, 1940, shows that the maintenance of the previous year's total dividend of 30 per cent. is amply justified by the satisfactory rise in equity earnings. In

common with other oil-producing companies Apex (Trinidad) furnishes no figures of oil production for the past year, but the accounts show a rise in oil profits from £417,957 to £598,926, the best level for the last decade. Since revenue from subsidiary sources of income has more than doubled at £6,275, total earnings for the year reach the highly satisfactory sum of £605,201. Charges for amortisation of wells and for general administrative expenses have remained relatively stable, but the company has to face a tax provision which has also more than doubled at £190,000 against £80,464. Thus the equity surplus has increased only from £167,335 to £195,367, representing a rate, grossed up with tax at the standard rate for the United Kingdom, of 39.6 against 30.7 per cent. The directors are able to place £30,000 to reserve, the first allocation since 1931-32, and to raise the carry-forward slightly from £130,706

to £131,073. The position of the Trinidad companies is, of course, exceptional, and the decision of Royal Dutch to pass the interim dividend for the current year—5 per cent. was distributed in January, 1940—is less encouraging, although coming as it does after the similar decision of Shell Transport it can occasion no surprise. For 1939, total income dropped from £89,407 to £26,200, a sum which provided only very narrow cover for the 5 per cent. total payment absorbing £25,181. During 1940 the profit-earning capacity of the company, now totally severed from its European connections and installations, must have been depressed to an extremely low level. It remains to be seen whether trading conditions will justify the distribution of a final ordinary dividend. After recent improvements in the oil market the 5s. ordinary shares of Apex (Trinidad) at 2½s. 6d. ex dividend yield £6 2s. 5d. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash.

THROUGHOUT the week, sentiment has been firm and prices have been well maintained in all sections of the market. The predominance of gilt-edged at the beginning of the previous week has given way to general buying of industrial equities. Before the week-end, the prices of gilt-edged securities showed a certain stagnation, although recent gains were fully held, since investors, encouraged by the better figures for shipping losses, were not disposed to sell. The continued success of the Middle Eastern campaign maintained interest in the oil market at a high level, and dealings in the rubber market were more lively than for some time past.

★

After a quiet opening to the week, the demand for gilt-edged issues revived on Tuesday and was well maintained in mid-week. On Tuesday, both 3½ per cent. Conversion and 3½ per cent. War Loan gained ½ and a long list of undated securities gained ½, including 2½ and 4 per cent. Consols, 4 per cent. Funding and Local Loans. Turnover was, however, on a small scale and derived no immediate inspiration from the announcement of the latest call up of dollar stocks. The foreign bond market was generally lively. A steady demand for Brazilian and later Chilean issues raised the prices of most securities by daily advances of the order of ½ point. Egyptian Unified gained on the continued success in the Western Desert, but Greek 7 per cent. bonds reacted moderately on Tuesday. Support was also forthcoming for the German potash issues and for French railways. Japanese bonds gave way, the 6 per cent. issue of 1924 losing as much as 2 points before the week-end.

★

After last week's advances, home rails were subject to a certain amount of profit taking, and the junior issues in particular lost ground. Great Western ordinary lost ½ point on Monday and L.M.S. eased ½ then and on the following day. Senior issues on the whole remained firm. Among foreign rails, speculative purchases of Argentine issues continued and Canadian Pacific preference improved ½ early in the week.

★

Buying was concentrated on the industrial market and most sections enjoyed substantial advances. Electrical equipment shares were in steady demand and gains were realised by G.E.C., Crompton Parkinson, W. T. Henleys and Callenders Cable. The ordinary stock of the Gas, Light and Coke Company, however, lost 1s. 9d. on the announcement of the postponement

of the preference dividends. Among motor shares, Leyland was singled out and Rolls-Royce also advanced on Tuesday. The iron and steel section was relatively quiet, but a number of fractional gains were realised by companies, including Babcock and Wilcox, Dorman Long, and Stewarts and Lloyds. The shipping section was weak, and interest in tobacco leaders not on a large scale, although B.A.T. improved ½ on Tuesday. Among textile issues, there was steady support for Coats and some buying of Courtaulds and Lancashire Cotton. General industrial were characterised by the further advance of Associated Portland Cement and London Brick, while Murex, Boots, and Turner and Newall also found favour. Brazilian Traction lost ½ before the week-end, which was subsequently regained, and International Nickel eased ½ on Monday. Cable and Wireless preference was consistently supported.

★

The demand for kaffirs was never on a large scale, and price movements were irregular and without trend. Developing mines were relatively neglected. Crown Mines and Consolidated Goldfields were firm spots, but "Sallies" lost ½ at the beginning of the week. There was little doing in other mining markets. The demand for rubber shares was on a rather larger scale than recently, Tamiang gaining 1s. 3d. on Monday, when several tea companies, including Empire and Eastern Produce, also realised gains. The strength of the oil market continued, being promoted both by military news from the Middle East and by rumours of a settlement of the dispute with the Mexican authorities. Shell Transport, Anglo-Iranian, Burmah Oil, and Mexican Eagles all displayed considerable strength.

New York

BEFORE the week-end, interest fell away and markets closed quietly, traders being unwilling to enter into fresh commitments. Copper shares turned weak and there was some profit taking. This

week, however, sentiment was encouraged by the satisfactory level of domestic business activity and by the show of Bulgarian resistance in the Balkans. Later, news of the latest call up of British-owned securities was an unsettling factor, since the market in these stocks was thereby limited. Rail issues turned easy on account of profit taking on Tuesday, and aircraft and chemical issues were offered. By mid-week, the market had turned easier, dealers being anxious to ascertain the outcome of the proposed legislation to carry through the "lease and lend" scheme.

The Iron Age estimates the level of steel mill activity at 98 per cent. of capacity, against 97½ per cent. in the previous week.

Industry and Trade

A Cement Committee

The promised committee to investigate the cement position was set up at the end of last week by the Ministry of Works and Buildings. Its terms of reference are "to consider and report whether, bearing in mind all probable demands for cement in meeting current needs and in post-war reconstruction, and taking into consideration economic, strategic, and other factors affecting the allocation of cement, new cement works should be established, existing ones extended, or old plant modernised; and, if so, what general considerations, financial, geographical, and economic, should apply." The committee is a strong one. Its chairman is Mr George Balfour (chairman of Messrs Balfour, Beatty, and Company, civil engineering contractors); its members include representatives of interested trade unions and trade associations, of the Ministry of Transport, and Sir William McLintock, senior partner of Messrs Thomson, McLintock and Company, chartered accountants. It is to be hoped that the investigation into post-war requirements of cement will not delay the publication of the committee's findings on the more immediate problems, possibly in an interim report. It is officially reported that the seasonal decline in demand has enabled the industry not only to meet current requirements but to begin the accumulation of stocks. The course of demand next year depends, in a large measure, on the Government's construction programme; it is therefore for the Ministry of Works and Buildings,

with the assistance of the newly appointed committee, to make provision now for the supply of the necessary quantities of cement next year.

★ ★ ★

Smaller Shipping Losses

It is perhaps too early to draw definite conclusions from the figures of shipping losses published during the past four weeks, but the marked reduction is encouraging. As the table below shows, the consistent level of sinkings has been broken for the first time since the Germans gained control of the French ports:

	AVERAGE WEEKLY SHIPPING LOSSES* (In gross tons.)		
	British	British & Allied	British, Allied & Neutral
Sept. 3, 1939–May 27, 1940 ..	20,000	25,900	40,800
June	63,400	100,000	100,200
July	56,600	67,300	91,400
August	64,800	72,700	82,400
September	76,200	90,300	100,200
October	63,700	77,200	86,500
November	68,100	85,400	89,200
Week ended December 8th	107,500	125,600	128,400
Average May 28–Dec 8th	65,100	82,100	93,500
Four weeks ended Jan. 5	29,800	37,700	41,000

* Most of the figures which were given in a similar table in *The Economist* of December 21 last have had to be amended owing to subsequent corrections to the Admiralty figures.

BY TENDER

East Worcestershire Water.—Issue by tender of £16,000 4½ per cent. irredeemable debenture stock and £14,000 5 per cent. redeemable preference stock (1950). The minimum price of either issue is £100 per cent. Tenders by 10 a.m., January 27th.

BY STOCK EXCHANGE INTRODUCTION

Farnham Gas and Electricity Co.—Issue of £70,000 4½ per cent. debenture stock to be redeemed at par June 30th, 1955, or after June 30th, 1952, at three months' notice. Messrs. Snell and Swaffield, Sidney J. Lovell and Co., have purchased this stock at 99 per cent. net.

Shorter Comments

This Week's Company Results.—SMITH'S DOCK CO. are maintaining the 6 per cent. dividend. Gross profits have risen satisfactorily from £274,197 to £437,269, but the company has realised only a small increase in net profits from £77,798 to £78,704. BLUEMEL BROS., cycle manufacturers, have realised a rise in total earnings from £16,575 to £20,167 and in net earnings from £6,219 to £14,463. The 10 per cent. dividend is repeated. THE NATIONAL OMNIBUS & TRANSPORT CO. is also repeating the previous year's dividend at the rate of 7 per cent. tax free. Both gross and net income were higher, the latter amounting to £116,636 against £109,508. Despite an increase in total earnings of LEY'S FOUNDRIES AND ENGINEERING from £98,222 to £108,467, a moderate rise in tax charges reduced the net figure from £65,668 to £65,385. The 11 per cent. dividend is paid as before. MICHAEL NAIRN, GREENWICH, makers of oil cloth and linoleum, have reduced the ordinary dividend from 15 to 14 per cent. in view of a reduction in total earnings from £230,968 to £190,919 and in net earnings from £227,019 to £186,773. RIO DE JANEIRO FLOUR is maintaining the 8 per cent. payment despite a fall in earnings which leaves net profits at £64,927 against £75,023.

MISCELLANEOUS

Smith's Dock Company.—Trading profit year to September 30, 1940, £437,269 (£274,197). Depreciation, £50,000 (£50,000). To income tax and E.P.T., £295,000 (£125,000). To reserve, £30,000 (£30,000). Ordinary dividend 6 per cent., as before. Carry forward, £42,219 (£33,765).

Bankers Trust Company.—Total resources December 31st, 1940, \$1,579,523,714 (\$1,245,134,596). Deposits \$1,460,558,560 (\$1,125,410,058). Investments \$680,467,251 (\$576,421,775). Cash \$613,287,942 (\$406,561,197).

Clydesdale Bank Ltd.—Net profit, 1940, £310,064 (£313,890). Dividend 16 per cent. as before. To reduction of bank buildings, £20,000 (£20,000). To superannuation fund, £35,000 (£40,000). To reserved surplus fund £50,000 (£50,000). Forward, £38,068 (£91,004).

Chase National Bank.—Total resources December 31, 1940, \$3,824,403,000 (\$3,085,819,000). Deposits, \$3,543,338,000 (\$2,803,730,000). After semi-annual dividend, to be paid Feb. 1st, \$5,180,000 undivided profits on December 31, 1940, were \$36,212,000 (\$33,022,000). Net earnings 1940, \$13,550,000 or \$1.83 per share, against \$13,315,000 or \$1.80 per share.

Dusseck Bros.—Gross profit, year to October 31st, £76,706 (£76,647). Net profit, £24,594 (£25,300). Ordinary dividend 12½ per cent. (same). Carry forward, £16,021 (£18,558).

Hollins Mill Co.—Net profit, year ended November 30th, £67,495 (£53,689). Preference dividend £40,200. Total ordinary dividend, 5 per cent. (3 per cent.). Carry forward, £41,542 (£26,748).

British Rubber Estates of Java.—Net profit, year to June 30th, after debenture interest, £6,220 (£6,488). Depreciation, £5,040 (£5,218). Taxation £19,470, amounted to £29,177, against £3,041. Debenture redemption, £7,294. Ordinary dividend 3 per cent. (nil). Carry forward, £19,184 (£18,871).

Bajoe Kideol Rubber.—Net profit, year to March 31st, £13,960 (£5,908). Ordinary dividend 5 per cent. (4 per cent.). Carry forward, £39,179.

Ashdown Investment Trust.—Net revenue, year ended November 30th, £24,922 (£24,146), after taxation, £14,784 (£10,465). Dividend 4½ per cent. (4 per cent.). Carry forward, £13,323 (£7,213).

Houlder Line Limited.—Profits 1940, £206,906, after taxation provision. Profits 1939, £213,975. To Fleet Replacement Account, £104,500 (£32,143), making that account £200,000. For 1939 £100,000 was placed to Depreciation. Dividend maintained at 7½ per cent. Carry forward, £39,599 (£27,412).

Transvaal Gold Output, December. (Fine ounces). Witwatersrand, 1,148,004; other districts, 28,518; total, 1,176,522. November total, 1,187,536. Native labour employment at end December: Gold mines, 346,726; coal mines, 18,374; total, 365,100.

National Omnibus.—Net profit, year 1940, £116,635 (£109,508). Ordinary dividend 7 per cent. tax free (same). General reserve, £10,000 (£5,000). Carry forward, £31,959 (£30,323).

continued on page 90

January 18, 1941

The significance of the figures is that, having never once fallen below 82,000 tons per week in any month since the end of May, the losses of British, Allied and neutral shipping for the four weeks ended January 5th were at half that rate. Bad weather is not a complete explanation and there is no reason for thinking that German bombers, more affected by the weather, have replaced the submarines as the most effective of Germany's counter-blockade weapons. The better record is probably due to a combination of circumstances, including—possibly the most important—stronger naval escorts for the convoys. It may also be that the several raiders which are still at large are lying low for the time being, and that our bombing of the U-boat bases is beginning to yield results. It is not, of course, known whether the graph of repairs has shown a corresponding fall, but in any case the loss of cargoes has been less serious. The record of the next few weeks will be particularly interesting. If it is a good one, and is combined with an improvement in the handling of ships and cargoes in the ports as a result of the recent changes in control, and with an increase in the rate of production in the shipyards, a shadow which was becoming darker will have lightened.

* * *

Coal-Tar Oils as Motor Fuels

In the matter of alternative motor fuels neither the Secretary for Petroleum nor his colleague at the Mines Department have shown much inclination to "go to it." As long ago as last March six committees were set up to investigate the possibilities of replacing imported motor fuels with alternative products manufactured at home. When announcing this fact Mr Geoffrey Lloyd also revealed that "a most valuable survey" had been completed showing how "our production of tar creosote and pitch can take the place of imported oil and bitumen to the extent of some 300,000 tons in the current year." For ten months little appears to have been done to put the results of this survey into practice; but, at long last, a scheme to encourage the use of certain medium coal-tar oils (such as creosote) as fuels for commercial motor vehicles is to be inaugurated on January 24th. It provides that operators of goods vehicles and public service vehicles who intend using these oils will be granted additional coupons to enable them to cover an extra mileage with the vehicles concerned. They must declare their intention of using coal-tar oils when applying for their ration coupons. Creosote, with which the scheme is mainly concerned, is one of the by-products of the high-temperature carbonisation of coal and may be burned in spark-ignition engines or engines of the diesel type. Its principal disadvantages in the former case are the special carburettor system required and the need for frequent decarbonisation; and in the latter, the difficulty of starting the engine when cold. Though these drawbacks can be mitigated by blending the creosote with petrol or diesel oil, this coal-tar oil is certainly not a ideal motor fuel. Nor would it be capable of replacing more than a fraction of our imported supplies of petroleum fuels. Nevertheless, the quantity produced by the high-temperature carbonisation process in 1938 was about 90 million gallons (of which over one-third was exported) and it has been estimated that the potential output in this country is in the region of 150 million gallons, or about 550,000 tons. If the whole output of creosote were used, as in the last war, for automotive purposes it would thus represent a by no means unimportant contribution to British motor fuel supplies, and for this reason the Government's new scheme, which is subject to review at the end of six months, is to be welcomed. But this is only one way in which imported petrol might be economised. It is a pity that the findings of Lord Ridley's Committee on the use of alternative motor fuels, which were in the hands of the Secretary for Mines as long ago as last August, have not been made public and, if practicable, put into effect.

The Rise in Earnings

The December issue of the *Ministry of Labour Gazette* carries further the inquiry into earnings of which the first instalment was published in the *Ministry of Labour Gazette* for November, by covering additional groups

of manufacturing industries and some of the principal non-manufacturing groups. The two dates for which figures were obtained were October, 1938, and July, 1940. For the later date some firms did not give separate particulars for men, women, boys and girls, so that the figures for these groups are based upon a smaller number of returns than the total figures. The averages cover all grades of wage-earners, including unskilled labourers. During the period October, 1938, to September, 1939, there were few general changes in wage rates in the industries under consideration, but a fairly general improvement in employment led to some increase in earnings, so that the percentage increases in earnings between the outbreak of war and July, 1940, must in most cases have been rather less than those shown in the table:—

AVERAGE WEEKLY EARNINGS

	Last Pay-Week in October, 1938	Week ended July 20, 1940	Percentage Increase
	s. d.	s. d.	%
Chemicals, paint and oil.....	55 4	69 1	24.8
Brick, pottery and glass.....	47 9	58 9	18.8
Leather, leather goods and fur	47 10	55 7	16.2
Miscellaneous manufacturing	47 7	62 10	32.0
Iron, stone, etc., mining and quarrying	56 5	69 2	2.26
Treatment of non-metallic mining products	61 6	77 9	26.4
Transport and storage	67 6	80 7	19.4
Public Utility Services	59 5	65 7	10.4

It is estimated that for the industries given in this table the average increase between the outbreak of war and July, 1940, in nominal rates of wages for a full week without overtime was about 12 or 13 per cent.; the average increase in earnings was considerably more, as long hours of overtime were being worked in July, and various bonus systems were in operation. The most striking increases came under the head of miscellaneous manufacturing; the scientific and photographic instruments group showed a rise of 37 per cent. and the rubber industry one of 32.7 per cent. Iron mining, cement, lime-kilns and whiting, artificial stone and concrete, chemicals and explosives, road transport, warehousing and storage all showed increases of over 25 per cent. Fur dressing alone showed a decrease; musical instruments, toys, games and sports requisites showed an increase of only 8 per cent. Apart from these groups public utility services had much lower increases than most other industries. Except in the public utility group, where women's earnings increased more than those of men or young people, there has been the same tendency as appeared in the first half of the enquiry for boys earnings to increase more than those of men and for both to increase more than the earnings of women and girls.

United States Export Control

In a message to Congress President Roosevelt has asked for an extension of the export licensing regulations to copper, zinc, nickel, bronze, potash and glass as from February 3rd. As regards glass the regulation is of little international influence. So far as potash is concerned, America's production has increased from 4,374 short tons of 2,000 lb. in 1915 to 634,000 short tons in 1939. As a result net imports declined to the low level of 117,942 short tons in 1939. In 1940 production has further increased and may now, if exports are discontinued, just cover the country's total needs. As supplies from Europe are at present limited to the tonnages which may be obtained from Spain the control of United States exports does not cause surprise. The control of bronze, which contains a high percentage of tin, is presumably designed to conserve the stocks of that metal which has to be imported. In the cases of the three non-ferrous metals included in the new order, however, the situation is different. The United States is the world's largest producer of copper and zinc, and for her nickel supplies she can rely on the huge Canadian output, which covers more than four-fifths of the world's total production. True, America's visible stocks of zinc in the hands of producers have declined from 65,995 short tons at the end of 1939 to 12,900 short tons

January 18, 1941

at the end of 1940 and her market is at present in comparatively short supply. The German occupation of Belgium, however, has greatly increased America's supplies of foreign zinc-ore, a fact which should soon help to restore normal conditions on the market. In copper American producers' stocks have only declined from 159,485 short tons at the end of 1939 to 158,418 tons at the end of November last, after having been down to 135,441 tons earlier in the year. Production is rising and has almost caught up with consumption. Moreover the United States has recently contracted for the delivery of 100,000 tons of Chilean copper. The reserves of Chilean metal produced with American capital are still very large and will certainly prevent any stringency in United States supplies. Consequently there seems to be little likelihood that considerations of domestic requirements alone have caused the inclusion of these metals into the export licensing system. For months past, however, Russia has shown an extraordinary interest in American copper and Japan has bought large quantities of American zinc. Both these countries have also acquired a substantial tonnage of nickel in the United States, as exports of this metal from Canada are controlled. The new export licensing order will enable America to limit exports to Russia and Japan. It is unlikely, however, that she will also restrict shipments of copper and zinc to this country, as the greater part of our imports in 1940 consisted of Empire metal refined in the United States owing to the shortage of facilities elsewhere.

* * *

Industrial Progress in Southern Rhodesia

Southern Rhodesia has hopes of becoming a great manufacturing country in the future. That these hopes, based on a cheap labour supply, an abundance of good coal, and a favourable marketing position, are not mere day-dreams is shown by the results of a census of pro-

duction taken in 1938 and 1939. The following table summarises the principal results:

	CENSUS OF PRODUCTION (000's omitted)		Manufacturing, Building, Public Utilities and Govern- ment Departments	
	1938	1939	1938	1939
	£	£	£	£
Gross Output	4,561	4,859	8,128	8,972
Cost of Fuel and Mate- rials	2,466	2,590	4,165	4,609
Net Output	2,095	2,269	3,963	4,363
Salaries and Wages ...	970	1,038	2,457	2,685
Numbers Employed ...	15	15	42	43
Net output per £100 salaries and wages ...	216	219	161	163

The value of the net output of secondary industries in 1939 was just over half the gross mineral output, and exceeded the gross agricultural output, which was £3,700,000 in 1938-9. The gross and net output of all secondary industries both increased about 10 per cent. between 1938 and 1939. The greatest increases in net output took place in the vegetable oils, seed crushing, and various derivative industries, in chemicals and soap, metal manufacture, building and the leather trades. As the salaries and wages bill has in most cases risen more than the numbers employed, earnings have evidently improved. Net output per £100 of salaries and wages has increased very slightly over industry as a whole, but there are wide variations between industries, ranging from a fall of over 40 per cent. in waterworks undertakings to a rise of nearly 37 per cent. in the seed crushing industry and its derivatives. The ratio of Europeans to other races is relatively high in the non-factory trades. Among factory trades it is highest in paper, printing, bookbinding and stationery, metal and metal repair, wood and furniture, chemicals, fertilisers and soap, and food, drink and tobacco. In most factory trades the European labour bill exceeds that for native labour.

COMPANY MEETINGS

BURMA CORPORATION, LIMITED

WAR-TIME CONDITIONS OF PRODUCTION

ORE RESERVES REVIEWED

MR M. L. BURNET'S ADDRESS

The annual general meeting of Burma Corporation, Limited, was held at Rangoon on Tuesday, December 31, 1940.

Mr M. L. Burnet (the vice-chairman) said that his first duty was the melancholy one of referring to the death of their distinguished chairman, Lord Horne, and it was impossible adequately to express their sense of the loss sustained through the untimely disappearance of so kindly and forceful a personality. Mr Marmion had been appointed to succeed the late Lord Horne.

Proceeding, the chairman said: We have tried in our report to give an outline of the events affecting our affairs which succeeded the declaration of war on September 3rd. The most important was perhaps the conclusion of the contract for the supply of lead to H.M. Ministry of Supply. We had no hesitation in accepting the fair terms offered by the Ministry for a large tonnage of lead, representing the greater part at least of our normal exports to the United Kingdom, for in this way we not only contribute to the war-time needs of Great Britain but we are assured of the retention of our proper share in the demand of our most important market.

The matter of zinc concentrates, in point of volume our second largest product, was more difficult. Here again we have been able to conclude a contract for a large tonnage with the Ministry of Supply.

The figure of net profit, Rs.68,12,359, which is of most concern to shareholders, does not differ very much from last year's figure—Rs.69,70,759—but the total of the two dividends paid at 7 annas compares with 9 annas for that year, which was too liberal having regard to the increase in the rate of income tax, announced and imposed after the dividends had been declared and paid. This year, with that experience of retroactive taxation in mind, we have limited our dividends to what we hope will be a safe figure, leaving a reasonable margin of profit undistributed to provide for any contingency.

ORE RESERVES AND GRADE

The further data that have become available since I last addressed you justify a preliminary reassessment of the original estimate of tonnage and grade of ore reserves, so that after allowing for the tonnage and grade of ore extracted the former will accord more closely to what we believe represents the tonnage remaining in reserve in the mine, and so that the latter will accord more closely to the grade of ore extracted and treated in the years following the adoption of our policy of grade reduction.

As a preliminary step towards this adjustment it has been decided to apply a factor of 5 per cent. to both the tonnage and the grade of the original ore reserve estimate, an increase in the case of the tonnage and a decrease in the case of the grade. After applying these factors and allowing for a total of 8,141,790 tons of ore extracted to June 30, 1940, the estimate of the balance of ore remaining in reserve in the mine at that date becomes 3,411,192 tons, with an average grade of 15.7 oz. Ag. 20.4 per cent. Pb, 12.6 per cent. Zn, and 0.90 per cent. Cu. This compares with a grade of 14.4 oz. Ag. 19.0 per cent. Pb, 10.8 per cent. Zn, and 0.60 per cent. Cu. for the 473,568 tons actually extracted and treated during the year now under review.

The 5 per cent. increase in tonnage represents an addition of 550,142 tons of excess ore, or sufficient to keep our treatment plants in full operation for 14 months at last year's rate of extraction. The 5 per cent. reduction in grade still leaves the estimated average assay value of the reserves remaining in the mine well above the average grade actually mined and treated during the last few years, and from which current profits have resulted. The addition of 550,142 tons of ore includes the 286,417 tons of excess ore to which I referred last year and the tonnage of 3,411,192 estimated to be in reserve at June 30, 1940, compares with 3,607,945 at the end of the previous year, after allowing for the extraction of 473,568 tons during the year under review.

The report and accounts were unanimously adopted.

ANSELLS BREWERY LIMITED

ADJOURNED FORTIETH ORDINARY GENERAL MEETING, held in Birmingham on Tuesday, January 14th, 1941

TO BE CARRIED FORWARD	£251,176 3 5
-----------------------------	--------------

Points from the Chairman's Speech:—

You will have noted the large amount which has been provided for taxation in the accounts of the Company. The increase in this burden more than offsets the improvement shown in the Trading Account, and so the surplus available for Dividends and Reserve is some £37,000 below that for the preceding year. Part of debit for taxation is in respect of Excess Profits Duty.

BURDEN OF TAXATION

By virtue of the basis upon which this tax is levied the profits which we are allowed to retain are fixed at a pre-war figure plus some allowance for subsequent capital expenditure. Accordingly, although our industry is in no way connected with armaments production, we may not gather the full fruits of our enterprise and initiative in the past. Nevertheless, we must accept the burden because we realise the national needs. I told you last year that this Company with its subsidiaries contributed in Government Duties and Taxes between two and three million pounds. This year the figure is nearer four million than three million.

INCREASE IN FIXED ASSETS

In regard to the Balance Sheet as at 30th September, 1940, there are a few observations which I would like to make in regard to the changes which have taken place as shown on comparison with the Balance Sheet as at 30th September, 1939. The net increase in the Company's Fixed Assets in the form of Land, Brewery Buildings, Licensed and Unlicensed Properties is £117,095. This represents the cost of new buildings and new property and plant less the annual provisions made for depreciation.

A VERY CREDITABLE PERFORMANCE

So much for the financial aspect of our position after a year of war conditions, and I hope the Stockholders will agree with the Directors that it is a very creditable performance. Owing to war-time taxation, however, it is evident that we are not able to reap the full benefits of our enterprise and conservative finance in the past, but by reason of the policy we have pursued there should be less difficulty than there otherwise would have been in maintaining our dividends, and, I hope, making adequate reserves in the future.

TWO-FOLD NATIONAL BENEFIT

Our product—the National Beverage—is of two-fold benefit to the country at the present juncture. For those who enjoy a glass of well-brewed beer it creates that genial atmosphere which contributes so much to the pleasure of meeting friends in that citadel of democracy the Public House, which is one of the few diversions left to the war-weary worker. On the other hand, the beer drinker contributes to the Exchequer a far larger amount than any other section of the public are asked to do on a taxable article. The Chancellor looks like getting £150,000,000 in a full year from this source, so I hope he will be satisfied that he has reached the limit, and in his search for further revenue he will not overlook the importance of equality of sacrifice.

Copies of the Chairman's Speech may be obtained from the Secretary, Park Road, Aston, Birmingham.

ALEXANDERS DISCOUNT COMPANY, LIMITED

STATEMENT BY THE CHAIRMAN

(MR COLIN F. CAMPBELL)

The directors have considered that in view of the difficulties connected with travelling in these short winter days shareholders would appreciate a statement being sent to them dealing with the affairs of the company during the past year at the same time as the balance-sheet and profit and loss account. Consequently I have prepared this statement, which I hope will be found of interest, but it should be understood that the ordinary general meeting of the company will be held in the usual way on January 22, 1941, when the necessary resolutions will be submitted to the meeting, but no further address will be made by me at that meeting.

Shareholders will be sorry to learn that some damage was done to the offices of the company last month through enemy action, when I much regret to say a faithful servant of the company, who had been with us for fifteen years as messenger, lost his life. The damage caused considerable dislocation to the work of the office, and the management and staff were exposed to very great inconvenience and extra work.

The past year has been a satisfactory one for the company notwithstanding the upheaval caused by the war, and the turnover has been very considerable.

CONDITIONS IN MONEY MARKET

Conditions in the money market were in marked contrast to those prevailing in 1939, inasmuch as the Bank Rate remained at 2 per cent. throughout the year, rates for money to the discount market were 1 per cent., while the rate for Treasury Bills ruled at only a few pence above this figure. Under such circumstances I need hardly tell you that the profit derived from Bills was very meagre, though the turnover, as I have already said, was large. It is, however, satisfactory to know that the Treasury has been able to secure a very considerable volume of money during the year by means of Treasury Bills for national purposes in times of war at so moderate a rate of interest. Commercial Bills have again been scarce, due in great measure to the control departments set up by Government for the purpose of ensuring a steady flow of commodities into this country, both for war purposes and for the well-being of the nation. We must expect the scarcity of Commercial Bills to continue so long as the war lasts.

The bulk of the profit earned has once again been derived from our holding a considerable volume of short-dated Government securities, and it certainly would appear that this is likely to continue to be our main source of profit in the year that has now begun.

When you look through the figures presented to you in the printed statement of the profit and loss account and balance-sheet, you will notice a considerable increase in the current expenses. This is by no means a permanent increase and is due partly to A.R.P. arrangements, most of which are non-recurring, and partly to a cash payment, in lieu of pension, made to a member of the staff who has resigned his position in the company. A further sum of £5,000 has been transferred to the Clerks Widows' Pension Fund, as this fund is not fully able to carry the charges for which it was created.

PROFIT AND ALLOCATIONS

The gross profits for the year, after making provision for taxation and a transfer to contingencies, are shown in the profit and loss account at £431,000, before providing for rebate. The amount brought forward from last year was £151,000, making a total of £582,000, as mentioned in the directors' report. From this, rebate has been provided to a total of £202,000, being £7,100 more than a year ago, and after deducting this amount and also current expenses and interim dividends (together £129,000) an amount of £251,000 remains to be dealt with.

Interim dividends on the preference and ordinary shares were paid as usual in July, and it is proposed at the forthcoming meeting to pay a dividend on the preference shares at the rate of 6 per cent. per annum and on the ordinary shares at the rate of 20 per cent. per annum, these being the same as in the previous year, and to carry forward to the next account £160,000, against £151,000 brought in a year ago. I feel sure

that these figures justify my having said the year's trading was a satisfactory one.

MAIN FEATURE OF BALANCE-SHEET

The balance-sheet is drawn up on the lines to which you are accustomed, and its main feature this year is the large increase in securities as compared with a year ago. This is due to the repayment last summer of our holding in 4½ per cent. Conversion Loan, which holding was then included in the bills discounted.

The proceeds derived from this investment were reinvested in such short-dated Government securities as were available, and I consider our present holding in every way satisfactory. The value of the securities is higher than the figure shown in the balance-sheet.

Bills discounted amount to rather less than a year ago and they consist almost entirely of Treasury Bills.

The volume of the business in 1940 was greater than in 1939, which is an index of our desire to take our full part in the discount market under war conditions consistent with the resources of the company.

CAM AND MOTOR GOLD MINING COMPANY (1919), LIMITED

TAXATION PROBLEMS

The ordinary general meeting of this company was held on December 7 at Salisbury, Rhodesia.

Mr Bailey Southwell, chairman of the company, who presided, said that the financial position of the company representing creditors, less cash, investments and debtors, showed an adverse balance of £192,785, as compared with an adverse balance of £101,140 at the end of the previous year, and of £89,656 in June, 1938. A glance at the accounts would show that the passing of the final dividend and the further decline in the company's liquid position were solely brought about by heavier taxation.

In view of the large under-reservation for taxation on the accounts to June 30, 1939, there was no alternative in June, 1940, but to face the position fairly and squarely, and to make such provision in the 1939-40 accounts as would safeguard the company against a recurrence of an under-estimation of such magnitude. With regard to the large adverse financial balance at June 30, 1940, of £192,785, stockholders would agree that it must be the policy of the board to wipe that off as soon as was reasonably possible, and get the company on to a proper financial basis. That meant that out of the current profits they must provide for current taxation, capital expenditure and head office expenses.

An estimate of the position showed that if 1s. per unit was declared this month the cash insufficiency would have been reduced to approximately £133,000 as at December 31, 1940, after allowing for decrease in value of stores on hand. By June next year that figure would have been reduced to well below the £100,000 mark under reasonably normal conditions.

Dealing with the position at the mine, it seemed likely that when the total payable ore reserves were estimated as at June, 1941, the tonnage might show a slight decrease, and that the value was likely to be about 0.2 dwt. lower at, say, 7.3 dwt. Even if no further development work were done, however, the ore reserves indicated that the mine could run nearly 6 years, while the ore from reclamation would extend that period.

The report was unanimously adopted.

BAJOE KIDOEL RUBBER AND PRODUCE COMPANY, LIMITED

THE OVER-PRODUCTION OF COFFEE

The twenty-ninth ordinary general meeting of this company was held, on the 14th instant, in London.

Mr H. Eric Miller (the chairman) said it had been a much better year for rubber by reason of the higher export releases and better market price, but it had been a difficult year for coffee growers. The low price of coffee which had prevailed during the last few years had not so far benefited Brazil by curtailing supplies from other countries and the "sacrifice quota" extracted from Brazilian producers of nearly five million bags last season, while effective in supporting the

SEVENTY-THIRD REPORT OF THE DIRECTORS

To be submitted to the Shareholders at the ORDINARY GENERAL MEETING to be held at the Offices of the Company, 24 Lombard Street, in the City of London, on Wednesday, the 22nd day of January, 1941, at Two o'clock in the Afternoon.

The Directors beg to submit to the Shareholders the statement of the affairs of the Company for the year ending 31st December, 1940.

The Accounts, including the balance brought forward from last year, and after provision for bad and doubtful debts, taxation and contingencies, show a gross profit of £582,312 9s. 11d. After allowing rebate of interest on bills not yet due, amounting to £201,796 8s. 0d., and deducting current expenses and interim dividend, there remains a balance of £251,570 0s. 6d.

Out of this sum the Directors have transferred £5,000 to the Clerks Widows' Pension Fund and recommend the payment of a dividend on the Preference Shares at the rate of 6 per cent. per annum, and on the Ordinary Shares at the

rate of 20 per cent. per annum for the final half-year, making 17½ per cent. for the year, carrying forward to next account £180,570 0s. 6d.

During the year Mr. B. F. Crowdon resigned his position as Sub-Manager of the Company, and Mr. E. J. Rowie and Mr. A. Macnaghten have been appointed Joint Sub-Managers.

The Members of the Board retiring by rotation are Mr. Colin Frederick Campbell and Mr. Robert Alexander, who, being eligible offer themselves for re-election.

The Auditors of the Company, Messrs. Price, Waterhouse & Co., who retire in accordance with the Articles of Association, offer themselves for re-appointment.

The Dividends will be payable on and after 23rd inst.

By Order of the Board,
P. C. TONG, Secretary.

24, Lombard Street, London, E.C.3.

Industrial Mobilisation

ON Tuesday, Mr. Bevin announced the Government's new plans for mobilising industrial manpower. It was an important and gratifying statement. The time has come, the Minister declared, for greater recruitment of labour from non-essential occupations and from among the unoccupied. Non-essential trades, and especially clerical and managerial work, are to be closely scrutinised, in order to release men for fighting or war work, and in order to replace men by women wherever possible—a policy which is also to be applied to the host of non-combatant functionaries in the Army itself, who often considerably outnumber the men actually expected to fight. An industrial register is to be made, on the basis of which it will be possible to call up men and women for war employment. In effect, it is recognised that the Army has two parts, one that fights and does ancillary duties in uniform, the other that works to equip them. The two forces are to be recruited on a common basis. Finally, in view of the importance of maintaining the existing labour force and the efficiency of war factories, permission for employers to dismiss workers and for employees to leave their work, in the case of certain vital industries to be stated later, will have to be obtained from a representative of the Ministry of Labour; and the production departments will have power to replace inefficient managements.

It is probably too soon to see in these plans an intention to introduce large-scale industrial conscription in the near future. The Minister made it plain that, in his view, the wide powers granted to the Government were to be regarded as "sanctions in the background." Indeed, it would not be possible for Mr. Bevin to institute wholesale compulsion forthwith. To say this is to cast no doubts on the Minister's determination. His speech was a welcome and significant event. It indicated a change in his personal

views which represents a sharp break with the routine tenets of the political groups to which he unswervingly belongs. The principles upon which the Government now proposes to act were in the minds of the many people who advocated a full national register even before the war started, and were sorely disappointed by the barren count actually taken under that title after its outbreak. It seemed common sense, not only to make a global approximation of the labour that would be "surplus" in each of the civilian trades under war conditions, but also to devise machinery for directing dispensable individuals in those trades to undertake essential work. Now these steps are being taken. But the call-up cannot begin until the machinery has been completed. The plan announced by Mr. Bevin is still only half a plan. It is a plan to place men and women at present in non-essential trades into war employment. It lacks the necessary complementary measures to make men and women available for placing.

The absence of means to "slim" civilian industry and trade efficiently and economically has been a gap in manpower policy for seventeen months. The fighting regiments and their auxiliaries have been called up in successive age-groups according to the misleading precision of the Schedule of Reserved Occupations, without full regard to the effect of the sudden, scattered, and indiscriminate withdrawal from industry of large bodies of men, or even to the actual importance to the nation of the work in fact being done by the individuals reserved. Men have been called up whose relative importance to the occupations or firms from which they were taken—and which have to be carried on in a shrunken form—was perhaps greater than that of men left behind. Other men, by reason of occupational qualifications which might fit them for national work, have been

reserved to continue in work of no national importance at all. This defect in the Schedule has been becoming more and more apparent, and several emendations in procedure have been made to place the proof for reservation less on mere categories of qualifications and more on the actual work being done by particular individuals—as in the case of “managerial” reservations. Now, when the industrial regiments are to be brought within the frame of recruitment, it is vitally important to pay as much attention to the process of freeing men from their civilian jobs, and to the relative importance of those jobs in actual fact, as to the procedure for bringing them to their war stations.

There are further pressing duties that must be urged upon the Government. The task of making a man's actual job the criterion of his importance, and not his nominal “occupation,” should not be difficult; it has already been started. The complementary task of adjusting civilian industries in the most efficient way to their depletion by the calls of the services and the war industries requires closer thought. At present, men and women are made available for war work in two ways. The Board of Trade, by the drastic limitation of supplies to individual firms, encourages them to cut down their staffs; and, secondly, individual workers can volunteer for training in Government centres. The effect of the first method, because it is applied to individual concerns and carries with it no scheme to concentrate permitted production on the most efficient firms in whole industries or in homogeneous groups of undertakings, is to produce only a derisory result in the number of workers set free; the policy is rather to *limit* the unemployment created. The second method is still less effective: the training centres, run on the principle of “less eligibility,” offer little or no inducement to volunteers; and they are by no means full.

Now a third method is proposed—the method of compulsion. No clear indication has been given of how the workers registered under the new plan are to be called up. But it would be a grievous error, industrially, economically and socially, if it was done indiscriminately by ordering large batches of men and women, in, say, age groups or according to localities, suddenly to down their tools and leave their desks, without reference to the consequences of their going upon the industries they belong to. *Their trades must be prepared for their departure.* The fact is that, in a war economy, it is no less important to organise the civilian industries for war than it is to organise the war industries themselves. The overriding object in both cases is to obtain the maximum output of goods and services from the minimum use of resources of labour, plant, and materials. Even though the permitted output of certain trades may be drastically curtailed, the need for the utmost economy of resources still stands. Indeed, since the proper aim of these restrictions is to *release* resources

for more important trades, this need is especially pressing.

Thus, Mr Bevin's plan for industrial mobilisation requires an addendum—a plan to *demobilise* labour in the non-essential trades. And it is a plan that cannot be applied to individual firms in isolation, but to whole trades or industries. The limited amount of work that is allowed or adjudged necessary in these trades or industries must be done in the most efficient way, by the most efficient units; wasteful or uneconomic units, whether firms or departments of firms, must be closed down. It is not hard to find examples: small firms struggling on with disproportionately large staffs; redundant shops and offices; sales organisations. No firm or department, serving no proved use, has any inherent right to remain in business, though all have a claim to compensation for compulsory closing down or to the means to maintain useful plant in running order. The work of weeding out will not be easy. It involves a system of pooling: the distribution of quotas of labour and materials to groups of businesses; and their allocation to individual concerns under firm Ministerial direction. It means that civilian production will be carried on by industrial groups with their resources and rewards pooled.

It ought not to be too difficult. It is a main part of German war economy; and the tendency in war is for trades and industries to come closer together in the combat against common difficulties, and for their associations to grow in strength and authority—and rapacity. The task of the Government now is to make pools of economy out of these pools of interest. Perhaps the greatest feat asked of Ministers is to remember that the rôle of money is subordinate to the rôle of men and materials, and to realise that money paid in compensation to firms without a war-time function is well spent if it makes labour or other resources available for the war effort.

The Government has at last decided to take steps to expand the industrial army in proportion to plain strategic needs. For too long the cart has been put before the horse. Mobilisation has been confined to the calling-up of soldiers, and bottlenecks have inevitably followed in the supply of their equipment. Now there is likely to be a bottleneck in men, for both in the field and in the factory Hitler can find in Germany and in German Europe many more recruits than we can. The necessity to make the utmost use of the manpower available is correspondingly acute, and, unable to rival the enemy in men, we must outstrip him in equipment. We must translate inferior manpower into superior equipment. Modern wars are won by equipment and mobility, and by next year we shall have the material aid of the United States to add to the fruits of the industrial mobilisation that is now envisaged. But the labour that is needed to make and bear the equipment of victory will not be found unless it is made available.

Spain and the New Order

IT is possible that Hitler will have to fight a full dress war in the Mediterranean, and as a consequence it looks as though the Spanish people, after the respite purchased by General Franco's firmness and by the Nazis' concentration on Britain, are again to move into the front line of diplomatic interest. As an auxiliary in an Atlantic war, Spain is quite valuable enough. In a war to drive the British from the Mediterranean, her harbours and airfields are almost indispensable. For what other reason did the Condor legions fight in Spain?

The atmosphere is perhaps more favourable for German pressure than in October last. The Falange is in a strong position and recent political reshufflings

have increased its strength. To give one example, early in December the Conservative Ministers of Finance, Agriculture, and Public Works were dismissed, their posts abolished and the whole of the domestic affairs of Spain grouped under the one Ministry of Industry and Commerce over which Señor Casceller, one of Suñer's men, is to preside. On the whole, the retiring Ministers represented the traditional outlook on Spain's economic policy—restoration of trade, foreign loans, international co-operation. Their disappearance must strengthen the hold of the expansionist, autarkist school of thought which the Falangists took over from their Axis partners.

If undiluted Falangism is to be Spain's future, foreign policy must finally fall into line. The corollary to self-sufficiency is a territorial empire which makes self-sufficiency possible. There are signs that here, too, the Falange is trying to force the pace. “Non-belligerency” and the first occupation of Tangier in June, Suñer's visit to Berlin and his appointment as Foreign Secretary in October, Colonel Yuste's coup in Tangier in November and recently an exposé by Suñer of Spain's foreign policy in which Tangier is claimed as a “natural right” are all pointers along the way of greater Falangist control in foreign policy. Suñer's January speech is particularly revealing, since he claimed that “geography, history, and natural right” were to Spanish foreign policy what “the theory of living space, the sea ways of their existence, the strategic doctrine of the defence of an empire” were to other Powers. Spanish history could, after all, take Spain anywhere, from Patagonia to the Philippines.

Spain's imperial passion is Germany's opportunity. It is on the point of expansion and aggrandizement that Nazi propaganda most insists. All the immediate objectives of Spanish ambition are, the Germans point out, controlled by the “plutodemocracies.” Gibraltar, Morocco, the Americas are to be reconquered for “Hispanism”—and the realisation of that dream can come only through the “new order” in which the regenerated nations will plunder the decadent. Spain must seize her opportunity now, before the tide of conquest sweeps on. She must jump on the bandwagon while the Nazis are still prepared to find her a place.

Fortunately for the future of Spain, there are other forces in public life besides the Falange, and in Franco the country has a leader still able and determined to arbitrate between them. Although the conservatives are giving ground to the Falange and there is virtually no opposition to their political programme of internal unification, the Army preserves its identity and its enforced absorption into the Falange last year has not led to a *Gleichschaltung* of opinion. In foreign affairs, particularly in adventurous foreign affairs, the Army chiefs can exercise during “pre-belligerency” a control in keeping with their responsibility in time of war. There is every evidence to believe that their influence is steadfastly directed towards peace and that their determination to avoid war is shared by the Caudillo.

To any politician whose mind is not lost in imperial daydreams, it is obvious that Spain's first need is to live, not to expand. As the German *Bankarchiv* put it recently, “Spain is economically annihilated.” An army still marches on its stomach and still fights with weapons forged from costly raw materials. But in Spain to-day there is a deficit of over a million metric tons in the basic wheat supply, supplementing foodstuffs—oil, beans, chickpease—are all rationed while industries are at a standstill for lack of raw materials, skilled labour, and capital. Suñer himself has admitted Spain's “terrible burden of starvation and misery.” It is little credit to his intelligence that he can almost in the same breath conjure up the Empire he is to build on such unpromising foundations.

This picture of dearth and dislocation is in the mind of Spain's saner statesmen when they consider their chances in Hitler's “new order.” Europe knows more about this “new order” than when it was first hawked about as a utopia of riches and stability, and it does not take much wit to see that Spain's dream of power is virtually incompatible with the grim realities of German Europe. If Spain is to be a Great Power, she must have the industrial capacity of a Great Power. She must build up heavy industry. She must save and invest. But if this is her ambition, what can she hope from autarky practised in a ruined community, and what advantage can she gain from the German *Lebensraum*? If autarky is adopted by the most powerful state

in Europe, lesser autarkies will sooner or later be absorbed into it for, to satisfy its need for all essential raw materials within its own frontiers, those frontiers must expand. Autarky can in fact only be practised by the very strong at the expense of the weak and anyone who has devoted even the slightest attention to Spain's shattered economy cannot fail to realise who will be the exploiter, who the exploited.

Even Italy, in a much stronger position economically, is now abandoning autarky in favour of what is euphemistically called “fusion with the German economy.” Spain in the “new order” could hope for no better fate. German control of most of the basic raw materials is known to be strict. Nazi agents in *Hisma* are still in Spain to safeguard German interests. An illuminating sidelight on their activities was the virtual ban imposed by Germany this autumn on the building up of a local car industry—a step that is symptomatic of Germany's determination to keep all her satellite states at a colonial level of exploitation.

Spain must choose between greatness in independence and colonial status in the “new order.” True, she might with German arms conquer Gibraltar and French Morocco—but only in order to hold them in fief for Hitler. Fortunately the choice is not already determined. Even in Europe there are still possibilities open to small states other than those offered by the Nazis. The Peninsula as a whole is still free, and Portugal is a striking example of what can be achieved by a small and not particularly wealthy power, where respect for national independence and sane conditions of international trade still prevail rather than the servitude and autarky of the Third Reich.

If on Señor Suñer's analysis the seaways of the world are held to mean to Britain what *Lebensraum* means to Germany, can any comparison be made between the two systems? Portugal has just celebrated the eight hundredth anniversary of her independence. For the last two hundred years at least of that independence Portugal's existence and that of her empire have been at the mercy of British sea power. *Si monumentum requiris*. . . . To-day, although our blockade is raising problems over the disposal of Portugal's unsold stocks of colonial goods (£1,500,000 lie at Lisbon alone) her commerce can still carry on, her ships sail the seas, her empire is intact. Spain would not be condemned to “plutocratic exploitation” by accepting the benefits of international trade. Portugal shows that it is a safeguard of freedom.

There are signs that Spain has learnt the implications of Germany's *Lebensraum*. In her need she has already turned to the New World. Argentina is granting credits for wheat, the United States has already advanced \$13½ million, and there are rumours of the negotiation of a far larger credit. Britain, too, has played a part. A £2,000,000 credit will forward Spanish purchases in the sterling area and further credits are possible if Spain can furnish the necessary exports in exchange. As Mr Churchill put it: “Far be it from us to lap Spain and her economic needs in the compass of our blockade. All that we need is that she shall not become a channel of supply to our mortal foes . . . there is no problem of blockade that we will not study with a sincere desire to aid Spanish interests and revival. British interests and British policy are based on nothing but the independence and unity of Spain.”

The Prime Minister's words are perfectly sincere, and Portugal is there to show Spain what are our objectives in the Peninsula—stability, prosperity and independence. On the other side of the ledger is the fate of Norway, of the Low Countries, of France, yes, even of Italy. We can only hope that if Hitler is again to seek a choice and a decision from Spain in the next few weeks, the balance sheet will be drawn up and the answer given in the fundamental interests of Spain.

The Meaning of Fire

FIRE insurance has been known in England for well over two hundred years. Both the London Assurance and the Royal Exchange Company were founded as fire offices in the South Sea Bubble; in 1728 a suit on a fire claim (Lynch v. Dalzell) came before the Court of Chancery on a policy signed in 1721; for generations every lease has contained provisions for fire insurance; thousands of millions of pounds sterling have changed hands in premia and in settlement of losses; and less than a fortnight ago the High Court decided for the first time what the word "fire" in a policy of fire insurance really means.

The decision arose out of a very unusual episode. A Mrs Harris had taken out with Lloyd's underwriters a comprehensive policy on the contents of her premises, covering them in one document against fire, burglary and theft. Mrs Harris was particularly afraid of burglary and the loss of her jewels, and it occurred to her that the place in which they would be safest against a burglar's visit was the grate. Wherever else a burglar might look, he would surely never think of investigating the coal in the drawing-room fireplace. So, before she went out, she laid the fire with the jewellery and £100 of money underneath the coal and left the premises happily confident that her valuables at any rate would not be stolen while she was away. And safe from burglary they undoubtedly were.

But they were not safe from the other main peril covered by the comprehensive policy, for Mrs Harris when the time came for lighting the fire forgot her ingenious ruse and applied a match to the coal with over £400 worth of jewellery and £100 of Treasury notes hidden inside it, and she burnt the lot.

In due course Mrs Harris presented her claim to the underwriters and was told, doubtless to her surprise, that the loss was not recoverable. It was true that fire had destroyed the jewellery and the underwriters were careful to say that the *bona fides* of the claim was beyond dispute; but fire "within the meaning of the policy" did not, so the underwriters declared, mean any sort of fire. It meant a fire which broke bounds and did its destructive work outside the place in which it was intended to be, so that the burning of an article secreted in the grate or accidentally thrown on to the drawing-room fire was not the kind of loss against which an insured party was protected.

It probably seemed to Mrs Harris, as it has seemed to many people before her, that this construction of the policy was unfair and ridiculous. It is not unlikely that she was angry with her underwriters for raising such a defence. But it is only fair to the underwriters to say that the answer they gave her and the view they took of the law were not invented by them *ad hoc*. On the contrary their reading of the fire policy was (until this case was tried and decided) the orthodox reading accepted, not only by insurance officials and underwriters, but also by the text books and by at least one of the most eminent commercial lawyers who ever wore a silk gown and adorned the bench of the Court of Appeal.

One of the standard books on the law of insurance is McGillivray's "Insurance Law," which competes with Bunyon and Welford and Otter-Barry for the chief place among the text books on non-marine insurance law and is comparable to Arnold's monumental work on marine insurance. And McGillivray in the 1912 edition defines the word "fire" for purposes of insurance in this way:—

Fire within the meaning of the policy means fire which has broken bounds.

It is clear from this that the learned author would

have rejected Mrs Harris's claim, since the fire which destroyed her jewellery had certainly never broken its bounds, any more than a lion which kills a trainer in a circus cage has broken his bounds to commit the slaying. McGillivray would have been with the underwriters.

And six years after this edition of McGillivray was published a curious case (Upjohn v. Hitchens) came to the Court of Appeal. It was during the last war that Upjohn the landlord found that Hitchens the tenant (who was bound to insure against fire with the Alliance) had not insured against fire arising from enemy bombs. He had not done so for the very good reason that he couldn't. Neither the Alliance nor any other Tariff Office would cover the risk. "That," said Upjohn, "is no business of mine. Fire is fire, whether it comes from a defective flue or a German bomb, and when I said fire I meant fire. The lease is cancelled and I want my premises back."

The Court of Appeal found against Upjohn and decided that fire in a legal document does not necessarily mean fire of any sort. It means only certain kinds of fire—a point that was emphasised by the great Lord Justice Scrutton, who said categorically and clearly without hesitation:—

It has been held that fire within the meaning of a fire policy means fire which has broken bounds.

So the high authority of McGillivray is reinforced by the tremendous weight of Lord Justice Scrutton's opinion expressed without doubt, qualification, or mistrust. It is not to be wondered at that when underwriters refused this claim they thought their reading of the law was an orthodox, indisputable part of the ABC of insurance law.

It turned out that they were wrong, for Mr Justice Atkinson found against them and delivered a judgment which blew sky-high both the doctrine of the text books and the *obiter dictum* of the Lord Justice. The essence of his judgment is that on the rules of construction fire means any kind of fire and that the restriction of breaking bounds cannot be imported into the policy by one party to the contract. Unless a conventional meaning of the word can be proved—and Mr. Justice Atkinson held that it was not proved—"fire" must be taken in its ordinary obvious sense, and, furthermore, if there is an ambiguity in its meaning, the benefit of the doubt must be given to the policy-holder, because the document was drawn up by the underwriter—the legal doctrine of *contra proferentem*. And the conclusion to which these rules of construction led him—the conclusion that fire need not have broken bounds to produce a claim—was in his Lordship's view the sensible one. Are we to believe, he said, that if the wind blows the candle flame into the curtain there is a claim, but if it blows the curtain into the candle flame there is none?

On the whole the law has been clarified by the judgment into a more sensible shape, but the astonishing fact remains that it has taken nearly 250 years for this elementary matter to be determined, and hundreds or thousands of policy holders have had claims refused because the only available authorities never been codified and the industry must work on case law which (with all its advantages) fixes the law only on those points that litigants choose to bring before the Courts. And owing to the arbitration clause in all company fire policies very few disputes on fire claims ever reach the Courts. They are decided in secret and contribute nothing to the body of the law. Hence the curious phenomenon of the most important word in the most common of all English contracts being misunderstood by all the experts for more than two centuries.

NOTES OF THE WEEK

Africa: Advance on All Fronts

The week has gone well enough for us in Africa to make the already gloomy background of the Axis meeting gloomier still. On January 19th the Italians abandoned Kassala, whose capture in August was a severe blow to the security of the Sudan, and, unlike the Italians, our troops are following up their victory. The Italian forces were content to sit in Kassala. No serious attempt was made to secure the railway either to north or south, and any decision to advance the 200 miles to Khartoum was early abandoned—if it was ever taken. We, on the contrary, have already advanced far into Eritrea, with surprisingly little resistance from the Italians. Meanwhile, in Abyssinia months of patient preparation are bearing fruit. British officers, going in alone to organise resistance among the tribes, laid the foundations of concerted action, and now that the British are giving the lead we may expect a widespread development of offensive action. It is significant that Ras Kassa, the veteran general of the Italo-Abyssinian war, has passed through Khartoum. And as though

Kassala were not enough for one week, Tobruk has fallen and at least 15,000 more prisoners have been "captured"—if the word is not too melodramatic to describe the rounding up of Italians surrendering *en masse*. And we now control the best naval base in Libya. Our successes raise the question whether Hitler can afford to allow the whole of Italian resistance in North Africa to be wiped out. East Africa—yes; but the Mediterranean seaboard is uncomfortably close to German Europe and the establishment of full British control would free resources for use on other fronts. Germany has an army to spare. There are rumours that sections of it have been training for desert warfare on the sands of East Prussia and preparing for tropical climates by hours of exercise in specially prepared hot-houses. We should undoubtedly be embarrassed by German landings, but no amount of horseplay in the dunes of Pomerania will solve the vital problems of supply in the Libyan desert or of transshipping heavy equipment under the vigilant eye of the British Navy.

Before a New Offensive?

Those who have seen *The Great Dictator* will remember that at the meeting between Hynkel and Napoloni, the robust Italian has it all his own way. As a reviewer of troops, as a god of the populace, even as a thrower of custard pies, the unfortunate Führer is definitely outclassed. Nothing we may imagine could be more unlike the meeting which has actually taken place. Master of a defeated army, an apathetic country and a

crumbling Empire, Mussolini has come, hat in hand, to receive the angry reproaches and contemptuous instructions of his Axis "partner." The Roman papers, justly sensitive, deny that the past was discussed at the meeting, but self-control was never one of Hitler's marked characteristics, and the meeting lasted far into the night. Nevertheless, its significance for us is not its re-creations but in the plans which were laid there for the next phase of the war. First, then, the separate Italian command is to disappear. Unity of command is the euphemism used to express the subordination of the Italian High Command to Keitel. Badoglio would not have stomach this, it is doubtful whether Graziani will. And it says little for the "independent spirit" of the Italian Monarchy that the Crown Prince has allowed himself to be promoted General this very week. Unity of command means that, with the Italians as mercenaries, Hitler is now fighting a war on several fronts, a manoeuvre which has never attracted him. If the past is any guide he may prefer to settle each campaign in turn and the relish and length and explicitness with which the German press has been preparing us for invasion suggests that, in keeping with Germany's habitual deceit, Hitler's immediate objective is perhaps to postpone the invasion until the early summer, and in the meantime to concentrate on ending the menace to his Balkan flank and on rendering our position in the Western Mediterranean untenable. On the other hand, successful invasion would settle the war once and for all, and as the months pass Hitler's need to finish the war certainly grows no less. If this need is the determining factor, widespread Mediterranean action would be merely a preliminary designed to draw off ships and aircraft from the defence of Britain—which is perhaps the more likely interpretation. Britain cannot, after all, be decisively beaten in the Mediterranean, and a decisive defeat is what Hitler needs most.

Conscription for Civil Defence

It is possible that the chief importance of the Government's fire-fighting scheme lies in the fact that it is the first exercise of its powers over persons and their services for other than military service, rather than in its immediate object of closing a gap in our civil defences. By new defence regulations additional power is given to the appropriate authorities to compel civil defence arrangements and power is also given to impose compulsory part-time service in any branch of civil defence work on all British civilians, of both sexes, between the ages of 16 and 60. There is, of course, nothing new in power of this sort, since a far wider power over persons is given to the Minister of Labour by another regulation; the innovation is that—to a very small extent, it is true—the new power is being applied. An Order (which supersedes the original Fire Watchers Order), made under one of the new regulations, imposes an obligation on the occupiers of all premises to which

it applies to make adequate arrangements for fire prevention, which will include compulsory spare-time duty by all male employees, though joint arrangements may be made by occupiers in the same or adjoining buildings. A second Order made under another regulation provides for the compulsory registration by age groups and calling up for fire prevention duties of all male persons in areas where the number of volunteers is insufficient, although there are all manner of exceptions and exemptions. Men already doing 48 hours of civil defence work a month in their place of residence will not be called on for duty in their place of employment, but, subject to this, compulsory service at the place of employment takes precedence; the Home Guard, policemen and special constables will be exempt; and tribunals will hear appeals for exemption on grounds of unfitness or hardship. The arrangements made under the first Order must satisfy the responsible authority, who for war factories is to be the Admiralty and the Ministries of Supply and Aircraft Production; the appropriate Government Departments for public utility companies; the Ministry of Labour for non-war factories employing more than 30 persons; and the local authorities for small factories, shops, dwelling-houses, theatres and so on, which form by far the greater part of all buildings. The difficulty about applying the scheme is that it is these small firms, with small staffs, many of whom are already doing civil defence work, and dwelling-houses, many of which, in vulnerable areas, are now unoccupied, that have most difficulty in making satisfactory arrangements. Yet it is these that are left as the responsibility of the local authorities, who may well be forgiven if they complain that they have been allotted the hardest part. It is true that rules are to be drawn up for their guidance, and the Regional Commissioner will direct and supervise the calling up of men where volunteers are insufficient. But there is a danger that the patchwork affair, which the scheme for protecting these smaller premises and private houses appears to be, may be inadequate in another night like that of December 29, 1940.

* * *

The War Cabinet

On Wednesday, the Prime Minister strongly defended the committee system of Cabinet control of policy. It was better fitted, he claimed, than a Cabinet of four or five Ministers without departmental duties, to determine policy and oversee administration, because neither of these functions can be carried out without the close contact with the factual working of departments which only their chiefs, among Ministers, have. This argument can, of course, be contested. The entire practice of Parliamentary Government, both in the Commons and in the departments, implies that chosen men of ability can lay down fairly closely the lines of policy, without the direct *expertise* for which they must rely upon professional civil servants, soldiers or business men. But the operative argument in Mr. Churchill's case for the present system—that it is a question of men rather than of machinery—cannot be questioned. There cannot be any controller of policy on the home and economic side of Government akin to Mr. Churchill on the side of defence and strategy, because there is only one Mr. Churchill—and one Prime Minister. True, as Mr. Churchill pointed out, the small War Cabinet of non-departmental Ministers in the last war was designed to allow Mr. Lloyd George—"the great man who then conducted our affairs"—wide powers over the whole field of Government; and it might perhaps have been imagined that Mr. Churchill himself could have emulated the energy and scope of his famous forerunner. But the root of the Prime Minister's case, implied rather than spoken, was that there are not at his disposal sufficient able lieutenants to man a non-departmental Cabinet and the Ministries as well. The men who can must do the work by which the system will be judged, and there are already signs that the latest committees, the Production and Import Executives, are getting well ahead with their job.

* * *

"Good Sense" in Wages

Mr. Bevin's views about wages policy have been long and eagerly awaited. Now it seems, from his statement in the Commons on Tuesday, that he has no views, because he does not believe in the need for a policy. Wages

are best left to the "good sense" of employers' and workers' associations, he claims, and he cited as evidence of this the striking absence of major labour disputes. It is true that, apart from sporadic unofficial outbreaks, labour disputes have been very few. But this surely has been due to the fact that the trend of wages has been uniformly upwards, and it is precisely this trend, with its potentialities for inflation, which (together with consistent rises in other strategic prices) has led to the demand for the statement of a wartime wages policy. The test case of the 1,200,000 engineers and ship-builders who approached their employers for an increase of 10s. a week has, meanwhile, been judged by the National Arbitration Tribunal, who have approved an increase of 3s. 6d. in their war bonus, with, however, no concession to the demand for the reinstatement of pre-1931 conditions of work. It was the engineering employers who made this a test case by refusing the rise "on grounds of national interest"; and now that the Tribunal has shown itself, at least partially, in agreement with this attitude, the need for some plain official statement is more than ever pressing.

* * *

The Workhouse Principle

The purpose of the Government's industrial training centres is plain. With the technical schools and colleges, their wartime job is to ensure that at no time in the future will war production be held up for lack of labour suitably instructed in the elements of war engineering. Direct training on a large scale can only be done in the factories themselves; but in default of any mass scheme for training by employers and because of the crucial importance of transferring men and women from idleness or non-essential work into war production at an increasing rate, it might have been expected that the training centres set up by the Ministry of Labour would be full to capacity. Actually, this does not seem to be the case. It is even reported by men from the centres that there are many vacant places; and the channels which should be feeding the industrial army appear to be delivering little more than a trickle. Moreover, an appreciable part of that trickle is running to waste. Men who have been trained now report themselves out of work. It may, of course, be that these men have been found wanting, but the fact remains that there is no guarantee of war employment even for successful trainees. The truth is that these centres, channels in theory, are not channels in practice at all. They are devised on the pre-war principle of finding something for the unemployed to do, and, as in all departments of unemployment policy, they are run on the principle of "less eligibility." That is, pay and allowances are contrived to make training, though essential for the war effort, clearly less remunerative than work, however non-essential. It is foolish to blame workers for not flocking into the centres. The terms of entry and conditions of training are a deterrent and not an inducement, and since no secure employment is promised at the end, it is scarcely surprising that the workless regard the centres as only a last resort, while those engaged on non-essential work never think of them at all.

* * *

The Price of Overtime

The Select Committee of the House of Commons on National Expenditure only begins its work with the investigation of "current expenditure defrayed out of moneys provided by Parliament." The comments on labour policy contained in the third report presented this session are characteristically shrewd and topical. The main theme is overtime, where the conclusion is that a reduction in munition workers' hours should take place immediately before their health is seriously affected, as it was in the last war. After Dunkirk, many factories began to work 24 hours a day for seven days a week, and national and local holidays were cancelled. After two months, the result was extreme fatigue, shown in absenteeism and unpunctuality; and the Select Committee is in complete agreement with the view of the Ministry of Labour, expressed in a memorandum last July, that excessive hours are undesirable, "both physically and economically." Figures published by the Health of Munition Workers Committee in 1917 showed that the reduction of hours by as much as 18 or 20 a

week increased net output. The difficulty, however, in the way of reducing hours as the Ministry suggested, first to an average of 60 a week and, then, to 55 or 56—shown by a generation of experience and research into industrial fatigue to be "the optimum standard"—is the problem of expanding the labour force. The solution is obviously to keep the machines running continually, but to have more workers in three shifts to man them, and this means that to reduce the amount of overtime worked involves much greater progress in dilution and labour training than has yet been made. It also necessitates uniformity so that workers will not leave establishments with controlled hours to seek high overtime wages elsewhere. The workers want overtime however bad it may be for their health and efficiency. This question of overtime is more than merely one of fitness and output. It is a financial question as well. Overtime and Sunday work are sought by workers because they bring in high rates of pay, and when they are sick or tired it is on week-days, when normal wage rates are paid, that they tend to stay away. The strict curtailment of overtime and Sunday work is desirable, not only to obtain the greatest possible output from the individual worker compatible with the maintenance of his health, but also to put a brake on the inflation of the cost of Government contracts. Over-work not only damages the health and efficiency of workers. It also sends up the cost of production strikingly. At one factory in 1917, overtime payments for week-end work caused a rise in price from 2.4d. to 4.54d. per unit of production; and at a national shell factory in 1918 a reduction in hours from 53 a week to 50 brought down the cost per shell from 8s. 4.09d. to 7s. 5.54d., as well as increasing output from 44,000 to 45,500 shells. The problem of costs is, in general, a mystery, and the Select Committee, having been "unable to see the actual costs of almost any articles," has been unable to find out whether the Government is paying too much for its supplies. But this point about the effect of overtime on labour costs is well taken; and a great deal of credit is due to the Select Committee for showing succinctly that no single aspect of the labour problem, such as hours, can be approached, without all the other aspects, health, productivity, wages, earnings, mobility, turnover, hiring and training, coming in of necessity.

Laval Again

For a few brief weeks it seemed that Marshal Pétain was following a strong and comprehensible policy both in France's external affairs and in relation to his own position of personal authority in unoccupied France. The news of his reconciliation with Laval and the reports that Laval will return to high office throw our ideas about him once more into confusion and doubt. That his own prestige will be damaged by the return—under German pressure—of the man he himself dismissed for attempting a *coup d'état* is obvious. And since the point of Laval's plot was to secure unqualified French co-operation with Germany in her onslaught on Britain, French foreign policy, in spite of official assurances that "the French Fleet will in no circumstances be used against France's former ally" is again open to the suspicion of disloyalty—even treachery. It is clear that our attitude to Marshal Pétain must be dictated by this question of collaboration with Germany. There is nothing dishonourable in defeat. There is nothing dishonourable in attempting to preserve some small part of the French patrimony free from the corruption of Nazi ideas and from the presence of the Nazis. Much of the honourable support given to Pétain by sincere patriots springs from their conviction that he stands between them and the disgraceful performances of a Laval or a Déat. But enthusiastic collaboration with the former enemy against an ally who still fights on cannot be reconciled with any preservation of national or personal honour, and the restoration of Laval would destroy the integrity of the regime. On the German side there is less confusion of policy. Germany is seeking, in the face of successful British resistance, to keep France cowed and immobile. It is not the nature of France to remain long in any attitude. The political temperature of the people is rising, and to allow them to unite behind any leader would be dangerous from the German standpoint. Thus the split between Vichy and Paris is preserved in order to bewilder the mass of the people, who hear more about the "aggressive clerical reaction" of the one centre and the "subversive activities" of the other than of the doings of the invader who has en-

slaved them both. Germany, too, is glad to keep both Paris and Vichy discredited. Without leaders, popular resentment remains uncanalised. One of the reasons why Laval has been forced back may well be the fear that, standing alone, Pétain would become a rallying point for genuine patriotism.

Second Thoughts in the Balkans

Until Hitler makes up his mind about the next move on the Danube, the Balkans will remain in uneasy tension, hoping for the best, fearing the worst. The Greeks continue to give a valiant example of what free men can do in defence of their independence. Further heights round Klisura have fallen, there has been a successful offensive on the central front, and on the western wing advance troops are said to be within four miles of Valona bay. And the Roumanians continue to show their neighbours that the price demanded by Germany for "peace" is hardly distinguishable from the hard costs of war. Once again the country is plunged into civil strife. Once again Iron Guard factions are busily engaged in exterminating each other, and over it all General Antonescu in sublime fatuity appeals for order and refers to the "splendid but soul-destroying" months of government through which he has passed. The truth is that Roumania is in dissolution and only a German administration can now create any semblance of order. As the troops on the Bulgarian frontier have been withdrawn, the police the interior and General Antonescu is doubtless left to consider how unsatisfactory it is to be given a vacuum as advance base for a Balkan campaign. Although it offers only a short respite, the withdrawal of the troops may have relieved the tension in Bulgaria a little, and there are signs that the Prime Minister's resolute speech reflects the temper of the people. The leaders of the old political parties (banned since 1934) have issued a stirring manifesto in defence of their country's independence and it has been widely circulated in leaflet form. The Government, too, may have been encouraged in their determination by the arrival of Colonel Donovan, the American President's personal envoy to confer with the King and the Ministers. Colonel Donovan comes from Cairo and Athens, two centres of successful resistance. He can also speak of the United States' determination to check the aggressors and to give all aid to those who defend their independence. Nor do these assurances seem so remote as in the days when France was disintegrating and Britain's fate in the Mediterranean hung in the balance. There is at least a chance that Hitler, engaged in Sicily and above the Channel will not willingly add to his military commitments at this point. Bulgaria's chance, therefore, lies in showing, in company with Yugoslavia and Turkey, that a violation of Bulgaria will entail the added commitment of a Balkan war.

The Inauguration

President Roosevelt's inaugural speech was an inspiring appeal to the American people and, indeed, beyond them to all peoples who still uphold the cause of freedom to remember their faith in this time of crisis and to remember, too, that without that faith there can be no survival. "The life of a nation is the fullness of the measure of its will to live." The democratic countries face an adversary in whom negative faith has been whipped up to the pitch of fanaticism. This they must oppose with a positive faith, the faith that made America "the New World in all tongues to all peoples"

in the creation of "a new life, a life that should be new in freedom." If this is their spur, there can be no thought of defeat, for freedom is not an incident in history, "it is history." But the President does not delude his people into the belief that they can sit and guard "the sacred fire of liberty" behind their own defences. In "the narrowing circle of the world" isolation has become a peril. The will to live must include the will to act. The United States "will not retreat." It "will not turn back." It will meet this crisis of attack from without in the spirit of Washington, who forged the nation, and Lincoln, who defended it from disruption from within. Now the danger is without and America takes up the challenge. The tone of the speech has not been lost on the totalitarian powers. Japan has made another appeal to America's "sense of responsibility" to avoid war by giving Japan a free hand in East Asia, or, more simply, by abandoning Free China. And in Europe the German press speaks threateningly of the "end of German tolerance" and of the necessity of setting limits beyond which the United States cannot go with impunity, America can afford to dismiss these threats. They are a sign of growing fear.

Organisation of Road Transport

There are welcome indications that the Government is beginning to move towards the relief of the transport bottleneck by measures designed to remedy the present state of affairs in the road haulage industry. On Wednesday, the Minister of Transport announced the outline of a scheme designed to lead to a more efficient utilisation of the road transport industry. In some respects the scheme resembles that which has been successfully applied to shipping. Instead of merely controlling the intensity of the use of lorries by a system of petrol rationing, with supplementary rations for essential traffic, the Ministry of Transport has decided to enter the road haulage business on its own account. The Ministry will hire lorries from the hauliers, though to begin with it will confine itself to the transport of Government traffic. As a first step, arrangements have been made by the Ministry with other Government departments—such as the Ministries of Supply and Food—for carrying some of their traffic by road. As in the case of shipping, the actual operation of the vehicles will remain with the hauliers, but, in contrast to the practice of the Ministry of Shipping, the lorries will not be requisitioned, at least to begin with, but hired by agreement with the road haulage industry. Again, as in the case of shipping, the owners of lorries operated by the Ministry of Transport will be paid rates of hire to be determined in consultation between them and the Ministry. The scheme is a step in the right direction; the pity is that its inception has been delayed so long. Its success in bringing about an improvement in the traffic position will depend on the speed with which it is applied and extended from the small beginning at present envisaged. It is only when the carrying capacity of the transport industry—and *a fortiori*, that of its road haulage branch—is considered as a whole that it will be utilised to the best advantage. It may be necessary to try the scheme out at first; but partial control is inadequate. The road haulage industry, represented by its Consultative Committee, has given its blessing to the scheme, though, no doubt, in the expectation of satisfactory rates of hire. While it will be interesting to see the financial terms of the new scheme, these are its least important feature. The urgent problem is to fit the road haulage industry into a general scheme of transport, designed to speed up the movement of essential goods.

* * *

Suppression of a Newspaper

One of the most drastic powers given to the Home Secretary under the Emergency Powers Acts is the right to suppress newspapers. In exercising his power to suppress persons by detention without trial his decision may eventually be subject to the hearing by the Court of an application for a writ of *habeas corpus* from the person detained, though it is true that the Court has held an affidavit by the Home Secretary that he believed that he had good grounds for the detention order to be a good answer to such an application. But the case of Mr. Harry Sabini, whose application for a writ was this week opposed by the Home Secretary and

refused by the Court—after an adjournment of the case, during which a writ had been served—shows that the Court has to be fully convinced that the Home Secretary "honestly believes," even though it does not enquire into the grounds of his belief. Similarly, if a person is concerned in systematic publication of matter calculated to foment opposition to the war effort, the Home Secretary must first warn the person, who will be prosecuted if he ignores the warning. But in the same circumstances a newspaper can be suppressed, without warning, simply by an order of the Home Secretary, and there is no right of appeal. Little surprise, and still less regret, will be expressed that Mr. Morrison has now applied his powers to the *Daily Worker* and the *Week*, though it may indeed be questioned whether the present circumstances of the war are such as Sir John Anderson, in a debate last summer on the relevant defence regulation, appeared to regard as a necessary background to its application. As the *Daily Worker* has enjoyed immunity for so long, largely because of its singular lack of influence, and as it is the first occasion on which opinion has been suppressed, it might have been wiser to use the longer process of warning, a prosecution and trial. But the *Daily Worker* was, in fact, unofficially warned by Sir John Anderson last July, and in any case no sympathy need be wasted on the departure of a newspaper which urges a negotiated peace and systematically tries to encourage disaffection among munition workers, members of the Services and the general public. That a Communist organ should find itself suppressed for the support it has, in effect, been trying to give to a "Fascist warmonger" is a plain case of *felo de se*.

* * *

Conduct of a Member

The Select Committee of the House of Commons appointed to enquire into the conduct of Mr Robert Boothby has found "that Mr Boothby's conduct was contrary to the usage and derogatory to the dignity of the House and inconsistent with the standards which Parliament is entitled to expect from its Members." This judgment is based upon a finding of fact—namely, that while Mr Boothby was, by speeches in the House of Commons and pressure upon the Treasury, urging the payment, out of Czech assets blocked in this country, of the claims of Czech residents in this country, he did not disclose—in fact, that he denied—that he had a financial interest of his own in the matter. Final judgment on the personal aspect of the matter will rightly be deferred until Mr Boothby has defended himself in Parliament. But the airing of a rather sordid story will have done good if it directs attention to the whole subject of the private interests of Members of Parliament. The present state of Parliamentary usage is that, before taking part in any political activity, a Member must disclose any interest of his own in the matter under discussion. Nobody will quarrel with the view that this is an indispensable minimum safeguard against corruption and that any Member who transgresses it deserves very severe censure. But it is also present practice that once a Member has made the disclosure of interest—sometimes in quite formal terms—he is free to advocate his own interests to a very considerable, if not quite unlimited, degree. The chances that a Member will have a private interest in some item of legislation or administration are infinitely greater than they were in the Gladstonian era, when "the trade" was virtually the only trade affected by Parliamentary proceedings. It seems to have become forgotten that it is to represent the interests of his constituents, not of his companies or his business associates, that a Member of Parliament is given his opportunities and privileges. It is clearly an unreal state of affairs that the formality of disclosure alone should distinguish propriety from impropriety. It would make for a cleaner public life if it became the usage of Parliament that no Member should take any action, by speaking, voting, or putting pressure on Ministers and Departments, in any matter in which he has a personal interest, disclosed or undisclosed.

The Book Trade After The Fire

It would be malicious to attribute the great losses experienced by the book trade in the Great Fire to a nemesis which has remembered its refusal to submit to

the purchase tax. Certainly, General Goering has done far more to "destroy culture" and "prevent the spread of democratic ideas" than could possibly have been achieved by Sir Kingsley Wood's modest proposals. About twenty publishing firms have been either completely destroyed or very severely damaged in recent raids, the majority, of course, suffering on the night of December 29th, when Simpkin Marshall, the biggest wholesale booksellers in the English-speaking world, lost its stock of between 8 and 4 million books. However, the destruction of Simpkin Marshall has produced another co-operative experiment in the book trade, which follows hard upon the formation by nine publishing firms of a Publishers' Guild to sell cheap books on a co-operative basis. The Publishers' Association is to buy, on behalf of the whole trade, the goodwill, and what other assets remain, of Simpkin Marshall, through which about 10 per cent. of the books reaching the retailers formerly passed. Book Centre, Ltd., which, incidentally, deals with the distribution of the new Guild's cheap books, is to pass on the orders it receives to the publishers, collect the books from them and dispatch the books to the retailers. There will thus be no question of a vast quantity of books being held in one place, as in the case of Simpkin Marshall. The increased cost of replacing the burnt books, where they are replaced, will prevent the new experiment from cheapening the price of books to the public—the price will, in fact, probably go up. And there are still independent wholesalers to be contended with, though these have, it is true, given their approval to the new arrangement. But when the effects of the destruction have worn off, which will certainly not be in wartime, it is possible that this co-operative distribution will be aptly situated to pave the way to a cheaper retail price, which even the publishers now realise is generally wanted.

* * *

Exchange and Mart

A brisk traffic is springing up in the quotas permitted to manufacturers under the Limitation of Supplies Order. A perfumery company advertises for quotas for the December to May and subsequent periods; a fur retailer "urgently requires" a wholesaler with "available fur quota Dec./May"; and so on. It is true that transfers of quota from one firm to another are nominally subject to the approval of the Board of Trade. It is true, too, in theory, that if such transfers were to lead to the concentration of the restricted production permitted into the hands of the most efficient firms, i.e., those using the smallest quantity of economic resources (especially labour) per unit of output, the process might even be regarded as economically desirable. The aim in wartime in essential and permitted civil work, no less than in war work, is to turn out as much as possible with as little use of labour, plant and materials as possible; and the scientific concentration of production would be a valuable step towards releasing labour for work of national importance. Indeed, it is a defect of the quota method of limiting supplies and manufacture that by restricting the supplies of each firm individually and not of each industry or group of firms as a whole, the advantages of concentrations are not obtained. Supplies are cut to a third or a quarter, but only 100,000 workers from the entire range of industries affected are released. It may also be taken that the firms willing to surrender their quotas will be the smaller and less efficient ones in most cases. But they will only surrender them and go out of business, entirely or as regards a single line, at a price. The advertisements suggest that this is a sellers' market, and one effect of the trade in quotas, if it is left unbridled, seems likely to be to mulct consumers. The drawing together of manufacturers or traders, exemplified by the hardening of the retailers' firm through their trade associations, has already become a marked feature of the war, because all kinds of sectional interests are struggling to preserve an enlarged corner in the restricted field of civilian enterprise; and the danger is that this trade in quotas will lead, not so much to a concentration of production in the cause of efficiency, as to a concentration or monopolising of control over a depleted market. If concentration is desirable in the public interest, it should be sought directly by the public's representatives, and not by the hole-and-corner haggling of narrow private interests.

Lifts for the Troops

A recent broadcast by "an Army officer" aroused a deal of interest. To listeners accustomed to the sight of soldiers riding in interminable lines of trucks and lorries, it was a surprise to learn that a pivotal part of training in offensive tactics was drill in marching very long distances, with little or no rest, before attacking the enemy. It is not possible for the layman to express a final view about a professional matter of this kind, and it is probable that the physical hardiness induced in the survivors of this particular method of schooling will be invaluable. But this marching is, explicitly, offensive tactics, not physical training, and it is impossible to avoid the suspicion that, once again, it is the last war, and not the present one, which is being won. The suspicion may, admittedly, be quite unfounded, but at least it is generally accepted that the striking forces of to-day are the swift-moving mechanised columns of the Battles of Flanders, France and the Western Desert, the forces so shrewdly envisaged years ago by General (then Colonel) de Gaulle, rather than the foot-slogging masses of 1914-18. Moreover, this is a point of peculiar importance to the British Army, since in numbers of men it is bound to be inferior, at every stage of the war, to the 200 or more divisions that the enemy can presumably raise. It is in material, and not in men, that superiority must be sought—if only because the United States will send the one and not the other; and in battle it can only be by superiority in equipment, and in the speed with which heavily armed forces can be thrown into unexpected attacks at unexpected places, that victory can possibly be secured. Because the German Army is the biggest, the British must be the best—and swiftest; and it would seem axiomatic (again to the layman) that, apart from considerations of health and physique, the British soldier should never walk when he can ride.

Shorter Notes

The Dominion and Provincial Conference on the recommendations of the Sirois Report on Canadian constitutional reform came to an abrupt and unedifying close before it had attempted to discuss the report. The Premiers of Ontario, Alberta and British Columbia objected to what they considered an ultimatum from the Minister of Finance, and the Conference ended in mutual recriminations.

*

The number of road deaths in December was 1,313, compared with 1,156 in December, 1939. The worst feature of this shocking return is the increase in the number of deaths in daylight from 259 in December, 1939, to 440 last month. Careless driving by the Army has for so long been a cause of complaint and claimed to be the reason for the increase in road accidents that the Ministry of Transport might do well to publish the number of accidents in which an Army vehicle has in fact been involved.

*

In contrast to the rise in road deaths, the number of deaths due to air raids showed a welcome fall in December:—

1940	Killed	Detained in Hospital	Total Serious Casualties
September	6,954	10,615	17,569
October	6,834	8,695	15,029
November	4,588	6,202	10,790
December	3,793	5,044	8,837
Total to date ...	21,669	30,556	52,225

Of those killed in December, 1,691 were men, 1,434 women, and 521 children under 16, the remaining 147 persons being unclassified.

*

A minor stir has been created in the House of Commons by a letter written to the Press by the Commander of an Officer Cadet Training Unit alleging that candidates who have not had the advantages of "gentle" birth or of a "Public School" education make less successful leaders of men. It is, of course, wrong for a serving officer to publish his views. But indignation about the views expressed, as distinct from the manner of their expression, seems to have been strangely misplaced. It is idle to deny that those who have not had a "correct" upbringing labour under a severe handicap. What should arouse anger is not the statement of the truth but the conditions that permit it to be true.

THE WORLD OVERSEAS

The Exploitation of Holland

(By a Dutch Correspondent)

January 11th.

SOME figures about Dutch exports and imports from June to September, 1940, are a convincing proof of the deterioration in the country's economic situation. These figures were issued by the German economic dictator in the Netherlands, Commissioner General Hans Fischboeck, one of the four principal assistants of the *Reichskommissar* Seyss-Inquart. In order to understand their significance, it may be recalled that average monthly exports from Holland to Germany amounted to fl.11 millions in 1939 and average exports to all other countries to fl.69 millions. The corresponding figures for the period June-September, 1940, are:—average exports to Germany, fl.32 millions; average exports to all other countries, fl.4.5 millions. Out of total exports during these four months of fl.145 millions, fl.127 millions went to Germany. Imports from Germany amounted to fl.84 millions, leaving a gap of fl.43 millions. The disadvantages for the Dutch are far greater even than appears, for the Dutch exports include food and finished products, whereas the imports from Germany do not include commodities which are of any use in everyday life. The Germans seem, on the contrary, to have adopted the practice of considering as normal exports the military material sent to the army of occupation. This must be inferred from the fact that Herr Fischboeck put the imports from all countries except Germany in the month of June at fl.55 millions. In that month, almost all international non-military traffic in Western Europe had come to a standstill. There is only one item that may have been "imported" into the Netherlands in quantities which can explain the extremely high figure of fl.55 millions. This item is material of war. Looting of this nature—the export of Dutch goods in return for as good as nothing—will be intensified now that all customs duties between Germany and Holland have been abolished.

Apart from imports and exports, the business situation as a whole is very unfavourable. Written and spoken propaganda about the New Order does not yield any tangible results. The number of unemployed is decreasing only owing to the virtual deportation of Dutch workers to Germany. According to Seyss-Inquart more than 80,000 Dutch unemployed are now labouring in the country of the occupier; and the number of unemployed in Holland still amounts to 185,000.

The incorporation in the New Order has marked the end of Dutch financial autonomy. Within the framework of the German system of multilateral clearing, which is reported to have been joined by Belgium, Bulgaria, Denmark, France, Finland, the Netherlands, Italy, Norway, Switzerland, Sweden and Yugoslavia, detailed agreements have been made by the Germans between the Netherlands on the one hand and Bulgaria, Italy, Yugoslavia, Sweden and Belgium on the other.

The deterioration of the country's economic situation is accompanied by a heavy increase in the expenses of the State. The State has to pay for all the requirements of an army of occupation which may be of the order of 250,000 men. The notes in circulation, issued by the Nederlandsche Bank, amounted to fl.1,157 millions on December 4, 1939. The last return before the invasion started showed an amount of fl.1,158 millions. The figure had swollen to fl.1,499 millions on December 2, 1940. Treasury bills in various forms amounted to fl.308 millions on May 7, 1940. The total was fl.1,142 millions on November 23, 1940. In the six months between May 6 and November 7 the State had covered expenses up to fl.966 millions by the creation of new money.

The abundance of money in conjunction with the shortage of commodities has brought about a strong fear of inflation, and the Dutch public want to get rid of their money. As a result the prices of almost all shares

quoted on the Amsterdam Stock Exchange show a series of spectacular rises. The average rise between May 9 and December 1, 1940, was 58 per cent. For various groups of shares the rise amounted to:—tramways, 7 per cent.; railways, 22 per cent.; banking, 40 per cent.; tea, 41 per cent.; commerce, 47 per cent.; shipping, 48 per cent.; gas and electricity, 49 per cent.; industry, 62 per cent.; oil, 64 per cent.; mining, 74 per cent.; rubber, 87 per cent.; tobacco, 88 per cent.; sugar, 89 per cent.; the last five groups represent East Indian companies. Their striking rise indicates that the Dutch public is well aware of the fact that their guilders is primarily backed by the wealth of the Dutch colonial empire. Only this fact can explain that *Amsterdam Rubber*, which yielded an average dividend of 4.8 per cent. for the last ten years, is at the moment quoted at 300.

Stamp Buying

There has been, apart from the flight to shares, a hardly less remarkable flight to all kinds of real property, from rare stamps—which are sold at double their usual prices—to landed property. The land prices nearly doubled in half a year. The consequence was that the Germans on December 2 issued an order forbidding the sale of all farming land at prices above the level of 1939. Moreover, farming land can only be bought by farmers. This measure, "taken in the interest of the farmers, who are the cornerstone of the community," has by no means met with general approval on the part of the farmers concerned. Acquiring the sole right to buy farming land, they practically lost the possibility of selling their farms, even if they are crippled with mortgages.

Another effect of the fear of inflation was that farmers were extremely reluctant to have their cattle slaughtered. The official meat ration amounted originally to 70 per cent. of the normal consumption. The meat available this autumn was barely 10 per cent. of the former quantities. The situation improved only after the Germans threatened the farmers with compulsory requisition of cattle for slaughtering purposes.

Needless to say that as a result of all this the standard of living of the Dutch people is rapidly on the decline. Various sources of income have almost completely dried up. The biggest shipping firm in Rotterdam is busy organising different courses in modern languages for its employees. Fishing has practically come to a standstill. The production of milk is decreasing owing to a shortage of feeding stuffs. The building trade, for which there should be many possibilities, is remarkably inactive. The builders are very reluctant to make use of the many substitute materials which are of common use in Germany. It is reported from The Hague that only 500 dwellings were under construction last autumn; the normal number is between four and five thousand. The quantity, as well as the quality, of the commodities available to the general public is steadily decreasing. The Germans try hard to impose their very elaborate rationing system on the population. However, many rationed commodities are hardly available at all, as has been the case with fats, margarine and, for many months, with meat. On the other hand, some rationed articles are so expensive that the poorer part of the population simply cannot afford them. This applies to butter. The lack of coal for domestic purposes is certainly a source of much grumbling. The Germans assured the Dutch in the autumn that there would be enough coal to heat at least one room properly. A recent warning not to use more electricity or gas than in previous years indicates that the general public was not satisfied with a situation in which many people were forced to spend every evening in the kitchen.

Rise in Prices

The attempts of the Germans to prevent a rise in prices have failed. Prices of all kinds of groceries have sharply risen, to the dissatisfaction of working-class housewives. In the beginning of December, a Dutch official, Mr Schokker, was made general commissioner for all prices. Four days earlier, all wages and salaries had been fixed—for the second time. The public is, however, busy circumventing all these decrees. There have been countless convictions for hoarding and similar offences, not because the Dutch have a lack of public spirit, but simply because they revolt against every German measure, however socially justified it may seem. As the prices for agricultural products have been fixed on a disappointingly low level, many farmers only sell their products when the wholesale dealer pays them a handsome tip. The requisitioning of horses for the German army has created much unrest amongst the agricultural community.

The decline in the standard of living is accelerated by the rise in taxation. Since January 1st, a new wage-tax has been raised which replaces the former income tax for all wage-earners. The propaganda about the "social justice" of this tax (which forces unmarried people to pay 50 per cent. more taxes than married people and which grants important reductions to big families) could not conceal the fact that the total amount to be raised by it shows a big increase. The profit tax has been raised from 10 to 30 per cent.; the land tax has been doubled; a new tax forces all people to pay half of the profit which results from the sale of real property.

It is, therefore, not surprising that the propaganda for the New Order has utterly failed. It was stated in a recent letter that at least four-fifths of the Dutchmen are "violently pro-British."

January 21st.

Turkish Foreign Trade

[FROM OUR ISTANBUL CORRESPONDENT]

December 2, 1940.

FOREIGN trade is still the outstanding Turkish economic problem. For one thing, it has receded in value, and still more in volume, compared with 1939. For another, the present unprecedented favourable balance of trade does not entirely compensate for the fact that existing stocks of foreign supplies are beginning to run low, although it may augur well for the future. Exports during the first ten months of 1940 amounted to £T88,529,000, against £T103,789,000 in 1939; during the same period, imports fell from £T106,312,000 to only £T58,091,000. In other words, last year's 2.5 per cent. surplus of imports has been turned into a 34.3 per cent. surplus of exports.

Tobacco, olive oil, mohair, cotton, hazelnuts, sultanas, opium and chrome ore have been Turkey's main export staples. As will be seen from the following table, Italy heads Turkish foreign trade, followed by the United States, Roumania, Great Britain and Germany, these five countries absorbing about two-thirds of the whole:

	(January-October, 1940)			
	Exports		Imports	
	£T.000	%	£T.000	%
Italy.....	17,538	19.8	9,751	16.9
U.S.A.....	14,141	15.9	7,238	12.5
Roumania.....	10,102	11.4	8,580	14.7

Germany.....	6,950	7.8	7,150	12.3

Of some interest is the fact that Italy, Germany, Czechoslovakia, Hungary and Bulgaria, taken together, have had only 36 per cent. of Turkish foreign trade, against the 55 to 66 per cent. share formerly possessed by Germany, while another fact deserving notice is the increase in trade with the Balkan countries from only three to as much as seventeen per cent. of the total.

Commercial exchanges with a great number of other countries have practically ceased. Such is the case with all the territories seized by Germany, except Czechoslovakia, as well as Spain and Japan. Sweden, Finland and Switzerland are doing their best to maintain business relations with Turkey, despite the unusually high transportation and insurance rates prevailing to-day. Finland has arranged to send her goods via Russia on somewhat lower rates, and Sweden seems to be prepared

to follow her example. Very typical of the "new" European order is the fact that, while Germany is now selling no newspaper at all to Turkey, and will not do so before the old Turco-German twenty-one million agreement has begun to be applied, a German-Swedish arrangement provides for a limit in Reichsmarks below which Swedish newspaper cannot be offered on the Turkish market.

Czechoslovakia in the New Year

[BY A CZECH CORRESPONDENT]

January 14th.

THE Czechs entered the New Year with a great deal more confidence in liberation than they felt a year ago. They are cheered by the disorganisation inflicted by the R.A.F. on German economic life, and by the military achievements of the Allies in the Balkans and North Africa. On the other hand, growing uneasiness is felt among the Germans, because of the evident influence on the whole Czech population of the London Czech broadcasts. In general, the broadcasts from abroad are listened to. The German-controlled transmitters in the Protectorate, even German stations broadcasting in Slovakia, devote a large part of their time to polemics against the B.B.C., and especially against the messages of President Benes and Mr Jan Masaryk.

The successive visits of the Reich Ministers, Goebbels, Franck, Dorpmüller and other high Nazi functionaries since the customs and monetary union was established, has been followed by an intensified move towards incorporation. On orders issued by Goebbels himself, the Czech puppet Prime Minister's office advised all newspapers and periodicals, even technical ones, to publish articles in a prominent place in every number expressing a positive attitude towards questions of "public interest," that is to say, towards the incorporation of the Protectorate in the Reich. Prague, and big Czech provincial towns, the Moravian capital, Brno, at first glance scarcely differ from German towns in their outward appearance, owing to the German street and business inscriptions, communication marks, etc. In every Czech town, even in small ones, there is an "Oberlandrat" with a whole gang of Nazis, so that the Czechs are kept under close observation. In December, sign painters in the workshops of the Czech railways began the repainting of the coaches, which are to be marked DRB, as is the rolling-stock of the Reichsbahnen. On January 1st German freight tariffs were introduced on the Protectorate railways.

A number of new German leading officials have been taken into the administration of the City of Prague; most of them are completely superfluous and without any material or linguistic qualifications. Nevertheless, they are allotted large salaries from Czech public funds; young officials begin their career with a salary of 30,000 kr. a year, an amount which Czech officials usually earn only after ten or fifteen years of public service. The Protectorate Government asked Herr von Neurath to increase the wages of Czech State officials by 10 per cent. and the annual bonus by 6,000 kr. He refused, and only the wage increases formerly in force have remained. By direct order of Hitler, on the other hand, factories had to pay their German clerks 1,200 kr. special New Year allowances.

Head Offices:
LIVERPOOL **LONDON**
North John St. Lombard St.

January 25, 1941

The arrests of Czechs continue. The Mayor of the town of Czeaslav was recently arrested on suspicion of economic sabotage. In the Pilsen district, members of workers' factory committees have been arrested in considerable numbers. The "Sokol" Centre at Kladno has been transformed into a prison where several hundred members of the former Social Democratic Party and a certain number of Communists are held. The Czech authorities are carrying out at German orders a new census of the officials of various associations, and the list is to be given to the Gestapo. Many new arrests are expected. An inventory is also being made of the property of the Czechoslovak "Sokol" Association, which, with over one million members, is the biggest gymnasts' organisation in the world. It is in danger of being confiscated under the pretext that the "Sokols" are the main representatives of Czech national consciousness.

Rise in Share Prices

The Prague Stock Exchange Committee has issued a warning against the economically unjustified purchase of shares. The demand for shares is causing a rise in prices, and the capital market has at present more important tasks in the nation's economy. Capital must be available after the war for new investments. At present shares are bought regardless of their lucrativeness, the return often being only 1 per cent. of purchase price. Outside speculators are blamed for this by the Committee.

All factories working for the war industry are producing at full speed in three shifts. There is a shortage of workers, however, and most University students have accepted fully paid jobs with Czech firms (300 kr. per month) in order not to have to go for forced labour to Germany where already 80,000 Czechs are working.

Since November, there has been practically no fruit on Czech territory. It has been commandeered by the Germans and taken away from the country. In Moravia, the granaries of the agricultural co-operatives are quite empty. By January 1st, granaries and store houses had to be made ready, by order of the Protector, for some 50,000 wagon-loads of grain. Milling companies in Prague have received for storage 3,000 wagon-loads of grain from Lithuania from the 1937 harvest. This grain, though, is at the disposal of the German authorities alone.

There is very little meat. The 300 grammes, 10½ ounces allowed per person per week is not always obtainable. Chocolate is almost unobtainable and, when it is, uneatable. One kilogramme of coffee is sold on the black market at 450-500 kr. (in 1938 it was about 100 kr.), 1 kg. of butter at 100-120 kr. (1938-27 kr.), 1 kg. of garlic at 80 kr. (1938-12 kr.), 1 kg. of onions at 60 kr. (1938-10 kr.).

Although this year the area of sugar beet cultivation was larger than in 1939 there is considerably less sugar in Bohemia, owing to lack of coal. There is, therefore, a great demand for saccharine, but factories which produce this substitute have the same difficulty in obtaining coal and substitute materials. The sugar ration (300 grammes, 10½ ounces per week) has already been provided, since September, out of the new harvest, so that supplies will certainly soon be exhausted.

On the Czech railways experiments are being made in fuelling locomotives with surface (brown) coal of which there is plenty in Bohemia. The heating capacity of this kind, however, is so small that it does not bring about the necessary steam pressure. Oil used on railways is refined in order to be used again.

Hongkong's Trade Prospects

[FROM OUR HONGKONG CORRESPONDENT]

December 20th.

AFTER some three or four months of abnormal slackness, most branches of trade have recently shown signs of revival. Gaps in the Japanese blockade seem to be increasing, and exports of essential requirements have been passing into Free China in greater volume than for some time past. The Canton River is officially open once again. Although the British steamer, which is allowed to carry a limited number of passengers, made one trip after the reopening of the river, the Japanese quarantine

restrictions kept it at a buoy for four days and further sailing has taken place. The main object of despatching the vessel was to take fresh stores for the foreign residents marooned on Shameen, and, so far as the shipping company was concerned, it was an unremunerative voyage which is not likely to be repeated until the Japanese authorities remove their present restrictions. Canton is still a destitute city mainly populated by the coolie class, and it is reported that many Japanese shop-keepers have given up the struggle to make a living and have returned to Japan. The plight of the population is appalling, as the price of rice has risen to a prohibitive figure and there is a great scarcity of fish, vegetables and other necessities of life.

The poorer classes in Hongkong have also been suffering from increased cost of living, both rice and firewood having risen enormously in recent months. The Government has now stepped in and fixed maximum retail prices for the various grades of rice and is obtaining fresh supplies to replenish its reserve stock. The Japanese occupation of Indo-China has cut off one important source of supply, and as there are difficulties in arranging shipments from Bangkok, it will be necessary to look to Burma for rice requirements. The rice problem is not confined to Hongkong, for throughout the East the population is suffering from the effects of the dislocation of the rice trade brought about by the Japanese. In Japan itself a series of bad harvests have left a deficiency which necessitates imports at high cost, Shanghai has been suffering a serious shortage, and in Chungking Marshal Chiang Kai-shek has had to admonish the wealthier classes for hoarding rice at the expense of the ordinary consumer.

The appointment of Sir Robert Brooke-Popham to be Commander-in-Chief in the Far East has encouraged hopes that eventually Great Britain will be in a position to stop further Japanese encroachment and assist China in driving out the invader. There is general recognition of the importance of co-ordinating the various British administrations in the Far East. Sir Robert Brooke-Popham will be visiting Hongkong shortly and will find that so far as land defences go this Colony is now well protected. For the past six months, however, Hongkong has been hemmed in by what amounts to a besieging force, and although the interference with trade has not been so serious as was at one time expected, there is no doubt that the Colony is greatly handicapped by its inability to trade freely with Canton and the neighbouring provinces. The new Commander-in-Chief has already expressed himself frankly in an interview on the Pacific question with a Japanese journalist, and the time may not be far away when his warnings and those of the American Ambassador in Tokyo may begin to be taken to heart by the Japanese Government.

Hongkong's War Potential

The Hongkong delegation which attended the Eastern Group Conference at Delhi has now returned. No official report has yet been issued, but the members of the delegation feel confident that the industries of this Colony will be able to play an important part in supplying war material for the forces east of Suez. At the opening of the Conference, the Hongkong delegates found that they were practically alone in having prepared a comprehensive survey of the potential capacity of their territory. The details which they were in a position to supply did much to convince an incredulous gathering that Hongkong was unique among Crown Colonies in possessing an extensive manufacturing industry, covering a large variety of war requirements. Steel helmets, gas-masks, web equipment and all types of wearing apparel needed by the services are obtainable from Hongkong. The well-equipped ship-building yards of the Colony are also in a position to supply munitions, provided raw material is available. But, before orders can be placed, a good deal of preparatory work is necessary, and this is now in hand. Finance is a major consideration and such questions as extending existing plant, ensuring supplies of raw material and shipping space have all to be tackled. A Central Purchasing Board has been set up at Delhi, and it will presumably be necessary for each unit of the Empire to have its own organisation for dealing with orders as they are issued by the Board. It is imperative that no time be lost in giving effect to the decisions reached at Delhi, and so far as Hongkong business circles are concerned there is every desire to co-operate with the official authorities in setting up an organisation which will function efficiently and economically.

January 25, 1941

Commercial Banking Trends in the U.S.A.

(FROM OUR NEW YORK CORRESPONDENT)

December 14th.

A RECENT letter reviewed the monetary developments of three autumn months as reflected in the Reserve Bank data. This letter will refer to the member banks. This emphasis seems justified by three facts: (1) under our gold programme the expansion of credit is automatic, and any relation to the needs of commerce and industry is, as the cinema titles say, "purely coincidental"; (2) our economy is reaching the stage of hypothetically full utilisation of human and material resources, and (3) as it reaches this point it finds itself in the presence of increasing demands.

While the general tendency of the three-month period is the continued rapid climb of bank credit (total loans and investments), this comprehensive generalisation is marked by two qualifications, neither of them absolutely new—that New York continues to differ from that of the rest of the country; and that whereas one could formerly remark that a growth in loans and investments principally (almost exclusively) meant a growth in investments in Government securities, in recent months the marked growth has been in commercial loans. Both of these phenomena appeared some time back, but they seem to be more accentuated recently.

REPORTING MEMBER BANKS IN NEW YORK CITY.

	End May '40	End Aug. '40	End Nov. '40
Total loans and investments	9,219	9,568	9,848
Security loans ..	509	421	502
Commercial loans ..	2,293	2,316	2,480
Securities (total) ..	6,417	6,881	6,861
U.S. securities ..	3,820	4,030	4,088
Guaranteed securities ..	1,275	1,372	1,530
Other securities ..	1,322	1,489	1,243
Demand deposits adjusted ..	9,898	9,727	10,225

All these items show increases except the "other securities"; but the increase in the loan items in the last three months exceeds the increase in investments—a most unusual occurrence in recent years.

REPORTING MEMBER BANKS OUTSIDE NEW YORK CITY.

	End May '40	End Aug. '40	End Nov. '40
Total loans and investments	14,805	14,589	15,059
Commercial loans ..	5,223	5,868	5,721
Securities (total) ..	8,632	8,817	8,918
U.S. securities ..	5,261	5,357	5,455
Guaranteed securities ..	1,124	1,210	1,177
Other securities ..	2,247	2,250	2,281
Demand deposits adjusted ..	10,894	11,326	11,964

The increase in deposits and in total loans and investments is about the same as in the New York banks; the ratio of total loans and investments to demand deposits is larger than outside New York, because of the larger element of time deposits outside New York. The increase in investments (well over \$400 millions in New York, under \$300 millions outside) was relatively, as well as absolutely, larger in New York; the distribution was rather different. Both bought U.S. securities, but beyond that the New York banks preferred the guaranteed securities, while the interior banks leaned slightly toward "other securities." The loan account shows the more marked deviations. The security loan does not figure heavily outside New York, and even in New York it is but a minor item. Commercial loans outside New York have expanded continuously over the past six months, but more rapidly in the past three, and more rapidly outside New York. The aggregate of commercial loans of the banks outside New York is more than double the New York figure; and while commercial loans outside New York are above one-third of total loans and investments, in New York they are under one-quarter. However, for both groups the increase in commercial loans is not far from 10 per cent. in the past six months—a relatively large and rapid increase, and larger than the relative increase in investments.

This increase is, of course, what would be expected from the marked increase in business activity over the period. It is not yet as great as in the 1936-7 cycle, probably because of the inertia of commodity prices.

18th CENTURY PROPHECY

*The time will come, when thou shalt lift
thine eyes
To watch a long-drawn battle in the skies,
While aged peasants, too amazed for words,
Stare at the flying fleets of wondrous birds.
England, so long the mistress of the sea,
Where winds and waves confess her
sovereignty,
Her ancient triumphs yet on high shall bear,
And reign, the sovereign of the conquered
air.*

(Translated from Gray's 'Luna Habitabilis,' Cambridge 1737)

Make it come true! Just two hundred years ago this remarkable vision of the war in the air was written down in Latin verse by the great English poet who composed the famous 'Elegy'. To make Great Britain 'Sovereign of the conquered air' is now our task. There is no time to 'stare at the flying fleets', we must exert all our energies to increase them. Everyone must help. You can help with money. Save every shilling you can and lend it to the Nation!

Save regularly week by week. ... a Post Office or your Bank or Stockbroker and put your money in ... Savings Bonds 1955-1965, 2½% National War Bonds 1946-1948, or 3½% ... Issued by The National Savings Committee, London

THE BUSINESS WORLD

Continental Bourses

ON the western fringe of the continent of Europe, all stock exchanges are at present more or less under German control. In consequence, price movements in these markets provide a significant indication of the fear of inflation which possesses the inhabitants of all the occupied territories. A striking contrast is provided by movements on the Swiss stock exchanges, where, despite the serious political threat to Swiss independence, both dealings and prices have remained, in general, completely normal. Moreover, business on the Swiss markets has continued without interruption, although those of Paris, Brussels and Amsterdam were closed for several months.

Since the reopening of the stock exchanges in occupied and unoccupied France, Holland and Belgium, business has been characterised by a continual inflationary upward movement in quotations. The widespread destruction, for which the spring campaign was responsible, the continued dislocation of communications and transport, the decline in business activity, caused by rationing, the scarcity of goods of all sorts and the complete standstill of foreign trade suggest a fall rather than a rise in values. The results of industrial companies for the past year contain no information calculated to encourage the purchase of shares, while in France the position is obscured by the fact that no company reports at all are published and there is a complete lack of information, together with a widespread failure to seek for facts on matters of vital interest. The increase is thus based solely on fears of inflation, the signs of which are so familiar to more than one generation of continental investors. A further important symptom of the incipient inflationary boom is the general lack of interest in matters relating to the currency, despite the fact that currency movements are the most generally recognised warning of approaching inflation.

Purchases are curiously unselective, there being a keen demand for "values" which are liable either to depreciation or to seizure by the German authorities. Presumably the latter view the prospect of inflation with equanimity, and it is clear that they are at least partly responsible for it. They are taking advantage of the opportunity to acquire holdings in key industries or to increase existing participations. Whatever they may say later they will find it difficult to place the blame on their favourite scapegoats, the Jews. These are excluded from membership of stock exchanges in occupied territories and Jewish capital in Western Europe has but one objective, to achieve the maximum liquidity and mobility.

Since the collapse of France, the structure of the French capital markets has undergone a complete change. The Paris stock exchange, which had been for decades the leading and the most vigorous financial centre of the Continent, has fallen to the level of a small provincial market. But the provincial markets of Lyons and Marseilles, in unoccupied France, have achieved unexpected importance. With the exception of an abortive attempt to reopen on July 30th, the Paris market remained closed from June 10th to October 14th, 1940. No adequate reason for the failure to restart dealings at the end of July has yet been provided by the authorities. The official explanation, that the valuation of stocks was made impossible by the existing lack of information, sounds unconvincing in view of the fact that the bourse at Bordeaux, also in occupied territory, was open throughout the autumn. It was eventually closed at the same time as the Paris market, however, only since then the market has been reopened.

Since then the market has been reopened. Dealings in industrial shares are prohibited and no recognised market in equities exists in occupied France except in a few gas and electricity shares, although there are, of course, black markets as there are for dollars.

petrol or bread. The stocks quoted are French State loans, except those containing a currency clause, and a variety of Treasury bonds. The bourse is completely cut off from international business, including that with unoccupied France, by the continued suspension of telegraphic and postal communications and by the currency regulations. The initial quotations of State securities, with which investors in this area have to content themselves, were substantially higher than the prices prior to the French collapse and have increased steadily. Between the first week of June last, when panic had not yet spread, and end-December, the price of 3 per cent. perpetual *Rentes* rose from 70 to 87 and that of 4 per cent. *Rentes*, 1917, from 73 to 91. It is interesting that quotations at Lyons are from four to eight points below those of Paris, a disparity which is explained by the greater choice of negotiable stocks in unoccupied France and by the more obvious degree of inflation in the occupied area.

Throughout France, there is a general flight from currency, but this pressure is more marked in the German occupied part of the country, where large quantities of *Reichskassenscheine* have been issued by the occupation authorities in payment for requisitioned goods and for the purchases of German soldiers. It is reliably reported that the sum of this German currency, circulating in occupied France, exceeds the value of franc notes in circulation. The abundance of cash renders possible both a rise in gilt-edged prices and a general anxiety regarding inflation, usually mutually exclusive conditions. The acquisition of State loans appears to the public to be the only existing method of acquiring real values—although others doubtless exist—and this despite the fact that the debt position of the French Government is becoming rapidly worse. It is true that the total of long-term loans remains unchanged, but this is hardly significant beside the recent commitment for fr. 75 milliards to meet the cost of the German occupation, a sum which is bound to be increased, while provisions have also to be made for current expenditure.

In unoccupied France, market operations are conducted in more favourable conditions. Lyons has triumphed over the difficulties attendant on its sudden elevation to be the leading French bourse. It has, of course, for long been an important financial and industrial centre and the seat of the head office of the biggest French bank, the *Crédit Lyonnais*. Since the summer, the list of quotations has been considerably extended. The position of the Marseilles stock exchange has also been strengthened, partly because bad communications have favoured a certain degree of local patriotism in southern France. The market at Toulouse is still merely a provincial exchange. On all these bourses, dealings are characterised by the absence of professional speculation; all dealings are for cash and business in futures or credit transactions of any kind are barred. The main business comes from genuine investment orders for private persons. They are individually small and point the more obviously to the fear of inflation which has inspired them.

In Vichy-France, the boom is a boom in industrial equities, and the absence of professional speculation, inadequate organisation and an insufficient network of brokers have all helped to promote some very sharp price fluctuations. The authorities, who would like to see interest focused on Government issues, and who deprecate the anxiety concerning inflation, have issued constant warnings against excessive bidding up of quotations, but the popular investment remains, even at present levels, the industrial equity, especially that of a foreign company. In November, Suez Canal bonds were quoted at 17,000 against 13,000 in the first week of June—despite the first failure to honour a coupon in the

history of the company—Nestlé rose from 8,700 to 19,000 and even Royal Dutch, which has not been favoured in other centres, improved from 4,800 to 6,000. Several French industrials have realised gains in price of as much as 100 per cent. over the same period and the attempt to escape into "real values" is underlined by the relatively modest rise in the price of "gilt-edged."

The Brussels stock exchange, under the control of a German commissioner, was not reopened until August 21, 1940. At first, dealings took place in a few stocks only, mainly state loans. The chief aim of the commissioner was to create a market for German bonds, but the Belgian public, like the French, showed a strong preference for industrial shares, and, in order to avoid over-speculation on the black markets, dealings in equities were permitted in the late autumn. It is, of course, true that prices on May 9th last year, the day preceding the invasion, were abnormally low. But in the meanwhile a recovery in quotations of the order of 80 to 100 per cent. has been the rule, and, on paper, the investing public has become the richer by several milliards. The prices of the big electrical concerns with international interests, such as *Sofina*, *Brufina* and *Electrobel*, are quoted at approximately double their pre-invasion levels, and the scarcity of stock is so marked that the bourse committee has had to prohibit the quotation of buying prices, while rationing was actually suggested. The purely inflationary character of the Brussels boom is also indicated by the fact that it does not extend to gilt-edged issues. The public is prepared to pay prices, which are obviously unjustified, provided the security appears to be backed by some material asset, but they only subscribed some 36 per cent. of a recent issue of 4 per cent. Government stock, of which three milliard francs was offered.

In Holland, the German authorities have so far been less heavy handed in their control. The Amsterdam stock exchange was opened about the middle of July, and several restrictions imposed at that time have since

been lifted. To begin with, the authorities took precautions against a spectacular collapse in prices, but in Amsterdam, too, prices have risen considerably, and there is a general fear of inflation. The main causes of the boom in equities are the same as those operating in unoccupied France and Belgium, but the impetus is rather less powerful. It is true that considerable sums of money have been released for investment by the liquidation of stocks and the impossibility of replenishing them; and an imprudent policy of public expenditure has contributed to the increase in the circulation. The Dutch public is, however, extremely well versed in financial matters, and the flight into goods is much more discriminating than in France. Dutch capitalists are perturbed by the fact that they are completely cut off from the numerous big concerns, now controlled by the Dutch Government in London, with plant located in the Dutch colonies. Thus, Royal Dutch, for long a market favourite in Amsterdam, is steadily losing ground. On the other hand, a surprising improvement has taken place in the quotations of international concerns such as *Aku* and *Lever* and *Unilever N.V.* In view of the existing political conditions and the currency regulations, Dutch shareholders realise that they can draw no immediate profit from the favourable business and financial position of these enterprises, but are still prepared to pay high prices if the long-term outlook is encouraging.

There is also considerable German buying with the object of securing a stake in international concerns. It has not yet been generally realised that—unhindered by transfer difficulties—a comprehensive infiltration of German interests into Dutch and international companies is in progress or in preparation. Dutch interest in the progress of German industry is being encouraged by the readmission to the Amsterdam bourse of all German securities previously quoted there as well as numerous additions to the list. Thus, Amsterdam has become the western outpost of German financial strategy. The simultaneous introduction of a number of

American industrial securities on to the Amsterdam market seems to be dictated by a desire to extend German interests even into this field. When, as at Amsterdam, the German authorities have succeeded in establishing business in I. G. Farbenindustrie, Vereinigte Stahlwerke, and Siemens & Halske, on the one hand, and in such shares as U.S. Steel, Radio Corporation and

General Motors, on the other, it has to be admitted that considerable progress has been made in restoring German influence in international finance. Less progress has been made in the other countries, where, for the time being at least, any infiltration or co-operation will be carried out *sub rosa*, but throughout the occupied areas Germany is in virtual control of the markets.

War Risks on Export Goods

(By a Correspondent)

THE diversion of British production to the war effort has rightly placed export goods in a category of importance second only to munitions. It has yet to be recognised that there is an obvious corollary: that when export goods are destroyed by enemy action they should be replaced as fast as possible. To this end it is therefore imperative that war-risk claims in respect of such losses be given precedence over others, so that the replacement is not held up for lack of the necessary funds. Any delay beyond what would normally be incurred by the process of trade turnover or any uncertainty regarding insurable interest is a brake on production, whilst if payment can be made more rapidly than the trade-turnover criterion a definite advantage is achieved.

Losses by enemy action can be divided into three classes according to the place at which they occur. Stocks may be in the workshop or warehouse of the supplier, in transit from warehouse to ship, or on board the ocean-going steamer which conveys them to their market. This classification conforms to the common factor in various trade usages, and existing insurance practice falls into line: the war risk can be insured to cover (a) stocks in warehouse, or (b) inland transit or (c) water-borne transit. Until quite recently only the third of these hazards could be covered, but the Government schemes now offer facilities for both other locations.

In recent experience, claims arising from losses in warehouse have proved to take some time in their formulation, assessment, and final settlement. Following complaints of delays, an official speeding-up has been undertaken which promises to curtail the period between lodgment and settlement. From the export market's viewpoint, prompt replacement can often be effected by tapping alternative sources of supply e.g. by diverting goods which would otherwise have gone to home markets, though the extent to which this is feasible largely depends on the nature of the destroyed merchandise.

The problems of loss at sea are, as far as the exporter is concerned, more a matter of securing the prompt return of the title-documents essential to the formulation of the claim. More delays have been due to this factor than to any other. It is normal trade practice for all parts of the bill of lading, and all copies of the marine and war risk policies or certificates, to be sent overseas: either they are lodged for presentation through collecting bankers where bills of exchange are drawn, or else they are sent direct to the "open-account" buyer. In view of the fact that at least one part of the bill of lading, accompanied by a copy of the insurance contracts, is required to support the claim, it seems desirable that these should be retained by the exporter or his agent. Banking practice appears to have been going through a change—complete so far only in the case of the Australasian banks—in order to conform to the necessities of present circumstances. Since commercial practice can be modified in this way it is undoubtedly better that traders, and not the insurers, should be responsible for the evolution.

A different problem arises with the land-transit loss. In normal trade export merchants buy from their suppliers on F.O.B. terms: the supplier sells "free on board" and is thus responsible for all expenses up to the time the goods are on the ocean-going steamer. Conversely, the duty of the buyer is to arrange with the shipowner for the carriage of the goods and advise the seller of the name of the vessel on which they are to be placed. During the past few months this has been particularly difficult on both sides. Ships have not arrived, or have been diverted to other ports, and enemy bombers have singled out the harbours and quays for their most

determined attack. It has been necessary to keep shipping arrangements secret, since to broadcast information regarding arrival and departure is to invite enemy attack at inopportune moments.

With so many difficulties in the way of the export merchants seeking to take up F.O.B. goods, some of them have been buying "Ex works" or "Ex warehouse" instead. This is not a satisfactory solution since it carries with it the more normal risks and expenses of transit from warehouse to ship: moreover, the manufacturer's organisation is usually built up to carry out this transit, as when he employs road transport in his own ownership or in that of a contractor who distributes for him in the home market as well as in export merchandise. Such insurance cover as the manufacturer arranges against fire and pilferage is usually applicable to stocks in land transit as well as in warehouse. Under these circumstances, the merchant's ex-works purchase of export merchandise is seldom a satisfactory solution of the land-transit war risks: it too often involves changing several cogwheels in a piece of machinery which functions well enough without the change.

In extreme cases goods are actually on the quayside or in course of loading when enemy bombs drop: ships have been cleared without allowing the loading process to be carried through with the care considered usual, and so the "subject to goods being on board" bill of lading has come into being. If the vessel should then be sunk, it is quite impossible for the parties to determine whether the loss occurred during transit by sea, or during transit to the vessel: in other words, if the merchant had bought F.O.B. it is not clear whether he or the supplier suffered the loss. This is, admittedly, a comparatively rare case so far, but it serves to emphasise that the F.O.B. contract, under present conditions of war-risk, is no more satisfactory than the "ex-works" sale of goods.

It is quite clear that the existing trade mechanism is being asked to carry a hazard which it is not suited to bear, and for which it cannot evolve a satisfactory solution. That can only be adequately provided by a more elastic approach to the provision of war-risk cover by the Government, possibly by the combination of sea- and land-transit risks into a more comprehensive policy for those whose trade it suits: the marine policy usually incorporates a "warehouse to warehouse" clause, and it would seem that a parallel is called for in the realm of war risk insurance.

If it is to prove attractive the "through" policy must necessarily recognise that its issue curtails clerical labour, and reduces the number of parties to be dealt with. Moreover the merchants who would be the insurers are more used to taking an intelligent initiative in the direction of insuring, as has been recognised by the conscription of warehouse stocks in the scheme covering static merchandise. In order to avoid dispute it would be well to offer a through policy at a premium slightly cheaper than the combined cost of present s.a. and land-transits.

TO CORRESPONDENTS.

Owing to the shortage of paper and the rise in postage rates it is necessary to announce that letters cannot ordinarily be acknowledged or manuscripts returned unless a stamped and addressed envelope is sent for the purpose.

THE ECONOMIST, 8 BOUVERIE STREET, LONDON, E.C.4.

Finance and Banking

Scarcer Credit

The supply of funds in the money market has contracted appreciably during the past week. The total of bankers' deposits at the Bank of England has fallen by £24,077,000 to £95,127,000. In part this is offset by a further reduction in Government securities, but in the main it reflects the expansion in public deposits which have risen by £20,520,000 to £35,309,000. One of the factors at work is the preparation for the repayment of 1 per cent. Treasury Bonds which fall due on Saturday of next week. It may now be assumed that the Treasury have no intention of making a conversion offer specifically aimed at this maturity. So small a portion of the £100,000,000 outstanding is in the hands of the public that the maturity of this loan can be handled without undue disturbance to the Exchequer position. The ease with which the repayment of the outstanding balance of this loan will be repaid must be accentuated by the fact that revenue payments are flowing in very well at this particular time. In addition, the cash resources of the Exchequer have recently been supplemented by official sales of Conversion 2 per cents. The public departments were left fairly large holders of this issue when it was offered in exchange for Conversion 4½'s last year and the stock has been available on tap ever since. The tap price has been twice raised during the past fortnight and this confirms other indications that the outlet for this stock in the market and among banks has recently broadened. The draining of bank cash consequent on heavy revenue payments and sales of securities by public departments has proved sufficient to force the authorities to give special help to the market. It is interesting that this help has not been given by direct purchases of bills from the clearing banks, but by purchases from the discount market. The bills taken this week have been March maturities at a rate of 1 per cent.

Sterling Area in Africa

The spread of the sterling area in Africa has this week proceeded even more quickly by agreements made with our Allies than by force of arms. The commercial and financial agreements made with the Belgian Congo and with the Free French territories virtually bring these important areas within the bounds of the sterling area. They make Africa—except for the rapidly contracting

enemy territories and the North African fringe—a vast area whose different currencies are stabilised in terms of sterling, subject to the same system of exchange control and readily interchangeable into one another. It is this accomplishment rather than the gain in foreign exchange promised by the new agreements that gives them their importance. The commercial part of the agreements provides for certain minimum British purchases of commodities from the territories concerned. The exports of these Belgian and French territories to countries outside the sterling area will, from now on, feed the foreign exchange resources of the British Treasury. The proceeds of such exports, after providing for the essential needs of these colonies, will be sold to the British authorities in exchange for sterling. The rate of exchange between sterling on the one hand and the Belgian and French colonial francs has been fixed at 176.625 francs to the £. The whole system of exchange regulations in the Belgian Congo is to be overhauled and made to comply as closely as possible with the system operating in the sterling area, and the Banque du Congo Belge, which is the issuing authority for the Belgian colony, will be endowed with the necessarily enlarged powers.

Erlangers' Acceptances

The balance sheet of Erlangers, Ltd., for the end of 1940 is of particular interest for the resistance it reveals of the acceptance business of this firm of merchant bankers. The acceptances outstanding at the end of the year amounted to £2,222,733, against £2,401,921 a year previously. Part of these totals, namely, the facilities granted to customers in Germany, is, of course, not susceptible of contraction at the moment. The total involved on December 31st last was £739,775, and the value to be attached to these claims must remain a matter for considerable conjecture for the time being. But the balance, representing the active acceptance business of this firm, has shown an exceptional degree of resistance to the forces which have been making for a persistent contraction in the volume of banking facilities used by trade and industry in this country. That this should be so can only be due to the initiative with which the firm in question has tackled the problem of diverting its facilities from the traditional channels of international trade to that of domestic finance.

Life Assurance New Business

In 1940 sums assured by new life policies fell away by 37 per cent., after a decline of 20 per cent. in 1939. There is no need to seek far afield for explanations; in fact, it is rather surprising that the loss of business has not been greater. Contracts of a long-term nature can only be entered into where it is possible to look ahead with some measure of certainty, and many prospective policy-holders must have hesitated before committing themselves to payments which must continue in an unpredictable future. Higher rates, due to lower interest earnings and increased taxation, as well as less favourable bonus prospects on with-profit policies, have added to the difficulties with which the offices have had to contend. The reduction in new business is a matter for serious regret, not only because of the merits of life

* Approximate.

assurance *qua* life assurance, but also by reason of its importance as a medium for saving. The significance of the new business figures should not, however, be exaggerated. New policies form but a small proportion of the total assurances in force, and it is unlikely that premiums have fallen to any marked extent. On the savings aspect of assurance it is thought that the offices have suffered, instead of benefiting, from the National Savings Campaign. The two forms of saving are not, of course, on all fours—life assurance connotes sustained saving over a long period by contrast with the more transitory appeal of the savings campaign—nevertheless, there may well be a popular feeling that it is more patriotic to subscribe to defence loans than to save through a life office, an illogical feeling, since a high proportion of life funds finds its way into Government securities. To counteract it, some offices, as in the last war, are offering 15-year endowment policies under which the sum assured is payable in savings bonds in lieu of cash. These contracts have the apparent attraction that the payment of the first premium initiates the immediate purchase of bonds for the full sum assured, but the extent to which they can be offered is clearly conditioned by the total funds available for investment.

More Exchange Loopholes Closed

The history of most schemes of exchange control is one of constant catching up with would-be evaders of the regulations already in force. Provided the basis of the general scheme of control is sound, these occasional amendments are in themselves of little concrete importance. That is true of a batch of new regulations issued this week to regularise the position of travel agencies in their foreign exchange transactions. The broad effect of the new regulations is to restrict the purchase of travelling facilities and hotel accommodation in the United Kingdom to places in the United Kingdom. They also forbid the refund of any such bookings in any currency other than sterling. The developments which have given rise to this further tightening of the sterling exchange control, though unimportant in terms of the absolute amounts involved, offended so grossly against the spirit of the regulations that the attack on them had become rather overdue. Recent reports from centres such as Lisbon had revealed the emergence of a market in return tickets to Britain and hotel accommodation in this country. These were mostly sold at appreciable discounts and the foreign buyer would thereupon cancel the accommodation represented by his purchase and claim refund in foreign currency. The foreign exchange proceeds of the deal would then be divided between buyer and seller. The new regulations should effectively stop such small but noxious loopholes in the control of capital exports.

Investment

Long Term Factors

In days long prior to the outbreak of war, it used to be said that the only development outside this country, which had power to affect prices for more than a day at a time, was some major move by Germany. Since the country has recovered from the shock of the French collapse, this insensitiveness to overseas developments has, in large measure, returned. Except for stock directly involved, the market has taken no very great account of our successes in the Mediterranean, of the deterioration, and subsequent improvement in our defence against the submarine attack on shipping, or indeed of the conversion of the average American from benevolent neutrality to something approaching full co-operation. It is, however, just possible that talk of invasion has still power to slow down investment demand and that the burst of publicity, which the possibility of an attempt has just received, may have helped to stop the rise in prices and to produce the semi-stagnation from which the market began to suffer early this week. On the other hand, it is perhaps more probable that this change is mainly the inevitable reaction from a rather

rapid rise in some prices, intensified by the realisation that important changes in internal conditions are now matters of official policy, even if it may still take months before that policy becomes effective. These promised developments contain the possibility of a further limitation of private control of industry—at least so long as a state of emergency lasts—and must give pause to those who are investing in equities. There is nothing so far to indicate any further attack on the earning power of those concerns working for national ends, but there is a new uncertainty as to the general status of private capital. As against this, the position of the firms working in the national interest, as compared with those who cater merely for private satisfactions, is made clearer than in any official statement hitherto. It may be that investors have to face a swing of earning power away from the latter more protracted, if not even larger, than they had anticipated. There is, however, in the recent movement of equity prices some evidence that this new development has been discounted. While the slight rise in industrial values has been very widely spread, there has been going on behind it an exceptional improvement in a few ordinary shares on a much more substantial scale.

This has resulted in a very definite widening of the yield margin between these few selected shares and the general body of industrial equities. The select few cover in the main the leading concerns in a few small industries, whose activities are not only essential in war-time, but whose secular trend may be expected to continue upwards when hostilities are over. This is, of course, not a new development, but it has been accentuated. Whether in point of fact yields, which begin to approach the gilt-edged scale, are really justified even for this group will depend on future taxation policy, that is to say on political factors, but it is interesting to observe that post-war factors are beginning to be given more weight. A more logical reaction would perhaps be a protracted halt in the rise in general equity values. It seems probable, however, that these will be dragged upwards by a rise in the Funds such as is almost inevitable as a result of the growing substitution of Government finance for bank advances, and the resultant purchase of longer dated Government stocks by the banks, in an attempt to maintain the rate of earnings on total resources. There is also a slight hope of some revision of E.P.T. to buoy up prices.

Need for Longer Session

In commenting on the decision of the Committee of the Stock Exchange, London, reached in the latter part of September, to curtail the hours of official dealing and to close at 2 p.m., *The Economist* stated that this was a concession to the difficulties of transport, which were then at their greatest. Even so, it was rather felt that it might have been as well to wait for the end of summer-time. Summer-time has been with us throughout the winter; the days are now beginning to lengthen, and there is every reason to suppose that the new Government measures will lessen the burden on the shoulders of those who up to now have borne the whole weight of A.R.P. There have been many other developments since last September, one of particular importance in this connection being that, even if you obey the G.P.O. advertisements and catch the noon post, whatever else you miss, your order will still arrive comparatively late. Moreover, the volume of business is increasing, and telephone communications are such that in some cases it is necessary to revert to the messenger, a type of employee conspicuously difficult to obtain. In fact, for a variety of reasons, the time has come when the Committee ought to go back on its decision of September last and return to later closing. Nor does there seem any justification for paying attention to a minority movement which is urging a compromise of closing at 2.30 p.m. Lloyd's have set the example of going back to a 4 p.m. closing as from Monday week. While they closed at 3 p.m., they made the time up by working through the official lunch hour. Since the stock market had not permitted itself the luxury of a mid-day recess, it could not follow this example, but it is now the talk on Lloyd's that, despite the return to the full working day, the new practice of avoiding a break is to be retained. Surely this example

should suffice to encourage the stockbroker to keep the House open until 3 p.m. and the jobber to remain for a reasonable length of time after that. It is even possible that, if the authorities decide to add a second hour to summer-time, the market may be called upon to work even later, when the days are longest, with or without a corresponding delay in opening to permit of more complete delivery of mails before the official start.

"Tap" Issue Results

With subscriptions amounting to £9,477,415 for 2½ per cent. National War Bonds, 1946-48, and to £6,124,914 for 3 per cent. Savings Bonds in the third week in which they have been on sale, the three weeks' total for both classes of issue is brought to £55,899,239. Thus the upward trend of weekly subscriptions has not been maintained. The initial reception of the new issues was, moreover, much less satisfactory than that accorded to 2½ per cent. National War Bonds, 1945-47, in June and July last. In the first fortnight in which that issue was on tap, subscriptions amounted to £61,000,000, compared with £38,296,910 for the first fortnight's subscriptions to both classes of the new issues. It is difficult to estimate to what extent this £38,000,000 represents a net increase in savings and to what extent it has been obtained at the expense of other Government issues. The new experiment of a 3 per cent. medium term loan, issued through the tap, may, to some extent, have attracted savings away from 3 per cent. Defence Bonds. It is true that the earlier maturity of the latter should make them more attractive, but for months past it has been the demand for the "longs" which has dragged up the price of "shorts." If the recent trend in this market continues, it may not be long before the new 3 per cent. Savings Bonds stand at a premium in a free market, whereas the holder of the 3 per cent. Defence Bonds has to wait seven years for his one point premium, and suffers limitation on his power to realise in the meantime. In fact, the Defence Bond terms, which read like a "pipe dream" to many institutions, may prove to have less attraction than was expected for the man of moderate means. Whatever light a fuller experience may throw on the point, the latest returns of small savings for the week ending January 14th do lend some support to this view. So far, no substantial recovery has been made from the low level to which both types inevitably declined over the Christmas holiday, and sales of Savings Certificates, after a partial recovery, actually declined in the latest week from £3,322,000 to £2,756,000. Sales of Defence Bonds continued to improve, but reached a total of only £3,373,000, against £4,548,000 in the week ending December 17th, the last normal week before the holiday period. The total of small savings for the week to January 14th, at £9,722,000, against £9,471,000 in the previous week, is the fourth in succession which falls short of £10,000,000, a level which was achieved throughout the greater part of November and December. No doubt the commencement of collection of income tax at source from wages is partly responsible for the continuation of the Christmas setback. Too late, sales of the new "tap"

issues have not been sufficiently satisfactory to offset the low level of small savings, weekly subscriptions varying about a mean of some £17,000,000 compared with a mean of some £20,000,000 for 2½ per cent. National War Bonds, 1945-47, in the first three weeks of December. Thus, the reception of 3 per cent. Savings Bonds alone, despite the undoubted attractions of the issue, cannot be said to have been exceptionally enthusiastic. The issue is not a failure, but a substantial measure of its success appears to have been secured at the expense of other forms of national savings.

* * *

Commonwealth Mining Affairs

While the boards of the Commonwealth Mining-Great Boulder group of companies, both British and Australian, are presumably making some progress with the scheme of reconstruction sanctioned at the end of last year, it appears that the dissentient shareholders have not been idle. The business of compiling a register of those who are dissatisfied with the position is nearing completion, and the solicitors to the Great Boulder Proprietary Shareholders Committee—the body representing the dissentients—have prepared an analysis of some of the more important facts available, from which those interested should be able to reach a conclusion on the broad outlines of the affair. So far there is no sign of any contact between this Committee and the boards of the companies, nor is there any reason to suppose that a *rapprochement* will be effected after the very summary treatment accorded to the outside interests in the matter of the annual meetings. So far as can be gathered, however, the Committee appear to consider that they have a strong case, and, that being so, since neither party seems to favour negotiation, there seems to be no alternative but to incur the expense of taking the matter to the courts. This is in a sense regrettable, but it is only by such action that the intention of the Companies Acts can be exactly determined and the standard of behaviour expected made clear.

* * *

Home Rail Enigma

In a state, which does not shrink from adopting authoritarian procedure to make its war for democracy more effective, there can be few complaints from the owners of British railways—who themselves constitute a financial democracy—that they, too, must yield some peace-time privileges. Since the beginning of the war, the Home Rail stockholder has been kept on distinctly short commons for information regarding his fortune and prospects. Like the rest of the community, he has never been vouchsafed the full details of the financial agreement which was published in outline nearly a year ago. He knows the general way in which the agreement works, and has gradually learned to distrust its inflationary symptoms—sensing that an arrangement which the railways did not invite, and which causes such opposition among traders, can hardly be laying a satisfactory foundation for the lasting welfare of British railways. But these are general and very obvious propositions. The rest is shrouded in a factual black-out. Since the transport pool results were published for the first half of 1940, no firm evidence of the level of railway earnings has been made available. The large unknowns in computing an estimate of railway earnings are the volume of traffic, the extent of war damage, and the measure in which rising costs have outstripped the rising charges which have been conceded to the companies and London Transport. There is no possible scope here for dividend estimation, and any special attention which is paid to Home Rails on dividend expectations alone can only be described as irrational. In the first half of 1940, pool earnings ran about midway between the guaranteed Stage 1 minimum of £89.7 millions per annum and the Stage 2 level of £43.5 millions. What has happened since depends upon the major factors which have already been referred to. But there are other elements in the problem. What has happened to London Transport revenues as a result of the "blitzkrieg"? The board's financial year is now a calendar year, and the pool will feel the full effect of the depletion of revenues of its weakest partner. Are the finances of the wagon pool in self-balancing order? And will the companies have to pay back, from their earnings last year (if they suffice), between £2 and £3 millions for A.R.P. outlay originally expended by the Govern-

ment on their behalf? There is scarcely need, in these circumstances, to stress the necessarily arbitrary character which the forthcoming railway dividends and accounts will present. They will, in truth, be accounting approximations, which make the best estimate of revenues, having regard to a host of controlling factors. In each one of these factors, there is room for a sufficient margin of error to make nonsense of any dividend forecasts. It will be better for the railway stockholder's peace of mind if he waits for the tablets to be handed down on February 19th.

* * *

Tobacco Prospects

The full accounts of Tobacco Securities Trust, which holds interest in the subsidiary companies of British-American Tobacco and is itself controlled by B.A.T., shows that for the year to October 31, 1940, the level of earnings has been well maintained. Net profits, after all expenses, including directors' fees and taxation, amount to £498,910, against £535,700. Despite higher taxation, the company is able to maintain the 11 per cent. final dividend on ordinary capital, making 16 per cent. for the year, and also the 4.6 per cent. payment on deferred capital, both of which rates have been paid since 1936-37. Allowing for under-deduction of tax on the interim dividend distributed in May last, and for Dominion income tax relief, the payments on ordinary and deferred capital are subject to tax at 5s. 11½d. in the £. As in the three previous years, no allocation is made to general reserve, but the steady increase in the carry forward is continued from £156,345 to £162,255. The balance-sheet shows a rise in creditors, including taxation from £41,875 to £221,892, which has financed an increase in other investments from £2,952,642 to £3,232,655, being a rise of £280,013 in the company's subscriptions to war loan. Cash holdings are slightly higher at £879,544, against £827,408. In the course of his speech circulated with the report, the vice-chairman, Sir Hugo Cunliffe-Owen, stated that the trust had disposed of its balance of shellac at improved prices by October last and consequently has no further interest in the commodity. In his speech at the annual meeting of the British-American Tobacco Company, Sir Hugo drew attention to the heavy drain on net profits caused by the increasing taxation, to which the company is subject in a large number of countries. He pointed out that the payment of a dividend, which absorbed so high a proportion of the year's earnings, was made out of consideration for the views of stockholders, and was also made possible by the conservative dividend policy of the board in previous years permitting the transfer of £500,000 to reserve for contingencies from "premium on ordinary stock" rather than from dividends. Whether, in the face of the certainty of further rises in taxation during the current year, present dividend levels can be maintained is highly doubtful, although Sir Hugo has affirmed that the curtailment of the first interim payment for the current year does not necessarily imply a reduction in the total payment below that of last year.

* * *

Lancashire Banking Earnings

In *The Economist* of a fortnight ago, there was printed a comparison of figures of some of the leading banks which did rather less than justice to the showing of the District Bank. The error arose from the regrettable lack of uniformity among the banks in the manner of presenting their profits, in that some deduct tax on dividends before arriving at the published figure, and some do not. It is particularly to be regretted that the

	1938	1939	1940
District ...	£ 581,615	£ 582,372	£ 586,728
Martins ...	772,929	776,025	791,029
Williams Deacon's	292,678	298,865	301,418

District Bank should have suffered in this comparison, since it adheres to the more general practice. Really comparable figures are given above for the three "Lancashire" banks. The profits are before deducting tax on dividend in each case. In accordance with the practice of *The Economist*, the figures are given after deducting staff pension appropriations. The modest character of the rise in the figures of the District Bank in 1940 is due entirely to the fact that this item increased by £10,000, whereas for the other banks it was unchanged.

REPUBLIC OF CHILE

SERVICE OF THE EXTERNAL DEBT RELATING TO THE YEAR 1940 (Law No. 5580, 31st January, 1935).

The Caja Autonoma de Amortizacion of the Public Debt of the Republic of Chile, in accordance with the provisions of Article 6 of the Regulations of Law No. 5580 of 31st January, 1935, approved by the Supreme Decree No. 3837 of 24th October, 1938, declares that it has received in the year 1940 the following revenues applicable to the service of the External Debt:—

	U.S.\$
Profits of the Chilean Nitrate and Iodine Sales Corporation ..	3,468,354.84
Fourth Category and additional income tax on the Copper Companies	5,864,979.84
Quota of the duties on petroleum for the Nitrate Industry (Article 7 of Law No. 6155 of January 6, 1938)	60,161.14
Quota of the duties on petroleum for the Copper Companies (Article 7 of Law No. 6155 of January 6, 1938)	64,286.74
	<u>U.S.\$9,457,782.56</u>

50% of this revenue, or the sum of U.S.\$4,728,891.28, will be applied to the payment of interest at the rate of U.S.\$1.539 per hundred dollars nominal capital, Sw. Fcs.1.539 per hundred Swiss francs nominal capital and £1 10s. 9.36d. per hundred pounds nominal capital.

With the remaining 50% of the revenues received, bonds have been redeemed to the nominal amount of U.S.\$6,215,500, Swiss francs 30,000 and £1,100 and have been withdrawn from circulation.

After making the above-mentioned redemptions the balances of bonds of the External Debt are as follows:—

£27,762,471
U.S.\$170,208,500
Swiss Fcs.108,964,000

The last-mentioned of these balances has, moreover, been reduced by Sw. Fcs.236,000; this reduction corresponds to Swiss franc bonds redeemed extraordinarily by the Municipality of Santiago in the year 1940.

Deducting this amount from the figures given above, the actual balances of the bonds of the External Debt in circulation are as follows:—

£27,762,471
U.S.\$170,208,500
Swiss Fcs.108,728,000

Santiago de Chile, 28th December, 1940.

THE STOCK EXCHANGES

London

Note: all business is for cash

At the close of last week, the firm tone in all sections of the London market was maintained, and interest continued to centre on industrial equities, though immediately before the week-end business was on a smaller scale than in the earlier part of the week. On Monday, markets opened cautiously and the next day a general profit-taking caused small losses in all but the gilt-edged market. This movement was, however, corrected in mid-week by encouragement derived from the capture of Tobruk and a long list of industrials improved. Home railway ordinaries were easier during the whole period, and in the foreign bond market selling predominated.

After falling to a low level before the week-end, turnover in *kaffirs* failed to improve this week. Sub Nigel lost $\frac{1}{8}$ on two consecutive days and "Sallies" and E. Daggas were also offered. There was little interest in developing mines. In the rubber market, a number of stocks changed hands, but the transactions exercised small influence on price movements. Pataling, however, gained $\frac{1}{2}$ d. on Monday and Tandjong lost the same amount the following day. The leaders in the oil market reacted in sympathy with the general selling movement on Tuesday, Anglo-Iranian, Burmah Oil and Attock all being quoted lower, although Shell Transport stood firm. In mid-week Anglo-Iranian and Burmah eased further.

New York

MARKETS showed little reaction to the President's inaugural speech and business continued to be at a low ebb. Prices moved irregularly, usually opening firm, with a certain amount of investment buying, which was followed by renewed dullness. Steel issues fluctuated uncertainly, but there was some sustained support for aircraft and rail stocks. Rumours of further liquidation of British-owned dollar securities contributed to a somewhat uneasy sentiment, which was, however, counteracted by news of the capture of Tobruk. In mid-week, consequently, markets closed firm. The *Iron Age* estimates steel mill activity at 99 per cent. of capacity, against 98 per cent. in the previous week.

Apart from the sharp reaction on Tuesday, due to profit-taking, the upward trend of industrial equities continued. The motor section was generally higher and Rolls Royce gained $\frac{1}{8}$, against the trend on Tuesday, when, however, the stores section and breweries eased. There was some demand for electrical equipment, and among general industrials Associated Portland Cement remained a favourite, while Dunlop, I.C.I. and British Aluminium were all in demand. On Tuesday, International Nickel dropped $\frac{1}{2}$ point and Brazilian Traction $\frac{1}{4}$, while Turner and Newall and Murex failed to hold earlier gains. Small rises were enjoyed daily, except on Tuesday, by a long list of heavy industrials. At the beginning of the week there was some improvement of interest in the shipping section, Clan Line gaining $\frac{1}{4}$. The tobacco leaders were in demand, although, pending the announcement of the Imps. dividend next week, buying was somewhat cautious.

Shorter Comments

This Week's Company Results.—Despite a small setback in both gross and net earnings, the latter from £67,808 to £58,350, GREAT NORTHERN INVESTMENT TRUST is maintaining the 6 per cent. dividend. Total profits of RIVER PLATE & GENERAL INVESTMENT TRUST are also slightly lower at £59,823 against £60,785 and net earnings have fallen from £43,548 to £42,226, but the 10 per cent. dividend is paid as before. BIRFIELD INDUSTRIES, the engineering concern, have realised a satisfactory rise in total earnings from £72,975 to £81,458 and in net income from £64,994 to £70,440. The company is repeating the 12 $\frac{1}{2}$ per cent. dividend. The ordinary dividend of SECOND COVENT GARDEN PROPERTY is cut from 6 to 2 $\frac{1}{2}$ per cent. Net profits amount to £40,779 against £56,386 and total income is also lower. Moreover, the market value of the company's investments has fallen from £83,670 at November 30th, 1939, to £29,708 a year later, while the balance-sheet value, at cost, remains £160,723. The ordinary dividend of JOHN CROSSLEY & SONS, carpet manufacturers, is

Industry and Trade

Chemical Control Board

In a brief statement issued by the Ministry of Supply on January 19th, it was announced that Mr F. W. Bain had been appointed chairman of the Chemical Control Board. The Board will "deal with questions relating to the control and development of supplies of the chemicals falling within the scope of the Raw Materials Department of the Ministry of Supply." It will consist of the controllers of the various chemicals and of other persons whose services may be available for the consideration of special problems. Ever since the outbreak of war the Ministry of Supply has relied largely on Imperial Chemical Industries for the organisation of supplies of chemicals at home and abroad. In view of the dominating position of this concern in the chemical industry, this is scarcely surprising. Nor, in view of the frequent practice of appointing as controllers leading personalities from the industry concerned, is it surprising that the name of the chairman of the new Chemical Control Board is included among the list of directors of I.C.I. The appointment of the new Board is a step in the consolidation of the control of chemical supplies. It would be a pity if it also became a step in the process of extending the dominance of British industry by legally-recognised monopolies.

Control of Cold Storage Industry

Heavy shipping losses and the growing need of ships for the transport of munitions have not only forced a curtailment in the carrying space allocated to food, but they have also affected the regularity of food shipments. The conservation of stocks is now more important than ever. It was therefore to be expected that, in addition to increasing storage facilities, the Government found it necessary to exercise closer control over the cold storage industry. The Cold Storage (Control of Undertakings) Order, 1941, made by the Ministry of Food, and the Cold Storage (Control of Undertakings) (Charges) Order, 1941, made by the Treasury, bring virtually all the stores capable of maintaining the temperatures needed for storing meat, butter and bacon within a comprehensive scheme of control. The Minister of Food has been given power to issue directions to cold storage undertakings concerning the commodities to be stored, the temperatures to be maintained, the method of storage, and the persons to be employed by them. The scheme also ensures to the controlled undertakings the minimum revenue necessary to keep them in efficient operation. The Ministry of Food is to fix cold storage rates for all Government-owned produce which, at present, forms a very high proportion of the total quantity of produce in cold storage. Individual undertakings will have to hand over to the Ministry any net revenue in excess of the minimum deemed necessary to maintain them in operation, this amount being based partly on the net cubic capacity of the stores. This fund is to be used to make up the deficiency in the revenue of undertakings which have failed to earn the minimum necessary for their efficient operation. The remainder is to be distributed, up to a maximum, to those concerns whose earnings are in excess of the minimum standard, while the balance, if any, is to be disposed of by agreement between the Ministry of Food and the Treasury. In order to ensure the smooth operation of the scheme, the Ministry of Food has invited the cold storage industry to select a small committee to collaborate with it.

Rise in Rayon Prices

After five months of stability, the price of rayon yarn has been advanced by about 3d. per lb., with effect from March 1st. So far no change has been announced in the price of staple fibre, which is only 15 per cent. higher than before the war. The increase in the price of continuous filament yarn, which has been made necessary by rises in the cost of materials and labour, and by the increased overheads per lb. produced consequent upon restriction of consumption, reduces the

margin between rayon prices and wool and cotton prices, though rayon has still not risen as much as the others. The demand for rayon has been improving during the last three months, partly as a result of reductions in stocks which were considerably accelerated by enemy action, partly owing to an improvement in export trade. It is expected that the rise in prices will cause a rush for early delivery and then a lull. The Central Rayon Office, which was recently formed as a non-trading, voluntary body with the object of eliminating export competition within the trade, and of initiating export business, has already done good work in promoting exports. It has been asked by the weaving section of the industry for an increase in margins to allow for a 5 per cent. advance in wages demanded by the operatives.

Quicksilver Supplies and Prices

The Italo-Spanish mercury cartel's attempt to hold up to ransom the rest of the world has in a sense been a blessing in disguise, for the high level to which it raised prices in 1939 has provided a powerful stimulus to the production of this armament metal in other countries. In the United States, for example, the production of mercury rose from 17,991 flasks of 76 lbs. in 1938 to 18,633 flasks in 1939; in January last year output was at the rate of 21,600 flasks per annum, and in August it reached the rate of 42,000 flasks per annum. Since then the important Californian mines of New Almaden and Knoxville have been prepared for the resumption of production, while the capacity of the Bonanza Mine in Oregon has been appreciably enlarged; consequently the annual rate of production across the Atlantic is now probably no less than 48,000 flasks, compared with an annual rate of consumption of between 24,000 and 30,000 flasks. As a result of the expansion in domestic production, the United States has not only rendered herself self-sufficient, but she has even exported 8,517 flasks in the first ten months of 1940. Already in 1939 her net imports had been reduced to 2,291 flasks from 18,463 flasks in 1938. But other countries accessible to the Allies have also increased their output as a result of the rise in prices. Thus, Mexico's output in 1940 probably reached 10,000 flasks, against 7,400 flasks in 1939, while Peru has resumed production, and Canada (British Columbia) has entered the list of producers. At the moment, of course, Britain is still dependent on Spain—potentially the world's biggest producer—for some of her supplies of mercury, which is used in detonators, anti-fouling marine paint, scientific instruments and other tools of war. But the reduction in prices, from £58-£60 per flask in July to £48-£50 is an indication of the decreasing hold of the cartel on the world market.

Is Nazi Europe Short of Oil?

Pronouncements from the highest quarters still tend to encourage the belief among laymen in this country that within a matter of months the Germans will be suffering from a great and growing shortage of oil products. The implications of such a shortage would be so far-reaching that it is well worth while to re-examine the oil position of Nazi Europe on the basis of the best available information. On the question of crude oil production, it is obviously difficult to estimate how much Roumanian oil can be forced through the transport bottleneck and placed at the Axis' disposal in the near future. Though Roumanian production may possibly exceed 6 million tons this year—the 1939 figure was 6,240,000 tons—it appears extremely improbable that the quantity supplied to Nazi Europe can amount to more than 4,500,000 tons—equivalent to Roumania's export surplus in normal times. This quantity may be supplemented by crude production elsewhere, as follows:—Germany, Austria and Czecho-Slovakia 1,200,000 tons; Albania 300,000 tons, provided the Greeks do not destroy the Devoti wells; German-Poland 200,000 tons; occupied France 70,000 tons; Italy 10,000

tons. This represents a total of almost 6,800,000 tons of crude oil, or about 6,000,000 tons of finished products. The present theoretical capacity of the German coal-oil industry is probably in the neighbourhood of 3½ million tons, but it is impossible to say how much this has been reduced by the attentions of the R.A.F. On the arbitrary assumption that bomb damage will keep the equivalent of one-third of this capacity out of action, this year's output of oil from coal may be put at 2,250,000 tons. The addition of 250,000 tons of alcohol and benzole from German-occupied Europe brings the total of potential supplies to 8,500,000 tons. Imports must now be taken into account. So far as Russia is concerned, her export surplus had fallen to no more than 500,000 tons in 1939 and she is apparently still sending small quantities of oil to Sweden, Greece and perhaps other countries. On the other hand, Russia recently resumed imports from the United States, has doubtless repaired the war damage in the Galician fields and has lately taken tentative steps to reduce consumption at home. It is not impossible, therefore, that she may be able to supply the Axis Powers with 500,000 tons of oil this year. If, as there is reason to suppose, the stocks seized by the Germans in Western Europe represented a net addition of at least 1½ million tons to their own supplies, the total quantity of oil at the Axis Powers' disposal in 1941 may be as high as 10½ million tons.

Normal peace-time consumption in German Europe (excluding bunker requirements) was approximately as follows: Germany, 7 million tons; Italy, 2 millions; occupied France, Belgium, Holland, Norway, Denmark, 7½ millions; Yugoslavia and Bulgaria, ½ million. This gives a "normal" total of 17 million tons for German Europe, on the assumption that Hungary is self-supporting and that the rest of Europe must make its own arrangements for covering its requirements. To close the gap between potential supplies and consumption during the coming year would not appear to be by any means an impossible task for the Nazis. The virtual ban on private motoring—a very important consumer of petrol in Western Europe in normal times—together with drastic restrictions on the use of other products for non-essential purposes might reduce total consumption by one-third or even more, without crippling the economic life of the occupied territories. So far as oil is concerned, moreover, the collapse of Italy would improve the German position. Local shortages of certain products may well occur; but no general shortage of oil seems likely this year in German

Europe unless prolonged and large-scale military operations are undertaken or unless the R.A.F. succeeds in destroying the bulk of the German coal-oil plants, or in so disturbing transport facilities as to cause supplies, on the face of it sufficient, to be brought close to what Mr Dalton has called "the distributional minimum"—in which case there would be appreciable local shortages. In respect of oil, as of other essential materials, it remains true that victory cannot be achieved by the British blockade alone.

Enterprise on the Downs

The County War Agricultural Committee of East Sussex has magnificently refuted the accusation of insanity levelled at it by less enterprising persons, by bringing under the plough an extensive area of downland which, it was thought, nobody in their senses would tackle. Bramble thickets five feet high, gradients of one in six, gorse, thornbushes, and a variety of soil which baffled all "practical men," merely served to stimulate the inventive genius of these men of East Sussex. By a most unconventional use of chains and Fordson tractors, driven by untrained unemployed men who found the job inspiring and soon acquired skill, they extracted, roots and all, bushes which were supposed to be beyond the power of ordinary farm equipment. They then set to work with considerable ingenuity, adapting their ploughing methods to the idiosyncrasies of each individual slope, and ploughing twice in some cases, only going four inches deep the first time. Ploughing completed, the land is ringrolled, and then broken down with disc harrows. The peculiar value of their demonstration is in their use of ordinary implements for land so intractable that experts believed it impossible to reclaim it without the use of special tackle at a prohibitive cost. If the Committee is as resourceful in its subsequent cultivation as it has shown itself so far, these acres should contribute handsomely to the nation's food supply.

The Economist Trade Supplement

Paper rationing has rendered it impossible to publish the *Trade Supplement* at monthly intervals, as hitherto. The Supplement will in future be published quarterly—with the last issue of *The Economist* in March, June, September, and December. The table of statistics relating to the United Kingdom, however, will continue to be published in the last issue of each month; this week it will be found on page 133.

COMMODITY AND INDUSTRY NEWS

Cotton.—Government cloth needs are apparently satisfied for the next two or three months and home trade buyers are limited by quota restrictions to occasional purchases of specialities. Trading has therefore been confined to export requirements. These have been on a minor scale, but the freer operations for South America, especially the Argentine, have continued and steady buying has again

occurred for the Dominions. Recently there has been a tendency for more business to be done by British Overseas Cottons, Ltd., most of the contracts being in white shirtings for India and finishing qualities for South America. A steady flow of small orders in prints and dyed

fancies has been received from Java. Spinners of coarse yarns are becoming increasingly indifferent sellers. They do not want to commit themselves to deliveries further ahead and are uncertain of their raw cotton supplies. In the week ended January 18th, deliveries of all kinds of cotton to spinners totalled 60,133 bales of which 25,884 bales were American, a big increase on the previous week's total of 35,425 bales, of which 10,403 were American.

Wheat.—Slightly increased activity on the part of the Control offset improved crop reports from United States at first, but later Canadian prices were easier, though Australians were held.

Rubber.—American consumption figures for 1940, at 618,000 tons, constituted a record. The market has been quiet but steady.

Metals.—There has been a further decrease in warehouse stocks of tin, presumably owing to sales to America. Stocks in London warehouses were down by 6 tons on the week to 65 tons and in Liverpool 181 tons to 4,385 tons. There was some trading activity in anticipation of the freer grant of export licenses. The Ministry of Supply has requisitioned

about 8 tons of Chinese-refined tin warehoused here.

Oils and Oilseeds.—Supplies are well maintained. Prices of controlled vegetable oils will remain unchanged until the end of the month. The outlook for supplies continues good. The Control is arranging for increased quantities of linseed and ground nuts from India, and is reported to be showing more interest in Argentine linseed. The new crop in Argentina has suffered severely from the excessive rains of late December, the damage being officially estimated as 17 per cent. This has involved a reduction in the estimated exportable surplus

which the Ministry of Agriculture puts at 1,479,000 tons compared with 1,862,000 tons in the December report and 987,000 tons a year ago. Fine weather has returned and it is hoped to complete the harvest without further setback, although there are complaints as to some deterioration of quality. The area sown with linseed in India is practically the same as last season and latest official reports are that the condition of the growing crop is fair to good. No transactions are reported in Egyptian cottonseed and Soya beans, palm kernels, and castor and rape seed are quiet and prices more or less nominal.

AUDITORS' REPORT.

S. G. DOBSON, General Manager.

TO THE SHAREHOLDERS, THE ROYAL BANK OF CANADA:

We have examined the above Statement of Liabilities and Assets as at 30th November, 1940, with the books and accounts of The Royal Bank of Canada at Head Office and with the certified returns from the branches. We have checked the cash and the securities representing the Bank's investments held at the Head Office at the close of the fiscal year, and at various dates during the year have also checked the cash and investment securities at several of the important branches. We have obtained all the information and explanations that we have required, and in our opinion the transactions of the Bank, which have come under our notice, have been within the powers of the Bank. The above statement is in our opinion properly drawn up so as to disclose the true condition of the Bank as at 30th November, 1940, and it is as shown by the books of the Bank.

COMPANY MEETINGS MIDLAND BANK LIMITED

STATEMENT BY THE CHAIRMAN, THE RIGHT HON. R. McKENNA

In view of the circumstances in which the annual meeting of shareholders is to be held, on January 30, 1941, the chairman does not propose to follow the custom of delivering a speech. In place thereof the following statement has been circulated to shareholders.

Our first concern at this moment is the war. Personal liberty, national independence, even civilisation itself, are at stake, and no sacrifice is too high a price for what victory will secure. You as shareholders of the Midland Bank will above all want to know how this great institution is facing up to the demands of war.

Last year I reported that nearly one in eight of the male personnel had joined up; to-day the proportion is one in five, and further enlistments are to be expected which will bring it to one in four. No less than 2,500 of our men are now serving in the Navy, Army and Air Force. Twenty-seven, alas! have lost their lives, and their memory will be held in honour by us all; three are missing. Six have received decorations for bravery on active service, and to them we send a special word of congratulation. The enthusiasm with which the formation of the Midland Bank Flying Club was welcomed four years ago is evidence of the air-mindedness of many of our staff. Some of our men were among the exalted few to whom so much was owed. Large numbers, both men and women, are engaged in various tasks of civil defence, thus adding other arduous duties to their daily work in the bank. The importance of this voluntary service becomes more and more evident as attacks from the air develop.

Quite apart from active service in these ways, those who carry on the business of the bank find themselves often in danger. We civilians feel honoured that in this as in no other war in our history we are able to take our share in the risks incurred by the fighting forces. Despite all difficulties—damage to premises and loss of working time through air-raid warnings, travel delays and disturbance of communications—we have been able to maintain essential services to the public with scarcely more than momentary local interruptions.

Up to date nine of our branches have been completely wrecked; eight others have been severely damaged, but repair work now in hand is enabling us to return to them shortly. A large number of other branches have suffered damage, such as broken windows, but this has caused nothing more than inconvenience. In every instance customers have found that within a very short time, and often without any delay at all, they have been able to transact business either in the damaged office itself or at some nearby branch. On occasion, too, we have received the helpful courtesy of neighbouring branches of other banks. In not a single case have safes or strong-rooms been destroyed. Anxious preparation was made for dealing with possible attack from the air, and the precautions have proved effective.

THE GROWTH OF DEPOSITS

Passing now to a consideration of the balance-sheet, a record figure is shown for current, deposit and other accounts. At £577½ millions there is an increase over the year of £81 millions. Though to a small extent the rise is due to delays in clearing, we have shared to the full in the general monetary expansion corresponding to the enlarged volume of production at a higher level of prices.

The growth of deposits has led to suggestions that the banks are making large and undue profits out of what has been described as "costless credit." But for banks such a thing as costless credit does not exist. The banks pay for all deposits placed with them, partly in interest and partly in service. Of the two forms of payment the cost of service is ordinarily much the greater, and has been substantially increased of late by difficulties arising from the war. On the other hand, what the banks have been able to earn on the additional money entrusted to them is readily ascertainable from their balance-sheets. To take our own as an example, if on the liabilities side we show an addition of £81 millions to deposits, we find on the assets side that coin, bank notes and balances at the Bank

of England have increased by £11½ millions; Treasury bills are up by £1½ millions; and, under a new head, Treasury deposit receipts appear at £67½ millions. The total of these three items, £81 millions, is precisely equal to the increase in deposits. The first item, cash, brings us in nothing; Treasury bills yield 1 per cent.; and Treasury deposit receipts 1½. In fact, on the whole £81 millions we earn rather under 1 per cent.—barely enough to cover the cost to us of the new deposits. With this in mind it will cause you no surprise that our profit for 1940 is much the same as for the previous year. The reduction shown is due to the higher rate of income tax. The bank has incurred no liability for excess profits tax.

Of our more profitable assets, advances and investments, advances have declined by no less than £32½ millions over the year. Ever since the beginning of the war the trend, apart from short interruptions, has been downward, notwithstanding the rise in prices, employment and production. In part, the fall in advances is a natural consequence of the shrinkage in the volume of many forms of business not essential for the war effort. Meanwhile, the flow of Government payments has been such as to limit the demands made upon the banks by undertakings working directly for war purposes; to this extent loans by the banks to the Government have replaced accommodation to private customers. Furthermore, war-time arrangements, especially in the form of official commodity controls, have tended to simplify the channels of trade by making them more direct, and have eliminated the services of intermediaries who used to borrow from the banks. The fall in advances is more than offset by the increase in investments, an increase which covers also the decline in trade bills. The new investment has been in three per cent. war loan and two and a half per cent. national war bonds.

Finally, we have to record a fall in our liabilities on acceptances and confirmed credits, which is obviously due to the restrictions on overseas trade. Engagements of other kinds are roughly unchanged in amount, and the volume of forward exchange transactions has again declined.

EXPENSES, PROFITS AND ALLOCATIONS

Current expenses have inevitably risen in some directions. We have felt it necessary, for example, in view of the higher cost of living, to introduce a system of grants-in-aid, taking the form in part of family allowances, by way of supplement to the salaries of lower-paid members of the staff. In order to ensure the maintenance of service to customers, moreover, we have had to make special and rather costly transport arrangements for a large number of our staff. Again, stationery is more expensive, and postal charges have been raised. These, along with war-time precautions, are the principal items which go to swell our general expenses.

On the other hand, such opportunities as we have had for making economies have not been neglected. We have been able to cut down expenses by closing a number of offices where this could be done without impairing reasonable service to customers, and we have also made further progress in mechanisation, which has been of special value at a time when clerical labour is difficult to obtain.

The net profit of £1,933,000 for the year, together with the balance of £642,000 brought forward, gives a total of £2,575,000 for disposal. Out of this we make an appropriation of £250,000 to contingent account for war damage to bank premises. The cost of repair or rebuilding cannot yet be accurately assessed, nor can the scale of the ultimate compensation to be received under the Government's scheme, now in its course through Parliament. Moreover, we cannot foresee what further damage may be sustained. Consequently, while the figure we have provided must not be taken as an estimate either of the damage already suffered or of the net charge that may ultimately fall upon the bank, we have chosen it as a tentative provision from the profit of the year against the possible extent of our losses.

In addition, we have allocated £250,000 to reserve for future contingencies. In disposing of our trading profit we must have regard to the need, imposed upon us by war developments, for

making further provision against doubtful advances. Direct war damage to customers' premises and businesses, the evacuation of many areas and restrictions on various branches of trade have put some borrowers in difficulties which are none of their own making. In all such cases of sheer misfortune we have given the utmost assistance and consideration; but the circumstances which demand this treatment do not allow us to relax in any way our own standards of judgment as to the prospects for repayment.

There remains to be considered the final dividend for the year. We propose 8 per cent. actual less tax, which, with the interim dividend already paid at the same rate, will absorb £1,435,000. This will make the total dividend for the year the same as for a number of years past. The apparent high rate of 16 per cent. has often given rise to the misconception that banks earn excessive profits. But on what is the dividend paid? It is reckoned on the paid-up capital, which by no means represents the whole capital funds in the bank owned by the shareholders. With exceptions insignificant in amount in relation to the present capital, the shares have always been issued at a premium, which has been placed to reserve. Moreover, during the hundred years and more of the bank's existence savings out of profits have been made, quite small in annual amounts, but large in the aggregate, which have led to a steady growth of the true capital funds. The yield of something over 4 per cent. on the market value of the paid-up capital more accurately represents the return the shareholder receives on his actual capital in the bank than the dividend rate of 16 per cent.

I cannot pass over without mention the temporary cutting off of our business in the Channel Islands. Happily, in the evacuation no lives were lost among the staff of the bank; moreover, we were able to remove records and valuables in more volume as to safeguard the interests of customers. We look forward to the resumption of our relations with the islands when happier days return.

I am glad to be able to report that our affiliated institutions, in common with our own bank, have helped to the full in carrying on the essential business of the nation. Particulars of the Belfast Banking Company, The Clydesdale Bank and the North of Scotland Bank all show to how large an extent, relatively to their resources, they are assisting the war effort. The Midland Bank Executor and Trustee Company performs, on a larger scale than ever, services which have become more urgent as the perils of life have increased.

MANAGEMENT AND STAFF

Surveying the course of our business over the past year, it is evident that the maintenance of unimpaired service to the public could not have been achieved but for the wise control and leadership of our chief general manager, supported by his colleagues and head office assistants and by the managers of the branches. In addition, we have enjoyed as always the co-operation of a keen and devoted staff. They have played their part with fortitude and characteristic zeal, and I am happy to say that the relations between them and the management continue to be marked by mutual understanding and loyalty. Very helpful co-operative work has been done by the Midland Bank Staff Association, an organisation entirely independent of the management and supported by the contributions of the subscribing members. Those who conduct the affairs of the Association and represent it in discussions with the management are freely elected by ballot among the members. It must be remembered that bank employees, unlike those in the great majority of occupations, are ordinarily destined to spend the whole of their working career in a single institution; they have every reason to expect a pension when they reach retiring age; and they are as deeply interested in the stability of their institution as the shareholders or the customers of the bank. It follows that their interests can best be represented by colleagues who know the inside of their own bank, are provided with confidential data by the management and can take a view both larger and longer than that of the moment. At all events, it has been found from more than twenty years of experience in our own bank that our system works well, maintaining both the strength and efficiency of the bank and the welfare of the staff. As for the immediate position, it was inevitable that the task of those who carry on the service of the bank should have been rendered more difficult by withdrawals into the forces. The gap thus created has had to be filled largely by recruiting

men and women on a temporary basis—no less than 1,100 juniors and 800 women have been taken on to the staff since the war began. The recruits have to be specially trained for their duties if they are to become useful within the short time allowed by present conditions, and to this end we are operating a number of training schools in London and provincial centres.

Whatever the war may have brought in the way of hardship or inconvenience, the course of affairs in our own branch of the national effort has demonstrated the indispensability of banking service in the life of the community. When we remember how that service has been carried on under conditions of continual danger and strain, and how typical this is of the national effort as a whole, we cannot doubt the ultimate outcome of the struggle. Alike in facing the problems of war and peace, our bank, as a company of men and women loyal to their nation as to their business undertaking, will do its work with all the accumulated strength of training and tradition.

BENGAL-NAGPUR RAILWAY COMPANY, LIMITED

The eighty-second ordinary general meeting of the Bengal-Nagpur Railway Company, Limited, was held, on the 16th instant, at Gresham House, London.

Sir Trevredyn Wynne, K.C.S.I., K.C.I.E. (chairman and managing director), who presided, said: Gentlemen, owing to the late arrival of the accounts from India, due to delay in mails, we were unable to hold the meeting until to-day.

The gross earnings for the year under review increased by nearly 153 lakhs. This resulted in the payment to us of surplus profits amounting to Rs.5,20,071 after payment of Indian income tax. At the moment we do not know what will be the company's liability to Excess Profits Tax, but negotiations are proceeding and the position is being examined for us by experts.

As you know, some of the best mineral areas are served by the Bengal-Nagpur Railway, and, up to the end of March, 1939, very low rates were charged for the carriage of materials for the steel companies. The position now is that the improvement in the company's gross receipts is mainly due to the long view policy adopted by the company 30 years ago of granting special concession rates to the steel companies for their raw materials until a time when the manufacturers of steel were in a safe position to stand on their own feet. That time having arrived this company is now benefiting from this policy, as also is India, in the active development of her natural resources.

The gross earnings from April 1 to December 31, 1940, amounted to 8 crores 77 lakhs and are 91 lakhs more than for the same period in the previous year.

The report and accounts were unanimously adopted.

BRITISH RUBBER ESTATES OF JAVA, LIMITED

DOUBLE TAXATION BURDEN

The adjourned eighth ordinary general meeting of this company was held, on the 21st instant, in London, Mr. James Davenport, chairman of the company, presiding.

In his review of the working of the year, the chairman stated that an analysis of the final figures clearly showed that the company had made progress, though the full effect of it was hidden behind a smoke screen of taxation, not only at home but in the East as well. Rubber producers were making an important contribution to the economic side of the national war effort in that the sale of their commodity produced substantial amounts of exchange required for the purchase abroad of aeroplanes and other materials of war. And apart from that question of exchange they had directly and heavily contributed to the war effort, not only in this country but also in the Netherlands Indies, through heavy taxation.

In all, export duties, the N.E.I. company tax, the difference in exchange and the debenture redemption fund had absorbed no less than £35,402, or the equivalent of nearly 5 per cent. on their share capital.

The report and accounts were unanimously adopted.

At the extraordinary general meeting which followed, the resolution in connection with the directors' further remuneration was unanimously approved, subject to an amendment that the fees should not exceed £1,500 in any year without the consent of the shareholders in general meeting.

LLOYDS BANK LIMITED

ADDRESS TO THE SHAREHOLDERS OF THE BANK BY THE CHAIRMAN,
THE RIGHT HON. LORD WARDINGTON

In order to shorten the formal business at the annual general meeting of the bank to be held on January 31, 1941, the address of the chairman (the Rt. Hon. Lord Wardington) is being posted to shareholders with the annual report and balance sheet, and reads as follows:—My Lords, Ladies and Gentlemen,—I much regret that during the past year we have suffered heavy losses through the death of several of our colleagues. Mr Charles Ker and Lord Horne died earlier in the year, and more recently Major J. W. Garton succumbed to an illness from which we much hoped he would have been able to recover.

Mr Ker had been a member of the board for many years, and had a long business experience which was of great value to his colleagues, both in this bank and also in our associated bank, the National Bank of Scotland. We all affectionately admired his sterling qualities and appreciated the valued help he gave us.

Lord Horne, associated as he was with several highly important companies and as a former Chancellor of the Exchequer, was well known to you all, and as you can readily understand we shall miss him much, not only for his wise counsel, but also for his personal qualities, which endeared him to his friends.

Major Garton came to us from the Wilts. and Dorset Bank, and ever since our amalgamation with that bank we have relied upon his thorough knowledge of affairs in the West Country. He was most regular in his attendance at our meetings and we highly valued his advice.

I must also put on record our sense of loss owing to the death of Mr W. A. Smith, a joint manager of our City office. The many letters of appreciation of his courtesy, tact and ability which we have received from grateful customers of the bank testify to the general regard in which he was held, and it is with the deepest regret that we realise we can no longer look forward to many years of invaluable and increasing help from him.

THE BALANCE SHEET

You will notice some interesting figures in the balance sheet now in your hands, which, together with the report, I shall ask you to take as read at our meeting on January 31st.

The first point to which I wish to draw your attention is the credit of £500,000 which we have placed to our published reserve fund. The latter will now appear at the figure of £10,000,000. You will remember that in 1931 we took from our published reserve fund the sum of £2,500,000 to keep in our internal funds for the protection of any depreciation of our investments. It was always the intention to replace this amount when we felt that it was no longer likely to be required. Transfers, amounting in all to £2,000,000, have already been made in 1932, 1934, 1936 and 1937, and the balance of £500,000 has now been transferred, restoring our published reserve to its former figure of £10,000,000. This last payment of £500,000 does not come from our profits—it would have been very pleasant if they had been large enough to enable us to take some for this purpose—but it represents a transfer from our investments reserve fund and leaves a substantial amount in that account, which we feel justified in believing to be more than sufficient for any probable deficiency in the future, seeing that practically all our first and second line investments are dated stocks, more than half of them with less than ten years to run.

Our current, deposit and other accounts again stand at a record figure and show an increase over last year of £57,000,000. Other banks have shown increases in like degree, and this feature in all our balance sheets is a sign of the times in which we live. It is the result of borrowing by the Government, which spends the proceeds in paying for war weapons and contracts connected with the war, and these payments come back to us from those who receive them and are deposited in their banking accounts.

When we come to the other side of our balance sheet you will see how we have employed the increased amount deposited with us.

The last two items of our liabilities—acceptances, endorse-

ments, etc.—show a natural decline, due to the fall in international business.

On the assets side our cash has increased by £14,400,000 and our balances with, and cheques in course of collection on, other banks by £1,308,000, another sign of the times and the result of delays in postal delivery.

Our money at call and short notice has decreased by £8,000,000 and our bills by £29,000,000, while our investments in Government securities have increased by £27,000,000, and, in addition, we have lent to the Government £65,500,000 on what is called Treasury Deposit Receipts.

In other words, the whole of our real increase in deposits (allowance having been made for the swollen volume of uncleared cheques) has been lent to the Government.

THE BANKS' WAR EFFORT

It is possible to go further than this and to say that practically the whole of the deposits held by the clearing banks is applied directly or indirectly toward the war effort of the nation. The final figures for the year are not yet available, but the November figures show that of the total deposits of £2,701,000,000, £285,000,000 were kept in cash and balances at the Bank of England to meet the currency requirements of the public. Stocks of currency have been increased and redistributed by the banks through their network of branches, so as to ensure that there shall be no failure in the supply of currency to the public in any emergency.

£389,000,000 were represented by Bills, which, in these days, are mainly Treasury Bills, and are therefore direct advances to the Government, and a further £236,000,000 have been advanced to the Government in the form of Treasury Deposit Receipts.

£140,000,000 were lent to the money market against Treasury Bills and British Government bonds.

The investments of the banks amounted to £786,000,000, and probably £600,000,000 of this were in British Government securities.

Of the banks' advances to customers, £941,000,000, it may be said to-day that by far the greater part is lent for war purposes and other public needs—i.e., to Government contractors and sub-contractors for armament work, to public authorities, public utility companies and farmers, and for other essential purposes, such as the finance of our import and export trade and the manufacture of essential civilian commodities.

It is the policy of the banks to ensure that no essential war activity of the nation shall be hindered by any financial difficulty, and that there shall be no interruption in the continued flow of armament work through any lack of finance. War time activities have called for extended credit to borrowers in many directions; to the direct producers of armament work for the Government and to their sub-contractors; to farmers for the ploughing up and cultivation of extra land; to food distributors for the holding of larger stocks; to merchants and manufacturers engaged in our export trade; to public authorities; and in numerous other ways. No single request or suggestion by any Minister of the Crown or Government Department in connection with the provision of war time credit has been otherwise than willingly responded to or actually anticipated by us.

It is a tribute to the manner in which the banks conduct their business that they have been able to supply all the additional accommodation required for war work and at the same time to lend large additional sums to the Government without in any way impairing but rather strengthening their liquidity. They have of course only been able to do this through the additional credit created by the Government and by restricting advances for non-essential purposes. This has given rise in some cases to complaints of undue hardship, and it is right to make it clear that anyone who has been asked to repay a pre-war advance, and to sell securities to do so, has the right to appeal to the Courts under the Emergency Powers Act, 1939, for relief if suffering from war time conditions.

Every encouragement has been given by the banks to the War Savings movement. Posters and literature have been

PROFIT AND LOSS ACCOUNT

We now come to our profit and loss account. The net profit brought in at the figure of £1,383,807 is somewhat lower than that of last year, but I think we can congratulate ourselves that it is not lower still. When you consider the unprecedented times in which we have been living during the last year with its many extraordinary expenses, its heavily increased taxation, the serious curtailment of our usually most profitable assets, and with many of our normal activities in abeyance, I feel that the result is better than we might have expected.

I have already referred to the drop in our advances and our bills, while our commissions, especially those connected with underwriting and acceptances, have either wholly disappeared or been largely reduced.

On the other hand, our greatly increased investment figure has resulted in larger dividends, which helped to offset the decline in revenue earning capacity shown by some of our other assets. The income from Treasury Deposit Receipts—a new item in our balance-sheet—also goes to counteract the loss of revenue in other respects, and I am glad to say that in spite of the troubles that have befallen so many of our smaller trading and shop-keeping customers, the provision required for bad or doubtful accounts has been comparatively light.

HEAVY ABNORMAL EXPENSES

On the expenditure side we have been severely hit from many quarters. Our staff has been greatly increased, because, as I think you know, we keep all those serving in the Forces on our books and have so far continued to pay their salaries, less their service pay and allowances, while we have to pay the salaries of 4,521 new staff. In addition to this, greatly increased expenditure has been incurred by the exigencies of the service in these abnormal times. Expenses of moving men from their houses; grants in aid on account of the higher cost of living; the decentralisation of much of our business; the duplication of records; heavy A.R.P. expenses; all these and many other factors have brought up our expenditure total to a wholly unprecedented figure.

I confess I am agreeably surprised by the size of our total net figure, and I trust that you will regard it as satisfactory. If you read a recent financial article in the Press, and believed it, you may be disappointed. The writer, by some process of reasoning which he did not fully explain, estimated that bank profits would be up by 50 per cent. He rightly pointed out that our assets had largely increased, although he took the figures as at a particular date and disregarded the average through the year, but was quite wrong in estimating that we would be able to obtain a 2 per cent. return from them, or a net 1½ per cent. after allowing for interest granted on our increased deposits. He ignored the fact that a large proportion of this increase—I estimate that for the "Big Five" banks alone, in November it amounted to £72,000,000—found its counterpart in cheques in course of collection and items in transit, neither of which earn any interest at all. A further 10 per cent. has to be kept in cash, which of course earns nothing; while the other unsatisfactory features, which I have already mentioned, he dismisses with a casual caution that some small deductions must be made to allow for smaller earnings on other assets, while no allowance is made for increased expenditure. It is a queer kind of accountancy which estimates its profits on the earnings of the more remunerative assets only, and takes little or no account of anything else, including greatly increased expenditure.

I am satisfied that owing to the cheap money policy of His Majesty's Government, and to heavy increased working expenses, the banks are not earning any excess profits, and I would further remind you that if they did the whole of the amount would be handed over to the Government.

THE STAFF

I cannot conclude without saying a very special word about the staff. They have been living and working in similar conditions of danger and discomfort common to many other people, and with a readiness to put up with these hardships unsurpassed by any other body of men and women. Many of our buildings have been damaged in some degree—mostly by broken windows—and a few have been destroyed for the time being.

prominently displayed in their offices; they have reduced the rate of interest which they allow on deposits with the object of encouraging subscriptions to the issue of 2½ per cent. National War Bonds; and the maximum amount which may be held in a Savings Bank account at the special rate of interest allowed to such depositors has been reduced to encourage the purchase of National Savings Certificates and 8 per cent. Defence Bonds. The Banks have given every possible assistance to the War Weapons Weeks which are being held throughout the country and have themselves made investments to supplement the splendid local efforts.

The whole of the intricate and difficult work of a special character in connection with foreign exchange which has arisen since the outbreak of war has been conducted on behalf of the Government through the medium of the banks in a wholly admirable manner.

I am not giving these facts and figures in any spirit of complacency, or with any desire to blow a bankers' trumpet. Bankers are not perfect and no doubt are guilty of sins both of omission and commission from time to time, but that they are sincerely anxious to do their utmost to help the nation's cause, particularly in this time of anxiety and stress, I think there can be no reasonable doubt. This feeling permeates their ranks right through from the lowest to the highest. It is humiliating therefore to find a noisy few amongst the public, who, from their position in literature, politics, or finance, should be able to guide and instruct others, yet, nevertheless, either from ignorance or prejudice, never let an opportunity pass of trying to belittle the efforts of banks, to curtail their profits, or misrepresent the facts. I can think of nothing which would please Hitler more than the success of these gentlemen who appear to be trying to undermine the confidence which in this country is generally, and I believe rightly, given to the banks. A strong and prosperous banking system, at all times highly desirable, is more than doubly so in war time.

THE BALANCE SHEET (continued)

To return to the figures of our balance-sheet. Our Scottish subsidiary, The National Bank of Scotland Limited, shows a position of increased strength and usefulness, and we congratulate them and ourselves on their latest satisfactory balance-sheet.

Of Lloyds and National Provincial Foreign Bank Limited I cannot give you any detailed information, so many of their branches being in enemy occupied territory or in places with which we are not able to communicate, but we have every reason to suppose that their capital, which is in sterling, is intact.

We next come to our advances. These are smaller both actually and relatively than they were last year, and perhaps it is permissible for me to point out that it has appeared to us particularly desirable at the present time to follow the advice of the Cunliffe Committee, and separate items in transit from advances. Unless this is done the swollen figure is apt to be misleading.

I was myself surprised to find this reduction in the amount of our advances. I had thought that the demands upon us for assistance in meeting higher taxes, and in increasing trade activity in war production would have had an opposite effect. I had not sufficiently foreseen to what a large extent peace time banking would come to a stop with the outbreak of war, nor had I realised the various restrictions on borrowing by municipal and other public authorities, nor the extent to which Government itself would finance the purchase of commodities and war work generally. From the point of view of the bank and its profit earning capacity this is to be regretted, itself and its profit earning capacity of its assets, and I think as advances are the most profitable of its assets, and I think anyone would have been surprised a couple of years ago if he had been told that to-day the percentages of our advances and investments to deposits would be practically identical.

I ought perhaps on this occasion to make a reference to our bank premises account, which has been reduced not only by the £100,000 specially allocated out of profits and the proper annual amount for the amortisation of leaseholds, but also by the transfer to other assets and accounts of the value of certain branch premises damaged by enemy action, against which, presumably, we shall have claims for compensation under the War Damage Bill when it becomes law.

This often entails working in draughty, cold, and dark extemporised quarters, accompanied in many cases with similar troubles in their own homes, but without resulting in the slightest diminution in their determination to see that essential services shall be carried on, and without a word of complaint except against the author of these discomforts. It is indeed an inspiring sight to see the countless numbers of young and

old, of both sexes, throughout the country, coming to, or going from, or at their work, cheerful, uncomplaining, and determined. If it has always been right to send them a message of encouragement and admiration, it is more than ever our grateful duty now, and I would like our meeting of shareholders to pass a very special vote of thanks for their services during one of the most trying years of our existence.

NATIONAL PROVINCIAL BANK LIMITED

Statement by the chairman, Colin Frederick Campbell, Esq., relating to the accounts to be submitted to the 108th annual general meeting to be held at the Head Office, 15 Bishopsgate, London, E.C. 2, on Thursday, January 30, 1941.

I am taking the unusual course of sending my observations on the accounts with the report and balance-sheet as at December 31, 1940.

So many of our shareholders are engaged on important Government work and others may find travelling to the City inconvenient that I hope this change will commend itself to all.

At the annual meeting on January 30, 1941, only the necessary business will be transacted and no further comments will be made by me as chairman.

Before dealing with the ordinary affairs of the bank, it is with much regret that I have to report that during last year we lost the services through death of our esteemed colleague, Sir Alfred Lewis, who died on February 21. For a number of years Sir Alfred Lewis occupied the position of chief general manager and later he was elected a director of the bank and finally became a deputy chairman. Sir Alfred rendered valuable services to the bank and gave to it a full measure of ability and experience.

I also have to report the deaths of two of our local directors who were much attached to the bank throughout a long period of time, Sir Prince Prince-Smith, Bart., who died on July 2nd, and Mr D. A. Aubert, who died on June 30th.

THE STATEMENT OF ACCOUNTS CURRENT, DEPOSIT AND OTHER ACCOUNTS

There have been notable changes in a number of items in the balance-sheet. At £380 millions deposits show an increase of £44 millions compared with a year ago and now stand at a record high level. Our experience in this respect is shared by the other great banks and the general expansion is due to the increased volume of Government borrowing and expenditure for war purposes.

BILLS DISCOUNTED, TREASURY DEPOSIT RECEIPTS, INVESTMENTS

As is well known, the portfolio of bills discounted, which shows a reduction of £12 millions, has for many years consisted largely of British Government Treasury Bills.

A new item in the balance-sheet is Treasury Deposit Receipts, of which we hold at present £31 millions. The advantage of this method of borrowing by the Government is that it places a check on any undue increase in the floating debt through Treasury Bills.

In view of the substantial increase of funds at our disposal, represented by deposits, we have augmented the bank's investments by no less than £38 millions. Practically the whole of the investments are British Government direct liabilities, and I can say again that a large proportion of our holding is redeemable within a few years.

The total of the above three items amounts to the very substantial sum of £192 millions, or 50.6 per cent. of our customers' deposits, and is a complete answer to those who sometimes ask rather thoughtlessly what banks are doing to help towards financing the war. In addition to this direct support of the National Finances, our money at call and short notice which stands at over £19 millions is nearly all lent to the market to assist in carrying British Government Treasury Bills.

ADVANCES

Our main earning asset, advances to customers, shows a reduction of nearly £20 millions compared with the year-end

1939, and now represents only 31.3 per cent. of deposits as against 41.4 per cent. Banks generally have witnessed a diminution of advances during the year and in the case of this bank nearly all classes of loans have contributed to the decline.

Owing to the control exercised by the Government in various commodity markets, the accommodation which we have been in the habit of extending to merchants in connection with the importing and holding of stocks is no longer required.

Another factor is the cessation of ordinary activities in certain trades, such as those normally engaged in building and estate development.

In addition there are, of course, the restrictions imposed by H.M. Treasury on borrowings by private individuals. These restrictions have been freely accepted by the banks and their customers as being in the national interest.

On the other hand, as a partial offset to these decreases we have lent substantial sums of money to those engaged in the production of armaments and to other industrialists whose businesses play an important part in our war effort. Indeed, we may say that during the past year our fresh advances have been almost entirely confined to purposes connected with the prosecution of the war. The needs of agriculture have figured rather prominently in the public Press and in this matter special steps were taken by the banks so that no farmer who is in any way credit-worthy could say that his farming operations had been hindered through want of financial facilities on reasonable terms.

These and other factors may be expected to persist throughout the period of the war, but after the war there is little doubt that we shall be called upon to play an important part in financing the change over of the vast industrial machine from war-time to peace conditions.

Our branch offices in the Channel Islands have unfortunately ceased to function, so far as their association with us is concerned, since the occupation of the islands by the Germans, and our sympathy goes out very sincerely to our friends there in the distressing circumstances in which they are placed. We are doing all that is possible to safeguard our interests there and we have made such provision as we think necessary in view of the present situation. We can only assure our friends that we look forward to the day when we shall be able to resume our relations with them.

With one exception, the remaining items in the balance-sheet call for no special comment. This exception is our holding of 50 per cent. of the capital in Lloyds and National Provincial Foreign Bank, which has carried on a business in England, France, Belgium and Switzerland for a number of years. It may be remembered that the bank was started by Lloyds Bank in 1911 and we joined them in 1917 by taking a 50 per cent. interest in its capital. We have no information as to the procedure now being adopted by the Germans in regard both to the assets and liabilities of the bank in France and Belgium, but I may say that inasmuch as the capital of the bank is held in London in sterling, there is no reason for thinking that this, at any rate, is not intact. Consequently our share holding is taken at par in the balance-sheet.

PROFIT AND LOSS ACCOUNT: DIVIDEND

The statement of profit and loss discloses a profit of £1,697,538, which is less by £21,445 than the profit we were able to earn in 1939. Having in mind the heavy expenses we have had to meet in many directions, notably those occasioned by the migration of our customers' businesses and continued A.R.P. expenditure, I think it will be agreed that the result is a great deal better than might well have been expected.

At this stage it is not possible to comment with any degree of certainty on the effects of the War Damage Bill, which as

yet has not become law. It is an extensive and somewhat complex measure, but the principle of affording protection to the owners of properties of all classes is one which will be generally welcomed. The bank will be affected from more than one angle and the contributions which we shall be called upon to make under the scheme will be substantial in amount.

The dividend is at the rate of 15 per cent., being the same as for several years past. It will be noticed also that £100,000 is transferred to premises account and £150,000 to pension fund.

THE BANK'S OPERATIONS

In common with other industries the banks have experienced inconveniences and difficulties in maintaining their services during 1940. A year ago I made reference to plans we had made before the war to meet possible eventualities, and mentioned that all the banks had agreed to co-operate in rendering mutual assistance should the need arise. We acknowledge with gratitude timely assistance afforded us by other institutions, and are glad that we have been able on occasion to give help to others. The arrangements made in advance have been fully justified by our experiences of last year, and I am happy to be able to tell you that although a number of branches have suffered more or less serious damage from enemy action, we have been able to give virtually uninterrupted service to our customers.

WORK OF THE STAFF

The work of the management and staff calls for very special mention by me. However perfect schemes for the future may be, their successful execution depends entirely on those individuals charged with the responsibility of carrying them out properly, and from this point of view the manner in which extra burdens were cheerfully assumed by one and all has been beyond praise. In addition to the day's work—often after a tedious journey to and from the office—large numbers of the staff up and down the country give unstinted voluntary service to the bank and to the community, in A.R.P. work, Home Guard, Special Constabulary, Nursing, Ambulance, Fire Watching and other services. Their strength of purpose is derived from their appreciation that banking services form a vital section of the nation's war economy and they share the determination of the nation to play a full part in defeating the enemy.

As anticipated, our permanent staff has been further depleted owing to the requirements of the military authorities, and we now have approximately 2,000, or about 28 per cent., of our pre-war male staff serving in the armed forces. Shareholders will be interested to know that over 360 of this number hold commissioned rank and that one D.S.C., two M.C.s, one D.F.C. and one M.M. have already been gained. I much regret to say that there have been casualties, both among the service and civilian members of the staff, but the number of those killed by enemy action is relatively small. The loss of experienced men has also thrown a heavy burden on those who remain with us and on the staff of both sexes who are temporarily filling vacancies.

THE OUTLOOK

As we look back on the course of events in our country during 1940, we recognise that it was a year of grievous trials successively endured, of mistakes rectified, and of unshaken faith in the final triumph of our cause. The progress of military events during 1941 lies beyond our present knowledge, but it would be prudent for us to assume that whatever successes our arms achieve, our qualities as a people may be more materials thus liberated devoted to war ends.

Notable progress has undoubtedly been made in switching over the nation's economy to production for war, but much remains to be done before we can be satisfied that we are putting forth our maximum war effort. Consumption of goods for civilian use will be cut still further and the labour and materials thus liberated devoted to war ends.

The urgency of increasing our export trade, particularly with the United States of America, will continue in an ever-increasing degree. The people of that great country are rendering us magnificent help in our struggle and the recent declarations of policy made by the President of the United States are of the utmost value and importance.

NATIONAL DISCOUNT COMPANY, LIMITED

SUCCESS OF GOVERNMENT'S LOAN POLICY

SIR SIGISMUND F. MENDEL'S SPEECH

The ordinary annual general meeting of the National Discount Company, Limited, was held on the 22nd instant at 35 Cornhill, E.C.

Sir Sigismund F. Mendl, K.B.E. (chairman of the company), who presided, said: You will probably expect a few words from me on the general situation of the money and discount market during the last year, and the method in which the Government has dealt with the financial problems created by the war.

TREASURY BORROWING

The salient feature of the Treasury's policy during the whole of that period has very naturally been to avoid the mistakes made in the four war years 1914-1918, during which Treasury borrowings were effected at an ever increasing cost to the taxpayer, with the attendant evil of a considerable measure of inflation. This time, whatever else may be criticised, the Chancellor of the Exchequer may be congratulated on the success of his loan policy in obtaining his money at low interest rates from the various classes of investors to whom he has appealed, and at having so far kept in check the tendency to inflation arising from the increased spending power created by huge Government war expenditure.

The various methods by which money has been raised during the year 1940 have been so widely made known, as well as the magnificent totals achieved, that no particular reference to the details is called for except in the case of 4½ per cent. Conversion Loan, 1940-44. In January, 1940, the Government offered conversion to the holders of 4½ per cent. Conversion Loan, which they gave notice to repay on July 1st, into a new 2 per cent. Conversion Loan, 1943-45, at par. The money market was a large holder of the 4½ per cent. loan, and as it was desirous of giving the Government all assistance in making a success of the conversion operation, it converted its entire holdings into the new loan. It may be pointed out that, by its action, the market suffered a reduction in income from a considerable portion of its investments. The operation was a success—nearly three-quarters of the repaid loan being converted.

A NEW FEATURE

A new feature of interest to the market during the year was the plan by which the Treasury would borrow the surpluses of the bankers' deposits at Bank of England at a rate of 1½ per cent. for six months. By this method the Treasury would obtain the additional finance required to meet current expenditure, as an alternative to increasing the outstanding volume of Treasury Bills. Undue disturbance to the market can thus be avoided, for by this procedure the Treasury is able closely to estimate its weekly requirements, which are subject to wide fluctuations, due to the uneven spread throughout the year, of the receipt of revenue.

It must be recognised that in no sense can those lending their resources to the Government be accused of taking advantage of the national emergency to profiteer. The various methods of financing the war have resulted in a considerable increase in the floating debt, and it appears that a funding operation may be required unless there are very considerable subscriptions to the new 2½ per cent. National War Bonds and 3 per cent. Savings Bonds.

The year's taxation receipts and the public subscriptions to the various loans will, however, fall short of total Government expenditure, and it would, therefore, seem that a considerable increase in taxation in subsequent Budgets is inevitable, and that the banking system will be called upon to create an increasing amount of money for Government account.

THE YEAR'S RESULTS

Turning to profit and loss, after making provision for taxation, which includes national defence contribution tax, and providing for all contingencies, our gross profit stands at

£242,601, a reduction of £14,507 on last year's figures. The rate of money and discount during the year has been stabilised since the month of January and the margin has been the small one of $\frac{1}{2}$ per cent. per annum, and in view of the increase in the rate of income tax to 8s. 6d. during the year I think we may consider this result quite satisfactory. The expenses of management show a reduction of £7,297. I pointed out to you last year when this figure showed an increase that there were non-recurring expenses included. Our premises sustained some small damage from enemy action. We have made full provision in the expenses, which, however, are recoverable, to cover the cost of the necessary repairs, and our architects advise us that no structural damage has been done to the building.

With regard to the balance-sheet, the total is an increase by £2½ million over the previous year's figures, and now amounts to over £56 million. The reserve fund has been increased by £100,000 and now stands at £1,250,000. Deposits and other accounts amount to nearly £50 million, being £6 million more than last year. Bills re-discounted have declined by £3½ million. This decrease is attributable to the cessation during the year

of trade between ourselves and the European countries which have been overrun by Germany. On the assets side of the balance-sheet, cash at bankers shows a slight increase. Investments at £18½ million are higher by nearly £13 million. As mentioned on previous occasions our investments are all of a short-dated currency, and for the presentation of the accounts they are included when approaching maturity in the item of "Bills and Short Bonds Discounted." As I have already told you, we were holders of a considerable amount of $\frac{1}{2}$ per cent. Conversion Loan which matured on July 1st last, and which we converted into the new 2 per cent. Conversion Loan, 1943-45. This holding was previously in the total of "Bills, etc.," but has now been included under the heading of "Investments," and this accounts mainly for the increase in that item. The total of bills and short-dated bonds is lower by £10½ million, and this reduction is mainly due to the transfer which I have just explained to you. I may here remark that the actual value of our investments is somewhat greater than that shown in the balance-sheet.

The report and accounts were unanimously adopted.

WESTMINSTER BANK LIMITED

STATEMENT BY THE HON. RUPERT E. BECKETT

The annual ordinary general meeting of Westminster Bank Limited will be held at the head office, 41, Lothbury, E.C.2, on Wednesday, January 29, 1941, and the procedure this year has been slightly altered. The chairman of the bank, the Hon. Rupert E. Beckett, has issued a statement to shareholders, which takes the place of the usual address made by the chairman at the actual meeting, and which reads as follows:

In view of the official request to the public to refrain from unnecessary travel at the present time, it is anticipated that the attendance at our annual ordinary general meeting will this year be smaller than usual. I have therefore decided to give shareholders the information to which they are entitled as to the year's accounts of Westminster Bank Limited in the form of this printed statement, accompanying the balance-sheet, and sent out prior to the date of the meeting. This will take the place of the oral statement usually made by me as chairman at the meeting and subsequently circulated in print. The proceedings at the meeting will therefore be confined to the submission to shareholders present of the customary resolutions, and to any discussion arising thereon.

In August last, our senior director and esteemed colleague, Sir Arthur Stanley, felt compelled to resign his seat on the board. He was appointed a director of Parr's Bank in 1902, and for close upon 40 years he served that institution and, later, Westminster Bank, giving regular and devoted service, in spite of indifferent health. We are grateful to him for the work he so ably performed. The New Year Honours List included the name of our co-director and chief general manager, Charles Lidbury, upon whom a knighthood has been conferred, and it is a matter of gratification to us in this bank which he so ably serves that such a signal honour should have been conferred upon our chief executive officer.

INFLUENCING FACTORS

Before commenting on the figures of our balance-sheet, I will briefly refer to the main factors which have been at work in influencing their course. The banks, in common with every other form of national activity, have had to adapt themselves to the great changes brought about by the war in the country's economic life, which is being designedly controlled as regards both financial and productive resources to ensure the maximum war effort in every direction. This has largely influenced the course of banking, but other major changes, such as the decentralisation of business and the evacuation of large groups of the population, have also played important parts.

The dominating factor of the banking year is to be found in the magnitude and acceleration of the nation's extraordinary wartime expenditure, which is readily seen from the following figures. During the first quarter of last year, the total Governmental expenditure averaged approximately £7 millions a day and rose in the second quarter to £7½ millions. By the third

quarter it had reached an average daily figure of £10 millions, and in the last quarter £12 millions. During the second half of the year, the war effort was greatly intensified, and as an index of the speeding-up of the war machine the rising rate of expenditure is, of course, satisfactory. It is unlikely that the peak point has yet been reached, and further increases seem certain. The payments out of the Exchequer for the 16 months of war to December 31, 1940, total no less than £4,011 millions, which has been found as to £1,515 millions from taxation and as to £2,496 millions from net borrowing. Of this increased borrowing, £1,459 millions was provided by a net increase of the "Floating Debt," including Ways and Means Advances, Treasury Bills and Treasury Deposit Receipts—the increase in the "Tender" Treasury Bills and Treasury Deposit Receipts being £683 millions.

INCREASED DEPOSITS

In the 15 months (end August, 1939, to end November, 1940) the deposits of the clearing banks have increased by £487 millions, but more than £100 millions of this increase arises from the changed methods of clearing and the effects of postal delays upon those clearing methods. The effective increase in clearing bank deposits during the 15 months from the end of August, 1939, to the end of November, 1940, is therefore in the neighbourhood of £300/330 millions and at the rate of 14 per cent. upon the pre-war deposits of the clearing banks.

Increases in banking deposits of this magnitude and character are unwelcome: the proper home for increased savings and increased resources of this character created in wartime by the extraordinary disbursements of Government is their direct return to Government in the form of subscriptions to the various Government loans by the persons who have the increased resources placed at their disposal by virtue of such Government disbursements. It is far preferable that this process of direct lending to the State should be expanded than that a large increase in banking deposits should occur, although it is true that such increased deposits would find their way back to the Treasury by one or other of the various means by which the resources of the banks are made available to the Government.

The re-lending by the banks to the State of the increased wartime banking deposits entirely, or even mainly, in the form of long- or medium-term issues has been recognised as undesirable; hence the creation of the Treasury Deposit Receipts which now figure in bank balance-sheets to such a material extent, and in our own accounts as at December 31, 1940, show as a new item of £50 millions.

During the last war and commencing from March, 1915, clearing banks made special deposits with the Bank of England and continued to do so until the end of 1919. These special wartime deposits carried the rates of interest which were then thought appropriate, and were held at seven days' notice and at three days' notice.

TREASURY DEPOSIT RECEIPTS

On this present occasion a far better system has been instituted by the Treasury to deal with the incidence of increased banking deposits. Treasury Deposit Receipts, which are non-negotiable, are issued to the banks. They carry the low rate of interest of one and one-eighth per cent. per annum, have a normal usance of six months, and can be used by the banks to pay for the subscriptions of their customers or those made on their own account to any public issue of H.M. Government other than Treasury Bills. They carry with them the added virtue of liquidity, as repayment can be obtained under discount at Bank Rate if the proceeds are at any time needed by a bank for emergency use. Thus this new type of non-negotiable security provides at one and the same time a convenient and cheap means of borrowing for H.M. Government, a desirable addition to the liquidity resources of the banks, and a method whereby the increased deposits of banks may, upon their conversion into new issues of Government loans, be transferred with the minimum of inconvenience.

The effect of the impact of war upon the resources of our own bank and upon the disposition of our assets, and the increasing degree to which our resources are being harnessed and utilised for the purposes of the national war effort are

with other clearing banks, Westminster Bank has its appointed representatives available to attend, for consultation on credit matters, meetings of the various War Agricultural Committees set up to assist in securing the maximum wartime agricultural production.

It is thus evident to what great extent the resources of the bank are employed for purposes of the nation.

PROFIT AND ALLOCATIONS

After providing for rebate and taxation, and appropriations to the credit of contingency accounts (out of which full provision for bad and doubtful debts has been made), the net profit for the past year amounts to £1,310,629, which is £165,115 less than last year's figure. This result has been achieved in a year of great vicissitudes, and can be regarded as satisfactory. It enables us to make the accustomed allocations for dividend purposes, to transfer £300,000 to officers' pension fund and £100,000 to bank premises, as last year, and to increase the carry-forward from £584,006 to £551,129.

With regard to our foreign auxiliary, Westminster Foreign Bank Limited, as a result of events in Belgium and France all its branches are now in enemy territory within the meaning of the Trading with the Enemy Act, 1939, including even Lyons and Marseilles in unoccupied France. With one exception, all

well illustrated by the figures in the balance-sheet which accompanies this statement and by the following comparative statement of items from the bank's accounts as at December 31st in each of the past three years.

Our deposits at £410 millions show an increase of 12 per cent. on the year. The combined items of cash, balances with the Bank of England and with other banks, and cheques in course of collection on other banks, total nearly £84 millions. Out of the remaining £346 millions, our funds employed almost directly on Government account include:

	millions £
Money at call and short notice (advances almost entirely against British Government Treasury Bills)	28.6
Bills discounted (almost entirely Treasury Bills)	34.6
Treasury Deposit Receipts	50.0
Investments in British Government Securities	107.2

which together total £220.4 millions and represent 63 per cent. of the £346 millions already referred to. Moreover, a large and increasing proportion of our advances to customers, and indeed new advances practically without exception, provide assistance for contractors engaged on Government account, for agriculture, or for other activities vital to the war effort. Here I may mention that, in common

the British members of the staff managed to escape to this country, not without thrilling experiences, but the branches were all left in charge of an experienced and trustworthy staff of Belgian or French nationality, well able to protect our interests in so far as they may be so permitted. All the repatriated staff have, of course, been given employment with the parent bank. As the branches are now all in enemy territory, or territory so regarded, up-to-date statistical information cannot be obtained from them. A very conservative policy has, however, always been followed in connection with the finance and accounts of these branches. For many years past, profits have not been distributed, and both when war threatened and after its actual outbreak a high state of liquidity was maintained. Loans and overdrafts were scrutinised with special care, bearing always in mind the likely effect of war upon the ability of borrowers to repay their indebtedness. This conservative policy should go far to minimise any adverse effects of the impact of war on the business.

The figures of our affiliate, Ulster Bank Limited, show over the year a steady increase of deposits (£22,592,542, against £21,143,766) and a decrease in lendings (£8,601,252, against £9,277,460). The trading result, at £184,616, shows a decrease of £24,682 on that for 1939, due to increased overhead charges, coupled with decreased income from lendings and lower employment rates. Though prudence has dictated a somewhat reduced dividend distribution, I am pleased to report that the business remains healthily sound and progressive.

BRITISH-AMERICAN TOBACCO COMPANY, LIMITED

SATISFACTORY RESULTS—BOARD'S DIVIDEND POLICY

SIR HUGO CUNLIFFE-OWEN'S ADDRESS

The thirty-eighth annual general meeting of British-American Tobacco Company, Limited, was held, on the 20th ultimo, at 7 Millbank, London, Sir Hugo Cunliffe-Owen, Bt., the chairman, presiding.

The chairman, in the course of his speech, said: Taking the assets side of the balance-sheet first, you will observe that the item of real estate and buildings at cost less provision for amortisation of leaseholds, £835,499, shows a small increase of £7,149. Plant, machinery, furniture and fittings, at cost or under, £598,155, shows a net increase of £9,580. Goodwill, trade marks and patents at cost less sales remain at the same figure as last year, viz., £200,000. As I have pointed out in previous years, this is purely a nominal valuation and is very much below their actual value.

Investments in shares and bonds in subsidiary companies at cost or under amount to £29,257,791, showing an increase of £1,647,538, and loans and current accounts with subsidiary companies amount to £5,217,699, showing a decrease of £429,095. These items total £34,475,490, which shows an increase of £1,218,443 over the same items in last year's balance-sheet.

As you will see, there has been some reduction in loans and accounts current with subsidiary companies. There has, however, been a substantial increase in investments in shares and bonds in subsidiary companies. This is partly due to the acquisition during the year of additional shares in one of your company's associated companies. This acquisition having given your company a majority of shares, this company (previously an associated company) had to be reclassified as a subsidiary company, thus necessitating a transfer from "investments in shares and bonds in associated companies."

Investments, at cost or under, in shares and bonds of associated companies amount to £2,845,330, showing a decrease of £1,092,389, and loans and current accounts with associated companies amount to £1,846,002, showing a decrease of £108,252. These items total £4,691,332, which shows a decrease of £1,200,641 compared with the corresponding figure in last year's balance-sheet. This reduction is chiefly due to the transfer to "investments in shares and bonds in subsidiary companies" to which I have referred. Other investments, £2,020, stand at approximately the same figure as last year.

Stocks of leaf, manufactured goods and materials, at cost or under, now stand at £5,148,664, an increase of £365,362.

CASH AT BANKERS, IN TRANSIT AND AT CALL

Cash at bankers, in transit and at call, £3,391,920, as compared with £5,399,298 under this heading last year, shows a decrease of £2,007,378. During the year under review, some subsidiary companies have required additional funds, and your company has repaid a substantial proportion of deposits by these subsidiary companies. With a view to assisting the Government in providing funds required for war purposes, your company has paid taxes amounting to £2,000,000 in advance of the due date.

In addition, our subsidiary and associated companies in this country have made substantial investments in War Loan.

In the opinion of your directors your company's cash balance is now no larger than is necessary for the efficient conduct of the business.

PROFIT AND LOSS ACCOUNT

This account shows a net profit for the year, after deducting all charges and expenses and providing for taxation, of £4,865,441, a decrease of £800,012.

Last year we carried forward a balance of £2,274,131. To this must be added the profits for the year as previously mentioned, £4,865,441, less the dividend on the 5 per cent. preference stock of £225,000; on the 6 per cent. preference stock of £860,000; and the four interim dividends paid for the year on the ordinary stock, amounting to £3,957,335, leaving a disposable balance of £2,597,287, out of which the directors recommend the distribution on the 7th February of a final dividend (free of United

Kingdom income tax) on the issued ordinary stock of three-pence per £1 of stock, amounting to £296,972, leaving £2,300,265 to be carried forward.

The last accounts which were before you covered only one month of the war, and the accounts now before you are the first accounts for a full period under war conditions.

I do not think you will be surprised to see some reduction in the net profits, in view of the heavily increased taxation that has been imposed in this country during the year under review. Unfortunately, we have been faced with increased taxation, not only in this country, but in most other countries throughout the world. In view of the foregoing, I feel you will not think that the results for the past year are unsatisfactory.

ALLOCATIONS

At the last annual general meeting you authorised the allocation from profit and loss to "reserve for contingencies" of £500,000, as a reserve against your company's investments in enemy countries. It is well known to you that, during the year under review, several other countries have suffered enemy occupation, and your directors have thought it advisable that a further reserve should be set up against the value of your company's investments in these countries.

Your directors considered very carefully whether a reserve for these investments should be made out of current profits—which would have entailed a drastic cut in dividends—or whether the required amount could be provided from some other source.

On several occasions in previous years one or two stockholders have urged a more generous dividend policy. I would say that, due to the conservative policy which your directors have always followed in the past, they felt justified in transferring £500,000 from "premium on ordinary stock issued" to "reserve for contingencies" instead of providing this amount out of current income. This has brought the "reserve for contingencies" up to £1,000,000, which is sufficient to cover the book value of your company's investments in all countries now in enemy occupation.

I might add that in recommending a total dividend distribution almost equivalent to earnings for the year, your directors had in mind particularly the interests of the numerous small stockholders, who are dependent to a larger extent on dividends from their investments.

THE OUTLOOK

Now, what of the future? I told you last year that I was not a prophet, and still less do I feel able this year to prophesy as to what may happen in the future, in view of the very disturbed conditions prevailing to a greater or lesser extent in practically every country in the world. I can confidently say, however, that the company's business is thoroughly sound financially and well equipped to meet any fair competition that may arise.

You will appreciate that a world-wide business such as yours is always faced with uncertain exchanges and, to-day especially, the possibility—and I might even say the probability—of further increases in taxation in many countries.

Allowing for this, however, I am hopeful that during the current year we shall be able to meet and counter difficulties that may arise just as successfully as we have done during the year now under review.

I now beg to move the adoption of the report and balance-sheet, including the payment of a final dividend (free of United Kingdom income tax) on the issued ordinary stock of three-pence per £1 of stock. The directors have declared for the year 1940-41 an interim dividend of ninepence per £1 of stock (free of United Kingdom income tax), payable on the 7th February next.

Mr Montague L. Whishaw (deputy-chairman) seconded the resolution, which was carried unanimously.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended January 18th, 1941, total ordinary revenue was £62,324,000, against ordinary expenditure of £88,663,000 and issues to sinking funds of £145,000. Thus, including all sinking fund allocations, the deficit accrued since April 1st is £2,048,635,000, against £640,912,000 (including defence loan issues) for the corresponding period a year ago.

increased from 5 to 7½ per cent. Total income improved from £78,690 to £149,850 but net profits were only moderately higher at £79,850 against £78,690. WM. TIMPSON, LTD., is repeating the 15 per cent. ordinary payment. Gross profits rose from £190,955 to £202,002, but net income was slightly lower at £101,002 against £102,455. NEW ZEALAND AND RIVER PLATE LAND MORTGAGE CO. realised a small improvement in total income which rose from £86,037 to £87,707 and a rather larger increase in net earnings at £34,778 against £32,697. The 4 per cent. ordinary dividend is maintained.

Bank of Nova Scotia.—Net profit for 1940 \$1,941,331 (\$2,033,333), after taxation \$1,004,027 (\$559,191) and contingencies. Bank premiums \$250,000 (\$250,000), pensions fund \$200,000 (\$190,000), Carry-forward \$1,225,891 (\$1,174,560), dividend again 12 per cent. Cash \$63,609,272 (\$67,130,107). Investments \$131,171,218 (\$136,065,455). Deposits \$269,639,665 (\$279,766,509).

Hibernian Bank.—Net profit, second half 1940, £32,035 (£33,603). Bank premises £5,000. Carry forward £27,608. Dividend again $5\frac{1}{2}$ per cent. Deposits £10,776,791. Government securities, etc. £4,702,423 (£5,031,488). Bills discounted £5,952,561 (£6,111,541).

Hongkong and Shanghai Banking Corporation.—Total dividend for 1940 £5 per share as before. Written off

bank premises account	\$1,000,000
(\$300,000). Carry forward	\$3,422,000
(\$3,411,330).	

Westinghouse Brake.—Net profit, year to Sept. 30th, £159,781 (£88,932). General reserve £50,000 (£25,000). Contingencies reserve £25,000 (nil). Investment reserve £13,293 (nil). Carry forward £92,384 (£90,432). 10 per cent. dividend repeated.

Second Covent Garden Property Co.—Total income, year to Nov. 30th, £163,746 (£175,949). Debenture interest £59,000 (£59,000). Mortgage interest £17,651 (£17,628). Income tax and N.D.C. £31,621 (£26,252). Net income £40,779 (£56,386). No final dividend to follow interim of 2d per cent. (total 6 per cent.). Carry forward £55,232 (£44,266).

LONDON ACTIVE SECURITY PRICES AND YIELDS

Allowance is made for net interest accrued, and for redemption for fixed interest stocks and for changes in interim dividends for ordinary stocks.

Japan's Difficulties

THE Japanese Diet reassembled on January 21st.

Prince Konoe's Government appear to have faced the session with some misgivings, since, before the House met, a series of conferences was held to enable the Ministers to outline before selected audiences — one day it was peers, then deputies, then industrialists — the policy of the Government and the nature of the crisis through which Japan is passing. Prince Konoe clearly expected the keenest opposition to be directed against the structural changes in the State introduced during the course of last autumn. These changes were Japan's attempt to keep abreast with the development of totalitarian technique in Europe. Her former superficially democratic institutions had been borrowed from the West at a time when liberal democracy was everywhere in the ascendant, and were incorporated in a Constitution granted by the Emperor Meiji. But in the spring and summer of 1940, liberal democracy lay moribund on the battlefields of Flanders and France. The Japanese naturally attributed the astonishing successes of the Axis to its political organisation. Prince Konoe called for a "new order" and a Committee was appointed to produce a plan.

The whole Empire is to be organised under a Supreme Economic and a Supreme Cultural Council. The State is thus to give unified direction to all the activities of the community, and the community has dutifully spent the autumn organising itself to fit in with the new plan. Industry has amalgamated under its own leaders, churches have transformed themselves into national churches, a single party has been created to transmit the views of the Government and to express the will of the people.

The people of Japan have accepted the changes with the docility of those who realise that it makes not the remotest difference to them however the State is run. The opposition comes from more influential quarters. For years now—since the murder of Mr

Inouye in 1931—the big industrial and financial interests have been fighting a desperate battle against the revolutionary factions among the armed forces. The younger officers, representing an impoverished landed gentry and peasantry, refuse to accept the hegemony of big business and the parliamentary system manipulated by it. War plays into their hands, since total war demands totalitarian control of industry. These extremists have long clamoured for complete nationalisation of industry with a complementary military dictatorship in the sphere of politics. Resistance to their demands has been accompanied by a rising tide of violence: war in China, political murder at home.

There is reason to believe that Konoe's "new order" is a compromise. As such, the industrialists have accepted it, like Belloc's child, "for fear of finding something worse." But it was expected that the Diet would bring to a head the unsolved problem of the relations between the Meiji Constitution and the new structure. A God given Constitution cannot be re-scinded, and the Constitution guarantees the status of the Diet and the right to vote. The deputies have proved jealous of their privileges in the past. They were expected to be quite as tenacious in this crisis.

In fact the session has opened in a mood of intense loyalty and fervent compromise. This mood may in part be due to the Government's readiness to shelve the more controversial measures. The electoral system is not to be reformed and the Diet's lease of life is extended by one year. All industrial reorganisation is postponed and the Budget will come up for immediate consideration. But the real motive behind the Diet's unexpected quiet is the feeling, carefully fostered by Prince Konoe and Mr Matsuoka, the Foreign Minister, that Japan is facing so grave a crisis in her existence that "faction" is out of place. "Our

Empire to-day faces the gravest emergency in its history" was the verdict of the Prime Minister, and Mr Machida, former President of the disbanded Minseito Party, gave the nature of the emergency when he said, "The foreign situation is growing tenser every day. The enemy character of Great Britain and the United States against this country is asserting itself more and more boldly."

Whether or no this stressing of a foreign crisis was a shrewd political manoeuvre to tide the Government over an awkward parliamentary moment, it is undoubtedly true that the relations between the Western democracies and Japan have deteriorated. The change is more marked in the case of the United States, since British relations with Japan have been very bad for some time now. Since September last the Japanese have done everything in their power to underline their resentment of American policy and to multiply their threats of the awful consequences to the American Republic if it attempts to interfere with anybody's "new order." Article 3 of the Three-Power Pact was phrased to read as an almost specific warning to the Americans to keep out of the European war if they wanted to avoid trouble in the Pacific. President Roosevelt's reply—to summon American nationals home from the Far East—had a sobering effect for a short time, but the Presidential election and the great spurt given by it to the policy of helping Britain restored the earlier bitterness. The Japanese now talk as though a clash were inevitable, and Mr Matsuoka has taken a positive, if sombre, pleasure in underlining how inevitably Japan must enter the war if the United States becomes involved on any pretext short of being directly attacked by Germany.

The Japanese Foreign Minister has left us in no doubt over the reasons for this hostility. It is that "the United States has evinced no adequate understanding of the fact that the establishment of a sphere of common prosperity throughout Greater East Asia is a matter of special concern to Japan." The Japanese objection is twofold. It deals with two different aspects of "Greater East Asia," both of which, however, are vitally concerned with the foreign policy of the United States.

On the one hand there is the Japanese *Drang nach Süden*. Ever since the defeats of May and June placed in a new light the whole question of sovereignty in Indo-China and the Dutch East Indies there have been powerful forces—certain groups in the Navy and some sections of the business world—at work behind the Japanese Government, pressing them to adopt a "forward policy" in the area loosely called the South Seas, now held to be Japan's natural *Lebensraum*. In Indo-China the Japanese have had considerable success; indeed, French concessions in the matter of airfields, naval bases and supplies add up to a virtual occupation. And now that the dispute between Thailand and Indo-China is to be settled by Japanese mediation, it is likely that more pickings will come the way of the arbiters. In the Dutch East Indies, however, in spite of the efforts of Mr Kobayashi and the readiness of the oil interests to sell Japan

900,000 tons of oil, the Dutch, conscious of American interest, are resisting Japan's efforts to secure whole-sale rights of exploitation. Mr. Cordell Hull stated last summer that a change in the status quo in the Dutch East Indies would be a matter of concern to the whole Pacific area, and nothing in his recent statement on the Far Eastern position modified the earlier view.

The possibility of American intervention is inconvenient in the South Seas. In China it is a major obstacle in Japan's imperial way. The Japanese are, militarily speaking, no nearer winning the war than they were a year ago. They have even had to abandon the Nanking area this autumn in order to send their troops to Indo-China and Hainan. But the puppet government at Nanking is established, and the Japanese hope to rally the Chinese to Wang Ching-wei by waiting for a disintegration behind General Chiang Kai-Shek's lines. Mr Matsuoka described Chungking as a "regime riddled with internal disruption and friction which are rapidly growing acute, while the masses under its control are suffering from high prices, a dearth of commodities and other tribulations."

We know that the Communists are causing the Generalissimo anxiety by their insubordination. Only a few weeks ago the Fourth Army was disbanded for mutiny. We know, too, that Free China is economically in a dangerous position, which the reopening of the Burma Road last October can mitigate but cannot cure. The Japanese are experimenting in a new policy of fighting little and squeezing home the blockade. The lull deprives the Free Chinese of the spur of danger, the blockade causes grievous shortage and distress. It is therefore not fantastic for the Japanese to hope that this policy of attrition may soon secure its end.

There is only one obstacle—the moral and material reinforcements sent by Britain and the United States to General Chiang Kai-Shek. Last autumn there were two loans—£10 millions from Britain, £25 millions from the Americans—and all President Roosevelt's recent statements on aid for the belligerents have included Free China among the armies fighting for freedom. Japan finds her policy of attrition frustrated and fears instead that an economic anaemia will beset her own community while the United States, far from restoring it by loans, may well aggravate it by further additions to the existing embargo on high octane petrol and steel scrap.

Japan is, therefore, endeavouring by bellicose threats to frighten America off China and out of the Western Pacific. America, says Mr Matsuoka, can have peace if she will purchase it at the expense of East Asia. The Western democracies can afford to ignore these warnings. Nothing so advances our cause in the Far East as the extent of Japan's commitments in China. If the price we were to pay for "peace" were the abandonment of the Free Chinese we should be purchasing the certainty of aggressive expansion at the price of our only guarantee against it. Our interest is the preservation of Free China. So long as the China incident is unsettled, Japan must hesitate before embarking on further wars. The maintenance of China is also our best guarantee of peace.

Unity and Opposition

TWO sentences in the Prime Minister's remarkable defence of his policy last week attracted possibly disproportionate attention. Mr Churchill told the House of Commons that reconstruction was being planned to extend over a period of three years after the war, and expressed the belief that, "if we can continue on the morrow of the victory to act with the unity which we shall have used to bring that victory," great and speedy achievements would be possible. The Prime Minister may very well have intended to do no more than suggest that there should be no greater disagreement about the scope and character of the reforms that will be immediately practicable—and desirable—on the resumption of peace than there is now about the prosecution of the war. It was not Mr Greenwood's duty, he said, to set up a new order, or to make a new world. But much more than this has been inferred from Mr Churchill's statement. It has been widely conjectured that his intention was to propose a perpetuation of the present Government and an extension of the party truce beyond the limits of the war; and it is noticeable that commentators associated with the Labour Party have accorded a special welcome to the idea, as giving the leaders of the Labour movement a sure stake in the making of post-war policy. The fact that Mr Greenwood, deputy-leader of the Labour Party, is Minister-to-be of Reconstruction is taken to reinforce this interpretation of the Prime Minister's views.

It is hard to believe that Mr Churchill, with his deep-set trust in the Parliamentary process, is in fact thinking quite along these lines. While the war is on, there is obviously no time or place for the formal clash of parties. The people support the war; they trust the Prime Minister; and, for these reasons, it is possible to fold the vigilance and criticism which are still active and essential within the frame of national unity. It is, in some ways, a regrettable necessity. The House of Commons, elected over five years ago, is unrepresentative in detail. But its ill-balance can be hidden for the duration by a general zeal for the common cause. The position is tenable—even essential—because life and death are in the scales and because Mr Churchill's Government, unlike that of his predecessor, is popular and efficient. Despite the reservations of the Labour rank and file, the present Government is a coalition, a temporary expedient for winning the war. It will be judged by the fruits of its labours in that direction; and the term of its authority, like that of any other government in a democracy, will be set by its ability to continue popular and efficient in the public esteem. It is by no means an infallible government, and the power of the people to change it has been suspended, not dispensed with. No government in a democracy has a right to existence; it has only a claim.

Mr Churchill would probably not quarrel with this statement of his position, and it would be unfair to suppose that he himself wants to do more than prevent the larger interests of the community from being lost from sight among lesser creeds and interests. The danger lies rather in the views of those people who have so eagerly seized upon his words. There are two classes of these: those who have imbibed the evil doctrine that political opposition is *ipso facto* a disruptive and subversive thing; and those who see in the continuation of the present regime an opportunity for place and advantage. The former would do well to study the case of Mr Wendell Willkie. Mr Willkie was Mr Roosevelt's honest and determined opponent in last year's election. Now he is in England, to see for himself the best way to work out the policy of aid to Britain in practical terms. Mr Willkie

has not surrendered his opposition; his visit to England is a clear proof that responsible political opposition in a democracy is an aid and no hindrance to the shaping of public policy in a popular and efficient fashion. The twenty-two million American citizens who voted for Mr Willkie are not obstacles to Mr Roosevelt's programme; they rather represent so many guarantees that his programme will not be executed in an arbitrary or slipshod manner. As a political portent, Mr Willkie is neither subversive nor disruptive.

The peril of the latest totalitarian-tending arguments arises not so much from the present situation as from the unhappy history of the last ten years or so in British politics. On the one side, we had the Conservative hierarchy, unbendingly opposed to ideas from within or without likely to disturb a tenure of office and a trend in policy which were well calculated to advance the narrow liberties of the industrial and commercial baronage. On the other side, we had the Labour Party, ostensibly pledged to a policy of drastic economic and social change, but actually unwilling to take office. Time and again, from the industrial troubles of the 'twenties onwards, the leaders of the Labour movement showed themselves indisposed either to advance or to retreat. The suggestion of their extremist followers that they should stake their political future on a determination to put their Socialist programme into full operation filled them with indignation and dread. The suggestion of their Liberal neighbours that, by abating a doctrinaire programme which they never intended to execute, they could convert their backing of a solid third of the electorate into one half or more, they fastidiously refused. After 1931, the party settled down as His Majesty's permanent Opposition, well contented to be marking time. The Parliamentary process, as we know it, is dependent for its working upon the power of the people through their representatives to replace one Ministry by another; and, by the defection of the Labour Party from its political duty, democracy came to lack a leg. There were honest and able critics in plenty within the ranks of all parties, but they had no party machine or cohesion; while Mr Attlee, leader of the Labour Party, was Leader of the Opposition with a salary, Mr Churchill, a Conservative rebel, was leader of the Opposition in fact. Neither could come into office in normal times—Mr Attlee because he and his party caucus would not take the steps needed to win elections, Mr Churchill because his party caucus was against him. These were the conditions of Tory misrule.

The fact is that an alternative administration in Opposition—able and willing to become a Government, but with no wish, real or professed, to disrupt the State itself—is a necessity of sound democratic government. Indeed, one of the chief items in any really satisfactory reconstruction of the post-war world would be the emergence of such an Opposition, and certainly not its suppression. In the event, of course, the advocates of a strait-jacketed "unity" and the place-seekers may conceivably have their way, for it is hard to see where a real Opposition is to come from; but it would be a setback, not progress. An all-party Government with the full backing of a loyal but keenly critical Parliament is absolutely essential now; and the Labour leaders did their duty by coming in. But current discussion suggests that, even when the necessity has passed, the method of opposition by direct assault may still be distasteful. It may be tempting to imagine that the notorious gaps in official Conservative policy on such crucial questions as the control of trade and industry and the remodelling of the educational system could

be filled by Labour associates working "inside" and "on the ground floor"; but it is very optimistic. The material does, admittedly, exist in the ranks of all three parties for a sound and effective Opposition that could play its part in the hammering out of a new and dynamic policy. The core is probably among the "young" Conservatives, just as it was in the years of Churchillian opposition—and, earlier, in the days of Pitt, Canning, Disraeli, and Lord Randolph's rising son, in turn. But it lacks a party machine and a leader; the Conservative machine is guarded like a vestal's virtue; and Mr Eden is not likely now, after forgoing so many opportunities, to stray far from the narrow path—merely in search of the traditions of Young England.

Time and the people will tell. One of the reasons given for the desirability of freezing political activity after the war is the undesirability of another Khaki Election, all passion and prejudice. But unless a new Parliament was elected as soon as possible after the war, representation would surely become a mockery; and, if the first post-war election were to be held under some sort of party truce, it would run the

risk of not being an election at all. It would be a *plébiscite*—with something of the ill-savour that the word has mounting acquired from Napoleon Bonaparte to Adolf Hitler. It would very largely bring back to Westminster the men who are there now—not for any sound democratic reason, but because the people would have no choice. No man can judge now what the political situation will be when the war ends. Mr Churchill is completely right when he says that the utmost agreement will be essential about the reforms immediately required; haggling over interests or ideologies will be fatal. This, indeed, will be the test of democracy. But his "echoes" are no less completely wrong when they set out to commit the sovereign people in advance to a particular Government or a particular Parliament. In Europe, before the war, the movement towards one-party government was a disaster. Here, it was a sign of serious weakness; and deliberately to encourage and intensify it as a part of post-war "reconstruction," simply because in wartime it appears to be inescapable, would be a plain betrayal of the very principles upon which it is hoped to build the post-war world.

The Future of Spending

IF the national war effort can be judged by the figures of expenditure—and there are many worse *prima facie* indications—then the country is in the midst of another spurt like that of last summer. A year ago, in January, 1940, the total of Government spending, reduced to an annual basis, was at the rate of £2,275 millions a year. Three months ago, in October, 1940, it was at the rate of about £3,850 millions a year. In the first 25 days of January, 1941, it has been at the rate of over £4,680 millions a year—more than double a year ago, one-fifth larger than three months ago. It is still too early to judge whether the Budget estimates of revenue will be realised. The intake in this last and crucial quarter of the financial year would have to be about 20½ per cent. larger than last year for the estimates to be exactly achieved. So far this proportion has not been attained, though the last week showed some improvement. But, in any case, a few millions of revenue more or less matter comparatively little; it is already certain that the deficit will be of the order of £2,500 millions.

In present conditions, revenue matters less than expenditure and this year less than next. The really crucial factor in the fiscal outlook is the probable expenditure in 1941-42. That it will be larger than the present rate of expenditure is obvious; but how much larger? Expenditure increases for two reasons: because of the steady rise in the physical proportions of the national war effort; and because of the steady fall in the value of money. The former can hardly be estimated without access to secret information; the latter is slightly more susceptible of estimate. In the current issue of the *Economic Journal*, Professor Pigou estimates that the National Income rose by 25 per cent. in the first year of war. If we assume that this rate of increase of 2 per cent. per month still holds good, we shall not be running any risk of over-estimation. By this somewhat crude method of calculation, the gross National Income, which was about £6,000 millions per annum in August, 1939, must be running in the present month at the rate of about £8,120 millions and Government expenditure represents 57 per cent of it. By the same method, gross National Income on the average of the financial year 1941-42 will be at least £9,000 millions, and expenditure £5,180 millions. This is certainly a minimum figure, since it makes no allowance, either for an increase in the physical output of munitions, or for an acceleration in the rise of prices.

What can be put against this on the side of revenue? The estimated yield of revenue in the current year is

£1,360 millions. There will be certain automatic increases next year owing to a full year's operation of certain taxes (notably the Purchase Tax) which were officially estimated last July at £118 millions. It was also then stated that the effect of increasing the rate of E.P.T. from 60 per cent. to 100 per cent. would not be apparent until next year. No figure was given for this increase, but by simple proportion it can be put at about £50 millions. So far the total is £1,528 millions. But if the money figure of the National Income is rising, the yield of certain taxes will also rise. This will not be true of Customs and Excise, the greater part of the revenue from which comes from specific, as distinct from *ad valorem* duties, and will be reduced by limited consumption. Nor will it affect Death Duties. As for income tax, there will be some increase, but with a considerable time-lag. There is also a natural delay before rising values are reflected in the yield of Excess Profits Tax. A 15 per cent. increase in the total of income tax and surtax would bring in £90 millions, which must be regarded as a maximum from this source, while for E.P.T. to produce an additional £100 millions would involve a virtual doubling of the volume of excess profits. In view of these figures it would seem to be the limit of reasonable optimism to put the yield of revenue next year, on the basis of existing taxes, at £1,700 millions.

There is thus a prospective deficit—what may be called the "gross gap"—of £3,400 millions at the least, and probably more. To get the advantage of a convenient round figure, it can be put at £300 millions a month. The next step is to enquire what non-inflationary means are at hand for meeting this deficit.

The first of these is clearly savings. Thanks to the efforts of the National Savings Committee, the total of subscriptions to the various issues of Government securities are now over £100 millions a month. Not all of this, however, can be accounted real savings. There is the "difficult theoretical problem of how to treat funds which are merely re-invested in War Loan. And there is the fact, commented on in an article dealing with the clearing bank figures on page 148, that some part of the total subscriptions is made, not by saving individuals, but by the joint-stock banks, who are "creating credit." The investment holdings of the members of the London Clearing House, who do not represent the whole of the banking system of the country, increased by over £28 millions in December, while the total of subscriptions to the various War Loans was £105 millions. It is true that increasing incomes should lead to increasing savings, but the

yield of genuine voluntary savings in 1941-42 cannot be put even with optimism at more than £100 millions a month.

The second source from which resources can be drawn is the undisclosed income of various Treasury Funds. The Unemployment Fund, for example, is reported to have saved something like half its income last year; but, if this is true, it represents only some £8 millions a month. The collection of contributions under the War Damage Bill will be of the same dimensions, and most of the other funds are even smaller. The chief exception is, of course, the Exchange Equalisation Account. The figures revealed by Mr Morgenthau in Washington on Tuesday show that the dollar assets of the British Government have been drawn upon, over the whole 16 months of the war, at the average rate of nearly £40 millions a month. The counterpart of this loss of dollar assets is, of

course, an investment in sterling Treasury Bills or War Loan. But this source of relief will shortly be coming to an end, either from exhaustion or from the great reduction in American payments under the "Lease and Lend" Bill. A similar relief, derived from the excess of purchases from sterling area countries and the consequent piling up of their balances in London, can hardly produce more than £15 millions a month at the most.

When all these non-inflationary resources are added together, it is very difficult to put their combined prospective total in 1941-42 at more than, say, £150 millions a month, or half the "gross gap." There thus remains a "net gap" of a further £150 millions a month. This is the sum that has to be met by increased taxation, by induced or compulsory saving—or by inflation. It is the figure that should set the tone for the financial discussions of coming months.

A Medical Parliament

ONE upshot of the last war was that the Local Government Board became the Ministry of Health. But it was a change of title much more than of function; and one of the transformations which might well be the outcome of the pressing problems of health and working efficiency in this war is the establishment of a Ministry of Health in deed as well as in name, administering services to protect the health of the public at every point, and marshalling every resource of medical skill and experience in a single organic system. The doctors have clearly a crucial part to play in this, and the British Medical Association recently set up a "planning commission" to "study war-time developments and their effects on the country's medical services, both present and future." Most of the important medical institutions will send representatives to the commission; and the Ministry of Health and the Department of Health for Scotland have been invited to appoint observers. In fact, some sort of "medical parliament" appears to be in the making. Many of the commission's tasks will be exclusively medical and pathological. The war has offered new problems to medicine—of which the dangers of sheltering to health and the shocks due to air raids are obvious examples. But the commission intends to tackle economic and social problems as well. As the *British Medical Journal* observes, "war has thrown up into sharp relief the deficiencies of our peace-time system of administering relief to the sick and of promoting and maintaining the health of the people."

How medical science may touch directly on essential economic needs can be illustrated by a problem like that of industrial fatigue. Before the last war the view that long hours of work keep down and do not increase the power of labour to produce had nearly triumphed—after a century of industrial and political struggle. It was then a view based purely on empirical observation; and it was left to the doctors during and after the war years, 1914-18, to subject it to more precise analysis. Lengthened hours did not produce the desired increase in the output of munitions; the Health of Munition Workers' Committee was set up to consider the question of fatigue; and towards the end of the war the Industrial Fatigue (now the Industrial Health Research) Board was set up. At the beginning of this war, on the basis of two decades of intensive medico-social investigations, the warning was given that over-long hours and continuous working without rest periods should be avoided for the sake of efficient production. Even now, the Select Committee on National Expenditure finds it necessary to recommend, in its latest report, that "some reduction in hours should take place immediately, before the health of munition workers is seriously affected, as happened in the last war." The current need

for more war workers, and not just for more work from existing war workers, is as eagerly pressed by doctors as by economists and industrial experts.

But the new commission, if it is to do a useful work, will have a wider field. There are long-standing administrative problems, made more urgent by the war, to be solved. The capacity of the country's medical services to ensure the health of citizens is the prime instance. The need to prevent ill-health rather than merely to cure disease is greater than ever, and the existing system—with its specialists and general practitioners dependent upon fee-paying patients and its voluntary hospitals dependent on charity, side by side with the tax and rate-fed public health services—is being subjected to a supreme test. The medical profession, which, as a service to the public, has many of the faults of unco-ordinated individualism, is closely woven into the complicated network of two great social services which are themselves acknowledged to be defective and capable of drastic reform—national health insurance and workmen's compensation.

Here the doctors have their greatest chance. The plain truth is that the combined efforts of private medicine and public health services do not provide the community with satisfactory care and attention. Responsibility is scattered; there are gaps; and there are essential treatments which are not brought within the reach of most people. The new commission should be in a position to press for remedies, and to educate doctors themselves on the ways and means of securing the health of the whole community by bringing the greatest care to the greatest number. It can press for better provisions for the rehabilitation of injured workers; for an extension of specialist, consultative, dental and ophthalmic benefits under national health insurance; for the substitution of medical boards for the single referee in insurance adjudications; for the compulsory appointment of medical officers in factories; for the provision of useful light work for the partially incapacitated; and for the widening of the nation's public health services to include everybody and not merely the breadwinners at present entitled to health insurance.

In approaching the organisation of national health services, the doctors are taking up a task they set aside a generation ago. Long before the introduction of national health insurance, the medical profession had worked out a plan for what was called a "public medical service." Their scheme was set aside after the appearance of the Report of the Royal Commission on the Poor Law in 1909 and the National Health Insurance Act of 1911. The National Health Insurance Act, as it finally emerged, made an end to the original aim of the doctors, because, as a member of the Royal Commission on Workmen's Compensation

recently observed, "there were interests powerful enough to force their way into the scheme, although it had never been intended that they should be in it;" and health insurance became burdened with the work and inequalities of being administered by thousands of independent approved societies. In regard to workmen's compensation, too, the British Medical Association has voiced disapproval of retaining private interests as the insurance carriers of the system.

Insurance interests, however, are far from being the only private interests involved. The B.M.A., with a membership of 89,000, is one of the most important trade unions in the country, and, to a point, the protection of doctors' interests is right and proper. But

it is imperative that no "craft-guild" bias should distract the new commission from its higher aims of serving the public. Such questions as the rights and competence of general practitioners and the availability of specialists must be examined from the standpoint of national welfare and not from that of competing professional interests. In 1929 the British Medical Association published proposals for a general medical service for the nation; another scheme for a general medical service was published by the B.M.A. not long before the war. It now depends to a great degree upon the courage and impartiality of the co-operation of doctors whether this war-time opportunity is taken to make reform a reality.

NOTES OF THE WEEK

General Metaxas

Although death has deprived General Metaxas of his share in the final victory of the Allied Cause, at least he lived long enough to know that his country was providing one of the most brilliant episodes in the long struggle against tyranny, and to see in its magnificent stand the fruit of five years' patient effort. Without Metaxas, Greece's victories would hardly have been possible. He created order and unity after a period of political confusion. His wise measures of social legislation and agricultural credit gave the people a stake in their own community. He found it sunk in the indifference and apathy bred of the disasters in Asia Minor and a decade of political faction. He restored it to the magnificent fighting force we know to-day.

More Men

On Wednesday, a Royal Proclamation rendered men aged 18-19 and 37-40 liable to register for military service; and those aged 19, the 1921 class, will register on February 22nd. Thus, the full range of the men made liable for service by the Military Service Act is now liable to be called up. This step, which came to many as a surprise, follows on the Government's belated decision to mobilise the nation's entire man power for fighting or for the manufacture of fighting equipment; and the new Proclamation was accompanied by a statement to the effect that men will only be retained in their present jobs, under the Schedule of Reserved Occupations, if it can be shown that they are actually doing work of greater national importance to the war effort than they could do in the fighting services or in the direct war industries. Only men in a new category of "protected" work (which at first will be certain work in munitions, the metal industries and shipbuilding) will be *ipso facto* exempt. It should not be supposed that this sudden extension of liability to calling-up implies that the Government intends to proceed with the recruitment of a vast army, regardless of the size of the industrial army upon which the ability to fight under modern conditions of heavily equipped and mobile warfare must entirely depend. The Government has already decided, if it should be necessary, to register and call up men for war work as well as for the services; and the amendment of the Schedule of Reserved Occupations, in order to make the work actually being done the real test for reservation—an eminently reasonable adjustment—is probably intended as much as a means towards industrial mobilisation as an instrument to create an inflated army. Mr Bevin has set to work this week to hammer out with representative workers and employers the way to concentrate the maximum man power on war production. The frequent argument that it is impracticable to expand the fighting services because the industries furnishing their equipment are under-manned was, in any case, unconvincing so long as there were millions of men and women neither in the forces nor engaged in any work of real national importance. The new procedure, which includes a determined effort to replace men by women at every point in the nation's economy, should break up this pool of unmobilised labour, and the test of statesmanship in the near future will be to decide in what proportions the men released are to pass into the forces and the equipment industries, respectively.

It is true that equipment, rather than numbers, counts in modern battles. It is also true that, where equipment is roughly equal, numbers may decide the issue; and it would be fatuous to replace the delusion of an army of many millions by the absurdity of one of a few hundred thousands. The aim should still be to build up the biggest possible Army—and Navy and Air Force—that can be provided at every point with superior equipment to the enemy.

Bill No. 1776

The pressure of American public opinion behind the President's foreign policy of assisting Great Britain, Greece and China is not being allowed to relax. There has been a constant stream of testimony before the Committees of the Senate and House of Representatives which are considering the "Lease and Lend" Bill, and though the isolationists have had their say and have produced their star witness, Colonel Lindbergh, the weight of evidence has been against them. Members of the Cabinet and serving officers have alike given their opinions on the danger in which America stands, of Britain's need of assistance and of her good chance, given that assistance, of early and complete victory. The isolationists are deserting the main battlefield and giving their greatest attention to the red herring of querulous demands for "war aims." These tactics are not endangering the Bill and though the President is said to be ready to make a few concessions, they are needed to speed up the Bill's passage, not to ensure a favourable vote, which is not in doubt. The reported concessions are three in number—a limit of ten years to the powers conferred on the President, acceptance of the obligation of reporting all loans and leases to Congress and the prohibition of conveying by the American Navy—and only the last is of importance. Nothing has happened to weaken the conclusion that the United States is now virtually a non-belligerent Ally of the democracies—indeed, the arrival of Lord Halifax on Great Britain's newest battleship and Mr Roosevelt's unprecedented action in going to meet him might have been designed to emphasise that fact.

Purgings in Italy

It is difficult to sift truth from falsehood in the reports from Italy of widespread rioting and of German troop movements. The week has undoubtedly seen a great increase in the numbers of German troops on Italian soil, and the Germans, after limiting Brenner traffic to "military transport," now admit that many units have crossed the frontier. Nor is it difficult to believe that the Italian people—especially in the North—have given violent expression to their ingrained hatred for their Teutonic ally, but the German infiltration is still more a matter of aircraft units, technicians and secret police than of massive arrivals of German troops. No German infantry is reported yet on any of Albania and Africa. In the meantime, the defeats concurring of the Italian Fascist leaders, Farinacci has gone to the front, so have Ricci, Pavolini, Bottai, Gorla, and, most sensational of all, Ciano. Superficially, this

mass deportation suggests the familiar totalitarian technique of creating scapegoats. Yet it has certain remarkable characteristics. There was a purge in November, when the scapegoats were the High Command of the Army and Navy and Badoglio was singled out for a vicious attack by Farinacci. Since then the defeats have continued, the people have shown signs of violent discontent with the régime and of marked confidence in the dismissed military leaders. Moreover, Germany is taking a hand. The Nazis are not fools. They are faced with the necessity of keeping Italy upright in the war, and the gang of opportunist politicians round Mussolini have more than proved their incompetence. It would be a shrewd move to cover up a German "occupation" by bringing back the soldiers who have some military competence and enjoy the people's confidence. It is another question whether the dismissed officers would consent to serve. But Pétain is an example of the attraction the Germans can exercise upon professional soldiers, and there are—admittedly totally unconfirmed—rumours of a new Supreme Council made up of the Crown Prince, Badoglio and a German general.

Africa: The Advance Continues

The sphere of operations in Africa is extending rapidly. In Libya, Derna is surrounded and its fall is imminent. In the south of Tripoli the Free French, advancing from Chad, have made a spectacular attack upon the air base of Murzuk, during the course of which hangars, aircraft, workshops and other installations were completely destroyed. This exploit is a reminder of what Britain and France could have accomplished together if the surrender of June had not taken place, and perhaps it will not be lost on General Weygand, who, according to many reports, already regrets the earlier decision, based as it was on a false premise—the inevitability of a British collapse. Our most striking successes have, however, been scored on a new battlefield to the East. The advance into Eritrea has been even more rapid than our advance into Libya. Little over a week after the fall of Kassala our troops are closing in on Agordat, halfway between the Eritrean frontier and Massawa, on the Red Sea. We are now operating in Italy's oldest and best developed colony, where in the 59 years it has been under Italian control there has never been disloyalty or unrest. Its native soldiers, the Askaris, were the backbone of the army which conquered Abyssinia and have a high reputation among colonial troops. Yet our advance has met scarcely any resistance and no engagement has lasted more than three hours. The precipitate Italian withdrawals are perhaps due to the rapid deterioration of the situation in Abyssinia. If the whole country rises in revolt, every Italian soldier will be needed to hack a way for troops and colonists through to the coast.

Evacuation—Official Views

A good deal of surprise will be felt at the opinion of the Ministry of Health Committee on the reception areas that, in the great majority of cases, evacuation is a

success. "The tremendous efforts made by local authorities," says their report, "by devoted members of voluntary organisations and by the warm-hearted householders themselves, cannot be adequately realised without a personal visit to the reception areas." When, however, it is considered that, so far as can be understood from the report itself, the Committee performed the spectacular, if tidy, feat of visiting seventeen counties—in four Regions—in seventeen days, it is pardonable to point out that their own personal inspection must have been somewhat cursory. But this slight air of complacency—which may, after all, only mean that the Committee started out with extreme pessimism and was relieved to find that things were nothing like so bad as they had feared—has not blinded them to the real difficulties of the evacuation experiment; and the report suggests many remedies for easing the burden on the reception areas and inducing the evacuees to stay there. The remedies are none the less useful for having been unofficially urged many times before. Co-ordination between civil and military billeting authorities; welfare facilities, that is, clubs for mothers, hostels for husbands; nursery centres and communal eating places; the requisitioning of premises, furniture and equipment; special hostels for difficult or unclean cases—almost all of these were recommended when the first evacuation broke down in September, 1939. Of more interest are the Committee's discovery that, in some districts readily accessible from London, saturation point has been reached and their recommendation that such districts should be declared closed areas to which no more official parties would be sent—unofficial evacuees only being allowed in on the understanding that they can be sent on by the reception authority if necessary. Also of significance is the reliance placed by the Committee on the regional machinery for putting the recommendations into effect, rather than on the local authorities. Thus, it is urged that the regional staff of the Ministry of Health should perform the distasteful task of requisitioning; that senior members of the staff should pay periodic visits to the local authorities; and that the regional welfare officers should be empowered to authorise on the spot the purchase of equipment for hostels and communal centres, which have hitherto had to wait for equipment from central stores. A wider use of regional powers originally, instead of giving large and drastic powers to the local authorities, which they have naturally shrunk from using, might have saved a great deal of unnecessary friction.

Education's Progress

Like the committee on evacuation, the Board of Education has decided that things are not so black as they are made out to be. In a written Parliamentary reply, Mr Ramsbotham has stated that in all the evacuation areas, excluding Southampton, there were, last December, 1,038,878 elementary schoolchildren, of whom 849,030, or 81.7 per cent., were enrolled for full-time instruction, 93,248, or 9 per cent., for half-time, 1,237 for less than half-time, and 13,185 were receiving home tuition provided by the authority. Those receiving no instruction numbered 82,178, about 8 per cent.

BANKERS TRUST COMPANY

NEW YORK

Complete banking facilities

26 OLD BROAD STREET, E.C.2.

Incorporated with limited liability in the U.S.A.

of the total, and 48,000 of these were in London, where steps have now been taken to re-enforce compulsory school attendance. In the country as a whole it has since been revealed that 93.2 per cent. of the 4,609,000 elementary schoolchildren were enrolled for full-time instruction, and the Committee on evacuation endorses this by its statement that the great majority of evacuated schoolchildren are now receiving full-time education. These figures are most encouraging, but it may be questioned whether the situation is quite as favourable as they make out. It would be reassuring to know, for instance, that enrolment for full-time instruction necessarily means full-time attendance and that full-time education always means something more than attendance in crowded classes in makeshift premises. Even on an optimistic view, it is clear that after the war there will be hundreds of thousands of children whose education will have fallen well below peacetime standards—for what they were worth. In this connection, Mr Ramsbotham's recent statement that he, personally, would like to see the school-leaving age raised to 16 after the war is of interest, in that he implied that he could not commit the Board of Education to this view, presumably because it feels the administrative difficulties then will be too great. But surely there could hardly be a more appropriate time for such a measure, since not only will demobilisation problems be a strong incentive to keeping potential employees off the labour market, but there will also be a real need for the schoolchildren to make up for what they are losing now.

Rationing Expenditure

The views published by members of the Oxford Institute of Statistics on wartime economic policy have been consistently shrewd and realistic, and the proposals made by Mr Kalecki, in the Institute's latest bulletin, for limiting civilian expenditure follow aptly upon earlier papers on the scope and method of rationing supplies for civilian use. Briefly, Mr Kalecki's plan is to reduce total civilian expenditure by about one-sixth by limiting the weekly expenditure of each individual civilian on articles other than food to 25s. for adults and 15s. for children. His object is to set a term to what is spent on unrationed goods, and it is an error to regard this scheme as an alternative to rationing. Rationing is concerned solely with physical supplies; the aim of rations is to distribute supplies that are scarce, or likely to be scarce, evenly and to eke them out over a period; and price-fixing may be either the consequence or the cause of rationing—that is, either lowered prices may be necessary to enable individuals to purchase their rations or prices may be so low that, without rationing, official or unofficial, supplies would be taken up too rapidly. Mr Kalecki's scheme, on the other hand, is not primarily concerned with the physical distribution of consumption—except in two respects: it would restrain the tendency for expenditure baulked by rationing to cause a proportionate increase in the consumption of unrationed supplies—a tendency checked in any case by the inevitable increase in the price of these supplies; and by securing an over-all decline in total civilian expenditure, it would necessarily bring about a curtailment in total civilian consumption—a more than proportionate curtailment, in fact, because of the rise in prices.

Mr Kalecki's approach is fiscal. War economy has two facets: there is the physical transfer of goods from civilian use to military use, which involves a curtailment of civilian purchases; and there is the fiscal transfer of purchasing power from civilians to the Government. Obviously these are two aspects of the same process, and it is reasonable to argue that, if the fiscal transfer were performed with sufficient ruthlessness, by taxes and loans, the physical problem would then be set within its proper bounds and would become simply a matter of apportioning the permitted amount of expenditure between alternative channels of consumption, according to overriding military demands for various goods and to the actual state of supply. Unfortunately, the fiscal transfer has in fact been far from sufficient; there are grounds for saying that it never can be; and this means that there is much more money in the hands of civilians than they can be allowed to spend on goods, if the war effort is not to be impeded. Mr Kalecki's scheme, which amounts to a proposal to ration expenditure, is—like Mr Keynes's plan for compulsory

savings—a scheme to prevent this surplus purchasing power from passing into consumption. It is a pendant to taxes and loans; and would leave unresolved the problem of distributing physical supplies. In wartime all goods are, actually or potentially, in short supply—essential goods because of the competing demands for them and non-essential goods because it is not necessary to supply them; and the way in which Mr Kalecki's 25s. is to be distributed between clothing, furniture, travel, entertainment, tobacco and drink will still be a problem. Nevertheless, the proposal does go to the root of the matter in its attempt to prevent fiscal shortcomings from fatally weakening the real war effort; and it is a plain absurdity that solutions of such ingenuity to curtail consumption should be being worked out against a background in which civilian purchasing power—and therefore the difficulty of restraining its use—is mounting more steeply every day. The clear need for more taxes and smaller earnings (in every class of society) was never more apparent.

Criticism of War Damage Bill

The various interests affected by the War Damage Bill have now formulated amendments to certain clauses, but on the whole the measure has been favourably received in the country. There has been little criticism from tenants whose liability is limited by the Landlord and Tenant (War Damage) Act, 1939. On the other hand, the community of landlords is dissatisfied—and not without justification—for they feel that they have been singled out to bear the brunt of the burden. The National Federation of Property Owners rightly claims that the mortgagee is not called upon to bear his fair share of the contributions. The Federation suggests that all persons having an interest in property should bear an equitable proportion of the contribution. It also holds the opinion that ground rent or mortgage interest should not be paid in the case of complete destruction of property for which a "value payment" is to be made at a later date. Further, it holds the view that, in the case of tenants, liability to contribute to the compensation fund should not be confined to tenancies of a duration of seven years or more, but should include all tenancies of a duration of more than three years. Property companies are concerned, not only with the incomprehensible provision that mortgagees are not called upon to make any contributions except in the case of dwelling-houses with an annual value up to £100, but also with the failure of the Bill to make any provision for interim compensation in respect of loss of income and with the clause that prevents contributions being considered as an expense for taxation purposes. The building societies, on the other hand, as mortgagees of the smaller dwelling-house properties that are to share the contribution with the landlords, are anxious to be relieved of this liability.

The Bill reached the Committee stage in the House of Commons last week, when Sir Kingsley Wood gave further details of the function of the Treasury and of the constitution of the War Damage Commission. An amendment providing that the amount of the value payment should be a sum equal to the difference between the value of a hereditament after the execution of the works necessary to make good the damage and the value that it would have as a site clear of buildings or works and with the damage so far as it affected the site Exchequer. He pointed out that this suggestion would to the one that had been destroyed. He admitted, however, that value payments, based on the value of properties on March 31, 1939, might lead to injustice if a consider the suggestions that had been made to avoid this contingency. The present provision of the Bill, which guarantees full re-instatement in the case of properties that are repaired and a value payment that may be out of relation with the cost of building after the war in the case of properties that are not repaired or reconstructed, is discriminating unfairly between one set of owners and another. A solution could be found by arranging that every beneficiary under the scheme, whether for total loss or partial damage, should have the choice of immediate compensation on a pre-war scale, in blocked bonds, for example, or deferred compensation on a post-war scale.

Another of the amendments proposed concerned the clause providing that no compensation should be made in cases of damage amounting to less than £5. In reply the Attorney-General pointed to the immense increase in the cost of administration that the removal of this limit would involve, but he promised consideration for the suggestion that it should be possible for single owners of many properties to aggregate individual claims of less than £5.

Supply Problems in Albania

For a week now Italian counter-attacks in Albania have been attempting to restore both the positions and the morale of the Fascist troops. In the central sector of the front these have been very heavy. The Greeks, however, are quite undismayed and have even improved their position in the area where the heaviest Italian attacks had been launched. So great were the losses to the attacking troops that there are reports of strong disagreement in the Italian High Command. General Cavallero, the newly arrived—and appointed—commander-in-chief, is a thruster and believes in offensive action. The officers on the spot, headed by General Merhani, of the Fourth Army, understand the exhaustion of the troops, the difficulties of supply and the treacherous terrain. Their advice is said to include a general retreat, the abandonment of Valona, Tepelini and Berat and a new stand round Skumbi, where, under General Soddu, a new defence line was already under construction. The difficulties, however, are not all on the Italian side. The Greeks have even greater difficulties in the sphere of transport and there are specific supply problems arising from the provenance of Greek arms. Most of these came from France and Germany and no spare parts are available. The Greeks are showing a brilliant turn for improvisation. Some of the severest Greek raids on the enemy lines have been carried out with captured Italian aircraft. But supply remains the biggest single problem, and it is likely that it was an important item on the agenda when General Wavell visited Athens recently to discuss the question of further aid to Britain's allies. Captures of material in Libya have been on a scale sufficient to equip an army, and since the Greeks are already familiar with captured Italian arms it might well be profitable to arrange for a transfer if ammunition can be made available. Wilder additions to the agenda—such as a British Expeditionary Force to Salonika—may be dismissed with the stamp "Made in Germany."

The End of the Legionary State

The fighting in Roumania has subsided, but there is no reason to suppose that General Antonescu's "restoration of order" will last longer than the time it takes for the young thugs in the Iron Guard to draw breath, filch some more weapons, and return to the only work for which they have any aptitude or training—terrorism. The whole revolt is a melancholy example of the fate of a community in which all social and moral ties—even to the last tie of blood—have been destroyed. The Iron Guard's only *raison d'être* in the years before it attained power was street fighting and Jew baiting. The Nazis, by using it to break King Carol, gave it a political responsibility not one "legionary" was fit to carry. Within a month of achieving power the movement was split with the Codreanu clique and the Sima clique and the Transylvanian clique shooting each other down. General Antonescu made appeals for order, arrests were made and the disturbances quieted down. In the New Year, however, the inter-clique struggle for control within the Iron Guard grew to such a pitch of bitterness that it passed beyond all hope of control. In the recent fighting, over 6,000 people lost their lives, the country was in an uproar, and the fighting took on the scale of a minor civil war. General Antonescu has finally put an end to the struggle by suppressing all factions, by dismissing the Iron Guard from the Government (Horea Sima is probably shot by now), and setting up a purely military regime with eight generals in the Cabinet. The "legionary state" is thus no longer, and Hitler, Mussolini and the Caudillo might have spared themselves the expense of the flowers they sent to lie on the coffin of the re-interred

Codreanu. Antonescu with a military dictatorship backed by German "moral support" will, no doubt, keep some kind of state structure intact. The main bone of contention between the cliques—political power—has been removed by the dismissal of all legionaries from political power. But sporadic terrorism will continue so long as Antonescu has nothing to offer but the rigours of police rule to a disillusioned, brutalised, and cynical younger generation. Germany, it may be added, probably had no hand in the disorders. The Nazis hoped to find a stable element in the Iron Guard. Like Antonescu they were wrong.

American Blockade?

There is a new air of frankness in official circles about the state of the blockade. It dates from the broadcast appeal to the United States by the Minister of Economic Warfare some time ago, when Mr. Dalton urged the Americans not to grant financial facilities to the enemy. Now, it is even admitted, as a number of critics in Parliament and the Press have been claiming for a long time, that Soviet Russia represents a disturbingly wide corridor through the British control of German purchases and sales. Mr. Dalton himself has cited cotton, copper, brass, wheat and petroleum as commodities which are entering Russia in abnormal quantities for Germany's benefit, not usually by direct transit to the Reich, but most often by replacing and releasing similar goods of Russian origin to be sent to Germany. The new candour can obviously be traced to a desire to secure American co-operation in the main area, the Pacific, where British ship warrants and navicerts do not run. The American Dies Committee, which investigated German activities in the United States, went so far as to suggest that, in the first year of the war, more American assistance was given to Germany than to Britain; and, however improbable this allegation may be, it is welcome news to know that the United States authorities—in consonance with the approved policy of full aid to Britain—are now considering the question of the supply of dollars and American exports (including appreciable Latin American sales) to Britain's enemy. Not the least useful first fruit of Lord Halifax's mission would be the dosing by the American non-belligerent of an unfortunate gap in the fortress line of our economic warfare.

Determination of Needs

The Old Age and Widows' Pensions Act, which was introduced a year ago, took up more Parliamentary time than any other piece of legislation introduced by the Government since the war began—though the War Damage Bill may beat it. The long delay over such a relatively small measure was due to the uncompromising attitude of Labour, then in Opposition, to the institution of a household means test in determining the amount of supplementary pensions to be paid by the

INSURE WITH

7, CHANCERY LANE, LONDON, W.C. 2

Assistance Board. In August, when the Act came into force, the cry was raised again, and far more criticism was expressed about the 340,000 claims for supplementary pensions which were rejected after a household mean test than rejoicing over the million odd which were allowed. Since then, however, Labour has gained its point, and the Determination of Needs Bill, which proposes to substitute a test of personal need for a test of household means, for both unemployment assistance and supplementary pensions, was introduced in the House of Commons on Thursday of last week. But though the personal need of the applicant is to be the new basis, distinctions are drawn between his needs as a householder in a home where expenditure is shared by other members, as a person living alone or with strangers, or as a member of a household though not himself the householder. Thus, though the resources of members of the household, other than the applicant himself and any dependants living in the home, are not to be regarded as resources of the applicant, a contribution by, say, a son earning 20s. a week or over to household expenses will be assumed and will be taken into account to a normal maximum of 7s. a week. By another rule, a non-householder applicant will not be considered as having to pay for his board and lodging unless the income of the householder is below £5 a week if he has a dependant, with an increase of 15s. for each additional dependant. A householder with a wife and two children would, therefore, have to have an income of £6 15s. a week before he could be assumed to be giving free board and lodging to a relative in need—in which case the relative in question would be given no supplementary pension and an unemployment allowance of only 5s. a week. Otherwise, applicants will be enabled by the Assistance Board's grants to make a contribution to household expenses. The proposed regulations, which by an important precedent will be available to Parliament when the Bill is discussed, will be awaited with interest; but it is already quite clear that the new Bill, besides going a long way towards codifying our social service legislation by amalgamating the tests for unemployment assistance and supplementary pensions, establishes the important principle that persons in need are the responsibility of the State and not of their families.

The second part of the Bill rectifies a misunderstanding which arose from the Chancellor of the Exchequer's Budget speech last April. He said that war savings would not be taken into account in the assessment of means, a statement which prompted some people to realise their pre-war savings and reinvest the proceeds in Government securities. The previous Bill, which excluded such savings, was dropped when the misunderstanding on what constitutes a war saving was realised; and it is now proposed that in enacting the Chancellor's statement no pre-war saving which has been realised and reinvested after August 14, 1940, the date of the second reading of the first Bill when the misunderstanding was explained, will be counted as a war saving. After that date, savings must be new savings before they qualify for exemption from the needs test.

The Land Leeches

In peacetime, the great bar to town and country planning is the price of land. On the face of it, the powers of local authorities to prescribe the use to which land may be put, under planning schemes, are considerable. Land can be earmarked for development, redevelopment or conservation. But the cost of compensation to owners—genuine users of the land or, perniciously, pure speculators—and the different valuations of land for different purposes represent formidable obstacles in practice. Now there is every indication that a movement is on foot which will intensify these old difficulties when the problem of replanning the bombed areas comes to be solved. Land in these districts is being bought to sell again for redevelopment, and the speculators are plainly determined that, if the community is to have new cities, it will have to pay through the nose for them. It is the best of news, therefore, to learn that Lord Reith, the Minister of Works and Buildings, is working on plans to frustrate these pirates, and it should scarcely be possible to take the wind out of their sails without laying down principles of general application, which will prevent ordinary peaceful planning from being held to ransom in the future as it has been in the past. The obstacle to be surmounted, apart from mere

money-grabbing speculation, is the idea that an owner is entitled to compensation, not for the use to which his land is actually being put, but to the most profitable use to which it might conceivably be put. In dealing with the "grave-snatchers" of the scarred cities, Lord Reith's newly-announced committee under Mr Justice Uthwatt has an excellent chance to open up new channels for the betterment of the face of Britain.

The Daily Worker

It was a foregone conclusion that an overwhelming majority of the House of Commons would approve the action of the Home Secretary in summarily suppressing the *Daily Worker*; the final vote was 297 to 11. It was more surprising that no more than 6 votes were recorded for the words in Mr Bevan's motion expressing regret that the more formal process of warning, prosecution and trial had not been used. In the middle of last summer the defence regulation used in this case by Mr Morrison, which gives the Home Secretary power to close down a newspaper without warning and without a chance for the defendants to reply to the charges laid against them, was received with suspicion and some apprehension, not only by the Press, but also by most supporters of civilian liberties; and the critics' fears were only allayed by the understanding that the regulation would not be used except in circumstances of exceptional emergency. The *Daily Worker* is, admittedly, an exceptional publication, and the complacent attitude of most liberal opinion is perhaps best summarised in the frank statement of the *News Chronicle*, that "if it had been any other paper . . . suppression without proceedings would have raised a storm of protest." This is surely somewhat disingenuous, for there is no reason in either logic or equity why there should be any discrimination in the administration of law; equality before the law stands as a basic principle, and what is sauce for the *Daily Worker* is sauce for the *News Chronicle*—or the *Times*, or *The Economist*—as well. There remains expediency, or *raison d'état*, to justify the eighteenth-century procedure used by Mr Morrison. The Home Secretary says there was no time to lose. This is wartime; the offending newspaper had been habitually publishing matter deliberately intended to impede the war effort; and it had been given a long run. All this is perfectly true. The fact is that the *Daily Worker* had been too tolerantly treated. Sir John Anderson's warning of last July would not count for purposes of prosecution because it was "unofficial," and the need for hasty and arbitrary action now arises from the absence of more formal steps to curb the rake in the earlier stages of his suicidal progress. In itself, the episode is unimportant, for it appears that financial stringency might have forced the little-read *Daily Worker* to go out of business very soon in any case; but, as a precedent, the case is important. For all their reservations, most newspapers—the *Evening Standard* is a notable exception—have accepted what could be a most damaging precedent with remarkable smugness.

Shorter Notes

The Governments of Great Britain, Australia, New Zealand, South Africa and India have approved the proposal to establish an Eastern Group Supply Council, which was recommended by the Delhi Conference. Sir Archibald Carter, Permanent Secretary to the Admiralty, will represent Great Britain and be chairman of the Council.

By the Government's amended scheme for pensions and allowances for members of the mercantile marine and fishing fleets, compensation will be given at the same rates as those applicable to equivalent ranks of the Royal Navy. It has also been decided to introduce a dependants' allowance scheme for members of the women's services.

This week's announcement of shipping losses shows a rise in the week ended January 19th to five British ships of 34,772 tons and six Allied of 23,440 tons, a total tonnage of 58,212. This is the highest loss for just over a month.

THE WORLD OVERSEAS

Supply Difficulties in Canada

(From Our Ottawa Correspondent)

December 20th.

OTTAWA continues to put out highly optimistic reports about the progress of the war effort, but there is a growing impression that there is still a lack of co-ordination in the work of the departments concerned with the programme. Some co-ordinating committees, which have lately been established, are full of zeal, but there is still disturbing evidence of a confusion of efforts and objectives. For example, quite apart from the needs of the Royal Air Force, more aircraft are needed in Canada for the Commonwealth Air Training scheme, but there is the strange case of the huge aircraft plant of the National Steel Car Company at Malton, near Toronto, with which the *Financial Post*, of Toronto, dealt in its issue of December 14th. First built in 1938 and extended in 1939, it cost \$2½ millions to construct and is fully equipped with modern machinery for the manufacture of aircraft. The *Post* alleges that at no time has more than a fraction of the capacity of this plant, which, working on a three-shift day, could employ 9,000 men, been utilised. It says that at present only 1,800 men are working at it and that about half of these are engaged in building a type of plane now obsolete. The paper then points out the curious anomaly that, while this aircraft plant is standing more than half idle, the Government has announced the construction of a costly new aircraft plant at London, Ontario, which cannot possibly be in production for many months.

One argument is that the war programme continues to be handicapped by the fact that there is no standardisation in armaments and supply between Canada and Britain, on the one hand, and the United States, and that little headway has been made towards co-ordination to ensure the most effective use of each country's resources of machine tools, raw materials, plant facilities and labour. Elaborate plans have been worked out for the manufacture of the American type of cruiser tank on an extensive scale in Canada, but the scheme has run into difficulties which it is hoped will be temporary. But, in spite of the obvious need for Britain to have British types made in Canada because they cannot be made in America, there is a feeling that Canada can no longer be tied to Britain in the matter of "military standards," and that the obvious course is to develop common ones with the United States. It is understood that a plan is under consideration for the Permanent Joint Defence Committee to extend its work into the field of supply. Two members, who were qualified experts on the industrial capacity of each nation, might possibly be added to the Board, but an alternative suggestion is that a parallel board should be created, manned by prominent industrialists or persons engaged on the procurement side of each country's war programme.

A Wage Plan

The Federal Government has taken indirect measures to check any spiral rise in wages. The plan, which has the approval of the National War Supply Board and has been endorsed by representatives of both capital and labour, aims to anchor wages to the cost of living. Whenever the cost of living rises by 5 per cent. workers will be able to claim an equivalent bonus, which will be adjusted quarterly and will be diminished if the cost of living falls. The workers will have the alternative of choosing as the basis for calculations either their present rate of wages or the rates prevailing in the period 1926-29, whichever is the highest. It is hoped that most of the readjustments will be achieved by voluntary agreements, but, wherever this proves impossible, the Government will appoint conciliation boards which will

base their decisions on the principles laid down. It now appears that the Government itself will be forced to show an example by conceding a bonus to a substantial number of its own civil servants, as the cost of living has risen 6.2 per cent. since September, 1939, and few of them have had any increase in wages or salaries.

The Bureau of Statistics in its first estimate of the value of Canada's principal field crops for 1940 gives it as \$648,286,000, a decrease of 3 per cent. from the revised gross value of production for 1939, but except for last year's figure it is the highest recorded since 1930, when the value was \$662 millions. The actual volume of production was substantially greater than in 1939, but the increase was offset by lower prices, the average farm price of wheat being 51 cents per bushel, compared with 54 cents. The closure of navigation on the Great Lakes and the St. Lawrence is causing wheat stocks to pile up, and for the week ended December 6th the visible stocks of Canadian wheat amounted to 471½ million bushels, compared with 349½ million bushels for the same week of 1939. The Canadian Wheat Board has now made general the increase, from 10 to 12 bushels per seeded acre, in the quota of wheat which individual farmers are allowed to deliver to the elevators. This will permit the delivery of an additional 25 million bushels of wheat and the distribution of about \$12½ millions more in the prairie provinces.

High Business Activity

Canadian business has now finished the process of readjustment to winter conditions, and the predictions that it would move to higher levels during the last quarter of 1940 are being fulfilled. A survey of business conditions covering the first ten months of the year, which the Bureau of Statistics recently published, places the index of the physical volume of business for this period at 143.5, compared with 120.5 during the same period of 1939, a gain of 19.4 per cent. The index of manufacturing production was 151.1, compared with 123.1. Moreover, a preliminary survey covering November shows a "spectacular" advance during the month, which has brought the index of the physical volume of business up to 156.7, compared with 133 in November, 1939. For the eleven months ended November 30th, the total Canadian output of steel was 1,761,201 tons, a gain of nearly 375,000 tons, or 48.3 per cent., over the figure for the same period of 1939.

Unemployment continues to decline steadily, and on November 1st the employment index of the Bureau of Statistics had risen at 139.2 to the highest figure ever recorded.

The Good Neighbour Policy

[FROM OUR NEW YORK CORRESPONDENT]

December 12th.

In the course of the autumn, the Good Neighbour Policy developed financial aspects on a substantial scale. In this, two different agencies have taken part. In the early autumn the funds (or availabilities) of the Export-Import Bank were increased by \$500 millions, and from these funds the bank has made a \$20 millions loan to

Brazil to assist in expanding its local steel industry, a \$60 millions loan to Argentina and one of \$7.5 millions to Uruguay. These latter are not additions to, but substitutes for, credits of \$20 millions and \$4 millions, extended earlier in the summer and unused.

In addition, the Treasury has made to Argentina a loan of \$50 millions from the Stabilisation Fund. The object of this loan has been stated as the stabilisation of the Argentine currency, but it appears that the idea is rather the liquidation of the Argentine exchange position. In September, the Argentine position had become so tight that Argentina (on September 19) found it advisable to declare a temporary exclusion (since removed) of imports from the United States. It is probable that the "stabilisation" loan will unfreeze the Argentine position—a position which, by the way, had been in part at least occasioned by the payment of British sums, due to the Argentine, in "blocked sterling."

A "Continental" Approach

At the same time that the United States was moving actively to further its commercial, political and financial relations with the several countries of South America (the so-called hemispherical policy), the nations of South America have been developing a "continental" policy of their own.

The geography of South America is utterly unlike that of North America. In North America it was conducive to integration on a large scale; in South America it was conducive to disintegration. Overland communication in North America has always been geographically easy, and in South America geographically difficult. It was easier for a South American country to trade with Europe or North America than with another South American country; and its products, being generally agricultural or extractive, were the complements of North American and especially European products. But three recent forces are affecting the ancient status. The radio and the aeroplane facilitate communication between areas separated by distance, mountain, desert and jungle; and the industrialisation of certain parts of South America is gradually increasing the internal complementary economy. The first major definitive step resulting from this is the Argentine-Brazilian trade agreement. As yet, it is understood that it is an agreement only "in principle"; but the principle is extremely interesting and seems to be a promising enterprise of imagination. It is understood that it is premised on the idea of the complementary economy, not only as of the present, but projected a certain distance into the future. If this agreement in principle is put into effect on a large scale it may prove of great significance. It is understood that Argentina is negotiating similar arrangements with Uruguay and Chile.

All these measures are embryonic; it is too early to appraise their ultimate results or even to distinguish between the possible and the probable. The general tendencies at work are clear enough—the hemispherical policy; the growth of a South American continental consciousness (one could hardly call it solidarity); and the evolutionary process of industrialisation, notably in Argentina and Brazil. The general impediments are also obvious—climatic and geophysical. At the moment, one could say that one marked consequence of the European war to date has been for North and South America to draw closer together; and for the units of South America to draw closer to each other.

BANK OF MONTREAL

(Incorporated in Canada in 1817 with Limited Liability)
Financial Agents of the Government of the Dominion of Canada in London
CAPITAL \$36,000,000
RESERVE \$39,000,000
TOTAL ASSETS IN EXCESS OF \$950,000,000

Head Office: MONTREAL
H. R. Drummond, Esq., President.
Major-General The Hon. S. C. Mewburn, C.M.G., V.A. Bog, Esq., Vice-Presidents.
Jackson Dodds, G. W. Spinney, Gen. Managers.
(The Most Honourable The Marquess of Willington, P.C.,
G.C.S.I., G.C.M.G., G.C.I.E., G.B.E. (Chairman).
F. R. S. Balfour, Esq., Sir Hardman Lever, Bart., K.C.B.,
Sir Frederick Williams-Taylor.

London Offices: 47 Threadneedle Street, E.C.2 (Edward Pope, Manager)
9 Waterloo Place, Pall Mall, S.W.1 (J. H. Pangman, Manager)
The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

* 1935-9 = 100 for industrial production; 1923-25 = 100 for other series.
† Preliminary.

The actual level of production is of course significant; but just as significant is the fact that this has been the longest-sustained period of high production for ten years. The maintenance of production and payrolls at a relatively high level for a long time has implications quite different from the brief spurts and ephemeral boomlets of the past decade. As yet, some of the customary phenomena have been absent; there has been little disposition to capitalise this activity in either the stock market or the real estate market, although it is understood that individuals in numerous cases have already manifested a willingness to use their increased earnings as a basis for commitments.

Economic Difficulties in Transylvania

[BY A HUNGARIAN CORRESPONDENT]

January 21st.

THE Transylvanian territory which has been returned to Hungary increased the number of the Hungarian population by two million. It is a difficult task to reorganise the economic life of this returned population, because the twenty years which have elapsed since the peace treaty of Trianon have left their marks. All the railways and other means of transport have been organised with a view to orientating economic life towards Roumania. Now, after the return of the territory to Hungary, a new order has to be introduced into the system of communication, in order to direct Transylvanian economic life towards Hungary. There are other profound adjustments to be made. The raw material for serving the power system in Roumania was naturally mineral oil. Hungary imports oil, and has to be economical in its use. She now intends to transform the whole Transylvanian industry for running with coal and wood. A further difficulty arises because Roumania, before surrendering the Hungarian part of Transylvania, transferred considerable economic investments into the Roumanian part of Transylvania. The whole problem has, moreover, been complicated by the fact that the last Transylvanian harvest was a very poor one, and the Hungarian Government was forced to supply foodstuffs (and also fuel for the factories) and to take prompt measures to rescue this year's harvest. More than 450 waggons of seeds have been sent to Transylvania by the Hungarian Ministry of Agriculture.

Economic reorganisation is for the time being partly in the hands of the military administration. This administration has established, under the name "Distributia," eight centres in Transylvania, which supply the retailer with stocks. The retailer has to sell under the control of the military authorities. The "Distributia" centres, which are established in the eight biggest towns of Transylvania, are provided, though somewhat irregularly, with supplies of oil, gas,

oil, petroleum and machine oil. Prices of oil and petrol are stabilised at the same level as in Hungary.

It has proved beyond the power, even of the military, to fit the Transylvanian factory system into the Hungarian system. Methods of production are widely different, and despite the reunion the Transylvanian industry has decided to work as a separate organisation. It does not want to amalgamate with the Hungarian industrial corporative system.

Australia's Budget

[FROM OUR SYDNEY CORRESPONDENT]

December 1st.

LAST May the Commonwealth Treasurer gave a preliminary outline of the Budget for the financial year 1940-41. He stated that war expenditure in Australia during the year would be £A79 millions and that taxation would be increased by £A20 millions to meet the bill. These figures were swept aside in the record Budget introduced last week. Commonwealth Government expenditure from all sources is now estimated at £A276 millions, and, of this, £A143 millions will be war expenditure in Australia. War expenditure overseas will be £A43 millions, making a total of £A186 millions to be spent directly on the war.

The enormous increase in the Budget estimates reflects the huge extension and rapid acceleration of Australia's war commitments following the collapse of France. It is proposed to obtain £A150 millions by taxation, and the consequent increase cannot fail to cause far-reaching readjustments in the economic life of the Australian people.

The Treasurer proposes to find an additional £A31.1 millions from taxes in the remaining seven months of the current financial year. To do so, he intends to impose considerably heavier taxes in both the direct and indirect fields. Rates of income tax on individuals have been raised to yield an extra £A17.7 millions; company tax should yield £A5.8 millions more; while sales tax and Customs and Excise are expected to return an additional £A7.6 millions. These heavier taxes, added to the revised estimates of yields from the increases imposed last May, make a total of £A45.1 millions of new taxation in the current financial year. Direct taxation accounts for £A28.3 millions, and indirect taxation for £A16.6 millions of the increase.

The higher income tax introduced in the Budget covers a very wide field. The sweeping change caused by reducing the statutory exemption from £A250 to £A150 means that the single basic-wage earner will pay income tax at the rate of sixpence in the £, and many lower income groups, hitherto exempt from Commonwealth income tax, will now be included. In his Budget speech the Treasurer estimated the incidence of income tax on various income groups in a full year as follows:—

	% of total Incomes	Total Income of Individuals £A millions	Commonwealth Income Tax Assessments £A million
Higher Incomes (over £1,000)	11	85	20
Middle Incomes (£400—£1,000)	19	143	8
Lower Incomes (under £400)	70	517	5
	100	745	33

Comparisons with rates of taxation in Great Britain indicate that incomes up to £400 a year will now pay a higher rate of income tax in Australia than in the United Kingdom. Further, there is the burden of increased Customs, Excise and sales tax.

It may be argued that the new taxation falls too heavily on the lower and lower-middle income groups, and not heavily enough on the higher groups. There are, however, many factors to be considered before this view can be accepted without qualification.

The new indirect taxes are not levied on basic food-

stuffs and services or on commodities essential to primary production. The basic wage, which moves according to variations in the cost of living, should thus not be very greatly affected. These taxes have been designed to reduce consumption. The heavy imports of the past two years point to the urgent necessity for doing this. The lowest income groups will undoubtedly have to reduce their total consumption (not consumption per head) more drastically than the higher groups. When the £A517 millions of income in the group below £A400 a year is compared with the £A143 millions and £A85 millions in the middle and upper groups, it is apparent that steps must be taken to reduce total consumption at the bottom if resources are to be appreciably diverted to war production.

Expansion of Secondary Industry

There is a further important point. The big expansion of secondary industry will greatly increase the number of skilled artisans, who come into the middle income group. They should be able to make important contributions to revenue. Finally, the Government will rely largely on bigger incomes to subscribe to defence loans. By doing so, their consumption will also be reduced and the Government's purposes will be achieved.

The Government has consistently opposed undue expansion of credit with the inevitable risk of inflation. The severity of the Budget indicates that, in the Government's view, credit expansion has proceeded to the limits of safety, and that the time has now come to divert resources from peace to war uses by direct reduction of consumption. The sincerity of its purpose is evidenced by the fact that the Commonwealth Budget will absorb about 30 per cent. of the national income. With the State Budgets added, total public expenditure in Australia in the current financial year is likely to be nearly 50 per cent. of the national income.

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE BUSINESS WORLD

The Growth of Bank Credit

THE tale of the bank balance sheets for the end of 1940 and of the chairmen's comments on them and on the general banking position—delivered this year on paper and not in person—is now complete. Out of it emerges one dominating factor: the growth in the volume of bank credit over the year. The movement has carried the total of the banks' resources to the highest levels yet attained. It provides the motive for a considerable part of the various chairmen's explanatory and defensive comments. The explanation of the phenomenon focuses on one point: the extent of the banks' direct participation in financing Government expenditure. The defensive aspect of the chairmen's comments is more particularly concerned with the charge of profiteering which, in some quarters, has been levelled against the banks on the reasoning that for the past year they have had such greatly increased resources at their disposal.

Half explanatory, half defensive is the stress laid by some of the bank chairmen on the element of duplication and unreality which enters into this growth of the apparent volume of bank credit over the past year. Longer postal delays and the transfer of the greater part of the London clearing to provincial tranquillity and safety have not merely swollen the total of cheques and other items in course of collection at any one time; they have also expanded the amount of items in course of being cleared as between the various branches of each bank. It is unfortunate that the true dimensions of this fictitious element in the growth of bank deposits cannot be exactly determined. This is due to the fact that only two of the eleven clearing banks, namely Lloyds and Martins, have followed the recommendations of the Cunliffe Committee in showing such inter-branch clearing items separately as "items in transit" in the balance sheets. The other banks include them with "advances and other accounts." During 1940 cheques in course of collection rose by £11,086,000. If one may take the experience of Lloyds and Martins in the matter of their inter-branch clearings as being representative of the clearing banks as a whole, the items in transit for the 11 clearing banks must have risen by about £22,600,000. Thus, of a total increase in deposits, amounting to £359,083,000, some £33,700,000 was accounted for by such duplication. The proportion is by no means such as to distort comparison or grossly exaggerate the extent of credit inflation which has actually occurred. Nevertheless it is not surprising that some of the bank chairmen should have felt constrained to draw attention to it in the course of their reply to the charge of profiteering out of the conditions created by the war.

The rise in bank deposits over the year 1940 is, of course, entirely due to the direct use of bank credit in helping to fill the void of the budgetary deficit. As against the true expansion in deposits of about £325,000,000, the new item of Treasury deposits alone had by the end of the year risen to £313,500,000; in addition investments had risen over the year by £162,138,000. These two items alone more than account for the expansion in deposits; but they do not by any means exhaust the banks' financial participation in the war effort. Thus, while the holding of bills discounted has fallen by £69,004,000, this is a movement which must be wholly interpreted in the light of the reduction of commercial paper circulating in the London market. If we may generalise on the basis of the experience of those banks which differentiate in their balance sheets between Treasury and commercial bills, we can assume that the decline in the total bill portfolio veils a modest increase in the total of Treasury bills held by the clearing banks.

Equally reticent and, indeed, misleading concerning the help given by the banks to financing the war effort is the decline of £96,008,000 shown by the item of advances over the year 1940. The persistent decline in advances has repeatedly been explained during the course of the past year. It reflects the increasing intrusion of Government departments, trading in markets which previously were largely dependent on bank credit, and the restrictions placed by the war on certain industries, such as building, which before the war were large users of bank credit. These factors and the restrictions placed on personal borrowing from the banks would explain a decline in advances considerably greater than the figure revealed by the latest balance sheet comparison. Within this contraction there has occurred a considerable redistribution of bank advances, and the amount lent by banks to firms engaged on war work of every kind has in fact been several times multiplied during the year. One of the bank chairmen suggested that the greater part of the total of bank advances now outstanding was being used directly in financing war work. If in addition we take due account of the short loans made by the banks to the discount market against the security of Treasury bills and short-term Government bonds, and if we add to the tally the cash in hand and at the Bank of England, which is in effect an interest-free loan to the Government, we shall begin to appreciate how completely the banking system is now harnessed to the task of Government finance. The drift from commercial banking to this new and more stereotyped form of activity may not be to the liking of all those who have in fact had to witness it at the closest quarters. But it is an inevitable and necessary accompaniment of transition to a total war economy.

Needless to say, the cash basis has faithfully kept pace with the growth of credit, and the latest cash ratio of 11.59 per cent. compares with one of 11.24 per cent. at the end of 1939. This has not been the banks' doing; the cash has been provided for them. Equally independent of their volition has been the tremendous improvement in the liquidity of their assets structure over the year, which has been the direct result of the reliance of the Treasury on six months' deposits from the banks for meeting its current needs. Given the rediscount facilities attaching to these Treasury deposits and their nominal six months' currency, the banks have been fully justified in counting them among their "quick" assets. The ratio of these "quick" assets to total deposits (omitting the transit items on both sides) has risen over the year from 33.7 to 40 per cent. The days of strain in the early part of 1939, when this percentage dipped below the conventional danger line of 30 per cent., have been left far behind, and from the point of view of banking profits the pendulum is, in fact, swinging rather far the other way.

The growth of bank credit and its genesis in Government financing appear to have made the bank chairmen as a whole peculiarly sensitive to the charge of profiteering, a charge based on the growth of resources which, as the advocates of Social Credit are never tired of telling us, have been created without cost to the banks. It is quite true that the whole of the additional credit represented by the growth of deposits has found its way to current accounts, on the bulk of which no deposit interest is paid. The Bank of England Summary, which gives figures up to November, shows that over the first eleven months of the year the clearing banks' fixed deposits fell by £12,000,000, while current accounts rose by £273,000,000. None the less the bank chairmen who took up this charge could point out that increased

deposits require increased services to be rendered by the banks (though possibly not in proportion) and that the cost of these services has risen very substantially in wartime, when records have to be duplicated, when the process of cheque clearing is complicated, when personnel charges are necessarily rising. Mr. McKenna asserted that the net cost of servicing current accounts (presumably after allowing for service charges made to customers) is greater than the present interest allowed on fixed deposits. If on the other hand it be realised that the gross return on the additional resources invested by the banks last year (allowing for increased cash and items in transit on which nothing is earned) was rather less than 1 per cent., it is apparent that the banks' profits do not rise in proportion to the total of their resources.

The declared profits certainly confirm this conclusion. And if it be contended that there can be wide differences between published and true profits, the banks can point out that as a whole they have not been called upon to pay Excess Profits Tax. Mr. McKenna asserted that the Midland Bank had not been liable for this tax and this in all probability holds true of all the big banks. The Inland Revenue has considerable experience in the delicate task of ascertaining true profits.

It remains to point to a weak chink in the armour of the banking position, namely, the rate at which the investments have recently been growing. Their increase for the year is £162,818,000; but of this as much as £135,236,000 occurred in the last six months of 1940. Admittedly the banks have given their full support to War Weapons Weeks throughout the country, encouraged by pressing appeals to play their part and in the full conviction that they were doing their duty. But one must seriously question whether the 2½ per cent.

War Bonds or any other of the Government's tap issues are a fitting vehicle for the expansion or creation of bank credit. It is an expensive basis for such expansion, and if utilised for this purpose to a much greater extent it would provide some justification for accusing the banks of extracting excessive profits out of the peculiar conditions created by the war. The warning should be uttered, because the temptation to expand investments of a comparatively high-yielding character is likely to grow. Such temptation is inherent in the extraordinarily liquid position in which the banks now find themselves; it may gather strength from a further reduction in bank advances. If the banks answer that the cost of servicing the additional deposits thus created makes it imperative that they obtain a gross return of 2½ or 3 per cent. on some part of their additional assets, the counter must be that the facilities and service granted to depositors should be paid for by the depositors themselves and not subsidised by the Exchequer. If it is necessary, let there be a small charge for clearing cheques; let there be a general increase in the charges made for helping what are now unremunerative accounts; let there be an end of the many gratuitous services which a customer now expects from his bank. If the banks act in concert in this matter they need have little fear of losing clients and their deposits. And if the new current accounts become really self-supporting the credit thus created can be given a less expensive counterpart than the new medium-term securities with which the banks are now in process of filling their investment portfolios. It would be wholly wrong if the expense of doing banking business were allowed to override the principle that purchasing power newly created to finance the community and based on the Government's credit should not bear more than the most nominal rate of interest.

Finance and Banking

Credit Position Eases

The spasm of tighter credit which suddenly developed last week has proved short lived, and this week the position in the money market has been gradually reverting to normal. The incidence of heavy tax payments has again been felt during the week and has been accentuated by calling on the part of several of the clearing banks which have been making up their January balance sheets. On the other hand the help given to the market last week by the special buyer has made itself more felt, and further purchases from this quarter were reported on Monday of this week. Since then no official help has been required by the market, which has found with the clearing banks all the outlet it required for the few bills it wished to sell. Last Friday the market only obtained 28 per cent. of its applications for Treasury bills, and this fact, as well as the incidence of payments for the new bills, has helped the market during the middle of the week. The bills to be paid for this week were dated Monday, Friday and Saturday, the syndicate going for the 89-day bills and thus getting a slightly better rate of discount than in any week since the November 29th tender.

The Bank return reflects the easier position. The note circulation shows a very small rise of £777,000 and the Reserve is down by almost the same amount, but the bankers' deposits show the fairly substantial rise of £12,757,000. The main factor in this expansion has been the open market operation of the Bank, whose Government securities have risen by £6,965,000 over the week. Public deposits, though down by £2,986,000, are still at the high level of £32,374,000 in preparation for the large February 1st dividend disbursements.

Floating Debt Changes in January

The floating debt changes between the end of 1940 return and the latest monthly Treasury statement, dated January 25th, are on balance the smallest revealed for a year past. The total floating debt over this

period has risen by £21,445,000 only—a figure whose modest dimensions reflect the seasonal spurt in revenue payments and the good showing made by the public's subscriptions to the various tap issues of the Government. During these 25 days the £50,500,000 of Ways and Means advances from the Bank of England were repaid, while on the other hand a further net amount of £28,000,000 was borrowed from the banks on six months' deposits. These are the only changes in the floating debt which affect the market. The outstanding amount of Treasury bills issued through the tender has remained constant (taking end of week figures) at £845,000,000. The tap bills have risen by a further

Exports & Imports

While the war has increased the already vital need for exports and imports, it has, at the same time, necessitated the introduction of numerous regulations and restrictions which add considerably to the trader's difficulties.

The Westminster Bank maintains specialized departments where its customers may obtain expert advice and assistance in dealing with such problems as arise, and it strongly advises those who are exporting or importing to consult it as soon as their intentions are known. Information is also available regarding Documentary Credits—so necessary to the financing of war-time trade.

Further particulars may be obtained from the Manager of any branch or from

WESTMINSTER BANK
LIMITED

Foreign Branch Office: 41 Lothbury, London, E.C.2

£33,900,000 (again taking end of week figures), while Ways and Means advances from public departments show an increase of £10,045,000 for this period. Thus the expansion in the floating debt has been more than accounted for by the investment of funds accumulating in various Government accounts. The most important of these is presumably still the Exchange Equalisation Account. The Account's losses of dollars seem, on the showing of these figures, to be losing momentum—a phenomenon attested by even stronger corroborating evidence than that of the tap bill figures.

An interesting accounting problem will arise when the gold and dollar resources of the Account finally give out, and the support to the financing of war expenditure hitherto provided from this source is given direct by the United States through whatever scheme emerges from the Lease-and-Lend proposals. Will the expenditure covered by these American supplies be included in the Exchequer returns, and will its counterpart be found in some new national debt item? If the loans are to be *real* operations expressed in terms of the materials and machines supplied, will some monetary expression be given to them for the purpose of our own accountancy? This, incidentally, does not appear to have been done on the occasion of the exchange of U.S. destroyers for leases on naval bases. The answers to these questions will enliven discussions of the Exchequer returns later in the year.

Financing Expenditure

The following table gives a summary of the Exchequer returns for the financial year to date (January 25th), and shows the respective shares of revenue and borrowing in meeting the total expenditure:

(£'000)				
Total ordinary expenditure		3,023,979	Total ordinary revenue	960,903
New sinking funds		8,320	Loans raised—	
Loans repaid—			3% War Loan	203,234
4½% Conversion Loan		104,392	3% Defence Bonds	153,358
National Savings Bonds		81	3% Savings Bonds	26,900
Miscellaneous issues (net)		7,016	2½% National War	
Increase in balances		388	Bonds 1945-47	443,422
			2½% National War	
			Bonds 1946-48	34,100
			National Savings Certs.	
			(net)	135,500
			Other debt (net)	28,265
			Floating debt (net)—	
			Treasury Bills—	
			Tap	643,924
			Tender	114,000
			Ways and Means	
			Advances—	
			Public Departments	34,570
			Bank of England	
			Treasury deposits	366,000
3,144,176				3,144,176

The items shown as net are given after allowing for repayments and receipts.

Our Ebbing Dollar Resources

Mr. Morgenthau, testifying before the Senate Foreign Relations Committee on the Lease and Lend Bill, stated that British gold and dollar resources had been depleted by \$2,316,000,000 in the first sixteen months of war. Allowing for the substantial holdings of British gold which remain intact but unavailable for conversion into dollars in such countries as South Africa and for the comparatively meagre rate at which British owned dollar securities have been liquidated, it is fairly evident that the actual expenditure revealed by Mr Morgenthau must have reduced the available dollar balances of the British authorities to small proportions. Mr Morgenthau confirmed this impression by his statement that the placing of certain important orders for aircraft was awaiting the facilities which a scheme such as the Lease and Lend Bill would provide. It is now announced that the British Government has sent Sir Edward Peacock to America to examine the possibilities of realising the additional assets represented by the control of American businesses by British companies. One of the reasons for the rapid encroachments which have been made on British dollar resources, explained Mr Morgenthau, lies in the fact that after the collapse of France the British Government took over all French

contracts in the United States, although the same process could not be extended to French assets in that country. Mr Morgenthau, incidentally, announced that he had "mentally written off" Britain's last War debt to the United States, a debt which with accumulated interest has now reached the academically impressive total of \$5,728,821,000. It is interesting to note that the sterling equivalent of the debt has risen from £897,534,000 at the time of the Hoover moratorium in 1931, to £1,432,205,000.

December Bank Statements

The December clearing bank statements show the figures as on December 31st and a discussion of the movements revealed by the latest yearly balance sheet comparison will be found in a leading article in this issue. The movements over the month are particularly

(In £ millions)						
	Dec., 1939	Aug., 1940	Sept., 1940	Oct., 1940	Nov., 1940	Dec., 1940
Capital and reserves	138.7	139.7	139.7	139.7	139.7	140.2

Cover for acceptances, premises, &c.	173.3	163.8	164.2	157.6	160.0	152.5
Total assets	2,522.8	2,741.0	2,856.8	2,914.4	2,957.7	3,049.8

large and dispersed even for the final month of the year. The cash item is, as usual, well up in preparation for the year-end balance sheet and despite a further substantial growth in deposits the cash ratio has risen from 10.55 to 11.59 per cent. Bills discounted show a drop of £73,803,000, which indicates the magnitude of window-dressing operations in the discount market which throughout December was accumulating bills for balance sheet purposes. The same process is reflected in the increase of £18,188,000 in the money lent at call and short notice. Advances show a drop of £17,491,000 and have fallen to the lowest figure recorded since February, 1937. The reductions in bills and advances are more than counterbalanced by increases of £77,500,000 in Treasury deposits and of £28,625,000 in investments.

Insurance Aspects of the War Damage Bill

The War Damage Bill is more in the nature of a scheme for providing compensation than an insurance measure. But at certain points it impinges on the sphere of insurance, and at these points care ought to be exercised to ensure that there is no undue violation of insurance principles, which might bring untoward consequences in its train. Thus, in those sections where insurance is voluntary, notably the "business scheme" for goods (insurances not exceeding £1,000) and the "private chattels scheme," there is a danger of getting into trouble with the time-honoured rule of "selection against the insurer." It is well known that insurers work on most elaborate tables of rates, in which risks are carefully graded, from every possible angle, according to degree of risk. Any insurer who omitted to do this would immediately find his account overloaded on the heavier risks, and insufficiently leavened with the lighter ones, with the result that very soon he would be operating at a loss. The absurdity, for example, of a fire office asking the same rate of premium for a thatched cottage as for a brick-built house needs no emphasis; actually quite small gradations of risks are

sufficient to bring the rule into force. Now, the Government, under these voluntary schemes of insurance, is proposing to charge a uniform rate, for the whole of the country, of 30s. per cent.; furthermore, power is taken to make payments where damage occurred before the coming into operation of the schemes. It is true that the rule of "selection against the insurer" will not govern to the same extent as it would in the case of a private insurer, because of the absence of an alternative market. At the same time, it seems too much to hope that there will not be an excessive proportion of applications from the inhabitants of the large cities, and those who have already suffered damage will presumably insure as a matter of course. If this unfavourable prognosis is correct, the rate of 30s. per cent. may soon prove inadequate, and to increase it will merely accentuate the trouble. The remedy, of course, is either to make the scheme compulsory, or to vary the premium according to locality, but the latter solution will not dispose of the selection difficulty which arises from making the insurance retrospective.

The reason advanced against compulsory insurance of chattels is that there is no machinery for valuation, and under-valuation—by residents in the less vulnerable areas—would defeat the purpose of compulsion. It cannot be denied that this is a very real difficulty. Fire insurers also have to contend with the problem of valuation, it being very unusual for chattels to be valued when an insurance is effected, but their concern is mainly to ensure that a policyholder does not secure a "first loss" policy at the rate appropriate to a "full value" insurance. Tables of rates are usually prepared on the assumption that the insurance is for the full value of the property: to ensure that the sum fixed is adequate, policies embodying a so-called "average" clause, which provides that, in the event of under-insurance, the policy only pays *pro rata*, and it is one of the duties of the loss assessor to examine carefully this feature. If the average clause, coupled with expert assessment of losses, is retained in war damage "chattel" policies there will be little risk of a policyholder securing, through under-valuation, an unfair advantage in rate; but adoption of fire insurance practice will not dispose of the objection that, to the extent that under-valuation takes place, compulsion has been avoided. The choice is here between two evils: either there must be a voluntary scheme, with "selection against the insurer," or a compulsory scheme, with some measure of avoidance of compulsion. The administrative problems of a compulsory scheme would be enormous, even if it only operated above a certain income limit—say £400 for married persons and £250 for single—where in most cases a fire insurance would already exist to serve as a guide on the adequacy of the sum insured. The choice is not easy to make and any solution for this particular problem is bound to be imperfect. Incidentally, in fixing the upper limit for the insurance at £1,500, plus £500 in respect of a motor-car or motor-cycle, the Government will in effect be furnishing large householders with cheap "first loss" cover, although most householders would doubtless prefer to pay premium on full values and secure complete protection.

Sterling Free Accounts

The Bank of England has this week given its sanction to certain extensions in the use of sterling area accounts opened in the name of non-residents. From now on it will be permissible to credit such accounts with distributions to beneficiaries of income on capital trusts set up prior to September 3, 1939, and with repayment of income tax deducted from such income at source. On the other hand, official sanction is now given to the debiting of bank charges to such accounts, while permitted debits will also include subscriptions to newspapers and periodicals. The sanction given to the debiting of bank charges merely gives official recognition to a practice which has obtained ever since sterling area accounts were created. In the matter of their own remuneration for keeping these accounts the authorised banks have, not unnaturally, taken the law into their own hands. The extension of the uses of sterling area accounts to the payment of newspaper and periodical

subscriptions seems an overdue concession, assuming the Treasury wishes to encourage the circulation of such British literature abroad. This latest addition to the permissible uses of sterling accounts must not be taken as a token of the authorities' desire to encourage the development of such accounts. Their place and utility in the system of sterling exchange control is recognised, but the limits already placed upon them are fairly rigid and are unlikely to be relaxed by amendments more important than those announced this week.

Life Assurance New Business

In a note on page 112 of *The Economist* of January 25th, the new business of the Prudential Assurance Company in 1939 was given as £35,047,000. The correct figure should have been £25,047,000, and the fall in 1940 was thus £6,247,000, not £16,247,000 as stated. The total for 1939 should correspondingly be reduced to £150,016,000 and the total fall in 1940 to £48,972,000, a decline of 32½ per cent.

Erlangers' Acceptances

In a note on Erlangers' balance-sheet for December 31st last, which appeared in these columns last week, it was stated that £739,775 of the acceptances represented amounts due from customers in Germany. These German commitments are included under advances and not among acceptances. Erlangers, in common with all London acceptance houses, took up such of their own German standstill bills as may still have been circulating in the market on the outbreak of the war and converted the credits represented by them into cash advances. This gives even greater emphasis to the remarks on the resistance of the firm's active acceptance business to the difficulties of the past year.

man's speech. In the meanwhile, shareholders have done quite as well as could be expected. The company's £1 ordinary stock at 101s. 3d. cum dividend yields £4 1s. tax free, equivalent to £7 0s. 10d. less tax.

* * *

Dalgety Report

The full accounts of Dalgety and Company for the year to June 30 last show an exceedingly satisfactory rise in total profits, after depreciation, from £877,445 to £1,109,871, the highest level since £1,133,891 was earned for 1928-29. The improvement was probably due to the disposal of a record quantity of wool from Australia and New Zealand to the British Government under the existing Purchase Agreements, to a satisfactory wheat crop and to Government expenditure on the war effort. The company's tax liabilities have, of course, risen sharply, the provision for British income tax and E.P.T. alone increasing from £18,872 to £120,917. The total provision for Australian and British taxation has expanded from £82,545 to £221,173, and the cost of exchange differences is also higher at £141,105 against £93,667. Thus, after meeting all prior charges and increasing the allocation to staff provident fund from £15,000 to £20,000, equity earnings show only a moderate rise from £81,625 to £102,682, a sum which does not completely cover the total distribution of 7 per cent. for the year on ordinary capital, absorbing £103,000, gross. Equity earnings rose from 5.7 to 6.8 per cent., but the carry-forward is reduced from £124,162 to £121,844. The distribution of the 7 per cent. total payment for the year in the form of two interim dividends without a final payment, does not imply any disappointment with trading results in the last quarter of the year. The directors announced in December last that distribution of the second interim of 4 per cent. was made to avoid the new Australian Undistributed Profits Tax and that it would be followed by no further payment for 1939-40. The directors do, however, report that the current Australian wool clip is expected to be below that of the previous season and that the wheat crop will also probably show a decrease. Since tax liabilities, both British and Australian, will almost certainly in-

crease further in the current year, it appears doubtful whether the company will be able to maintain the increase in the total ordinary dividend from 5 to 7 per cent. Apart from a normal rise in both creditors and debtors, and one in cash holdings from £511,595 to £748,118, the balance-sheet position shows little change. General reserves still stand at £1,360,000.

* * *

Jute Industries Progress

With another satisfactory year's trading to September 30th last, total income of Jute Industries has increased from £111,068 to £123,248. After maintaining the previous year's allocation of £55,000 to depreciation and obsolescence and writing £5,000 off shares in a subsidiary company earnings for dividends are up from £46,068 to £57,748. The 10s. preference shares receive a 4 per cent. payment less tax, with Dominion income tax relief, at 8s. 3d. in the £. No payment is made on ordinary capital, but for the first time since 1928-29 an allocation of £20,000 is made to contingencies reserve, leaving the carry-forward £3,123 higher at £40,668. There is no doubt of the wisdom of the directors' decision to refrain from paying an ordinary dividend, for not only is the company faced with the normal difficulties of war-time trading—shipping and export complications and rising costs—but there is evidence that spinning and manufacturing competition from Calcutta is increasing. The home demand for the company's products was less well maintained during the past year than in 1938-39, and export markets on the Continent have, of course, succumbed to the German advance. In the course of his speech, circulated with the report, the chairman, Mr. J. Ernest Cox, points out that there is no hope for some time to come of obtaining a dividend from the subsidiary, the Camperdown Pressing Co. of Calcutta. Moreover, the three wage advances sanctioned by the Trade Board for British workers since July, 1939, have undoubtedly increased the difficulties of effective competition with the rising Calcutta industry. There is hope that some sections of domestic demand will be maintained during the war and of success in development of the newly formed Export Group for the industry.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

THE tone in all sections of the market has been dull both before the week-end and during the current week. Sentiment remained firm and there was little selling, but a hesitant atmosphere prevailed and, on Tuesday and Wednesday, daylight alerts depressed business to a low level. In the gilt-edged market, early losses were mainly made good. Home rails lost a measure of recent support and price movements among industrial shares were, in general, trendless. Markets derived some encouragement on Tuesday from the continued successes in Africa, as also from the announcement of the Imperial Tobacco dividend, and of the excellent Woolworth results in the preliminary statement.

The gilt-edged market closed distinctly dull before the week-end, but there were few changes in quotations. On Monday, a long list of dated and undated funds suffered losses of $\frac{1}{8}$, including 2½ and 4 per cent. Consols, 3 and 3½ per cent. Conversion and 2½ and 4 per cent. Funding. Local Loans were also quoted lower. Later in the week the market hardened and a number of the former losses, including those of 2½ per cent. Consols and 4 per cent. Funding, were made good. The foreign bond market remained generally buoyant, and although Japanese issues continued to be offered, there was further support for Egyptian Unified. French rails returned to favour and daily gains were enjoyed by Belgium 4 per cent. bonds, following the conclusion of the purchasing agreement between Great Britain and the Belgian Congo.

Second thoughts on dividend possibilities caused home rails to ease. While the majority of the senior and marginal stocks stood firm, the ordinary stocks reacted from recent levels. Thus, Southern preferred ordinary lost $\frac{1}{2}$ point on Monday and Tuesday, while Great Western and L.M.S. ordinary and London Transport "C" were all quoted lower. Among foreign rails, Canadian Pacific preference was supported at the close of last week. The ordinary issue moved irregularly.

Sentiment in the industrial market was certainly encouraged by the Woolworth and Imps. announcements, but business remained slack and a number of issues eased. Brewery shares were offered, including Charringtons, Distillers and Mitchells and Butlers. Last week's support for the textile section was not continued and buying in the stores and tobacco groups was on a very moderate scale. Heavy industrials moved uncertainly. In the miscellaneous section, Dunlops, I.C.I. and Metal Box received attention, but Turner and Newall and Murex both lost ground. Recently de-restricted S.I. (B) stocks, in particular International Nickel and Brazilian Traction, fell away and are thus brought more nearly in line with the New York quotations.

Business in *kaffirs* was also dull, although the market provided a few bright spots. "Sallies" gained $\frac{1}{8}$ on each of the first two days of the week, but Crown Mines, E. Geduld and W. Wit Areas gave way. The rubber market experienced a number of small losses, among which were setbacks for Malayalam and Anglo-Dutch. Tea shares were offered on a substantial scale at the close of last week, Doars

easing 1s., but prices hardened after the week-end. In the oil market, the recent advance appeared to have spent itself, although a number of the smaller concerns, including Kern and Trinidad Petroleum Developments, improved.

New York

WALL STREET opened this week, as it closed the previous week, idle and trendless. A few incipient rallies were damped at the outset by lack of interest, and dealers refused to derive encouragement from favourable industrial news or from the continued progress of British armies in Africa. Motor issues remained a bright spot, apparently thanks to the belief that the prosecution of the defence programme will necessitate curtailment of production. For the rest, price movements were narrow, with fractional losses predominating.

The Iron Age estimates steel mill activity at 197 per cent. of capacity against 99 per cent. in the previous week. Uncertainty regarding the con-

(Continued on page 166)

Industry and Trade

Less Wool for Civilian Use

Imports of wool last year were at a record level, but it is doubtful whether shipments can be maintained this year. While stocks are still substantial, military requirements are also heavy and exports must be increased, if possible. In the circumstances, the wool textile industry is expecting a reduction in the allocation of wool for civil use for the next rationing period beginning on March 1st. Indeed, signs of a forthcoming reduction are not lacking. Thus, when supplies of wool and tops were requisitioned earlier in the war, stocks in the hands of spinners and manufacturers were emptied and could still be used for civilian purposes. An Order has now been made, however, prohibiting the use of stocks of cross-bred tops, except by licence. This means that the remaining free stocks of cross-bred tops are now reserved for Government needs. Moreover, the Wool Control has appealed to spinners and manufacturers to exercise the greatest possible economy in the use of all types of wool for civilian purposes. But in view of the comparatively mild restriction of wool supplies hitherto in force, a further cut is unlikely to cause hardship.

Shopkeepers and Mutual Help

Southampton has set an example, which is held up by the Board of Trade as a model for other districts, of public-spirited co-operation between bombed retailers and their more fortunate neighbours. Where retail premises are destroyed and there is no prospect of alternative accommodation being obtained in the near future, it is not in the public interest that the owners should cling to their rights of replacement of stocks, or consumers in badly bombed areas may go short of essential supplies. Realising this, Southampton victims have surrendered replacement rights to the value of thousands of pounds, and this has enabled a score of retailers whose premises are undamaged to obtain corresponding additional stocks. A particularly satisfactory feature of this arrangement is the manner in which chain stores and multiple shops have co-operated with the local shopkeepers. The Board of Trade has appealed to retailers all over the country to work out a similar arrangement before they are bombed. While it is hardly possible to fix beforehand the extent to which traders will surrender their rights, since this must depend on the extent of the damage, and the possibility of obtaining alternative accommodation quickly, it is desirable to fix the proportions in which traders whose premises are undamaged will take up the surrendered rights of the others. It is also important to fix the basis upon which the profit is to be divided between the original owner of the stock and the retailer who sells the goods the former receives in replacement of those that have been destroyed. If a workable scheme has been evolved among the ruins it should be possible for satisfactory arrangements to be made in advance among people who have not yet suffered damage.

Building Materials Controlled

The more important of the building material supply trades, cement, bricks and timber, are now subject to the benevolent dictatorship of Government control; others, such as the roofing material industry, are shortly to lose their liberty in defence of liberty. In the early months of the war much precious time which should have been devoted to the building up of stocks was lost. In spite of war factory extensions and the erection of new munition establishments demand fell heavily owing to the embargo on civil building, workers left the cement factories and the brickyards and machine capacity stood idle. After the capitulation of France the position changed. There came a sudden demand for cement, bricks and timber for defence works, for shelters, and for the repair of properties damaged by the Luftwaffe. Maximum output is now required of the cement, brick and roofing trades, and maximum domestic production and importation of timber. Lack

of transport, rail and road in the case of cement and bricks, and shipping space in the case of timber, has created difficulties. The cement industry has its own particular problem, the direct result of the rationalisation policy pursued in the years prior to the war. Present capacity is inadequate, and a Committee has been set up by the Ministry of Works and Buildings to consider whether new cement works should be set up, existing ones extended and obsolete plant modernised. The need is urgent, and use of the "shadow factory" system would seem one way of meeting the needs of the country. The brick trade is better placed, in that local yards can be brought into full employment with small delay and at relatively small cost, though they are hampered by labour shortages. A somewhat similar position obtains at the establishments of roofing material manufacturers. In three of the cases cited above the raw materials of the industries come mainly from home sources. Timber, however, has to be imported in large quantities and requires much valuable shipping capacity. During the first eleven months of 1940 timber imports declined—even on a value basis—but it should be possible to make up the deficiency by yet a further increase in domestic production.

Record Steel Production in America

In 1940 the output of steel ingots in the United States, at 66,500,000 tons of 2,000 lb., was higher than ever before. Production was 27 per cent. higher than in 1939, and it exceeded the previous record, established in 1929, by about 8 per cent. Some 18 per cent. of the semi-finished and finished steel made last year for sale was produced for export, one-half of it for this country. Already at the end of 1939 America's crude steel producing capacity, then rated at 81 million tons of 2,000 lb., was 38 per cent. bigger than at the end of 1918 and 15 per cent. greater than at the end of 1929. But while the rated capacity rose to 83 million tons by the end of 1940, Mr. W. S. Tower, President of the American Iron and Steel Institute, estimates that it is now practicable for the industry to produce crude steel at the rate of 85 million tons per annum. The American iron and steel industry has spent no less than \$1,500 million during the past ten years on the modernisation and extension of its plant, and further heavy expenditure is contemplated to increase its capacity still further.

* * *

Poultry Price Control

The Ministry of Food order, in expectation of which poultry has recently been withheld from the market, has now come into effect. Retail prices are fixed at 2s. 4d. and 2s. 2d. per lb. for English and Irish roasting chickens respectively; 1s. 8d. and 1s. 6d. for English and Irish boiling fowls; 2s. 1d. per lb. for ducks and 1s. 11d. for geese. Retailers' margins are 4d. per lb. for roasting chickens and 3d. for all other controlled birds, and producers' prices are fixed to yield 1d. per lb. to wholesalers in all cases. Wholesalers are appealing to the Ministry of Food to allow a larger margin, and, meanwhile, only small supplies are coming on to the market. How far the shortage is really due to control, however, is doubtful. Birds were killed in large numbers last year, when the difficulty of feeding them first became acute, and the supply must remain very restricted for a long time to come. As it is practically

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

impossible to increase substantially, under present feeding conditions, the number of birds reared, it would be a doubtful policy to fix prices at a level which would encourage poultry keepers to kill them off too rapidly. The goose that laid the golden eggs in fairyland was not nearly such a valuable bird as the hen that can be persuaded to lay category A.1 eggs in blockaded Britain.

* * *

Crude Oil Production in 1940

With the exception of the United States and the Soviet Union, the chief oil producers are heavily dependent upon export business. The majority of exporters were seriously affected last year by the British blockade of the Continent, which cut several of them off from their principal overseas markets and forced them to curtail production. But since almost two-thirds of the world's petroleum comes from the United States, these declines are not reflected in total world production, which is estimated to have advanced by 4 per cent., from 2,069 million barrels in 1939 to 2,151 million last year. Most of the following estimates, taken from *The Oil and Gas Journal*, should in present circumstances be regarded as rough approximations only:

	CRUDE OIL PRODUCTION (Million Barrels)		Percentage Change
	1939	1940	
United States	1,255.8	1,345.8	+7.2
Russia	216.5	224.0	+3.5
Venezuela	208.1	189.2	-9.1
Iran	77.0	76.3	-0.9
Dutch East Indies*	68.7	68.7	—
Roumania	45.6	42.5	-7.0
Mexico	42.9	43.5	+1.4
Iraq	30.8	25.7	-16.5
Colombia	23.8	26.9	+13.0
Argentina	18.6	20.5	+12.2
Trinidad	19.3	20.3	+5.2
Other countries	61.6	67.3	+9.3
World total	2,068.7	2,150.7	+4.0

* Including British Borneo

Despite a serious decline in exports, production in the United States showed a marked advance due to a highly satisfactory home demand and to the fact that in 1939 many of the producing wells were closed during the second half of August. Russian production again lagged well behind schedule, and was barely sufficient to cover growing home requirements. In Venezuela, on the other hand, home consumption is small and the loss of European outlets was acutely felt. Production is also thought to have been somewhat reduced in Persia—though here the dependence on the European market is not so great—mainly owing to shipment difficulties. A high proportion of Iraqi oil went in normal times to the French refineries, and the collapse of France is reported to have been followed by the closure of the Syrian branch of the Iraq pipe-line. Since the southern branch, through Palestine, was already used to capacity, production in Iraq had to be curtailed appreciably, and it is possible that the figure in the table underestimates the decline. The Dutch East Indies has been little affected by the European war, and operations there have been maintained at around the 1939 level; but the downturn in Roumania was accelerated by earthquake damage and by shipping difficulties due to British action following the virtual German occupation. Certain quantities of Mexican oil were admitted to the United States market last year, and the gradual recovery of production in the Republic was consequently able to proceed, despite the disruption of business with the Axis Powers. In Colombia and Argentina the development of new fields was responsible for a higher output, but the contraction of Peruvian production was continued. Among other minor producers, Trinidad, Canada and Egypt made further marked headway.

* * *

Difficult Coffee Position

The United States has recently concluded an agreement with the coffee exporting countries of the Western Hemisphere regulating her coffee imports during the current season. The scheme, which has still to be ratified by the Governments concerned, introduces fixed import quotas for every State. America's total import quota is 15,545,000 bags of 60 kilos each, against actual imports of 14,025,978 bags in 1939-40 and of 13,878,257 bags in 1938-39. Brazil's share is 9,300,000 bags, against

9,063,676 bags and 9,014,862 bags respectively in the last two seasons. At present most of the Central and South American coffee-producing countries are preparing steps to make the best possible use of these quotas by selecting their best grades of coffee for export. Concurrently, Government control of the coffee industry is being strengthened in a number of countries. While the fixing of fairly high import quotas by the United States is a favourable factor for the coffee market, this move falls far short of the ambitious plans discussed at the Pan-American Conference at Havana last summer. Possibly the present quota scheme will be supplemented by United States credits to the coffee countries in order to assist them in financing the holding of their huge stocks, but so far nothing definite is known in this respect. Meanwhile, all coffee exporting countries are suffering seriously from the effects of the war, which has virtually closed the European market to them. In 1938-39 Europe still imported 11.6 million bags of coffee, but current imports are at the rate of less than one million bags per annum. In present conditions world sales of coffee will probably fluctuate between 16 and 17 million bags a season, while the 1940 crop amounted to slightly less than 21 million bags in Brazil and 10 million bags in the other producing countries, a world total of about 31 million bags. The next crop will probably be smaller, for the chief producing States in Brazil have suffered from serious drought. But even a major decline in the Brazilian crop would leave that country with a huge surplus, owing to its dependence on the Continental European market.

* * *

Palestine Citrus Fruit

In normal years this should be the height of the Palestine citrus season. This year imports of oranges into this country are to be reduced to a minimum, and part of the very small quantity allowed will be bitter oranges for marmalade. For Palestine this means the virtually complete loss of her export trade in oranges, for the small quantities that were not exported to England mainly went to Continental Europe. Total citrus exports, and lemons and grapefruit are under a severer ban than oranges; they amounted to some £P4 millions before the war and accounted for three-quarters of the country's export trade, while a high proportion of the population is dependent on the industry, either directly as growers, or indirectly as pickers, packers, farm labourers and transport workers. In most of the colonies where the exigencies of war have cut off their staple export, the British Government has come to the assistance of the growers, either by direct purchase as in the case of West African cocoa, or by bolstering up the price at which they can be bought locally. In the last citrus season, Italy had not yet entered the war, and about half Palestine's orange crop was exported. Moreover, the local banks came to the assistance of the growers by granting cultivation loans of about £10 an acre to tide the growers over the summer months. Some £500,000 was advanced in this way, of which three-quarters was guaranteed by the Palestine Government. This season no financial arrangements have yet been made, and Palestine is faced with a surplus of about 10 million boxes and the prospect of allowing most of the groves to go out of cultivation. Over £20 millions has been invested in the industry—a high figure for a colonial crop, but citrus trees take five years to bear fruit, and need careful and scientific attention throughout that period—and a large part of the investment is now seriously threatened. Moreover, the five years interval means that supply cannot be quickly expanded when markets are restored after the war.

*

Local efforts to help the position include an excise tax on local sales to help the growers, but the local market is so small that very little benefit is expected from this. The manufacture of by-products, too, cannot be more than a palliative, which in any case will take time to put into effect. The growers have hopes of expanding markets in India and Russia, but something must be done quickly for this season. The industry itself suggests that the British Government should buy the whole crop on the trees at about £20 an acre. This would mean an expenditure of about £1 million in all, which in relation to the average export value of the crop is not disproportionate to the help given to West African cocoa and Jamaican bananas. But so far no satisfactory reply has been received from the British Government.

COMMODITY AND INDUSTRY NEWS

Cotton.—The general inquiry in the market has been well maintained and a fair amount of business has been done, but many producers were reluctant to sell their production far ahead. The raw cotton supply situation tends to become more acute. Only narrow fluctuations have occurred in prices. There has been an active demand in coarse and medium yarns in both American and Egyptian qualities, but more spinners have refused to sell. Cloth demand has covered a wide range of goods, most of the buying being in printed and dyed sorts for Java, Rangoon and South America, with fair sales in a variety of fabrics for the Dominions. Some offers for India have improved and a few more transactions have been put through. Further Government contracts have been given out.

Oils and Oilseeds.—The official maximum prices of controlled vegetable oils are due for revision. Meanwhile supplies of practically all necessary vegetable oils are well maintained and permit of substantial allocations, especially to the industries engaged in the manufacture

of margarine and cooking compounds. Paint and soap makers and allied technical users are well supplied within the limitations imposed by present conditions. The outlook for supplies of raw material is considered satisfactory. Apart from India large supplies of linseed are available from South America. The second estimate issued by the Argentine Ministry of Agriculture gives a probable gross output of 1,567,000 tons compared with the previous season. Allowing for home requirements and seeding there still remains 1,400,000 tons approximately to be marketed during 1941. Prices however remain steady. Trading in Egyptian cottonseed is still handicapped by present conditions in the Mediterranean. Indian ground nuts are being taken up in substantial quantities by the U.K. Control which is inviting further offers for February-April shipment.

THE IMPORTANCE OF EXPORTS

MR EDWIN FISHER'S ADDRESS

The forty-sixth ordinary general meeting of Barclays Bank Limited was held on January 27th at the head office of the bank, 54 Lombard Street, London, E.C.

Mr Edwin Fisher (the chairman) presided.

The chairman: My lords, ladies and gentlemen,—I will call upon the secretary to read the notice of meeting and the certificate of the auditors which appears at the foot of the balance sheet that has been submitted to you.

The secretary (Mr W. N. Seeley) then read the formal notice convening the meeting and the report of Messrs Price, Waterhouse and Company and Messrs Kemp, Chatteris, Nichols, Sendell and Company.

The chairman: My lords, ladies and gentlemen,—Is it your pleasure that the report and accounts submitted, and also the chairman's address which has been in your hands for some days, be taken as read? (Agreed.)

The chairman's address was as follows:—

DIRECTORATE AND STAFF

Through the death of Mr Herbert Leslie Melville Tritton, which occurred recently, a link with one of the great banking families so closely identified with this bank was broken. Like his father before him, he devoted his working life to service with Barclays Bank, and his intimate knowledge of the business and his wide interests, which extended to the countryside as well as to the City, made him an invaluable member of the board. We who had the privilege of working with him, and the staff, for whom he always showed an enduring and sympathetic interest, mourn his loss.

We have lost 27 of our staff as a result of the war, of whom 16 were serving with His Majesty's Forces and 11 were civilians. Their names are recorded in the report of the directors. We offer to their relatives our deepest sympathy, and we pay a sincere tribute to their memory. We also regret that 13 other members of the staff on active service have been reported as missing and that, in addition, 37 of our men are known to be prisoners of war.

THE BALANCE SHEET

The balance-sheet of the bank for December 31, 1940, reflects the incorporation in our figures of those of The Union Bank of Manchester Limited, which was amalgamated with this bank as from January 1, 1940. Our reserve fund has been increased to £11,250,000, by bringing in the reserve fund of £500,000 of The Union Bank of Manchester Limited, and on the other side of the balance-sheet, the amount representing our shareholding in that bank now no longer appears.

The total of our current, deposit and other accounts has risen to the record figure of £546,914,676, against £461,376,448 at the close of 1939. Suggestions have been made that the rise in deposits held with the banks and the increased amounts they have been able to lend to the Government are credit which the banks create without cost to themselves. Misconceptions possibly arise, owing to some lack of understanding of the fact that the employment of money by a bank is entirely dependent upon its success in attracting deposits from the public. A bank can only maintain its business if its credit is such that the public have confidence in its ability to meet its obligations and if the services which it places at the disposal of its customers

make the possession of a banking account attractive. The rendering of these services by the banks and the payment of interest to depositors are obviously costly matters, and, therefore, no part of the deposits which the banks are able to lend can be regarded as credit which has cost them nothing. In order that they can continue to conduct their operations, the banks must be able to recoup themselves for the expense incurred in affording the various and ever-increasing facilities and services which they place at the disposal of the public, and which are so necessary to the life of the community. Increased deposits do not necessarily produce increased profits, as our own figures make clear, since, although our deposits have risen during the past three years by about £112 million, our net profits have been lower.

LIQUID POSITION

The manner in which our funds are employed is shown on the assets side of the balance-sheet. As the shareholders will see, our position is very liquid, due to the short-term finance we are providing for the Government. Apart from cash in hand and with the Bank of England and balances with other British banks and cheques in course of collection, which show increases compared with a year ago, the remainder of the specially liquid assets represents very largely money advanced, directly or indirectly, to the Government, i.e. money at call and short notice, which consists to a large extent of loans to the money market, mainly against Treasury Bills; bills discounted, which are almost entirely Treasury Bills; and Treasury Deposit Receipts, a new form of short-term security appearing in our balance-sheet for the first time. The total of these five items amounts to no less than 44 per cent. of our current, deposit and other accounts. This abnormally high ratio, which reflects the conditions prevailing as a result of the war, means that a larger proportion of our funds than usual is being employed in the less remunerative of banking assets. The Treasury Deposit Receipts which I have mentioned and of which we hold £68,000,000, are issued to the London clearing banks and the Scottish banks against loans to the Government. They are six months' maturities, the current rate of interest being 1½ per cent. per annum.

INCREASE IN INVESTMENTS

Amongst our other assets, the total of our investments, excluding those in subsidiary banks, amounted at the end of December last to £121,474,855, and showed an increase of £22,634,026 compared with the close of 1939. This rise is entirely accounted for by an increase in British Government securities, our holding of which amounted to £113,491,466 at the date of our balance-sheet. In support of the war effort, we have invested largely in the new issues of Government loans and, as the shareholders are no doubt aware, we have given considerable support to the War Weapons Weeks held in many parts of the country, by subscribing locally for National War Bonds. The extent to which the banks are directly assisting in the provision of war finance is not always appreciated by the public. Apart from the considerable sums we are lending to customers of the bank for financing war contracts, we have, as I have already mentioned, greatly increased the amounts which, in one form or another, we are lending to the Government. To

give an illustration, while our deposits have risen, since the beginning of the war, by £118 million, our combined holdings of British Government securities, Treasury Bills and the new Treasury Deposit Receipts have increased by £106 million.

NATIONAL SAVING

Nevertheless, it cannot be too widely understood that the successful financing of the war and the avoidance of inflation can only be secured if each individual in the country will play his part and save all he can, for investment in Government loans, even to the point of sacrifice. No better security is to be obtained; and the investor, by practising rigid self-denial, is helping to safeguard his future in the broadest and truest sense. The work of the savings committees has attained a notable success. It is no mean achievement to have raised from the sale of National Savings Certificates and 3 per cent. Defence Bonds a sum of £407 million in just over a year, and, in addition, to have secured an increase of £121 million in the sums deposited in the Post Office and the Trustee Savings Banks. Moreover, £300 million has been subscribed for an issue of 3 per cent. War Loan, 1935-39, and £441 million for 2½ per cent. National War Bonds, 1945-47, while £25 million has been lent to the Government free of interest. These results, however, must only spur the community to even greater efforts, for, gratifying as they have been, the needs of the country call for more and still more saving.

The cost of the war is met by taxation and Government borrowing. Taxation should aim at the equitable distribution of burdens, obtaining the maximum amount without creating avoidable hardship. Hardship, it is true, may well descend upon us all; and the degree to which we have to forgo the standard of life to which we had become accustomed will be decided by the encroachment of the overriding necessities of the war. Government borrowing, so far as possible, should be based upon and have relation to the savings of the people, which must be maintained at the maximum level. To the extent that incomes have been increased as the result of war conditions, so should contributions towards Government expenditure, in the shape of subscriptions to Government loans, be looked for and expected. We must, however, go further than this: for the demands on the productive capacity of the country, made by the fighting Services, leave no doubt that our standard of living to-day will have to suffer further reduction until the war is won. To the extent that increased profits accrue as a result of war conditions, it is right that they should make the fullest contribution to the financial needs of the Government. At the same time, it is perhaps proper that some proportion, however small, should be retained by trade and industry. In this way, a monetary incentive to further endeavour would be kept alive and possible tendencies towards extravagance would be checked. In addition, industry would be helped to build up reserves against the time when a change over from war essentials to a peace-time programme has to be undertaken, and in return for a concession of this kind, any sums so retained could be lent to the Government and thus, in the meantime, contribute to the general war effort.

FALL IN ADVANCES

The total of our advances has declined to £197,283,706, against £200,847,108 twelve months earlier, and, as our figures now include the advances of The Union Bank of Manchester Limited, the diminution is even more pronounced. In view of the great industrial activity, this fall may be surprising to many, although it has to be borne in mind that, while some trades and businesses have become more active by reason of the war, others have been adversely affected, and it is natural that, in existing circumstances, many borrowers should desire to reduce their obligations as far as possible. Moreover, in transactions where the Government is a buyer, there may have been less need to depend on bank loans as a means of providing finance, while the control exercised over markets and prices and the reduction in the stocks of commodities held by individual traders and manufacturers have lessened the demand for accommodation. The shareholders may feel confident that the bank is doing all it can to ensure that the credit resources it commands are employed to the best advantage of the country,

and we are taking every opportunity, in line with the policy of the Government, to give all assistance in our power, consonant with sound banking practice, to those engaged in work of national importance.

POSITION OF AGRICULTURE

The industry of Agriculture has quite properly come into greater prominence as a result of the war, and the position of farmers has been improved through the steps taken by the Government to afford them increased security and more stable conditions than in the past. At the present time, the farmer has been guaranteed fixed prices for the principal agricultural products and an assured market for the duration of hostilities and for at least one year thereafter, with the knowledge that prices will be subject to adjustment to the extent of any substantial changes in the cost of production. Moreover, the Government, which is representative of all the major political parties, has, through the Minister of Agriculture, expressed its recognition of the importance of maintaining after the war a healthy and well-balanced agriculture as an essential and permanent feature of national policy. The Bank values its farming connections and has always endeavoured to see that its farmer customers should receive the accommodation which their position justifies. There will, of course, be cases, which would be quite exceptional, where it would not be wise, even in present circumstances, for a bank to grant accommodation: but the bank is fully conscious of its duty to see that the Government's policy of increasing home food production is not retarded by any failure on its part to provide banking credit where it can properly be given. In order to minimise the possibility of any deserving case being overlooked, the banks, in agreement with the Minister of Agriculture, have appointed liaison officers in every county to work with the County War Agricultural Executive Committees. The existence of such a selected body, readily available, should ensure that the farmers, so far as local banking problems are concerned, will receive sympathetic and careful consideration and every possible assistance.

NET PROFIT AND ALLOCATIONS

The net profit for the year ended December 31st last, after payment of all charges and after making provision for all bad and doubtful debts and for contingencies, amounted to £1,525,655 16s. 0d., which is a reduction of £259,214 8s. 5d. compared with the figure for 1939. This fall was not unexpected in view of prevailing conditions. The total of our advances, as I have already mentioned, has declined and, in addition, we have suffered a higher rate of taxation and have had to meet increased expenditure, and these factors are responsible in the main for the lower figure of profit which we were able to show. The sum of £568,726 15s. 0d. (including £38,145 2s. 8d. profit unappropriated by The Union Bank of Manchester Limited) was brought forward from December 31, 1939, making a total to be dealt with of £2,094,382 11s. 0d. As will be seen from the report, the directors have allocated from the profit for the year £150,000 to contingency account and £200,000 to reduction of premises account, and I feel confident that the shareholders will approve these appropriations. Our premises account has been increased during the year by the inclusion in our figures of the Premises of The Union Bank of Manchester Limited. Interim dividends at the rates of 5 per cent. on the "A" shares and 7 per cent. on the "B" and "C" shares, less income tax in each case, were paid on August 8th last, amounting to £598,844 2s. 9d. The directors now recommend the payment of final dividends of 5 per cent., making 10 per cent. for the year, on the "A" shares, and 7 per cent., making 14 per cent. for the year, on the "B" and "C" shares, less income tax, involving a sum of £598,844 2s. 9d., and leaving a balance of £546,704 5s. 6d. to be carried forward. In arriving at their decision to recommend the maintenance of the dividends at the same rates as for the preceding year, the directors have not been unmindful of the difficulties under which business has to be conducted, the extra expense that has to be met, and the uncertainties that are inevitable in wartime. They have been fortified in their decision, however, by the ability of the bank to make adequate provision for contingencies out

of the profit for the year and by the policy of prudence adopted in the past. Some shareholders, at times, may have felt that, when profits were rising, some extra return, by way of increased dividend, might have been forthcoming. I have little doubt that the shareholders will agree with us that the policy which has been steadily pursued has been in their real interests, and it can be regarded as a contribution by them to the stability of the bank, which has, so far, been in a position to maintain its dividend payments unchanged for many years through good times and bad.

EXPORT TRADE

The export trade of this country at all times demands and deserves attention. Exports were always essential to Great Britain and this is particularly so to-day, when we are at war. It was in realisation of their increased importance, and the very special considerations attaching to them in wartime, that the Government, early in 1940, set up the Export Council, whose object is to foster the export trade of the country. In peace-time, imports were paid for by the proceeds of our exports, together with the income from invisible exports, such as shipping earnings and the yield from overseas investments, and in many years there was a surplus for further investment abroad.

Wartime conditions are quite different; our home industries are concentrating on war production and many of our European markets are closed: hence, the problems of imports and exports demand review from a fresh angle. Under war conditions, many essential commodities which have been imported cannot be paid for entirely by exports and by invisible receipts. We must draw upon our capital invested abroad, i.e. through sales of overseas investments. The amount of this capital, however, is not unlimited, and payment by means of exports is, therefore, of increasing importance; but exports are only beneficial in wartime if they result in a return flow to this country of the goods we need, or of the exchange with which to buy them from other countries, and if the material and labour absorbed can be spared without impeding our war programme. It, therefore, becomes us to be selective in our exports, paying due and proper regard to their character and destination.

The exports which are most advantageous to Great Britain are those that go to countries from whom we in turn buy goods that are essential for our needs, or, preferably, from whom we receive dollar exchange, as being the form of foreign exchange which suits us best. An export which, in addition, involves a minimum of imported raw materials—thus economising in foreign exchange and in shipping space—and which makes no undue demand upon labour essential for our war production would seem to have all the virtues. No one is asked to imagine, for a moment, that all exports should comply with these requirements. They are only mentioned to point out some of the considerations which have to be borne in mind when assessing the relative value of exports and to emphasise the need for selectivity.

AN ENCOURAGING FEATURE

It is encouraging to note that the Government, through the machinery of the Export Credits Guarantee Department, have gone a considerable way to help with many of the difficulties which lie in the path of the exporter in wartime. Through a variety of policies and guarantees, the Department offers insurance against such things as loss caused by insolvency of the buyer, exchange difficulties, impediments to the completion of export transactions, such as non-shipment of goods arising out of the inability of the buyer to take delivery, or interruption of payment for goods delivered, owing to war happenings, and increases in rates of insurance or freight affecting export contracts. In view of the present rising cost of production at home the price of our exports may become a matter of serious consequence, for in world markets—as indeed in all markets—it is not only the quality, but also the price of the goods that counts: and if our prices are not comparable with those of our competitors, then our goods may not be sold. It is, therefore, of paramount importance that every effort should be made by our manufacturers and traders to keep their export prices on as competitive a basis as possible.

WARTIME EXPERIENCE

The shareholders will recall that last year I referred to the internal arrangements we had seen fit to make in the bank as wartime measures, and, in particular, to the system of duplication of records which had been instituted so as to ensure that our services could be carried on in all circumstances. It was hardly to be expected that we should be able to avoid sustaining damage to some of our bank premises, when the enemy air attacks on this country developed: but when we consider the number of our branches in London and elsewhere, the amount of serious damage is not large. Any dislocation of business caused has been speedily remedied and immediate steps have been taken to ensure the resumption of banking business with as little delay as possible and with the least inconvenience to our customers. In making these arrangements we have received much assistance from the neighbouring branches of other banks, and we are grateful to them for the spirit of helpfulness and co-operation which was so readily forthcoming.

The experience of enemy bombing since August last has tested and shown the wisdom of our plan of preparedness. I make no apology for giving the following details to show how the system worked when it had to be brought into instant operation, as I feel sure it will be of interest to the shareholders.

Our Wealdstone office—a branch on the outskirts of London—received a direct hit from a high explosive bomb. The books of the branch were almost completely destroyed and the contents of the strong room suffered considerable damage from the explosion and from water. Happily, no one was hurt, notwithstanding the fact that the manager and his family were sleeping on the premises. The damage occurred early one Friday morning. The reconstruction of the records of the branch was immediately taken in hand and by noon the next day all the current accounts had been reconstructed and proved and a branch balance-sheet was drawn up the same afternoon. On the following Monday morning the branch was reopened in temporary premises, and all customers' statements were ready for them. By the evening of the same day, deposit, home safe and loan accounts had been verified, while, by the afternoon of the next day, the deposit interest had been checked and the branch was working normally.

AN IMPORTANT BRANCH

At Coventry, where we have an important branch, a large part of our premises was destroyed by enemy bombing and by fire, but the front part of the premises was left standing. A wall 20 feet high was built in one and a half days, across the office, screening the damaged from the undamaged portion of the premises, so that work could be resumed. The branch was hit on a Thursday night, but, by 10.30 on the following Saturday morning, after the debris had been cleared away, access was gained to the strong room door, the keys turned in the locks and all the securities, cash and ledgers were found to be perfectly safe and undamaged. Half an hour later our cashiers were paying out wages and all our customers' requirements were satisfied. The office bookkeeping machines had been transferred to an adjacent branch and everything there has continued to work well. In the damaged office at Coventry great discomforts have been borne by our staff, but all have faced the situation cheerfully.

There are other instances of a comparable kind which I could quote, but the examples given show what has been achieved and are typical of the way in which the difficulties have been faced and overcome. In dealing with our special problems the staff have invariably shown great resource and initiative, and the success of their efforts to maintain banking services whenever they have been threatened reflects the greatest credit upon them, as well as upon those members of our head office staff who evolved our own scheme which has made possible such rapid reconstruction of accounts. A valuable contribution to the maintenance of an efficient banking organisation in these times was made by the chief executive officers of the London clearing banks, who, acting in concert, have devised many agreed measures to meet the various emergencies which might arise as a result of the war.

The occupation of the Channel Islands by the enemy created

further problems for the bank, as we have branches in Jersey and Guernsey. Our duplicate record system again justified itself, and those of our customers who left the Islands have been able to continue their accounts with a branch of the bank on the mainland.

One effect of the war is that we have been completely cut off from our Italian Bank in Rome and from the branches of another subsidiary institution, Barclays Bank (France) Limited. It is clear that nothing can be done by us, with regard to these subsidiaries, until after the war, but shareholders will be glad to know that when the control of these banks passed from us the position of both concerns was one of extreme liquidity and was thoroughly sound.

INCREASED STAFF

The number of those on the permanent staff who, on December 31st last, were absent from the bank on full-time War Service was 3,787, which compares with a figure of over 2,000 that I gave to you a year ago. The gaps in our ranks have been made good in various ways. A number of pensioners have returned to help us, and, in certain cases, men who had completed their service on reaching the age of 60 and were about to retire have been invited to stay in the service of the bank for the time being. We are indebted to them, and the experience which they are able to bring to bear is undoubtedly of great value to us at this time. We have a number of men working in the bank as temporary clerks: but the vacant positions have been mainly filled by women clerks, who, I am glad to say, have adapted themselves readily to working conditions in the bank. I would take this opportunity of thanking, on behalf of the board and of the shareholders, all our staff, both permanent and temporary, for the example which they have shown, in the unusually difficult times of to-day, and for the unsparing efforts which they have given so freely to the bank.

I now beg to move: "That the report of the directors produced, together with the annexed statement of the company's accounts as at December 31, 1940, duly audited, be received, approved and adopted, and that a final dividend of five per cent., making ten per cent. for the year, on the 'A' shares of £4 each fully paid, and a final dividend of seven per cent., making fourteen per cent. for the year on the 'B' and 'C' shares of £1 each fully paid, less income tax in each case, be declared, payable on the 8th proximo, to the shareholders registered in the books of the company on December 31st last."

Mr W. M. Goodenough, the deputy chairman, seconded the resolution and it was carried unanimously.

The retiring directors were re-elected, and the auditors, Messrs Price, Waterhouse and Co. and Messrs Kemp, Chatteris, Nichols, Sendell and Co., were reappointed for the ensuing year.

A vote of thanks to the chairman for presiding at the meeting the chairman made reference to the impending retirement of Mr W. N. Seeley, the secretary, and Mr J. H. Beckwith, the chief accountant, each having completed 46 years' service, and conveyed to them the good wishes of the shareholders and of the directors of the bank in their retirement. The proceedings then terminated.

LLOYDS BANK LIMITED

ANNUAL GENERAL MEETING

The eighty-third ordinary general meeting of this bank was held, on the 31st ultimo, at the head office, 71 Lombard Street, London.

The notice convening the meeting and the auditors' report having been read, the chairman, the Right Hon. Lord Wardington, said that he assumed that the report and accounts which had been circulated would be taken as read as usual and, as his address to shareholders had also been circulated, he did not propose to take up the time of the meeting by reading it.

The report and accounts were adopted and the usual business transacted.

The proceedings ended with votes of thanks to the chairman and directors and to the staff.

UNION BANK OF AUSTRALIA, LIMITED

REGULATIONS WORKING SMOOTHLY

The annual general meeting of the Union Bank of Australia, Limited, was held, on the 27th ultimo, in London.

Major-General Sir John H. Davidson, K.C.M.G., C.B., D.S.O., the chairman, who presided, said that for the first time for several years costs showed little increase: those applicable to Australia and New Zealand were slightly down, but that reduction had been offset by increased cost at home due to the maintenance of the various departments of the bank in the country and the necessary A.R.P. expenditure. Taxation, on the contrary, had risen substantially, and its effect had not yet been fully felt.

While control and restrictions were now far-reaching and impinged on almost every operation, both in finance and trade, no undue hardships seemed to have been imposed, and the regulations appeared to be working smoothly. It could hardly be denied that the effect so far, on balance, had been to the present and immediate economic benefit of the community by reason of the stimulus to industry arising out of the war effort and to the purchase by the British Government of all such primary products as wool, butter, cheese, sugar, dried fruits, canned fruits, meat, eggs and certain metals.

Reverting to the affairs of the bank, the balance-sheet total had risen from approximately £49½ millions to £52½ millions. That was due to the rise of some £3,000,000 in deposits. The improvement in their own ratio of advances to deposits was marked, and their degree of liquidity showed a great improvement over that which had existed during the past few years. It was satisfactory that while that had occurred, earnings for the year had been maintained. There was a net profit of £196,958, and, with the sum of £157,851 carried forward, there was a total available of £354,809. The board had declared a final dividend of 4 per cent., less tax, making 7 per cent., less tax, for the year, which left £159,809 to be carried forward, or £2,458 more than the previous year.

The report and accounts were unanimously adopted.

TOBACCO SECURITIES TRUST COMPANY, LIMITED

RESULTS OF A DIFFICULT YEAR

The thirteenth annual general meeting of the company was held, on the 30th ultimo, in London, The Right Hon. Lord Bradbury of Winsford, G.C.B., presiding.

The chairman, in the course of his speech, said: It is usual at our annual meeting to review the important items of the balance sheet. Taking the assets side first, shares in a subsidiary company stand unchanged at £2,000,000. The subsidiary company is Tobacco Investments Limited, which is a holding company holding the bulk of our unquoted investments. Other investments at £3,282,654 show an increase of £280,012 due to our subscriptions to War Loan and War Bond issues during the year.

Advances to a subsidiary company, £804,155, show a reduction of £166,070, representing payments made to us by Tobacco Investments Limited, which payments are made in the ordinary course of our business. Cash at banks at £879,544 shows an increase of £52,186.

Turning to the liabilities side of the balance sheet, there is no change in the capital in form or in amount. Sundry creditors at £221,891 shows an increase of £180,016, due mainly to provisions for income tax and excess profits tax. Capital reserve at £119,207 shows a small increase of £2,152, accounted for principally by profit on American stocks requisitioned by the Treasury. The general reserve remains unchanged at £200,000. This brings me to the revenue account for the year, which shows a net income of £498,909 compared with £385,700 for the previous year, a reduction of £86,791. This reduction in net revenue, however, is due entirely to increased taxation.

At our meeting last year Lord Catto informed you that we were continuing our sales of the much reduced balance of shellac at greatly improved prices; this balance has been sold during the year ended October 31st.

Now as to the future—I am not brave enough to prophesy when the war will be over. I have unbounded faith in our ultimate success, but cannot foretell just when it will take place. The report and accounts were adopted.

WILLIAMS DEACON'S BANK LIMITED

STATEMENT BY THE CHAIRMAN, MR G. P. DEWHURST

In view of existing conditions, and in place of his usual annual address, the following statement has been circulated by Mr. G. P. Dewhurst, chairman of Williams Deacon's Bank Limited, to the shareholders of the bank in advance of the annual general meeting held on January 23, 1941.

From the report you will see that Colonel Sir Edward Johnson-Ferguson, who succeeded his father as a director of the bank in 1906, has decided not to seek re-election at this time, finding that fresh duties in connection with the war make attendances here increasingly difficult. To fill the vacancy thus caused we have invited Mr. Harold Slaney Kershaw to a seat on the board, and I should like in your name to offer Mr. Kershaw a very hearty welcome, feeling confident that his wide experience and knowledge of affairs will be of the utmost value to the bank.

BALANCE SHEET—LIABILITIES

Taking the figures of the balance-sheet, the striking feature on the liabilities side is an increase in our deposits of £9,231,000, or 22 per cent. in excess of the figures of last year, which in turn were a record in the history of the bank. Doubtless the incidence of the various controls and rationing by the Government of shipping, imports and exports and the home trade has been the principal factor in these larger deposits, while the considered policy of the trader and private individual alike to retain profits in his business and keep himself liquid has doubtless also had a similar effect. It is certainly more than a coincidence that the rise in our deposits practically corresponds with the increase of £3,500,000 in our holding of British Government securities through subscriptions to new war issues and the allotment to the bank of £5,500,000 of Treasury deposit receipts, the bank thus acting as a medium for the direction of public and private savings to the Government and giving proof, if it were needed, of our desire to assist the Government in its loan policy for financing the war.

Acceptances and credits opened show a decrease of £278,000 largely owing to the change in the method of financing the import of certain commodities. On the other hand, endorsements, etc., due to increased guarantees given on behalf of customers are higher by £174,000.

ASSETS

Turning now to the assets side of the sheet, our cash, balances with other banks, money at call, bills discounted and Treasury deposit receipts reach the figure of £25,600,000, and taking these five items together they amount to over 50 per cent. of our deposits, the principal increases being £1,900,000 in our cash and £5,500,000 in our Treasury deposit receipts, an item which appears for the first time. The only decrease appearing in these items is for bills discounted, which reflects the lack of commercial bills.

Regarding the advances we have, in common with other banks, to report a decrease, in our case of £1,900,000, caused mainly by changed methods of financing imports due to Government control, retention of companies' profits in their businesses and liquidation of private advances, these reductions having more than offset advance facilities granted in connection with war production and the export trade.

Bank premises account shows a reduction of £28,000, and with no branch extensions undertaken during the year it practically benefits by the full amount appropriated from the year's profit.

I feel confident that the balance-sheet figures I have outlined, which, of course, have only been arrived at after the fullest provision has been made for all weak or doubtful positions, all tend to emphasise the extreme liquidity of the bank's resources, leaving us in a position to give every assistance to our customers in financing their engagements on war production.

PROFIT AND DIVIDEND

Turning now to the figures of profit and loss, our net profit, after making the usual provisions, appears at £292,672 as

compared with £298,863, or a decrease of £6,193. This profit, with the balance of £120,125 brought forward from last year, gives us a total of £412,798 to be dealt with. After transferring £30,000 to premises account we are in a position to pay a dividend at the rate of 12½ per cent. on both our "A" and "B" shares and carry forward to next year's account £148,423 as against £120,125 brought in. If we take into account the extra burden of taxation and the difficulties under which the business of the bank has been carried on I feel we have every reason to be gratified with these results and the evidence they afford of the progress maintained during the year.

You will probably agree that at this time it is hardly appropriate to give more than this brief résumé of the bank's operations, but you may be glad to know that where damage has been incurred to our premises through enemy action the inconvenience to the public has been largely minimised through our system of duplicate records, and we have to be very thankful that so far no loss of life amongst the staff has occurred through such action.

You may also be interested to hear that 171 members of the staff are serving with H.M. Forces and in addition 14 messengers and porters and one V.A.D. from the female staff, bringing the total up to 186. Of the former I regret to say one has been reported killed and to his relatives I should like to offer our deepest sympathy.

TRIBUTE TO STAFF

And now I would wish to convey in your name our very special thanks to the staff for the magnificent way in which their work for the bank has been carried on during the year that has passed. Where one and all have done their best under the most trying circumstances I hesitate to mention the occupant of any one position in the bank, for you can as well appreciate the extra stress and responsibility that has fallen upon the executive and management as you can visualise the trials and discomforts that have been the lot of so many of our junior members. So to one and all I repeat I would like to offer our hearty thanks and keen appreciation of their loyalty and devotion to the service of the bank.

THE NATIONAL BUILDING SOCIETY

A STEADY COURSE

The ninety-first annual meeting of the National Building Society, held, on the 24th ultimo, in London, was presided over by the chairman, Mr. Stanley C. Ramsey, F.R.I.B.A.

The chairman said: For the past year the life of Britain and the Empire has been directed ever more sternly towards furthering the war effort, and in this concentration of energy building societies have played their part. Generally speaking, our policy has been one of prudent retrenchment, which has enabled us to conserve to the full the interests of our members, and to make substantial contributions, both directly and indirectly, to the cause we all have at heart.

The total of shares and deposits entrusted to us amounted to £31½ millions at the time of the balance-sheet, an amount within 1½ millions of the figure for 1939, the highest we have held at any time. Mortgages in aggregate exceeded £32½ millions, and here also the reduction from record figures was correspondingly small. A steady flow of new money still reaches the society, fresh subscriptions and deposits during the year aggregating nearly £2½ millions, a smaller figure than that to which we have grown accustomed in recent years, but nevertheless quite considerable in view of other claims upon investment funds.

The chairman, continuing, said: The enforced pause in the progressive policy of our society should not give rise to impatience, for it permits us to gather our strength in preparation for the calls which will surely be made upon our movement with the advent of peace.

The directors' report and accounts were adopted unanimously.

MARTINS BANK LIMITED

RECORD LEVEL OF DEPOSITS

FINANCING OF WAR EFFORT

MR F. A. BATES' SPEECH

The one hundred and tenth annual general meeting of members of Martins Bank Limited was held at the head office, Liverpool, on Tuesday, January 28th.

Mr. Frederic Alan Bates, chairman, presided, and in his address said:

My lords and gentlemen, may I assume that you will take as read the report and accounts which have been circulated?

It is with deep regret that we have to record the death of Sir James Readhead, Bart., a member of our North Eastern board. He died in May last after eight years of valuable service on that board. His firm have had a long association with the bank, in the affairs of which Sir James always took a keen interest. He was a man of a most likeable personality.

Lord Woolton of Liverpool, as you are aware, is now Minister of Food. On his appointment in April he resigned from the board. We congratulate him on the distinguished office he fills, but regret the loss of his collaboration and sound judgment at our board meetings.

Mr. Robert Vere Buxton, D.S.O., was appointed to the general board in November. As a member of our London board from the amalgamation of Martins Bank with the Bank of Liverpool in 1918, he has given outstanding service, and his varied experience in the city of London will be of great value on the general board.

In July last Sir William Gray, Bart., was appointed to the North Eastern board, where his wide knowledge of that area is highly appreciated by the directors generally.

THE ACCOUNTS

I now turn to the accounts. The main changes are in the deposits by our customers and in the items Treasury deposit receipts, investments and advances. These items are closely related in that they are all affected by the country's vast war effort. Our advances have been much reduced, offsetting the return upon largely increased deposits. Profits have also been affected by heavy wartime expenses and increased taxation, but, notwithstanding, we have been able to show a small increase. At £891,029, they are some £15,000 more than for the previous year. With £330,749 brought forward from a year ago, there is available for distribution £1,221,778. A dividend of 7½ per cent. was paid in July last, and it is proposed to repeat that as a final dividend for 1940, again making 15 per cent. for the year. These two dividends will absorb £624,006. From the balance, £100,000 has been transferred to the staff pension fund, and in view of the difficult times ahead we have considered it prudent to place £150,000 to reserve for future contingencies. We have carried forward £347,772, being £17,023 more than last year.

SECURITY HOLDINGS

The bank's liquid position is maintained. Cash in hand and at the Bank of England amounted to £14,317,000, that is 11.55 per cent. of our deposits, which at the record level of £123,813,000 are up by £12,893,000, while the total of our quick assets consisting of cash, money at call, balances with other banks, Treasury and other bills, and Treasury deposit receipts amounts to £41,267,000, being 33.29 per cent. of our deposits. Further, the bank's short-terms investments amount to £11,006,000.

We are taking a full share in financing the country's war requirements. Our investments stand at £45,628,000, an increase of £11,456,000 on the previous year. This increase, with our holdings of Treasury bills and Treasury deposit receipts, represents funds lent to the Government during last year. Our total holding of British Government securities, including Treasury bills and deposit receipts, is £53,173,000, a large percentage (actually 43 per cent.) of our deposits. In addition, a considerable part of our advances is given directly in connection with the production of war material. This is typical of what all the banks are doing in furtherance of the war effort.

Advances show a decrease of £7,767,000, for reasons of which you are aware. The banks are eager to lend money, and are

in a sound position to do so when the return to peace enables them to resume their normal functions.

Premises account stands at £2,845,000, an increase of £98,000. There is a decrease of £1,078,000 in our acceptances, endorsements, etc., occasioned by the reduction in foreign trade under war conditions.

STAFF

That brings me to the end of my remarks upon our accounts, and in accordance with the general desire, in present days, to curtail proceedings of this nature, I will only detain you a few moments longer. My closing words will be in appreciation of our staff, including our temporary staff, in discharging their duties in very trying circumstances. Along with many other commercial concerns, and indeed with every section of the country's life, we have suffered by enemy action, but I am glad to state not unduly anywhere, and nowhere in a degree to affect our business materially. The arrangements which were made at the outset of the war with such care to meet casualties among our offices and to avoid any interruption of banking service to the public have worked admirably. This reflects the greatest credit on the executive officers and the staff, clerical and manual, of all ranks, but it will not be regarded as invidious if I make special mention of the lady members of the staff for the way they have devoted themselves to their duties, particularly in London and our other large centres which have suffered from bombardment. Our fire watchers and the staff who look after our premises have worked untiringly, and have been the means in several instances of saving our property from serious damage. I have recently visited a number of our branches in those areas which have had to meet bombing attacks, and am proud to say that everywhere I found the spirit of the staff excellent. No effort has been spared in continuing to give our customers a high standard of service.

We have lost by death one member of the staff on civilian duties, and two members in the forces. Others are wounded, missing, or prisoners of war. To their relatives I am sure you will wish to send our deepest sympathy. We have now 607 members in the forces. Our thoughts go out to these young men. We wish them a safe return, and promise them a warm welcome when they come back to their duties in the bank at the conclusion of a victorious peace.—(Applause.)

The report and accounts were adopted.

MIDLAND BANK LIMITED

ANNUAL MEETING OF SHAREHOLDERS

The ordinary general meeting of shareholders was held on January 30th at the head office, Poultry, London, E.C.2.

The Right Hon. R. McKenna (chairman), who presided, referred to the fact that in substitution for the customary address to the meeting there had been circulated with the annual report a statement by him on the affairs of the bank during the past year. (The statement was reproduced in these columns on January 25th.) He then moved the adoption of the report of the directors and the audited statement of accounts; the motion was seconded by Mr S. Christopherson (deputy chairman), and carried.

The following resolution was moved by the chairman, seconded by Mr Christopherson, and carried unanimously:

"That the meeting records with deepest regret the death on active service of 27 members of the staff, the posting of three others as missing, and the death by enemy action of 14 civilian members of the staff; and desires to express its sense of the loss the bank has sustained and its sympathy with the relatives."

Further resolutions were adopted authorising the payment, on February 1st, of a dividend of 8 per cent. actual, less income tax, for the half-year to December 31st last; re-electing the retiring directors, Mr. Lewis H. Walters (deputy chairman) and The Right Hon. Lord Davies; and appointing Messrs Whinney, Smith and Whinney as auditors for the ensuing year.

JUTE INDUSTRIES LIMITED

STATEMENT TO THE SHAREHOLDERS BY THE CHAIRMAN

The chairman of Jute Industries Limited, Mr J. Ernest Cox, has issued a statement to shareholders, which takes the place of the usual address made by the chairman at the actual meeting, and which reads as follows:—

Your directors have decided that, in present circumstances, it is advisable that the annual meeting should be held in Dundee. The attendance is not usually large, and it seems probable that this year the numbers would be even fewer.

This statement is enclosed with the annual report, and, as no speech will be made at the meeting, the business will assume a formal character and will enable both directors and shareholders to carry out their daily tasks without undue interruption.

Since we met last year the company has sustained a severe loss in the death of one of our managing directors. Mr W. G. Fair had been associated with the jute trade throughout the whole of his business life. He was a man of great ability and foresight, qualities which he employed to the full in his consideration of the problems which confront one in a position such as his. His genial disposition and his keenness will be much missed by his colleagues on the board.

You will not expect me to enter into details in my remarks this year. The country is at war, and, as a consequence, the wheels of industry cannot be expected to function as they were wont to do in times of peace. Every trade has its own particular difficulties, and it is not, in my view, necessary for a board of directors to draw attention to them, but rather to exercise their thoughts and aims in the direction of making the best of what must be, and in endeavouring to surmount them in so far as is humanly possible.

Of our partners in this trade—agents, managers, office staff, both at home and abroad, and the workers in our mills and factories, I would, however, like to speak and to offer them on our, and your, behalf, and on the nation's account likewise, unstinted appreciation and thanks for the cheerful manner in which they have faced conditions of work which are strange, and which, in peace time, would be considered uncongenial. One and all have displayed a desire to accommodate themselves to the changed conditions, irrespective of personal feelings.

Production during the past year has not been so great as in the previous period, and this was more evident in the latter months of our financial year. The hindrance to our trade continues to emanate from the import of Calcutta-made goods, to which I have made repeated references, and from which no relief is as yet in sight. Considerable anxiety is expressed by the trade as to the relationship which imports of cloth bear to those of raw jute, and it would seem that, at a time when conservation of shipping space is necessary, preference might advantageously be given to the latter on which employment of British labour depends. Representations have been made in the appropriate quarter which it is hoped will meet with a sympathetic reaction and result in an increased supply of basic war material.

On the accounts I would merely say that the net result is better than last year, and, had it not been for the necessity of making provision for the heavy increase in taxation, would have been considerably larger. From the profit of £128,247 we have deducted the usual sum of £55,000 for depreciation and obsolescence, and have made a further contribution for aid-raid shelters of £5,500. There has also been provided £5,000 to write down the book cost of our holding in the Camperdown Pressing Company Limited in Calcutta, and £20,000 has been transferred to contingent fund.

The Camperdown Pressing Company, as its name denotes, presspacked bales of raw jute for export. For some years it has been increasingly difficult to secure balers, and latterly the rates obtainable for packing the material have become unremunerative. With a surplus of presshouses in Calcutta, and a decreased demand for export, it seemed highly probable that, for some years at least, it would be difficult to meet overhead charges, while the more distant future did not appear to offer any

certainty of more profitable times. When, therefore, a prospective tenant, in an entirely different line of business, approached the company with a view to leasing the buildings, negotiations were entered into and finally a ten years' lease was concluded. We hold slightly more than half the shares in the company, and I am afraid that we cannot expect to receive a dividend for some time, as a debit at profit and loss account must first be eliminated. We are, at any rate, assured that this debt will not be increased, and in time the company should again become a profit-earning concern.

The transfer to contingent fund is, in our opinion, a provision which it is wise to make at this time. We have made, what we believe to be, adequate provision for all liabilities which are known to us, but you will realise that unforeseen changes—sometimes retrospective in their application—are apt to arise, and, as we have so far been unable to set up any reserve fund, it seems appropriate and wise that we should take this opportunity of making a provision of this kind.

After all these deductions, there remains, including the amount brought into the accounts from last year, a sum of £73,292 17s. 5d., out of which we recommend a dividend on the preference shares of 4 per cent., less income tax at 8s. 5½d. in the £, after payment of which the balance amounting to £40,667 17s. 5d. is carried into the new account. There may be disappointment that we have not suggested an increased dividend, but there are cogent reasons why we should conserve our resources until the outlook is clearer. It seems certain that, in the financial year now running, our output will be considerably less than in the last year, and the consequent smaller production will require to carry a larger share of overhead expenses. Wages have risen considerably. Since July, 1939, the Trade Board has granted substantial increases on three occasions. The cost of materials, other than jute, which enters into our manufacture had advanced appreciably, while commodity insurance, extended scales of compensation in cases of accident, and practically every other item, have shown an upward tendency.

I would refer in particular to the advance in wages as affording a danger signal to the trade of the future, when viewed in relations to the scales in force in Calcutta. I trust that in making this statement I shall not be misunderstood. I realise that it is in the interest of industry and the workers alike that the highest wage which circumstances permit should be paid, but, so far as I am aware, there have been no increases granted to mill operatives in India, and consequently the gap between our costs and theirs, which was sufficiently serious pre-war, has been further widened. The inference therefore is that, unless the home market is to be reserved for the products of the hands and industry of our home workers when normal times return, the outlook for our trade has not improved. We have repeatedly pleaded our cause with Government officials, and I fear that you will tire of my renewed reference to this fact. We have received sympathy, but we cannot live on sympathy alone, and, unless it is translated into some tangible action, our furrow will be deep and difficult.

As mentioned in the report, the volume of our export trade has been reduced by the enemy occupation of European countries, but I am glad to be in a position to state that our trade with Empire countries and the United States of America is still satisfactory.

The export group which has been formed for the industry will, we hope, bring trade to this city, and we trust that it will be possible to keep any new connections thus made. It will certainly be our endeavour to do so.

It is clearly impossible to venture any forecast, but one can at least hope that before we meet again next year many, if not all, of our difficulties may have become memories.

Our buildings, plant and machinery, have been maintained in excellent repair, and whenever demand improves, we are fully prepared and ready to meet it. A small amount of new machinery has been installed during the year, but any further additions must necessarily lie in abeyance meantime.

TURNER AND NEWALL LIMITED

MAXIMUM HELP TO NATIONAL EFFORT

PROPERTIES AND PLANT IN HIGHEST STATE OF EFFICIENCY

DEVELOPMENT OF EMPIRE AND SOUTH AMERICAN MARKETS

SIR SAMUEL TURNER'S REVIEW OF YEAR'S OPERATIONS

The annual general meeting of Turner and Newall Limited was held on January 24th in Manchester, Sir Samuel Turner, the chairman of the company, presiding. The secretary, Mr. John L. Collins, read the notice convening the meeting and the report of the auditors, Messrs. Deloitte, Plender, Griffiths and Co.

The chairman dealt with the accounts at some length, as usual, and then explained that under present conditions it was undesirable for him to attempt to go into detail with regard to the nature of the company's present operations in this country; he would therefore only give a very much curtailed review of the company's activities at home and abroad.

PROGRESS OF MANUFACTURING COMPANIES

After referring to the mining companies in South Africa and Canada, and mentioning that while they had produced to capacity during the whole of the financial year under review, production as from October 1, 1940, has had to be somewhat curtailed consequent on the closing of certain markets on the continent of Europe, the chairman dealt with the manufacturing companies situated in the United Kingdom, and said:—

Turner Brothers Asbestos Company, Limited, have had a busy year, and general sales development work has continued to the fullest extent possible under present conditions. This applies not only to Asbestos Textiles but also to the rubber belting products which they manufacture, and the new "V" type rubber belting has made significant progress.

J. W. Roberts, Limited, have, of course, felt the loss of European markets in connection with sales of their speciality "Limpet" sprayed asbestos, but the other sections of their business remain in full activity.

Ferodo, Limited, during the year under review, have naturally experienced a reduction in the demand for their products from the replacement section of the brakelining trade, owing to the present restrictions on private motoring. At the same time, however, increased demand for equipment purposes has been sufficient to offset this reduction. Sales of "Ferogrip" fan belts have steadily increased during the year, and this new department is now contributing substantially to the success of the business.

Turners Asbestos Cement Company have been fully occupied during the past year, as the demand for their products has been stimulated by present conditions. You will appreciate that their products, which are suitable for numerous constructional purposes, are likely to continue in considerable demand for some time to come.

The Washington Chemical Company has during the past year been employed at full capacity in the production of all its standard products based on carbonate of magnesia.

Newalls Insulation Company have also been very fully occupied on contract work and have experienced some difficulty in obtaining the necessary supply of skilled labour. Steps, however, have been taken to establish special training facilities to deal with this problem.

EXPORT TRADE DIFFICULTIES

All our manufacturing companies operating in the United Kingdom have naturally been somewhat handicapped in their export activities by the closing of the majority of the European markets. In every case, however, active steps have been taken to replace these lost export markets by others, and I am glad to be able to tell you that during the year under review the total of the export business obtained by the group was greater than that obtained during the previous year. You will appreciate, however, that the closing of the majority of the European markets was not fully effective during the whole year

in question, and the loss of export trade to Europe will therefore probably be felt to a greater extent during the ensuing year. We have, however, undertaken an active campaign to develop Empire and South American markets and we have every hope that this will be successful in minimising the effect of the loss of European business.

The chairman next referred to the manufacturing companies situated abroad, namely, Keasbey and Mattison Company, Ferodo and Asbestos Incorporated, and Asbestos Cement, Limited, and the progress made by them during the year, and then continued as follows:—

The pension scheme of the group has now completed its fourth year and is operating very satisfactorily. So far as the Robert Turner fund is concerned, you will have noted that the directors again recommend the contribution of £10,000 to the Turner and Newall Welfare Trust Limited for account of the trustees of this fund, which is being steadily built up in order that the means may be available to deal with exceptional cases not covered by the pension scheme itself. I informed you last year that the total cost to the group of pension fund contributions and the holidays with pay scheme amounted to £91,000. For the year ended September 30, 1940, the comparative figure was £94,500.

AIR RAID PRECAUTIONS

A complete financial year under conditions of actual war has necessarily involved substantial additional expenditure in connection with air raid precautions of various kinds. Up to September 30, 1939, £65,826 had been expended in connection with the provision of shelters for employees and certain other precautionary measures. During the year under review a further £51,390 has been incurred on the extension of these measures, including revision of some of the black-out arrangements in order to give the maximum amount of daylight in our factories during normal working hours, extra provision for the protection of vital plant, and, as a result of the adoption of the policy of working during "alert" periods until danger is imminent, the provision of extra shelter accommodation in closer proximity to the actual places in which work is carried on.

Before leaving the subject of air raid precautions, I am sure stockholders would like to know that at the suggestion of certain of our employees it was decided to open a Fighter Aeroplane Fund, and to invite contributions from the directors, managers, staff and workpeople of this company and its subsidiary companies in this country. As a result of very gratifying contributions, which were supplemented by the company, we were able to send to the Minister of Aircraft Production a cheque for £15,000 for the purchase of fighter aeroplanes.

TAXATION AND PROFIT DISTRIBUTION

In recommending a dividend of 15 per cent. for the year on the ordinary stock, your directors are conscious of the disparity between the total profits earned and the amount distributed in ordinary dividend. You will realise, of course, that the one overwhelming reason for this is taxation. While the gross amount of the ordinary dividend recommended for the year represents 8s. for each £1 ordinary stock unit, the taxation liability of the company necessitates the provision of an amount equal to 8s. 6d. per unit, and this in spite of an excess profits standard which is reasonably favourable to the company. I am sure, however, that the ordinary stockholders will be glad that the company is in a position to make this contribution to the National Exchequer, and at the same time distribute a reasonable dividend to its stockholders.

In the conditions which obtain to-day, and which are likely to obtain for some considerable time to come, you will readily understand that it is impossible for me to make any forecast

of the immediate future. Your directors remain satisfied that the policy which I outlined to you last year is the appropriate one in the circumstances, and every effort is being made to contribute the maximum possible to the national effort, without reference to the prospect of immediate reward.

At the same time, all the necessary steps are being taken to maintain your company's properties and plants in the highest possible state of efficiency, and research work, far from being neglected, is being intensified.

POST-WAR PROSPECTS

The future may contain difficulties which we cannot at present foresee, but you may be assured that your board's policy of constant vigilance is not being, and will not be, relaxed in any way, and we remain confident that when the present war has been satisfactorily terminated, your company will emerge in a condition of health and strength, and be capable of resuming its forward policy and retaining its place as one of the foremost organisations in the world devoted to mining, manufacturing and the distribution of asbestos, magnesia and allied products.

In conclusion, may I once more, on behalf of the board and on your behalf, express to the officials and employees of our various businesses at home and abroad, our thanks for their continued efforts, often under extreme difficulties, and assure them that we have every confidence that they will continue to render the efficient and loyal service which has played so large a part in making the Turner and Newall Limited organisation one in which we can all have pride?

The usual resolutions were then passed, approving and adopting the directors' report, the accounts for the year to September 30, 1940, and the balance-sheet as at that date, and authorising the payment of the ordinary dividend of 1½ per cent., making 15 per cent. for the year, subject to income tax, following which Mr R. Starkey, one of the retiring directors, was re-elected a director of the company, Mr C. S. Bell, the other retiring director (having reached the normal age of retirement) not offering himself for re-election.

Messrs Deloitte, Plender, Griffiths and Co., chartered accountants, were reappointed as auditors for the current year.

APEX (TRINIDAD) OILFIELDS, LIMITED

BURDEN OF TAXATION

The twenty-first ordinary general meeting of Apex (Trinidad) Oilfields, Limited, was held, on the 28th ultimo, in London. Mr Walter MacLachlan (the chairman) said that the net profit was £393,617, as compared with £256,049. It had been necessary to reserve £190,000 against taxation in the United Kingdom and Trinidad, as compared with £80,464, and £30,000 had been transferred to general reserve, increasing it to £400,000. The directors now recommended a final dividend of 17½ per cent., less British income tax at 5s. 3d. in the pound, making a total of 30 per cent. for the year.

Shareholders would be interested to know some facts as to the extent to which they in the Trinidad oil industry were contributing towards the nation's financial requirements. Out of the past year's profits of the three companies whose accounts had recently been published, including this company, no less than £1,544,000 was appropriated to taxation and the special levy placed by the Trinidad Government on oil production, whereas the dividends receivable by the shareholders totalled £363,000, of which no doubt a substantial part was also liable to surtax. In other words, the ratio of the division of the profits distributed between the State and the shareholders, without taking any account of surtax, was the State 16s. 2d. in the pound, the shareholders 8s. 10d. in the pound. At the same time, he desired to point out that excess profits tax at 100 per cent., the wisdom of which was now generally doubted, bore with particular severity on a company operating such wasting assets as oil wells, and especially since the requirements of the Government were the factors which now determined the rate at which such assets were exhausted.

As to prospects for the current year, the present trend of prices appeared to be below that of the past year. He could assure shareholders, however, that all the operations on the company's property had made good progress, that their results had continued to prove successful, and that the condition of the property was in every respect satisfactory.

The report was unanimously adopted.

Shorter Comments

This Week's Company Results.

Despite a slight fall in the gross and net income of DEBENTURE CORPORATION, the latter from £112,414 to £100,591, the ordinary dividend is maintained at 10 per cent. The gross income of HENEKEYS is slightly higher at £66,511 against £65,326, but the dividend is reduced from 16.8 to 15.52 per cent. in view of a small decline in net earnings. E. G. BROWN & CO., sheet metal workers, have realised an increase in gross profits from £118,328 to £301,223 but net income declined from £48,520 to £45,666. The 25 per cent. ordinary dividend is repeated. WESTINGHOUSE BRAKE earned a substantial improvement in both gross and net profits which have risen from £91,932 to £162,573 and from £83,932 to £141,488 respectively. The 10 per cent. dividend is paid as before. LOTUS LTD., shoe manufacturers, have raised the ordinary dividend from 7 to 9 per cent. Gross earnings are up by over £50,000 to £149,054 and net income from £51,446 to £65,311. Despite a jump in total profits from £67,494 to £91,984, a rise in E.P.T. liability from £13,000 to £41,358 is responsible for a decline in net earnings of R. B. PULLIN from £33,230 to £25,580. Consequently, the 25 per cent. ordinary dividend is reduced to 20 per cent. The improvement in earnings of KAPALA (MALAY) is even more substantial than that of the majority of rubber companies for 1939/40. With gross profits of £50,453 against £19,133 and net income of £28,809 against £12,211, the ordinary capital receives 10 per cent. against nil. Despite a well maintained gross income at £59,733, FINLAY & CO. suffered a moderate setback in net profits from £34,587 to £24,733 and the dividend is reduced from 14 to 10 per cent.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended January 25th, 1941, total ordinary revenue was £62,170,000, against ordinary expenditure of £84,786,000 and issues to sinking funds of £145,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £2,071,396,000, against £633,132,000 (including defence loan issues) for the corresponding period a year ago.

(d) Including import duty and delivery charges.

(e) Average weeks ended Jan. 18th and Jan. 25th.

EXCHANGE RATES (Monthly Tables)

CENTRAL AND SOUTH AMERICA

Following rates, issued by Bank of London and South America, are related to U.S. \$, except for Bolivia and Paraguay; approximate sterling rates can be calculated from \$-£ rate.

Bolivia.* Sight selling rate 143.42 bolivianos per £, Oct. 11, 1940.

Colombia.* Sight selling rate 175.50 pesos per 100 U.S. \$, Oct. 16, 1940, for holders of permits buying in the "open" market.

Ecuador.* Sight selling rate 15.40 sucres per U.S. \$, Oct. 25, 1940.

Guatemala.* Sight selling rate maintained at one quetzal per U.S. \$, less commission of 1 per cent. to Central Bank.

Nicaragua.* Sight selling rate for payment of imports fixed at 5.522 cordobas per U.S. \$ (incl. 10 per cent. tax and 1 per cent. comm.), June 9, 1938.

Paraguay.* Sight selling rate 80.25 Paraguayan pesos per Argentine "free" paper peso, Oct. 18, 1940.

El Salvador.* Sight selling rate New York 3-15 colones per \$, Oct. 26, 1940.

Venezuela.* Sight selling rate New York 3-15 bolivares per U.S. \$ since April 27, 1937.

* Exchange controls are operative in these countries.

LETTER TO THE EDITOR

Irish Neutrality	180
------------------	-----

Look to Your Moat

THIS is the open season for Nazi menaces. By every channel that Goebbels' ingenuity can devise the threats are being uttered. The barges are ready in the Danube and in the French ports; the Stukas are waiting in Sicily and along the whole Continental coast; the bombers are being loaded up; the submarines are being fuelled; the poison gas tubes rolled out; the invading divisions paraded. It is the most deadly Armada the world has ever known, and its size and weight are daily being magnified by rumour and report, by artful suggestion and "neutral" comment. Hitler's speech to the Reichstag last week was a distillation of the whole concentrate of envy, hatred and malice. There will be no moderation or reticence in the blows that he has in store for us this year. He knows that 1941 may well be his last chance to win the war. We can be sure that he will stop at no the devilry, that he will set no limits to the scope of the slaughter or to the magnitude of the resources he will throw into the attack. There will be no mercy for any of us in the onslaught—and still less if it should succeed.

It is as well that this should be realised. After the miracles of 1940, it was only natural that some grateful illusions should be cherished, and there were those in October and November who allowed themselves to think that the worst was passed, that the famous corner had once more been turned. It is Mr Churchill's greatness as a leader that, just as he never abandoned his hopeful confidence in the summer, he has never relaxed his vigilant warnings during the autumn and winter. Causes for rejoicing have been many: the brilliant offensives in Africa; the astonishing changes in American opinion and policy; the defeat of the day bomber. But these gains have been sideshows, or hopes for the future, or avoidances of disaster that might have been. None of them affects the prospect that, for many dreary months to come, we shall

remain on the defensive. Each of them swells the hope of ultimate victory; none of them alters the fact that we can lose the war in 1941.

To the nation that kept its head all through 1940, there is nothing in this prospect to appal, but there is much that calls for resolution from the many and for clarity of vision from the few. There are two places where the war might be lost this year—the invasion beaches and the trade routes of the North Atlantic. In the war on shipping Hitler has already promised to do his worst; the chances of invasion rest on his generals' estimate of the risks—and perhaps on his own desperation. But whether they come or not, these are the two dangers. There are many ways of winning the war, but only these two of losing it outright. Let us, then, not neglect any of the multitudinous tasks of preparing the victory and planning the peace—but let us fix our most watchful attention on the seas and the coasts. Once again, as in many past years, the watchword must be Halifax the Trimmer's: "Look to your Moat."

It is a high duty and privilege that fall to the British people this year. No one can help us very much. We shall get planes from America, perhaps some ships; but the flood of American material will not begin to be ready until the battle of 1941 has been won and lost. Civilisation has only one champion this year, and for the contest of the spring almost all the cards are already on the table. The people of Britain must—and do—have confidence in the leaders who will have to play the hand, and there will be no hesitating or complaining among any whose orders are to throw away their tricks so that the game may be won.

The Shakespeare Cliff and the seaways of the ocean—these are the bastions that must be held. They are symbols of the strength, the spirit and the wide freedom for which Britain has always stood, and will always stand, in the world.

ECONOMIST BINDING CASES

Attractive binders to hold three months' issues of *The Economist* are still available.

These binders have no wires, clips or metal contrivances, so that each issue can be bound in an instant for permanent reference.

Reading Cases to hold two issues, and made on similar lines, are also available.

Both are bound in full cloth (blue) and lettered in gilt.

The price of the Binder is 5s. 6d. post free (Overseas 6s. 6d.) and of the Reading Case 4s. post free (Overseas 4s. 6d.)

Lares and Penates

AMONG the many assaults which the enemy has made upon civilian life and property, the damage sustained by personal chattels is neither the most devastating nor the most vital. None the less, the elementary accessories of living—pots and pans, beds and tables—have an important if indirect influence on work and output, and their destruction on a large scale must to some extent hamper the national war effort. The most outstanding fact about the total loss of these household possessions is that either they must be replaced or their losers must find a new way of living. The immediate official solution, described in the pamphlet issued by the Ministry of Home Security, "After the Raid," is to encourage the benighted persons to find lodging with neighbours or, failing this, to apply to a Government rest centre until arrangements can be completed for billeting or evacuation. This scheme meets the immediate need for accommodation; but it also raises a number of social problems, if it is proposed as anything more than a temporary measure. In the long run certainly, and in the short run probably, the aim of ninety-nine bombed-out persons out of a hundred is to replace their household belongings and to carry on as before. Lodgings and billets are not home—which is more a question of efficient living than just of sentiment; and to forbid replacement would raise more social difficulties than the economic problems which might thereby be solved.

From the more general standpoint of war economy, this general desire to replace goods lost in air raids does, however, set a serious problem. As stocks of furniture, linen, crockery and cutlery, not to mention clothing, become exhausted, the replacement *en bloc* of the ordinary adjuncts of living for thousands of unfortunate persons will cease to be compatible with the concentration of productive forces on the output of munitions. There is, rightly, little possibility that labour and materials will be deflected from their task of equipping the armed forces, and it must be expected that personal and household chattels of all sorts will become exceedingly scarce.

In consequence, it will become more and more important that the task of distributing such supplies as do find their way into the shops should no longer be left simply to chance and the somewhat maimed operation of supply and demand. Most of the goods needed to re-equip homes and hostels are, of course, already within the scope of the official orders which sharply limit supplies to manufacturers producing for consumption purposes. Office equipment, too, falls into the same class: the output of typewriters is limited to 25 per cent. of output in the six months ended May 31, 1940; secondhand machines are practically unprocureable; and the purchase of new machines by City firms whose office equipment was destroyed in the London fire on December 29th has been a matter of extreme difficulty. The restriction is inescapable; but it is obviously undesirable that these firms should be deprived of typewriters they cannot do without, because machines have been acquired by firms for whom they are not an imperative necessity. In the same way, there is a case for preventing the purchase of household goods except by persons who can show good cause: those who have been bombed out; or, as in Germany, persons about to marry and set up a new home, or those who are expanding an existing home to keep pace with an increasing family. In all these cases, distribution could be simply regulated by the issue of special permits to buy. The fact is that some control of retail distribution for those articles whose production and wholesale distribution are already regulated by the Government is essential in every case where it is important to ensure that real needs are satisfied.

Where a reasonable proportion of furniture can be salvaged from the wreckage, there is obviously a strong case for replacing only the most essential losses. Most households could carry on their existing method of life without a considerable proportion of their existing possessions and *bric-à-brac*—the grandfather clocks, the pictures on the walls and the umbrella stands; but probably very few of the people who have suffered from bombing realise that it is a national duty to live without these treasures until the war is over. The general impulse—among those who can afford it—is to replace most things while present stocks last, and, for many, replacement is made possible by higher money wages. It is this consideration, too, which underlines the true iniquity of outbreaks of looting. This wartime crime—burglary in bombed premises—is subject to penalties which, for the English legal system, are unusually severe—primarily, no doubt, because of the exceptional opportunity which air raids provide for the disturbance of public order by desperate characters. But, from the economic and financial standpoint as well, looting must have very grave consequences. By exacerbating the shortage of domestic goods and increasing the general pressure to replace them, it clearly places an enhanced strain on the system of production and distribution for civilian needs, and it powerfully raises the propensity to spend instead of save.

Indeed, in a system where production is controlled, the effect of these fortuitous purchases is most marked in the monetary sphere. If the damage is voluntarily insured under the Government's war damage scheme, compensation will be delayed until the end of the war, and funds for replacement now have to be found from the individual's current resources; and this means, not only that the German bombers have been responsible for an important and undesirable increase in the demand for consumption goods, but also that they have caused past savings to be realised. Moreover, it is probable that loss from enemy action is one of the most important deterrents to saving; in technical language, the velocity of the circulation of money is increased just when it is least desirable. If economic loss is not to be added to social loss, the public must be urged, not only not to realise their investments or to spend insurance moneys, but also not to acquire new household possessions, except in cases of the most unmistakable necessity.

The pill can be sugared in a number of ways. The voluntary principle could be called in to inspire the collection of freewill offerings of chairs and tables from those who have them, for sale at nominal prices to those who have not—the proceeds being donated to Lord Beaverbrook or some other deserving object. Again, it might be pointed out in, say, the advertisement columns of the daily and weekly Press that replacement, so long as danger from the air continues, runs the risk of second loss, while new or continued lending to the Government lays up treasure for the future, when the absorption of post-war unemployment will become a national necessity. And for those who must buy, let them buy in moderation and with the knowledge that dwindling supplies are not exposed to the competition of frivolous or hoarding purchases.

This problem of the household's goods and goods is only one aspect of the complexity of monetary and production policy in time of war. But it is a very practical problem, and its timely exposition by the authorities might prevent an irritating and wasteful muddle. If, before the comparative lull of the winter months comes to an end, the public could be advised about the course to follow when replacing their homes, there would be much less danger of an acute scramble for goods when a new air offensive begins, accompanied by sharply rising prices and a decline in the total of national savings.

Emergency Powers

MEMORIES of D.O.R.A. were fresh enough for the passing of the Emergency Powers (Defence) Act on August 24, 1939, to be taken as a matter of course. Yet, though the object of both Acts was the same—to confer extraordinary powers on the Executive for the prosecution of the war—there are several important differences both in the statutes themselves and in the defence regulations which spring from them.

By the first D.O.R.A., the King in Council was empowered to issue regulations for securing the public safety and the defence of the realm; and provision was made for the trial by courts-martial of offenders against certain of the regulations; most of these were concerned with the requisition of property for military purposes, and espionage. Not until November 27, 1914, was any attempt made to depart from the military aspect of defence. Then, the Defence of the Realm Consolidation Act allowed regulations to be made enabling the Army Council and the Admiralty to requisition munition factories or their output. This D.O.R.A. was supplemented by two amending Acts of 1915: the first allowing a civilian British subject the right to trial by jury—though this right could be suspended in the event of a special military emergency; the other, which was supplemented by the Munitions of War Act of 1915, extending the earlier provisions regarding munition factories to all factories, and conferring powers for supervising and restricting work with the object of increasing the production of war materials—the economic front had won recognition for the first time.

In many respects, the first Emergency Powers (Defence) Act of this war began where D.O.R.A. left off. Authorisation is given for regulations to be made "for securing the public safety, the defence of the realm, the maintenance of public order and the efficient prosecution of any war . . . and for maintaining supplies and services essential to the life of the community." There remained, however, two big qualifications on the powers which the Government could exercise. It was expressly stated that no authorisation was given for the imposition of any form of compulsory naval, military or air force service, which was covered by the National Service (Armed Forces) Act, or any form of industrial conscription; or for the making of provision for the trial by courts-martial of civilian persons.

Soon after the invasion of the Low Countries, the first of these qualifications was removed. The first measure to be introduced by Mr. Churchill's Government was the Emergency Powers (Defence) Act, 1940, which provides that defence regulations may be made "requiring persons to place themselves, their services and their property at the disposal of His Majesty" for war purposes. By this short Act, all limitations on the Government's power to mobilise the country's resources in men and materials were removed. What legislation could do to win a total war it had done.

The clause in the 1939 Act, specifying that there should be no courts-martial, has not been affected. But last summer, when invasion appeared more than a possibility, the Emergency Powers (Defence) (No. 2) Act, 1940, was passed, which allows defence regulations to be made providing for the trial of offenders by special courts. It carefully specifies that the courts in question are not courts-martial. On the other hand, if they are set up, they are to be used for the trial of any offenders; their object is to expedite criminal justice in an urgent military emergency. The courts-martial of D.O.R.A. were for the trial of offenders against the defence regulations only.

Regulation 1 of D.O.R.A. said that "the ordinary avocations of life and the enjoyment of property will be interfered with as little as may be permitted . . . and ordinary civil offences will be dealt with by the

civil tribunals in the ordinary course of law." Business As Usual was, thus, legally blessed. Since this time, with the exception of the ban on courts-martial, there has been no such attempt to qualify the totality of the emergency powers granted to the Executive, many of the defence regulations go much farther than those of 1914-18. There is little practical difference in those relating to the defence of the realm proper, but, in the group of regulations allowing the mobilisation of resources, the present ones are much more sweeping. Under D.O.R.A., regulations were made authorising the Government to take possession of factories or plant, and to require work to be carried on under its directions. But, whereas last time there was power to restrict, but not compel, employment, the present Regulations 54C, 55 and 58 A between them authorise the use of compulsion, both on undertakings to employ persons and on persons themselves to be employed.

Another difference can be seen in the financial side of the economic front. In the last war, regulations empowering the Government to mobilise foreign assets and to prohibit the transfer of funds abroad were not made until the war was half over, and at no time was there a ban on capital issues in the United Kingdom. This time, a separate body of regulations, the Defence (Finance) Regulations, were issued under the Emergency Powers Act as early as August 25, 1939, which, with considerable later amendments, give the Treasury complete control over the foreign exchange and capital markets, and power to requisition gold and foreign assets.

Like the economic front, the home front has won far more legal recognition in the present war than in the last. It is true that D.O.R.A.'s regulations provided for power to detain suspected persons and to prevent the spread of false reports. But in this war the home front regulations are much wider and at the same time more specific. For instance, Regulation 18B, which allows the detention of certain persons without trial, originally gave as grounds for the detention order reasonable cause for belief that the suspected person was of hostile origin or associations, or concerned in acts prejudicial to the public safety or the defence of the realm—grounds similar to those of Regulation 14B of D.O.R.A. But an amendment of May, 1940, gave, as an additional ground, membership of an organisation subject to foreign influence or control, or controlled by persons associated, or in sympathy, with the system of government of an enemy power, the latter part of which was specifically directed at the British Union of Fascists.

Then there is the notorious Regulation 39BA, which makes it an offence to spread reports likely to cause alarm or despondency. The early regulations of D.O.R.A. did, it is true, couple alarm with disaffection; but alarm disappeared in the Consolidation Act, and the final version of Regulation 27 forbade the spread of false reports, and reports likely to cause disaffection, to prejudice foreign relations or the successful prosecution of the war, or to undermine confidence in the nation's currency or finances.

Another interesting contrast is in the treatment of the Press. Last time, insofar as public order and morale were concerned, the restrictions on newspapers were confined to this Regulation 27, which affected everybody. But, under the present regulations, the Press has not only to take care, along with the general public, against causing alarm and despondency and publishing prejudicial reports, it also has a regulation all to itself. By Regulation 2C, if it appears to the Home Secretary that a person is concerned in the systematic publication of matter calculated to foment opposition to the prosecution to a successful issue of the war, he can warn the person concerned, who is liable to prosecution if he persists in the offence. But

under Regulation 2D, if there is systematic publication of similar matter by a newspaper the Home Secretary can, without warning, prohibit any further issues of the newspaper in question. And there is no appeal from his decision.

The prominence thus given to the Home Secretary is repeated in other regulations, and is, perhaps, partly a consequence of the importance allotted to the home front. In the last war the regulations which gave him the initiative were mostly routine ones, such as black-out restrictions or ordering early closing. Under others, such as the power to detain, or to restrict the movement of suspected persons in certain areas, either he acted on the recommendation of the military or naval authorities or they themselves were given the necessary powers—another example of the much more military character of D.O.R.A. Now, however, a person may be detained under Regulation 18B if the Home Secretary "has reasonable cause to believe . . .", and an affidavit that he had reasonable cause has been held by the Court to be a good answer to an application for a writ of *habeas corpus*. "If it appears" to him; if he "is satisfied"; "if, in his opinion"—these phrases permeate the home front regulations. Last time it was "the competent naval or military authority may by order . . ." which was the theme song.

Moreover, in this war it is to civilians, in the persons of the Regional Commissioners, that extraordinary powers can be delegated for quasi-military purposes. By Regulation 16A the Minister of Home Security can declare certain areas to be defence areas, in which persons have to obey the directions of the Regional Commissioner. By Regulation 18BB the Commissioners can be empowered to detain suspects pending the consideration of a detention order by the Home Secretary. And, by Regulation 84A, they can, if the military situation demands it, be empowered to make bye-laws—local defence regulations—for any of the purposes authorised by the Emergency Powers Acts of 1939 and 1940, though such bye-laws must have, if possible the prior, and in any case the eventual, approval of the Minister of Home Security.

Obviously, many of all these powers would only be used in a time of extreme military urgency and, in practice, after consultation with the military authorities. As it is, they remain largely in abeyance. It is true that over a thousand persons have been detained

under Regulation 18B, and the *Daily Worker* and the *Week* have been suppressed, under Regulation 2D, at a time when the military situation is, to say the least, no worse than it has ever been; but there has been no attempt to stifle genuine criticism, whether in the Press or among the public, or to persecute pacifists, and, except in the first defence areas, the Regional Commissioners have kept to their original functions of co-ordinating A.R.P. Although, too, there is little or no judicial check upon some of the powers, Parliament has shown itself ready to pounce upon any abuse. It cannot amend a regulation; it can only reject the whole Order-in-Council containing it if a prayer to that effect is moved within twenty-eight Parliamentary days of its being laid before the House. But it is enough to recall the uproar over the first "alarm and despondency" sentences and the fierce struggle over the second Emergency Powers Act of 1940 to show that in practice a very real check exists.

But Parliament is more than a policeman keeping watch on the Executive, and there is a strong contrast between its attitude towards the emergency powers granted for the home front and those for the economic front. The Home Secretary's powers are wide, but they are negative—they are concerned mainly with prevention. The Minister of Labour, on the other hand, has positive powers to further the war effort, powers which have never before been granted by Parliament—the right, under Regulation 58A, to compel the services of any citizen, man, woman, or child, for any purpose. Yet it is not Parliament but the Government itself which has been worried by this regulation. No sooner had its enabling Act, the Emergency Powers Act of last May, passed into law than it was soft-pedalled, and Mr. Greenwood said later that the Minister of Labour "has far greater powers than he ever contemplated using"—an attitude to which Mr. Bevin has, until now, faithfully adhered. It appears, in fact, that for the Government the Act was merely a political gesture. From recent debates in the House of Commons, however, it is quite clear that Parliament placed a different interpretation upon it and intended it to be the means of an all-out policy to win the war. There is no judicial check upon an Executive which acts *infra vires*. But Parliament can hold a Minister guilty of a breach of trust, not only for abusing or misusing his powers, but also for not using them at all.

NOTES OF THE WEEK

Hitler and Pétain

For some weeks Marshal Pétain received no reply to the letter he sent to Hitler at Christmastime, outlining his views on the Armistice and on the extent of the collaboration which was permissible according to its terms. For economic co-operation he was ready. Hitler's views of France as an agricultural colony of the Reich fitted in well enough with the Marshal's *mystique* of redemption through suffering and subsistence farming. And France's economic plight has been—and still is—desperate enough to warrant co-operation on almost any terms. But military collaboration in the form Hitler demands—bases in the Colonial Empire and German use of French naval bases and the French Fleet in the "defence" of the colonial empire against Britain—is excluded by the terms of the Armistice in which the French colonies were left intact though demobilized, and a guarantee was given that the French Fleet would not be used against France's former allies. The terms of the Armistice were left so unsatisfactory from the German standpoint, because they were a bait to catch the French Generals and were based on the confident certainty of a British collapse. Now—with Marshal Pétain placing himself *au pied de la lettre*—they are very inconvenient. If Hitler is to help the Duce effectively in the Mediterranean, French bases, particularly the fine naval base at Bizerta, and the use of the French Fleet to coop up the British Navy in the Eastern basin would be invaluable.

Of the men of Vichy, past and present, only Laval is prepared for complete subservience. So the drama of the last week has revolved around his unpleasing personality. There have been great comings and goings—Abetz and Brinon between Paris and Berlin, Darlan between Paris and Vichy—and from the diplomatic journeys two points emerge, that Hitler is attempting to force Laval back into the Vichy régime, and that the Marshal is adamant in his refusal to accept military "co-operation." The balance of power is still roughly the same. Hitler's hand includes the cards of two million French prisoners of war, France's economic straits, the disaffection in Paris now canalized in the Nazi-organised *Rassemblement national populaire*. But Pétain still appears to hold the trumps of Britain's continued resistance, the undefeated French Colonies, and the watchful presence there of General Weygand. The most likely outcome is the return of Laval, combined with continued non-co-operation, in any case a sorry and distasteful business.

The African Battlefront

The Imperial forces in Africa have another week of successes to record. On all the fronts of this vast battlefield—Derna is over 1,500 miles from Kassala, and from Kassala on to El Wak is another 1,000—the Italians are

giving ground. On some fronts they are not only losing territory but thousands of prisoners, supplies and war material as well. Derna fell on January 30th, and a stand was expected in the rocky country behind the town, but after a brief encounter the British advance swept on to take Cyrene, which lies only some 50 miles from Barce, the terminus of the railway to Benghazi, the capital, which is only about 100 miles further on. Indeed, it seems more and more likely that the Italians will make little or no stand in Cyrenaica and concentrate their defence in Tripoli. The advance into Eritrea has been even more sensational. Agordat has fallen and Barentu was evacuated by the Italians after a week's stiff fighting. It should now be possible for the forces operating in these two areas to converge on Asmara. The troops advancing from Agordat have the advantage of the railway, an important one, for the terrain is difficult and favours the defender. However, the Italians are taking singularly little advantage of their position and of their intimate knowledge of the country, and it is possible that their precipitate retreat is in part dictated by an increasing shortage of supplies. Since June, virtually nothing has reached Italian East Africa, and there is no hope of making good losses in war material sustained in any engagement. The strategic nemesis which is visited on anyone who creates an empire without looking to its communications is falling on the isolated Italians. And there will be no navy waiting for them on the beaches of Massawa. The British action, on the contrary, is one long illustration of the efficacy of our empire, whose life lines have not been cut. The Australians, New Zealanders and Indians in Libya and Eritrea have come to Africa across thousands of sea miles; in the south, troops from South Africa, Rhodesia and Kenya have breached the frontier of Italian Somaliland, while the canal zone has among its defenders Arab cavalry from Palestine and Trans-Jordan.

Abyssinia Resurgens

"His Majesty's Government would welcome the reappearance of an independent Ethiopian State and recognise the claim of the Emperor Haile Selassie to the throne." When one thinks "of the injustices that are done under the sun," it is pleasant to record that one at least of the major injustices of recent years will be undone and the rights of at least one weak State restored and recognised. Mr. Eden's statement in the Commons will be widely welcomed not only as some small assuagement to a national conscience which has remained—under all the hardening administered by Hitler—a little sensitive over the Sanctions episode, but also as a very statesmanlike approach to the problem of Abyssinia's future status. The British Government have never been under any delusions about Abyssinia. Britain opposed its admission into the League on the grounds that it had not reached a sufficiently civilised standard of living. On the other hand, Haile Selassie was recognised to be a capable and moderate ruler, determined to raise his country to a higher level. His work was interrupted by the Italians, who attacked him in the name of civilisation and used his more corrupt, barbaric and recalcitrant chiefs to bring him down. Italian rule may, here and there, have improved the amenities. It has not altered the character of the people. Haile Selassie, on his return, will face the old problem of imposing reforms on the barbaric fringe of his patrimony, and he has expressed his unwillingness to do so without outside assistance. During the process of reconquest—which with the advance on Gondar is well under way—that assistance can only come from Britain, but Mr. Eden's statement contained the welcome assurance that the Government "consider that any such assistance and guidance in economic and political matters should be the subject of international arrangement at the conclusion of peace." There need be no doubt about the honesty of British intentions on this score. The principle thus laid down represents the direction in which all colonial thinking in this country, official and unofficial, has been moving for many years past. There is in it the seeds of wider experiments in international co-operation for the good of Africa, and it is not altogether irrelevant to compare it with Governor-General Frank's declaration that "Poland is for ever a German State," or the Fuehrer's frenzied promise last November that "no German soldier shall ever be withdrawn from the lands he has occupied."

Greece Advances and Bulgaria Waits

With the capture of the Trebesina massif, the Greeks have secured an excellent strategic advantage which makes their familiar manoeuvre of encircling and shelling out an enemy position practicable in the Tepelini sector. The town is reported to be under heavy fire and the Italians may well have started evacuating. Even without the new Greek advance, the position in their rear is growing precarious. The Italians still hold the coast road to Valona, but there are persistent rumours that the Greeks have reached Valona bay. The Trebesina mountain group also commands the road from Klisura to Berat, and heavy shelling may oblige the Italians to undertake a further withdrawal in this sector. The Greek advance is all the more remarkable in that it followed a desperate Italian attempt to secure the initiative in a week's fierce counter attacks along the whole southern front. These attacks have now died down after accomplishing nothing at great cost and they are hardly a recommendation for the military skill of the new Commander-in-Chief. Their failure also suggests that the Italians of their own initiative are incapable of restoring the Albanian front and that it is mainly the wretched weather that holds the Greeks back from even more sensational successes. If this is so, the spring may bring an Italian collapse and however indifferent Germany may be to local reverses, a complete Greek victory accomplished with British aid would represent too severe a blow to Axis prestige and create too dangerous a military situation in the Balkans to be tolerated. The Nazis must therefore make their plans against a further Italian disintegration. Direct help—aircraft, troops, war materials—might not be decisive on so small and mountainous a front. The obvious strategic move is across the easier terrain of Bulgaria to Salonika and the unfortunate Bulgarians continue to exist in the gloomy and nerve-racking condition of pre-invasion. This week the Germans are again pressing Bulgaria to sign the Three Power Pact and troops are massing on the Bulgarian frontier—the invariable accompaniment of diplomatic pressure. The Germans do not, very probably, intend action at once. When it comes it may well be part of a combined Mediterranean feint to throw Britain's defensive position out of balance at home. Delay is not, of course, much consolation for the Bulgarians and there is no doubt that outside the Army Germany is violently unpopular. But internal divisions prevent them from turning anywhere else for support and the country waits its fate in suspended animation.

Compensation for War Damage

The War Damage Bill is moving slowly, but with some profit, through Committee. Amendments have been accepted by the Government on a number of comparatively minor points. But on the two major defects of the Bill—the unfair discrimination against the owner of property which is wholly destroyed, and the unsatisfactory treatment of the relationship of mortgagor to mortgagee—no concessions have been offered save a number of vague promises to look into the matter of sub-

Export
and
Import
Banking
on
Sweden

SKANDINAVISKA BANKEN

sequent legislation when and if serious hardship emerges. The discrimination against the case of total loss is entirely a matter of the prospective value of money. The owner of a destroyed building is to be paid its value at the prices of March, 1939; the owner of a damaged building is to have the damage made good, the State paying the cost of reinstatement at the time the work is done. Clearly if there is no change in the value of money, and the level of building costs after the war (when all but a fraction of the replacement and reinstatement will necessarily be done) is the same as it was in March, 1939, there is comparatively little difference between the two methods. But the experience of the last war and the methods being adopted to finance this war make it virtually certain that the level of building costs will be considerably higher after the war. In that case, the man who has only suffered partial damage will be restored in full, while the man who has suffered total loss will receive a sum of money which may be enough to pay off his mortgage but will certainly not give him an equivalent house to live in. It is this manifest injustice that the Chancellor of the Exchequer refuses to meet. Three arguments are offered. The first and most stupid is that there may not be any inflation of values after all. "Such an occurrence is most unlikely," said the *Times* on Monday; "indeed, it would mean the complete failure of the Government's economic policy." This is an astonishing example of wilful blindness. The pound sterling has already lost about a quarter of its purchasing power, and the fall in the value of money is about as great as at this stage in the last war. There is no excuse for not facing the problem.

The second argument is one used by the Attorney-General, that the great majority of cases will receive "cost of works" treatment and be reinstated in full. It is true that the number of cases of minor damage will outnumber those of total loss; but this does not in the very least affect the fact that those who suffer the most damage will be treated worst. Finally, there is the argument used by the Chancellor of the Exchequer himself. Sir Kingsley recognised the possibility of injustice, but said that nothing could be done about it, since to compensate an owner of a totally destroyed house by building a brand-new house for him would be to replace more than he had lost. But there is no need to do anything of the sort. All that is needed is a simple provision that the number of pounds due on a "value payment" shall be increased in the same proportion as, by ascertainment of the War Damage Commission, the cost of building has increased between March 31, 1939, and the date of payment. It is astonishing how reluctant the Treasury is to admit to its mind the principle of "valorisation" with which every Continental country became familiar after the last war. No increased real burden on the Exchequer is called for, merely another effort to be rid of what Mr Keynes has been calling "the humbug of finance."

The Conditions of Service

The pace and scope of the new industrial mobilisation are still hard to calculate. Last week's proposed changes in the policy of reservation for military service made it clear that one intention is to force men engaged on non-essential jobs to look for war work if they wish to escape calling-up; and the Minister is known to have asked certain industries to prepare schemes to release a considerable number of their workers. Those mentioned have been the manufacture of boots and shoes and hosiery, which employ large numbers of young women; and it is said that the plan is to select certain low age-groups of female labour in particular areas for the first registration. Actually, the policy of registration and call-up for industry is, by all appearances, still to be kept in the background, while the problem of finding, releasing, recruiting and training the new millions for war production is done by discussion and agreement. The trouble is that, if the old methods are to be used—even with this new sense of urgency—the old shortcomings will remain to impede their success. If the flow of workers, first of all from non-essential work, then into training and finally into essential work is to be left to mainly voluntary means, except for the threat of military service, the conditions do not exist for its success. For one thing, no plans have been made to

scale down non-essential industries in such a way, by pooling their resources and concentrating their output in their most efficient units, as to set free the greatest possible number of workers. For another, apart from unemployment, the worst paid and least attractive occupations are, in order, training for war work and serving in the Forces. Work on munitions and so on is, admittedly, well paid—for those already skilled and for those who are fortunate. But the prelude to it, the way of getting in, is poverty-stricken unemployment, poverty-stricken instruction and costly migration. No tank traps are more obstructive—so long as the people concerned can hang on to the jobs they are in. For voluntary transfer to have a chance of even limited success, the wage structure would have to be so constituted that, even with the cost of travelling and rehousing taken in, labour would be stimulated to move to the work and the places where it is most needed. The fact is that the present economic differentials between one occupation and another and one status and another are, over a wide field, calculated to make people stay where they are. The need is not simply for plans to mobilise manpower; but for measures to make sure that no one can benefit by remaining out of the one or the other of the front lines, or lose by taking the path of duty. It means instituting, not only a minimum level of consumption below which no individual should fall, but also a maximum above which no one should rise. It means evolving a system of compensation for all war losses, indirect as well as direct, whether due to calling-up, bomb damage, ruined trade or industrial transfer—either by meeting burdens from State funds or by abating them. And, within this wartime framework of equal sacrifice, it means imposing upon every citizen the obligation to work—not just on the working girls of Leicester but on the leisured ladies of the Shires as well. To talk of conscription is to miss the point. What is wanted are the conditions of service.

Party Lines in South Africa

The outbreak of war came as an earthquake to the structure of South African politics, and there are still plain signs that the process of settling after the shock is far from finished. General Hertzog has left the scene—it is said for good. A number of his followers have formed a new "Afrikaner" party. General Smuts has proclaimed that the South African troops who are tearing at the Italian Empire will fight on to the shores of the Mediterranean—at least. Only last week, there was an ugly clash in Johannesburg between soldiers on leave and Afrikaner extremists of the so-called "cultural" Ox-wagon group. The new party is pledged to the policy of co-operation with the British which, through almost every vicissitude, was the prescription of General Hertzog for the Union's future; and it directly denies the racialism of the extremists among the Afrikaners who drove General Hertzog out when he attempted to rally Afrikanerdom, not against the British, but against the war policy of General Smuts. It is a small party—only 10 members of Parliament out of General Hertzog's former following of more than 40, not half the number who supported the Nationalist Dr Malan in the pre-war Parliament. It should not be supposed, however, that the balance of the Hertzogites have remained in the uneasy alliance with the extremists which General Hertzog himself finally found to be impossible. In fact, to a considerable extent, the reverse is probably true; that is, an appreciable number of them must now be supporters, if not of General Smuts personally, at any rate of the war.

The point is that the new party, so far as can be seen at this stage, is an attempt to find a *via media* that is almost certainly not there. Its members will have no further truck with the "Afrikaner segregation" policy of the extremists, with its invitation to anti-British activities likely to aid the Germans and its affinity to the blood-and-soil doctrines of Nazism, but they are also opposed to what they call the "holistic imperialism" of General Smuts. The logic of General Hertzog's experience, when he found that opposition to the Prime Minister and the war led him into disloyal and subversive circles, is ignored; and the new party (it is reported) still advocates neutrality. Actually, the war has clarified the political situation in the Union. There are really only two sides: those who support the war—which a majority of the population unreservedly approves;

and those who oppose the war, favouring any means to their end, even at the risk of forwarding Germany's ambitions. On the one hand, that is, there is General Smuts; and on the other, there is, not the old leadership of General Hertzog or even of Dr Malan (who is not prepared to be actively disloyal), but the old-Boer and new-Nazi Ox-wagon group, led by Dr Van Rensburg. The elements in between must ultimately shake into one or the other of these two groups; and the fighting in Johannesburg, which seems to have been actually started by the soldiers, who resented the anti-war attitude of the Ox-wagoners, shows how high feeling is running over this issue. What has happened is simple: General Smuts has gained enormously in backing since the war started; a growing majority in the Union is prepared to support the war wherever the tide of victory may take its soldiers; but, correspondingly, the Opposition has grown more stubborn and virulent.

Congress Takes its Time

Not for the first time in American history, Congress is following the movement of public opinion at a leisurely pace. The responsible members of the Administration have made no secret of the anxiety with which they regard the next three months. They have underlined the perils and the need for haste. They have revealed the very disquieting fact that British ordering of munitions—that is, new orders, not the execution of contracts already entered into—has virtually come to a standstill. But the constitutional character of Congress—an independent legislature, without much party discipline or leadership from those who are responsible—imposes delays. It also inevitably, in circumstances such as the present, gives the word to the minority. The majority who support the President will save their breath for the voting, and it would be a mistake if anxious observers in Great Britain formed the wrong impression from the spate of anti-Roosevelt, anti-British oratory that is coming from the Capitol. The Bill has not yet suffered serious amendment. Indeed, the only important amendment—that on conveying by American naval vessels—is far less serious than, on the basis of early cables, was here assumed last week. It merely declares that nothing in the Bill must be construed as authorising conveying; it does not attempt to take away from the President the power that constitutionally belongs to him as Commander-in-Chief of the Navy. When the House passes the Bill, it will be subject to further discussion—and perhaps more serious amendment—in the Senate. But nothing has happened to pre-empt its very good chances of enactment. As for the delay, we must bear it as a vigil—one of those eternal vigils that are the price of liberty.

The Redistribution of Work

On page 183, in our regular summary of economic events in enemy territory (now presented under the title *events in enemy Europe instead of Germany at War*), an account is given of an interesting experiment by which a sort of clearing house for sub-contracting Government work to factories with spare capacity is being operated. This problem of elasticity in the distribution of work is common to every war economy. It arises in the first place from the need to make full use of every available item of industrial equipment, and is made particularly acute by the shift from civilian to military manufacture, which carries with it the danger that the restricted civilian factories will many of them be making only partial use of valuable plant and labour. In the new drive in this country, for instance, to recruit hundreds of thousands of fresh workers for war employment, it is of prime importance that the civilian tradesmen, affected by the cutting down—the boot and shoe and affected by the cutting down—should, by hosiery trades are now under discussion—should, by organised posting, so adjust the work that they are allowed to carry on as to release a maximum amount of plant and labour for Government contracts. Until now, the consequence of restricting civilian manufacture has too often been, not the disemployment, but simply the wasteful underemployment of machines and man-power.

Nor is this simply an industrial problem. The need for pooling and the re-allocation of work by mutual arrangement arises hardly less in the distributive trades.

Retailing and wholesaling are not only sharply affected, naturally, by the curtailment of civilian supplies; they are also thrown out of gear by the considerable wartime movements of the population and by bombing. The quotas of goods supplied to them cease to correspond with their markets; some have too much, while others have too little. At the end of last year, the Board of Trade took up this question of shifting markets with the wholesale textile trade; and in the middle of January a clearing scheme was proposed whereby textile wholesalers with surplus stocks could be put in touch with those whose supplies, for one reason or another, were insufficient. Actually, an informal trade in quotas has already sprung up in connection with almost all goods which come under the Limitation of Supplies Orders; but as the *Monthly Record* of the Manchester Chamber of Commerce has pointed out (referring specially to yarn quotas and the price of finished textiles), the danger of these transactions is that prices to consumers tend to be "rocketed up." In the fields of both distribution and industry, the necessity for Government direction of pooling and transfer arrangements is plainly imperative. There is not simply the need to restrain engrossing and price-raising. It is essential to see that the nation's requirements, and those only, are met; that, on the one hand, supplies are distributed where they are most wanted; and that, on the other, trading and manufacturing firms which surrender their quotas of work actually transfer their labour and plant exclusively to war work.

Ship Warrants and the Blockade

By a slip in a Note on economic warfare last week (p. 148) it was inadvertently stated, with reference to supplies passing to Germany through Soviet Russia, that ship warrants issued by the British authorities have no validity in the Pacific trade. This is, of course, untrue. British navicerts which certify that cargoes are not intended for enemy or enemy-controlled destinations are, it is true, only needed in trade to Europe, certain islands in the Pacific or French and neutral ports in North Africa. Ship warrants, on the other hand, which give the shipowner's guarantee that cargoes will not be run to blockaded areas without navicerts, are needed all over the world before ships can obtain repairs, coal, oil or even water at any British port or bunkering station. Indeed, these certificates constitute practically the only defence which Britain possesses, apart from actual co-operation on the part of the Americas, against the running of the blockade by the Pacific back door; by this means, it is possible to deny to blockade-runners the great range of British port and shipping facilities in the Far East.

Monopolies and the State

A marked feature of economic development in wartime, that is, in periods when markets are dominated by the prospect of scarcity, is the tendency of monopolists to take charge of entire trades. This was so even before the ubiquity of Government control led to the use of legalised monopolies as official agents. At the end of the long war against Napoleon, a commission was set up to investigate "the high price of beer" with special reference to the influence of the brewing ring. To-day, the problem is acute, for one thing because, since British civil servants are never trained (as administrators are,

intensively, in some other countries) in the routine and expertise of particular trades and industries, traders and industrialists have necessarily to be used to operate official controls; they are the working parts of the Ministries of Supply and Food; and, with the best will in the world, it is difficult for civil servants to gainsay the expert advice of business men. Nevertheless, the tendency to farm out control to the largest traders—which was already a feature of State intervention in the Tory years before the war—is disturbing; and, to take one instance, it was a sign of indifference to a development of national importance that the terms of reference given to the committee set up by Lord Reith to consider cement production did not include any investigation into the effects of combination on prices and supplies. This is not to suggest that there was anything at all to uncloak; the point is rather the need for constant vigilance on the behalf of consumers—one of the notable results of the work of the Reconstruction Committee on housing in 1917 was a report on “combinations in the building material trades.” An important instance of quasi-monopolist organisation under the official aegis is given in the Winter issue of the *Fabian Quarterly*. An article on “Meat Policy” rightly praises many features in the strict control by the Government of the wartime trade in meat; but its author makes the criticism that though the Government has been right in selecting large units for supply, it has wrongly given control through the Ministry to the larger wholesalers; the chains of stores of importing syndicates, he says, have been allowed to handle the home-produced meat they once ignored; in transport, by making the Wholesale Meat Transport Association its sole agent, the Ministry has, it is claimed, in effect given this body power to force retailers into affiliation; and the use and

distribution of edible fats are ruled by a committee of manufacturers. There are answers, of various degrees of conviction, to these criticisms; but the fact remains that the officially sponsored monopoly is a portent to be scrupulously watched. At the best, it is a regrettable necessity; at the worst, exploitation.

Shorter Notes

A terrifying sidelight is thrown on the contagion and deadliness of Nazi ideas by the letter sent by the seven Bishops of Norway to the Quislingist Minister for Church and Education protesting against the violence, lawlessness and brutality of the *Hirdmen* (Quisling's Hitler youth), whose watchword is: “We knock down so hard that we destroy sight and hearing, and we return ten blows for one.” And they are living up to it.

The arrangements for sending remittances to British subjects in enemy and enemy-occupied territories through banks in this country have now been cancelled. From January 1st, British subjects detained in such territories, who are willing to be repatriated when facilities exist, may continue to obtain advances from the United States Consul, but in order to avoid duplication of payment permission to effect remittances through banks has been withdrawn. It has hitherto been possible to remit up to £2 a month to officer prisoners of war only through banks. Now, this permission has also been withdrawn, as if the arrangements were extended to all ranks, as was intended, it would involve payment to the enemy of £1,000,000 a year in dollars.

Letter to the Editor

Irish Neutrality

TO THE EDITOR OF “THE ECONOMIST.”

SIR,—Irish readers have been surprised on several occasions during recent weeks at the position taken by *The Economist* on Irish neutrality. Two complaints have been made against the Irish Government: first, that by not placing the so-called Treaty Ports at the disposal of the British Navy it has increased the menace to British and neutral shipping in the Atlantic, and, secondly, that by refusing to enter the war on the British side it has unwittingly and unintentionally rendered aid to Germany. These two complaints are not quite independent. If the Irish Government offered the use of the ports to Great Britain, Eire would automatically enter the war on the British side, while, if it entered the war on that side, all Irish ports would at once become available for the British Navy. In fact, the two complaints are different methods of expressing dissatisfaction at the continued neutrality of Eire.

English people and newspapers are quite entitled to regret that the neutrality of Eire is inconvenient for naval operations in the Atlantic. The same regret could be expressed regarding the neutrality of Portugal and other countries that have the misfortune to possess situations of strategic importance. They are also at liberty to argue that Irish interests would, in the long run, be best served by entering the war as an ally of Great Britain. This argument might be based on grounds either of expedience or of principle, and there would, no doubt, be something to be said in favour of it—and against it. But they are not entitled to assert that the Irish people, by remaining neutral, have “compromised their whole moral position in the world.” The question of Irish neutrality is a matter to be decided by Irish public opinion, correctly interpreted, as it is, by the Irish Parliament and Government.

This is an essential corollary of the principle of Irish nationality for which British Liberalism professes to stand. If it be asked “for what did Ireland's English friends fight so many bitter battles?” the answer is “the right of Ireland to govern its own affairs in its own way.” If the right of self-government be granted in principle, the right of declaring or refusing to declare war cannot be denied in practice. To argue

that unwise decisions may be taken is to raise the eternal issue of self-government against good government, which in the case of Ireland has been decided in favour of the former alternative. To provide the moral justification for forcing Ireland into the war by direct intervention or by economic pressure, it is necessary to retreat to the old Unionist line that the interests of Ireland must always rank second to those of Great Britain. Such action would be an open exercise of power politics, impossible to reconcile either with declared British aims in the war or with the acceptance of the essentials of the Irish nationalist position. Anglo-Irish relations would be brought back to the time and terms of Cromwell.

The question of the Treaty Ports is simple. These ports were transferred to Eire in 1938 by a public act of the British Government, ratified by Parliament. Many people in Great Britain questioned the wisdom of that action at the time, but it cannot now be unilaterally revoked. To argue that the capture by the Germans of the French ports has altered the facts of the situation is no doubt true strategically, but, juridically, it is to seek to apply the principle of *rebus sic stantibus*, which, if valid, can justify the breach of any international agreement. So long as Irish public opinion remains unchanged on the question of neutrality, Eire is clearly entitled to continue in her present attitude, which undoubtedly reflects the wishes of the great majority of the people. If this attitude leads to unfortunate results for the Irish people, they must be prepared to abide by the consequences of their own decision. They are entitled to object to any attempt from without to bring pressure to bear upon them in making up their minds on matters so vital for their future welfare.

YOUR DUBLIN CORRESPONDENT.

[There is little, if any, analogy between Ireland and Portugal. Eire is entirely dependent upon Great Britain's strength, not merely for her future happiness, but for her day-to-day existence. If it were not for the British armed forces, she would be invaded to-morrow; if it were not for the aid of British shipping, she would collapse economically the day after. If the Irish wish to be independent and neutral, let them be so. But to accept all the benefits of dependence and claim those of neutrality too is, indeed, to “compromise their whole moral position.”—EDITOR.]

THE WORLD OVERSEAS

New Railways in Free China

(From Our Shanghai Correspondent)

November 30, 1940.

FREE China is still making strenuous efforts to improve and extend her communications. A great deal of work is constantly carried out on the Burma-Yunnan Road, now Chungking's chief line of foreign communications, but the Road's monthly transport capacity still remains limited to less than 10,000 tons of truck freight. To relieve the Road permanently, the Chinese in recent months resumed the construction of two railways from Kunming capital of Yunnan—northward in the direction of the Upper Yangtze port, Suifu, and westward towards Tali. The materials used in this railway construction are those of the French Haiphong-Kunming Railway's Chinese section, which since the Japanese penetration of French Tongking is being torn up systematically at an average rate of two kilometres a day. The two new railways built to the north and west of Kunming are scheduled to run to an aggregate length of over 300 kilometres, and to be completed by the end of next year. Railway construction also continues in Kwangsi Province, recently evacuated by the Japanese, where a new line is being built from Liuchow north-west towards Kweichow Province. The Liuchow-Yishan section of this line already sees normal railroad traffic, which has thus advanced to within an easy two-day truck journey from Kweichow, capital of Kweichow. Of less economic than political importance is the completion in October of the new mountain motor road in West Szechuan from Yachow (Ya'an) to Kangting (Tachienlu), already passable for small motor cars, and now being widened for truck traffic, which is thus thrust forward to the gates of Eastern Tibet.

Less advance has been made in recent months in Free China in the field of industrialisation. The suppression of the Chinese transit trade through Indo-China, the marooning there of large machinery and motor truck consignments for Chungking, and the Burma Road's three-month closure considerably delayed the execution of a great many industrial projects and completely prevent that of others. Lack of spare parts for machinery is a serious difficulty, hampering numerous plants in operation. Yet a series of new industrial establishments were recently successfully completed and started operating, such as a rubber-tyre plant in Yunnan, some big and many small machine shops, a few chemical works, and several new iron foundries. Japanese air bombing has so far had little effect on Changking and Kunming factories. Free China's industry still expands, though more slowly than a year ago. Szechuen Province alone reports the following industrial growth for the past three years:—472 plants newly established with a capital of over £250 (130 chemical, 96 foodstuff, 67 metal and machinery, 62 paper and printing, 31 electrical supply plants); 339 plants transferred to the Province from Japanese-occupied territory (193 metal and machinery, 37 chemical, 21 electrical supply plants). Many of these establishments, of course, are but of lilliputian size. The number of new industrial co-operatives all over the country continues to increase, some of these developing into big establishments executing large war orders.

The March of Inflation

Yet, despite continuous progress in communications and industries, there is everywhere in Free China a great shortage of industrial products which, combined with the high cost of motor transport and with advancing inflation, has boosted prices of such products to all-time high levels. At Chungking, numerous Shanghai-made

mass-consumption products, such as cotton yarns and cigarettes, are priced between four and ten times higher than at Shanghai. Elsewhere in Free China, industrial goods are frequently still more expensive. Prices of agricultural products also sharply increase in all areas which the new lines of communication bring within the reach of Chungking's wartime economy, with the result that the former low cost of living in such areas disappears, and the decline in the standard of living of tens of millions of people is raising increasingly serious economic and social problems. The Chinese National Government are trying to cope with these problems as best they can by means of official price fixing, the control of the supply of foodstuffs from province to province, anti-profiteering laws and severe excess-profit taxation, but it proves difficult to enforce such measures over an area as huge and as little touched by modern administration as Free China.

America's Labour Reserve

[FROM OUR NEW YORK CORRESPONDENT]

January 17th.

THE business indices for December showed only nominal changes from November, except for non-residential building. The general index of industrial production declined two points, but allowance for the “seasonal” adjustment converted this two-point decline into a 4-point rise. On the other hand, the unadjusted index of department store sales rose from 114 in November to 179 in December; but the adjusted index advanced only from 100 to 101.

This is a statistical picture of an economy occupied at very near what can be termed its “normal capacity.” For example, normal capacity is measured by the 40-

hour week. As late as October, the Bureau of Labour Statistics reported an over-all average work week of 39.3 hours, although the durable goods industries averaged 41. There is considerable elasticity in this element in the form of overtime, although, of course, at increased cost. There is also elasticity in the labour supply. It appears that the total number of persons engaged in non-agricultural employment in November was about 36,500,000, a figure almost identical with the average of 1929. As the adult population of working age has increased, perhaps five or six millions, since 1939, this figure suggests that there is still a substantial reserve of labour. The availability of this labour, that is, its geographical distribution and its skill or aptitude, is less clear than its numbers. During the past decade, the characteristic movement of the population from rural to industrial areas was held back, and it is estimated that several million employable persons are now scattered in rural areas, where their services find little opportunity. Given the fluidity of the American population, it may be supposed that large numbers of these are being drawn and will in the early future be drawn towards urban industry. Then, of course, there is always the possibility of shifting personnel and plant from its normal use to uses regarded as more essential. In other words, the statement that our economy is operating near normal capacity does not mean that aggregate production cannot be increased, and still less that specific production cannot be materially expanded. It does mean that increases from this level, whether general or specific, will introduce certain phenomena which have so far either been absent or have been relatively inconspicuous.

FEDERAL RESERVE BUSINESS INDICES (unadjusted)

1935-9=100 for industrial production
1923-5=100 for other series

	Nov., '39	Nov., '40	Dec., '40
Industrial production (total)	124	135	133
Manufactures (total)	126	137	138

Freight car loadings (total).....	73	84	77
Miscellaneous	81	95	88
Department store sales	168	114	179
Department store stocks	64	83	...

As this Correspondence has several times stated, it is noteworthy that the great increase in demand since the middle of 1938, or even since the summer of 1939, has produced little effect on the price index. This inertia in the general index rather conceals several relevant facts. For example, there has been a substantial rise in building materials and in building costs—as would be expected from the index of building contracts given above. In consumer goods, a marked shift has been reported in consumer preference, from cheap to more expensive articles, for instance, women's clothes in towns where business is particularly booming. Difficulties in securing delivery are occasionally encountered. But, generally speaking, there is a marked resistance to higher prices.

Russia's New Lands

[BY A POLISH CORRESPONDENT]

THE formal absorption of the Baltic States, Bessarabia and Northern Bukovina into the U.S.S.R. was finally completed last month. The peoples of these territories have elected their representatives to the Supreme Soviet and are represented in the Parliament of the Peoples of the Soviet Union. The voting was, as usual, on one list only—that is, for the candidates of the Communist Party and the so-called "non-party representatives,"

and candidates were nominated by local committees dominated by the members of the Communist Party. Between 80-95 per cent. of the electorate cast their votes for the official candidates; and there were the usual mass demonstrations of workers and peasants.

The Stalin administration has shown considerable finesse in handling peoples of different races and nationalities. It is unlikely that all the electors in these newly-acquired territories voted as they did because of force or pressure. The Soviet authorities, in fact, are doing everything possible to make things easy for the new populations during the period of transition; and the Russian method of dealing with the 23 million peoples in the Soviet's latest acquisitions works more smoothly than the brutal force used by the Nazis in their occupied countries. The method is the same as that which Lenin used in Russia in the years 1923-25 to save the Soviet economy—the so-called New Economic Policy (N.E.P.), very far removed from the strict programme of Communism, but designed to pave the way for the introduction of a fully planned economy.

Co-operation with the Invaders

Each of the Baltic States and the provinces of Bessarabia and Northern Bukovina are now passing through this transitory period. During this stage the population is treated quite differently from the population of Russia proper. This process of the "evolutionary introduction of the Soviet system" and the policy of giving to the different national minorities comparatively considerable autonomy has yielded fairly good results. The new regime has managed to obtain the co-operation, not only of the peoples who were by race and natural structure most closely linked with the Russ, such as the Ukrainians and the White Russians, but also of people like the Latvians, Estonians and Lithuanians. Even the Poles, who are still stubbornly resisting the German invaders, show some signs of co-operating with the Soviet authorities in the territories of Western Ukraine and the other parts of Poland occupied by the Russians. Polish papers appear and Polish schools are open in all the districts with a Polish population; and, though all cultural and educational activities must, of course, be in line with Communist ideology, there is no actual suppression of the Polish language and no tendency to create anti-Polish feelings. The Baltic States have so far received the best treatment, and these countries are still less "socialistic" than any part of the Soviet Union. It is, however, doubtful if this state of affairs will be tolerated for long.

Transition to "Socialism"

The first stages of socialisation were carried out everywhere in the same way. Banks, transport, land and large industrial concerns were nationalised and taken over by workers' committees. The former owners were in some cases elected as directors of their establishments. The land was generally distributed to landless peasants, but farmers were allowed to keep their farms, on the condition that they did not possess more than 30 hectares of land and employed only members of their own family. Only a comparatively small number of collective farms have been organised, and, actually, collectivisation has not been encouraged. Private belongings, including furniture, have not been confiscated, but a system of redistributing houses and flats has been introduced, each person being allowed a specified amount of cubic space, and rent being fixed according to the amount of room-space occupied. Former landlords are often still entitled to rents; and many businesses, especially in distribution, are carrying on as before, though the tendency is for all trade to be concentrated in the co-operatives, private trading being limited to a minimum. People are not prohibited from practising their religion, and churches and synagogues are still open. But a very strong campaign of anti-religious propaganda has been steadily conducted by various atheist organisations.

The relations between the different nationalities—Poles, Lithuanians and Jews in Lithuania; Russians, Jews and Latvians in Latvia and Estonia—are on the whole smooth, and there is little or no sign of serious friction. All the key positions, however, are controlled by Russians from Moscow and other districts of Central Russia, though there is no marked tendency to push the local population out of even important jobs. It is not likely that any appreciable resistance will be shown when these lenient preparatory measures are gradually transformed into the full Soviet system.

German Europe

The Industrial War Effort.—Official pronouncements during the last few months have emphasised the need for still further intensification of arms production. This is, perhaps, surprising; first, because the German armament factories have been working practically at peak production for some years; and, secondly, because other official statements have seemed to view with disfavour any urge to increased effort. In his last Munich speech, for instance, Hitler said that, up to the present, "only a portion of the monthly munition output was being consumed." The newspapers assert that the *Blitzkrieg* has shown an amazingly low record of consumption, wear and tear and loss of material. But they now go on to say that Germany must not make the mistake of being too complacent about the progress of production. What has become apparent in this war, in fact, is that reserves of labour, machinery, stores and vehicles alone do not suffice, but what matters most is quick adaptability to the ever-changing needs of each new phase of the war. The present drive to increase industrial war potential may be, therefore, regarded as the harbinger of important strategic events.

One of the most important innovations in the organisation of German industry during the last few months, it is true, is obviously due to air raids. This is the large-scale transfer of factories from Western Germany to Upper Silesia, Bohemia, Moravia and Poland. These transfers have led to a large demand for improvement and modernisation, for the industrial plants of those Eastern territories can only slowly be adapted to modern methods—even if machinery is transferred as well. In the course of these changes of locality one principle is being strictly observed which has been followed for some time in German armaments production, namely, the greatest possible standardisation of types, particularly in aircraft construction. It is even claimed that, in this way, far-reaching disorganisation by British air activity has been avoided.

Industry in the Protectorate and in Poland is being drawn more effectively into the industrial war effort by yet another reorganisation. As many of the factories have far more orders than they can deal with, the Government has organised so-called "order exchanges," which serve as "clearing-houses" for Government contracts within certain areas. At these exchanges, the factories, by mutual agreement, try to ensure the speedy execution of Government orders; many factories no longer allowed to produce consumers' goods and those deprived of their export markets are enabled to switch over to war production—which they could not do without this clearing system, because they could never obtain raw materials and semi-manufactured goods without offering evidence of corresponding purchases in previous years. It is not easy, however, to see how this system of subcontracting by individual entrepreneurs fits in, either with the rigidity of State control or with the concentration of production that is being intensified in the civilian industries. The output of consumers' goods, it is true, is still steadily falling; but, at the same time, care is taken to ensure that individual factories, whose civilian business has been curtailed, do not just go on working half-time, but rather that more and more works are "closed down entirely," while those which do carry on work at full capacity, in order most fully to exploit both labour and plant. It is hard to see the room in this situation for the clearing-house for sub-contracts—unless it is that the Nazis' notably efficient planning is not proving so efficient in practice.

In the newly-acquired mining districts of Poland, North France, Belgium and Holland, the equipment is being fully utilised for the German war effort, and the German Government has spent large sums for this purpose. New machinery, both for the hauling and load-pose, has been introduced; and, as the German coal industry is experiencing difficulty in finding labour to train, a special training scheme has been evolved for the coal pits which is partly compulsory. Despite the general wage-stop the scheme offers considerable wage inducements, and in future the miner will be the highest-paid worker in Germany.

The production of motor vehicles for the civil population—private cars, vans and lorries—has entirely ceased. Only in exceptional cases are lorries produced for armament factories and tractors for agricultural use.

What remains of the motor industry produces only for export, which, however, is very small, since motor traffic all over Europe is strictly limited now on account of petrol rationing. The motor factories, however, are fully occupied with the manufacture of war materials; and, recently, some of them have even substantially increased their capital in order to meet increased demands.

Permits for Gaseous Fuels.—The compulsory conversion of commercial motor vehicles to the use of liquefied hydrocarbon gases was one of the means adopted by the German Government soon after the outbreak of the war to economise liquid fuel supplies. Fair quantities of these gases (propane and butane) are obtained as by-products in the German coal-oil industry. Until recently these gases were unrationed, but they have now become so popular that the demand for them has out-run the available supply. Now, therefore, users are required to present a "consumer's certificate" before they can obtain liquefied gas. During a transition period, an equivalent quantity of petrol is being supplied to consumers who, although they have the necessary permit, are unable to obtain the gaseous fuel.

Agricultural Supplies.—A recent publication of the *Institut für Konjunkturforschung* dealt with the effect of the British blockade on the food and fat position of the Continent. It points out that, at the outbreak of the war, German stocks of cattle and of pigs exceeded those in 1914 by 7.5 per cent. and 11.5 per cent., respectively. The incorporation of Austria and the Sudetenland in the Reich, it is claimed, did not complicate the food difficulties of Greater Germany, for the grain deficit of one million food calories in these regions can be met by raising the output per acre to the German level.

The *Institut* states that the crops of German Poland can be increased immediately by 20 per cent., and estimates that the Reich will benefit next year by a Polish export surplus of three million tons of potatoes, sufficient to raise two million pigs for slaughter. The *Institut* concludes that import requirements of approximately 6.7 million tons of grain in the German occupied territories of France, Belgium, Holland, Denmark and Norway can be reduced, without causing deprivation, by intensified cultivation of the land for grain crops and a reduction in cattle, pigs and poultry.

Public Utility Prices

THE cost of public transport and of electricity and gas—the public utility industries—not merely absorbs something like 10 per cent. of the national income, but it enters the budget—and often as an important item—of every firm and of every individual. Increases in public utility charges have much the same effect on the general price-level as stones thrown into a pond, since their influence reaches the furthest corners of the economic system. They are the most strategically placed of all prices and no war-time economic policy can claim to have any substance unless it takes them fully into account. The most obvious rule that should be laid down is that there should be no “excess profits” in the public utilities in war time; the net revenues of the industries should not rise above the limits imposed by the need of maintaining plant and machinery in good condition and of permitting a reasonable return on the capital invested. These are inevitably question-begging phrases; but the principle is plain enough. But clearly it is only the beginning of a war-time policy for strategic prices. In some cases, where the damage that would be done by price increases would be very heavy, it may be preferable to compensate the public utilities for rising costs out of the public purse rather than out of increased prices. In other cases, where the incidence of rising costs has been unequally spread over an industry, some measure of pooling may be necessary. Or again, where an industry is prosperous and has built up large reserve funds, it may not be inequitable to refuse a rise in prices in strict proportion to the rise in costs. On occasion, it may be advantageous to permit an increase in prices, but to relieve certain classes of those who would suffer; thus it may be considered to be against the nation's interest to add the whole of the increase in the cost of shipping services to the price of exports, and it was considered to be contrary to the public interest to apply the second increase in railway charges to workmen's tickets and season tickets. Finally, to secure more efficient use of facilities which have become scarce in war-time, it may be advisable to secure some measure of financial community of interest between undertakings which normally compete. Wartime price policy in the public utilities cannot be a simple matter; it should exercise the highest qualities of discriminating judgment on the part of those who are ultimately responsible—that is, of the economic members of the Government.

Of the three main branches of the transport industry, the railways have been distinguished in peace-time from road transport and shipping by the greater degree of control to which they are subject. In war-time, however—or at least in this war—the railways have escaped the full measure of control that has been imposed on shipping. They have not been taken over by the Government, as in the last war, and though they are subject to the directions of a Railway Executive Committee which is itself the servant of the Minister of Transport, the Committee is in fact composed of the general managers (or other representatives) of the railway companies. The financial arrangements were also designed to preserve to the maximum possible degree the independence of the railway companies. The main outline of the Agreement is well enough known from the controversy it has excited. It provides what is intended to be a virtually automatic correlation between costs and charges. If costs are certified to have risen, then the Railway Executive Committee must recommend, and the Minister of Transport can hardly refuse, increases in charges calculated to bring in an equivalent amount. The

proposed increases in charges are scrutinised by a Consultative Committee—substantially the same in membership as the Railway Rates Tribunal—but its recommendations are confined to the form that the increases shall take, and it is not called upon to give an opinion on the advisability of the increases themselves. Under this machinery there have been two increases—the first in May, 1940, of 10 per cent., and the second, in December, 1940, of a further 6½ per cent. of the pre-war rates. (These percentages were not universally applied to all charges.) The machinery has been specifically designed to ensure that railway charges shall depend upon costs alone and that other considerations shall be excluded. Thus, even in the somewhat unlikely contingency that the net revenue produced by increased charges should be larger than a reasonable return on the railways' capital (defined as the “standard revenue” of the Act of 1921), the excess is not to go to the consumer of railway transport, but to the Exchequer.

Merchant shipping has been requisitioned by stages. The last category to be requisitioned, at the beginning of the present year, was the tankers. Before the war, with the exception of the Conference rates for liners and the not wholly successful attempt of the Tramp Shipping Administrative Committee to put a bottom into the rates charged by tramp vessels engaged in the principal grain trades, shipping freights were determined in free—often in subsidised—competition. Since the war, however, the Ministry of Shipping has secured control over the greater part of the world's shipping and is in a position to control freights. For individual rates, the Ministry is free to discriminate upwards or downwards in the national interest; but for freights as a whole it is instructed to follow the principle of balancing income and expenditure, so that freights as a whole depend upon costs as a whole. The rates of hire for British ships, which have been agreed with the shipping organisations, are divided into basic rates—covering running costs (wages, stores, insurance of normal risks, etc.)—and fixed allowances for depreciation and interest on capital. The basic rates are adjusted from time to time; the fixed allowances, being based on the pre-war cost or value of the ship, remain unchanged. The Ministry itself bears the cost of fuel, dues and war risk insurance. In the absence of the necessary data and the complete change in circumstances, it is impossible to calculate the average increase in shipping costs. Nor, in view of the policy of discrimination and of the non-disclosure of the rates charged for Government traffic, is it possible to estimate the average rise in freight rates. The advance must have been substantial. To take two representative trades: the outward coal trade to the Lower Plate, and the homeward grain trade from the Plate to this country. In the former, controlled rates have recently been given at 38s. per ton, against an average of 13s. 3d. per ton in 1939; in the latter the rate charged by neutral vessels towards the end of 1940 was 115s. per ton, compared with an average of 21s. per ton in 1939. The level of shipping freights has an influence out of all relation to the income of the shipping industry—as the first few months of the war demonstrated so clearly. It should at least have been considered whether the money saved by the policy of requiring the Ministry of Shipping to be self-supporting was not the most expensive economy that could well have been contrived.

Compared with either the railways or shipping, the road transport industry has been strikingly exempt from control. Indeed, there can be said to have been some relaxation of control, for the greater part of the control

mechanism set up before the war was intended to limit the liberty of the industry to expand and was clearly inappropriate against the background of a shortage of all forms of transport. Unlike the railways, the road hauliers have no uniform system of charges, and the attempt to formulate such a system, initiated by the railways' demand for a “square deal,” was abandoned. Freed from the extreme pressure of competition and faced with a rise in costs, road haulage rates have risen considerably. Figures that have been quoted in the *Commercial Motor* indicate that the cost of running a goods vehicle has risen since 1938 by about 20 per cent. for the lighter lorries and by a slightly higher proportion for heavier vehicles. The largest items in this increase are wages (which have increased by rather less than the average of all costs) and the cost of petrol (which has risen by 40 per cent.), but there have also been heavy proportional increases in the cost of insurance, tyres and repairs. Accurate information on the course of rates charged is not available, but it is probable that the average rise has been slightly higher than the rise in weekly running costs, the difference being explained by the increased difficulty of securing economic loading. Regulation 55 of the Defence (General) Regulations, 1939, gives the Ministry of Transport the power to control charges, and last October the Minister requested that no general increases in rates be made “without submitting the proposals to the Regional Traffic Commissioners.” But Government control over charges has hitherto been far from strict or comprehensive, partly, no doubt, owing to the enormous difficulties of standardising haulage services.

The price policy of the gas and electricity industries was already closely controlled before the war, but the system of statutory control, administered by the Ministry of Transport in the case of electricity and by the Board of Trade in that of gas, differs, partly for historical reasons. Prime costs have naturally risen with the advance in the price of coal and other materials, but the incidence of the increase has been very uneven, as undertakings in some areas have experienced a substantial fall in sales while those in other districts have been able to maintain them. While electricity undertakings still operate within the price regulations in force before the war, gas undertakings have been enabled to increase their charges with a fall in output by an Order issued after the outbreak of war. (It is interesting to note that the principle of relating charges to changes in the volume of turnover, though operated in this case against the consumer, is excluded from operating in his favour in the case of the railways.) The increase in charges, like that in costs, has been far from uniform.

Thus, of the electricity undertakings, numbering between 200 and 300, that have notified the Electricity Commissioners of a rise in charges, the majority have raised them to yield increases in revenue per unit sold ranging up to 20 per cent. A few undertakings that have suffered heavily from war conditions have raised their tariffs to yield as much as 50 per cent. more per unit sold. The Minister of Transport, however, pointed out in the House of Commons on February 7, 1940, that he would not hesitate to use his powers under the Defence Regulations to ensure that an unjustified burden was not placed upon consumers if it were shown to his satisfaction that the prices of any individual undertaking had been raised to an unreasonable extent, even within the limits of the authorised maxima.

In general, the Government appears to be guided in its policy towards public utility industries by the principle of allowing costs to be passed on to the consumer in increased charges, irrespective of whether their profits were high or low before the war. As a result there has been a widespread rise in charges which has given a decided upward twist to the general price level. While the policy of virtually guaranteeing pre-war profits—a privilege that is not shared by industry generally—is questionable, the Government does not seem to have given sufficient thought to the possibility of preventing, or slowing down, increases in charges, where it is to the general good, by the pooling of revenue or by other means, or, if necessary, by drafts upon the public purse. Nor, except in the case of shipping, has sufficient use been made of the possibility of discrimination between the charges made for different purposes, according to their importance in the war effort. Indeed, there seems no valid reason why the principle of charging adopted by the Ministry of Shipping should not also be applied to rail and road, assuming that the road haulage industry is to be fully controlled. Again, if some gas and electricity undertakings have been hard hit by evacuation or enemy action, and have been allowed to advance their rates by 50 per cent. or more, one solution would have been the formation of a pool for the earnings of these industries in order to spread the advance in costs over the industries as a whole.

Indeed, a search for an enlightened price policy in relation to public utility undertakings ends in disappointment because no such policy can be discovered. Each industry has been treated in isolation by the Government Department concerned. True, the conditions in which they operate differ widely, but it is surely not beyond the bounds of possibility to lay down, in a set of principles, the price policy most suitable to conditions of war.

War and Tobacco Shares

ON its record since the outbreak of war, tobacco comes near to being that Philosopher's Stone, Shareholder's Dream, and Chancellor's Delight—a commodity in completely inelastic demand. Although consumption statistics are unavailable, all the evidence suggests that the industry has taken heavy wartime increases in taxation and the war itself in its stride. The history of the last seventeen months, in fact, lends some colour to the “tobacco legend” of imperviousness to ill-fortune and infallible capacity to benefit from favourable chance, which has made tobacco company shares well-established favourites with conservative investors of all classes. Hardly any general unit trust formed before the war failed to include Imperial Tobacco (of Great Britain and Ireland) or British American Tobacco in its portfolio. And little more than a fortnight ago the chairman of the latter company gave “the interests of the numerous small stockholders” as a reason for the dividend policy which the company chose to follow.

This “legend” is worthy of closer examination, in the light of events and tendencies since the war started, because it is, in fact, the real security, and the only security, for Stock Exchange investment in tobacco shares. There are few industries about whose internal affairs the world knows less; for those responsible for the administration of the biggest tobacco concerns have made of reticence a fine art, and carried to its logical

conclusion the principle that dividends speak louder than words. There are, however, exceptions to all rules, and the last annual speech of the chairman of Carreras, the largest company outside the “Imperial” group, included an informative review of trading conditions in the first year of war, which certainly suggested that so far the “legend” has been largely borne out by facts.

Such difficulties as have arisen are certainly not on the demand side. The company's plants—including an auxiliary factory recently opened—are working at full capacity. The chief problems are productive, distributional and financial. The productive problem arises because manufacturers are allowed to clear 90 per cent. of normal tobacco supplies from bond, but import and currency restrictions do not permit of anything like proportionate replacement by new supplies of leaf from abroad. The distributional problem is due to evacuation of large numbers of people from the great cities, the development of war work in new areas, and the stationing of ever-increasing numbers of Army and Air Force personnel in new camps and barracks. The export position, however, has presented, on the whole, fewer difficulties than might have been expected, since lost markets in Europe were far less important for the tobacco trade than the much larger number in the rest of the world with which communications are still maintained. The financial problem is the result of three

Telegraphic Address : KANSALLISPANKKI

187

(a) Free of Tax. (b) Subject to Tax.

On the whole, therefore, the market's favourable, but cautious, estimate of tobacco share prospects may be as nearly right as any estimate can be in war-time, when nothing is certain and everything is possible. The verdict would seem to be, that investors who have tobacco shares in their portfolio should continue to hold them, but that any rise in their value, during the war, must come from a resumption of the recent upward tendency in equity shares generally, rather than from causes peculiar to the tobacco industry.

The short month of February is introducing its customary complications in the weekly tenders for Treasury bills. On Friday of last week the bills to be applied for fell into two scales: 88-day bills dated Tuesday of this week and 89-day bills dated all other days. The market syndicate appears to have spread its applications fairly evenly over the week, bidding £99 15s. for the 89-day bills and £99 15s. 1d. for the 88-day bills. The competition was exceptionally keen, as might have been foreseen from the fact that at the corresponding tender, three months previously, applications reached what was then the record level of £147,270,000. There was evidently a substantial volume of semi-official holdings of bills maturing, and to ensure their renewal the authorities, acting as agents of the holders, raised their bid price for the 89-day bills to £99 15s. 1d. At this figure all applications for both 88-day and 89-day bills were allotted in full, the actual amount of bills issued being £64,955,000, or £45,000 short of the maximum on offer. The market syndicate was allotted in full on its application for Tuesday bills, but missed the bills dated on other days of the week. The syndicate thus found itself with an allotment of bills equal to between 20 and 25 per cent. of the quota application of £65 millions. All these bills had to be taken up and paid for on Tuesday of this week. The outcome of the tender has been to reverse the slight recovery in bill rates which had been expected to develop this month. The average rate of discount on all bills allotted was £1 0s. 2.84d., compared with £1 0s. 4.40d. per cent. for the previous week.

The restrictions on the imports of Bank of England notes into the United Kingdom were further tightened up at the beginning of this week. From February 1st the right granted to anyone entering the United Kingdom to bring with him £10 of bank notes (a right conceded last August when a general ban on the re-import of bank notes was announced) has been restricted to *bona fide* travellers. The restriction of this facility is clearly aimed at seamen and others who in the course of their normal occupation make frequent journeys between the United Kingdom and neutral ports in which free markets in bank notes have developed. In Lisbon, for example, the Bank of England note has recently been quoted in terms of dollars at a discount of about 50 per cent. on the official sterling-dollar rate.

A decree recently promulgated by the Netherlands Government required refugees from Holland residing in the United Kingdom to register guilder notes in their possession with a Netherlands consulate during the fortnight which ended on February 4th. These notes have been stamped by the consulates in question, and from now on it is only to stamped notes that the facilities for conversion into sterling will apply, that is, at the rate of £10 per week. The registration of refugees' guilder notes must be regarded as a precautionary measure to guard against the possibility of notes making their way out of occupied territory, and being presented for conversion into sterling. In the case of Belgium and France such registration was required very soon after the influx of refugees from those countries was completed. That Holland should now have followed suit need not be taken as an indication that a sudden influx of guilder notes into this country has been discovered. It is a wholly precautionary measure applied at a time when the supply of guilder notes remaining in refugees' hands must have dwindled to very small proportions indeed.

THE TRUSTEE DEPARTMENT
54 LOMBARD STREET, LONDON, E.C.3
27 REGENT STREET, LONDON, S.W.1

£190,955 to £202,002 and in the rate of earnings for ordinary capital from 25.3 to 29.8 per cent. No doubt the major part of last year's improvement in earnings was due to realisation on the part of the public that the last chance to buy for stock was rapidly passing. Shortage of supplies, the purchase tax and bomb damage to property must tend to restrict a further rise in this source of income in the current year. The demand for footwear for the fighting services will no doubt increase for some time to come, but it is unlikely to yield as high a profit margin as sales of civilian footwear have done in 1940. In general, while utility will doubtless be more important than in the past, it is likely to remain the case that, with competition increasing for the smaller market, ability to gauge customers' taste will remain a decisive factor in the results of individual companies. Of the six companies, Weber and Phillips and John White manufacture only, while the others are interested also in retail shops. The figures give no clear answer to the question whether the simple manufacturer has an advantage over the vertical group, such as Lotus.

Further Investment Trust Results

A second batch of investment trust results—a first group was discussed in *The Economist* of January 4, 1941—confirms the view that revenue has on the whole been satisfactorily maintained during the first full year of war. In any case, none of the trusts, whose results for 1939-40 are analysed in the following table, has lowered its payment on equity capital, and one of them, Second Scottish Eastern, has actually raised its dividend from $\frac{1}{2}$ to 5 per cent. There are fewer cases where a higher total income has been realised than in the earlier list, but Second Scottish Eastern and Third Scottish Northern have both earned satisfactory increases in total revenue and equity surpluses alike. In the first case, the rate of equity earnings has improved from 5.3 to 7.3 per cent. and, in the second, from 3.4 to 3.9 per cent. Total earnings of Debenture Corporation again showed a moderate decline, but the equity surplus of £71,496 against £79,304 actually represents a rise in the earned rate from 11.5 to 11.9 per cent. The decline in total income, suffered by Great Northern Investment and River Plate and General Investment to £166,060 and to £59,823 respectively, are in both cases less than £1,000. It is clear that last year income losses have been much less severe, as far as investment trusts are concerned, than capital losses. In the majority of cases, no indica-

tion of the extent of the depreciation of market value of investments against book value is provided. Whatever the loss, there is no reason to suppose that investors would succumb to panic if told the truth. Indeed, there is good reason to believe that publication of current depreciation would be less alarming than the present cult of obscurity. It is interesting that the two trusts, which have continued to publish an estimate of depreciation, show a divergence between market and book value of no more than 20.6 per cent. in the case of Great Northern

* Not available. † With deduction of 1 year's preference dividend only: 0.5 per cent. after payment of preference arrears.
* Appreciation or depreciation compared with book cost.
† Excluding arrears of interest and dividends carried to Contingent Fund.
†† Investment depreciation shown after reserves.

Investment and of 31.34 per cent. in the case of Third Scottish Northern. At present prices, yields on investment trust stocks range between $5\frac{1}{2}$ and 7 per cent. and compare satisfactorily with general industrial yields. It is probable that dividends in the current year, influenced by lower net earnings for industry, may be moderately reduced, but the considerable resources of a large number of trusts will tend to promote stable dividend policy.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

WITH sentiment hopeful but cautious during the past week, and business before the week-end severely curtailed by the number of daylight alerts, price movements have generally been irregular and trendless. After some selling of gilt-edged at the beginning of the week, a moderate rally took place and prices in this market subsequently remained firm. Before the week-end, interest in home rail junior stocks revived and continued until mid-week. The market in industrial issues was weak on the whole, though at times the iron and steel section showed to advantage. In the mining and commodity markets, business was at a very low ebb.

* * *

After a day, in which business was restricted by constant alerts, at the close of last week, the gilt-edged market opened on Monday with prices rather easy and a long list of issues, including 2½ and 4 per cent. Consols, 2½, 3 and 4 per cent. Funding and Victory Bonds, all lost ½. On the following day these losses were mainly recovered, and 3½ per cent. War Loan, which was strongly in demand, put on ½ point to close at 103½. Subsequently, the demand for the funds was well maintained. In the foreign bond

market, Japanese issues returned to favour and most stocks improved, although on Tuesday the 4 per cent. bonds of 1899 eased ½ point. The market was characterised by a strong and persistent demand for French railways, and there was support for such miscellaneous issues as Czech, Austrian and Mexican bonds and for the City of Danzig 5 per cent. loan of 1925.

* * *

Renewed optimism regarding dividend prospects was responsible for further buying of junior home rail issues, marginal stocks were also in favour, and L.M.S. 5 per cent., redeemable 1955, improved 2 points on Tuesday. Before the week-end, Southern preferred gained ½ point and the deferred stock ½, and most of the other ordinary issues also improved, although L.N.E.R. preferred and deferred remained relatively neglected. Outside the home rail market, a sudden improvement in demand gave rise to a gain of 12 points in the price of Bengal and North Western on Tuesday, when Canadian Pacific ordinary eased ½, following a similar decline before the week-end.

* * *

In the industrial market most sections were weak. A number of aircraft issues, including Bristol, De Havilland, Fairey and Hawker, all lost ground early in the week. Among breweries,

Courage, Distillers and Bass were offered, and the tobacco leaders were also easy. The only section which showed general resistance to the downward trend was the iron and steel group, where small gains extended to Vickers, B.S.A., Guest Keen, Baldwins and Staveley. At no time was selling on a large scale, and price movements remained very narrow. Among general industrials, there was some reaction in the price of Associated Portland Cement, and both I.C.I. and Lever and Unilever were quoted lower. Brazilian Traction and International Nickel continued the downward course of recent weeks.

* * *

The kaffir market showed no tendency to give way on news of the Johannesburg riots, but dealing became subdued and turnover low. On later advices, prices were on the whole well maintained, Sub Nigel correcting a loss of ½ on Monday on the following day and E. Geduld, Rose Deep and Johnnies all improving. Although the market was sufficiently satisfied with the dividends declared before Tuesday's close by Ashanti and Bibiani, the reduction in the dividend of the former was responsible for the loss of a few pence in its price. Very little business took place in the rubber market, although Allied Sumatra was sold in a small way. In the oil market, sentiment revived on Tuesday under the

influence of renewed successes in Africa, and Anglo-Iranian, Shell and Trinidad Leaseholds were all supported. Throughout the week, Mexican Eagles enjoyed small but persistent buying.

New York

PREVAILING uncertainty as to the future of the international situation survived the week-end and continued to restrain improvements in prices. Before the week-end, newspaper publicity for the view that invasion of Britain was imminent served to depress prices, which generally recovered during the present week on the assumption that a technical rally is overdue. Both these movements, however, showed themselves only in fractional gains and losses, and price changes continued to be narrow, with business at a low ebb. Rail securities were a firm spot, but motor issues eased under market disappointment with the General Motors dividend, and steel and aircraft securities moved uncertainly. Among domestic influences, the Tax Bill is proving a sobering factor. In mid-week, markets became firmer under the leadership of steel issues. The Iron Age estimates steel mill activity at 96 per cent. of capacity, against 97 per cent. in the previous week, to which it had declined from 99 per cent.

ISSUES TO SHAREHOLDERS ONLY

Broken Hill Proprietary Co., Ltd.—Issue of 2,500,000 shares £A1 at par in proportion of 22 to every 100 shares of their holding as on February 14th, 1941. Australian Government has consented to the issue. Permission of the British Treasury has been granted for issue to shareholders on the London register. The new money is required for "Shipbuilding, munitions, and other war work."

Shorter Comments

This Week's Company Results.—A welcome revival in the earnings of ENGLISH VELVET AND CORD DYERS has permitted the company to declare an ordinary dividend of 2½ per cent. against nil. Gross profits rose from £40,014 to £57,399, and net earnings even more strikingly from £13,952 to £36,550. OMNIUM INVESTMENT TRUST is maintaining the 3½ per cent. ordinary payment with earnings which show a slight increase in both gross and net totals from £114,076 to £115,134 and from £52,350 to £53,598 respectively. GENERAL CONSOLIDATED INVESTMENT has suffered a moderate decline in total revenue from £94,971 to £88,392 and in the net figure from £39,686 to £31,854, but is repeating the 7 per cent. dividend. Total income of the YORKSHIRE WATERWORKS improved from £68,607 to £79,557, but increased allocations to depreciation caused a small decline in net profits from £11,784 to £11,608. This company is also repeating the previous year's 7 per cent. dividend. The reduction in net earnings of THOMAS MARSHALL, MARLBECK, clothing manufacturers, from £31,417 to £18,849, despite a rise in gross profits from £64,931 to £72,179, is due to the company's sharply increased tax liability. The 25 per cent. ordinary dividend is maintained.

Industry and Trade

Unemployment in January

The reduction in unemployment between December 9th and January 13th was small; the number of persons on the registers of employment exchanges in Great Britain fell by only 9,673, from 705,279 to 695,606. It should be remembered, however, that normally unemployment shows a sharp seasonal increase between December and January; a year ago, for example, the number registered as unemployed rose from 1,362,000 to 1,519,000. Further analysis of the returns shows that the number of wholly unemployed fell by 20,512 to 521,388 on January 13th, and that the number temporarily stopped and normally in casual employment rose by 10,839 to 174,218. Changes in the number of registered unemployed, however, are no longer an indication of the increase in the intensity of the war effort on the economic front. It may be difficult to reduce the unemployment register below the half-million mark, for some persons will always be between two jobs, while others will be temporarily unemployed through adverse weather conditions, for example. But there is considerable scope for speeding-up the transfer of labour from unessential to essential occupations.

* * *

Improvement in Overseas Trade

The trade returns for December reflect the reduction in the intensity of the battle on the Atlantic front and the decrease in the number of air raids upon this country. The improvement in trade has been small, but is nevertheless welcome. Imports rose in value from £72.9 millions in November to £73.6 millions in December, while domestic exports increased from £21.7 millions to £24.4 millions. Compared with the corresponding month in 1939, however, the value of imports last December showed a decline of 15 per cent. and that of domestic exports one of 40 per cent. Moreover, in view

U.K. IMPORTS AND EXPORTS

	1938	1939	1940	Change between 1939 and 1940
<i>December</i>	£'000	£'000	£'000	£'000
Total imports	74,132	86,585	73,575	- 13,010
British exports	39,098	40,169	24,397	- 15,772
Re-exports	4,770	2,500	653	- 1,848
Total exports	43,877	42,670	25,050	- 17,620
Excess imports over exp'ts	30,255	43,915	48,525	+ 4,610
Transshipments under bond	2,852	2,270	376	- 1,894
<i>Twelve Months ending December</i>				
Total imports	619,509	885,513	1,099,869	+ 214,356
British exports	470,755	439,536	413,084	- 26,452
Re-exports	61,525	46,033	26,189	- 19,844
Total exports	532,280	485,569	439,278	- 46,296
Excess imports over exp'ts	387,229	399,944	660,596	+ 260,652
Transshipments under bond	32,530	29,551	3,104	- 26,447

of the rise in prices during the past year, the decrease in the volume of trade must have been appreciably greater than the fall in its value. There was a decrease between November and December in the value of the intake of food and drink and of raw materials, but an increase in that of manufactures—chiefly in the non-ferrous metals, oils, fats and resins, and vehicles categories. The improvement in exports was fairly general; it included vehicles, textiles, iron and steel, pottery and glass and chemicals. Shipments of machinery and of coal showed a further decline; those of coal were only £679,000 last December, against £3,508,000 a year earlier. A survey of the course of the trade in the past year shows that imports and exports rose steadily during the first four months, but fell abruptly from May onwards with the extension of the Nazi hegemony on the Continent. Recovery later in the year was prevented by the intensification of Germany's submarine-air attacks upon merchant ships and ports. The value of domestic exports last year was 6.1 per cent. smaller than in 1939, but that of imports still showed an increase of 24 per cent. As a result the excess of imports over exports showed a further increase of £261 millions to £661 millions in 1940.

Plan for Cotton

On Saturday of last week Mr Raymond Streat, chairman of the Cotton Board, gave an account of the Board's work and of the kind of policy that would ensure the cotton trade's future after the war. He pointed out that, in his view, international trade and foreign exchange dealings will continue to be subject to a measure of control after the war and that other countries will agree to take cotton goods from the United Kingdom only if prices and quality were attractive. The cotton industry must forget its squabbles and present a united front if it is to achieve prosperity after the war. Mr. Streat outlined a six-point plan of campaign: Cotton goods must be given "a front seat" by the Government in international trade agreements; their prices must be controlled to prevent both flagrant profit-making when demand is great and selling at a loss when the market is weak; mercantile practice must be adjusted to a system of managed prices; technical progress must be encouraged and applied to the full; the basis on which wages are regulated must be brought up to date so as not to hinder technical progress; lastly, the best use must be made of modern methods of propaganda, sales promotion and market research. There is much to be said for thinking ahead in order to prevent a repetition of the mistakes made by the cotton trade after the last war. If it faced post-war conditions without a plan the industry might well drift into disaster. But on the question of price control, in particular, much hard thinking still remains to be done in the light of the results shown by the experiments made during the war.

* * *

Retail Trade in December

While the average daily value of retail sales of food and perishable articles in December, as given in this week's *Board of Trade Journal*, was 0.8 per cent. higher than in the corresponding month of 1939, the turnover of other merchandise showed a decline of 6.7 per cent. The percentage changes, from the corresponding months in 1939, in the average daily value of sales from August to December last year are as follows:—

	Percentage Change from 1939.
<i>1940</i>	
August	+5.4
September	+21.0
October	+6.7
November	+20.9
December	+1.3
	-6.7

In view of the heavy purchases made before the purchase tax became fully operative, a decline in sales of non-food goods in December was not unexpected. But as the purchase tax had been in operation long enough by December to raise the prices of an appreciable proportion of the goods sold in that month, the fall in the volume of sales must have been considerably greater than the decline in their value. Another factor contributing to the fall in non-food sales was the more drastic limitation, from December 1st, of the supplies of goods covered by the Limitation of Supplies (Miscellaneous) Order.

Purchases of Surplus Commodities

In order to provide Continental countries with ample food and raw materials after the war and to relieve the distress of primary producing countries during the conflict, steps are being taken to accumulate substantial reserve stocks of such products. The latest development has been the appointment, by the Free Dutch Government, of a special commissioner to acquire a four to six months' supply of food and raw materials to be shipped to Holland after its liberation from the Nazi yoke. Moreover, in order to assist the Belgian Congo and the Free French colonies, now cut off from their principal markets, the British Government has

decided to purchase large quantities of their exportable surplus of primary products. By an agreement with the Belgian Congo, the British Government undertook to buy 126,000 tons of copper a year, as well as large quantities of the colony's output of palm kernels and palm oil and the whole of its gold production amounting to nearly 500,000 ounces per annum. A similar agreement with the Cameroons provides for the purchase of that colony's cocoa crop, of its output of palm kernels, palm oil, groundnuts and certain other oilseeds, of part of its coffee and banana crops, and of timber. Britain's purchase of copper from the Congo—whose potential output is 200,000 tons per annum—and America's purchase of Chilean copper should go a long way towards alleviating the difficulties on the world's copper market. So far as palm kernels are concerned, the Congo exported almost

100,000 tons of these each year before the war and was thus the largest non-British exporting country. Another 40,000 to 50,000 tons per annum were normally exported by the Cameroons. The combined total of nearly 150,000 tons represents about one-fifth of pre-war world exports. The Congo also exported nearly 70,000 tons, and the Cameroons about 10,000 tons, of palm oil per annum before the war, out of total world exports of slightly less than 500,000 tons. The surplus of vegetable oils and oilseeds is at present particularly large. In cocoa, the markets for which have also dwindled, the Cameroons used to export about 30,000 tons and the Congo about 10,000 tons per annum. Altogether the agreements with the Belgian Congo and the French Cameroons should materially assist these colonies in marketing their surplus of primary products.

Metals.—It is reported that allocations of steel for tinplate manufacture are to be reduced. Stocks of tin in the United Kingdom were 4,187 tons at the end of January, compared with 5,209 tons in December; United States stocks were 32,484 tons, including stocks afloat, against 31,646 tons.

*

Oils and Oilseeds.—The supply position of vegetable oils is satisfactory. The official maximum prices of controlled oils and fats operating in January are to continue throughout February. The United Kingdom extraction mills and oil refineries are well employed, in many cases to the limit of capacity, and generous allocations of edible oils are made to margarine and cooking compound manufacturers; and also to meet the current requirements of the soap and paint trades and other technical users.

COMPANY MEETINGS

DISTRICT BANK LIMITED

LARGE INCREASE IN DEPOSITS
EFFECTS OF GOVERNMENT'S WARTIME POLICY
THE EXPORT TRADE DRIVE
IMPORTANCE OF COMPETITIVE PRICES
SIR R. NOTON BARCLAY'S SURVEY

The one hundred and eleventh annual meeting of shareholders of District Bank, Ltd., was held, on the 31st ultimo, at the Head Office, Spring Gardens, Manchester.

Mr R. Noton Barclay, the chairman, presided. His speech was as follows:—

As war-time conditions make it difficult for many shareholders to attend our annual meeting, and since the Government discourages large gatherings, I have thought it advisable to circulate advance copies of this year's address.

Before I discuss the accounts and trading results for the past twelve months I have, with deep regret, to announce the recent death of our esteemed colleague Mr George Lockhart McKelvie. Our associations with him extend over many years, since he was the survivor of the three Bank of Whitehaven directors who joined our board when, in 1916, we took over that bank.

Then I should like to refer to the honour which has this year been conferred upon our director Sir Kenneth Lee. I know that you will join me in expressing pleasure at this further recognition of his valuable public services, in which, of course, he is still actively engaged as a member of the British Mission recently sent by the Government to South America. In his absence on this important work we wish him every success.

You will be sorry to learn that Mr Leslie Shaw, one of the bank's auditors, has suffered bereavement and also physical injuries by enemy action. Under the circumstances he has not been able to co-operate with Messrs Halliday, Pearson and Company in auditing the accounts, and, therefore, the auditors' certificate is not signed by him. I am sure you will desire me to express our sympathy with him and also to wish him a speedy recovery.

DEPOSITS EXCEED £100,000,000

The effects of Government war-time policy are reflected in our balance-sheet, and the most noticeable feature is the sharp increase this year in deposits of over £14 millions, which for the first time in the bank's history exceed £100 millions. While part of the present year's increase is, to a certain extent, fortuitous, I may point out that, prior to the war, the deposits of the bank were showing considerable annual increases. The present figures may be compared with the deposits of £73 millions following the amalgamation with the County Bank in 1935.

In the expansion of our resources this year our experience has been similar to that of the other clearing banks. Part of the increased deposits has resulted from delays in the postal services, which increase the average time taken in the clearing of cheques. This augments deposits, since larger balances result from the fact that cheques issued to distant payees are not debited within the normal period.

Other reasons for increased deposits are abnormal ready balances which business concerns keep as reserves available for payment of heavier taxation, including Excess Profits Tax, National Defence Contribution and Purchase Tax. Government restrictions of supplies orders also mean large idle resources being turned over to the banks by merchants and manufacturers. For most of the remainder of the increase in deposits we must look to the Government's war expenditure, which increasingly finds its way into the banking system.

ASSISTANCE TO THE GOVERNMENT

Our assets reflect the employment of the additional deposits to which I have referred. Our large cash holdings, together with

other short assets, represent a ratio of 42 per cent. of our deposit liabilities. The comparable figure for last year was 35 per cent., and such a notable increase in these first lines of defence is to be explained by Treasury deposit receipts, which at £12 millions make their first appearance and represent six monthly loans to the Government maturing at successive dates.

These loans, together with Treasury Bills, constitute the short-term assistance which we provide for the Government towards financing the war. To this must be added longer-term advances in the form of British Government securities, to our holdings of which we added over three millions during the period under review. Our investments are mainly repayable at fixed dates and appear in the balance-sheet at much less than their market value.

FACTORS CONTRIBUTING TO THE DECLINE IN LENDINGS

Our lendings have declined from the figure of a year ago. It should be observed that the Ministry of Supply, through the allocation of raw materials, is able to regulate production. The effect is that a big expansion of business has been brought to certain industries engaged on war contracts, and finance has been readily provided by us to expedite such important work. On the other hand, non-essential industries have been unable to obtain supplies; consequently their trade has been seriously curtailed, with the result that they require less banking accommodation. The completion of long-term constructional war contracts has accounted for some repayment of advances, whilst the speeding up of Government payments has also liquidated many outstanding bank loans.

Furthermore, the Government itself now finances many bulk purchases and stocks of raw materials which previously were handled by merchants and traders with the backing of their bankers. The activity of the building trade has diminished and the accommodation granted in the past is being repaid. Such factors have all contributed to the decline in our lendings, and to these must be added repayments of private advances and of normal borrowings which have no place in our war effort.

BANK PROPERTY

Bank property now stands at £1,532,704 a decline of £60,500 as compared with last year. Our expenditure on opening new branches has, of course, ceased for the time being, and, while certain additions and alterations to existing branches have been necessary, the account reflects the appropriation made to write down the value of this item. I may mention here that a certain amount of damage by enemy action has occurred at some of our branches, and where it has been necessary temporarily to vacate the premises we have been housed by other banks, to whom I would take this opportunity of expressing our appreciation and thanks for their assistance. We have in some cases been able to reciprocate this kindness.

PROFIT AND LOSS ACCOUNT

To those who may think that an expansion of resources necessarily means proportionately increased prosperity for the banks, it is as well to point out that we have to pay interest on these additional deposits. Over 10 per cent. of this new money is held in cash which earns nothing, and between 20 and 30 per cent. in short assets, earning only 1 per cent. per annum, or, in the case of Treasury deposits, 1½ per cent. per annum. Then the war has in many ways heavily increased our expenses,

amongst other items of which I may mention increased emoluments to the staff, the allowances paid to those members of the staff serving with H.M. Forces to which I referred last year, the heavy demands upon us in relation to air-raid precautions, and enhanced costs of stationery and mechanical equipment, transmission of cash, etc.

Taking these items in conjunction with the considerable increase in taxation, we must expect some reduction in net profits. As usual, our profit is arrived at after full provision has been made for bad and doubtful debts, including provision for possible loss on amounts owing by debtors in enemy-occupied countries. Notwithstanding the large foreign business conducted by the bank and the rapidity with which such countries were overrun by the enemy, I am pleased that the management have been able to confine these latter risks to a figure which will probably entail little or no ultimate loss. We have, however, considered it prudent to make provision against them.

At £446,018 the net profit is £44,072 less than the previous year.

TRADE CONDITIONS

It is difficult nowadays to give a survey of trade as a whole as so many industries are engaged primarily on war work. Owing to the exigencies of the present situation many businesses regarded as being of a non-essential character are having their activities very substantially curtailed, and we can only sympathise with them in the position in which they find themselves.

The effects of the last war on the Lancashire cotton industry are well known. Prior to 1914 this country was the largest world exporter of cotton goods and exports far exceeded home consumption. Subsequent to that war our exports seriously declined and we had to rely to a very large extent on our home trade. It is, of course, impossible to forecast the effects of the present war. There is a large demand for a variety of types of cotton goods for the Services, but that demand is not sufficient to keep the whole of the industry in anything approaching full employment.

ORGANISATIONS TO FOSTER EXPORT TRADE

The Government is anxious that exports should be increased to provide the necessary exchange to assist in paying for essential imports. With this in view, organisations have been set up to develop the export trade by regulating both the manufacture and the sale of cotton goods, with the dual object of freeing mills for export business and reducing expenditure by people in this country on such goods.

In order to achieve this the production of goods for home consumption has been restricted, and it will be appreciated that this raises many problems.

If exports are to be increased it can only be on a competitive basis, that is, by selling the manufactured articles at a price equal to or lower than that of competitors, but unless the demand for these goods is such that it will replace the forcibly reduced demand from the home consumer, the cost of production is raised.

Moreover, with further wage increases (now approximating 30 per cent. more than pre-war rates in the spinning and weaving sections of the industry) production costs again will be advanced. Some of these higher costs may be offset by the organisation of the Cotton Board, whose primary function is to direct exports through syndicates or through the recently formed subsidiary to the Board, British Overseas Cottons, Ltd.

CENTRAL RAYON OFFICE LIMITED

In endeavouring to organise the cotton trade to meet war conditions, we must not lose sight of the post-war prospects of the industry. Our future problems are going to be difficult, more difficult than they were after the last war.

What applies to the cotton trade is also applicable to certain other of our export industries, and in this connection I might mention rayon, which is used either in place of or along with cotton to a considerable extent. I am pleased to say that this industry also is taking steps which it is hoped will result in

holding and capturing markets. The Rayon Export Group has formed a company, Central Rayon Office, Ltd., whose objects are the organising and arranging for the production of rayon goods suitable for the export trade, with provision for financial assistance from the industry as a whole. We wish them every success in their efforts.

LOYAL SERVICES OF THE STAFF

During the past year war conditions have imposed increasingly heavy calls upon our staff. Our grateful thanks are due to those members of the staff in our principal offices who have acted as voluntary fire-watchers and have been, in turn, on duty every night since the outbreak of war. They do not take shelter, but patrol the different floors of their respective buildings during an alarm. Incendiary bombs have fallen on several of our offices, and it is due to the energetic and unceasing vigilance of our watchers that in such premises we have escaped an outbreak of fire. Also, as more and more of our younger men have been called to the Colours, many of those who remain have had to undertake more work and greater responsibilities, owing not only to reduction of staff but also to the additional supervision needed with a less experienced staff.

Again, the temporary evacuation of some offices arising from enemy action has involved additional strain on many of our executive officers. Through it all be it remembered that the majority of the staff are, in common with others, giving their erstwhile leisure hours to Home Guard, A.R.P. and other activities in furtherance of the war effort.

It is, therefore, with more than usual earnestness that I avail myself of this opportunity to place on record our warm appreciation of the loyal and devoted services rendered to the bank in these exceptionally difficult times by our chief officials and by the whole of the staff.

The report and accounts were adopted and the retiring directors were re-elected.

Messrs Halliday, Pearson and Company and Mr Leslie Shaw, the retiring auditors, were reappointed.

After the usual vote of thanks the proceedings terminated.

THE NATIONAL BANK LIMITED

IMPORTANCE OF HOME PRODUCTION

The annual general meeting of the National Bank Limited was held, on the 30th ultimo, in London.

Sir George F. Murphy, Bart. (deputy chairman), who presided, said: On reference to the profit and loss account it will be seen that we propose to pay a dividend at the rate of 10 per cent per annum, less income tax, and that we transferred £10,000 to contingencies account, carrying forward £42,890.

In spite of the difficult and anxious times through which we are passing, the bank's position remains sound and liquid.

The continuance of armed conflict of the most destructive nature has, of course, severely restricted the field of profitable investment, and this, together with the importance of maintaining a high degree of liquidity, has caused a falling off in our gross income, while, on the other hand, heavy taxation and increased cost of all items essential to the conduct of our business have added considerably to our working expenses.

In the abnormal times through which we are living no one can expect to remain unaffected while the industries and resources of mankind are being diverted from their peace-time activities. The Government finds it necessary to impose restrictions and require sacrifices which would never be undertaken except in face of the gravest emergency. The growing tax burden can be lessened only by an increase in individual savings and the importance of restricting consumption cannot be too strongly emphasised. With the limitation of shipping space the home production of those imports no longer available becomes a matter of urgent necessity. Here the farming industry is of paramount importance, and it is to be hoped that when happier times return the efforts of this industry will be rewarded by a more general recognition of the fundamental position of agriculture in the economy of the nation. Each section of the community has its special task for the good of all, and the banking profession has willingly co-operated with the authorities in various measures essential to the maintenance of trade and industry.

The report and accounts were unanimously adopted.

HAWKER SIDDELEY AIRCRAFT
COMPANY LIMITED

STATEMENT BY THE CHAIRMAN

The following is the statement of Mr. Thomas O. M. Sopwith, C.B.E., F.R.Ae.S. (chairman of the company), to be presented at the annual general meeting of the company, to be held on February 12, 1941.

This, our fifth annual general meeting, takes place after a year which has been one of the most eventful in the history of the nation. That we are enabled to meet to-day is largely due to the heroic work of the fighter squadrons of the Royal Air Force during the period known as the "Battle of Britain," and you will, I am sure, share my pride in the fact that the Hawker "Hurricane" was not only the backbone, but formed the majority of the aircraft flown by that gallant band to whom the Prime Minister referred in the House of Commons when he informed members that "never before had so many owed so much to so few."

THE LOAN POSITION

The accounts show the comparative figures at the corresponding date last year. At that time we had a very substantial balance at the bank, represented by the unused proceeds of our debenture issue. This balance has now been fully absorbed by additional loans to our operating companies to enable them partially to finance work in progress for the Government. The loans now amount to £3,386,250 (as against £2,186,250 last year). In view of the fact that at the termination of the present abnormal conditions the operating companies will be in a position to repay the loans they have received, no further provision for the redemption of the debenture stock is necessary.

We have again provided for the redemption of the necessary number of 5 per cent. redeemable cumulative preference shares in accordance with the terms of their issue.

The profit and loss account shows receipts from dividends and interest at £817,717 after providing for taxation.

Provision has been made by all the operating companies for reserves and contingencies on such a scale as their directors consider advisable.

Your board recommend approval of a final dividend of 17½ per cent., less tax, which, with the 15 per cent., less tax, interim dividend already paid, brings the year's total up to 32½ per cent., less tax, and allows a carry-forward of £320,447, an increase of £99,435 over the previous year. This dividend is the same as that distributed last year.

Taxation makes a very heavy call upon profits, and while I do not dispute either the need for, or the equity of, the burden, I hope the Chancellor of the Exchequer in his wisdom will not lightly disregard the need to permit industry to make adequate provision for resources to be applied to meeting post-war conditions.

WORK OF OPERATING COMPANIES

You will understand that I can only refer in broad and general terms to a subject which is of vital importance to us all individually and nationally—the work of the operating companies. Their achievements are in advance of anything anticipated a few years ago, and in face of many difficulties they have succeeded in maintaining a very high standard of output.

You have read of the many stirring exploits of the "Hurricane" pilots—British and Allied—at home and abroad, and of the dashing work of the Australian pilots with the "Gladiator" in Northern Africa and Albania. You have heard of the many important long distance bombing raids carried out by the "Whitley"—of the less spectacular but no less effective job of the "Anson" on coastal reconnaissance work, and of the "Cheetah" engine—one of the most reliable power units in the world. All these are products of this organisation.

You have seen references to new types which indicate that design and research are showing results such as I am confident will bring even greater help to the nation. In other branches of supplies to the Forces I can report equally satisfactory progress.

I cannot say anything of the immediate future. I am confident that the interests of the shareholders are best served by the continuous and whole-hearted contribution to the national effort, and that outlook dictates our policy.

DALGETY AND COMPANY, LIMITED

RECORD WOOL PRODUCTION

THE HON. EDMUND PARKER'S ADDRESS

The adjourned fifty-sixth annual general meeting of Dalgety and Company, Ltd., was held, on the 30th ultimo, at 65 Leadenhall Street, London.

The Hon. Edmund W. Parker (the chairman of the company), who presided, in the course of his speech, said: Both the Commonwealth and the Dominion may be said to have enjoyed a period of prosperity during the year under review, which naturally has been reflected in the results of your company. This prosperity may be largely attributed to the purchase of the entire Australian and New Zealand wool clips by the British Government for the duration of the war and one year afterwards, at prices approximately 30 per cent. above those ruling in the previous season. Growers were thus assured of a market at a reasonable level of values at a time when the disposal of their wool might have proved difficult and, in certain events, impossible.

WOOL AND WHEAT

A record volume of wool was dealt with, due to greatly increased production in the Commonwealth and to the fact that wools normally shipped overseas for sale were in the main appraised in the countries of origin. It is not expected that last season's high level of production will be maintained in Australia, as seasonal conditions are less favourable, but the official estimate of the 1940-41 clip is 3,500,000 bales, including 153,000 bales of skin wool.

In New Zealand, owing to exceptionally favourable seasonal conditions, the clip is expected to show a substantial increase over 1939-40. I feel, however, that I should sound this note of warning. Owing to various reasons, including the temporary loss of the continental market, consumption probably lags behind production, and thus some piling up of stocks appears likely. This will accentuate marketing problems after the war.

As regards wheat, I fear once again it is not possible for me to give as comprehensive a survey as was my custom in more peaceful times. As you know, the entire buying programme for the United Kingdom is in the hands of the Government, and, if I may say so, has, in my opinion, been most competently handled.

MEAT, TALLOW AND BUTTER

Frozen meat, copra, tallow and butter are all now controlled by the Government; frozen meat and butter being sold direct by the Australian and New Zealand Governments. Your company, therefore, does not take any part in the importations to the United Kingdom, since these commodities are requisitioned by the authorities immediately on arrival.

Copra is a product which in times of peace is used to a very large extent on the Continent, but this trade has now ceased. A useful outlet has, however, been found in America, and this has in part compensated for the loss of the European trade, and further developments of it are hoped for. The Ministry of Food are purchasers of tallow, and I am glad to say that we continue to maintain our share of this trade.

In East Africa we continue to make satisfactory progress. The burden of taxation is extremely disconcerting, although inevitable in these times. It is not only in the Commonwealth that we have to bear this, but also in the Dominion and, as you know, very heavily in the Old Country.

THE DIVIDEND

I feel sure that you will all be satisfied with the further interim dividend of 4s. per share, making 7 per cent. for the year, which was paid on December 20th last. It is a good distribution in these times, and an improvement on recent years, but I cannot make any forecast as to the future. The season in Australia up till recently has been causing us great anxiety, but I am glad to say that we have news of a certain amount of relief which may put a different aspect on the situation.

The report and accounts were unanimously adopted.

1st February, 1941.

SHORTER COMMENTS

(Continued from page 191)

Canadian Pacific Railway.—Aggregate net earnings of the Canadian Pacific Railway for 1940 \$35,639,000, an increase of \$7,115,000 over 1939.

English Velvet and Cord Dyers' Association, Ltd.—Profit 1940, £57,399 (£40,014). To depreciation, £17,261 (£17,683). Debenture interest, £8,379 (£8,379). Surplus on realisation of investments, £4,791. Net profit, £31,759 (£13,752). Preference dividend 3½ years to end of 1940, £21,321. Ordinary dividend 2½ per cent. (nil). Carry forward, £14,286 (£5,312).

Peter Robinson, Ltd.—Proposals are under discussion for a moratorium in respect of debenture interest and sinking fund. Payment due on February 1st to be withheld.

Fison, Packard & Prentice.—Total profit of group for year to June 30th, 1940, £445,815 (£331,385). Taxation, £227,857 (£83,383). Ordinary dividend 10 per cent. repeated. Carry forward, £534,946 (£515,341).

Bell & Nicolson.—Trading profit, year 1940 (after taxation and bad debts), £41,032 (£48,578). Net profit, £35,877 (£43,625). Ordinary dividend unchanged at 14 per cent. Carry forward, £35,161 (£25,044).

General Engineering Co. (Radcliffe).—Net profit, year to November 30, £8,671 (£4,327), after taxation, £13,883 (£4,965). Ordinary dividend 15 per cent. against 10 per cent.

Barrow, Hepburn & Gale.—Ordinary dividend of 6 per cent. recommended for 1940 as in 1939. Net profits for 1940 £67,583 (£80,129 after £10,828 written off shares in subsidiaries).

United States Steel Corporation.—Net income, fourth quarter, 1940, \$32,763,000 (\$28,729,000). Total net income for 1940, \$102,181,000 (\$41,120,000).

Scottish Stockholders Investment Trust.—Net revenue for the year to November 30 £21,795 (£20,081). A dividend of 5½ per cent. is again paid on preference stock, £400 (against £200) is provided for taxation, and £11,655 is carried forward (against £10,060). Preference dividends remain 12 months in arrear. A valuation of the investments shows a depreciation of 27.1 per cent. (against 23.8 per cent.).

Ashanti Goldfields.—Aggregate profit year to September 30th, 1940, £1,408,333, against a gross profit of £1,721,294, and a net profit of £1,354,722 in 1938-9. Ordinary dividend reduced from 95 to 80 per cent.

ASHANTI GOLDFIELDS CORPORATION LIMITED

NOTICE IS HEREBY GIVEN that a Final Dividend (No. 88) of 35 per cent., less Income Tax at 8s. 6d. in the £, has this day been RECOMMENDED on the issued Capital of the Corporation in respect of the year ended 30th September, 1940, and will be payable on and after the 26th March, 1941, to all Shareholders on the Registers on the 4th February, 1941.

The TRANSFER BOOKS will be CLOSED from the 5th to the 12th February, 1941, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,

H. E. ASHBY, Manager and Secretary.

Temporary Registered Office:

St. Hilda's School, Bushey, Herts.

4th February, 1941.

BIBIANI (1927) LIMITED

NOTICE IS HEREBY GIVEN that a Dividend (No. 7) of 17½ per cent., less Income Tax at 6s. 1d. in the £, has this day been RECOMMENDED on the Capital of the Company in respect of the year ended 30th September, 1940, and will be payable on and after the 26th March, 1941, to all Members on the Registers on the 4th February, 1941.

The TRANSFER BOOKS will be CLOSED from 5th to 12th February, 1941, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,

H. E. ASHBY, Secretary.

Bulgaria's Turn

MR CHURCHILL'S grave words on the plight of Bulgaria in his broadcast on Sunday brought the case of that unhappy country into the centre of the news. The Bulgarians can no longer deceive themselves into hoping that Britain will turn a blind eye to a quiet absorption of their country by Germany and the strategic problem of meeting a new German advance is put squarely before Britain and her allies, Greece and Turkey. Germany would perhaps have preferred a slower process of penetration, but Greece's resistance and the utter rout of Italy have made resistance and more brutal methods necessary. The easiest way to help Italy is to take Salonika, and Salonika can best be reached through Bulgaria. Hitler is already fighting on an Atlantic and a Mediterranean front. He cannot risk the opening of a third.

The German advance could perhaps have been checked by a resolute Bulgarian stand, and until recently the independent and courageous tone of King Boris and his Ministers suggested that a stand would be made. On January 12th M. Filoff declared his country's determination to defend its integrity "by arms if necessary," and only last week M. Bagrianoff, the ambitious and Nazi-inclined Minister of Agriculture, was dismissed from his office. A stand seemed all the more likely in the light of the various defensive possibilities open to the Bulgarians. There was Soviet Russia, linked with Bulgaria by common ties of blood and speech and by an overwhelming strategic interest in the Black Sea and the Straits. Another alternative—a combination with Turkey, Greece and even Yugoslavia—had the advantage of entailing the strong possibility of British support. Of all the ways open to Bulgaria, that of complete surrender to Germany seemed the least attractive. The people had only to look north to their Roumanian neighbour to see the price of collapse.

But it appears that surrender has been preferred. Military infiltration goes forward without any official protest, and Sofia is now describing resistance as "suicide" and attempting to secure Turkey's passivity if German troops are allowed transit. The primary reason behind the collapse is fear. Germany has mustered a large striking force on the northern frontier, and the Bulgarians must have felt that the acceptance of any outside help—whether from Russia or from her southern neighbours—would have automatically transformed Bulgarian territory into a battlefield. And behind this fear is perhaps the feeling which has already done Britain so much disservice among hesitant neutrals—that a small nation has less to fear from a victorious Britain than from a victorious Germany, and that it is better to appease Germany so long as the issue is undecided.

Behind these general grounds for inaction lie particular objections to each alternative line of policy open to Bulgaria. It may be true that M. Soboleff, the Russian envoy who visited Sofia two months ago and who returned there recently, brought on both occasions the offer of a military alliance provided Bulgaria would make a stand. It would be an astonishing break with Russia's previous diplomatic practice vis-à-vis Germany, yet the Kremlin may have argued that a stand in Bulgaria would have called Hitler's bluff—if it was bluff. But from the Bulgarian standpoint, the fate of the Baltic States makes a Russian guarantee a very doubtful blessing, and the ruling class at least must prefer German to Soviet occupation since, while both bring servitude, the former guarantees them something of their old status. Moreover, the Bulgarians may have argued that Russia's offer was insincere, and that, had they accepted it, they would have been left facing an enraged Germany while Russia conducted a "tactical withdrawal." Whatever the reason, the Russian

proposals, if made, were rejected, and now Russia is hinting that if Germany occupies the country, she must have bases to guard the mouth of the Danube and the Black Sea. This suggests a joint move on the Roumanian model, Russia getting the Dobrudja as she got Bessarabia, and Germany the rest.

An understanding with Turkey and Greece, backed by Britain, bore none of the risks of a Russian guarantee. There would have been no risk of absorption, and Britain had formally undertaken to secure Bulgaria's integrity and independence at an eventual peace settlement. Here, however, old antipathies, skilfully exploited by German propaganda, were probably the obstacle. King Boris and his Ministers have been very moderate over Bulgaria's revisionist claims, but they could not abandon them, and it may well have been the nationalist, pro-Nazi army that refused co-operation with Turkey, from whom Bulgaria claims Adrianople, or with Greece, from whom she asks Greek Macedonia and an Aegean coastline. It is also possible that the Bulgarians would have liked to stipulate conditions for co-operation, involving a new territorial settlement, and to this neither of her potential allies would agree. Revisionism has always defeated Balkan unity. It is certainly no less active to-day.

Bulgaria may, too, during the autumn of 1940, while the German pressure increased, have entertained some doubts over the efficacy of the help Great Britain and her neighbours could offer. Greece is fully engaged, Turkey has shown an alarming tendency to restrict the geographical scope of her "security zone" with each new Axis encroachment and, until quite recently, Great Britain's military power in the Near East seemed to be on the retreat rather than ready for new ventures, while her diplomacy was hardly such as to create real confidence in her power and willingness to give assistance. Here, however, is a situation which can surely be put right. The impression of diplomatic weakness should be rectified by firm action in Roumania. The Government has at last recognized that Roumania is part of the

Reich, and very properly, if belatedly, taken steps to break off diplomatic relations. But Britain should go further. Roumania contains the most vulnerable and largest single source of Germany's most vital war material. Contrary to official statements, the Roumanian oil wells are inflammable, incendiary bombs could cause chaos by igniting the national gas which Roumanian methods of boring sets free in large quantities, the area is practically restricted to Ploesti and the refining plant is vital to Germany, who cannot refine anything like all the oil in her own plants. The grip of winter is still on the country, water supplies are frozen, and the whole business of fire-fighting is complicated as a result. If it is militarily practicable, now surely is the time to strike a blow which will not only damage Germany's supplies system but will also be a reminder to Sofia that complete immunity cannot be purchased by surrender.

Nor is Britain's military weakness so apparent to-day. In Africa she has a victorious army which has secured astonishing results with remarkably little damage to its efficiency and which will soon be free for operations elsewhere in the Near East. Britain's freedom of manoeuvre is very great in a sea in which she has complete mastery, and her air assistance to Greece has already been effective. Very belatedly, but perhaps not too late, Britain is in a position to exercise counter pressure in an area which has hitherto been Germany's preserve and to make certain that the land front in Europe, of which grand strategy is so greatly in need, will not be allowed to go simply by default. Turkey is Britain's ally, non-belligerent so far, but the crisis for which the alliance was first planned is already upon the Balkans, and firm diplomacy on the part of the British Government can still at this juncture rouse the Turks to their opportunities and responsibilities—if not the Bulgars to the risks they run. Britain, with her victories behind her and the vast possibilities of Anglo-American collaboration opening out ahead, is a power and a portent even in the Balkans provided the strength of her diplomacy keeps pace with her increase in military strength.

The Battle of the Gap

THE promised pre-Budget debate on financial policy in the House of Commons duly took place on the resolutions for Votes of Credits at the end of last week; the House of Lords has also had a similar debate this week on a motion by Lord Balfour of Burleigh. These debates have amply fulfilled their purpose even though they have differed only in the magnitude of the figures from others that have been held since the outbreak of the war. Unofficial members of both Houses and of all parties have shown themselves anxious about the state of the national finances, well-informed on the principles at issue, moderate in their proposals. Spokesmen for the Government, on the other hand, have pursued their consistent policy of underrating the financial problems that face them. They have recognised the risk of inflation—but as something that might have to be feared in some years' time, not as something that has been with us since September, 1939, and in much enhanced degree since September, 1940. They are willing to consider novel and really drastic plans of fiscal rescue—but always in the future. They recognise, as the Lord Chancellor did on Wednesday, that there is a gap between expenditure and what can be raised by non-inflationary means, but since they cannot exactly assess it, they content themselves with saying that everybody else exaggerates it. The policy, in short, is still that of Let's Pretend.

The problem of the Budget in wartime is a continuous Battle of the Gap. Expenditure is chronically in excess of what can be raised by taxation or borrowed

from savings. That there should be a gap is almost inevitable; but it is essential that it should be kept to the smallest possible figure. An article in *The Economist* two weeks ago made an attempt to arrive at a preliminary estimate of the gap that will have to be bridged in the coming financial year. Without any pretence of precision, it was suggested that expenditure, which is currently running at nearly £4,500 millions a year, would certainly be well in excess of £5,000 millions in the year 1941-42, while revenue, on the existing basis, could not be expected to be more than £1,700 millions at the most. There is thus a prospective deficit of at least £3,800 millions, or, say, £300 millions a month. But the deficit is not the same thing as the "gap," in what is coming to be the accepted connotation of that word, for there are several sources of funds at the Treasury's disposal which, while not tax revenue, are nevertheless non-inflationary. The most important of these is, of course, the borrowing of genuine savings. Another is the realisation of foreign assets and a third is the accruing surplus on a number of funds such as the Unemployment Fund. But the conclusion reached a fortnight ago was that while the deficit can hardly be put at less than £800 millions a month, these non-inflationary sources can hardly be put at more than £150 millions a month, leaving a real "gap" of £150 millions a month.

This distinction between the deficit and the "gap" is the chief source of confusion, genuine or induced, in discussions of fiscal policy. The obscurities are at

their maximum in the case of foreign purchases. When the British Government buys £10 millions' worth of munitions in the United States, the effect is, of course, to increase the figure of expenditure by £10 millions. But if these munitions are paid for by a sale of £10 millions of gold, the Exchange Equalisation Account has £10 millions to invest in Treasury Bills, and the Exchequer's receipts are increased by this amount, which is neither tax revenue, nor savings, nor yet the inflationary creation of purchasing power in this country. In any discussion of the likelihood of inflation, it would be an advantage if it were possible to exclude, from both sides of the account, all foreign purchases paid for by the depletion of the country's external capital assets or the increase of its external debts. Out of the present total expenditure of, say, £4,400 millions a year, it may be that £800 millions a year is paid for by these methods. The balance would then be at the rate of £3,600 millions a year now, and we may guess that it will be at least £4,500 millions in the coming financial year. (This assumes a continuance of the present rising tendency of prices, and therefore to some extent anticipates the conclusion of the argument, but he would be a hardy prophet who assumed the contrary.) Against this £4,500 millions, revenue, as estimated a fortnight ago, will bring in, without any increase in taxes, no more than £1,700 millions. Having left the realisation of foreign assets aside, we are left, of course, with a diminished total of non-inflationary sources of finance. Indeed, they are unlikely to be much, if any, more than the gross total

of subscriptions to Government loans. We can allow a maximum of £1,200 millions a year, leaving a "net gap" of £1,600 millions a year, or, say, £150 millions a month. This calculation is not a revision of that given a fortnight ago, which was intended to include foreign purchases on both sides; it is rather a demonstration that foreign purchases—and by necessary extension, the "Lease and Lend" Bill—do not greatly affect the question whether the financing of the war is a predisposing cause of rising prices. Nor do they affect the fact that, whether the prospective gap is a dozen or a score of millions more or less than the figure of £150 millions a month, it is still a very large and very serious figure.

The phrase "predisposing cause" is Sir Kingsley Wood's. It is strictly accurate. The existence of a "gap" financed by the creation of credit does not make a rise of prices inevitable. It creates a greater quantity of purchasing power than can be spent on the available goods at present prices. But if rationing is all-inclusive enough, if the Prices of Goods Act is strictly enforced, if wages and material prices are kept down, this additional purchasing power may find it impossible to spend itself. It would, therefore, be a mistake to lay the blame for the rising prices from which we have suffered, are suffering, and shall suffer on Budgetary policy alone, without also blaming the Government's policy for industrial and raw material prices, which positively encourages them to rise, and on its complete lack of any wages policy at all. But "predisposing causes" also have their importance.

The South Seas

THE "China incident" drags on without hope of a decision on either side. Throughout the third year of war, Japanese resources and man power were drained away with little or nothing to show for it, and to-day with half another year gone, Prince Konoe has to admit that there is little likelihood of a quick decision.

Fortunately for the Japanese, a new field of manoeuvre has been opened by the events of last summer in Europe. Holland was conquered, France collapsed, and the naval balance appeared to be so transformed by the loss of the French Fleet that Japan could at least reckon on the democracies pursuing a more timid naval policy in the Far East. Japan was in the position of a man who suddenly discovers that a number of wealthy but intestate aunts have died and that he has a sporting chance of establishing himself as next of kin.

The drive began almost before the last gun had fired in France. In the economic sphere, it took the form of growing pressure on the Dutch East Indies. Mr Kobayashi arrived with an impressive trade mission, and, when weeks of negotiation led only to the sale of 900,000 tons of oil. Mr Yoshizawa was despatched on a "last diplomatic effort." Before he left Japan, he made a number of pointed statements about his country's Have-Not status and the necessity of securing important concessions from the Dutch; on his arrival it was found that the terms he proposed for discussion included the right for Japan to explore the outer Dutch East Indies, to establish an airline, to secure mining and fishing concessions and fields for exploitation in undeveloped areas, and finally to settle Japanese citizens in the Indies as business and professional men.

The Dutch took this to be an economic smoke screen masking political annexation and attempted to limit the talks to barter trade. Their suspicions have been increased in recent weeks by the Diet's bout of imperial bombast over Japan's "mission of leadership," and a strong protest has now been lodged with Tokyo, disclaiming all intention

of joining anybody's "new order." The Japanese rejected the protest, but Japanese officials both in Tokyo and Batavia went out of their way to stress the purely economic nature of the "new order." The Dutch remain obstinately unconvinced.

The economic offensive has so far fared badly. But Japan has had better success in Indo-China, where it was possible to bring direct military pressure to bear. After brief resistance in September, the French authorities had to agree to concessions—airfields, garrisons, trade facilities, and the rest. The Japanese had prefaced their drive by evacuating the Kwangsi peninsula, and by the time the French capitulated these troops were available for use in the South. To-day there are probably two divisions in Hainan, and at least another at Formosa. Under the agreement with Vichy a large garrison was established at Haiphong, and it has been steadily strengthened throughout the autumn. The economic advantages of this occupation are substantial enough. Indo-China was an "assimilated" colony, and the bulk of its trade was therefore with France. Japan will now be in a position to oust France and to create her own monopoly of textiles, equipment and cheap goods. In return there are mineral reserves—coal, iron, tungsten—as well as rubber and rice.

Japan's aims are, however, primarily strategic. After Indo-China has come the turn of Thailand. Here, too, the events of last June brought about a revolution of policy. As recently as June, 1939, the Thai Government offered France and Britain the use of Thailand's airfields and fueling stations, asking in return a guarantee of her independence. The catastrophe in the West was Japan's opportunity and Thailand's internal situation was favourable. The Thai regime, nominally elective, is actually controlled by a military clique under Luang Bipul Songgram, whose attitude to government is admirably illustrated by the fact that he combines the offices of Prime Minister, Minister of Defence, of Foreign Affairs, and of the Interior. Japan played on his intense nationalism, offering support to Thailand's long-

standing territorial claims on Indo-China, and hinting that with Vichy's impotence, the time for action had come.

Fighting broke out between Thailand and Indo-China in November along the Mekong River. Japan undoubtedly abetted both sides, and without her encouragement it is likely that the fighting would have petered out. Through December and January, the sporadic attacks continued, developing in the New Year into more vicious fighting with mass air attacks and sharp naval engagements. But both sides seemed to have little heart for it and were ready to accept the offer of Japanese mediation.

Negotiations have opened, and the purpose of Japan's intervention is made manifest in the terms which are shaping over the conference table. Thailand's claims are moderate enough—a rectification of the frontier on the Mekong, which involves the transfer of some islands. The mediator's terms are likely to be more onerous—the right to patrol the disturbed frontier and an effective occupation of Camranh Bay.

Enough has happened to explain Japan's general strategy. Behind the façade of speeches on the "new order," behind such extravaganzas as the recently founded "League for the Emancipation of South-Eastern Asiatic Nations," whose aim is to free the "five hundred million people in Annam, Cochin China, the East Indies, the Malay Peninsula, Burma, India and the Philippines," lies a ruthless expansionist diplomacy which is pursuing its objectives with a cold and consequent logic. A glance at the map of the South Seas (as defined by Japan) makes it clear that so long as 3,000 sea miles separate Japan from the riches of Java and Sumatra, so long as the Philippines with American naval squadrons at Manila lie in between, and the British Commonwealth remains on guard at Singapore, a Japanese "new order" must remain a wild hope in the minds of the Black Dragon Society. The concentration of troops in Formosa and Hainan, the gradual building up of an army of occupation in Indo-China, above all, the creation of a naval base near Saigon only some 850 miles from Singapore or Manila, are all necessary preliminaries to putting the military sting into the economic pressure which is being exerted on the Dutch to-day—and perhaps on Malaya tomorrow. Japan's gains so far are not negligible, and if Germany's blows in the West should come to exhaust the resources of the great democracies below the safety line in the Far East, a land and sea attack upon Singapore, the nodal point of Britain's whole Far Eastern defence system, comes within the bounds of possibility.

Retailers' Front

ASSOCIATIONS of retail traders have grown very much in strength since the war started. Indeed, within their own ranks, it is often said that a few months of war have brought them nearer to their objectives than many years of hard work in peacetime. The reason is not far to seek. These associations aim to speak for entire trades with a single voice in accordance with a common policy; and the control of supplies and regulation of prices by the Government have brought home to "independent" retailers the need for some spokesman or intermediary between them and the authorities. Individual traders are in no position to make constant approaches to public departments and official committees for information or to bombard these bodies with complaints and suggestions. So, in every branch of trade, they flock into associations in search of aid and shelter.

The tendency is natural and the result unexceptionable insofar as it makes wartime organisation easier. In war economy corporate groups can undoubtedly exercise useful functions. But some of the consequences must be suspect. The direction of these associations is always towards quasi-monopolistic domina-

tion of their trades, and in wartime this trend is encouraged in many ways. In every business scarcity and the limitation of supplies check newcomers. Prices tend to go up, and price-cutters—hitherto the chief obstacles to the associations' policy of keeping prices up—fare badly. The associations wax while their rivals wane.

Moreover, the various associations work together. Representations on any question relating to, say, retail tobacconists will possibly be made, not only by their own associations, but also by the associations, unions and federations, local and national, of confectioners, newsagents, hotels and restaurants and office-holders—perhaps even with the backing of that very active general body, the Retail Distributors' Association. Each trade association is a hierarchy, beginning with the local or district organisation and rising to a National Council or Federation, and as all these hierarchies interlock in their activities, it means that horizontally as well as vertically, over the whole field of retailing, they exercise a nation-wide power in pursuit of aims which are often by no means national. It is, for instance, a main plank in Lord Woolton's

Yet Japan's path to hegemony is by no means as smooth as her more enthusiastic publicists suggest. In the West, the very unwarlike attitudes of the Italian fleet and the insistence of Vichy on the strict letter of the Armistice have prevented Great Britain from feeling any serious naval embarrassment, and the appointment before Christmas of Sir Robert Brooke-Popham as Commander-in-Chief in the Far East coincided with the arrival of strong reinforcements at Singapore. Singapore is also an important air base, and its rear is secured by jungle country through which an invading army would make heavy going. The recent despatch of a strong bombing force to North Malaya shows that the High Command is leaving nothing to chance on the Thai frontier. The Dutch Navy, with cruisers, destroyers and a score of submarines, is not a negligible force, particularly when operating in the coral-strewn waters of the China Sea, where uninstructed pilots court certain disaster.

The Australian Navy with a strong force of cruisers and destroyers must be added, and since the situation in the Far East grew more threatening last summer, important concentrations of the American fleet have remained in the Western Pacific. Even on the basis of its unexpanded naval programme, the United States Navy seriously outnumbers the Japanese in destroyers and submarines, and in emergency would no doubt make full and co-operative use of Singapore. Germany's menace in the Atlantic has not yet been sufficient to warrant the withdrawal of any parts of the American Pacific fleet. Indeed, the Tripartite Pact has made it certain that in almost any circumstances the Pacific fleet will stay west of Panama. The Japanese have, in fact, pulled Germany's chestnuts out of the fire. Even if Japan entered the war, she could hardly change these hard strategic facts.

Short of a complete disaster in the West and the collapse of Britain's imperial power, the Japanese "new order" will remain for many years to come at the most the mere "area of common prosperity" the moderates proclaim it to be, provided always that Britain and America are prepared to maintain a vigilant guard and to abstain from any tempting openings for appeasement at their own or others' expense. If the Dutch are to continue to resist political concessions, if the Siamese are to maintain their independence, they will, of necessity, be faced with risks and hazardous decisions. The risks will be taken only if there is the assurance of solid Anglo-American support in the background. Our own security demands that we provide that assurance.

food policy that he is anxious "to do nothing that will prejudice the works' canteens which to-day are a general feature of industrial life." The retail trade associations, however, think otherwise. Only a short time ago, a resolution of one great retail trade organisation called for steps "to curtail the increasing number of canteens in connection with the auxiliary services, while regular traders are suffering from insufficiency of stock"; a local M.P. was approached; an "earnest appeal" was addressed to the Minister "for the removal of the privilege given to the service of industrial canteens in the matter of supplies"; and a Northern Irish retail confectionery association went so far as to complain of the priority given to "hospitals and the defence services" in the supply of block chocolate.

Again, it may be the legitimate right of retailers' associations to agitate against the "undue" limitation of these supplies by official Order, but it is disturbing—to say the least—to discover how far "representations" on this score are taken. The narrow-sighted protests of the cosmetics trade even secured the same sort of editorial publicity in the Press only a few weeks ago that most retailers' complaints obtained at the back-end of 1939 when nobody, shopkeeper or journalist, yet realised that the war had started. A leading figure of the hairdressing profession recently put on record his view that "The ladies' trade with 25 per cent. of its former supplies cannot exist . . . all trade organisations ought to bombard the Board of Trade with their protests . . . the posters ask our women to keep smiling and cheerful, but how can they do that unless they can get hairdressing service?" Similarly, leather-bag manufacturers complain that shopping bags are treated under the Limitation of Supply Order as fancy goods and "lumped in with art-craft ware, jewel cases and other luxury articles"; "shopping bags (so writes one firm to a trade journal) would seem to be just as much a necessity as children's wear."

Examples of this sort of special pleading, backed by considerable pressure, are legion. In another case, the sellers of electric lamps have been alarmed by the fact that some lamps can be sold at a lower price than others owing to the difference of discounts, or margins, granted by the manufacturers to retailers and, by agreement with the tax authorities, taken into account when the tax is charged. The tax does not work out to the same amount on the same type of lamp; so a "one-shilling lamp" plus tax may cost 1s. 3d. here, but 1s. 2½d. there if supplied by another manufacturer under other conditions of discount. The authorities, it is argued by a trade journal, ought to have known this, and before making

the arrangement should have "insisted that lamp manufacturers came to an agreement between themselves on basic discounts." Now, it is one of the great monopolist aims of trade associations to standardise discounts and margins so as further to reduce competition between manufacturers and their retailing customers; and in this case it is actually suggested that the Government should enforce this standardisation—in the direction most favourable to the organised traders. Manufacturers' associations are also involved in these interested discussions. The supporters of "standardisation" complain in this way about the differences in the discounts allowed to retailers by different manufacturers, but remain silent about the arrangement made by some manufacturers to grant a much bigger discount to traders who confine their business to one group of manufacturers—the "association manufacturers"—while they concede a much smaller profit-margin to the so-called "free retailer." It is not a very far cry from this attitude to, say, a request by traders' or manufacturers' associations for State assistance in building up monopolist organisations with universally fixed margins, discounts and prices and the rigid limitation of all forms of competition.

The fact is that war is a dangerous pace-maker on the road to monopoly. Nobody could deny the special difficulties under which the greater part of retail trade is at present labouring; and the majority of shopkeepers are by no means "capitalists." Charles Madge, in a recent statistical survey of a western town, reported that, out of seventy-two traders' families interviewed, forty-two had an income corresponding to that of the higher or lower "working class"; and it would be a good deed if the trade associations could help these impecunious retailers in their hard struggle. But this help should not consist in "bombarding" public departments with requests for a larger share of business than is actually reasonable or permissible in the national interest. It should not consist in receiving greater—even semi-official—powers against outsiders and non-association traders. It should not consist in demands for protection against new competitors or for the suppression of channels of distribution useful to the special exigencies of war-feeding, such as canteens, coffee stalls and the like. The work of trade associations ought generally to be limited to matters of technical organisation, to the simplification of trading methods and to assisting Government departments in public schemes. The basis of any sound attitude towards these new trade guilds is still Adam Smith's famous observation that "the pretence that corporations are necessary for the better government of trade is without any foundation."

NOTES OF THE WEEK

The First of the English

Mr Churchill has broadcast twice recently, once momentarily to the people of Italy, and once, last Sunday, to the British people at home and in the Empire—"taking stock" for the first time for five months. To the Italians, he forecast the tearing asunder of all their dominions, and to the British people last week-end he told how this was being done; how the "crafty, cold-blooded, black-hearted Italian" had "got into trouble"; how the heroic Greeks had thrown back his forces in Albania; how the Army of the Nile had "knocked" and "it had been opened unto them"; how the "process of reparation" had begun in Ethiopia; how the "forward surge" of the Army had been supported by all the "flexible resources of sea-power"; how the bolstering Junkers had been blown from the Malta sky; and how the "canonade of Genoa" had gone "rolling along the coasts"—towards France. Mr Churchill writes, makes and speaks history. He told of the "repulse of the invader" last year and the "frustration of terror"; of the

"Waterloo" won by civilians and the maintenance of good health and the abatement of crime. He spoke of "deep thankfulness, strong comfort and even rejoicing." But he spoke also, with his own stern frankness, of the "more serious, darker and more dangerous aspects," and of the "greater violence" that was to come; of the Nazis' swoop to the Black Sea with their "forward tentacles" in Bulgaria; of their complots in the Central Mediterranean with "the Italian Quisling, who is called Mussolini," and "the French Quisling, commonly called Laval"; and of the greatest danger of all, that to the subsistence and independence of "this island home and fortress"—which is "all that stands between that wicked man and the domination of the world."

He may carry havoc into the Balkan States, he may tear great provinces out of Russia, he may march to the Caspian, he may march to the gates of India—all this will avail him nothing.

Hitler must destroy Britain to win; and in his path there has risen, not only the proven fortitude and the gather-

ing strength of Britain, but also a "mighty tide of sympathy, of goodwill and of effective aid" from across the Atlantic. Mr Churchill's argument and his final words were to America: "Give us the tools and we will finish the job." Such speeches are an offensive in themselves. Mr Churchill's broadcasts are more than history. They are *English* history carved out of the common experience of English people and shaped in the centuries-old idiom of English life and English letters. Mr Churchill pointed to a terrible ordeal ahead. He denied none of its peril. But he pointed past the coming conflict with "devilry" to its place in the record of English freedom.

* * *

Team Changes

The chief features of the Ministerial changes announced last week-end were the departure of Mr Malcolm MacDonald and the absence of Mr R. B. Butler from the list. At first glance, Mr MacDonald's move from the Ministry of Health to be High Commissioner in Canada hardly seemed the translation his record and youthful ability had earned. Actually, the appointment is probably a marked tribute to him. For a decade and a half the High Commissioners in the Dominions have grown in importance, for in 1926 the position of the Dominions as independent nations equal in status to the Mother Country was formally recognised, and since then, whereas their Governors-General have continued to represent the Crown there, the British Government has been represented by the High Commissioners. The significance of their functions has not always been recognised in the appointments made. It has not been the practice for the United Kingdom to follow the example of the Dominions in appointing Ministers of the Crown to be their High Commissioners. But they are obviously capable of being regarded as Britain's Ambassadors to the self-governing Commonwealth—a fact which will surely not be forgotten when the High Commissionership to South Africa, which has fallen vacant by the resignation of Sir Edward Harding, comes to be filled. In fact, Mr MacDonald's mission to Canada, which holds a key position in the British war effort and is the bridge between the Commonwealth and the United States, is directly parallel to that of Lord Halifax in Washington. The task of each is to keep two Governments in step on the common ground of a common cause; and just as Lord Halifax, who remains a member of the War Cabinet, speaks with the authority of a former Foreign Secretary, so Mr MacDonald, who is to keep his seat in the Commons, will speak with nine years' experience of the Dominions Office behind him.

*

There is not so much significance to be attached to the other new appointments—Lord Moyne to be Colonial Secretary, Mr Ernest Brown to be Minister of Health, Mr Thomas Johnston to be Secretary of State for Scotland, Major Lloyd George to be Parliamentary Secretary to the Ministry of Food, speaking for Lord Woolton in the House of Commons, and a number of other changes in junior offices. Lord Moyne's appointment is further discussed in a Note on page 211, it is an excellent conventional choice. Mr Johnston has done notable work as a Regional Commissioner. Major Lloyd George has been discharging a double duty at the Board of Trade and the Ministry of Food with vigour and distinction. Mr Ernest Brown is well known. Mr Butler, who had been tipped by the *cognoscenti* for several new offices, stays where he is. Most of the list has a routine character, and it is plain that not even a Churchill can conjure up new Churchills in his wake.

* * *

Mr Winant and Mr Willkie

The nomination of Mr J. G. Winant to be United States Ambassador in London was, after the frequent anticipations, hardly a surprise, but it is none the less welcome that America will be represented by a man who combines so many personal excellences and so many varieties of experience. He is a Republican, but an intimate friend of the President. He has been Governor

of his native State of New Hampshire, but also Director of the International Labour Office. He is a man of wealth, but an enthusiast for social security. Great Britain has been particularly happy in recent weeks in the quality of the Americans who have come here to represent their country, officially or unofficially. Mr Harry Hopkins has established the closest links with Mr Churchill, whose "constant companion" he has been. Mr Willkie has returned to Washington to give the most forceful and effective evidence in favour of the "Lend and Lease" Bill. Indeed, in one respect it would seem that he would go further than some members of the Administration, for while he suggested that five to ten destroyers a month should be sent across the Atlantic every month, Colonel Knox, Secretary of the Navy, has expressed his unwillingness to deplete the American fleet further. The Bill passed the House of Representatives by a vote of 260 to 165 at the end of last week, and the Foreign Relations Committee of the Senate is now engaged in hearing evidence—much of it the same as was given earlier to the House Committee. The Bill is expected to be law by the end of the month. Its signature will make possible the resumption of new contracts, and it is also reported that further amounts of "surplus" stores have been found and will be immediately available.

* * *

Vichy Changes Again

The Vichy Government has now undergone its eighth change in nine months. Few French Cabinets of the Third Republic can have rivalled its instability, although the men who framed this "new order" were out to secure continuity. In pre-Vichy days, it was the head of the Government who changed, while there was a marked tendency for the same men to reappear with new portfolios. Now it is the head of the Government who remains, while statesmen whirl through the Cabinet with something of the air of a Punch and Judy show. In the latest reshuffle Admiral Darlan emerges with, roughly, the function fulfilled by Laval before his dismissal. The Admiral is to be Vice-Premier, Foreign Minister, and successor to Marshal Pétain as well as Minister for Marine. Flandin fades out like a pale and embarrassed ghost. With him may go M. Peyrouton, and there is talk of the return of M. Baudouin. Such, then, is the outcome of many days' struggle to secure the return of Laval, not only to a seat in the Government, but to a position of almost absolute authority within it. Vichy's refusal to accept Laval's terms is welcome evidence that the man's pitiful subservience to his "conquerors" is too much for the stomachs of Marshal Pétain's own people. On the point of the fleet they remain adamant, and the Germans, after attempting shock tactics over the week-end with fantastic rumours of the flight of the Marshal and Admiral Darlan to North Africa, have for the moment abandoned the frontal attack and are accepting the Admiral with the proviso that he is to prepare the way for Laval's later return—whatever that may mean. The key to French resistance now lies with Admiral Darlan. Since Oran he is no friend of Britain. On the other hand, he has categorically stated that the French fleet will not be handed over. And his statement is confirmed by the German rumours. In coupling his name with that of Marshal Pétain, the Nazis admitted that he, too, was concerned to maintain the strict letter of the Armistice. In short, after a week's threats, manoeuvrings, comings and goings, Vichy remains very much where it was—and where it probably will remain just so long as British resistance continues to provide the security of North Africa.

* * *

Benghazi and After

The fall of Benghazi and the occupation of El Agheila bring the brilliant campaign of Cyrenaica to a close. In two months the Army of the Nile has smashed Graziani's invasion army, driven it from Egypt and pursued it from Bardia to Benghazi; and, with a final burst of speed and fighting power, cut off its retreat to Tripoli. The main features of the advance were its strategic brilliance, its speed and the exemplary co-

ordination between the three arms. The lessons of the spring have been learnt. They remain to be tested against a sterner enemy. The Government of Cyrenaica has been vested in Lieutenant-General Sir Maitland Wilson, who commanded the whole offensive, and, judging by Benghazi's reception of the victors, the task of keeping order and safeguarding civilians will not present any insuperable difficulty. Nevertheless the reconciliation of Arab rights and the interests of thousands of unoffending Italian colonists will present our administrators with some delicate problems. Clearly, however, the arrangements are for the time being purely provisional. Two choices seem to be open to General Wavell. He may decide that the Italian forces in Tripolitania are sufficiently demoralised to make a lightning attack across the difficult desert country of Sirte a feasible risk. The difficulties of maintenance and supply would be enormous and presumably fresh Italian troops would wait on the other side. It is therefore possible that the Commander-in-Chief will prefer to prepare in greater leisure for the conquest of Tripolitania, and that in the meantime he intends to concentrate his blows on Eritrea. Here his troops are massing round Keren. The terrain is difficult and Keren is protected by a steep escarpment. However, British guns are already shelling the town and it is possible that the forces advancing from Karara and Mersa Taclai in the north will arrive in time to take Keren in the rear. Farther south, the advance towards Gondar continues, and although it is hampered by extensive minefields it is speedy enough to suggest that Italian resistance in Abyssinia is weakening. Signs of collapse here bring up the disturbing question of the fate of Italian non-combatants. There are 200,000 of these, and, in Addis Ababa alone, 8,000 children. The Abyssinian warriors have long scores to pay off, and the Italians would not scruple to lay them to Britain's door if practically unavoidable massacres were to occur. Count Volpi is said to have visited Vichy with a view to securing French mediation in a proposal to evacuate the Italian civilians with British assistance. It is to be hoped that the British Government will not miss an opportunity, not only for humanitarian work, but for a masterly stroke of propaganda.

* * *

Caudillo and Duce

The purpose behind General Franco's journey to Italy, at Mussolini's "express invitation," is the subject of the most varied speculation; every conceivable reason has been discussed, from a peace offer to Britain to safe conduct for the Italian troops in Tripolitania through French and Spanish North Africa. But Britain has officially denied the rumoured peace offer and the publicity given to the meeting in Germany must surely rule out the possibility, unless a "peace offensive" with Hitler's blessing is to be launched. Italy's collapse in the Mediterranean is so complete and will entail so serious a diversion of German resources if it is to be made good that, just conceivably, Hitler may be considering a new diplomatic offensive to take the Mediterranean right out of the war while the perilous business of invasion is undecided. The talks in Italy are to be followed by a meeting between the Caudillo and Marshal Pétain. If the three Latin Powers can agree upon a settlement in North Africa, it might be used as a preliminary to a larger settlement with Britain. But obviously Britain will not abandon the fight just when she has succeeded in forcing another front on Hitler. The most likely explanation is that Mussolini is appealing to Spanish honour and Spanish gratitude for help. If so, the moment is singularly ill-chosen. Whatever the Caudillo owes to Italy, he owes more to his own people and the bombardment of Genoa has come as a timely reminder that the guns which were trained on Genoa could find their mark in other no less vulnerable harbours.

* * *

Air Ministers

The British Broadcasting Corporation is to have two new "advisers"—one for foreign policy and the other for home policy, both officials of the Ministry of Information. What the appointments imply is not clear. Broadly, the censorship of British broadcasting, like the censorship of the Press, is still voluntary. The pub-

lication of news is, of course, strictly controlled in the national interest; the actual handling of news items is subject to "directives" or advice from Government departments; while the views expressed in talks and comments are normally submitted for Ministerial "vetting." In the nature of the case, since the British Broadcasting Corporation holds a monopoly in its own crucially important field, the control exercised—and willingly accepted—is tighter than with the newspapers. The B.B.C. has resisted attempts to make it no more than a mouthpiece, and by maintaining at least the appearance of independence in its choice of speakers and topics, it has done a distinct service. The result has been a compromise. The fact remains that wireless utterances have necessarily a greater *ex cathedra* character than newspaper articles, and it is noticeable that the very critics who have opposed any suggestion that the Corporation should become an official parrot have also called for pressure by the Government to compel the B.B.C. to alter its ways—chiefly in the field of overseas propaganda, but partly also in its handling and balance of home news. In general, the desire of critics is for the B.B.C. to be "free" to go what they consider to be the "right" way; and, at bottom, it is largely a question of efficiency. If the function of the new advisers is to secure the skill and effectiveness in propaganda abroad and publicity at home that, by contrast with the best Press standards, is still lacking on the wireless, they will do a job which at present, by the piecemeal and sometimes niggling oversight of Ministry of Information officials and the war Ministries, is not being done. It is, however, hard to see how this could be done without some radical alteration in the staffing of Broadcasting House, which is astonishingly lacking in people fitted by training and experience to exercise "editorial" control in the true sense over the work they have to supervise. If, on the other hand, the intention is simply to make the B.B.C. a branch of the Ministry of Information by a back door, then the move is regrettable: firstly, because M.O.I. has shown no superiority over the Corporation in its handling of war news and comment; and, secondly, because, if it has

been decided that broadcasting must, in the last resort, be a mouthpiece for the Government in wartime—a tenable proposition—then the best way to make the change is openly—accepting the consequences.

Fire Bomb Fighters

A tour of the City of London or of the centre of Southampton might suggest that Mr Morrison's new fire-watching and fire-fighting plans represent the usual belated locking of the stable door, for it is very unlikely that, with proper precautions, such destruction could be done again by fire-bombs. Unfortunately, however, it appears that the lock is still being haltingly and clumsily put on. In design, it is an excellent, stout lock—especially when it is considered that, from all appearances, there was no design at all six weeks ago when the bad fire raids happened, and the plans had to be hurriedly devised after it had been announced that they were due. First of all, there are three defence regulations: one giving power to conscript persons aged 16 to 60 for civil defence duties; another giving power to require occupiers of business premises to make adequate arrangements against fire—and workers there to take turns of duty; and a third giving power to require local authorities to make arrangements for all premises in their area other than business premises. Then there are two Orders: one, the Fire Prevention (Business Premises) Order obliging occupiers of business premises to make individual or joint arrangements; and another, the Civil Defence Duties (Compulsory Enrolment) Order, enabling local authorities to register and enrol men of prescribed ages if the number of volunteers in their area is insufficient. In addition—and very important, because the definition of what exactly constitutes adequate arrangements for fire-watching is the kernel of the whole scheme—instructions have been put out by the Ministry of Home Security giving, not only details about equipment and compensation, but also guidance about the number of watchers required for watching and spotting in areas of a specified size—two to cover a street of 150 yards (or an area with a radius of 200 yards if they can mount a roof 20 feet above the other roofs around), with three for each stirrup pump party. This looks, and indeed is, very comprehensive. The question is: how is it being applied? Sample inquiries suggest that the answer is not yet very encouraging—much less encouraging, at any rate, than might be inferred from the enthusiastic Press accounts of fire-fighters leaping in half-dozens upon single incendiaries.

* * *

"Ca' Canny"

When Mr Morrison announced a fire-watching scheme on New Year's Day, he was the first Minister to threaten compulsion for civilian duties. But the dominant theme of the work that has been done since has been a desperate insistence on voluntary effort until it is absolutely proved insufficient—presumably by further successful fire-raids. The Fire Prevention (Business Premises) Order has been applied to most vulnerable areas. The Compulsory Enrolment Order has not been applied at all; the trouble, in fact, is with streets and houses. In London, it is reported that an appreciable large number of firms have been unable to collect sufficient volunteers—even though the Fire Prevention Order lays a duty upon men working on business premises to take turns of duty; in several districts there are streets which have failed to produce sufficient volunteers to patrol; and a heavy burden is inevitably being laid on the thousands of public-spirited people who have come forward. Nor is the worst fault that of reluctant employees or residents. In very many areas the situation is satisfactory; but, where any lack of personnel does exist, the local authorities surely have the solution for it in their own hands; if they do not compel service at once they can at least make it plain to every individual that the obligation to serve is inescapable. Actually, too many authorities have not even made it plain what the obligation or the character of the duties is. In some places, voluntary enlistment has already failed; in more it has not even been properly tried. The excuse is that the "voluntary method" is being "fully explored"

first. As a result, not only is the stable door still open; there may also be a Trojan horse inside, an animal of our own making.

* * *

Shelter Policy

There are signs and statistics that shelter conditions have improved considerably in recent weeks. In the whole of the London region, shelter accommodation has now been provided for 80 per cent. of the population, of which 19 per cent. were provided for by public shelters and 61 per cent. by domestic shelters. On the other hand, a census of shelter-users taken on the first Sunday night in January, a raidless night, revealed only 4 per cent. of the population in public shelters and 14 per cent. in domestic ones, compared with 5 per cent. and 19 per cent. respectively a month earlier. In 149 out of the 154 shelters that accommodate 500 persons or more, medical aid posts have been established; 65 other shelters are being given similar posts in groups; while in seven very large shelters there are whole-time doctors. There are now bunks for 462,000 persons, and the number of canteens, excluding those in the Tubes, is 1,980. It is expected that, by the end of this month, all the 80 Tube shelters will be fitted with improved sanitation and bunks. These statistics are most encouraging, and show that a real and successful attempt has been made to make the public shelters tolerably habitable. But the Government has very wisely not surrendered its principle that dispersal is the better part of sheltering. This week Mr Morrison announced that a new indoor shelter has been designed and will be given to all homes up to an income limit of £350 a year. This will presumably supplant the Anderson, for which the income limit was £250, and will be much more satisfactory, since for homes without gardens an Anderson was useless—and in any case it was extremely difficult to keep dry. To begin with, the new shelter will only be distributed in priority areas, based on presumed vulnerability, but it is to be hoped that, in these areas, every effort will be made to persuade the recipients to use them, thereby relieving the congestion in the public shelters.

* * *

An Unreal Vote

The South African Parliament is still out of line with the movement of public opinion in the Union. A vote of no confidence in General Smuts at the week-end was only defeated by 78 votes to 59, a majority of 19 for the Government compared with majorities on similar votes of 13 in September, 1939, 22 in January, 1940, and 17 last August. Yet the situation has changed enormously in these eighteen months of war. The first peace and neutrality motions of General Hertzog were based on the argument that the Union was being forced into "England's war"—which was amply disproved by popular support for the war effort and the results of by-elections. In the debate of last August, in which Dr Malan rather than General Hertzog was the Opposition's most convincing figure, the argument was that Britain was already beaten; and that contention has since gone the same discredited way as its predecessor, well aided by the successes of South African arms. The Opposition to General Smuts still musters nearly sixty votes, but it has no leg to stand on. What is more, it is torn by dissension. The chief feature of the latest debate was the virulence with which the supporters of Dr Malan, who moved the motion, were criticised by the followers of General Hertzog, who has now retired, for their narrow racial outlook; and even among the Malanites the gulf between the calculating Republicanism of their leader and the blood-and-soil blindness of the extremists—whose actual leader is rather Dr Van Rensburg—was very evident. The Opposition vote was a hotch-potch—ranging from the Hertzogites' formal plea for neutrality, through the "anti-Imperialist" sentiments of the new "Afrikaner" party and Malanite separatism, to the active disloyalty of the Ox-wagon group. In the Union Parliament, there is an overwhelming majority for co-operation between Afrikaner and British, just as there is an overwhelming majority for the war among the South African people.

Politicians at Play

Indian politics continue to be surprisingly unreal. Congress, in the main strongly anti-Nazi, opposes the war vocally and demands a National Government at once and immediate independence for India. Mr Jinnah of the Moslem League has restated his demand for Indian independence, which includes a scheme for partition to set up a separate "Pakistan" consisting of Moslem States. The Christmas meeting of the Hindu Mahasabha put out a call for support for the war, but demanded a definite date for Dominion Status—not later than one year after the end of the war; while the conference of the Liberal Federation put the time limit for Dominion Status at two years after the war. Thus the demand for further self-government in the near future is common to all groups; and every section but Congress supports the war. But by self-government very different things are meant. To Congress it means the Congress rule. To the Moslem League it means the government of Moslems by Moslems. To the Mahasabha and the Liberals it means representative government on a broader basis—and the partition plans of the League are anathema. Mr. Gandhi has committed Congress to the anti-war campaign which has so far resulted in the imprisonment of many of the best brains and characters in India. But, although his stand is ostensibly the moral ground of pacifism, the Mahatma has now implicitly admitted the political character of his programme by stating that "We are resisting an authority that is itself struggling in a fight for life against a stubborn foe—our struggle must be coterminous at least with the European"—though reports that he may still be a little unsure of his ground. The Mahasabha, too, has threatened direct action if its constitutional demands are not satisfied. In detail, then, the politicians are presenting, with no will to compromise or even discussion, demands, in no way compatible, for constitutional changes which, in any case, are impracticable now while the war is on. As a result, the public is becoming less and less interested in what appears to be no more than a series of interested and opportunist manoeuvres. This is the chief feature at the moment. Indian troops are now in the front line, and the war effort in India is perceptibly growing. Congress membership is markedly falling off; and it is probable that the attitude of most unsectarian Indians is best reflected by the demand of the Liberals and of the moderates of all the communal factions for a broader and more national Central Government now and for Dominion Status at a specified date later on. The jockeying of the political groups may be largely irrelevant, but it would be a great mistake for the British authorities to allow the fact that the politicians cancel each other out to obscure the general wish for greater control by Indians over Indian affairs.

* * *

Lines of Communication

The first lesson of modern warfare is that power to produce counts more than manpower. The second, which has hardly yet been learned, is that power to transport may count most of all. The British blockade of German Europe will only be a decisive factor if transport difficulties, intensified by bombing, reduce the enemy's scarce supplies in his vast territories below what Mr. Dalton has called the "distributional minimum." Just as Hitler's greatest weakness is the distances over which his men, materials and machines have to be transported, so does his highest hope reside in the thousands of sea-miles across which the necessities of life and the sinews of war have to travel to Britain. Invasion is only the third and most speculative prong in the German offensive; at sea, in the ports and inland, transport is the target of a double assault by submarines and air-craft; and the Achilles heel in Britain's defences is not so much the vulnerability of transport to these attacks as its ill-organisation. In the spring, the ability to move and distribute goods through the ports and overland will be the key to the battle. If the final coup of invasion is attempted, its success or failure will depend, not merely on fire power in the air, at sea or on land, but on the mobility of war goods and essential supplies no less than of fighting men. A bulletin of the Vigilance-for-Victory Group* makes three points: first, that the in-

* "The Organisation of Transport for War." Bulletin 5 of the Vigilance-for-Victory Group. 10 Hertford Street, London, W.1.

ability of existing transport facilities, even under non-Blitz and pre-invasion conditions, to clear the ports and distribute supplies when and where they are needed is due to lack of ways, not lack of means; secondly, that this absence of efficiency is due to the fact that, whereas the demand for transport is organised and concentrated in the war Ministries, the supply of transport, apart from shipping, is not organised at all; and, thirdly, that a prime cause of the absence of organisation is the persistent assessment of transport operations by their financial results and not by their service to national requirements. This is familiar ground. The suggestion that the problem of moving traffic through the ports should be solved as it was in 1916-18 in the overburdened ports of France, when all forms of transport were amalgamated under a Director-General and armies of millions were supplied under fire, goes to the heart of the matter. Britain is in the front line now. Recent port delays and the chronic breakdown of coal transport only foreshadow how the German invasion of Britain might be favoured, or the British invasion of Europe frustrated, by a system in which, apart from petrol rationing and war demand, transport—as usual—limited by commercial considerations and working in watertight compartments, is the rule. The work of the pool of refrigerated road motor vehicles under the auspices of the Wholesale Meat Transport Association—often criticised for its quasi-monopolistic position—can be cited as an example of the efficiency—and cheapness—of new communal methods; and now the Ministry of Transport itself is to operate hired lorries in a single pool. Only when the entire transport capacity of the country—rail, road and canal—is pooled under a single direction and used as nationally required, regardless of financial or other considerations, will the country be really ready, first, to repel the invader, then to plot his defeat.

Trinidad's Constitution

The appointment of Lord Moyne as Secretary of State for the Colonies is welcome, for he is associated with the new colonial system, announced a year ago, when it was decided to establish a Colonial Development and Welfare Fund. The recognition that colonies ought to be given economic help from Great Britain sprang directly from the report and recommendations of the West India Royal Commission, of which Lord Moyne was chairman. Unfortunately, the course of the war has meant that the new system was stillborn, or at least has been considerably dwarfed. But there has been some attempt to implement the Commission's recommendations on the constitutions of the West Indies. Discussions are at present taking place with the Governor of Jamaica on a new constitution for Jamaica, and Trinidad received a new constitution last December. The latter does not appear, however, to fulfil the recommendations of Lord Moyne's Commission, except in the

Exports & Imports

While the war has increased the already vital need for exports and imports, it has, at the same time, necessitated the introduction of numerous regulations and restrictions which add considerably to the trader's difficulties.

The Westminster Bank maintains specialized departments where its customers may obtain expert advice and assistance in dealing with such problems as arise, and it strongly advises those who are exporting or importing to consult it as soon as their intentions are known. Information is also available regarding Documentary Credits—so necessary to the financing of war-time trade.

Further particulars may be obtained from the Manager of any branch or from

reduction in the number of official members of the Legislative Council to three—excluding the Governor. There is to be no provision for filling the resulting vacancies by nominated members representing all sections of the community. The number of nominated members will remain at 6, and though the number of elected members will be raised from 7 to 9—half the total of the new Council—no attempt is being made to reduce the high qualifications necessary for election. At present, an elected member must, among other things, possess, in his own right, real estate of the minimum value of £2,500, or a clear annual income of over £400. Moreover, though the qualifications for voters are more liberal, they are still high enough and narrow enough to exclude all but 6.5 per cent. of the population from voting. It is not quite clear whether the new Franchise Committee which is to be set up to consider the possibility of extending the franchise is completely in accordance with the recommendation of some members of the Commission that local committees for this purpose should be established. Nor is it clear whether in increasing the membership of the Executive Council, which is still to have the initiative for formulating policy, from 7 to 8, the opportunity will be taken for carrying out the recommendation that all important sections and interests of the community should be adequately represented on it. But what is quite clear is that so long as only the rich—by Trinidad standards—can be elected to the Legislative Council, the new Constitution marks no progress at all, and any extension of the franchise will be useless. It would surely be better to have an autocracy, with all authority in the hands of the Governor, subject, of course, to the control of Whitehall, than a plutocracy such as this.

* * *

New England

Mr Keynes recently remarked that war damage to buildings ought not to be viewed altogether with dismay. "Damage of this kind (he said) is up to a point an opportunity. It is only when it gets beyond a certain point that it becomes a disaster." This dictum can, of course, be read in conjunction with Mr Keynes's suggestion that the compulsory savings he advocates—or used to advocate—should be released at the onset of the first post-war slump; and it is obvious that, rightly timed and executed, rebuilding might be of the greatest help when work is most wanted. But it is, in any case, only when what Mr Keynes called the "humbug of finance" is allowed to cloud clear vision that the burden appears insupportable; "it is a question of materials and manpower"—not of money. What is more, rebuilding may in itself be an economy—in every sense, including the financial one. For instance, according to one calculation, damage to property and health caused by the "smoke nuisance" costs this country £80 millions a year, and if in the course of reconstruction the curse of air pollution could be abated some part of this sum could be saved. This is one of several points

made in an interesting study recently made for the Geneva Research Centre.* The task of reviewing the whole question of urban and rural housing was first considered by the Housing Commission of the League's Health Organisation before the war, embracing such topics as hygiene, environment, living space, noise, light, water supply, sewage and garbage disposal, as well as air pollution. The idea was to arrive at some sort of standard, to be modified by local or national variations in different countries; and at the outbreak of the war these plans for an "International House" were almost completed. It is an English rather than an International House that our rebuilders will want; but the possibility of the effective and economical standardisation in building, serving social and hygienic as well as architectural needs, deserves the most careful attention from future Wrens. There is no reason why English houses should invariably be either costly or tawdry, mansions or shacks, both alike uncomfortable.

* "Post-War Housing Problems." By O. E. W. Olsen, M.D. Geneva Studies, 14 Avenue de France, Geneva, Switzerland. 69 pages, 1.75 Swiss francs.

Shorter Notes

A scheme for commodity insurance, such as has been in force in Great Britain since the beginning of the war, is now in operation in Kenya and Uganda, and is being considered for other parts of the colonial empire which are liable to attack. The schemes will be administered by the dependencies themselves, but legislation will be introduced empowering the Treasury to guarantee them.

*

In December detention orders under Regulation 18B were made against 14 persons, of which one was a non-enemy alien and the others British subjects. Six of the British subjects were of enemy origin and one was of non-enemy alien origin. In 155 cases effect was given to recommendations of the advisory committee that the persons concerned should be released, and in 18 cases the Home Secretary decided not to act upon the recommendations. The number of persons detained under the regulation at the end of the year was 1,089.

In the last two months of 1940, road accidents in which military vehicles have been damaged occurred at the rate of 300 a day.

Letter to the Editor

The Finance of a Newspaper

TO THE EDITOR OF THE ECONOMIST

SIR,—May I make a small correction in your otherwise very objective note on the highly controversial case of the *Daily Worker*? I ask space to do so because this particular point is one that is of interest to everyone who is concerned with the finances of the Press—especially to those who studied carefully the admirable survey published by PEP before the war.

You say: "It appears that financial stringency might have forced the little-read *Daily Worker* to go out of business very soon in any case." This is a misconception. A glance at the files of the *Daily Worker* will show that throughout the last couple of years the amount requested from readers for the "Fighting Fund" was steadily rising—until it reached, in the last three months, following the founding of the Scottish edition, the sum of £4,000. This "Fighting Fund" took the place in the *Daily Worker* finances of the advertising which in other papers fills the gap between the cost of production and the sales price of the newspaper concerned.

It is true that, having raised the "Fighting Fund" by very large leaps and bounds—and almost invariably secured the required amount—and having on this basis enlarged its circulation by launching a Scottish edition, despite all the difficulties of the wartime situation, the *Daily Worker* was urgently appealing for realisation by its readers of the really essential need for this sum to be raised. Hitherto, all such appeals were in fact generously answered by the readers, and there is no good reason to suppose that the appeal would this month have failed to meet with that same response.

It is, therefore, a complete misapprehension to suppose that, because the *Daily Worker* was asking for much more money per month this year than it was asking for the year before, it was therefore in danger of financial collapse. On the contrary—the fact that more money was required, and was being steadily got, was itself a sign of the increasing circulation and support won by this newspaper in the year before the ban was imposed.

Yours faithfully,

WILLIAM RUST,

For *Daily Worker* Editorial Board.

London, E.C.1.

THE WORLD OVERSEAS

Headway in America

(From Our Washington Correspondent)

January 15th.

THE American ship of state is now moving out of the doldrums; since the New Year real headway has been gained.

The first impetus was given by the speech of Mr Knudsen, Defence Commissioner, before the National Association of Manufacturers on December 13th, when with characteristic bluntness he specified some of the current lags of production behind the quantities forecast last July—among them a lag in plane production of 30 per cent.—and affirmed that: "The defence job to my mind has not been sufficiently sold to industry and labour as yet. The public generally is sold on defence. . . . But have the two most important elements, industry and labour, been fully sold on the serious side of the job? . . . The European war is gradually taking in more and more territory and most of us hope that we will have the time necessary to get prepared for defence and thus avert attack. . . . So I think that the best and the only thing the United States can do and must do . . . is to prepare swiftly and well to protect ourselves—for by doing that I feel that we have the only insurance policy against attack. . . ."

The period between Mr Knudsen's statement and the President's Sunday-night speech of December 29th was one of intense activity on the part of private citizens. Radio round tables, conducted before audiences who participated to the limit of the chairman's patience, took the issues vociferously to the country. Telegrams and mail poured into the White House. Statements of conviction and open letters to the President and the incoming Congress, some of them regional, others nationwide in the roster of their signatures, were made public and subsequently attracted further adherents.

One widely-published letter said in part: "Many Americans understand the irreconcilable nature of the forces that are engaged on three continents and on many oceans. Many understand the dark consequences to us, to freedom and to democracy here, to the foundations of American institutions, should the Axis Powers gain the supremacy of the seas. But many, far too many, do not understand. A few do not want to understand. . . . We ask you to inform us, clearly and boldly, of the possibilities of English failure and of the consequences to us and to our children's children should Britain fall. We ask you to tell us what we believe to be the truth, that the materials of war and the military and naval and air strength we now have and the implements we can now produce are enough to make certain the defeat of the Axis Powers, so long as Britain is on her feet and fighting. . . ."

But not all of the communications made public during this period followed this line. On Christmas Day, in fifty newspapers across the country, full-page advertisements announced the formation of the No Foreign Wars Committee. This committee, a more or less one-man show by Mr Verne Marshall, an Iowa publisher, has aims running roughly parallel to the America First Committee; its initial announcement said: "The best Christmas gift for your family would be a safe and sane America! The best protection you possibly can give your children on this tense Christmas Day of 1940 would be complete independence and freedom from the perils of international political intrigue against the peace and security of their country and yours."

"We are giving away our national substance, exactly as we gave it away in 1917-1918. And to what purpose?" The use of newspaper advertising space to offer ideas, rather than goods, to the public is a new development of the past eight months. The half or full page advertisements which have appeared in the *New York Times*

and elsewhere since last June are strictly comparable to the pamphlets which helped to crystallise opinion in the months just before the American Revolution.

The President's December 29th speech was a milestone that showed where we are. Editorial and popular reaction to it and to his address before Congress a few days later indicated how eagerly the public had been awaiting a specification of ends.

Ironically enough, almost as soon as a statement of aims had at long last been made under Government auspices, difficulties developed in the private groups that had been working on both sides of the issue. Questions have been raised regarding the backing of the No Foreign Wars Committee. The international oil operator, William R. Davis, is scheduled to testify before a Congressional Committee; Mr Armstrong, the committee's chief organiser, has resigned; Colonel Lindbergh has withdrawn from an engagement to speak under the committee's auspices in St. Louis.

Upheavals have also taken place in the Committee to Defend America by Aiding the Allies. The prestige of the committee suffered somewhat in December, when a group of advertising men gave a banquet in honour of the chairman, William Allen White, at which he intimated that his committee was proficient in the tricks of their particular trade. Then early in January Mr White wrote a letter to Mr Roy W. Howard, head of the Scripps Howard newspaper chain, in which, in the course of disclaiming any intention of his committee to lead the country in the direction of war, he suggested that a good motto might be "The Yanks are not coming."

This letter was warmly commended by General Wood of the America First Committee and by Colonel Lindbergh. To many members of the Committee to Defend America, however, it made negative reading. In the course of a reorganisation, Mr White became honorary chairman, and executive responsibility was jointly assumed by Ernest W. Gibson, lawyer and former Senator from Vermont, and Lewis W. Douglas, former Director of the Budget.

Impetus to Production

The President's speeches have been followed by action. For some months it has been clear that a more centralised and authoritative structure was required to direct the defence effort. The seven commissioners appointed last May were merely advisers to the Council of National Defence, a Cabinet committee composed of the Secretaries of War, Navy, Interior, Agriculture, Commerce and Labour authorised during the last war. The Commission was without a chairman and without powers other than those of persuasion. This loose structure is now superseded by the Office of Production Management, of which Mr Knudsen, formerly Commissioner in charge of production, is Director-General, Mr Sidney Hillman, formerly Commissioner in charge of labour, Associate Director-General, and the Secretaries of War and Navy, members. Under an executive order of January 7th, this office has power, in addition to its former duties of planning, analysis and advice, to "formulate and execute in the public interest all measures needful and appropriate in order (1) to increase, accelerate and regulate the production and supply of materials, articles and equipment and the provision of emergency plant facilities and services required for the national defence, and (2) to insure effective co-ordination of those activities of the several departments, corporations and other agencies of the Government which are directly concerned therewith."

Included in the structure of the O.P.M. is a Priorities Board and a Division of Priorities. Whereas some months

ago, the country was assuming that the defence programme would not interfere with civilian consumption, the need not only for priorities among defence industries, but also for certain adjustments between requirements for armaments and requirements for durable consumers' goods is now recognised.

The crest of the wave has now moved from the stage of letting contracts to the stage of getting performance. The search for unused capacity which can be brought into production faster than new plants can be built has led to the development of a "bits and pieces" programme inside the Defence Commission; from the outside has come the Reuther plan, a proposal for using automobile facilities to make aircraft, advanced by the United Auto Workers Union of the C.I.O.

Meanwhile, future disposition of the armaments now being produced is before Congress in the "Lend-Lease" Bill which authorises the President: "When he deems it in the interest of national defence to authorise the Secretary of War, the Secretary of the Navy or the head of any other department or agency of the Government: to manufacture in arsenals, factories and shipyards under their jurisdiction, or otherwise procure, any defence article for the Government of any country whose defence the President deems vital to the defence of the United States."

Ulster's Linen Industry

[FROM OUR BELFAST CORRESPONDENT]

January 25th.

ONE of the last acts of Lord Craigavon as Prime Minister was to arrange for the appointment of a Select Committee on unemployment drawn from all parties in the House of Commons. The Committee recently presented its first interim report dealing with unemployment in the linen industry. This trade, upon which a large part of the industrial population depends, has been handicapped by shortage of raw material, and unemployment is about 37,000. The Committee places the flax requirements of the trade at 45,000 tons a year. Immediately before the war, only 21,000 acres of flax were grown, yielding about four or five thousand tons of fibre, and the industry drew its main supplies of raw material from the Baltic, Holland and Belgium—sources of supply which have disappeared. Some 46,000 acres were grown with flax in 1940, and strenuous efforts are being made to obtain 100,000 acres in 1941. Questions of quality in flax also arise. Irish flax in the past has been pond retted by the farmer and the seed has been lost. A good quality fibre has been obtained in this way, although inferior to the Courtrai product. In 1940 some 8,000 acres were harvested as green straw. There is little doubt that a more rapid expansion of acreage could be obtained in this way, as the farmers are relieved of the dirty and disagreeable task of retting the flax and the difficulty of disposing of the flax water. In the main, unretted flax is only suitable for the coarser branches of the trade, and experiments are proceeding in regard to the setting up of central tank retteries, where retting will take place as an industrial process. The Unemployment Committee has recommended Government expenditure in the erection of flax pro-

cessing plants, covering all stages in the treatment of flax—the saving of the seed, retting, whether in tanks or by chemical treatment, and scutching.

It is expected that the Government will, as far as practicable, agree to carry out the recommendations of the Committee. Any benefit to the linen industry from an increase in the home-produced supplies of flax will, however, not arise until after the harvest of this year and the subsequent treatment of the crop. Meanwhile, efforts are being made to secure additional Government orders in the making up of cotton goods, for the December unemployment figures again showed nearly 70,000 persons out of work—about one-tenth of the number in Great Britain, although the population of Northern Ireland is only one thirty-sixth of that of Great Britain. Some modification of the Board of Trade Limitation of Supplies Orders has also been suggested, since it is clear that labour displaced by these Orders in Northern Ireland is not absorbed into war work, as in Great Britain.

The unemployment position would, in fact, have been materially worse if 16,000 workers had not been placed in factories across the Irish Channel, but the difficulties in the way of the movement of labour from Ulster to Great Britain are even greater than in the case of similar movements in the latter country.

Congo in the Sterling Bloc

[BY A CORRESPONDENT]

February 1st.

THE invasion of Belgium completely upset the economic position of the Belgian Congo, which formerly exported most of its agricultural and industrial raw materials to the mother country. More than 80 per cent. of its total export used to go to Belgium; in 1938 the total of Congolese exports amounted to Frs.1,897,153,811, of which Belgium took Frs.1,587,478,000. It has obviously been necessary to find some remedy against the danger of economic strangulation which Congo had been facing. On the other hand, Congo produces some of the most essential war commodities, such as copper, palm-oil, gold and so on, for which there should be no lack of demand. The Anglo-Belgian Trade Agreement signed in London on January 21st came therefore as a most natural step.

The Trade Agreement consists of two parts: the Purchase and the Financial Agreements. Under the Purchase Agreement the British Government guarantees the purchase by the United Kingdom (from September 1, 1940, until August 31, 1941) of the following goods produced in Congo:

Copper	126,000 metric tons.
Palm-oil	All supplies available for export.
Cotton	20,000 long tons.
Palm-kernels	15,000 "
Groundnuts	2,500 "
Copal	7,000 "

These are minima only. Bigger purchases may be made with an increase in output and in available shipping space. The quota of copper fixed in the agreement is slightly above the total Congolese output in pre-war years, but the Union Minière du Haut Katanga, which owns the copper mines, is able to increase the output. It should be recalled that Congo produces more than 8 per cent. of the world's copper. The production of palm-oil amounted to 70,256 metric tons in 1938 (14 per cent. of world's production); what additional supplies may be available is not yet known. In cotton and gum-copal, British purchases will absorb about a half of Congo's output. High quality tin ore is being supplied to this country under a previous agreement still in force, and possibilities of sugar supplies will be considered in March. These figures become more eloquent if they are compared with the very low figure of British imports from Congo previously.

To give the Congo an additional feeling of security and stability, the agreement provides that in case it proves impossible to ship the agreed quantities the British Government "shall pay for and take title to any unshipped balance, where it will lie in the Congo. . . ."

The immediate benefits of the agreement to the Congo

producers need no further elaboration. Important as they are, the broader significance of the treaty lies in its being a conscious and broadminded effort towards the full utilisation of the colonial resources of the invaded European countries for the common war against Nazi domination. The spirit of this wide community of interests and resources is most clearly reflected in the Financial Agreement, which brings in Congo as a member of the sterling bloc and adjusts her currency regulations to the requirements of the British blockade.

The agreement fixes the rate of exchange of the Congolese franc at 176.625 fr. to £1. No change in the official rate may be made except by a prior decision of the two contracting Governments. Under Article 7 of the agreement, the monetary authorities of Congo are obliged to offer to the Bank of England, and the Bank of England to buy, their whole surplus gold production deposited with the Reserve Bank of South Africa. (The gold-price has been fixed at 168s. per fine ounce, and the value of the Congolese gold production amounts to £4,000,000 per annum.) The same obligation applies also to the surplus of foreign currency, which may be in the possession of the Banque de Congo Belge.

Other arrangements provide for the control of imports into Congo, for the supply of Congo's requirements within the limits of the sterling area, for the way in which payments have to be made outside the sterling area and so on. The whole network of currency restrictions, so familiar to all belligerent countries, has been set up there and closely connected with the British system. The financial agreement remains valid for the duration of the war.

German propagandists in Belgium responded to the agreement with a wild outcry of "patriotic indignation." The free Belgian Government has been charged by them with "selling out the Belgian Empire to the City of London." Their anger has especially been aroused by the fact that the Congolese franc has been fixed to the £. The Germans would, of course, prefer to see the Congolese franc in the area of the currencies they are able to inflate, instead of in the sterling area. They would prefer to see the economy of the Colony in a disorganised state, instead of seeing how it is being organised against them. Hence their indignation, the motives of which are no less transparent under the guise of Belgian patriotism.

Czechoslovakia's Bad Harvest

[BY A CZECH CORRESPONDENT]

February 1st.

IT is now possible to obtain a final picture of the grain harvest in the Protectorate of Bohemia and Moravia. As this region is not very different in the meteorological sense from other Central European areas now under German domination, the Czech data are a useful guide for forming an opinion on the general situation in Central Germany.

The general survey of the harvest in 1940 is as follows:

	000 metric cwt.	
Wheat: Autumn crop	3,760	
Spring crop	1,357	
Rye: Autumn crop	3,729	
Spring crop	80	
Barley: Autumn crop	104	
Spring crop	5,214	
Oats	700	
Potatoes: Autumn crop	38,343	
Spring crop	499	
Maize	241	
Mixed Wheat and Rye: Autumn crop	443	
Spring crop	26	

The summer harvest of grain for flour is 45 per cent. lower than last year's. Its quality is bad, it is overgrown and often unusable.

The significance of the bad harvest for the food supply of the Czech population only becomes clear if we compare the result of the harvest with the total needs of the Protectorate territory for the year 1940-41, including in this food supply for the population, industrial

consumption and cattle fodder. This gives a deficit for most of the crops as follows:—

	000 metric cwt.	Deficit
Wheat	863	
Rye	420	
Barley	916*	
Oats	60	
Potatoes	2,818	
* Surplus.		

The results of this unfavourable state of affairs can be seen already. Milk production has fallen by one-third because there are no nutritive feeding stuffs. The production of milk fats has fallen by 35-45 per cent. It is estimated that the pig stock has fallen by one-third, and it will clearly fall still further in the course of the winter. There will be a complete shortage of pork fat.

The harvest in leguminous vegetables was as follows:

	Area sown (hectares)	Yield (metric cwt.)
Beans	224	2,550
Peas	4,868	62,965
Lentils	544	4,407

This year's sugar beet production amounts to 530 grammes of pure sugar per metric hundredweight, against last year's 570 grammes. Although the difference in the sugar content is not great, nevertheless, taking into account the lower weight of the roots, there is this year 8 grammes less sugar in a single beet than there was last year. But the beet is rotting in the ground, and the rot will have been intensified by falls of snow which prevent the gathering of the sugar beet in the field.

The considerable diminution in the harvest output does not, however, give a complete picture of the total food situation in Central Europe. The output of bread and flour from the mills in 1940 dropped by 40 per cent. The oats harvest has been normal, the barley has been only slightly damaged. In Southern Bohemia the potatoes have been affected by canker, which is widespread in Moravia also. It is even more destructive than potato blight, and was brought into Bohemia and Moravia from the Reich, where it is said to be raging worse than in the Czech lands. Potato blight, however, is also of frequent occurrence this year, so that we may reckon with the rotting of the harvested potatoes, and this will be helped by their large water content this harvest.

Altogether, the potato harvest in the Protectorate is only a little less than it was last year; this may be attributed to the fact that after the frozen winter crops the fields were ploughed up and planted with potatoes. There will not be enough early potatoes for this year's sowing, because they have been already eaten.

The prospects for this year's harvest are not very good, because the supplies of phosphate may be used only for military purposes, and there is a shortage of phosphorous manure. It is forbidden to manufacture superphosphates.

The results of the shortage of foodstuffs were shown already last summer. According to official statistics which have just been published, the commodity index rose between March, 1939, and July, 1940, in the case of the families of officials by 27 per cent., in working-class families by 31 per cent., and it continued to rise rapidly while wages are falling. The report adds, as an example, that a goose (a very favourite dish in Czech middle-class families) weighing about 17 lb. costs 960 Kc. in Prague. Before the occupation of Czechoslovakia by the Germans a goose of the same weight cost 90-100 Kc.

Sir Frederick Williams-Taylor.

London Offices: 47 Threadneedle Street, E.C.2 (Edward Pope, Manager)
9 Waterloo Place, Pall Mall, S.W.1 (J. H. Pangman, Manager)

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

THE BUSINESS WORLD

Munition Contracts

SPEED in the expansion of production and economy in the use of labour and raw materials: these are the twin targets on the economic front. It is difficult enough to hit either one of them; and it is more difficult to hit them both simultaneously. In peace-time, competition and the urge to increase profits keep industry's aim straight; but in war-time, competition is being increasingly hampered by the growing scarcity of resources, while the profit motive has been profoundly modified by the imposition of the 100 per cent. excess profits tax. Simultaneously, the Government has replaced the civilian as industry's leading customer; it is already spending some 60 per cent. of the national income, against one-fifth in times of peace; and its demands are for guns instead of for butter. It is now for the Government to provide the conditions that will focus industry's aim at the war targets. One of the most important of these conditions is the procedure adopted by the Government in the purchase of munitions. Careful ascertainment of costs of production must take the place of competition, while in its choice of contracts with industry for supplies the Government must take care neither to stifle initiative nor to encourage extravagance or delay.

This aspect of war economics has received the attention of the Select Committee on National Expenditure in a lucid and forceful report—the fourth of the 1940-41 session—published last week.

As past experience in this and other countries has shown, there is scarcely a more thorny problem for Government departments than the ascertainment of costs in private industry. There is first of all the need for uniformity in practice. The tabulation of direct costs—labour and materials—may seem easy enough, but the distribution of indirect or general costs—for management, office staff, maintenance of plant, depreciation—over the individual units of output is the bugbear of every cost accountant, and their treatment has not yet yielded to uniform practice within each industry. The problem becomes even more vexed in the case of firms—and there are many—supplying a multitude of products to both the Government and civilians. But Government establishments, such as the Ordnance Factories and Royal Dockyards, which are not subjected to the test of the market in peace-time, have long had satisfactory systems of cost ascertainment. And in the United States considerable progress has been made since the last war by trade associations with the introduction of uniform methods for the members of individual industries. That the problem is not as intractable as might be supposed—even when time is scarce—has also been demonstrated by the Internal Combustion Engine Manufacturers' Association, which recently reached an agreement with the costing departments of the three Services concerning the method of ascertaining costs to be employed in contracts for the supply of engines. Indeed, there is no reason why uniformity in practice should not be adopted by the principal industries.

Secondly, there is the need for more frequent and earlier cost ascertainment by the supply departments of the Services; this would be greatly facilitated by the adoption of uniform methods by individual industries. In particular, the practice of estimating costs in advance should be extended as far and as rapidly as possible in order to secure the data for contracts. True, to estimate costs in advance with any degree of accuracy is quite impossible in the case of firms hitherto engaged on the production of civilian goods. Where no basis for a prior estimate of costs exists, however, they should be ascertained immediately after production. The same difficulty and solution apply to new types of product

that may have to be produced in small quantities before they can be turned out in large numbers. The frequent checking of costs during production, too, should provide useful information. In view of the importance of the need for watching costs of production, it is astonishing that the Select Committee should have had to record in its third report, published in January, that it had been unable to see the actual costs of almost any articles which have been delivered since the outbreak of war, and, in its fourth report, that even the information gathered by the ascertainment of costs after production reached the Supply Departments too late to be used to the best advantage, either in keeping a continuous watch on costs or in fixing prices for immediately succeeding contracts. The practice of estimating costs in advance has long been the practice of the Admiralty, the Royal Ordnance Factories, and of the Office of Works for stores, and it is employed by the Air Ministry for certain of its requirements. But the Ministry of Supply appears to rely almost entirely on the ascertainment of costs after production, and does not even possess the organisation for estimating them in advance; it must be conceded, however, that the Ministry of Supply, more than the other Supply Departments, has had to rely on large numbers of firms previously making civilian goods.

While the substitution of a fool-proof cost ascertainment system for competition may not be feasible in practice, even after several years, there is room for considerable improvement. And this would appreciably facilitate the second of the Government's tasks, which consists in choosing the most suitable type of contract for each purpose.

Supply contracts can be divided into two broad groups: those stipulating delivery at a fixed price, and those providing for payment of the actual cost of production, plus an agreed provision for overheads and profits. In normal times, the first type of contract, based on a careful estimate of costs, gives the best results, and the Committee strongly advocates its extension whenever possible. But the difficulties are many. On the one hand it is impossible to employ fixed-price contracts in the case of new types of product or in the case of firms changing over from civilian to munition work, for there is no basis for calculating costs in advance with any degree of accuracy. And this automatically rules out fixed-price contracts for a large proportion of supplies. Manufacturers are naturally loth to undertake the manufacture of goods if they cannot be certain of their ability to cover their cost; nor would it be in the national interest if manufacturers went bankrupt through being unable to cover their costs. In the absence of competition, if prices are to be fixed, manufacturers will insist on their being fixed high. On the other hand, there is the hardly less serious problem of fluctuating prices for raw materials and labour. If prices were stable the fixed-price contract could find much wider application. Unfortunately they are not; but who is to estimate the cost of labour and materials six months hence; and who can guarantee that materials will be delivered in time to the manufacturer so that he will not suffer costly interruptions in production? True, the Committee is aware of some of the difficulties. It realises the need for controlling direct costs, the prices of labour and materials. It even goes out of its way to urge the calculation of a war-time cost of living index to include only the items necessary for the maintenance of health and efficiency, as has been repeatedly suggested by *The Economist*. If the Government, at this stage, can be brought to adopt a policy that will enable direct costs of production to be estimated months in advance, then the fixed-price contract is by far the most suitable type. But this would now involve such enormous changes in

fiscal and labour policy that the Supply Departments and the individual industrialist may be forgiven if they make their plans on the basis of a continuance of frequent and unpredictable changes.

The "cost plus" type of contract protects the manufacturer against a rise in costs, but, in some of its forms, at any rate, it provides no incentive to him to keep at a minimum those costs that he can control. The extreme type of contract in this category is that by which the manufacturer receives his expenses plus a percentage of them as profit. It would no doubt be unfair to accuse manufacturers of adding their personal expenditure to costs of production, and of claiming a dividend on it. But there can be no doubt that this form of contract, which is still all too often employed, should be abolished wherever possible. In the cases of new types of product or of new firms, when no cost figures are available, some makeshift contract of this type cannot be easily avoided. It is usually possible, however, to fix maximum prices whereby the contractor is paid his costs plus an agreed profit, up to the maximum. Or, better still—for this method provides some incentive to keep costs down—it is often possible to fix a target price on condition that, if the attained costs are below the target, the contractor obtains, in addition to his costs and an agreed profit, a proportion of the savings he has made by his own effort.

In view of the upward trend in the prices of wages and materials, some kind of flexible contract has become unavoidable, even for established firms and types of goods. The type best suited—and already adopted in certain cases—is probably the contract which stipulates a fixed price (including profits) for that part of the costs that is within the control of the manufacturer and reimburses him for any increase in costs over which he has no influence. This method should neither stifle initiative (E.P.T. at 100 per cent. affects all contracts) nor encourage extravagance. But, like all other types

of contract, its success must depend, in a large measure, on an improvement and extension of cost control.

The procedure followed by the various Government Departments shows considerable divergences, and the Committee rightly stresses the need for more uniformity, at least so far as similar work is concerned. In peacetime the Admiralty relied largely on the fixed-price contract, based on the calculation of costs before production. But after the outbreak of war this practice had to be abandoned for repairs and conversions, and, instead, a type of flexible contract was adopted. The Air Ministry followed the Admiralty practice, and, while it has not been necessary to abandon it entirely in war, it has been modified by the McIntock Agreement. This provides for a contract based on costs plus a profit for the first batch of novel designs, and for a contract based on a target price for the transitional period until sufficient information is obtained to permit the introduction of the fixed-price type. The War Office's practice of fixing maximum prices, based on the ascertainment of costs after production in the Ordnance Factories and established contractors, has been retained by the Ministry of Supply. So far as constructional work is concerned, which remains under the contracts branch of the War Office, the extreme form of flexible contract providing for the payment of cost plus an agreed profit is still all too prevalent, in spite of the fact that the Office of Works, which has more experience in this field of activity, has demonstrated its ability to adhere to sound contract procedure.

In sum, better costing and improved contract procedure are necessary, among other things, if industry is to achieve the twin objectives of speed in production and economy in resources. It is for the Supply Departments to meet this need. True, the problem is complex and the difficulties are many. But the one is not insoluble, and many of the others can be overcome.

Industry's Reward

THE picture of this country being duped by a profit-seeking plutocracy is one of the fondest distortions drawn by enemy propagandists. This overworked trick is an attempt to exploit the unthinking delusion that there is something inherently profitable in war—that sinister motives of private gain plunge nations into bloodshed, and sustain wars for the financial benefit of the few. We need not examine in this article the clap-trap premises on which such argumentation is based. But a stage has now been reached in this war at which it can be put to satisfactory statistical disproof by an examination of the latest evidence from company profits.

In the long history of *The Economist's* profits surveys, it has been customary to take twelve-monthly stock at June 30th in each year, on the justifiable ground that profits recorded to June 30th represented, by and large, the earnings of industry in the previous calendar year. There are now two powerful arguments for changing this period of annual review to the calendar year itself. First, the reports appearing in 1940, having an average accounting date to April last, provide the first reasonably sound statistical basis for measuring changes in profits in the first year of war. Such are the inherent delays between the earning and the publication of profits, of course, that the 1940 figures still bear the imprint of many peace-time influences, though one predominant factor—taxation—has exerted growing war-time force. The second reason for providing an annual review at this moment is that a year has now elapsed since the new basis of computing our profits statistics was introduced. What has happened to trading and distributable profits in this period?

The first of the accompanying tables sets out the results of 2,260 companies reporting in 1940, and also those of the 558 companies whose accounts appeared during the last quarter. For the whole year, industrial profits (after depreciation) rose by 9.2 per cent. from £377,078,000 to £411,186,000. This is an increase which could be exploited by any propagandist who is unscrupulous in his use of facts. To anticipate him, let two points be made clear. First, these figures relate to total trading profits, so far as they can be ascertained from published accounts. They are not the net return to industry, and they are very far removed from the

eventual reward to shareholders. Secondly, it may be recalled that industrial profits in the first year of the war of 1914-18 rose by exactly 20 per cent., and earnings on ordinary capital jumped from 13½ to 17½ per cent. The prompt application of E.P.T. has evidently been more effective during the first stages of this war than it was in the last.

Net profits show a very different story, for the total weight of charges for depreciation and taxation more than offset the increase in trading profit during the past year. Published net profits have in fact fallen from £216,336,000 to £208,086,000 during 1940. This decline of less than 4 per cent. could not, admittedly, be represented as a grievous burden for industry and its shareholders, though if the full rigour of the current level of taxation had applied throughout 1940, the fall would undoubtedly have been more striking. The published net profits figure of £208,086,000 for 1940 corresponds to an estimated net figure, before charging standard income tax—but after E.P.T.—of £259,098,000. This latter

PROVISION FOR DEPENDANTS

There is no better way of providing for those dependent upon you than by effecting a Whole Life Assurance under *The Distinctive System* of this Institution, which combines Low Premiums with the right to share in the Surplus.

The Premiums may be paid throughout life or limited to a specified number, thus relieving the Assured in the later years when, owing to retirement, income may be reduced.

Founded for Mutual Life Assurance in 1837

estimate is merely another way of expressing the published figure, and is not, of course, comparable with the net total, after taxation, of £216,336,000 shown for the previous year. The difference between the published net profits total and the estimate of its equivalent before taxation illustrates the vital extent to which taxation charges intervene before shareholders receive their dividends. In future years, our grossed-up net profits estimates will provide the basis for stricter comparison of profits than has hitherto been possible. At the moment they throw no light on the issue whether war-time profits are excessive, for the simple reason that corresponding estimates for 1939 do not exist.

* After depreciation where not separately stated.
† Where separately stated. ‡ Incl. taxation

In the light of the comparable figures for 1939 and 1940, however, it is clear that the burden of proof of the charge of war-time "profiteering" lies with those who bring it. All the evidence points to the fact that taxation is progressively mopping up all the increases in trading profits, and more besides. That point can be put to simple test by study of Table II. Taken quarter by quarter, the past year has shown, on the whole, a declining trend in the gross rate of earnings and dividend payments to ordinary shareholders, even before the increased exactions of the tax gatherer have taken effect. Equity shareholders, in those companies whose reports were published in the first quarter of 1940, received an average gross return of 13.1 per cent. But for the last two quarters of the year the gross rate has been below 10 per cent., and the net return, after taxation, has fallen much more steeply. Meanwhile, industry can only maintain its capital intact—under a regime of 100 per

cent. E.P.T.—by setting aside a larger proportion of its net profits after making provision for this tax. There is the clearest evidence that it has done so during the past twelve months, for the proportion of profits set aside to free reserves has increased from 10.9 per cent. in the first quarter to 15.0 per cent. in the last quarter.

On page 232 there will be found a table showing the profits experience of 25 major industrial groups last year. Making every allowance for the imperfect basis of comparison between the 1940 net profit figures and those of the preceding year—for these figures are not adjusted for changes in the standard rate of income tax—it is

TABLE II.

DISTRIBUTION OF PROFITS AND RETURN ON CAPITAL

	Proportion of Adjusted Net Profits (%)			Rates of Payment (Gross)			
	Prof. Div.	Ord. Div.	To free Reserves	Deb.	Prof.	Earned Ord.	Paid Ord.
1st Quarter.....	17.5	71.6	10.9	4.2	5.5	15.1	13.1
2nd Quarter ...	20.3	65.0	14.7	4.8	6.2	12.3	10.0
3rd Quarter ...	29.4	55.9	14.7	4.9	6.9	12.2	9.6

Whole year ...	21.5	65.1	13.4	4.6	6.1	13.2	10.9

surely a sufficient interim answer to the materialist interpretation of current history to point out that, while all but six of these groups increased their trading profits, only six of the nineteen retained any part of their increased total profits in their net earnings. Of these groups, rubber and textiles are by far the most important. The bulk of the groups failed to increase their net profits in a year which was characterised by increased activity, due to the war, but which lacked the current impediments of closely controlled civil industry, rationing of raw materials, shortage of labour, and export difficulties. During the current year a much greater sector of civil industry will feel these burdens. In that sense, industry has been lucky in 1940, because our industrial preparation for total war was slower than it had any right to be. In 1941, it is already obvious, the story will be very different. It promises, in fact, to fulfil the oft-quoted precept "taking the profit out of war."

Finance and Banking

Tax Payments Again

Although the transfer of tax moneys to the Exchequer has again encroached heavily on the banks' resources this week, the position in the short loan market has been easing steadily. One factor in the situation has been the subnormal flow of new Treasury bills reaching the market. At last week's tender the market syndicate does not appear to have bid for the Tuesday 88-day bills on which allotment was made in full and received only 10 per cent. of its applications for the 89-day bills dated all other days of the week. This 10 per cent. allotment is lower than any received in the "bill famine" period early in 1939 (when admittedly the syndicate applied for rather less than half the present quota). Consequently, the market has been a diffident seller of bills to the banks, and the latter for their part have found it difficult to satisfy their moderate requirements for bills. One reason for this is to be found in the fact that the firm which operates in the market for the authorities has again been a persistent buyer of bills, taking any maturities on offer. It is still, presumably, acting in the main for one or more overseas customers whose requirements have not been fully satisfied at the weekly tender. Its activities must not, therefore, be regarded altogether in the light of open market policy. The Bank return, however, shows an increase of £13,680,000 in Government securities, and though market experience suggests that this movement must largely reflect direct transactions between the Treasury and the Bank, it may well be that the open market purchases of bills have to some extent been responsible for it. The strong tide of revenue payments may be seen

in the rise of £10,104,000 in public deposits. Bankers' deposits, at £110,628,000, show hardly any change on the previous week's total, the drain caused by the flow of funds into Government accounts and by a rather surprising rise of about £1,000,000 in the circulation, having been offset by the increase in the Bank's holding of securities.

Indian Securities Call-up

The vesting order for the compulsory acquisition of seven Government of India loans by the Treasury is the first instance on which use has been made of the Defence Regulations to repatriate Empire debt and thus check the inordinate accumulation of sterling area funds in London. Voluntary action on this line has already been taken by the dominions of Canada and South Africa, when the maturity of sterling loans provided the opportunity for outright redemption out of accumulated cash resources, but this is the first time the Treasury whip has been cracked to urge the movement along. The loans are outstanding to the tune of just over £90,000,000. It does not follow that the repatriation of capital resulting from this vesting order will reach these proportions. It is probable that a substantial amount of the loans in question are already held in India—whether by private investors or public departments. It will be remembered that the Indian Government undertook last year to facilitate the repatriation of sterling debt by undertaking to create and issue the rupee counterpart of any sterling stock. The Finance Member, in making his 1940 budget speech, stated that £9,000,000 of such debt

had been converted on these terms. It is probable that by now the figure has risen well above this level. The new vesting order will merely serve to accelerate this process.

* * *

Accumulation of Indian Balances

The need for a measure of this kind is emphasised by the recent growth of Indian sterling assets. By far the most important element in these assets are the balances and securities of the Reserve Bank of India. Prior to the establishment of the Reserve Bank the sterling balances of the Secretary of State were the most important fluctuating item in India's sterling assets. Now those balances have been reduced to the role of a current account in which is held the minimum petty cash requirements of the Administration. There is, in addition, a Silver Redemption Reserve in which some £7,500,000 is held, but this is a relatively stable item. The changes in the sterling assets of the Reserve Bank since the beginning of the war are shown below:

	in crores of rupees			
	Sterling securities	Sterling balances	Total	
Sept. 1, 1939	59.5	10.1	69.6	
Sept. 6, 1940	131.5	30.7	162.2	
Jan. 31, 1941	185.5	67.0	252.5	

The latest total gives a sterling equivalent of around £142,000,000. It is out of this reserve of sterling assets that the repatriation will be effected. The securities in question will be acquired by the Treasury and transferred at the price of acquisition to the Government of India. The mechanics of the operation as far as the Reserve Bank is concerned will probably involve a substitution of rupee securities for balances and securities now held in sterling. The Reserve Bank may subsequently decide to liquidate part of these additional rupee securities in the open market in India. Whether or not it does so must depend on the credit policy which the authorities in India desire it to pursue. It should be noted that since the vesting order only applies to holders of the loans in question who are resident in the United Kingdom, these sterling issues will not altogether disappear.

* * *

A Precedent and its Implications

One must assume that this latest vesting order marks a precedent which will be followed as and when the situation demands some compression of the liquid sterling assets of countries in the sterling area which have long-term sterling loans outstanding in this country. One interesting consequence of this will be to reduce the semi-official competition for such short-term assets as Treasury bills in the London market. The Indian operation alone will have a considerable effect in this direction. The development thus holds out the hope of rather larger allotments of Treasury bills for the discount market, and even of a recovery in the bill rate to a figure which will allow at least a $\frac{1}{2}$ per cent. turn on resales of bills to the banks. The market had for some time past viewed with concern the persistent growth in the semi-official competition for Treasury bills which had cut both the discount rate and the allotments of bills to subnormal proportions. It had, in fact, been entertaining hopes that in view of this increased competition for bills the Treasury might have been induced to raise the weekly offerings of bills above the present ceiling of £65,000,000. If, however, a substantial flow of Dominion funds now utilised in the bill market can be diverted to the repatriation of longer term sterling debt, the interests of all parties concerned will be served without any such adjustment. The Empire countries involved will gain by repatriating debt bearing interest at a considerably higher rate than that earned on their present short-term sterling assets. The market should find it possible to obtain a somewhat larger allotment of bills than the meagre rations to which it has lately been restricted.

* * *

Frozen Assets in U.S.A.

The United States Treasury has this week issued a statement of the foreign dollar assets frozen as a result of the invasion of the countries to whose nationals they

belong. The total reaches the imposing figure of \$4,369,000,000, of which \$1,596,000,000 is represented by foreign and domestic dollar securities, and the balance consists of gold and bank balances. All but \$29,000,000 of these frozen assets belong to countries which have been wholly or partially occupied by Germany. The \$29,000,000 in question belong to the Baltic countries now incorporated in the Soviet Union. The distribution of these assets is as follows:

	\$
France	1,593,000,000
Netherlands	1,619,000,000
Belgium	760,000,000
Norway	175,000,000
Denmark	92,000,000
Rumania	53,000,000
Luxemburg	48,000,000
Baltic States	29,000,000
Total	4,369,000,000

These funds are not all frozen to the same degree of solidity. Dutch and Belgian Government funds, for example, are to some extent being operated at the behest of the two Governments established in London. There have been discussions with Vichy for a partial release of the funds held on official French account. On the other hand, the dollar assets of Denmark and of the Baltic countries are, for the time being, completely immobilised.

* * *

Belgian Gold

The German Government have secured their biggest haul of gold from invaded countries through the intermediary of the Vichy Government. The metal which is thus finding its way to the enemy is that part of the National Bank of Belgium's gold reserve, which had, after many peregrinations, found its way to a safe deposit west of Dakar, in French West Africa. The amount in question, about £60,000,000, had left Brussels for Paris long before the invasion of Belgium. When the German break-through occurred, this gold, together with what remained of the Bank of France's own reserve, was first sent to Bordeaux, and then—in face of the protests of the Belgian Government, who wished it transported to Britain—to Dakar. Now the Belgian gold is in process of being transported back to Brussels. The orders which have led to this repatriation have ostensibly been given by the Brussels office of the National Bank of Belgium to the Bank of France. But German pressure can without difficulty be discerned both behind the instructions emanating from Brussels and in the compliance of the French authorities with these orders. The Belgian Government have been quick to defend their interests. Through their representative in the United States, M. Theunis, they have instituted legal proceedings for attaching an equivalent amount of gold—namely \$260,000,000—held by the Federal Reserve Bank for account of the Bank of France. This defensive move may safeguard the interests of Belgium. Unfortunately it does not prevent the German authorities from acquiring a much needed and considerable amount of gold.

Fire Losses in 1940

Although the ordinary risk of fire damage has of late been completely overshadowed by the incendiary menace from the air, the waste caused by ordinary fires

The OCEAN

Accident & Guarantee Corporation, Limited
Head Office: 36-44 Moorgate, London, E.C.

FOR ALL CLASSES OF INSURANCE

shows a marked upward trend. For the year 1940 the estimated total of fire losses in Great Britain and Ireland, based on known large outbreaks with the usual 60 per cent. addition for fires in which the damage does not exceed £1,000, is £12,640,000, an increase of £3,552,000 (39 per cent.) on the 1939 aggregate of £9,088,000. In December alone the figure was £1,512,000, against £622,000 for the same month of the previous year. These heavier losses must in the main be ascribed to the increasing tempo of the national war effort; with staff operating at full pressure, and many workers as yet only partially trained in their new duties, precautions inevitably become relaxed. In some measure the losses may be the reflection of increased exposure, resulting from larger output and higher values, and to

this extent the Fire offices will have something, in the shape of additional income, to soften the blow. But loss ratios on home business will unquestionably be considerably in excess of those for 1939, and policyholders who, faced with the necessity of finding heavy sums for war damage insurance, feel tempted to economise on ordinary fire premiums, should draw the appropriate moral. It is true that in the current year the offices will derive some benefit from the presence of fire-watchers, but how far this will offset the tendencies already mentioned is problematical. In view of the importance on national grounds of keeping fire waste at a minimum, it is hoped that insurers will be allowed to retain sufficient staffs of expert surveyors to ensure that fire-protection standards are not unduly weakened.

Investment

Unified Stockbroking

Modern wars have the characteristic of unifying those who suffer from their effects, and this applies to commercial and industrial groups as well as to the general body of the people. This circumstance has doubtless played its part in enabling those stockbrokers, up and down the country, who have been fighting for unity throughout the profession to bring their labours to a successful conclusion. The new developments are set out in changes in the rules just published by the London Committee. The changes cover two distinct but connected matters, namely, relations between the London exchange and other recognised brokers, and a general reduction in rebates on commissions given to agents. While the latter removes an immediate strain on the broker—and is perhaps the only alternative to a rise in the charges made to the public—the former, which has been agreed with representatives of both the Associated Stock Exchanges and the Provincial Brokers' Stock Exchange, aims at securing unity of practice in all such matters as minimum commissions, restrictions on advertising and sharing of commissions to which the London broker has conformed for generations past. The plan is based on the contention that London jobbers form the only real stock market in the country, except for a number of local securities, and that the best interests of all parties are served by having only one market and concentrating all business in it, whether it be in London or elsewhere. It continues the special privilege of a rebate of half commission between members of the three groups of brokers specified, but withdraws this right from brokers, not members of any recognised body, but who were admitted to the "White List" compiled by the London Committee under Rule 203 (1). Further, the London market bars from direct access to its facilities members of the Associated and Provincial Brokers' exchanges who carry on jobbing business in competition with itself. While at first blush, this may appear an undue limitation of individual initiative and of competition, it is perhaps more usefully regarded as a practical acceptance of the fact that telecommunications—even in these days of bombs and priorities—have made of the whole country one unit, with one market, and that jointly fixed rules for all those who use it, whether in person or by teleprinter, are a necessity. There is no change in rules which imposes any fresh limitation on membership of any exchange and, perhaps, all that the investor has a right to ask is that, now that uniformity has been reached, the task of improving existing practice should receive due attention.

Full Register of Agents

Unity of practice involved reconciling conflicts of interest, real or apparent, within the profession. To cut commissions required at least the "benevolent neutrality" of one powerful group of agents, the bankers. These, the "White List" brokers, remisers and brokers' clerks were allowed return of half commission when other agents were cut to one-third. All

are now cut to one-third, except the White List broker, who, in common with all other recognised agents, will receive 25 per cent. return. Further, all classes of agent will require to obtain entry to registers to be kept by the London Committee, who will have absolute power to decide who shall be admitted. The qualification for admission, even to the receipt of 25 per cent. rebate, is that the agent shall be habitually engaged in handling stock exchange business. Thus, for the first time, members of the three recognised groups of brokers obtain, in dealings with one another, an advantage over all classes of agent. The grounds for this further cut in rebates are that even in normal times, averaging good with bad years, brokers' expenses take one-third of the commission, leaving only one-sixth to him for profit if half commission is returned, and that such a contribution is insufficient recognition of the service rendered by maintaining the whole machinery of the central market, towards which none but London members make any direct contribution. The broker is entitled to drive as good a bargain as he can, and the change is presumably justified, provided it does not lead to business by-passing the exchange, and so reducing its efficiency and the brokers' commissions. But here again, the public has the right to expect that, with any return towards normal, some of the benefit to brokers shall be passed on to it in the form either of improved facilities or of reduced charges. The agreement represents an attempt to solve problems which have occupied brokers for over a decade, and which have been under almost constant consideration for several years. That it is potentially helpful to the public is certain, not least because it will render the path of the "bucket shop" and of other transgressors more difficult. Nobody, least of all those responsible, will claim that it solves all the problems of the broker or insures a perfect service to the investor. It does, however, promise to leave those who have evolved it free to build on what is felt to be a more solid foundation than has existed in the past.

Vesting India Stocks

The decision of the Treasury to take over all United Kingdom sterling holdings of the six loans of the Indian Government, which have fixed redemption dates, appears to have come as a very unpleasant surprise to the market and the investing public. It was realised that the concentration of our imports on Empire countries, coupled in the case of India with substantial war outlays which do not enter into the balance of trade, would cause the accumulation of large sterling balances here. It seems to have been considered that market purchases of stock by India would have sufficed to meet these, and investors have to some extent competed with the Indian Government in driving up prices. It was not, however, appreciated that needs would be on a scale which, after eighteen months of war, called for the vesting of stocks whose total issue is of the order of £90 millions, nor was it understood that the securities chosen would be those which brought the greatest immediate saving to the borrower without consideration of his contract

Company Notes

Woolworth Expansion

The detailed preliminary figures of F. W. Woolworth and Co. for 1940 were dealt with in *The Economist* of February 1st, and the full report adds little to this aspect of the company's affairs except for showing the growth in trading profit, the extent of the tax provision and the appearance of a new item of £150,000 for contribution under the War Damage Bill. Trading profit exceeded £8,471,000, a rise of some £514,000, as compared with £680,000. The increase has been exceeded three times since 1935, but it sufficed to raise the total expansion over three years to some £1,690,000, as compared with £1,672,000 in the preceding period of equal length and with £716,000 between 1931—the first year as a public company—and 1934. As was inevitable, the rate of expansion has been falling off for some time, but to have raised even the absolute amount of increase during three years devoted to war and preparation for war is no mean accomplishment, even given the rise in prices. The increase in tax provision last year goes a long way to absorb the expansion since 1937. Most other allocations are little changed, but the transfer to buildings reserve is more than doubled at £250,000, and there is the first contribution of £150,000 under the War Damage Bill. This amounts to almost 1½ per cent. on the balance-sheet value of properties, which would seem to be a reasonable measure of liability. That it is also just 2 per cent. on the ordinary capital is a measure of the burden this cost is likely to impose on shareholders.

	Years to December 31		
	1938	1939	1940
	£	£	£
Gross profits	7,275,021	7,957,120	8,471,291
Written off properties a/c ...	314,480	344,519	363,132
War damage insurance	...	...	150,000
Net profit	6,961,141	7,612,601	7,958,160
Taxation	2,031,746	2,950,725	4,310,910
Staff fund	110,000	110,000	110,000
Prof. divs.	217,500	195,000	172,500
Ordinary stock:—			
<i>Earned</i>	4,601,895	4,356,876	3,364,750
<i>Paid</i>	3,534,375	3,253,125	2,803,125
<i>Earned %</i>	84.7	87.2	78.0
<i>Paid %</i>	65	65	65
Buildings reserve	100,000	101,080	250,000
Carry forward	5,468,446	6,471,117	6,782,741

The report is, as usual, silent as to the future, but some of the figures are suggestive. There is a modest expansion in properties and a rise of nearly £600,000 in stocks and debtors, but the feature is a jump of £3,180,000 in gilt-edged investments to some £3,645,000, associated with a drop of £725,000 in cash and an increase of £3,156,000 in creditors. Granted that a substantial part of the rise represents the temporary investment of tax money, the switching of resources from cash to investments, rather than adding to the former, may perhaps indicate, when coupled with a rise in prices,

with the lender. The market, in fact, feels very strongly that, if vesting was necessary, loans already repayable ought to have been selected first and not those with some years to run, as have those selected. Presumably the justification for the action lies in the fact that this country must make the best terms it can for the settlement of its debt to India and that these are the best acceptable. If it is felt that they are arduous, India can plead that they are less so than those demanded by at least one of the Dominions.

Stock	Outstanding end 1939	Acquisition Price	Pre-vesting Yield
	£ 000's	£ s. d.	%
India 5% 1942-47	8,880	104 16 6	2.10
" 4½% 1950-55	38,903	110 1 10	3.30
" 4½% 1958-68	17,500	112 17 0	3.52
" 4% 1948-53	11,355	106 11 7	3.17
" 3½% 1954-59	10,000	102 16 4	3.35
" 3% 1949-52	9,500	99 16 2	3.12

Without denying the inequity of the procedure as between holders of different loans, it is more profitable to consider its immediate effects and its implications. The funds now to be repaid to India have, in the past, been invested in tap and tender bills and in longer-dated securities. They are largely loans of medium date whose holders will presumably place them in the Consol market and, in part, in other securities, mostly of trustee status. The basic figure of £90 millions is an over-estimate, as it represents the total outstanding at the end of 1939, since when there will have been some purchases by India, and as it includes holdings outside this country and India, where a similar order has been made affecting repayment in rupees of the same stock. The effect of vesting is likely to be a substantially increased demand for the longer-dated loans of the British Government and for other issues such as corporation stocks and railway and similar debentures.

New Yield Criterion

The implications of the decision to liquidate debts between members of the sterling bloc by vesting securities of the creditor are considerable. The first suggestion is that, where India has led, others will follow, and that India's turn will come again. It seems evident that Australia should be considered first favourite in the succession, with New Zealand and South Africa to follow up. Canada is a case apart, as being outside the sterling area and requiring, in consequence, hard currency or its equivalent. Evidently, a considerable section of the list of trustee investments is likely to disappear in the not distant future, leaving a restricted choice. But this is not all, for it is far from clear how far the value of a "date" is affected by the new departure. Fixed interest stocks are priced on the basis that redemption yields rise with the length of life of the stock, but, if the example now before the investor is any guide, this means little to the borrowing governments, who are likely to take the stocks which give the greatest immediate relief to their hard pressed budgets. Presumably, there are limits to the price which the borrower will be prepared to pay for this immediate relief, but it is hard to say where they will be set in the case of any particular Dominion. The nature of the market's reaction is likely to be a reduction of the margin in yield which the investor has hitherto been prepared to pay for a definite redemption or an early date, and to substitute for contractual obligations the nominal interest rate as an index of priority of redemption. This will tend to make all stocks with nominal interest over 4 per cent. into shorts, those with the highest rates being the shortest. This is, however, only a tendency. If it were a certainty, high-interest stocks would quickly be bid up to a point at which the yield was very low, but, as redemption is contingent only, this can scarcely happen. It is curious that the effect of the order has so far been concentrated upon Indian "irredeemables," but it cannot be long before the position of Australian stocks is considered. The Commonwealth and States have around £78,500,000 stock, whose first redemption date is passed, carrying interest of 8½ per cent. or more, but of which only £30 millions carry more than 4 per cent. As against this, there are more than £100 millions of 5 per cent. stocks, a first repayable in 1945 under the terms of issue. It is a matter of crucial importance which of these are taken first, and one would guess it will be the latter.

RISEING VALUES

English Electric Progress

The full accounts of English Electric for 1940 show a continuation of the steady expansion which this company has been enjoying since 1934. Unfortunately for the investor, trading profit is shown after tax provision at £517,066, instead of before tax as in previous years. In 1939, pre-tax earnings totalled £694,215, and tax provision amounted to £210,000, against £50,000 in 1938. It is clear that tax liabilities must have substantially increased last year, and it is evident that gross earnings of English Electric have in fact again expanded satisfactorily. Despite an increase in depreciation from £75,000 to £100,000, the surplus available for ordinary stock is actually higher at £289,906, against £281,826, representing an increase in the rate of earnings from 17.2 to 18.8 per cent. As in 1939, £100,000 is allocated to

general reserve, which now stands at £600,000 in the balance-sheet, leaving the carry-forward slightly reduced from £56,840 to £54,495.

	Years ended December 31		
	1938	1939	1940
Trading profit	667,003	694,215	517,066†
Depreciation and fees ...	66,000	80,247	103,208

Paid %	10	10	10
General reserve	200,000	100,000	100,000
Carry forward	67,265*	56,840	54,495

* After £70,554 written off new issue expenses.
† After tax provision.

The directors state that the company's liquid assets at December 31, 1940, totalled £2,918,983—a moderate increase on the corresponding figure of £2,806,718 for 1939. The balance-sheet shows a fall in debtors from £2,972,178 to £2,922,851. Since this decline coincides with an important increase in the total of stocks and work in progress from £1,923,593 to £3,157,481, there is a presumption that Government payments are being promptly received for the increasing amount of work "directly connected with the prosecution of the war"—to quote the report of the previous year—on which English Electric is necessarily engaged. Cash holdings are reduced from £83,176 to the exceptionally low figure of £38,169, and creditors including tax provision are up from £2,220,181 to £2,945,534. There is every prospect that profits will continue to rise ahead of taxation and costs, at least during the current year. At the present price of 30s. 6d. ex dividend the £1 ordinary stock yields £6 11s. per cent.

* * *

Thomas Tilling Report

The report of Thomas Tilling for 1940 provides little indication of the influence of war conditions on motor transport earnings. While the operation of the subsidiary companies must have been considerably hampered by fuel restrictions and by the requisitioning of vehicles, the realisation of a net profit figure of £541,633, against £553,919—in both cases after deduction of taxation, administration expenses and depreciation and in the latter year of war damage insurance provision—is a remarkable achievement. Gross revenue, which unfortunately is, as usual, not disclosed by the company, must necessarily have shown an appreciable rise during 1940. After the normal deductions for fees, interest payments and preference dividends, the equity surplus is reduced from £514,519 to £502,694, but, grossed up at the rate of 8s. 6d. in the £, the surplus represents a rate of ordinary earnings of 13.8 per cent., as in 1939, thus providing the same cover for the 10 per cent. ordinary dividend. After the usual allocation of £100,000 to general reserve, the carry forward is reduced from £180,615 to £171,310. Three years' trend of profits is analysed in the following table:

	Years to December 31st		
	1938	1939	1940
Profit†	535,531	553,919	541,633
Fees	2,650	2,650	2,650
Interest	20,685	20,250	19,789
Pref. div.	16,500	16,500	16,500
Ordinary shares—			
Earned	495,696	514,519	502,694
Paid	412,000	412,000	412,000
Earned %	12.8	13.8	13.8
Paid %	10	10	10
General reserve	100,000	100,000	100,000
Carry forward	178,096	180,615	171,310

† After depreciation and taxation and, from 1939, after E.P.T.

The balance-sheet continues to present an appearance of great strength. The total of investments at or below par has increased slightly from £6,059,399 to £6,082,899, while the total of the general reserve fund has risen from £1,101,861 to £1,186,841. It is not clear that allowance has been made for depreciation of L.P.T.B. stocks, but

"I think we've just got time for a Hot Bovril, old man"

Hot Bovril cheers!

Never get chilled and depressed. Keep warm and sustained by timely cups of good Hot Bovril. This is the secret of those cheerful, fit folks who greet you with a 'winning' smile.

GET IN A SUPPLY OF BOVRIL NOW!

the valuation of total investments appears conservative. Cash holdings are up by nearly £100,000 to £202,958, debtors by some £20,000 to £114,419, and creditors only from £68,198 to £69,820. No doubt last year's excellent results are due in some measure to an increase in the number of passengers carried by the operating companies in the group and to adjustment of fares. The expansion of the group in recent years may possibly be temporarily checked by the war, but there is a good prospect that the 10 per cent. ordinary dividend will continue to be earned. The £1 ordinary stock at 40s. 3d. ex dividend yields £4 19s. 2½d. per cent.

* * *

Yorkshire Electric Power

The report of Yorkshire Electric Power shows another rise in total income to a fresh high level of £1,814,972 for 1940, against £1,582,892. The usual figures of unit sales of power are omitted in the national interest, but it may safely be inferred that they have in fact risen in volume as well as in value, and that the war has done little to restrict this company's steady expansion. General expenses showed a number of important rises during the year. The cost of fuel and energy for generation and distribution rose from £388,266 to £510,628; liability for rates and taxes from £222,648 to £263,305, and general maintenance and repairs from £98,677 to £118,883. The allocation to plant renewals fund is halved at £50,000, but the directors have earmarked £100,000 for payment to reserve for war damage insurance charges. Thus, after maintaining the depreciation and reserve allocation at £300,000, the surplus for equity capital is reduced from £156,613 to £146,098, at which level, as in the previous year, it fails to cover the 8 per cent. ordinary dividend absorbing £152,934 net. The earned rate is reduced from 7.9 to 7.6 per cent., and the carry forward from £95,451 to £88,615. The following table shows the trend of revenue and expenditure over the past three years:

	Years ended December 31		
	1938	1939	1940

* Withheld in the national interest.

The most striking change in the balance-sheet position is the reduction in cash holdings from £170,045 to £7,439. Sundry debtors are substantially higher at

£913,573, against £771,941, an increase which is only partially financed by the rise in creditors from £621,052 to £693,003. The stock of coal and stores is providently increased from £321,022 to £381,224, and £20,000 is lent to the Treasury. The total of the A.R.P. suspense account, which is included among balance-sheet assets, has risen from £80,299 to £96,832. The cash resources are very moderate, but doubtless finance will present no difficulties even with the capital market closed. The £1 ordinary stock, at 35s. ex dividend, yields £4 11s. 5d. per cent.

* * *

Textile Progress

The reports of two leading holding and operating textile companies, *Amalgamated Cotton* and *Linen Thread*, show a very marked improvement in revenue during the past year. The aggregate trading profit of *Amalgamated Cotton* and its subsidiaries for the year to August 31st last, after depreciation and taxation, rose from £193,438 to £717,636, while the revenue of the holding company improved from £99,658 to £414,538. Even after an increase in the holding company's provision for taxation from £3,721 to £237,960 and an allocation of £50,000, against nil, to war contingencies, equity earnings increased from £22,768 to £63,830. In his speech, circulated with the report, Mr. A. C. Openshaw attributes the rise in revenue mainly to the better running time enjoyed by the plant of subsidiary companies, and states that the spinning mills of the group have operated at nearly 90 per cent. of capacity during the past year. In view of the official policy of restricting private purchases, the shortage of raw materials and rising costs, the directors are undoubtedly wise to refrain from raising the ordinary dividend from 8½ per cent. tax free which has been paid during the past three years and to leave the surplus to increase the carry-forward from £23,625 to £70,723. The tax free rate of equity earnings amounts to 31.4 against 11.3 per cent. The improvement in earnings of *Linen Thread* is also considerable. The total for 1939-40, at £288,861, was, however, shown after provision for war losses, while last year's total of £455,327 is before deduction of £140,000 for this contingency. With an increase in the tax provision from £60,000 to £80,000, the net profit for the year has risen only from £223,267 to £229,799. Thus, equity earnings at £108,799, against £102,267, represent a rate of 7 against 6.3 per cent. and provide a rather more adequate margin of cover for the 6 per cent. ordinary dividend. The balance-sheet of *Linen Thread* shows a rise in creditors, including provision for taxation and contingencies, from £350,773 to £1,220,497, and cash holdings are up from £93,092 to £501,763. The balance sheet of *Amalgamated Cotton Mills* shows an important rise in stock-in-trade from £606,800 to £976,556. Here, too, creditors, including provision for war contingencies, are significantly higher at £206,630, against £53,941. The chairman states that, since the date of the accounts, three of the subsidiary companies have suffered damage from enemy bombing. The company is apparently making satisfactory progress in finding new overseas markets. The 1s. ordinary shares at present stand at 1s. 9d. and yield £4 15s. 3d. per cent., while the £1 ordinary stock of *Linen Thread* at 23s. 9d. yields £5 1s. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

Stock markets have given an uncertain display during the past week. On Friday, the absence of exact news concerning developments at Vichy, and Sir Kingsley Wood's latest statement that taxation must be further increased, sufficed to restrain purchasers who were otherwise encouraged by the fall of Benghazi. After the week-end, all markets profited from the Prime Minister's encouraging statement and the funds were supported on the news of the call up of Indian stocks, 3½ per cent. War Loan reaching a new high level since the outbreak of war. Later in the week, sentiment was again depressed by rumours of adverse developments in the Balkans and the uncertain

upshot of the Franco-Mussolini meeting.

At the end of last week, very little business was put through in the gilt-edged market, but a few stocks incurred fractional losses, including declines of ½ in 3½ per cent. War Loan and of ¼ in 2½ per cent. Funding and Conversion. On Monday, the funds were extremely strong. The market was led by a gain of ½ for 3½ per cent. Conversion, while 3½ per cent. War Loan put on ¼ to touch 103½—a new war-time record—before reacting to 103½. The market enjoyed a long list of gains among which 2½ per cent. Consols and 3 per cent. War Loan were prominent. The announcement of the vesting order for Indian securities was responsible for a rise of 2 points in the price of India 2½, 3, and 3½ per cent.

bonds on Monday, followed by further gains. In the foreign bond market, continued support for Belgian 4 per cent. securities, which put on 1½ points before the week-end followed by 2 points on Monday, was again the most outstanding feature. Egyptian Unified were mildly supported, but Greek issues reacted ½ point at the beginning of the week, when Japanese bonds returned to favour.

After closing last week with a generally easier tone, home rails, in particular the ordinary stocks, have attracted some attention this week. Prices showed a tendency, however, to move irregularly. Thus, a gain of ½ on Monday for Southern deferred was followed by a loss of ½ the following day. Among foreign rails, Canadian

Pacific preference rose $\frac{1}{2}$ on Monday followed by $\frac{1}{2}$ point the next day, but there was little demand for the ordinary stocks. Renewed selling of certain Argentine issues, in particular Central Argentine stocks, took place after the week-end.

★

The bulk of the week's optimism found expression in buying of the funds, and almost all sections of the industrial market have been easier on balance. So far, the longer working day has done little to increase business in this direction. After several weeks of outstanding firmness, the iron and steel section has been generally easier with small losses extending to Babcock and Wilcox, Dorman Long, Guest Keen, Staveley and Vickers. Among aircraft issues, De Havilland was supported in anticipation of the report, but elsewhere there was little doing. Distillers, which closed last week with a gain of 1s., reacted on Tuesday in company with Charringtons, Guinness and Ind Coope. The tobacco leaders stood firm, Imps gaining $\frac{1}{2}$ on two consecutive days, but among general industrial losses of a few pence extended to Boots, Dunlop, I.C.I. and Murex, while International Nickel continued its downward course.

★

Mining markets enjoyed little business and there were few changes in quotations. Among *kaffirs*, Johnnies were on balance a firm spot and Sub Nigel put on $\frac{1}{2}$ on Monday, but Springs and "Sallies" were offered later in the week and there was no great enthusiasm to buy. In the rubber market, long enduring apathy gave way to a certain amount of selling on Tuesday when small losses were suffered by Highlands, Badenoch, Seaford, United Patani and Tamiang. The oil market was very quiet, apparently having discounted the progress of General Wavell's army to the borders of Cyrenaica. The ordinary and preference issues of Anglo-Iranian found some support, as did Apex (Trinidad), and Mexican Eagles attracted some attention.

New York

THE prevailing sentiment on Wall Street has continued to be cautious, and a number of short-lived rallies during the past week have failed to arouse continued support. Before the week-end, price movements were irregular and the tone, on the whole, dull from fears of increased taxation and uncertainty as to the future of the war. Mr. Churchill's speech over the week-end had an encouraging effect, and on Monday markets opened firm, with motor and aircraft issues strongly in demand. Later in the week disturbing reports from the Balkans caused buying to fall away again and steel and aircraft stocks were sold. In mid-week, all markets were, of course, closed in celebration of Lincoln's birthday.

Shorter Comments

This Week's Company Results.—CARDIFF GAS LIGHT & COKE COMPANY are raising the ordinary dividend from 5½ to 6 per cent. Both gross and net earnings are higher at £113,565 against £96,374 and at £41,725 against £39,818, respectively. H. E. RANDALL have also earned small increases in both gross and net revenue, the latter rising from £17,908 to £18,311. The 7½ per cent. dividend is repeated. Although the previous year's dividends are maintained by the majority of investment trusts whose results have appeared this week, METROPOLITAN TRUST is reducing the ordinary distribution from 12 to 11 per cent. in view of a decline in gross earnings from £158,426 to £152,789 and in net income from £83,339 to £74,099. BRITISH INVESTMENT TRUST is repeating the 12 per cent. dividend despite a setback in gross revenue from £324,421 to £311,269 and in net income from £148,449 to £125,057. SUNDERLAND & SOUTH SHIELDS WATER CO. are paying 7½ and 5 per cent. on ordinary capital as before and both gross and net profits, at £308,197 against £279,119 and at £78,172 against £73,980, respectively, show a satisfactory improvement on the previous year. BARROW, HEPBURN & GALE have suffered a moderate setback in earnings, net profits amounting to £67,583 against £80,129, but the 6 per cent. dividend is repeated. REDFERN'S RUBBER WORKS have cut their dividend from 17½ to 12 per cent. Gross income amounts to £41,687 against £45,827 and net profits to £26,704 against £31,203.

MISCELLANEOUS

Transvaal Gold Output, January.—(Fine ounces) Witwatersrand, 1,181,502; other districts, 29,769; total 1,211,271. December total, 1,176,522. Native labour employment at end of January: Gold mines, 364,912; coal mines, 19,021; total, 383,933.

Redfern's Rubber Works.—Profit for 1940, after working expenses, depreciation and bad debts, £43,017 (£46,752). Taxation, £13,578 (£12,982). Total ordinary dividend, 12 per cent. on £120,000 capital, against 17½ per cent. on £80,000 capital for 1939. Carry forward, £8,574.

Super Oil Seals.—Total profit for 1940, £87,294 (£40,403). Taxation, £65,000 (£21,000). Stock reserve, £4,000 (nil). Reserve, £4,846 (same). Carry forward, £5,428 (£4,502). Ordinary dividend, 40 per cent. (37½ per cent.).

Malayan Tin Dredging, Ltd.—Tin revenue year to June 30th, 1940, £279,360 (£100,412). Total revenue, £305,633 (£105,420). Net revenue, £139,382 (£31,113). Dividend raised from 10 to 55 per cent. Writing off property, etc., £34,520 (£10,996). Forward, £66,567 (£71,706).

Southern Malayan Tin Dredging.—Profits for year ended June 30th, 1940, reached the record figure of £531,082 (£179,611). Net profit £193,508 (£45,825). Dividend raised from 7½ to 37½ per cent. Property account reduced by £25,647 (£10,154). Forward, £34,440 (£28,760).

Manchester Ship Canal.—Net revenue for 1940, after fixed charges, taxation, etc., £215,219 (£215,007). Ordinary dividend, 1½ per cent. as before.

Wm. G. Gray & Sons.—Total profit 1940, £87,102 (£43,271). Net profit, £55,215 (£31,329). Ordinary dividend, 5 per cent. (nil). Goodwill written down by £10,000. Depreciation, £8,677. Carry forward (subject to tax adjustment), £21,000 (£14,730).

British Investment Trust.—Revenue for 1940, £181,644 (£212,663), after taxation, £117,583 (£98,866). Management expenses, etc., £12,042 (£12,892). Net profit after debenture charges, £125,057 (£148,449). Preferred dividend, 5 per cent., deferred 12 per cent. (same). Investment depreciation, £8,036 (£16,080). Carry forward, £107,370.

Industry and Trade

Agricultural Budgets

The January issue of the *Ministry of Labour Gazette* contains the results of an inquiry into the household budgets of agricultural workers. It was made at the same time as the inquiry into the weekly expenditure of industrial households, the results of which were published a few weeks ago—that is, it was made in one week in each of the months of October, 1937, January, April and July, 1938. The number of households furnishing the required information for the four weeks was only 1,491, compared with 8,905 in the case of industrial and commercial families; but as the total number of agricultural households in the country is appreciably smaller than the number of industrial and commercial families, the sample is not really unrepresentative; and there is little difference between the average size of the family in industry and agriculture; it was 3.77 in the former and 3.79 in the latter. The accompanying table, in which the weekly expenditure of the two kinds of households is analysed, shows that the average money income of the agricultural household in 1937-38 was 33 per cent. smaller than that of the industrial household. While this is, of course, chiefly a reflection of the lower rates of wages paid in

DISTRIBUTION OF WEEKLY EXPENDITURE PER HOUSEHOLD BY VALUE

	Industrial			Agricultural		
	s.	d.	%	s.	d.	%
Rent	10	10	12.5	4	9	8.2
Food	34	1	39.6	27	9	37.9
Clothing	9	4	10.8	5	10	10.0
Fuel and light	6	5	7.4	4	11	8.6
Other items	25	7	29.7	14	8	25.3
Total.....	86	3	100	57	11	100

agriculture, a contributory factor is the fact that, whereas in industry the average number of wage-earners per household was 1.75, it was only 1.59 in agriculture. Moreover, in contrast to the earnings of industrial households, the wages of many agricultural families are supplemented by allowances of food, fuel, etc., and by garden and allotment produce raised and consumed by the households; and the value of this supplementary income is excluded from the table. Another interesting difference between the expenditure of industrial and agricultural working-class households is to be found in the allocation of total expenditure among the main categories. In view of the allowances often made by employers in the form of food and the produce grown in gardens and allotments, it is somewhat surprising to find that agricultural households spend a much larger proportion (although a smaller absolute amount) of their total outlay on food than industrial households. Since the inquiry was made the income of agricultural households has been raised by the introduction of a minimum wage of 48s. per week in June last year, which, together with other adjustments, raised the weekly wage by from 9s. to 17s. per week.

Cut in Textile Quotas

On Tuesday Captain Oliver Lyttelton, President of the Board of Trade, announced further and fairly drastic reductions in the supply of cotton, rayon and linen piece-goods and made-up goods to retailers for the rationing period April-October, 1941. The changes in quotas—those for April-September are based on supplies in the corresponding period of 1939 and those for October-March on the corresponding period of 1939-40—since the introduction of the scheme on April 1st last year are shown below:—

QUOTAS FOR PIECE-GOODS AND MADE-UP GOODS (Bases: April-September, 1939, & October-March, 1939/40)	Cotton	Rayon	Linen
April-September, 1940	75	75	25
October, 1940-March, 1941	37½	66½	25
April-September, 1941	20	40	20

The reductions, true, are substantial; but if all the persons who can postpone replacements will do so, there

is no reason why the cut should cause hardship. But the stage may soon be reached when it will become necessary to introduce some form of individual rationing in order to ensure supplies to those who need them most urgently.

Lancashire's Export Policy

Recent speeches by the President of the Manchester Chamber of Commerce and the Chairman of the District Bank show how much alive Lancashire is to the importance of the export drive. Sir R. Noton Barclay, of the District Bank, called attention to the adverse effect upon cost of production of the restriction of home trade sales, and pointed out that unless overseas demand expanded sufficiently to offset this, our competitive power abroad would be hampered, especially as cost of production has been raised by wage increases, which now amount to about 30 per cent. over the pre-war level. He expressed the hope that some of these higher costs might be offset by the organisation of the Cotton Board. Addressing the Manchester Chamber of Commerce, Mr. Campbell stressed the readiness of the cotton industry to comply with anything which was necessary in the national interest, but he pointed out that the gradual development of the "full-blooded" export drive with which the year opened into the "managed" export policy which war exigencies had forced upon us must not be allowed to lead to the complete abandonment of any overseas markets. For the preservation of overseas trade the industry must rely mainly upon its own efforts, which must be directed both to the devising of means to make Lancashire products attractive to overseas customers, and to the difficult task of keeping our prices in line with those of our competitors in spite of the many additional war charges to which we are subject. "I believe, however," said Mr. Campbell, "that much can be achieved if we make the fullest possible use of research, by employing the most up-to-date methods of production, and by the closest collaboration amongst merchants. Following this line may involve throwing overboard old practices and preconceived ideas, but as the situation changes so, in my opinion, must we revise our ideas." If this attitude is representative of the cotton industry as a whole, the future of one at least of our major industries is not without hope.

★ ★ ★

Paper from Straw

The Paper Makers' Straw Trading Company, Ltd., has agreed with the National Farmers' Union on the price of 65s. or 70s. per ton (according to locality) for the purchase of first quality straw baled at the farm for paper-making. It is estimated that the paper trade will require in the region of 250,000 tons of straw a year, from which 75,000 to 80,000 tons of paper can be made. This quantity is equivalent to about 80,000 tons of wood pulp, and it will thus save shipping space, as well as £1½ to £2 millions in currency. The process of converting the straw into paper by boiling with chemicals and bleaching is, however, a somewhat costly one. Some mills began to use straw at the outbreak of war, but the interest in this raw material has increased with the difficulty of importing esparto, and some forty mills appear now to be using it. A good quality writing paper is obtained and, it is understood, a high-grade paper which is a substitute for esparto. The Paper Makers' Straw Trading Company, Ltd., are the sole buying agents for

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

the trade, and they allocate quotas to the various mills in relation to their consumption and stocks. The prices appear to be satisfactory to the farmers, and, in view of the increase in corn acreage, there should be no doubt about the paper trade's requirements being amply supplied.

* * *

Less Steel for Tinplate

The decision of the Steel Control to reduce the supply of steel to the tinplate industry conforms to the experience of control and trade exigencies in the last great war. Between 1914 and 1917 the output of tinplates was reduced from 800,000 tons to 355,000 tons, the number of mills in operation from 537 to 299, and exports fell from 435,302 tons to 177,383 tons. In August, 1939, the industry was consuming steel bars at the rate of approximately 900,000 tons per annum. On this basis a cut of 25 per cent. represents the release of some 225,000 tons per annum for the manufacture of other steel products, and if it is all withdrawn from the overseas trade it involves, on the basis of current prices, the sacrifice of an export revenue, in terms of tinplates, at the rate of between £6½ and £7 millions per annum. Over sixty mills and more than 6,000 workers are affected; hence the problem of redundant units which has been receiving the attention of the industry for some time past has been greatly complicated. The Ministries of Supply and Labour have given an assurance that every effort will be made to secure the absorption of the discharged workmen in more vital war work, but probably the men will in turn be asked to abandon the scheme of spreading out the available work in shifts of six hours instead of eight hours which has recently been in operation. The Area Board for Wales has reported that very little of the existing plant is suitable for war production, and at the new Government factories approaching completion in South Wales and Monmouthshire employment can be provided for only part of the additional men who are now being thrown out of work. Both employers and trade union leaders, however, are anxious to prevent, if possible, the migration of skilled labour to distant areas, and the Government has intimated its readiness to consider proposals put forward by the industry for the adaptation of the redundant plant for the manufacture of munitions or other essential war work.

* * *

Wages in 1940

There is hardly an industry for which statistics are available, in which there was no rise in wages in 1940. According to the January *Ministry of Labour Gazette*, there was an aggregate net increase of over £2 million in the weekly full time rates of wages of nearly 8 million workpeople, more than half of whom had already received some increase during the first four months of the war. In the whole period between the outbreak of war and the end of 1940 the aggregate net increase in weekly full time rates of wages is estimated to have been about £3 million. These figures do not take account of the increases in actual earnings due to overtime, fuller employment, and the extension of systems of payment by results. The table below, taken from the *Ministry of Labour Gazette*, shows the sharp contrast between 1940 and the ten years which preceded it:—

WAGE CHANGES IN 1930-40
(000's omitted)

	Individuals affected by		Estimated net change in weekly rates		Estimated net weekly increase or decrease in rate of wages of all workpeople affected
	Net increases	Net decreases	Net increases	Net decreases	
1930.....	768	1,100	£ 60	£ 116	+ £ 57
1931.....	47	3,010	5	406	— 401
1932.....	34	1,949	3	252	— 249
1933.....	180	894	17	83	+ 65
1934.....	1,344	80	96	4	+ 92
1935.....	2,307	50	199	7	+ 192
1936.....	4,062	1	493	2	+ 493
1937.....	5,161	4	788	1	+ 787
1938.....	2,382	322	282	19	+ 243
1939.....	5,655	66	940	9	+ 931
1940.....	7,902	...	2,148	0	+ 2,148

The largest aggregate increases were in transport, coal mining, textiles, building and engineering, but this was

due largely to the large numbers employed in those industries. The average increase was in the neighbourhood of 5s. per week, but there were wide variations from the average. In heavy chemicals the increase, for men, ranged from 1½d. to 3d. an hour; in engineering and shipbuilding and printing it was 5s. per week; in the clothing industries ½d. per hour; in boot and shoe manufacturing 9s. a week; in flour mills 8s. a week; in baking 1d. per hour; in tobacco 10s. 1½d. a week. Builders and gas workers received 1½d. an hour more and dock labourers 1s. a day. Tramway and omnibus workers had an increase of 3s. a week and merchant seamen 5s. together with an increase of 9s. 4d. a week in their war risk money. These random instances suggest that the wage increases of 1940 can by no means all have been intended merely to meet the rise in the cost of living. They seem to be clear indication of a lamentable absence of any national wages policy.

The Wholemeal Loaf

The controversy over the relative merits of the wholemeal loaf and the vitaminised white loaf, ranging over many columns of *The Times*, has now been settled by the Ministry of Food by the simple method of satisfying both sides. And the price of the wholemeal loaf will be the same as that of the white loaf. The flour for this bread will contain at least 85 per cent. of the wheat berry, against 73 per cent. in the case of the ordinary white loaf. The new wholemeal loaf will shortly be available in bakers' shops, except in districts where that type of bread has not hitherto been popular. Brown bread made from well-known proprietary brands of flour may still be on sale, though not necessarily at the same price as white bread. On the other hand, some time will probably elapse before the vitaminised white loaf will be put on the market. Thus ends a heated controversy, and with it the fear of indigestion of those who dreaded that it might end with a victory of the protagonists for the wholemeal loaf.

Roumanian Oil a Military Objective

The withdrawal of the British mission from Roumania will enable the British Government to take whatever steps may be necessary to check the flow of essential supplies from that vassal state to the German Reich. In this respect oil is of the utmost importance, for over one-half of the petroleum products potentially available to German-Europe this year must come from Roumania. It is not surprising, therefore, that the Nazis are making every effort to improve the existing facilities for the transport of Roumanian oil. According to reliable reports, they are now building some 200 tankers, with an aggregate capacity of 120,000 tons, for use on the Danube; they are constructing (largely with materials plundered from France) two new pipe-lines, one from the refining centre of Ploesti to the Danube loading port of Giurgiu, and the other from Ploesti to Moldova Neua, a port over 300 miles up-river from Giurgiu and above the rapids at the Iron Gate; and they are assembling every available tank-car for the carriage of oil by rail. When these preparations are complete the Nazis may be able, according to an estimate in the current issue of the *Petroleum Press Service*, to import Roumanian oil into the Reich and the occupied territories at an annual rate of over 4 million tons. This is double the capacity available last year, a fact which underlines the need for Britain to take offensive action in this part of the world. As our own authorities must be well aware, the Roumanian oil industry is highly vulnerable to attack from the air. The idea of bombing the oil wells themselves may be dismissed as quite impracticable—for they consist of hundreds of small and scattered targets. The oil refineries, on the other hand, through which virtually the whole of the country's output passes before it is exported abroad, are excellent targets. There are 16 principal plants at present in operation, all of which are situated in or near Ploesti. With their attendant storage facilities they could easily be located and attacked from the air—and their loss would be a serious matter for the Germans. The congested oil port of Giurgiu, where the refined products are transferred from pipe-line to river tanker, is another obvious objective, as are the various rail centres in the oil district.

COMPANY MEETING

INDIAN IRON AND STEEL COMPANY, LIMITED

(Incorporated under the Indian Companies Act, 1913)

MR LESLIE MARTIN'S ADDRESS

The annual general meeting of the Indian Iron and Steel Company Limited was held on December 18, 1940, at 12, Mission Row, Calcutta, Mr Leslie Martin (chairman of the board of directors) presiding.

The chairman, in the course of his speech, said:—Turning to the accounts, one important feature is the completion of the capital extensions programme on which we embarked three years ago, and although all the expenditure has not yet been finally allocated the statement in Schedule D indicates the large additions which have been made during the year. This has necessitated provision of a larger sum for depreciation.

Your company has paid the balance of Rs.55 lakhs due on its holding in the Steel Corporation of Bengal ordinary shares, so that these shares are now fully paid up and the balance-sheet shows a substantial sum of over Rs.1,30,00,000/- invested in shares, the market value of which exceeds Rs.2½ crores.

The profit and loss items call for little comment. Our aggregate sales have increased as compared with the past year, but the net receipts have not kept pace with the increased tonnage owing largely to increased costs of freight and insurance. Due to war emergencies, restrictions, and lack of shipping, the export of pig iron to Japan have been at times on a restricted scale. The control of prices maintained by the United Kingdom Steel Control prevented any change in prices throughout the period, although costs, over which the company has no control, rose substantially. There has been a further increase in railway freights since April this year.

You will have noticed that the offtake of iron by the Steel Corporation of Bengal, Limited, up to the end of March, 1940, amounted to 27,162 tons. At that date the corporation had just got into production, and since that date has been taking increasing quantities as its production has expanded. The somewhat complicated arrangements for the supply of services and

materials between the two concerns are working smoothly, and your directors are satisfied with the progress made by the corporation. It is hoped that by the time the next report comes before you the corporation will be working to full capacity, and thereby substantially reduce the dependence of your company's pig iron position on sales in foreign markets. These sales to the Steel Corporation are made in accordance with the terms of the agreement on a cost plus 5 per cent. basis. Your company, of course, under the same agreement will receive 20 per cent. of the net profits of the Steel Corporation. The progress of the Steel Corporation during the next year or two will be watched with interest.

The castings side of your company's business has made excellent progress, and advantage was taken of the increase in demand to liquidate old stocks and introduce new lines. It may interest shareholders to know that your company undertook the manufacture for use by the Steel Corporation of ingot moulds, required in pouring liquid steel. The manufacture of these moulds has proved successful, and their life in actual practice compares very favourably with the "life" of similar moulds produced in the United Kingdom.

The net profit available for distribution amounted to Rs.55,25,038/-, and the two dividends paid aggregating 20 per cent. for the year have absorbed Rs.50,71,424/-, leaving Rs.4,53,614/- to be carried forward. I trust that the distribution will meet with your approval.

Under pressure of war conditions the trading economics of industry are undergoing an important and, perhaps, enduring change. Your company's products are of first-rate importance for war purposes and, accordingly, our entire resources are now devoted to the production of materials which can be of assistance to the defence departments both in India and the United Kingdom. We have unreservedly offered to collaborate to the fullest extent in the war effort, for you and I know that unless the war is won the Empire will go under and with it all that we treasure and cherish. The future is in the lap of the gods, but it is for you and me, the common man, to hold dear to our ideals, to give unstintingly, to work for the final victory which alone can save mankind from a tyranny which looms so largely over the fair face of Europe to-day.

The directors' report and accounts were unanimously adopted.

COMMODITY AND INDUSTRY NEWS

Cotton.—A new Control Order (11017) came into force on February 7th. It provided that the official valuations should in future be the only basis for the fixing of yarn prices. It also removed the limitation on the amount of agents' commission, and removed the obligation on the spinner to charge to the buyer commission paid to agents (a) where no yarn produced by him is sold otherwise than through agents; (b) where he has an agreement with the agent prohibiting the latter from selling competitive yarns except on his behalf. The Controller has requested spinners and manufacturers to curtail their production as only limited quantities of raw cotton will be available during the next few months. Many spinners and manufacturers are in consequence refusing to quote at present. Order No. 18, which came into force on February 12th, increases the margins for American single yarns by 5 per cent., and the margins for winding both American and Egyptian single yarns by

5 per cent. The Government hopes that these increased margins will facilitate the continuation and extension of the granting of export derogations, and the Controller is prepared to authorise special additional derogations.

Grains.—Enquiries from Portugal for Canadian wheat, and conflicting reports about the American crop caused an upward movement until the week-end. Prices were still firm at the beginning of the week.

Metals.—There has been active trading in tin, largely on United States account, with prices firmer.

Oils and Oilseeds.—Supplies of edible oils are good and substantial allocations are made week by week to the consuming industries enabling the Government fat ration to be steadily maintained and reserves accumulated. India continues to be the principal source of oilseeds.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended February 8, 1941, total ordinary revenue was £58,121,000, against ordinary expenditure of £82,608,000 and issues to sinking funds of £145,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £2,115,847,000, against £627,081,000 (including defence loan issues) for the corresponding period a year ago.

CURRENT STATISTICS

Cash and Caritas

MR HOOVER has launched a new campaign for the feeding of occupied Europe and the passage, through the British blockade, of the necessary food-stuffs. The appeal, the arguments are not new. The problem was exhaustively discussed last summer. But now the winter has passed, conditions have deteriorated, the needs, it is claimed, are more urgent—and Mr Hoover's plans are more fully matured. There is nothing very new to say on the British side, but since memories are short and the humanitarian appeal of the Hoover crusade is strong, it is perhaps advisable to go over once again Great Britain's objections to this scheme, or, indeed, to any other scheme which might be devised in similar circumstances.

The Hoover plan, as outlined in a broadcast in the United States on February 15th, was obviously intended to give some safeguards against German exploitation. It is suggested that it should be tried out first in Belgium and extended only if it works on this small scale. The distribution of food would be through soup kitchens and a strong neutral body would oversee the work of distribution. Germany would be asked not to requisition any more food-stuffs from the countries thus served and both belligerents would have to guarantee the passage of food ships. Nor would the transaction be a free gift on the part of America. The foodstuffs would be paid for with the assets held by the various occupied countries in the United States and transport problems, too, would be met by using their immobilized merchant ships. Thus American objections to the possibility of American ships entering the prohibited war zone would be met. It is a plan of "Cash and Caritas."

What are we to say to Mr Hoover? Fortunately

he does not come to Britain in the guise of the humanitarian, pure and simple, who, while admitting all the British arguments about the unhappy political and strategic consequences of lifting the blockade, nevertheless hears the cry of the children and the despair of the mother and cannot think a day beyond their present misery. Mr Hoover's case, in spite of his appeal to the teachings of Christ and to "America's spiritual leadership," is not based primarily upon feelings of compassion. His scheme is based on certain realistic calculations—that Great Britain has some sort of responsibility for the people whom Hitler has enslaved, that widespread relief is necessary if starvation is to be avoided, finally, that his scheme would not impair Britain's war effort—and it is with these calculations, not with the desirability of relieving, other things being equal, the sufferings of Europe that the British Government takes issue.

Great Britain can accept no responsibility for conditions in Europe to-day. If Germany had not invaded Poland, Denmark, and the Western States, they would still be enjoying the prosperity that was theirs before September, 1939. And if Germany were to evacuate any of these countries to-day, the problem of their food supplies could be quickly solved. Germany has, moreover, an obligation in international law. By Article 43 of the Hague Convention of 1907, a power occupying a country is "under the obligation to take all measures possible to maintain public order and safety." In 1916 when Germany was seeking to justify the transference of French and Belgian civilians to work in the Reich, she pleaded that only thus could she feed them, and "there is no doubt that provision for the ensuring of the feeding of the population belongs to the work of maintaining

public order and public life." So much for international law, which is, of course, barely relevant to any discussion of the Nazi point of view but is significant in the light of Germany's great propaganda play on the extent to which the British blockade is a breach of international law.

The Nazis, both in practice and in theory, must carry the responsibility of feeding German Europe. Can they do it? Mr Hoover believes not, the British Government is confident that they can. Taken country by country, there seems unquestionably to be acute shortage in Poland, Belgium, and unoccupied France. In the other countries the shortage is felt in certain specified commodities—fresh fish in Norway, for example, or dairy produce in Denmark and Holland. But it is quite a different story to maintain that these shortages are inevitable and from there, by easy stages, to argue on to Britain's responsibility. In peacetime, Europe is largely self-sufficient in foodstuffs. Against 60 million tons of rye and wheat produced in an average year only 4 millions are brought in from overseas. Oats, barley, and maize to the amount of 5.5 million tons are imported against a production of 55 millions, while in potatoes and sugar self-sufficiency has been achieved. Only in fats is there some deficiency. The food is there, provided Germany will arrange for equitable distribution, a fact which is borne out by the Germans themselves. In a recent report of the *Institut für Konjunkturforschung*, Europe was described as being 90 per cent. independent of foreign supplies, while Germany was declared to be in a position to balance the surpluses of Eastern Europe against the deficits of the West by virtue of its consummate talent for organization and distribution.

Yet there is shortage. Poland is a mass of misery, conditions in Vichy-France are deplorable and in all the occupied countries rationing and declining standards are portents of worse to come. The explanation is simple. Germany has been steadily stripping these countries of their current food supplies and of their reserves. In most of them, at least a year's stocks had been laid by which, with the harvests of 1940, would, in spite of the damage of war, have kept them going until next summer. But they have been plundered to feed the invader. Norway has lost her fish supplies, Danish livestock has been slaughtered, 17 million lbs. of butter left Holland in one week, France is so divided that the hermetically-sealed frontier separates the rich farming country from the poorer unoccupied districts, and, not content with this, the Germans conduct forays into unoccupied territory and take a generous share of all the foodstuffs arriving at Marseilles. Once again, the question of the blockade must be thrown back on Germany. There need be no famine provided the Nazis accept their legal responsibility to share and distribute Europe's supplies.

Of the two, distribution is the real problem. South-Eastern Europe has a surplus of foodstuffs. But to-day Hungarian wheat can reach Belgium only across the railway system of Western Germany, which is already one of the worst bottlenecks in the German war effort and where wartime demands have led to a severe shortage of railway stock. Any scheme of outside provisioning would not only relieve the Nazis of the necessity of finding the food—which is no great problem—but also of diverting carrying space from military purposes. The Hoover scheme would reduce the strain on Germany's wartime transport system, in other words, it would directly increase Germany's military efficiency.

Mr Hoover's third point—that food relief as organised by him would not damage the Allied cause—is equally controversial. We need not doubt Mr Hoover's sincerity when he states his distaste for totalitarian rule and his support for the free peoples—even though he has consistently opposed the extension of American assistance to Great Britain. He no doubt genuinely believes that to take over some of Hitler's work in feeding the Nazis' subject peoples would in

no way impede a British victory. Yet on almost every showing the facts are against him. There is, first of all, the undoubted fact that foodstuffs are convertible into materials of war—potatoes and wheat provide fuel alcohol, fats give glycerine for high explosives, milk can be used to make casein for plastics. The British people know quite well that for years in Germany Goering's choice of guns or butter has meant that the butter has gone to feed the guns, and they have absolutely no guarantee that the process will not continue now that Hitler has all German Europe from which to scour supplies.

Foodstuffs affect the question of man-power. Before the war, a labour force of 9,500,000 people was necessary to feed the Germans, whereas Great Britain was fed by about 3,000,000 workers in agriculture, in fishing and in the export industries that paid for imported food. The difference is a difference in industrial strength which Germany is trying to make good by bringing in thousands of Poles, Czechs and Italians to labour in the fields, thus setting free Germans for the armies and the factories. If a relief system were to solve the problem of food supplies, many thousands more could be transferred from the fields and the scales of man-power would be tipped down even more heavily on the side of the Nazis. And apart from this differential factor, it would be folly to relieve Germany of a duty which in her own interests she will ultimately be compelled to fulfil. Hitler has made it clear that German Europe is to work for the Reich. He has spoken of the European labour force of 70 millions. But if this labour force is to work, it must be fed, and the Nazis cannot hope to keep a vast centralised "prosperous" economic system in gear if the men who work it are exhausted with starvation. They are already negotiating with Russia for extra grain for Belgium; there is no reason to suppose they will not extend these negotiations once it is clear that the job is not going to be done for Germany by a system of outside relief organized from America.

There are objections, too, to the details of Mr Hoover's scheme; among them, transport is by far the most serious. Distribution of the food supplies in the occupied countries would, of necessity, be the task of the relief organisations. But distribution is one of Germany's principal internal economic problems which blockade and bombing are designed to intensify. Transport is also Great Britain's most pressing problem, not internal transport over a damaged and unco-ordinated Continental railway system, but across the seaways of the Atlantic under the constant menace of the U-boat and bombing plane. If American ships are not to bring the food, then either Allied shipping must be used—which is inconceivable—or neutral shipping which both Britain and her friends in America hope may be used to make good her heavy losses under submarine attack. Mr Hoover's method of envisaging transport completely overlooks the fact that Britain, too, is blockaded for her life and that her continued existence may well depend upon the ships which he would divert from supplying Britain in order to feed German Europe.

These, then, are the powerful arguments with which the British people meet the Hoover scheme. Not only do they appear unanswerable, but one of them at least applies to any scheme of relief, however carefully it might be devised. Britain has no desire to damp humanitarian enthusiasm and provided on the one hand that the enemy were not helped, however indirectly, and on the other that no extra calls were made on transport—the world's shortest commodity—then all objections would be withdrawn. Under the first heading might fall schemes of relief drawn up to help, say, the Spaniards, the Irish, or even the unfortunate people of Britain, for in these three cases, there is a reasonable certainty that no food would be passed on to Germany. But it is difficult to see how any scheme operating from the United States could overcome the transport problem—which is and will remain the chief obstacle to any work of European relief.

The Scope for New Taxes

PREVIOUS articles in *The Economist* have given reasons for believing that the "gap" in the Budget next year—that is, the amount which will have to be covered either by increased taxation or by additional savings or by the pure creation of credit—will be something of the order of £150 millions a month. To close completely a gap of these large dimensions is clearly an impossible task. Least of all can taxation be expected to increase by such an amount, which is more than its whole present yield. But the taxpayer cannot hope to escape from bearing his share of the new effort that must be made if the volume of credit-creation—the "predisposing cause" of inflation—is to be kept down to the unavoidable minimum. It has been suggested in one previous article that the yield during next year of the present taxes can be put, with the aid of a certain amount of optimism, at £1,700 millions. It might, therefore, serve as an immediate objective of tax policy to raise another £800 millions and bring the figure up to £2,000 millions, which would still be considerably less than half the expenditure.

There is doubtless a great variety of more or less minor ways of raising small sums, but to provide anything like an additional £800 millions, the search can, for practical purposes, be limited to those that yield scores, if not hundreds, of millions a year. One such which has been advocated in Labour circles is a stiff tax on the capital value of property. The arguments with which it is put forward make it clear that this form of capital levy is intended to protect the community against the growth of wartime fortunes which has in the past been inseparable from inflationary finance. It may therefore best be discussed under the general heading of "taking the profit out of inflation," which is intended for a later article in this series. In the meantime, it may be briefly remarked that incomes from property have not escaped the wartime increases in income tax, surtax and death duties, and that it would be difficult to convince the public of the equity of aiming a heavy discriminatory tax at all property owners (most of whom will suffer from inflation) in order to hit the minority who are enriched by the war.

Apart from a property levy, there would seem to be two large sources of revenue open to the Chancellor. The first is the taxation of expenditure on services. It has frequently been pointed out in these columns that services have been generally neglected in British fiscal policy. Except for entertainments, they attract no peace-time taxation comparable to the customs and excise duties levied on goods. In wartime they have escaped both limitation orders and the Purchase Tax. But there is a rich field for the tax-gatherer here. According to one accepted estimate, the British public spent almost £900 millions in 1937 on services, excluding entertainments, rent, rates and taxes. The largest constituents of the total were travel, domestic service, public utilities, hotels and restaurants. Even if a substantial margin be left for categories that would have to be exempted (medical service, for example) and for wartime decreases, it should not be a difficult task to raise an annual revenue of £150 millions from a stiff turnover tax on service expenditure. There would unquestionably be administrative difficulties, but there is no obvious reason why they should be any greater than have been, and are being, surmounted in the case of the Purchase Tax.

The second source from which a considerable new revenue can be drawn is the smaller incomes, those ranging from, say, £250 for a single man to £800 for a family, which are too large to be seriously affected by indirect duties and too small to be hard hit by income tax. It is gradually coming to be realised that these

incomes escape comparatively lightly from the working of our existing tax system; in 1925-26, according to the Colwyn Committee's estimates, a married man with 3 children paid 11.9 per cent. of his income in taxes if that income was £100 (wholly earned) and only 6.2 per cent. if his income was £500; at £1,000 the proportion had risen again to 11.0 per cent. What is not so well appreciated is that this disproportion has been growing worse. The reason is not far to seek. The main reliance of the Exchequer is on indirect taxes, which must be levied at a flat rate and therefore cannot hit the middle incomes without crippling the poor, and on direct taxes which, so long as they are individually assessed, cannot embrace many of the middle incomes without imposing an impossible labour on the assessors and inspectors. During the period of rising tax burdens in the last five years, the procedure has been, in general, merely to increase the existing taxes. The curious shape of the tax curve, which imposes heavy burdens at each end of the income scale but descends to a pleasant valley for the middle incomes, has not been fundamentally altered; only the steepness of the valley walls has increased.

If the comparative neglect of these incomes has been due to the structure of the existing system of taxation, it follows that something new is required if the oversight is now to be made good. A new tax designed for this purpose must necessarily be a direct tax—that is, proportioned in some way to the income—if it is not to hit the smallest incomes even harder than those it is intended to affect. On the other hand, if it is to be administratively practicable, it must avoid the detailed examination of individual incomes—that is, the proportion to be levied must be fixed and there can be no allowances for different classes of taxpayer. In short, what is required is a flat-rate tax (say of 2s. or 3s. in the £) to be deducted at the source from all incomes. There could be—and should be—an exemption of 30s., or 40s., or 50s. a week to spare the lowest incomes, and the special case of the family could be met by a scheme of family allowances to be financed out of the yield of the tax. But any such tax must be of the simplest possible structure if it is to be workable.

This proposal, it will be recognised, is closely similar to that advocated a year ago by Mr J. M. Keynes. But the fate of Mr Keynes's proposals might be taken to show that even the attractions of "deferred pay" were insufficient to offset the dislike felt for a new tax specifically designed to fall on "the workers." This would seem to suggest another approach. The sort of tax that has been suggested is very closely similar to the original income tax; the "standard rate" of income tax, which is an impediment to it in its present-day guise of a progressive tax, is a relic of its origin. The political task of imposing a new tax of this character might be considerably less if the income tax itself (which is already very largely deductible at source) were adapted for this purpose, while the surtax took over the task of applying progressive rates to the incomes now subject to income tax.

It would be a mistake, however, to quibble over methods if the principle of a much more widely ranging direct tax, levied at a flat rate and deducted at the source, could be accepted. There can be little doubt that such a tax could bring in very substantial amounts—Mr Keynes's tax was to bring in a net amount of £500 millions a year. The two suggestions made in this article—a turnover tax on service expenditure and a direct tax on the middle incomes—could therefore be made the means of producing at least the £300 millions or so needed to raise the revenue to £2,000 millions. Until devices of this nature have been fully exploited, it cannot be said that the resources of taxation have been exhausted.

Colonial Black Spots

THE economic effects of the war have been very different in different parts of the colonial empire. Malaya, for instance, is enjoying an unprecedented boom, thanks to its rubber and tin; its total exports last year rose to the high figure of \$1,128 millions, compared with \$750 millions in 1939. Ceylon is fairly prosperous from its tea and rubber, and most of the sugar colonies are, at least, no worse off than they had been before the war—Trinidad and British Guiana are helped by their oil and bauxite respectively. Northern Rhodesia should be benefiting from higher sales of copper, but the present system of levying taxation does not allow the full benefit of the mines' higher profits to accrue to the colony's exchequer; instead, a large portion comes to the United Kingdom. In the case of the more unfortunate colonies, Government purchases have, it is true, prevented them from feeling the worst effects of the war, but the assistance given has not always been enough to prevent a fall in an already very low standard of living. Those colonies that have been hit by the war have been hit hard, and have been hit in their most vulnerable spot.

In his statement on colonial economic policy on December 17th, the late Lord Lloyd mentioned five "black spots"—West African cocoa and palm products, Pacific copra, Jamaican bananas, Palestine and Cyprus citrus, and East African coffee—but he claimed that in all these cases the Government had found, or was finding, financial means of saving the colonies concerned from grave suffering. What does this help amount to? Last year, the whole cocoa crop of the Gold Coast and Nigeria was bought at a price which was about £4 a ton higher than the price prevailing before the war. But the pre-war price was a depression price—lower than the 1931 average—so that the small increase could not be considered generous. Moreover, as sufficient markets could not be found, the mid-crop had to be burnt, a destruction which caused great bitterness among the growers, who claimed that cocoa was stored in the last war for two years, and who did not fail to point out that the deliberate waste of foodstuffs is punishable in Great Britain. This year, however, the bitterness has been intensified, because, without consultation with the producers, the purchase price of the crop has been reduced by 20 per cent.

Nor was the blow softened by the tactless language in which the announcement of the cut was made. After stating that the British Government had incurred an appreciable loss on the 1939-40 crop, and expected an even heavier loss on the present crop, the official notice went on to say that it had consequently been found necessary "to limit the liability undertaken in the cocoa purchasing scheme by reducing the price to growers. . . . The Government of Nigeria is again very conscious of the generous way in which His Majesty's Government has come to the assistance of cocoa producers, and has informed His Majesty's Government of its grateful acceptance of the new scheme. The Government is confident it will receive the loyal co-operation of the whole African community, growers, shippers, and others, in making the scheme work smoothly, and that all will refrain from criticising details of a plan which at the expense of the British taxpayer confers so great a benefit on the cocoa industry of Nigeria." Though this announcement appeared in the *Nigeria Gazette*, it is surely not fanciful to feel that it could only have been phrased in Whitehall. Moreover, the controlled price of West African cocoa in Great Britain will be raised by £10 a ton from March 1st. It does not appear, however, that the increase will be used to pay a higher price to the West African producer. It

will be retained by the Ministry of Food—in other words, will accrue to the British taxpayer, who is alleged to be conferring such a benefit on Nigeria.

Even if the cocoa purchase scheme were entirely satisfactory, parts of Nigeria and Sierra Leone which are dependent on the export of palm produce would still be in difficulties. Before the war the two colonies exported about 400,000 tons of palm kernels a year, whereas imports into Great Britain are now at the rate of 250,000 to 300,000 tons a year. The British Government is, therefore, only buying an amount equal to Britain's current needs—the price was reduced by £1 a ton last July—and the whole of its purchase is being made in Sierra Leone and in those Nigerian provinces which are entirely dependent on the sale of palm produce. In other provinces, a ban has been placed on exports as their farmers have an alternative means of livelihood; and they are being encouraged to grow cassava, as Britain is prepared to buy 10,000 tons a year for war purposes. Encouraging the natives to grow alternative crops is, of course, a sensible policy, for peace as well as war, but it is a pity the Government could not see its way to purchase their palm produce, or give them some other financial assistance, for one year until the new crop is ready. As it is, it has been estimated that the growers concerned will lose about £500,000.

The second of Lord Lloyd's "black spots" was Pacific copra. He announced that those islands and parts of Fiji, which are actually dependent on copra, will be subsidised, and as the total sum involved is comparatively small, it may be assumed that the subsidy will give them almost full compensation for their lost markets. But Jamaica's banana industry is as difficult a proposition as West Africa's cocoa. After the ban on imports into Great Britain had been imposed, it was announced that the Government would buy, in Jamaica, a maximum of 12 million stems at 3s. a bunch. In previous years, about 20 million stems were exported, and 4s. 6d. a bunch was considered a fair price. To help to dispose of the crop a committee has been appointed which is investigating the possibility of by-products and of bigger exports to the United States and Canada. But it is still likely that Jamaica will lose £1-1½ millions on her bananas without taking into account the unemployment among packers and transport workers.

Statistically, coffee is in the worst position of all. According to figures given by the chairman of the Kenya Coffee Board, even in peacetime world consumption only amounted to one million tons, against a production of 2½ million tons. The United States, which accounts for about 85 per cent. of world consumption, cannot cope with more than Latin American surpluses; a prohibitive consumption tax has been imposed in Canada; the South African market is small; Australia is obtaining supplies near at hand from Netherlands India; and the United Kingdom has stocks equivalent to two and a half years' consumption. East African coffee is, therefore, practically unsaleable, and the only consolation of the growers, European and African alike, is Lord Lloyd's statement that the Government "may have to buy and store" some of their coffee.

But on the whole the blackest spot is Palestine citrus. Total citrus exports amounted to about £P4 millions before the war, of which oranges accounted for about £P3½ millions, out of a total export trade of £P6 millions. Yet, though the growers have proposed that the British Government should buy the whole crop on the trees at about £20 an acre, so far no help has been forthcoming. In the House of Lords, Lord Lloyd said that certain help would be given to Cyprus, which is faced with the same difficulties as Palestine, but, when asked what the Government proposed to do

about Palestine citrus, he was strangely coy, though it has since been announced that proposals for assisting the industry are under urgent examination—now, when the normal peak of the citrus season has already been reached. It is true that the troubles of Palestine and Cyprus are not due to the closure of markets, since for fruit the United Kingdom is by far their biggest customer, but solely to lack of shipping, and that unlike West Africa they have the prospect of fairly normal exports before the war is over. But unless the Palestine growers are given immediate help, there will then be little fruit to export, for they will have to let their groves go out of cultivation, and it takes five years from the time of planting for an orange tree to bear fruit.

This loss in colonial export income is made more serious by the rise in the cost of imports. Lord Lloyd admitted that for West Africa the rise was about 80 per cent.—a reasonable estimate for the whole colonial empire—but he claimed that the things which West Africans would consequently have to do without were semi-luxuries. Yet, even if it were fair to call tinned meat and fish, flour, piece-goods, and household requirements semi-luxuries, curtailing imports only aggravates a colony's financial difficulties, for customs duties make up by far the greater part of colonial revenue, which in the vulnerable colonies is consequently dwindling noticeably.

Even from the foregoing very brief summary, it is apparent that the Imperial Government has not been neglecting the "black spots" of the colonial empire. But it can legitimately be asked whether more should not be done. The principle that the

colonial empire must be self-supporting was abandoned a year ago, when the Colonial Welfare and Development Fund was set up. It is impossible in wartime to carry out the more ambitious parts of the new policy because of the difficulty of supplying the necessary capital goods. But the Fund might very appropriately be used, if not for new schemes, at least for preventing any of the colonies from being forced to make cuts in their already small programmes of social services and economic development. Nowhere has the King more loyal subjects than in the Crown Colonies; they offer what they can in men, in materials, and in money. Up to the end of 1940 their cash and interest-free loans for war purposes amounted to £18½ millions—more than three times as much as the annual maximum to be spent on the colonies out of the Fund if it were in full operation. There is surely an obligation on the British taxpayer to see that the colonial peoples do not suffer more than is absolutely unavoidable in a war about which they were not, and could not be, consulted. The sums involved are not enormous. In 1936, the total value of exports of "black spot" commodities—that is, coffee from East Africa, cocoa and palm from West Africa, copra from the Pacific Islands, bananas from Jamaica, and citrus fruit from Palestine and Cyprus—was less than £24 millions, and the special assistance need be less than this because some part of these exports will, of course, continue in wartime. For an annual sum of money equivalent to the cost of running the war for not more than two days, the colonial "black spots" could be very largely removed.

The Complexity of Libel

IN normal times libel actions are tried with a jury; and the uncertainties of libel law and practice are often put down to the eccentricities of jurymen. To-day, in the absence of juries, verdict and damages are determined by a judge *per se*, and so by comparing present with past results we should be able to see how far jurymen have in fact been responsible for what is generally thought to be a queer state of affairs. And so far it looks as though the judges will be rather less generous in assessing damages but not less severe in their reading of an alleged libel.

A year ago *Reynolds' News* in a literary notice said that the Sitwell brothers and sister had "pushed themselves by energy and self-assurance into a position which their merits could not have won, but now oblivion has claimed them," and on the strength of these words, energy, self-assurance, oblivion, *Reynolds' News* appeared as defendants in a libel suit while the plaintiffs were Edith and Osbert Sitwell of Renishaw Hall and Sacheverell Sitwell of Towcester.

Towcester! The very word is like a bell. It tolls us back from 1941 to 1828, to another dispute between two writers whose names—and pray God the comparison be not defamatory—are not less widely known than the Sitwells' and will probably be remembered (if with pleasure when oblivion really has claimed (if ever it does) the Sitwell family. The writers' names were Mr Pott and Slurk, and in the Saracen's Head in Towcester they had their historic row in the presence of Mr Pickwick's party, with nothing barred—neither ridicule nor hatred nor contempt—a highly defamatory affair. But, deplorable as it was, it did beget one sentence of golden commonsense. It came from Mr Slurk, tence of golden commonsense. It came from Mr Slurk, who, taunted by a charge of resorting to the law courts, declared that the laws of his country in such a case would never be appealed to by him. And those who think that litigation over trifles is a waste of a man-power may feel sorry that in the middle of a desperate war the Sitwells did not sit at the feet of Mr Slurk.

The judge, in awarding 1,000 guineas damages

between the three plaintiffs, held that the words were defamatory and decided that you defame a writer if you say incorrectly that he reached a position beyond his merits by energy and self-assurance and that oblivion afterwards claimed him. His lordship was, of course, right in his judgment, but the layman unaided would not necessarily have reached the same conclusion, either on the ordinary meaning of the word or on its commonest legal meaning. Defamation in its commonest legal meaning consists of using language calculated to bring a man into ridicule, hatred or contempt. That is the test. Is he covered with ridicule, assailed with hatred, spattered with contempt? Take the words one by one. Does a reader of *Reynolds' News*, when he is told that the Sitwells reached their position through energy and self-assurance rather than by merit and that they are now forgotten, does he break into hearty laughter at the expense of the Sitwell family? If he has hitherto been friendly to the Sitwells or indifferent to them, does he now begin to hate and detest them? If he has formerly looked upon them with respect and tolerance, does he now think of them as despicable and regard them with contempt? Can a charge of energy, self-assurance and oblivion really produce these dynamic changes in the readers of a Sunday paper? Apparently they can, but a mere superficial student of human nature might be inclined to think it likely that a conversion so sudden, so drastic, so complete, would call for a more powerful impulse than these three words in a short literary notice.

This ridicule, hatred and contempt type of libel makes the most frequent appearances in Court, but in such cases as the Sitwell action it is possible for a statement to be defamatory without making the libellee hated, laughed at or despised. When you are dealing with a man in the way of his lawful profession and convey a reflection calculated to disparage him therein you are, by law, defaming him even though you stir up no ridicule, no hatred, no contempt, and the defamed party, without proving any loss resulting from

your statement may be awarded any sum by way of damages. If, for example, you say of a professional singer that when he was taking part in an oratorio he made use of what is called the intrusive H; if you accuse him of saying Pi-hilate, when he ought to have said Pilate, and if the singer satisfies the Court that he actually did say Pilate and did not say Pi-hilate, then the singer may get damages in four or (if the jury likes) five figures, because he has been disparaged in the way of his profession.

This type of libel is in its nature closely akin to the trade libel which consists in belittling the quality of the goods sold by a firm or a company. Instead of saying that a company sells poor stuff, you say that the writer writes poor books or that the painter paints poor pictures or that the musician makes poor music. But in the result of your libel there is this very considerable difference. The company, before it can be given damages, must prove that it has suffered a loss from the libel and indicate the extent of the loss. The private person may be unable to prove a loss yet secure enormous damages. In this Sitwell case, no evidence seems to have been brought to show that any harm was actually done to the plaintiffs, and it is unlikely that a ten-line notice in *Reynolds' News* would lose them readers or impair their future contracts with publishers or make them less welcome clients to their literary agents. But all that is beside the point. The law, because they are individuals following a profession, allows them unlimited damages without any proof of loss, damage or injury. The rights of a company selling goods are limited to its proved loss. The rights of an individual following a trade or profession are at large.

These subtle distinctions—libels actionable *per se* and libels calling for proof of special damage—libels which are not libels unless they provoke ridicule, hatred or contempt, and libels which are defamatory

without any of these consequences—libels which are trade libels and libels which reflect on a man in the way of his lawful trade, profession, business, office or calling—produce in the aggregate a law of such complexity that the writer, the editor, the publisher, the printer and the newsagent, all of whom are equally liable for damages, are reduced to a state of confusion in which almost any sentence if stared at long enough looks like a dangerous libel. In this Sitwell case, for example, the printers were among the defendants and can be called on for the whole of the damages. To avoid the pitfall the manager of the printing works would have had to make up his mind, and make it up rightly, on the following points:—

- (1) Whether the sentence was true in fact.
- (2) Whether the sentence if not true was calculated to bring the Sitwells into hatred, ridicule or contempt.
- (3) If the answer to question 2 was "No," was the sentence nevertheless a libel because it reflected on the Sitwells in a way calculated to disparage or injure them in their lawful profession?
- (4) Was the sentence fair comment?

The same questions must be posed and answered in regard to every word in every book and paper which they handle, by the publishers who issue the printed matter from headquarters and by the newsagents who sell it for a penny or twopence across the suburban counter.

This law of libel, grown up through centuries, in which at times it has been a crime and at times a tort, is in truth hopelessly overgrown. It needs to be heartlessly pruned, to be re-cast and to be simplified, and the first step of all is to cut down to a reasonable limit the present right of claiming unlimited cash without proving one farthingsworth of cash damage.

NOTES OF THE WEEK

The Turkish-Bulgarian Pact

Short of any sensational last minute change of policy on the part of King Boris and his Ministers, it now seems certain that a German occupation of all Bulgaria is only a matter of time—possibly of a very short time. The number of Germans in Bulgaria is steadily going up. The airfields are already controlled by "civilians," the disposition of the Bulgarian Army—which is concentrated on the Turkish frontier—is evidence of the complete connivance of the Bulgarian General Staff in the sacrifice of their country and the massing of German armies on the Rumano-Bulgarian frontier completes the picture of a small country slipping away into the twilight of Nazi servitude. It is against this background that the new Turco-Bulgarian Pact must be set. Both sides abandon "aggression" in their dealings with each other and agree that the new Pact alters none of their existing obligations to other Powers. On the Bulgarian side, the Pact is taken to mean that if, or rather when, Germany completes her occupation, the Bulgarians will not join the *Reichswehr* in an attack on Greece or Turkey. Since, however, a Bulgaria run by the Nazis would have virtually no say in its own affairs, it is difficult to see why the Pact is taken to contribute anything to Balkan peace save that Bulgaria will not do anything aggressive until she is wiped out. On the Turkish side, the Pact also appears to be limited to the period between its signature and Germany's take-over of Bulgaria. Turkey does not bind herself to abstain from action if Bulgaria is invaded, and although, equally, she is not bound to take action, she is not committed to allowing the Germans to push forward to Salonika without giving any assistance to the Greeks. Turkey is unwilling, perhaps on the analogy of the Allies in Belgium, to leave her prepared positions, push forward beyond the Rhodope mountains and there attack an oncoming German army. This does not mean that

a German advance beyond Bulgaria would be allowed to go by default. Satisfactory staff talks have taken place between the British and the Turks at Ankara, and one of the clauses of the Ankara treaty commits Turkey to giving "all aid and assistance" in her power should Britain be involved in war as a result of her guarantee to Greece. This clause may still be presumed to be one of those obligations which the Turkish-Bulgarian Pact does not modify.

Bribing the Yugoslavs

After weeks of resistance to Italian counter-attacks the Greeks appear to be taking the initiative again. The number of prisoners taken has risen, mountain heights have been taken in both the southern and central sectors of the front. Air activity, too, has developed and the Allies claim over thirty enemy planes shot down for a loss of a mere three on their side. Nevertheless, the general Balkan situation is developing unfavourably for the Greeks. So far they have enjoyed the advantage of being able to test themselves man for man against the Italians—with the results we already know. Now it looks as though Germany is determined to bring the Italo-Greek conflict to an end, either by the threat of invasion or by invasion itself. If possible Hitler would prefer to achieve his ends without fighting, for all his objections against turning his Balkan market garden into a field of war still hold good and it is significant that he is attempting to achieve his ends by indirect methods of which the summoning of the Yugoslav Prime Minister and Foreign Minister to Berchtesgaden is only one example. The Yugoslavs have been reticent about the results of the meeting, but it appears that Hitler offered

them a substantial bribe in the shape of Greek and Albanian territory in return for minor frontier rectifications with Hungary and Bulgaria and a general permission to Germany to take what steps she thought fit to end the war in Albania. The prizes offered were probably Northern Albania and the much coveted town of Scutari—captured in the first Balkan war but surrendered as the result of Austrian and Italian pressure—together with an Aegean corridor at Greece's expense. The Yugoslavs have apparently refused the bait and the army, at least, has lost nothing of the old Serb fighting spirit and threatens, behind the line of the Save and the Danube, to resist any German thrust by force of arms. Hitler may, therefore, transfer his attentions entirely to Bulgaria where he has found greater compliance. By doing so, he would undoubtedly kill the Yugoslav bird with the Bulgarian stone. Yugoslavia must therefore wait passively on Bulgaria's reaction to the crisis. It is clear that neither has made the slightest attempt to withstand the German threat by joint action.

The State of the Larder

On Tuesday, Lord Woolton told the House of Lords what the entire population has known for a long time. He was frank at last. He is "greatly concerned." There is a shortage, he said, of bacon, eggs, cheese and meat; supplies of bread, potatoes, many vegetables, oils and fats are sufficient; but there must be "much greater restrictions." The real question is whether the greater restrictions should not have come much sooner. The Minister still says that the choice was between meat and Bardi, and it must be admitted that the diversion of merchant ships for military purposes is inevitable and desirable, even at the expense of food imports. But at the time when the meat and other ships were presumably being first diverted to Egypt, Lord Woolton was raising the meat ration from 1s. 10d. to 2s. 2d. The time is long past for speeches "preparing" the people for cuts in their feeding. They know cuts are necessary; they have as wary an eye as any Minister on U-boats, bombers, raiders, and the approach of spring; and they know that the shipping losses, though they have fallen considerably, are still too high. The important thing is to make the cuts big enough now to prevent their having to be much bigger later on. Leniency is a sin in war-time government; it spells "too late and too little." The reduction of rations to the Forces is justified by the tremendous waste of food at camps and barracks—though it has still to be remembered that troops cannot normally eke out their allocation with unrationed extras. The elimination of "additional" and redundant feeding at restaurants and elsewhere may very well have to come because of sheer scarcity. If this is likely, it should be done now—not later. It is surely not the place of the Minister of Food to blame people for "eating a great deal more than is necessary," for he has the remedy in his own hands.

New Model Rationing

New forms of food control are in the air. Nothing is settled yet and it would be rash to prophesy, but the Ministry of Food itself has let it be known that the reaction of some of the less scrupulous members of the public—both sellers and buyers—to moderately short commons has "deeply hurt Lord Woolton's feelings." The trouble is, of course, that, with unequal incomes and an unequal and shifting distribution of the population, a policy of food distribution—compounded in part of rationing, in part of price control, dissociated from rationing, and in part of sheer shortages, which means that the price mechanism effectively reserves what there is for the moneyed—does not produce results which are socially ideal. Outside the sphere of rationed foods, there is no guarantee that true needs will be satisfied or that an inflationary pressure on the price level will be avoided. Yet, not all foods are suitable subjects for rationing. Thus, the problem is not easy to solve and it was even rumoured that there was at least a chance that the Ministry of Food would take the bull by the horns and limit the total weekly expenditure per head on food to a fixed sum for everybody, at the same time continuing to ration certain basic foodstuffs on the old model. There seems little doubt that such a limitation

would be both the simplest and most effective method of putting an upper limit to total expenditure on food and counteracting the present upward trend of prices. Selection of the weekly allowance would remain a matter of some difficulty and be susceptible to adjustment; presumably also an extension of rationing would have to be envisaged, since the aim is to equate monetary demand as a whole to the total supply of edibles. Moreover, the matter is complicated by the question of restaurant feeding and the sharply declining cost per head of feeding as the size of the household increases. But these are administrative difficulties rather than difficulties of principle, depending, in the first place, on whether or not there are sufficient resources to subsidise the feeding of the large household by refraining from cutting down the money allowance per head in their case; and, in the second place, on whether the allocation of food to restaurants is considered as separate from, or as an integral part of, the general rationing scheme. Finally, this plan to limit expenditure could not be considered in isolation from the distribution of other goods and services. If there is less money to spend on food, there will be more available for taxation, for saving—or for spending on clothes and amusements. Only concerted Government action could ensure that it would not simply be diverted to other consumption.

The Far Eastern War Scare

The war scare in the Far East is subsiding—in a manner which is, on the whole, advantageous to the friends of peace. Whether or no Japan set the rumours spreading which were responsible for the recent tension, it is certainly the Japanese Government that is responsible for any of the withdrawing that has been done. The attitude of the democracies has been commendably firm. Australia called a War Council and despatched troops to Singapore; Britain mined the waters of Malaya; President Roosevelt met the new Japanese Ambassador's fervent expression of hopes for peace with a firm reminder that improvement, if it were to come, was Japan's responsibility; in other words, that a better understanding could be brought about, provided Japan modified her provocative East Asian policy; and, finally, the Thai government issued a statement reaffirming Thailand's friendly relations with Britain, claiming that nothing in their negotiations—under Japanese mediation—with Indo-China had modified their attitude of strict neutrality, and flatly denying that any bases had been ceded to Japan. This show of firmness has had its results. The Japanese Government has interpreted the signs correctly, and Mr Ohashi, the Deputy Foreign Minister, was put up to express the conviction that if the Japanese resorted to military action in pursuit of their aims it "would result in their destruction." Nevertheless, the aims are not abandoned. To Japan the "South Seas" are now what the European *Lebensraum* is to Germany, and, as Hitler has shown in the Balkans, there are more ways of subduing a people than by merely launching against them a frontal military attack. It is significant that Nazi technical commissions are now installed—under the terms of the Tripartite Treaty—in Japan. The Japanese were ever apt pupils, and there is a number of things about economic

penetration and diplomatic pressure which they have yet to learn from their "progressive" Western allies. It will not be the first time that the methods of Europe have been transplanted *en bloc* to the Far East.

* * *

The African Front

The centre of interest in the African campaign has swung for the time being to the East African front. In Eritrea the investment of Keren continues. The town has formidable defences, and a frontal attack might prove to be a hazardous and costly business. Fortunately, British forces advancing from Karora are now within 40 miles of Keren, and should soon be in a position to attack the town in the rear. Keren is undoubtedly the Italians' strongest line, thanks to its natural cliff defences, and once this line is pierced an advance to the Red Sea should not be long delayed. Further south in Abyssinia, while British forces are operating in the Gondar area, the Abyssinians have scored their first really notable success by forcing the Italians to evacuate Danghila, in the Golljam district. If patriot and British troops in this area can get into direct contact with each other, it looks as though the Italians will be forced away from Lake Tana and all the surrounding districts. Meanwhile, R.A.F. battering of airfields and enemy troop concentrations continues. The most sensational successes, however, have occurred in the extreme south of the battle zone, where the South Africans have advanced into Italian Somaliland as far as the Juba river, taking over 10,000 square miles of enemy territory and occupying Kismayu, the second port of Somaliland and a comparatively important air and naval base. Only from the Libyan front is the news scanty, although the Free French are creating havoc in the south round Kufra, and there are reports of important bodies of Senussi tribesmen rallying to the Allied cause. From the main front there are no official reports, and observers are left free to speculate whether General Wavell has decided to push on along the Libyan coast or is seeking new spheres of action. The landing of parachute troops in Southern Italy cannot, on any interpretation, be construed as a preliminary to invasion. It was remarkable as the first public essay in a new technique, but its objectives appear to have been limited to the acts of sabotage which were stated to be its original purpose. There are, of course, no means of gauging the parachutists' success—or lack of it. But it is significant that Rome closed Southern Italy to foreign correspondents about the same time and that railway dislocation on a large scale was reported from Naples, in the west, as far as Brindisi, in the east. Since the British public has no official information, it can afford itself the luxury of believing the best.

* * *

Trouble in the Copperbelt

Until the full report of the Commission appointed to inquire into the disturbances in the Northern Rhodesian copperbelt last April is available, comment on its findings must be suspended. But, from the recommendations which have been published, it is clear that the fundamental causes of the trouble are nothing new. The breakdown in tribal life resulting from the drift to work in the mines and towns, and the consequent growth of a dissatisfied African proletariat, have produced problems in Central Africa which cannot be solved by indirect rule alone. Nor can they simply be solved by higher basic wages, which is the first of the Commission's recommendations, and has been accepted by the Northern Rhodesian Government, after consultation with the mining companies. Proper housing, improvement in diet, welfare facilities, machinery for collective bargaining—all these recommendations reveal gaps that are to be found all over the colonial empire; and they are gaps which can never really be filled while local financial resources remain so inadequate. Between them, the mining companies and the Northern Rhodesian Government have agreed to carry out the social and welfare recommendations as far as is practicable, though, in view of the principle of British colonial policy that tribal life must be preserved, a caveat has been entered that the Government is not committed to establishing a permanent industrialised native population on the copperbelt. On one fundamental point, however, there

is disagreement. The Commission recommends the extension of opportunities for advancement for African mine workers. The Government, on the other hand, feels that though some dilution with African labour has been accepted as a wartime necessity, it will be impossible to maintain Africans in posts previously occupied by Europeans, when the latter return from the war—especially as peace may well bring with it a decline in mining activity. Here is a problem which will have to be faced and solved in any plans for colonial post-war reconstruction.

* * *

Industrial Mobilisation

Mr Bevin has completed his talks with the representatives of industry. The Orders implementing his plan to register any class of labour and, if necessary, call them up are expected very soon; and a further statement by the Minister on how he proposes to use these powers is eagerly awaited. There has been much speculation. A report that the intention is to require all women between the ages of 20 and 23 to register for national service has been confidently put about; and it is said that Mr Bevin has reached an agreement with the representatives of workpeople and employers about the terms and conditions on which labour for war work will be recruited, transferred and employed. The real question, however, relates to ways and means, rather than terms and conditions. The most specific statement about what is likely to happen appeared in a broadcast to Australia by Mr Bevin himself. Then he denied that industrial conscription was being considered. The proposed registration, he said, was simply intended to find out what quantity and quality of fresh labour were available.

*

If this is the case, then the plan for mobilisation will need to be much wider, and go much deeper, than has yet been reported anywhere. If it is to be left to the uncommanded working of the labour market to bring in the millions more needed, that market will necessarily have to be rigged in such a way that no man or woman, without exception, can lose by moving into war work or gain by staying out—in such a way, indeed, that no one can do anything but lose, relatively, by refusing to go into war work, or into training for it. The present bias of differences in income, status, comfort and convenience is against labour transfer. There has been little or no attempt to cut down civilian industries in such a way as to set free the maximum amount of labour. Conditions at training centres act as a deterrent to movement. There is no obvious reason why women (with due allowance for family responsibilities) should not be openly mobilised at certain ages, as men are for the forces, either for national service in the factories or for recruitment into the women's auxiliary bodies; nor why men who are not called up to fight should not be called up for work. But there is no special virtue in "compulsion." It can never be more than a regrettable necessity. Mr Bevin will not have it, and his task—and that of the entire Government—is, therefore, to see that the nation gets the war workers it needs in other ways. It will not be enough simply to broaden the present arrangements about dilution, overtime, reinstatement and paying "the rate for the job."

* * *

No More Cotton Futures?

Since the war started, the delicate market mechanism which rendered possible the buying and selling of standardised types of cotton, wheat, metals, rubber, sugar, and other commodities for months ahead has been jammed, among other things, by the tightening of Government control of imports, necessitated by the need to economise shipping space and foreign exchange. Most of the so-called "futures" markets have already been suspended, while those still in operation, such as the cotton and rubber exchanges, have lost much of their freedom. Government purchases of cotton and the uncertainty over imports have already impaired the functioning of the Liverpool futures market, the oldest in the country. Now the Government has decided to become the sole importer of cotton; and the market will soon no longer even be in a position to discharge its

function. If the Government is supplying the country's needs in cotton, it will presumably no longer allow prices to fluctuate from day to day in accordance with expected changes in supply and demand, but will release the various grades at fixed prices. Already, though not for the first time since the outbreak of war, the directors of the Liverpool Cotton Association have decided to fix the differences between the prices quoted for delivery in one future month and another; these differences are to be those ruling between March and other "futures" at the close of the market on February 14th. The liquidation of all outstanding contracts, however, would be a lengthy process. But even if the "futures" market is ultimately to be suspended, the need for merchants skilled in sampling, sorting and classifying cotton should ensure the preservation of a nucleus for its reopening, if conditions favour the return to freer markets after the war.

* * *

Organising Production

The case for organising the curtailed civilian industries so as to make the most efficient use of their restricted resources—releasing the maximum of labour and machinery for war contracts, keeping down the price of their products to civilian consumers, and protecting individual manufacturers against uncontrollable losses—has always been theoretically sound. Every day now it receives practical backing. A fortnight ago the *Textile Review* declared that "there are mills to-day carrying up to 150 per cent. overheads in the cardroom to maintain only 50-75 per cent. of their spinning capacity." "Is there no one (the journal asked) practical enough to point out to the authorities how all this idle machinery, staffed by less efficient labour than normal, has eaten away spinners' margins?" It is true, of course, that the purpose of this plea was to lay claim to an increase in margins and, consequently, in the price of cotton goods; and it is always possible that the margins permitted may be demonstrably insufficient to cover an increased burden of costs. The claim would need to be proved by detailed costing; but it is always the case that, though price-fixing may be indispensable, the actual prices fixed may be the wrong ones.

*

Meanwhile, however, the importance of this point lies in the support it gives for organising civilian manufacture with the same care as war production. The existence of idle or under-employed machinery—and labour—ence sheer waste to the war effort; and whatever the adequacy or inadequacy of spinners' margins may be, the proper procedure would be, first, to make sure that spinning was exclusively concentrated in the most efficient mills; secondly, to see to the transfer to war work of every available worker and machine; and, thirdly, to pay compensation, from the funds of the industry or from the public purse, to firms thrown out of business—sufficient now to maintain their plant and meet their fixed charges, and, later, to restore goodwill. As it is, the burden of a restricted trade is thrown upon the individual firms whose only course, naturally, is to cover it so far as possible by raising prices. If, as it is reported, the official intention soon is to allow only 15 per cent. of the capacity of the clothing industry to supply civilian needs, the same problem of organisation will arise. Both the 15 per cent. doing civilian work and the 85 per cent. working for the Services will need and so that neither individual producers nor consumers at large will be penalised, by higher costs or increased prices, for needless inefficiency and lack of organisation.

* * *

The Needs Test

The dissident minority of the Labour Party which last week moved an amendment to the effect that the Determination of Needs Bill does not give full effect to the Prime Minister's pledge of last November were summoned by their party leaders to explain their revolt. No formal censure was, in fact, imposed, and it hardly seemed necessary to take official party action against members who were only expressing their disappointment that the new Bill did not go so far as they had hoped

and as their party in full conference had demanded. It is, perhaps, worth while to compare the Bill with Mr Churchill's original statement. The Prime Minister said that legislation would be introduced

to give effect to certain changes designed to remove causes of complaint against the existing means test. The test will become one of personal need and will be based on the following principles: the needs and resources of the applicant will continue to be aggregated with those of his wife and of any dependants, but the resources of any other member of the household will no longer be aggregated. . . . If the applicant is the householder, a standard contribution by non-dependent members of his household towards rent and other overheads will be assumed and taken into account as part of the applicant's resources. . . . If the applicant is not a householder, and is living with relations, regard will be had to the constitution and circumstances of the home in assessing his personal needs, but inquiry into the resources of other members of the household will . . . be greatly reduced and will often be unnecessary. No applicant without resources of his own will be left dependent on other members of the household for means to buy clothing and other necessary personal requirements.

Thus the Prime Minister did not promise, without any qualification, simply to substitute a test of personal needs for the household means test.

*

The proposed regulations, which were summarised on page 143 of *The Economist* of February 1, follow these principles so closely that judgment can hardly be given for the Labour rebels. Where the applicant is the householder, the principle of the household means test has been practically abolished, for though a contribution by non-dependent members of the household is to be assumed—in accordance with the Prime Minister's statement—the contribution will be a standard one, which will not be exceeded no matter what the contributor is earning. In the case of a non-householder applicant who is living with a householder relative, it is quite true that—only if the householder's income exceeds a certain figure, which may be as high as £6 10s. a week in the case of a householder with a wife and two children—it will be assumed that the applicant will be given free board and lodging, and this will be left out of account when his needs are determined, although no such assumption will be made where the householder is a relative only by marriage. Nevertheless, the Government can surely claim that, in abolishing the requirement that, before determining needs, the resources of all members of the household must be taken into account, it has fulfilled the Prime Minister's pledge. Whether a personal needs test pure and simple should be introduced, or whether there should be no means test at all, are quite other questions—which may have been in the rebels' mind. As it is, the new test will be on much the same principles as the assessment for income-tax reliefs.

Bombing Roumanian Oil

A combination of misprints with careless phraseology led *The Economist* of last week to contradict itself and confuse its readers on the subject of the extent of damage that could be done to the Roumanian oilfield—Nazi Germany's most important source of supply—by air attack. The bombing of the wells by high explosive—as was argued on page 226—is unlikely to be a remunerative proceeding, as the targets are small and

The MERCANTILE BANK of INDIA LIMITED

Branches and Agencies throughout the East

FIXED DEPOSIT ACCOUNTS

Rates will be quoted on application

comparatively easy to repair. But incendiary bombs are a different story—as was intended to be conveyed on page 204—since the natural gas is allowed to escape into the air. And in any case—as both passages agreed—the refineries are an excellent target. There seems to be very little substance in the view—expressed in the House of Commons by a very high authority—that it would be easier for the R.A.F. and more damaging for the Germans to bomb Roumanian oil in Germany than in Roumania. Transport is the root of the matter, and the strain, which is already great, would be much greater if the Nazis had to carry six tons of crude oil for every one ton of petrol, refined in Roumania, that they now transport.

* * *

The Civil Estimates

The total net estimates for 1941-42 for the civil departments, excluding the revenue departments, are £424,332,275, compared with £425,901,688 in the current financial year. As, for the second time, only token estimates have been given for the war ministries and war services of civil ministries, the total figure is incomplete, but it is reassuring that entirely civil expenditure is not being allowed to increase. The biggest saving has naturally sprung from the fall in unemployment; the estimate for the Assistance Board is down to £19,560,000, compared with £30,035,000 in 1940-41. Possibly, the saving would have been greater were it not for the non-unemployment help given by the Board, which is now also responsible for payments to needy evacuees and the bombed. The second biggest drop is shown by expenditure of the Exchequer on roads, the estimate for which is only £10,738,000, against £16,389,600 in 1940-41, when it had already been reduced by about £8 millions on the previous financial year. But these two big savings have been largely offset by the big rise in the estimates for supplementary pensions from £17,250,000 to £31,120,000. Part of this rise is possibly due to the unexpectedly large number of applicants for supplementary pensions after the change-over in administration to the Assistance Board took place last August, but the greater part is presumably due to establishment of a new needs test by the Bill which is now before Parliament. An interesting increase is the doubling of the Registrar-General's Office vote at £238,777; this may be the result of the great amount of work falling on the department owing to the big movements in population. A small, but welcome, increase of £333,990 is to be found in the vote for development and welfare in the colonies, including the South African High Commission territories, but the new amount, £804,010, is still very inadequate.

* * *

The Cinderella of Transport

The appointment of Mr Frank Pick "to investigate and report upon the carriage of traffic on canals and inland waterways" is an overdue step. There can be nobody in the country who is not in some measure directly affected by the congestion of road and rail transport brought about by the war; even those who never leave their firesides find those firesides only half-warmed because of the difficulty of transporting coal. Meanwhile, a large part of the canal system which fathered the Industrial and Urban Revolution is either under-utilised or abandoned. The last war did something to revive the canals, but the bulk of the traffic continued to be local, and with the growth of road transport even this local traffic began to leave the canals. The road competition has been reduced by petrol rationing, and the present pressure on the railways might reasonably have led to some return of long-distance traffic to the canals. But any such spontaneous development is impeded by the difficulty of rates. The canals' operating costs have greatly increased since the war, but they cannot raise their rates without the approval of the Railway and Canal Commissioners; nor, indeed, would an increase in rates help them much, unless railway rates rose still more. Moreover, the question of rates is more acute for the independent canals than for those which are owned by the railways and participate with them in the agreement with the Government. This chaotic state

of affairs becomes intolerable at a time when the transport system as a whole is liable to be strained beyond the limits of its present organisation and capacity. Centralised and uniform control is called for, and the task of bringing in the canals will not be easy. There is a shortage of labour, even for the maintenance and working of those canals whose upkeep has not hitherto been neglected; and whether any of those which have fallen into disrepair can be made workable in present conditions is extremely doubtful. Mr Pick has been asked to report—very late in the day. He might reasonably have been given a mandate to mobilise the canals—and power to act. It will be the duty of the Ministry of Transport to see that his report, when it comes, is acted upon, and not shelved, like its predecessors, for a decade or more.

Shorter Notes

The number of interned enemy aliens released under the different categories of the White Paper numbered 10,112 Germans and 1,001 Italians up to February 8th. By far the largest number—4,245 Germans and 461 Italians—have been released under Category 3, the invalid or infirm. Those accepted for enlistment in the Pioneer Corps account for 1,608 Germans and 161 Italians, and "special cases of extreme hardship" has secured the release of 738 Germans and 43 Italians. Releases under Category 19—active opposition to the Nazi regime—number 142 Germans and 8 Italians, but it is pointed out that many internees who would otherwise have been covered by it were released before it was added to the White Paper. In addition to all these and other releases, 410 Germans and 120 Italians have been released as special cases outside the White Paper procedure. All the figures given include internees in Canada and Australia as well as the United Kingdom.

*

When the changes in the machinery of Government were made in January, the co-ordinating work of the Economic Policy Committee was taken over by the "Steering Committee" under the Lord President of the Council, its import functions being merged into the new Import Executive. Now, the Economic Survey, under Lord Stamp, which gave valuable advice on all economic aspects of the war direct to the Economic Policy Committee, has also been wound up, as its work has been completed. It is not, perhaps, too much to hope that these changes mean that advice is at last to be translated into action.

*

Yet another American visitor is to come to England. Mr W. Averill Harriman, who has been working with the new Office of Production Management, is being sent to the Embassy in London to expedite the defence programme.

*

The following table gives the number of deaths and serious injuries in air-raids since mass raiding began last September:—

	Killed	Detained in Hospital	Total Serious Casualties
September, 1940	6,954	10,615	17,569
October, 1940	6,334	8,695	15,029
November, 1940	4,588	6,202	10,790
December, 1940	3,703	5,044	8,837
January, 1941	1,502	2,012	3,514
Total	23,171	32,568	55,739

Of those killed in January, 720 were men, 567 women and 189 children under 16.

THE WORLD OVERSEAS

Neutral Switzerland

(From Our Geneva Correspondent)

February 1st.

THOUGH an island of peace in the middle of Europe Switzerland is a besieged country. Her communications with other countries are either through Axis territories or Axis-controlled areas. The economic situation in the neighbouring countries is such that she can hardly get any foodstuffs from France and Italy, who were formerly her chief sources of supply. Overseas imports are reduced to almost nothing, owing to the British blockade on the one hand and, on the other, to the fact that she can only rely for her sea transport on half a dozen ships chartered by the Swiss Government and flying the Swiss flag. She still employs Marseilles and Genoa, in France, for unshipping her goods; it has just been announced that, owing to important troop movements, she can no longer use Genoa and Savona. In Italy, which she has been able to use hitherto. Rail communications from these ports to Switzerland are long and difficult, and, for reasons easy to understand, the Swiss railways are reluctant to send too much of their rolling stock to these countries. The consequence is that Switzerland's restocking of foodstuffs is seriously menaced, and a number of products—principally fats, comestible oils and textiles—are becoming very scarce.

Wheat supplies are still sufficient, so that wholemeal bread, which can only be sold two days after being baked, is not rationed, and the introduction of bread cards is not contemplated for the time being. Meat, fresh milk and cheese are plentiful and their sale is unrestricted, but all other products are rationed. Everyone is entitled monthly to 24 oz. of flour, maize or semola, 16½ oz. of sugar, 16½ oz. of rice, 16½ oz. of macaroni, 8 oz. of dried peas or beans, 9½ oz. of butter. Butter rationing may be surprising when one remembers that Switzerland is an important producer of dairy products, but the lack of fodder and exports have much reduced the national herd of cattle, while on the other hand the population have tended to hoard butter to make up for the dearth of fats and oils.

Clothing Cards

The abnormal hoarding of shoes and textiles last October led to the immediate rationing of shoes, cotton, wool and linen; for these cards on the German pattern have been delivered allowing everyone to purchase one pair of shoes and various linen, cotton and wool articles—according to choice—until the month of April, when another quantity will be allowed. The textile card includes 90 points; 34 points are to be given for a man's suit, five for a shirt, two for a pair of socks, eight for a skirt, one for a towel. Artificial silk and wool substitutes are now mixed with wool, and other substitutes are added to cotton. A new order has been issued for the control of textile manufacturing, allowing the use of from 50 to 80 per cent.—according to the class of goods—of pure wool and cotton in the manufacture of thread and tissues.

Petrol is also scarce; big quantities are stored, but they are reserved for the exclusive use of the Army. The few tons that can be imported are sparingly delivered to a restricted number of private motor vehicles—agricultural tractors, transport undertakings, doctors—at the rate of two to four gallons a month, and about three-quarters of Swiss motor vehicles—that is, about 80,000—are idle.

A great effort at making Switzerland almost self-supporting is being attempted, and plans are ready for compelling the Cantons and Communes to increase the area under cultivation so as to double it. The present 440,000 acres under cultivation—which already represents an increase of about 80,000 over 1938—enable the

feeding of half the population, and it is estimated that another 300,000 or 400,000 acres might be added by clearing some forest and pasture land and cultivating pleasure gardens and parks. It is estimated that about 9,900 acres of forest can be cleared up, which would at the same time provide Switzerland with important quantities of wood for heating, for industry and paper manufacturing. This, it is stated, is the only means of avoiding famine which might threaten next winter should imports remain at the present level.

Danish Troubles

[BY A SCANDINAVIAN CORRESPONDENT]

February 11th.

DANISH finance is seriously threatened by the large amount of liquid money resulting from the enforced realisation of livestock and other assets, mainly in the form of agricultural exports to Germany. Export prices are continuously increased, but are invariably accompanied by a corresponding increase in the cost of imports from Germany. As Germany pays for her imports from Denmark through the Danish-German clearing account, the increased prices involve no sacrifice on the part of the Germans. According to the latest figure of the clearing account, Germany now owes Denmark Kr. 432 millions. The balance sheet of the Danish National Bank shows furthermore that the account "diverse debtors" has increased to about Kr. 450 millions. This account represents the German Wehrmacht's expenses in Denmark. The total Danish payment for ten months of German protection, therefore, now equals about Kr. 850 millions, taking into consideration small amounts on these accounts before the German invasion.

Inflation Dangers

The increasing danger of uncontrolled inflation is emphasised by the fact that the note circulation of the National Bank last December amounted to Kr. 741 millions, against Kr. 599 millions in December, 1939. At the same time as the note circulation is increasing, the stocks of goods are dwindling. Those of raw and semi-manufactured goods are badly depleted, and this has consequently reduced industrial activity, especially of consumers' goods. The index of industrial production in November was already down to 91, compared with 116 in 1939. Tea, cocoa and cooking chocolate stocks were exhausted after Christmas and it is impossible to replenish them. Coffee stocks are expected to last until April if the present ration of 125 grammes (just over ½ lb.) a month per head continues. The weekly allowance of white bread is 18½ oz., of rye bread 52½ oz., of sugar 13 oz., and of butter or margarine 12 oz.

The following table shows the export trade in various agricultural products in 1940:—

	1939		1940	
	Quantity	Million Kr.	Quantity	Million Kr.
Butter, tons.....	150,000	291	108,000	329
Bacon, tons.....	100,000	394	143,000	311
Eggs, numbers in millions	1,704	146	1,344	129
Live pigs, numbers	132,800	25	753,000	115
Cattle, live and slaughtered, numbers	242,000	...	440,000*	...

* Estimated.

The increase in the price of agricultural products during 1940—81 per cent. for butter, 40-50 per cent. for cheese, 30 per cent. for slaughtered cattle, and 12 per cent. for

slaughtered pigs—does not mean that the Dutch farmer gets a corresponding profit. His cost of production has increased, and in the end he will see his livestock reduced, while instead he only has the paper money forwarded by the Danish National Bank, which is forced to finance the export to Germany.

High Unemployment

The biggest social problem in Denmark is unemployment. The total number of unemployed rose from 132,000 in December last to 193,200 in January. Of this total, 179,400 belong to unemployed insurance societies, which have 504,000 members. This does not, however, give the complete picture of the unemployment in Denmark. Some 30,000 workers avoided unemployment owing to reduced hours in industry, and 25,500 workers have gone to Germany. The actual unemployment is thus nearer 250,000. This means that every second insured worker is out of work. The 25,500 Danish workers in Germany live under conditions very different from those in Denmark. They live in barracks and are sent wherever the Germans want them, regardless of their trade. They work up to sixty hours a week or more, though it is asserted that a Danish workman produces more in eight hours than a German in ten. For how long he will do this under conditions in Germany is another question. The majority of the workers are navvies, ferro-concrete, harbour and transport workers. Danes destined for work in coal-mines have left Copenhagen for *Stinneswerke*, Essen. It has been stressed by the Germans that the much-desired supplies of coal and raw materials from Germany would be facilitated by giving Danish workers the opportunity of taking up work in Germany. Now, during the bitterly cold winter days in Denmark, the Danes are experiencing another German breach of promise.

Foreign Shipping in China

[FROM OUR SHANGHAI CORRESPONDENT]

December 23rd.

THE China shipping situation late in 1940 showed a sharp decrease in tonnage, compared with the period immediately prior to the European war, of maritime traffic in all Chinese ports, especially at Shanghai; a reduction by over 60 per cent. of British shipping; the maintenance of Japanese shipping's pre-war volume; and increasingly unfavourable effects on the Chinese trade of expense and shortage of bottom space in the North-eastern Pacific.

Ships entered from and cleared for abroad in all Chinese ports during the last quarter of 1940 aggregated a monthly average of 1,800,000 tons, against 2,700,000 tons in the months which preceded the European war. This decline in Chinese shipping of 900,000 tons, or one-third, is accounted for to the extent of 500,000 tons by Shanghai, 300,000 tons by South China ports, and only 100,000 tons by Yellow Sea harbours. In the remainder of China's foreign shipping, Shanghai accounted for almost 50 per cent., the North for between 40 and 45 per cent., and the blockaded South for from 5 to 10 per cent. only.

Japan's shortage of bottom space prevented her from increasing her tonnage in the China ports, but she managed to maintain the former volume of her Chinese shipping, and thus could seize the lead because China sailings declined under all other flags. The tonnage of Japanese mercantile ships visiting Chinese ports was slightly below 1,100,000 in November, 1940, as well as in August, 1939, but the share of this tonnage in the total Chinese shipping has increased from 40 to 62.5 per cent. In Shanghai, the Japanese shipping share went up from 24 to 40 per cent. These figures do not take into consideration almost 1,000,000 tons of Japanese shipping requisitioned and reserved for supply shipping on behalf of the Japanese forces fighting in China.

Britain lost her former lead in the total of Chinese shipping early in 1939 as a result of Japanese dis-

crimination—and since the outbreak of the European war in Shanghai as well, through the withdrawal from the Far East of an increasing number of British vessels. Not only were all P. and O. and some Canadian Empress liners withdrawn, but also numerous smaller units down to tugs and salvage boats. The volume of British shipping in China consequently contracted from almost 700,000 tons monthly, just before the European war, to less than 300,000 tons monthly late in 1940. British ships entering from and leaving for foreign ports at Shanghai aggregated 554,000 tons in August, 1939, and only 215,000 tons in November, 1940. The proportion of British shipping in the periods under review declined in the whole of the Chinese ports from 26 to 16 per cent., and in Shanghai from 40 to 24 per cent.

All other flags account for but 20 per cent. in the total shipping of China, and for 35 per cent. in that of Shanghai. The chief four of the minor participants are the United States, Norway, the Netherlands and—since the resumption last autumn of the *Messageries Maritimes'* Shanghai sailings—once more France. No expansion of Chinese shipping of these four nations may be expected for the duration of the European war. Though the new American President liners make Shanghai a port of call on their regular round-the-world voyages, elder bottoms of the same company are being withdrawn correspondingly.

Shortage of Cargo Space

The shortage of bottoms on the China coast this winter is more pronounced than ever since the start of the Sino-Japanese war. Japan complains of insufficient shipping space, and through lack of adequate transportation facilities experiences huge port congestions on her main islands as well as in North China. Shanghai meets with increasing difficulties in securing cargo space for importation of British Indian and Brazilian cotton as well as of Australian cereals. Christmas, 1940, found Shanghai perturbed over the threatening cancellation, for lack of shipping space, of a 40,000-ton wheat order placed in Australia. The important Saigon-Shanghai run (rice, maize) is burdened with a 5 per cent. war risk rate as well as with freight charges as high as trans-Pacific freight rates.

British dockyard and wharf companies in Shanghai report very satisfactory returns for the first half of 1940, but later in the year their business fell off. The chairman of the biggest of these companies this month told his annual general meeting of shareholders that he found it impossible to look forward with optimism to the near future of Shanghai shipping. British Chinese coastal shipping to and from Shanghai, minor sea ports and Lower Yangtze harbours since last autumn was equally outdistanced by Japanese coastal shipping, and towards the end of the year was almost paralysed by sudden additional financial exertions on behalf of the Japanese naval authorities.

America's New Budget

[FROM OUR NEW YORK CORRESPONDENT]

February 14th.

AS has become usual in recent years, the Budget presented by the President to Congress on January 8th is not much more than a sketch. Regularly, supplementary proposals have been presented in the course of the year, and often forecast without being enumerated in the Budget Message. In the current fiscal year, appropriations for defence to a total of about \$5,000 millions were interpolated. In the present instance, the Message states that "the time has come for immediate consideration of assuring the continuation of the flow of vitally necessary munitions to those nations which are defending themselves. . . . Such a complementary programme would call for appropriations and contract authorisations over and above this Budget." Likewise, the revenues are calculated by the incidence of existing taxation on an (expected) increased national income; but the Budget recommends that "a start should be made this year to meet a larger percentage of defence payments from current tax receipts," but makes no specific proposals other than that "additional tax measures should be based upon the principle of ability to pay."

Unique!

The **Crown Colonist**

WALL MAP OF THE COLONIAL EMPIRE

Invaluable to all concerned with Colonial Trade, Commerce and Education . . .

● Designed to show the situation and size of each of the British Colonies in relation to one another and to the British Isles, this new map consists of a general map of the World on which Great Britain and Northern Ireland, the Crown Colonies, Protectorates and Mandated Territories are shown in strong red; the South African Protectorates (administered by the Dominions Office) in red hatching; Condominium Territories such as Anglo-Egyptian Sudan by a red stipple, and the Dominions and their Dependencies by a pale red. The background colouring for the rest of the map is yellow, with the sea in blue.

Shipping routes, submarine cables, the principal coal and oil fuelling stations are shown, and the principal air routes are also indicated.

● Supplementing the general map are insets showing the various Colonies, Protectorates, etc., which are all grouped in their geographical relationship to one another, and include Colonies in Europe and the Mediterranean, the Middle and Far East; East, West and Central Africa; High Commission Territories in Southern Africa; the Bermudas, the Bahamas, the West Indies, and South and Central America; Fiji and the Western Pacific; South Atlantic and Antarctica. All these, together with a separate inset of Great Britain and Ireland, are drawn on a uniform scale of 1:10,000,000 (approximately 160 miles to the inch).

Principal railways and roads are shown on each inset, and the badges and crests of the various Colonies are given in full colour.

● Particulars of the total area and population, average trade, imports, exports and re-exports of the Colonial Empire are given, and the products of each group of territories.

THE CROWN COLONIST

33 TOTHILL ST., WESTMINSTER, LONDON, S.W.1

The following table shows the principal items of receipts and expenditures:—

Receipts for Fiscal Year ended June (\$000,000)			
	Est. 1940	Est. 1941	Est. 1942
Income tax	2,125	3,055	4,510
Miscellaneous	2,345	2,871	3,029
Employment taxes	833	891	961
Railroad insurance	5	7	7
Customs	349	302	295
Other miscellaneous	162	153	161
Realisation on assets	106	369	8
Total receipts	5,925	7,653	8,972

The total of actual receipts for 1940 includes an "adjustment" item, of which the largest element was \$1,083 millions representing a decrease in the Treasury's working balance.

It will be noted that the largest increase is attributed to the income tax—for 1941 it is estimated at 50 per cent. over the actual receipts of 1940, and, for 1942, 50 per cent. over 1941. The principal legal charge introduced thus far is the Excess Profits Tax on corporations; but the principal reliance is on the increase in the national income. The Message states: "Economic activities and national income are rising to record heights"; indeed, economic activity has been for some months at record heights.

The following table gives the principal items of expenditure:—

Expenditure for Fiscal Year ended June (\$000,000)			
	Est. 1940	Est. 1941	Est. 1942
Legislative, judicial, executive	37	39	41
Civil departments	952	965	956
Public works	541	570	503
National defence	1,580	6,464	10,811
Veterans' pensions	550	560	565
Aids to agriculture	1,375	791	1,062
Aids to youth	378	369	363
Social Security	384	430	463
War relief	1,861	1,477	1,034
Interest on Public Debt	1,041	1,100	1,225
Total expenditures	8,998	13,202	17,486

The totals are in excess of the items, as they include allowance for miscellaneous items, running to about \$500 millions.

The gross deficit is given as \$9,310 millions for 1942, \$6,289 millions for 1941 and \$3,740 millions for 1940; the actual increase in the public debt in 1940 was only \$2,528 millions, owing to the utilisation of previously accumulated Treasury balances.

The Message explains that, in the first six months of the current fiscal year, expenditures for defence totalled \$1,750 millions; but that contracts and orders of the period amounted to \$10,000 millions. This would indicate that actual defence expenditures in the second half of the fiscal year are expected to be more than double those in the first half.

Less Port from Portugal

[FROM OUR LISBON CORRESPONDENT]

January 21st.

ALTHOUGH England bought some 24 million litres of port during 1940, a figure in excess of the 1939 imports, for the trade as a whole last year was poor, total exports being only 31,785,000 litres, compared with 40 millions in 1939 and 38 millions in 1938. The "New Order" in Europe has meant that French imports fell from 10 million litres in 1938 to 2.6 millions, while Sweden's million litres of 1939 fell to 2,173 litres. Germany drops out altogether, Norway's imports were halved, Holland and Belgium each took a third of their usual quantity, taking 1938 as a standard. Switzerland and the U.S.A. were the only two countries that, like England, increased their purchases of port—from 438,000 litres to 693,000 litres for the U.S.A. and from 380,000 litres to 462,000 litres for Switzerland. Thanks to higher prices, the depressive effect of such reductions has not been extreme, but fears are felt for the future, since December shipments were but 1,032,000 litres, against 2,495,000 litres in the same month of 1939 and 3,608,000 litres in December, 1938. The mutual importance of Anglo-Portuguese trade in connection with, not only vintage ports, but also beverage wines, is obvious, and with the bouleversement of affairs in France, Portuguese supplies of wine become important.

Shorter Notices

"Employment and Equilibrium." By A. C. Pigou. Macmillan. 283 pages. 16s.

Intended for professional economists, Professor Pigou's latest contribution to the definition of the terms upon which latter-day economic discussion crucially depends is remarkable, as usual, for its clarity and terseness. Savings and investment; the relation between wage rates and employment; the motivation of changes in market conditions; the conception of economic society as a "flow" of relations; the use of mathematics—this book is in the main stream of modern thought. But many readers will value it most of all precisely because it is Professor Pigou's contribution. They will recognise with pleasure—even where they disagree—his "classical" integrity, his appeal to recorded historical facts, his insistence on the decisive rôle of business confidence in fluctuations and his lucid logic.

"The Shipping Industry of Japan." The Foreign Relations Council of the Japan Economic Federation. Tokyo. 32 pages. 1s. 4d. including postage.

A useful account, well furnished with statistics, of Japan's shipping industry. There is a chapter on Government control and shipping law.

THE BUSINESS WORLD

Continental Currencies

BESIDES the spiritual infection which attacks any currency in close contact with Germany, there are three material causes for the deterioration of the currencies of countries that have fallen into German occupation: the normal effects of a lost war and enemy occupation, the establishment of Reich credit banks which serve in the territories concerned as *Ersatznotenbanken* and increase the notes in circulation; and, thirdly, the lack of gold and foreign exchange holdings in the central banks at the time of the occupation, thus leaving the increased currency without any real cover. There was, too, a temporary adverse factor in the millions of refugees, who carried about with them vast, but unknown, amounts of hoarded notes.

The currency which is in by far the worst condition is the French franc. The chief reason for this is the enormous cost of the occupation, on which more than Frs. 60 milliards has already been spent. The Bank of France is losing all its gold rapidly—that part, at least, which is not blocked in the United States—and is receiving in exchange a State IOU. It is not surprising that the Bank of France returns are no longer published—a step which even the Reichsbank has never felt called upon to take. The German authorities, for their part, pay their bills, and provide their soldiers, with *Reichskreditkassenscheine*, the acceptance of which, at a fixed rate of exchange, is compulsory. As this paper money is circulating along with the franc and the mark, which, incidentally, has replaced the franc in Alsace-Lorraine, now considered part of the Reich, the total amount of notes in circulation has increased enormously. This plethora of paper money makes the French people extremely inflation-conscious, a fear which the Germans are not attempting to check. In fact, extensive spending by soldiers and occupation authorities provides a temporary stimulus to business in occupied France.

Twelve Reich credit banks operate in occupied France. As all such banks are branches of one institution, common to all occupied territories, it is not known how many of their *Kassenscheine* fall to the share of each country, nor is even the total issue of these *Ersatzbanknotes* known. But a law was published to the effect that they were covered up to Kr. 3 milliards by a loan to the Reich, and it may be assumed that the circulation is of approximately that amount. Moreover, most of the total must fall to the share of occupied France, since Scandinavia, the Low Countries and Poland are again using their own currencies, either exclusively or at any rate mainly. The rate of exchange has been fixed at 20 French francs to one *Kassenscheinmark*, and some idea of the huge amounts of paper money which have been pumped into occupied France can consequently be obtained. On the other hand, by a process of requisitioning or purchasing, commodities, which to a great extent are irreplaceable, have been pumped out. Thus the divergence between the note circulation and the available goods grows daily.

In Denmark, it was not found necessary to establish Reich credit banks, as the population accepted the *Kassenscheine* without demur. But since last summer no new ones have been issued, and those in circulation had to be exchanged at the Danish National Bank for Danish banknotes by September 10th. Payment for the costs of occupation is now being provided directly by the National Bank; its note circulation has consequently increased, amounting to nearly Kr. 750 millions in December, against Kr. 600 millions in December, 1939; its current accounts have also risen considerably. The shortage of goods and the rise in the note circulation are having their usual effect on prices, and the wholesale price index has passed its previous highest point.

The situation in Norway is even less favourable. The note circulation before the occupation was about Kr.600 millions. The Bank of Norway has stopped publishing a return, but the circulation is now estimated at Kr.1 milliard, the increase being mainly due to the payment of the costs of occupation. But since the gold is in the

possession of the legal Bank of Norway in Great Britain, there is no real backing to the notes. Moreover, the income from the merchant navy, the most important asset in the balance of payments, is not available; it is not surprising, therefore, that there is a flourishing trade on the Norwegian Black Bourse, where a dollar is quoted at Kr.6.50, against an official rate of Kr. 4.40.

In Holland, eight Reich credit banks were set up to begin with; but, with the exception of the one in Amsterdam, they were soon closed, and the amount of *Kassenscheine* in circulation, for which the rate fixed was 0.75 guilders to Rm.1, was not considerable. The note circulation of the Nederlandsche Bank, however, has increased by about 30 per cent., while its gold holding is under the control of the Dutch Government in London. The Bank's bill portfolio is four times as high as it was last year, an increase which does not reflect the credit demands of genuine business, but which is entirely due to the placing of Treasury Bills with the Bank. Moreover, the financing of the State deficit has mainly been carried out in the open market, and the circulation of short-term Treasury Bills amounts to more than a million guilders, but the authorities have not been able to float a bigger long-term loan.

The currency position in Belgium is not at all clear; but there is a very strong inflationary tendency, and in no other country has so rapid an expansion of the note circulation taken place. It rose from 27.9 to 29.8 milliards between the beginning of 1940 and the invasion, to 33.5 milliards during the next six weeks, and by a further 3 to 4 milliards since. Vast quantities of notes were hoarded by the population at the time of the invasion, and here, too, the circulation was swollen by the *Kassenscheine* of the Reich credit bank, the rate of exchange for which was fixed at 8 pfennigs to 1 Belgian franc. On the instructions of the Belgian National Bank, part of the gold reserve is now returning to Brussels from Dakar, where it was sent by the Bank of France after the German invasion. But it will surely follow the fate of the Bank of France's own gold holdings and will not be allowed to remain for long as a backing to the inflated Belgian note issue.

In German Poland, a new bank of issue was established as long ago as last April, and its notes are the only legal tender. Those of the former Bank Polski and the *Kassenscheine* of the Reich credit bank were then completely withdrawn and exchanged for the new issue. The new bank started off entirely without gold reserves;

WILLS & TRUSTS

In the present wartime emergency difficulty may be experienced in selecting a suitable Executor or Trustee. This difficulty can be solved by appointing a corporate body having the status of a Trust Corporation.

MARTINS BANK LIMITED

is a Trust Corporation and as

EXECUTOR & TRUSTEE

offers efficient service with security and continuity of management throughout the Trust. The fees are moderate; probably less than the legacy you would bequeath to a private Executor.

instead, according to its statutes, its notes are covered by the discount transactions which form the basis of their issue, and even by holdings of German marks. The German authorities, however, realised that they could never enforce the exchange of the old zloty notes by producing alleged securities such as these. They, therefore, introduced a compulsory mortgage of up to three milliard zloty on landed property to serve as real cover.

The German invasion was so sudden, except in Poland, and the ensuing campaign so short that there was no time for the usual last minute rush by the public on their banks; moreover, the absence of land fighting in Europe since has enabled the occupation authorities to

remodel the currency arrangements in their own time. Their carefully prepared plans, based on the Reich credit banks, obviated a currency vacuum, and in one or two cases have produced conditions which externally at least appear fairly normal. But the complete absence of any real backing either for the native currencies, swollen by the payment of occupation costs, or for the *Kassenscheine*, whose only cover consists of promises to pay on the part of the German Reich, makes any apparent normality unreal. No doubt, Germany hopes to balance the *Kassenscheine* against the payment of reparations by the Allies after a German victory. But as the prospects of a German victory diminish, the intrinsic value of the *Kassenscheine* dwindles correspondingly.

Finance and Banking

Larger Bill Allotment

Conditions in the money market have during the past week shown a very fine balance between the supply and demand for credit. At no time has there been the slightest evidence of abundance, and yet the market has, with a little effort, always found it possible to place the bills it wished to sell or to obtain additional money with one bank or other. Most of the banks have found their cash position seriously affected by the need to make heavy transfers of tax moneys, and have therefore been rather diffident buyers of bills. The market, for its part, obtained a better allotment of bills at last week's tender. The 89-day bills on which the syndicate again appears to have concentrated its applications provided an allotment of 23 per cent. at the price of £99 15s. The Tuesday 88-day bills were allotted in full at £99 15s. 1d., but most of these were taken by semi-official quarters. The market has thus been a somewhat better potential seller than in the previous week, and this change in its attitude has gained some emphasis from the disappearance of the special buyer. The semi-official orders which were being satisfied by open market purchases of bills last week have evidently been completed. The Bank return reveals the main force at work in the credit position—namely, the flow of revenue payments from bankers' to Government accounts. The former are £7,157,000 down, and the latter £7,810,000 up on the week. Another influence in this shift of funds has been the acceleration in public subscriptions to the various war loans. Bankers' deposits at £103,471,000 reveal how narrow has been the margin of credit on which the market has been working during the past week. There are indications, however, that the position will be appreciably eased next week, though until the close of the financial year approaches to stringency must be expected.

* * *

Clearing Banks' January Figures

The clearing banks' statements for January reveal the customary seasonal deflation of the credit structure following the year-end expansion revealed at its full in the December statements. Deposits have come down from £2,799,969,000 to £2,756,550,000. This reduction of

£43,419,000 is explained to the extent of £22,974,000 by the smaller volume of cheques in course of collection. There has also been some diminution in the items in transit of those banks which show them separately, so that it may be assumed that close on two-thirds of the January diminution in bank deposits was due to the normal contraction in the element of duplication due to outstanding items in course of collection or transfer. For the rest, the composite balance sheet reveals an exceptionally wide diversity of changes. Cash has fallen by no less than £45,359,000, a movement which is exceptional even measured in the light of the customary seasonal deflation of bank cash in January. The exceptional accumulation of funds in Government accounts in preparation for the redemption of 1 per cent. Treasury bonds on February 1st was in part responsible for this drop in the volume of bank cash towards the end of January. The only other item among the assets to show

Total assets	2,697.3	2,856.8	2,914.4	2,957.7	3,049.8	3,003.7

a diminution was that of short loans, which fell by £27,865,000 over the month. This reflects the much smaller bill positions carried by the market during the month. Treasury deposits continued their steady climb and rose by £27,000,000 to £340,500,000. The flow of bank money into gilt-edged securities was rather smaller in January than in the preceding months, but a further increase of £17,787,000 in the already swollen total of investments is none the less striking and significant. Both discounts and advances show slight increases on the month, the former movement being due to larger holdings of Treasury bills, of which the discount market was a readier seller in January following the year-end balance sheets.

Currency in Occupied Italian Territories

It is a most welcome change to be able to record details of currency arrangements in occupied territories in which the initiative and the decisions have been taken

by ourselves and not by the enemy. The first such arrangement is that announced from Benghazi, as capital of the occupied province of Cyrenaica. The lira currency is being maintained in circulation, but side by side with it Egyptian currency is being introduced by the occupying armies. The rate of exchange between the two currencies has been fixed at four lire to one Egyptian piastre. This gives a cross-rate of 385 lire to the pound sterling. This compares with a rate of 74 lire to the £ prior to the entry of Italy in the war, and may thus seem seriously to undervalue the local currency. It must not, however, be forgotten that the official sterling-lira rate was a highly artificial concept which bore little relation to the true purchasing power parity between the two currencies. A better criterion was afforded by the unofficial quotation for lira notes which ranged up to 400 lire to the £ in the early months of 1940. On this basis, it will be seen that the authorities have acted with moderation and fairness in fixing the rate of exchange in occupied Lybia. The same problem has not yet had to be tackled in the Italian territories in East Africa, since no large centres of population and commerce have yet been occupied. If and when they are, the question of parallel currencies will be considerably eased by the circulation in those parts of the world of the Maria Theresa thaler. This is a coin which the Royal Mint has in recent years been producing on a scale at least as large as the coinage from the official Italian dies. Adequate supplies of these coins (which also circulate in British territories) are thus assured, and the thaler will provide a common medium of currency in terms of which it should be easy to determine fair exchange ratios between the belligerent currencies.

Irish Banks' Returns

The returns for the banks operating in Eire for the December quarter, published by the Currency Commission, are as follows:—

(£'000)					
	Decem- ber Quarter 1939	Septem- ber Quarter 1940	December Quarter 1940		
			In Eire	Elsewhere	Total
<i>Liabilities</i>					
Capital, reserves, etc.	17-526	17-572	10-372	7-210	17-582
Notes in circulation	9-742	11-599	5-281	6-850	12-131
Current, deposit and other accounts	162-028	170-962	127-594	45-640	173-234
Other liabilities	5-693	6-196	4-705	1-906	6-611
Total	194-990	206-331	147-953	61-606	209-559
<i>Assets</i>					
Cash and balances with London agents and other banks	19-396	26-174	10-970	16-965	27-935
Money at call and short notice	8-658	9-799	...	10-514	10-514
Bills	8-274	5-367	4-313	769	5-082
Loans and advances	72-341	73-436	48-906	23-278	72-184
Investments :					
(a) Government	68-180	72-548	6-478	68-152	74-630
(b) Other	10-071	10-264	4-240	6-058	10-298
Other assets	8-117	8-739	4-198	4-714	8-913
Total	194-990	206-331	79-106	130-453	209-559
Excess of assets outside Eire over liabilities outside Eire	65-422	66-300	...	...	68-847

Part of the additional deposits have been stated by the chairmen of the banks to be temporary, and this, no doubt, explains the continued growth of liquid assets. The slight decline in advances is the result mainly of the repayment of old advances by farmers who have benefited by rising prices. The expansion in the note circulation was confined to Northern Ireland as the volume of the banks' issues in Eire is limited. The demand for additional currency in Eire was met by an increase in the volume of legal tender rates, which now amounts to £15,161,535. In consequence, the British Government securities held by the Currency Commission had risen in December to £10,798,363, as compared with £9,128,086 in September and £8,733,941 in December, 1939. The "Other Assets," which comprise mainly gold, have also risen during the year, the average for December being £4,863,172, as compared with £3,223,824 twelve months previously. These increases, together with the increase in the banks' net sterling assets shown in the table, demonstrate that Eire, in spite of her neutrality, is following the same monetary course as the belligerent Dominions.

Seven years SECURITY

—then a bonus

Price of Issue — £100 per cent.

Can be bought in sums of £5 and multiples of £5 from any Bank, Trustee Savings Bank, Post Office or Stockbroker.

Interest at 3% per annum accrues from date of purchase and is paid half yearly—May 1st and November 1st.

Repayable after 7 years at £5. 1. 0. for each £5 invested.

Interest is liable to Income Tax but tax not deducted at source. Can be cashed at any time, on six months' notice, at par plus any interest accrued to date of repayment.

In case of private emergency special arrangements can be made for repayment within a few days, less a deduction equal to six months' interest.

3% Defence Bonds are so advantageous to the holder that no individual may hold more than £1,000.

Investment

Three Per Cent. Maximum

The investing public continues to show distinct signs of lack of appetite, and the stock market has touched some new lows for 1941, based on a steady trickle of small selling which suggests that tax payments, and possibly some further stocking up, are being effected to a small extent out of past savings. Institutions appear to be taking advantage of this movement to pick up some cheap stock, but even they are not prepared to arrest the decline. There is no doubt that the cause of the general apathy is the growth of uncertainty, both as to military developments and as to the intentions of the Treasury, but the lack of interest is carried beyond reasonable limits. In times of active trading, it is difficult to suppose that there would have been no reaction to the acceptance by the Chancellor of the Exchequer of the amendment to the Consolidated Fund Bill, substituting for 5 per cent. the figure of 3 per cent. as the maximum to be paid on Government borrowing. It is, perhaps, improbable that the Government intended to issue any really long-dated stocks, but this measure successfully precludes any such offer until the long term basis is 3 per cent., as against the present figure of $3\frac{1}{2}$ per cent. on $2\frac{1}{2}$ per cent. Consols. Possibly, also, the Treasury hopes to see the odd quarter disappear, but in the meanwhile there is a guarantee that any issues made will be of medium life only. This should tend still further to raise the attractions which a large body of investors finds in the moderate volume of Government stocks which have, under the terms of issue, a minimum life of 20 years. It is also rather remarkable that the proceeds of vesting orders, past and prospective, are having very little influence on quotations. Next week brings the first instalment of money on the latest group of American securities taken over, and March 24 sees the start of disbursements on India stocks. Granted that a new savings drive is getting under way, a fair proportion of holders in both these groups will require more than a flat 3 per cent., and it seems inevitable that buying will be resumed. It will be selective, owing to acute uncertainty in a widening field, which now includes the leading Dominion stocks, but, where it falls, it should be the more marked. Some price rises seem certain, but their amount, and the extent of the ground covered, will depend in some degree on the absence of adverse developments in other fields.

* * *

Home Railway Earnings

The receipts of the British railway system, including the whole of the operations of the L.P.T.B., during 1940 just failed to reach £248,000,000, of which no less than £104,785,000 was for the carriage of passengers and £140,498,000 for merchandise. Expenses, including provision for war damage, rose to £203,480,000 and, after minor adjustments, the net revenue of the pool amounts to some £42,763,000. This figure compares with the guaranteed minimum of £39,850,000 and with some £43,450,000 for "Stage 2," the level above which the Government starts to share in any increase in net revenue. Certain additions have to be made to this revenue on account of receipts from investments in road transport undertakings and for the earnings of Irish railways owned by the companies, and the resultant revenue is set out in the table given below, together with the approximate figure for the second stage. For the main line railways, this means an increase of some £1,900,000 in disposable revenue on the year, of which no less than £1,080,000 falls to the London and North-Eastern. That company has devoted £837,000 to raising the distribution of the 4 per cent. second preference capital from $\frac{3}{4}$ to 2 per cent. and is placing £250,000 to contingencies. The L.M.S. and Southern payments are unchanged, as is the revenue of the latter company, while the former places the bulk of its additional revenue to contingencies. The Great Western, however, following a practice which has persisted for decades, distributes virtually the whole of its increase by raising the payment on the consolidated ordinary stock to 4 per cent. The position of the L.P.T.B. is somewhat complicated by the fact that the year has been

changed from the period ended June 30th to the calendar year. These results are fully up to market expectations, and exceed them in the case of the L.N.E.R. It is, however, difficult to know exactly what value can be placed on war-time accounts; it is probable that the 1940 figures provide an uncertain guide to results for

the current period and quite clear that they give no indication of the long-term outlook. The figures suggest that the economics resulting from increased traffics have been greater than was commonly supposed. The percentage of gross receipts retained fell in the second half-year, and must decline further as rises in charges lag more behind those in costs.

* * *

India Vesting Complaints

The passage of another week has added a great deal to the complaints made by the market, and by investors, concerning the decision to take over the "dated" India stocks, but has brought little information or enlightenment. A question by Mr De La Bere to the Chancellor of the Exchequer, as to whether Dominion stocks would be taken over, and in particular whether the 5 per cent. loans of Australia, maturing 1945, would be included, elicited the response that it would be against national interests to give an assurance that they would not, a reply which suggests strongly that they will share the fate of the Indian loans. Actually, holders of the latter have little to complain of—at least no more than many other classes of investor—but, if the conviction grows that other stocks are to be requisitioned, their holders will presumably tend to sell, and transfer into the most acceptable alternative they can find, so as to avoid being late in the rush which, it seems reasonable to suppose, would follow any substantial further vesting, despite the lack of response to the Indian order. Since that was made, there has been a fall of about a point in many Australian stocks, but it would probably be a mistake to attribute this mainly to fears of acquisition. The more probable explanation is a marking-down in response to the deterioration of conditions in the Far East, and this is borne out by the fact that there has been very little selling. Suggestions to would-be investors that they should buy on the fall have, however, usually been rejected.

* * *

Inter-Exchange Communications

The suggestion of the authorities that stockholders in London and the Provinces must hand over, for Government use, the bulk, if not the whole, of their teleprinters and private lines threatens to impose considerable hardship upon those outside the London area. It will also add to the load on the Post Office telegraph system. Brokers have in recent years invested a good deal of money in speeding up communications, with the result that the price differences, which previously existed between London and even the largest Provincial exchanges, have tended to disappear. The process has, of course, been carried furthest in those securities with the freest market, and particularly in the Funds, with the result that an investor in, say, Glasgow suffered virtually no disadvantage from being far removed from the central

market. Now, apparently, except to the minor extent that brokers may be permitted to retain their communications, or may be able to find alternative means, these facilities are to be withdrawn. It is particularly hard that this measure should have coincided with the publication of the agreement, dealt with in some detail last week, whose principal aim is the unification of practice throughout the profession and a tightening of inter-exchange ties. It would be an exaggeration to say that the measure will have an important bearing on the total of new investment in gilt-edged stocks, but, in so far as it tends to bring the marketability of these in provincial centres down to the level of that in other securities, it will render them slightly less attractive. It is also the fact that a rupture of effective communications between London and the principal provincial bourses would lead to dealings being done in the latter at prices which could hardly cause satisfaction to the Treasury. It is, therefore, advisable that sufficient means of communications should be left to the exchange to ensure a nation-wide market in the Funds. Since the business in these is nearly equal to the total turnover in all other securities combined, the criterion of whether a line should be left in operation is largely a matter of the volume of business it carries. Granted this, some degree of pooling would doubtless be possible. But to take all, or nearly all, facilities from the exchange would make the problem of maintaining the present national market almost insoluble.

* * *

Gas Companies

The announcement that three leading gas companies, the Gas Light and Coke Company, Commercial Gas (operating in the East End), and South Metropolitan Gas, will not declare dividends on preference capital for the last half of 1940 has caused something of a collapse in the market value of gas stocks. Thus, the price of Gas Light and Coke 4 per cent. consolidated preference fell from $70\frac{1}{2}$ on Thursday, February 13th—the day before the announcement—to 65 on the following Monday, February 17, and South Metropolitan 6 per cent. irredeemable preference fell 10 points to 85 between the same dates. The shock is the more disagreeable to the market since in all three cases an interim dividend for 1940 had been paid on ordinary capital—although at a reduced rate. The decisive factor has of course been the concentrated bombing of

Company Notes

Imperial Tobacco Report

As was to be expected, the full accounts of Imperial Tobacco, for the year to October 31, 1940, do not add very much to the preliminary statement discussed in *The Economist* of February 1st. After all charges except fees, net profits have declined from £10,230,150 to £8,882,829, the lowest level since 1932-33, but it must be assumed that higher taxation is responsible for an important part of the fall. The amount of equity earnings at £8,020,620, against £9,367,941, implies a reduction in the tax-free rate of ordinary earnings from 24.9 to 22.4 per cent., a decline which is almost parallel to the cut in the total tax-free distribution from 23 to 21 per cent. After the normal allocation of £500,000 to general reserve, the carry-forward is increased from £1,612,927 to £1,620,937. The following table indicates the course of profits over the past three years:—

	Years ended October 31		
	1938	1939	1940
	£	£	£
Profit*	10,686,053	10,220,150	8,872,829
Preference divs.	852,209	852,209	852,209
Ordinary stock (tax free):			
Earned	9,833,844	9,367,941	8,020,620
Paid	9,890,762	8,630,501	7,512,610
Earned %	26.2	24.9	22.4
Paid %	25	23	21
General reserve	500,000	500,000	500,000
Carry forward	1,384,487	1,612,927	1,620,937

* After fees.

The balance sheet, as at October 31st last, shows some important changes in the distribution of assets compared with the statement at October 31, 1939. Thus, loans to and current accounts with associated companies have risen from £616,496 to £1,665,365. Stock in trade at cost—including this year estimated amounts recoverable under war risks insurance in respect of leaf damaged or destroyed—is reduced from £39,936,254 to £31,781,496. It is perhaps reasonable to assume that this is mainly due to declines in stock of leaf tobacco held by the company and in advances for new purchases at the end of October, 1940. The funds released have been put into Government securities, which are up from £1,746,700 to £8,270,614. Cash holdings have risen from £2,467,943 to £3,498,258, presumably on account of the difficulties of investing promptly in larger holdings of leaf. Both creditors and debtors show a further large increase. No light is shed by the report on the future of the Imperial Tobacco Company, but it is not difficult to see that, of all the problems of war-time trading, shipping difficulties are likely to prove the most intractable. There is

"'E KEEPS ON SAYIN' 'BOVREEL'"

Bovril -cheers!

Keep cheerful and invigorated with delicious Bovril. You feel more confident—you radiate that 'winning' smile. And the sustaining goodness of Bovril fortifies you against winter ailments.

Always keep BOVRIL in the house

London, in which all three companies operate, since the beginning of September last. The decision of South Suburban Gas to pay a final dividend of 1 per cent. on ordinary capital, making a total for 1940 of 3 against 4½ per cent., is welcome, but bears little relation to the experience of the other three companies, since the major part of its interests lie in the home counties to the south of Greater London. There is a long list of considerations which has necessitated this somewhat drastic decision on the part of the London companies. The dividend policy pursued up to last summer provides reason for believing that general difficulties of war-time trading—higher taxation and rising costs—would not have prevented a payment being made on preference capital. It is even possible that the gas companies could have carried those extra costs which have borne on them with particular severity, such as the provision of A.R.P. arrangements, the loss of revenue through blackout and the early evacuation, with all it means in smaller sales of gas, coke and apparatus. In the bombing of London last autumn, damage to the property of the gas companies, both to premises, to mains and to equipment was, however, severe and the loss through the leakage of gas was not negligible. Moreover, intensified bombing further reduced sales of all types and, in the particular matter of coke, the more strenuous war effort meant that the bulk had to be sold at minimum prices to industry, so that even the much reduced domestic demand could not be met. Add to these factors difficulties of obtaining labour and transport and further rises in all costs, and it is not difficult to understand that the immediate outlook for the London companies is a gloomy one. Their loss of earnings is, in a peculiar sense, a war casualty. It is to be feared that no marked improvement in their fortunes is yet in sight and that the secular trend for the industry was, in any case, perhaps not far short of its peak.

* * *

Manchester Ship Canal

The information contained in the report of the Manchester Ship Canal Company for 1940 has necessarily been severely reduced, and shareholders are no longer supplied with detailed revenue and expenditure accounts of the separate working of the Manchester Ship Canal itself, of the Bridgewater Canals and of railway working. The accounts of the whole undertaking, which are supplied in the traditional form, show a considerable expansion in receipts with which an expansion in expenses has more or less kept pace. Thus, total gross receipts of the Manchester Ship Canal at £1,753,392 have touched the highest level for the last ten years, as have total gross receipts for the whole

undertaking at £2,460,115, against £1,993,014 in 1939. Total net receipts, after deduction of general operating costs, at £1,188,012, also touched the highest level for the past decade. The most important increases in charges against profits are a rise in tax provision from £70,000 to £245,000 and the allocations of £100,000 for deferred maintenance and of £50,000 for war damage insurance against nil. The allocation for contingencies is maintained at £35,000. Thus, the surplus available for equity capital showed little change on that of the previous year, just exceeding the sums required to meet the 3 per cent. payment on the 5 per cent. maximum preference shares, and the 1½ per cent. dividend on ordinary shares, both of which are repeated. The carry-forward is again increased, from £23,467 to £25,269.

	Years to December 31		
	1938	1939	1940
	£	£	£
Gross receipts:			
Manchester Ship Canal	1,323,788	1,421,745	1,753,392
Total	1,860,581	1,993,014	2,460,115
Total net receipts ...	739,590	853,609	1,188,012
Taxation	40,000	70,000	245,000
Contingencies	35,000	35,000	35,000
Interest and other charges	519,756	533,602	692,793
Corpn. 3½% pref. div.	37,143	37,143	37,143
Surplus:			
5% pref. shares:			
Earned %	1.8	3.0	3.0
Paid %	2	3	3
Ord. shares:			
Earned %	1.0	1.6	1.6
Paid %	1	1½	1½
Carried forward	21,877	23,467	25,269

The balance-sheet does not show any important change, though it may be suggested that the elimination of much valuable statistical matter from the report in the national interest has hardly made necessary the elimination of the comparative figures, usually supplied by the directors. Cash holdings are lower at £278,735, against £484,721 in 1939 and £799,143 in the previous year, but the company has paid £150,000 to the Treasury in the form of advance of income tax and has acquired Government securities to the tune of £75,000. Stocks are higher at £172,269, against £147,943, while outstanding traffic accounts have increased from £224,324 to £771,474. On the liabilities side, accounts payable are up from £284,132 to £709,387. Thus, there is every indication that traffic on the canal has notably increased during the past year. The company's £1 ordinary shares, at the nominal price of 4s. ex dividend, yield £7 10s. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

THE renewal of anxiety regarding the possibility of hostile developments in the Far East and the Balkans has given rise to a somewhat sombre outlook in most sections of the market. Among home rails, the situation was partially relieved before the dividend announcements by speculative buying and later sentiment remained firm, the distributions and revenue statements being at least as good as investors had any reason to expect and in some cases better. Business was on a small scale in the industrial market and most commodity markets were depressed by the possibility of a further extension of hostilities. In many cases, underlying diffidence was expressed rather by the marking down of quotations than by actual selling.

*

The funds were not encouraged by critical developments in the Balkans and the Far East, though the moderate degree of selling which developed in the gilt edged market before the week-end and on Monday was checked later in the week. On Monday, losses of ½ and 4 were common and included 2½ and 3 per cent. Consols and 2½, 2½ and 3 per cent. Funding. Three and 3½ per cent.

War Loan, and 3½ per cent. Conversion lost ½ on the same day. Later in the week, prices were mainly held, but there was some selling of L.C.C. 3½ per cent. stock. In the foreign bond market, the outstanding feature was the weakness of Far Eastern bonds to which political rumours gave rise. Japanese issues, which were easy on Friday, February 14th—the 5½ per cent. bonds of 1930 losing 4 points—recovered moderately in the early days of the current week, but Chinese issues were still generally offered. On Monday, French railways also lost ground.

*

Before the dividend announcements on Wednesday last, home rails lost ground on balance, although on Monday speculative buying led to a number of improvements. A gain of 1½ for Great Western ordinary was, however, followed by a fall of ½ point the next day, and a gain of 1 point for Southern preferred by a fall of the same amount. L.M.S. 4 per cent. preference, which lost 1½ points before the week-end, recovered ½ point this week and afterwards ruled steady. After the dividend announcements, Berwick second preference responded strongly to the improved distribution and put on 3½ points. Great Western ordinary showed no net movement.

Among foreign rails, Bengal and

North West improved a further 2 points at the end of last week. Canadian Pacific was on offer, both the ordinary and preference issues losing ground. There was further selling of Argentine rails.

*

No section of the industrial market displayed strength during the past week, and, while there was little selling pressure, a general apathy was responsible for declines in prices in most sections. Breweries were notably weak. Watney defd. losing as much as 3s. on Tuesday, when Bass, Benskins, Distillers and Guinness were also quoted lower. Losses in the iron and steel group included B.S.A., Babcock and Wilcox, Guest Keen and Powell Duffryn, while among motors Rolls Royce eased ½ on Tuesday. Textile issues were a weak market, but, in the catering sections, J. Lyons was firm. Among general industrials, Murex, Metal Box, Dunlops, Lever and Unilever and International Nickel were all quoted lower.

Mining markets closed last week with sentiment seriously depressed by the news of the Far Eastern situation, but there was no general slide in prices, and toward mid-week cautious buying was resumed. In the kaffir market, before the week-end, Crown Mines and W. Wit

(Continued on page 256)

Industry and Trade

Curtailment in Output of Consumers' Goods

The stage has now been reached when the Government is forced to resort to drastic curtailment in the output of goods for civilian consumption in order to release shipping space and labour for more urgent purposes, and to economise foreign exchange. Thus, last week it was announced that, for the six months ending on September 30th, supplies of cotton and linen piece-goods and made-up goods to retailers are to be eighty per cent., and those of rayon sixty per cent. smaller than during the corresponding period in 1939. Although the textile trades concerned are occupied on Government and export orders—the proportion of such orders to total orders varies among individual concerns—this decision may force some of them to cut their output very considerably. The cotton industry, for example, has been informed by the Cotton Controller that it will have to curtail production appreciably. It is understood that, in coming months, the industry will only be able to secure some sixty per cent. of its consumption of raw cotton last December and January; as a result it will have to run its mills at about fifty per cent. of capacity. But if the Government is now to conquer rightly taking steps to reduce the output of consumers' goods for the home market, it will also have to face the consequences upon industry of this necessary restriction that some units of production should close down completely for the duration of the war; only so will the fullest economy of labour and equipment be secured. The problem of choosing between different units bristles with difficulties, and there is also the awkward question of compensation. So far as cotton is concerned, the Government appears to have evaded the issue by asking the industry to formulate a scheme. But while the industry's co-operation is essential, it can hardly be allowed to dictate its own terms. The Government will have to face the problem of redundancy and compensation with—if not a cut-and-dried plan—a set of principles that will ensure some measure of equality of treatment between one industry and another and prevent undesirable price increases.

* * *

Encouraging Wool Textile Exports

The National Wool Textile Export Corporation, a non-trading corporation set up by the Export Groups and other trade organisations in the industry, is to be financed by a levy of one-tenth per cent. on purchases of wool supplied by the Wool Control for processing in the United Kingdom. No levy will be charged on wool intended for export without being processed. Last year the Wool Control handled wool to a value of over £60 millions, so that the Corporation should not suffer from lack of funds. The purpose of the Corporation, like that of similar bodies already set up in other industries, is to encourage and assist export in a variety of ways. It will maintain a central office to advise and assist manufacturers in matters of export, and will make provision for the conduct of market research and for obtaining the publicity abroad for the products of the industry. The trade is likely to show considerable interest in the work of the Corporation, for many manufacturers have already reached the limit of their allocation of yarn for the civilian trade in the current rationing period, and reduced allocations are expected for the next, so that if spinners are to avoid an increase in short-time working an expansion of export business is indispensable.

* * *

U.S. Aircraft Production

The output of aircraft in the United States rose appreciably between December and January from less than 800 units to 1,036 units. Of the aircraft produced last month, 957 were military machines, comprising training and operational units, and it is reported that this country is to receive a bigger proportion of them than the Fighting Services of the United States. But if the Allies are to reach superiority in numbers this year, America will have to expand her output very rapidly in

coming months, for Germany is striving hard to increase her capacity. Present estimates suggest that an output of 1,500 machines may be reached by June, provided full use is made of existing facilities and of the new plant due to be completed in the near future. But even if that target is attained, Great Britain will have to rely mainly on her own output of operational aircraft for the coming campaigns. At the same time there are indications of an intensification of America's efforts to make better use of her existing facilities and to extend her productive capacity, not only by additions to the plant of the aircraft industry proper but by drawing on the vast resources of the motor industry. Many of the expansion plans, however, are still in the discussion stage, and considering the time required for the extension of production facilities, it would be a feat if the rate of output were doubled by the autumn.

* * *

Lull in Shipping Losses

The reduction in shipping losses since early December, reflected in the accompanying table, has been welcome. The figures of losses for the week ended February 9th are again comparatively small; they comprise 19,364 gross tons of British and 10,442 tons of Allied shipping. But even at the level of some 50,000 gross tons per week the annual rate of British and Allied shipping losses is about 2½ million gross tons, which exceeds the capacity of British shipyards at present available for the construction of merchant ships. Moreover, there are

AVERAGE WEEKLY SHIPPING LOSSES
(In gross tons)

	British	British and Allied	British, Allied and Neutral
Sept. 3, 1939–April 28, 1940	21,500	24,900	40,500
May	22,600	49,800	59,300
June	57,900	97,300	121,400
July	56,700	67,400	82,500
August	64,800	72,700	82,400
September	76,200	90,300	101,000
October	63,600	78,900	88,300
November	68,100	85,400	89,200
Average, June–November ...	64,500	81,500	93,500
December, 1940	52,213	65,000	68,300
January, 1941	31,712	46,100	46,700

reasons for the belief that Germany may soon intensify her campaign on the Atlantic front; the possibility of an increase in the rate of shipping losses must therefore be faced. Fortunately, shipbuilding facilities in the United States can, and in fact are, being rapidly extended. Thus, the Maritime Commission is now awarding contracts for seven new shipyards for the construction of 200 ocean-going cargo vessels. In the near future, however, no effort must be spared to increase the output of British shipyards and to supplement it so far as possible by the purchase of second-hand ships in the United States and elsewhere.

* * *

Dearer Tin

The London tin price, which had been stable between £256 and £257 per ton since the beginning of December last, has advanced rapidly since the middle of last week. On Wednesday the cash price was

CITY OF TOKYO FIVE PER CENT. LOAN OF 1912 STERLING ISSUES.

NOTICE IS HEREBY given that the COUPONS due 1st March, 1941, will be PAID on that date between the hours of 11 and 12 and subsequently (Saturdays excepted) between the hours of 11 and 2 at The Yokohama Specie Bank Limited, where lists may be obtained. Coupons must be left three clear days for examination prior to payment.

For the YOKOHAMA SPECIE BANK, LTD.,
H. KANO, Manager.

7 Bishopsgate, London, E.C.2.
14th February, 1941.

£271 10s. - £271 15s., while the three months forward quotation, which had been above the cash price since August last, was then £3 5s. per ton below the latter. The chief reason for this sudden change is the growing political tension in the Far East, which has caused a strong re-stocking demand both in this country and in the United States. As something like two-thirds of the world's tin is produced in Eastern Asia, chiefly in Malaya, the Dutch East Indies, Siam and China, the sensitiveness of the market to changes in the political barometer can be readily understood. According to the Tin Research Institute world production of tin rose from 184,300 tons in 1939 to 236,600 tons in 1940—a new record. Last December production, at 28,000 tons, reached the highest monthly total ever recorded, and as the 130 per cent. quota will remain in force throughout the first half of 1941, further increases are quite possible. Owing to the extension of the British blockade on the Continent, however, world consumption has fallen, and probably did not exceed 155,000 tons last year. The difference between production and consumption was fully absorbed by the United States Government's accumulation of a reserve, by an addition of about 20,000 tons to private American stocks, and by the accumulation of a minor reserve by the British Government. The American Government's buying programme will continue until about the middle of this year, when the planned 75,000 tons should have been accumulated. Unless the American Government decides to increase its holdings beyond the original limit—and there is the possibility of such an increase—quotas will have to be curtailed in the summer, although the extent of the reduction would be mitigated, at least to begin with, by the need for replenishing the 15,000-ton buffer pool, which was depleted in the early months of the war. A continuation of United States reserve purchases would secure price stability around those ruling before the recent upward movement, for the price at which the American Government acquires its metal is fixed in its agreement with the International Tin Committee. But if a conflagration in the Far East became probable instead of possible, prices would continue to rise sharply.

* * *

Milk Prices

In an effort to prevent a repetition next year of last November's milk shortage the Ministry of Food has announced, well in advance, the prices which it proposes to guarantee to milk producers up to the end of March, 1942. It may be remarked, in parenthesis, that this foresight is more likely to accomplish its purpose if it is accompanied by a corresponding foresight in the matter of rationing cattle-feed; the present coupon muddle is not favourable to milk production. The returns which farmers will receive, in excess of those received in the corresponding months of 1938-39, are shown in the table below. To give some idea what proportionate increase this represents, the actual pool prices for one fairly representative region are also shown. These pool prices are the basic prices from which have to be deducted, in most

cases, charges for transport, and to which may be added premiums for special quality or services:—

		Guaranteed pool prices per gallon Eastern Region	Increase in producers' returns compared with 1938-9
		s. d.	s. d.
April 1941		1 6	5
May		1 2½	4
June		1 2½	4
July		1 4½	4
August		1 5½	5
September		1 5½	5
October		2 0½	10
November		2 3½	1 0
December		2 4½	1 1
January, 1942		2 4½	1 1
February		2 3½	1 0
March		2 0½	10

These increases in producers' margins are based upon a careful forecast of the probable movement of the cost of production, but if at the end of September, 1941, or at the end of March, 1942, the producers claim, through the agency of the Milk Marketing Board and the Farmers' Union, that the average increase in costs for the preceding six months over the costs for the corresponding six months of 1938-9 has exceeded the average increase in producers' returns, the Ministry of Food will review prices and make retrospective adjustment. The marked rise in October, 1941, is accompanied by an appeal to farmers to arrange their calving plans in such a way as to ensure an increase in the supply of milk next winter. If, in addition to guaranteed prices, some definite assurance concerning the supply of feeding stuffs could be forthcoming, this policy should have a good chance of success.

* * *

Mr Middleton in Whitehall

Having frequently urged the necessity for more education of the general public in their duties as war-time citizens, *The Economist* owes acknowledgment to one Ministry which is admirably carrying out its duties in this respect. The Ministry of Agriculture publishes frequently "Growmore Leaflets," which are excellently designed to help small farmers and gardeners, both amateur and professional. A leaflet last autumn on the uses of horse-chestnuts, acorns and beechmast for feeding stock probably taught even experienced farmers something they had not known before, while those published in the last two weeks on home vegetable growing and on tomato raising are models of clear exposition which should give confidence to the most timid beginner. Judging by the popularity of wireless talks on gardening, there is a wide demand for elementary horticultural instruction; the Ministry of Agriculture (which, by the way, pays the leading wireless exponent of the subject the remarkable compliment of alluding to him in another of its publications as "Mister" Middleton, adding in parenthesis that the "Mr" is rather a term of affection than a formal mode of address), is making a very creditable effort to meet that demand.

COMMODITY AND INDUSTRY NEWS

The marked increase in the price of tin during the last week is discussed on page 253; rubber prices have also been firm on increased tension in the Far East. The wheat market has been somewhat weak, and the position on the oilseed and vegetable oil markets shows no particular change. Supplies of eggs appear to be larger and the price has once again been reduced, while the prospect of more onions is favourable. Tea, on the other hand, will be bought in smaller quantities under the new agreement. The implications of the Government's decision to take complete control over cotton imports are discussed on page 240.

Grains.—The wheat market has been weak and North American prices and options remained easy at the beginning of the week, owing to restricted import interest and the uncertain international political situation. Prices were somewhat easier. Supplies of rationed feeding stuffs were inclined to be larger and there was a steady demand for non-controlled commodities. A normal supply of barley

was on offer, though demand was slow, while the light offerings of oatmeal were in demand.

Oils and Oilseeds.—Supplies continue satisfactory, and manufacturing plants are able to count on having war-time requirements met in good volume. The Control is steadily covering immediate and future requirements, principally in the Indian market by purchases of ground nuts, but there is little interest at present in other oilseeds, except perhaps copra. Shipments of Argentine linseed are still making but small impression on the huge exportable surplus which, according to the Argentine Ministry of Agriculture, is now 1,367,000 tons as against 837,000 tons a year ago. Since January 1st, exports have been only 57,000 tons compared with 240,000 tons in the corresponding six weeks of 1940, and have included only 13,000 tons destined for Europe compared with 151,000 tons—evidence of the inability of crushers on the Continent to import

supplies. Argentine shippers have abolished the minimum price for old crop, while in the open market easier prices are recorded for new crop for early shipment when shipping space is available.

Cheaper Eggs.—The Ministry of Food made an Order which came into force on February 17th, reducing wholesale prices by 2s. 6d. per 120 and retail prices by 3d. per dozen, of all categories of home-produced hen and duck eggs; this is the second reduction in a fortnight, the previous Order having come into force on February 3rd. The maximum wholesale price of Category A eggs is now 27s. 6d. per 120, and the retail price 3s. per dozen. These prices are the lowest since last August. Supplies of home produced eggs have improved, and there have been fresh arrivals of Egyptian eggs; small releases of Australian, Argentine and Chinese eggs have been made, and there is a gradual improvement in the supply position.

(Continued on page 262)

COMPANY MEETINGS

BAY HALL TRUST LIMITED

RESULTS MOST SATISFACTORY

The seventh ordinary general meeting of Bay Hall Trust, Limited, was held on the 19th instant, at the company's offices, Princes House, 95 Gresham Street, London, E.C.

Mr Charles J. Hambro (chairman of the company) presided. The chairman, in the course of his remarks, said: Before commenting on the report and accounts for the past year, I should like to pay tribute to the late Viscount Horne of Slamannan, who died, after a sudden illness, on September 3rd last. Viscount Horne became chairman of your company on its inception as a public company in 1936, and held that office up to the day he died. The benefit of his vast experience will be greatly missed at our conference table, and your directors personally mourn the loss of a very dear friend.

You will observe from the profit and loss account that the gross revenue amounted to £109,161. Debenture interest, directors' fees, management expenses and some small items amounted to £34,018, leaving a net profit of £75,143, against £86,433 for 1939. These net profit figures are not strictly comparable. The gross revenue from dividends and interest was practically unchanged, but the 1939 profit included, as you will remember, a sum of £7,471 recovered in respect of arrears of Dominion Tax relief, whereas this year there is a net outgoing for income tax of £2,639. Bearing that in mind, and having regard to the difficulties of the past year, you will, I think, agree with me that the 1940 results are most satisfactory.

PROFIT AND DIVIDEND

The net profit for the year of £75,143, added to £71,567 brought forward, make a total of £146,710 available for appropriation. Your directors have placed £10,000 to the credit of realisation reserve account, against obligatory realisation of some of our dollar securities at a loss under the requisitioning scheme, and they recommend the payment of a dividend of 6½ per cent., which will absorb £65,382. This will leave a balance of £71,328 to be carried forward to new account.

The allowance for Dominion relief amounts to 2s. 11d. in the £, therefore the net income tax to be deducted from this dividend will be at the rate of 5s. 7d. The relief is made up as to 2s. in respect of 1940 and as to 11d. in respect of arrears due to us for previous years. The proposed dividend is therefore equivalent to 7½ per cent., less tax at the standard rate of 8s. 6d.

Turning to the balance-sheet, there is little to report. The issued capital and the nominal amount of debentures outstanding are again unchanged. On the assets side, share and debenture holdings at £1,643,751 are lower by £24,131, largely due to the requisitioning by the Treasury of certain of our U.S.A. investments. The sale price of these investments was, in the aggregate, below our book-cost, and the loss resulting was debited to realisation reserve account.

VALUE OF INVESTMENTS

At market prices on December 31, 1940, or—where no market price existed at that date—at valuations by the directors, the share and debenture holdings and British Government securities had an aggregate value of £1,717,371, compared with their book-cost of £1,786,451. The depreciation represents 3.9 per cent. under cost, compared with an appreciation of 2.3 per cent. for the previous year. In other words, the aggregate value of our investments over the past year shows a decline of 6.2 per cent. Taking into account the acute and diverse international happenings during that period, and the consequent reaction on investment values of all descriptions, there is, I suggest, good cause for satisfaction that the decline is so relatively slight.

The geographical distribution of the investments based on the valuations at December 31st—including British Government securities—showed that about 96 per cent. are situated in the United Kingdom, South Africa, and other parts of the British Empire, and the balance of 4 per cent. are in the United States and elsewhere.

The report and accounts were unanimously adopted, the dividend of 6½ per cent. approved, the retiring directors were re-elected, and the auditors were reappointed.

THE STANDARD TRUST

ORDINARY DIVIDEND MAINTAINED

The thirty-eighth annual general meeting of the Standard Trust, Limited, was held, on the 14th instant, in London.

M. Ian W. W. Shepherd (the chairman), in the course of his speech, said: The gross income of the Trust for the year is £98,840, as compared with £101,741 last year, a small decrease of £2,901. Owing, however, to an increase of £4,345 in taxation, the net revenue is diminished by £6,774, notwithstanding some small savings in the cost of administration. Your directors feel fully justified in recommending that the dividend on the ordinary stock for the year be maintained at 5 per cent.

A valuation of the investments reveals a further decline of approximately 7 per cent., and, as mentioned last year, this depreciation is arrived at without attaching any value to the investments in Germany or German occupied territories, which, since our last general meeting, have been extended to include Norway, Denmark, Holland, Belgium and France.

During the past financial year the Government has requisitioned a large proportion of our American securities to provide additional foreign exchange with which to finance the country's purchases abroad. As a result of this action certain capital profits and, I regret to say certain losses, have had to be realised. Your directors are still actively occupied, as opportunities present themselves, with the reinvestment of these funds with a view to protecting the revenue position so far as this is possible. A further change, evident from these requisitionings, is revealed by the geographical distribution of the investments shown in the report, from which stockholders will have noted that the percentage attributable to Great Britain and the Empire has risen from 60.72 per cent. to 67.01 per cent., while that of the U.S.A. has declined from 14.25 per cent. to 9.97 per cent.

Despite the shrinkage in revenue and the fall in the value of our securities, the results may be considered not unsatisfactory, with which view, I trust, stockholders will agree.

The report and accounts were unanimously adopted.

F. W. WOOLWORTH AND COMPANY, LIMITED

BURDEN OF TAXATION

The thirty-second annual ordinary general meeting of the company was held, on the 14th instant, in London, Mr. W. L. Stephenson (chairman) presiding.

The following are extracts from the review of the year's operations by the chairman, which was taken as read:—

It has been a year of great and increasing difficulty. We have suffered some damage from the enemy and have also lost the services of the majority of our experienced men. The many Orders and Regulations sent out from the various Government Departments have thrown a great strain upon the organisation in order to comply with them both promptly and correctly.

The net profit for the year is £7,953,159. Of this amount taxation takes £4,310,910, dividend to stockholders, both preference and ordinary, will take £2,975,625, building reserve £250,000, benevolent fund £110,000—a total of £7,646,535, leaving the sum of £311,624 to add to the amount to be carried forward.

It will be noted that the total taxes, including income-tax, arising out of the company's operations for the year 1940 amount to over £5,000,000. The Purchase Tax, of course, operated only for a little over two months in the year in question, and then only partially, as all stocks purchased prior to October 21, 1940, were sold without the addition of the Purchase Tax. Should the company, therefore, be able to continue its business as successfully in this year as they have in the past year, it would seem as though something near £10,000,000 will be payable to the State on the year's operation.

It is possible that the increased tempo of the war machine will produce new difficulties and further restrictions of supplies. This is something obviously so much beyond our control that I can only express the hope that there will be as little dislocation as possible.

The report and accounts were unanimously adopted, and a final dividend of 1s. 6d. per unit, less income-tax at 8s. 6d. in the £, on the ordinary stock and a cash bonus of 9d., less income-tax at 8s. 6d. in the £, on the ordinary stock were approved.

OVERSEAS BANK RETURNS

(e) Ordinary and Self-balancing revenue and expenditure. Annual figures are totals for financial year, beginning in year shown. Monthly figures are cumulative. (f) Average of weekly figures. (g) Annual figures for 1929 and 1932. Data do not include District B.

(Continued from page 254)

Onions.—The Government is to purchase, at the price of 25s per ton, all bulb onions in sound and marketable condition grown in holdings of 1 acre or more, by which it is hoped to secure 14,000 acres of onions in 1941. The Ministry of Agriculture is importing seeds from the United States and elsewhere now that most European sources are cut off, and in spite of shipping difficulties it is hoped that adequate supplies will be available in good time for planting.

Dearer Bacon.—Details of higher retail bacon prices are to be issued before they come into force on March 10. It is expected that prices will revert to the level ruling in January 1940.

Tea.—Government purchases of tea for 1941 under the new agreement appear to be less than last season's. Purchases from India are to be 272,000,000 lb., from Ceylon 145,000,000 lb., from East Africa 27,000,000 lb., and from Java and Sumatra 48,000,000 lb. The corresponding figures for last season are higher in the case of India and Ceylon (323,000,000 lb. and 170,000,000 lb. respectively), but the Java and Sumatra figure represents an increase of 20 per cent. Prices show no change, except in the case of the Dutch East Indies, where the price fixed this year is 10d. per lb. f.o.b. Batavia, a rise of 2½d. per lb.

Poultry and Rabbits.—After February 24th importers of poultry and rabbits from Eire will be able to obtain supplies only under an Import Licence, issued by the Board of Trade after approval by the Ministry of Food. Licences will be obtainable only by firms who were regular importers from Eire during 1938, and they must furnish a guarantee to distribute their imports through their normal pre-war channels proportionately to their 1938 distribution.

of factories closed down and labour transferred will be kept and "the Departments concerned will take all measures open to them to assist their speedy reopening."

For this new policy in general there cannot be anything but unqualified, if somewhat impatient, welcome. It should have been made clear from the inception of the policy of limiting supplies that concentration of production was a necessary corollary. The hour is now so late that the task must be accomplished very quickly; the weapon of compulsion cannot be kept in reserve for very long. The President of the Board of Trade and the members of his Industrial and Export Council must steel their hearts to treat delay on the same footing as recalcitrance. Industries must be told that time is of the essence of their contraction.

It is unquestionably appropriate that industries should be given an opportunity of making their own arrangements for concentration before any question of compulsion arises. But the community has a concern not merely with the fact of concentration but also with the methods by which it is brought about. Circumstances should not be allowed to force the weaker firms in an industry to accept concentration on the terms of the stronger. Even apart from these questions of equity within the industry, there are points of general principle that arise. For example, in the majority of cases it would be better for the community if concentration took the form of a temporary pool of financial interests, or even a holding company, rather than that the majority of firms should, for the duration, lose not merely their physical participation in the trade but their financial interest as well. It is to be hoped that the negotiators will be provided with a code of principles to be followed wherever possible. This is not a matter that can be pursued quite haphazard.

Coupled with this general welcome, however, there will naturally be questionings on a number of the details and the implications of such a drastic policy. A whole series of problems revolves round the question of compensation. There is very considerable risk of real or induced confusion on this issue and it is important to get the various elements of the problem clear. It is obvious that an industry which has had its output compulsorily reduced to, say, 25 per cent. of its peacetime output has suffered severe financial damage, and it might well claim that since the necessity for the restriction arises out of the community's actions and cannot in any way be blamed upon the restricted industry, it should receive public assistance in the same way as the wounded, the widows and the orphans of the war. But this financial damage, and the resultant claim for compensation, emerge from the restriction of output, which is already in force. The new policy announced by Mr Lyttelton this week does not restrict output any further; it merely concentrates the existing restricted output. There is no reason, in the typical case, for supposing that the amount of profit accruing to the industry as a whole will be smaller when production is concentrated than when it is scattered. On the contrary, in the majority of cases it will be larger. There is, therefore, in general, no very strong case for compensation arising out of the policy of concentration, though there may be a case arising out of the previous limitation. What is necessary, of course, is to see that the profit made out of the concentrated output shall be equitably distributed among the different constituent units of the industry. Industries will have an opportunity of making their own arrangements for this, but in the typical case the nucleus factory (or factories) chosen to remain in production will, in effect, be trading not for its own account but as agents for the whole industry. Technical difficulties and commercial complications (of which the existence of brands and trade marks are not the least) will necessitate variations from this theme in different industries, but the principle is clear enough. Factories that are closed down can expect to receive a share in the profits of those that stay open; they should not ordinarily expect to receive compensation.

This will not, however, prevent claims for compensa-

tion from being put forward. It would be too much to expect that the effects of the previous limitation and the new concentration will always be rigidly distinguished. Where similar ideas have been put into practice or have reached the stage of detailed discussion—as, for example, in coal and cotton—it has usually been found necessary to include a *douceur* for those who are to be temporarily excluded, and the Board of Trade may well find that countenancing arrangements of the sort may be the price it has to pay for speedy agreement. If so, a warning must be entered from the outset. The financing of compensation to the excluded out of the proceeds of a levy to be added to the price charged to the consumer is an expedient that is indefensible in principle and pernicious in practice. It is a capricious and arbitrary form of regressive taxation. Where extra money has to be found for the payment of compensation and it cannot be taken out of the profits of those who remain in business, it should come from the Exchequer. To insist on this principle will, incidentally, ensure that compensation is paid only where there is genuine necessity for it.

Another set of questions arises out of the effect that the new policy, and its post-war corollaries, will have on the future organization of industry. The war has already very powerfully reinforced the previously existing tendency towards the "combination" of industries. For negotiating with the Government about output quotas or raw material allocations, for forming export groups, and now for devising concentration schemes—for all these purposes industries have been encouraged and compelled to regard themselves more and more as centrally directed and co-ordinated units. The Trade Association is already the governing body of the industry and now it bids fair to be the producing organism as well. All this was in greater or less degree inevitable in time of war, and it would be churlish for anyone who has advocated the mobilisation of industry to cavil at it. But for peacetime purposes the wholesale pooling, co-ordination and cartelisation of industry have severe and obvious disadvantages. The mechanism that has been built up in wartime for restricting production might be used in peacetime for the same purpose, though in a very different context. The latest development in the Government's industrial policy makes it more than ever imperative that the distinction between the requirements of peace and war should be clearly drawn, that the growth of monopoly and cartelisation should be very carefully watched, and that the Government and the public between them should devote a great deal of thought, before it is too late, to the problem of post-war industrial organization.

This necessity is enhanced rather than diminished by the tenor of the Government's proposals for restoring the *status quo*. There is to be a register of displaced firms and the Government are to "take all measures open to them" to assist in the reopening of these firms. These assurances are only reasonable. But what may they be taken to mean after the war? May it not be contended that newcomers in an industry must be kept at bay until every last one of the firms that existed in the industry in 1939 has been restored to production—and even to profitable production? The industries will certainly maintain such a claim and will try to enforce it by every device open to their Trade Associations; they will certainly invoke the assistance of the law, and unless public opinion is much more enlightened on the issues at stake than it has shown itself to be in recent years, the post-war Board of Trade will consider nothing more natural than to establish a *de jure* monopoly for the pre-war firms in these industries just as tight as the *de facto* monopoly which many other industries have already succeeded in establishing. The vista of restriction, of monopoly profits, of the discouragement of enterprise and the support of inefficiency thus opened up is frightening in the extreme. It may be true that there is nothing that can be done about it now—unless it is insistence upon

a rigid time-limit for the exercise of these special post-war favours. But extreme care will be needed immediately the war is over to ensure that those who have had the honour of being mobilised for the community's service do not exercise over the economic life of this country a dominance as restrictive and damaging as that exerted over the political life of other democracies by the "veterans" of their wars.

None of these questionings, however, should detract from the merits of a very substantial advance in the technique of industrial mobilisation. They should not, for example, be held to justify any watering-down

or postponement of plans that are already sufficiently mild and tardy. On the contrary, the next need is to extend a policy which is now proposed for a relatively small group of productive industries to the long list of other non-essential trades. As in every other department of the Government's mobilisation plans, the large service trades are still ignored. Distribution, for example, is much the largest reservoir of labour which, though it may not be "factory-trained," could nevertheless quickly be put to munitions work. The next task for the Board of Trade is to devise a plan for the concentration of retail trade.

Salvation by Ships

THE Commons are to debate shipping in secret, for there is something like a revolt in certain circles against the Admiralty. True, it is not the First Lord, but the Minister of Shipping, who is under fire. No critic would question the proved power of the Navy or the world-wide success of its activities to which Mr Alexander drew attention on Wednesday when introducing the Navy estimates. The President of the Chamber of Shipping paid tribute last week to the "ceaseless ingenuity and tireless work" of the Navy. But the charges Lord Rotherwick made touched matters which are the Admiralty's responsibility. He complained that slow ships had been built by the Government instead of fast ones; and that the best use was not being made of the fast ships there are. Actually, commercial shipbuilding is ordered by a department of the Admiralty; the First Lord disclosed on Wednesday that steps were being taken to give the construction of merchantmen the priority given in earlier crises to aircraft and Army equipment. The convoy and routing arrangements which determine the use of ships at sea, as well as the speed of their arrival in port and their times of sailing, are dependent upon Admiralty decisions. The belief of the shipping industry is that private enterprise could have done the wartime job better than public control; and, in their eyes, it is the Minister of Shipping who represents control. They had no alternative but to accept the policy of requisitioning. But they are dissatisfied with the rates of hire they are receiving; and they are discontented because they are not allowed to use insurance payments for war losses to buy in Government-built vessels. The fear of the industry is that, as the volume of privately owned shipping is reduced by sinkings and the volume of publicly owned shipping expanded by new construction, the basis is being laid for nationalisation. The desire of the shipowners, therefore, is to buy off the menace: to use insurance payments to keep up the strength of their fleets by the purchase of Government vessels; and to be paid sufficient in hire to maintain replacement reserves.

These contentions cannot simply be set aside. The trouble is that, at the moment, they tend to confuse larger considerations of national strategy—and security. It is unlikely that the Government has any intention of nationalising shipping and that the present arrangements represent a Macchiavellian means of doing it. Equally, it would be poor business for the shipowners to purchase these new ships at their present high cost. It is even improbable that they would be prepared to do so—without conditions. The fact that the Government requires a portion of the insurance payments for war losses (all over and above the pre-war value of the ships lost) to be pooled in a replacement fund suggests that the official wish is simply to leave the whole question of post-war shipping policy fluid—including the disposal of the Government fleet. If it would allay the industry's suspicions, the Government might at once make it clear that their object is definitely not to drive private enterprise out of business. The fears of the shipowners are not unnatural. But the demand for a "shipping man" to

run shipping has no more to commend it than any other scheme to insert self-government of an industry into public control. When Lord Rotherwick claims that, if a proportion of wartime building capacity had been set aside for private enterprise, the result would have been a "considerable volume" of faster tonnage, it is difficult to agree. It is true that, owing to the present shortage of escort vessels for convoy work, there is a case for building more ships capable of beating the U-boats by their pace. It is equally true that, as Lord Rotherwick said, it is only now, after eighteen months of war, that attention is being turned to building faster cargo liners. But the reason surely is that the strategic situation at sea has been greatly changed by circumstances which not even the most prescient shipowner could have foreseen when the wartime building programme was devised. When the war started, the Navy was confident that it would provide adequate protection, with Allied aid, for all convoys, and in the first nine months of war its confidence was amply justified. It was perfectly reasonable that plans should be drawn for building ships suited by their capacity and speed for relatively slow trips in well-loaded convoys; and it is very hard indeed to imagine that private shipbuilders would have acted otherwise.

It is arguable, of course, that more foresight might have been shown in the nine months which have elapsed since the fall of France and the defection of the French destroyers. Anti-submarine work by sea and air was outflanked by German bases in Norway and on the Atlantic coast of France, and the problem of protection became harder at the same time as the means of protection became fewer. Even so, no shipowner could deny that the task of altering the character of construction in the shipyards could not have been done suddenly—or without the risk of appreciably reducing output during the transition. While the rate of weekly sinkings was running at several times the rate of building, the chief consideration was inevitably the maximum unbroken flow of new tonnage.

The crux of the matter is the convoy system. The shipowners want faster ships—which would also be more remunerative in post-war trade. The argument is that there are not enough escort vessels, even with the moderately effective aid of fifty over-age American destroyers, to protect an adequate volume of shipments, and that ships in under-protected convoys are simply crowded targets for U-boats, bombers and raiders. Stripped of all questions of industrial interest, the case has much to commend it. It is a question of making the most effective use of the limited naval protection available—and the limitations imposed by growing commitments in the Mediterranean and the Far East are themselves considerable. The alternative policy of sending single ships at full speed along defined "sea lanes" patrolled by destroyers, corvettes and aircraft has been suggested as the best means of making the fullest use of the available means of protection as well as of the merchantmen's own mobility. It would apply the principle of dispersal to shipping.

But these arguments do not by any means clinch the

matter. The fast ships which went unconvoyed across the North and South Atlantic last autumn did not fare too well. A "sea lane" is a tempting target for the enemy as well as a chain of convoys. A vessel engaged to do 17 or even 20 knots, the speed needed to be sure of safety from submarine attack, has correspondingly less space for cargo. Finally, and in a sense most important of all, no revolution in building policy now will affect the issue much in the next few critical months. Britain's trade and American aid must stand or fall in these months by the convoy system, because by far the greater proportion of tonnage is too slow to play "devil take the hindmost" with any security. It may be reasonable to do as the shipowners wish and lay down faster ships. The solvent of difficulties is a full flow of new and suitable ships. But, before these greyhounds come off the stocks, the impending crisis at sea may well have been settled.

It is not easy, then, to make the case against the Admiralty convincing. There may sometimes have been an undue conservatism; but, for the most part, the Navy's record must be allowed to speak for itself. The shipowners have, of course, every right to be heard. They are expert and experienced in their trade. In the detailed working of ships, their voice should carry most weight; and, under requisitioning, they do in fact manage all ships. Their claim that fast vessels should not be used on trips which slower ships could do quite safely is sound. Their complaints about the needlessly long time taken to assemble convoys and then to disperse the component ships to their destinations merit examination—by the Admiralty. The

validity of their protests against the delays at the ports in handling goods and loading and discharging ships has been conceded by Mr Bevin's statement that he hopes that his scheme for reorganising dock labour will speed-up the turn-round of ships by as much as 40 per cent. Their proposal for a special department to be set up—as was done in the last war—to be responsible for repairs raises an extremely important question, because the rate of damage in this war, owing to the advent of the bomber, is high.

The present position is far from comfortable. Lord Chatfield has recently said that, for a short time at least, losses at sea may be alarming in the near future, and by far the greatest danger to these islands is the threat to shipping. It is excellent that there should be critics ready and able to speak their minds about the delays, at sea, in port and in the repair yards, which make loss of time almost as damaging as loss of actual tonnage. But it is important that their criticisms should be accurately drawn and delivered to the right addresses—not only to the Ministry of Shipping, or even the Admiralty, but to the whole governmental gamut involved, to the Ministries of Transport and Labour, to the Railway Executive Committee, to the Import Executive of Ministers which presumably decides the use of shipping space and to the War Cabinet itself. Simply to replace Mr Cross by some shipowner congenial to the industry would not be any remedy. It might only add fuel to the suspicion—possibly an unworthy one—that, in this discussion, shipping reform means security for the industry almost as much as it means salvation for the State.

Vichy's African Colonies

THE "new order" has functioned long enough for the main outlines to be visible through its smoke-screen of propaganda. Its most marked characteristic is a capacity for stripping any country included within it of all its economic wealth and for persuading the unhappy peoples to accept in return Reichsmark, *Reichskreditkassenscheine* or other equally illusory claims on the German Government's final ability—or willingness—to pay. Since, however, the essential nature of *Wehrwirtschaft* is to transform real wealth into armaments, guns or paper money remain in the last analysis all that Germany has to offer.

Nowhere is the inflationary effect of Germany's policy of spoliation more apparent than in France. The industrial areas and the best agricultural land are in occupied France. A Chinese wall separates the Vichy rump from the rest of the country. A high percentage of all the harvests of 1940 was requisitioned—in the case of sugar beet the percentage was 100 per cent. What is bought is paid for either in Reichsmark or in *Kassenscheinmark* fixed at the entirely arbitrary rate of 20 francs to one mark, both currencies representing claims on German supplies which either do not exist or will never be made available.

All this is familiar enough. It is sometimes forgotten that the economic disasters of France were bound to have important repercussions in the French colonies. Algeria and to a lesser extent Tunis have virtually a Customs Union with France, although Morocco, under the terms of the Act of Algeciras, gives equal economic opportunities to all countries. Further afield, a policy of "assimilation," that is again a virtual Customs Union, was applied in 1928 to a number of French colonies, including Madagascar, while French West Africa, like Morocco, was covered by various international agreements safeguarding the Open Door. Even so, the percentages of France's share in her colonies' foreign trade in a normal year were very high. In 1937, she provided 76.6 per cent. of Algeria's imports and took 81.1 per cent. of the exports. For Tunis the figures were 59.9 and 57.2, for Madagascar 73.5 and 77.6, for

Morocco 31.6 and 46.9, for West Africa 44.2 and 78.8. France's trade with her colonies has been, with few exceptions, the normal exchange of an industrialised metropolitan Power with its semi-developed colonial dependencies. Grain, vegetable products, grasses and a limited range of raw materials—including iron ore and pyrites, lead, zinc and phosphates (of which North Africa produces 50 per cent. of the world supplies)—were exchanged for textiles, machinery, fuel oil, coal, cement, tea, sugar and other commodities. In all these France has been the leading market and source of supply. On the whole, the balance between exports to and imports from France has remained fairly steady when allowance is made for the extent of French investment in the Empire. About five milliard francs were invested in Algeria between 1930 and 1935 alone, and total French investments in Morocco have been put as high as 30 milliards.

This situation of interdependence was radically altered by the French collapse last June. The Armistice created the unoccupied zone, which through its Mediterranean ports—above all, Marseilles—was in independent contact with French Africa. Nevertheless, the whole basis of the interchange of goods was destroyed, for France had nothing more to give. Even the industries in occupied France were working short-time or not at all. Economic life in the regions immediately accessible to the colonies—in Vichy France—was barely functioning at all. Nevertheless, goods continued—and still continue—to arrive at Marseilles from Africa. The colonies cannot break off the trading habits of over a decade, especially when there is no obvious alternative market. Yet there is this great difference. The old balance between imports and exports is lost. For the first time, the goods arriving in Marseilles far exceed the cargoes leaving the port. Moreover, there is strong evidence to show that the Germans take a sizeable percentage of any supplies reaching Marseilles.

In other words, trade between France and her colonies is conforming to the general pattern of German Europe. The French colonies are sending foodstuffs,

wine, meat and fats, vegetable oils, phosphates and other materials to France. Of these supplies the major part finds its way either to the markets or the reserve stores of the Reich. A little is left for France, but in either case the problem of payment is shelved. Germany may have permitted a shipload of goods here and there to return to the colonies, but while the balance is, from the colonial standpoint, what is known in usual terminology as "favourable," it is in fact as "favourable" as, for example, Denmark's balance with Germany, and for the same reasons. In return for the steady draining away of all economic resources, the only payment takes the form of mounting franc balances in Vichy France—and a franc balance, thanks to Germany's inflationary policy, is nothing but a nebulous claim on a still more uncertain future.

As for any attempt to bring up the exchange of goods to its old balance, Germany has not the will nor Vichy the capacity to do more for the African dependencies. Even if goods were there—which they are not—traffic problems would almost certainly baffle any serious attempt to satisfy the colonial markets. Both road and rail transport in unoccupied France are hopelessly disorganised.

It is, therefore, not surprising that the North African colonies are already beginning to show distressing symptoms of the "new order" contagion. There are severe local shortages of fuel. Rationing is under discussion. The oil situation is serious. There is, in short, a repetition in Africa of the conditions of privation and discomfort which are the rule in Europe to-day and which must prevail in any territory harnessed to the hungry and sterile German war machine. That the Germans intend this state of tutelage to be permanent is illustrated by the presence in North Africa of German economic "experts" and technicians and persistent rumours that Germany is preparing to buy out French shareholders in North African concerns, a transaction which, thanks to the gross over-valuation of the mark, would amount to virtual expropriation.

If the North Africans are not aware of the extent to which they are being exploited for Germany, it should be the aim of British propaganda to bring home to them the nature of the "new order." The colonies are not under the same intolerable military necessity as the subjugated nations of Europe. The Mediterranean ensures them freedom of movement, and it is not the case that trade with Vichy France—which is to a very great extent trade with Germany—is the only possibility open to them. Both their real political and their real economic interests lie elsewhere.

Great Britain could put an end to the draining away of French Africa's resources through Marseilles. There is a market in this country for the grain and

vegetables and perhaps the wine of Algeria and Tunis, for the great supplies of phosphates from all three North African territories, for Algeria's esparto grass and for the colonies' iron ore, zinc, lead, mercury, and antimony. Unlike France, Britain would be able and, unlike Germany, willing to restore the old exchange of primary products for manufactures and fuel. Even where textiles and machinery and coal and oil could not be directly supplied, payments made in sterling would open overseas markets to the French colonies. Transport difficulties would remain, but the use of the seaways of the world could be guaranteed to those ships of the French merchant fleet which agreed to the new dispensation, British shipping would be saved if products formerly carried from remoter continents could now be obtained from Africa, and American merchantmen would not be entering the prohibited zone if they came to the colonies' Atlantic ports.

The economic possibilities opened up by collaboration with Britain are not vague hopes and generalisations. In the arrangements made by the British and Free French authorities for Equatorial Africa the French in Africa have a working example before them of what can be done. The franc has been stabilized at 176½ francs to the £ sterling and the British Government has made certain advances to cover the colony's immediate requirements. Before the collapse in France Great Britain had already undertaken to buy up one-third of the cocoa supplies, half the coffee, and a number of other products, including timber. The principle has now been extended. The whole of the 1940-41 crop of cocoa in the Cameroons, of cotton in French Equatorial Africa, and of palm kernels in French Congo will be purchased, and in the meantime existing cotton stocks, hides, skins, beeswax, and glue have been bought up. In return essential supplies, including mineral oils, are coming into the colonies and a more comprehensive trade agreement is under negotiation.

What has been done for the relatively poor and undeveloped Free French territories could be extended to cover the more prosperous colonies with even greater effect. The shortages which have already appeared will not grow less. It is not part of Germany's plan to allow her dependencies to enjoy more than a subsistence level, and so long as the French African colonies continue their one-sided trade through Marseilles, their status as Reich dependencies is determined—a ludicrous situation, for, without suffering the military necessity which compels Europe to submit, they are in the ultimate political servitude and very immediate economic disaster when freedom and stable trade can be had for the asking.

Wives and Children

A PROPOSAL by the Bishop of Winchester for the institution of a national system of family allowances was refused by the Government on Wednesday in the House of Lords, on grounds of public expense. The position of large families in poor households under wartime conditions, however, remains a pressing social problem. One way of ensuring that the curtailment of civilian consumption would be fairly and evenly spread among all persons would be universal conscription for service, at fixed scales of money remuneration, together with the issue at fixed prices of a basic family ration. Actually, it has been decided to retain the apparatus of wages and prices, mainly competitively determined; and there is no guarantee either that the reduction of real income will be even approximately equal, or that actual privation will not be felt by those people whose ability to compete in the market for consumption goods is restricted by some wartime factor which reduces their

earning capacity. There are many such factors—the conscription of wage-earners into the armed forces, the disablement of wage-earners through air-raid injuries, the evacuation of women and children, which may add appreciably to the total cost of living of families, the measures adopted to reduce employment in non-essential industries and the conditions of remuneration provided at Government training centres.

In the round, the problem has not been faced. But it has not been possible to blink privation entirely; and the result has been a series of allowances and rates of compensation to counter family hardships. The principles on which these payments are based is difficult to discover; and the wide variations shown in the tables in this article show sufficiently that there is no common measure of compensation or need. In theory, three possible aims might be sought. In the first place, an attempt might be made to maintain pre-war money incomes by making

up, say, the difference between previous earnings and Army pay, leaving the rise that has taken place in prices as a crude way of curtailing consumption. Secondly, all that might be attempted might be to make subsistence possible; sheer need would be the yardstick. Thirdly, and more drastically, a wide system of graduated allowances might be used to bring about equality of money incomes in spite of differences of money wages—a common family ration of expenditure and consumption.

On the whole, in spite of large discrepancies it appears that the authorities have chosen the second way—the mere prevention of destitution. The administration of allowances to wives, adult dependants, and children is in the hands of many different Government departments. The following are the standard weekly allowances for adult dependants of soldiers (also sailors and airmen), trainees, and unemployed.

	Weekly allowance for adult dependant
Soldier	18/-
Government Training Scheme	15/- (30/- if worker is away from home)
Unemployment Benefit (General Scheme)	10/-
Unemployment Assistance	8/-

The soldier's wife may receive up to 24s. in special circumstances and in addition she is allotted 1s. a day from her husband's pay. Under the Government training schemes the worker receives, if he is away from home, a lodging allowance plus 8s., so that he and his wife actually handle 38s. weekly; if he lives at home he is allowed 26s., and the couple receive 41s. to spend. The allowances for soldiers' wives have often been criticised as inadequate—yet they throw into sharp relief the conditions of unemployed workers (whose personal benefit is 20s. per week). Allowances for the dependants of war-victims vary with the kind of injury sustained.

	Wife's Pension allowance
Non-regular aircraftsman (100% disabled)	33/6 5/-
Air-raid victim (100% disabled)	34/2 8/4
Air-raid victim (receiving hospital or other treatment)	25/6 (married) 11/- (unmarried)

Measured by the difference between the allowance for married and unmarried men injured in air-raids, the wife's allowance in the case of victims receiving hospital or other treatment is 14s. 6d. per week; and the outstanding feature of these two tables is the obviously haphazard and discrepant assessment of a wife's needs.

A comparison of children's allowances shows the same surprising discrepancies. The following table gives the allowances for evacuees and the children of soldiers (in this case, the allowances are the same for sailors and airmen), workers in Government training centres, and the unemployed.

ALLOWANCES FOR CHILDREN

	One Child	1st Child of several	2nd Child	3rd Child	4th (and each additional) Child
To host of unaccompanied evacuee (aged under 10)...	10/6	8/6	8/6	8/6	8/6
" (10 to 14)	10/6	10/6	10/6	10/6	10/6
" (14 to 16)	12/6	12/6	12/6	12/6	12/6
Soldier	7/6	7/6	5/6	4/-	4/-
Government trainee	4/-	4/-	4/-	3/-	3/-
Unemployment Benefit (Insurance)	4/-	4/-	4/-	3/-	3/-

The payment for evacuee children is, of course, higher, because it includes overheads which can be presumed to be already covered in the case of children living at home. Allowances for evacuee children, after the first, run at a flat rate for any number. In the other cases, they fall as the number of children to be kept increases. Even here, Service departments differ from the Ministry of Labour in their estimation of the point at which these "economies of large-scale production" begin to have effect. In the allowances for soldiers' children the rate is cut for the

second child and then again for the third, while for the children of trainees and the unemployed there is no reduction until the third child. The explanation probably is that to the Services sex differences do not exist, while the other Departments recognise the possibility that a family may consist of one boy and one girl. It is not easy to understand why the first child of a worker training for munitions production should have to be kept on 3s. 6d. a week less than the child of a man training to fight. And the same really applies to the children of the unemployed, though no doubt the reason here is the principle of "less eligibility," the idea that unemployment must be made less remunerative than the worst-paid work—and it is probable that the notion that training centres are still primarily places for the unemployed, and therefore also committed to "less eligibility," accounts for the other anomaly. The payments made by the Unemployment Assistance Board are different again; they vary according to the age of the child—from 3s. weekly for a child under five years of age to 6s. for a child from 14-16. Allowances are also paid for the children of men killed or disabled on active service, and for the children of air-raid victims, killed or injured.

	1st child	2nd	3rd	4th (and each subsequent child)
Air-raid victims (receiving hospital or other treatment).....	4/-	4/-	3/-	3/-
Air-raid victims* (100% disabled).....	6/3	5/-	5/-	5/-
Airman's pension (100% disabled).....	5/-	3/4	3/4	Nil
Airman's orphans under 16	5/-	5/-	5/-	5/-

* Where wife is still alive.

It is true that a man receiving treatment for an air-raid injury may be expected to return sooner or later to remunerative work. But it still seems unjust to penalise his children, as compared with those of a completely disabled man, during the period of his enforced absence from any work. Again, it is reasonable that orphans should receive slightly higher allowances than other children, because a new home must be found for them; but it is difficult to understand why they should be cheaper to keep than evacuees.

This is only one corner of the field of war-time compensation. But it is a corner affecting literally millions of families. Even on the bare principle of preventing destitution there is no good reason for these anomalies—set as they are in contrast to a background of increasing prices and steadily rising wages and salaries; nor is it a comfortable study to compare some of these "hardship grants" with the minimum sums judged by experts to be necessary for the maintenance of mere health. Apart from fixed charges and other commitments, no family has any right to more than an equal sufficiency; and no family can fairly be given less. Social justice and economic expediency alike would seem to require a nation-wide family ration of expenditure and consumption which would be small enough to reduce total civilian expenditure to the extent war economy demands and large enough to maintain every family in decent fitness.

COMMERCIAL HISTORY OF 1940

The 78th issue of the annual Commercial History will be published as a Supplement to *The Economist* of March 15th. As usual, the Commercial History will provide a concise summary of the economic landmarks of the past year, both in Great Britain and in the world overseas. In particular the Supplement will deal with the change-over from a peace to a war economy in Great Britain.

NOTES OF THE WEEK

The End of Bulgaria

With the entry of German troops on March 2nd, the immediate fate of Bulgaria is no longer interesting. Her King and Government have decided that unconditional surrender to the German invader is the only means of keeping Bulgaria out of war. Britain has broken off relations, and it remains to be seen whether their calculation is correct. It is in the wider sphere both of the Balkan and European war fronts that the consequences of Bulgaria's surrender become significant. In the Balkans, the position of Greece is obviously jeopardised. The Germans are determined to put an end to the daily scandal of Italy's performance in Albania, and they do not do things by halves. Their troops have already occupied the Greco-Bulgarian frontier. An immediate move on Salonika will perhaps be delayed in the hopes that intimidation and not attack will bring the Greeks to "reason." It is possible, too, that Hitler wishes to make absolutely sure of Yugoslavia before launching an offensive. There should be little difficulty here. It is true that the Yugoslavs have forty well-trained divisions, and that the Serb fighting spirit is not negligible. But Germany's move into Bulgaria has placed the Yugoslavs in an impossible strategic position, and there is evidence that as a result of the recent negotiations conducted by the Yugoslav Prime Minister and Foreign Minister in Germany, German war material has already been reaching Bulgaria across the Yugoslav railway system. There is nothing to suggest that Yugoslav official opinion has stiffened since then—rather the contrary. The question of Turkey remains. A direct attack across the Turkish frontier would bring Turkey into the war at once, and Hitler cannot even hope by confining himself to Greece to avoid unpleasant repercussions in Turkey. The nature of the Aegean battle-front makes direct Turkish intervention strategically inadvisable, but in the recent talks at Ankara, Mr. Eden, Sir John Dill and the Turkish authorities reached "complete agreement," and there are more ways, as Egypt has shown, of helping the Allied cause than by immediate intervention.

In the wider sphere of the war in its European aspect, it is extremely likely that the diversion of Germany's resources to the South-East did not feature in the original strategic plan, and that the necessity of forcing a military occupation upon Roumania and then Bulgaria has been to a high degree unwelcome to the German General Staff. Military occupation has brought a strongly worded though entirely unaggressive protest from Russia, whose good will Germany is still at some pains to secure. It has, moreover, drawn Hitler's Balkan back garden and his chief supplies of oil into the war zone at a time when Britain's air strength is growing daily. The necessities of defence in this new vulnerable zone upon Germany's flank has resulted in the transfer of important air units to the East at a time when the great offensive on Britain is—or should be—about to begin. For this general disruption of the German plan, Britain is indebted in the first place to the gallantry of the Greeks, and it is fitting that in the person of Mr. Eden, Britain should be with its ally at this time of new decisions and new dangers. Greece is determined to continue the fight, whatever the odds. It is therefore clearly Britain's duty to give the Greeks every aid in its power, whatever the difficulties. The opportunities for air attack are improving with the spring, and when the Luftwaffe appears over Greece the R.A.F. will doubtless welcome the opportunity of transferring their attentions from an air force so inefficient that in one day 26 planes can be shot down without loss to a far smaller group of attackers and so cowardly that it can send its bombers to punish a city already stricken by earthquake. The question of aid in a more extended form has, doubtless, been fully discussed in Athens. If it is Greece's overwhelming interest to preserve its integrity and independence, Britain's need is equally great to maintain intact its last fighting base on the Continent. Honour and interest coincide in the defence of Greece.

Filibustering While Rome Burns

The "Lease-and-Lend" Bill is still making its slow way through the Senate. It would be a mistake to say that it is being discussed and debated there. Everything that can be said for it has already been said at least five times, and everything, reasonable or unreasonable, that can be said against it has been said at least fifty times over. The opponents number no more than one-third of the Senate at most, but they are not scrupling to delay—and, if they can, by delaying to emasculate—the declared policy, on a matter of the utmost importance and urgency, of the great majority of their countrymen. It is known that while Senators Nye and Clark, Johnson and Vandenberg talk endlessly the ordering of munitions for Britain in America is at a standstill, but this does not influence them. It is not a pretty sight. Nor is it democracy, for while the principles of democracy permit the minority to state its case they should forbid it from obstructing the majority. But it is an object-lesson to all those who, bemused by the benefits of federation, would import into their constitutions the doctrine of the separation of powers.

* * *

Dock Labour

Further evidence that the reluctance of the Government to adopt drastic labour measures is misplaced may be found in the welcome which the Liverpool dockers are extending to the new dock employment scheme. The country has long been clamouring for steps to be taken to accelerate the turn-round of ships at the docks. At last an experimental scheme is to be inaugurated in the north-western region and possibly extended later to the Clyde, from which Mr. Bevin claims—"confesses" seems a more appropriate word—that a 40 per cent. quicker turn-round should be easily obtained. The scheme, which has been worked out by agreement between the Ministry of Transport, the dock employers and the Transport and General Workers' Union, introduces two epoch-making innovations: the direct employment of dock labour by the Ministry of Transport and the abolition of casual labour at the docks. It is voluntary, but men who are unwilling to work under it must surrender their port registration books. It comes into operation at the beginning of the first pay week after March 10th, and every man who accepts work under it must take any employment offered him in connection with the handling of coal or cargo, clearance of debris, fire prevention, or any other work considered necessary for the clearance of the port area, "without stopping to argue or waste time." He is

SKANDINAVISKA BANKEN

guaranteed payment for eleven turns weekly of four hours each, and must, if required, work this amount as a minimum with such additional turns, including Saturday afternoons, as the labour superintendent deems necessary and reasonable. There is additional pay for Sunday work. A system of payment by results will secure remuneration for extra effort. This labour force will be distributed to "approved employers" by the labour superintendent on behalf of the regional port director. Master stevedores, master porters and other "approved employers" will be registered and will have to pay the Minister of Transport each week the gross wages earned by each man, plus a percentage to be credited to the management fund. They must also keep the Minister indemnified in respect of accidents and compensation schemes. They may not make charges in excess of those determined by the Regional Port Director. If the scheme proves successful and is extended, it will constitute one of the major steps in the direction of defeating the blockade and thus of winning the war. If it survives the war, it will mark a very important advance in social organisation.

* * *

Short Sight on Clyde

It is now said that the bulk of the Clydeside dockers may have nothing to do with Mr Bevin's plan to speed-up handling at the ports—though the Minister has said that it is to be extended, with modifications, from Merseyside. There may be good reasons which have not been stated. It may be that the resistance has been exaggerated; and the acceptance of the plan by 600 dockers at Greenock may give a lead to Glasgow's 4,000. But, on the surface, it would seem as if the men of Britain's largest unblitzed port were to show themselves equally oblivious to their own and the country's interests. For generations, British dockers have been under-paid and under-employed. Now, when they are offered a minimum weekly wage of £4 2s. 6d. for 44 hours, whether they work or not, with overtime pay, the Clydesiders, it appears, may refuse—simply because the pressure of work, for the moment, is such that there are plenty of jobs and plenty of pay for all. They claim special rights; and they are said to be unwilling to accept the obligation to work when and where they are asked. Their future, and that of their union, when the present system of casual labour takes on the evil shape of redundancy and only sporadic employment again, are left out of account. They apparently wish to benefit to the full from the national emergency that has dammed up the Clyde with ships in order to work as and when they please; and the aspirations of all dock labour ever since the pioneer days of the eighties are apparently to be flouted. On the other hand, they told the King on Wednesday that they were doing all they could to speed the ships. This may be Mr Bevin's first personal test. Labour troubles have mostly been short-lived during the war because workers' demands have been willingly conceded, but this is one case where, if a dispute were to develop, national well-being—which is wrapped up in ships and cargoes—would require a strong hand from Mr Bevin, in one or the other of his guises.

* * *

The East African Front

In a week of continued successes in East Africa, two operations are probably the key to the next phase. In the campaign in Eritrea, the British column advancing on Keren from the north has captured "an important pass covering the approach" to the Italian stronghold. The natural and man-made defences of the town seem so far to have baffled a frontal assault, but a joint action with an offensive developing in the rear promises an end of the deadlock. In the south, while the cleaning-up of Italian Somaliland continues, new ground has been broken by a British advance inland from Mogadishu towards the frontiers of Abyssinia. While Allied and Patriot activity is developing satisfactorily in the Gojjam area, an advance from the south—where the Italians are already demoralised by the swift collapse in Italian Somaliland—would make the position of the Italian defenders in the north more hazardous, and by opening up the easiest and most straightforward approach to Addis Ababa, catch them in the rear as their comrades

have been caught at Keren. In the meantime, the fact that the problems of administering the vast areas which have passed from Italian sovereignty are growing more urgent is recognised in the announcement that those areas now controlled by Great Britain in East Africa are to be placed under the military jurisdiction of Lieutenant-General A. G. Cunningham, the Commander-in-Chief in East Africa. Although General Cunningham will not be faced immediately with a problem on the scale of the Italian settlers in Libya—where the maintenance of Mussolini's agricultural colonies demands a regular outlay on the part of the occupying Power—his difficulties are fundamentally the same: to keep the peace and to render justice in an area where the rival claims of Italian colonists and native tribesmen are completely incompatible. Given the complexity of the situation, it is good news that Sir Philip Mitchell, the former Governor of Uganda and Chairman of the Governors' Conference for East Africa, has been appointed Political Adviser to Sir Archibald Wavell. Sir Philip Mitchell has an unrivalled experience in colonial administration and has a magnificent record of devoted and intelligent service.

* * *

Settlement in Indo-China

Vichy has given way in Indo-China, but only after the Japanese had applied the extreme threat of further war. The Japanese insisted that "with 12,000 Japanese troops in Tonkin, a large air force at Hanoi, and warships off Southern Indo-China," resistance would have been useless, and the French have complied, accepting terms which are manifestly unjust. Some case could be made out by Thailand for possession of part of Laos to which the Thai people have a long-standing historical claim. The session of part of Cambodia has no justification, and France's final readiness to concede it is a measure of the pressure to which Vichy has been submitted. The French, who claim that Thailand was the aggressor are still demanding compensation. Otherwise, the issue appears to be settled, and one more scene in the Japanese "South Seas" drama is completed. Thailand is cast for the part of grateful puppet, and Indo-China for the cowed neighbour. There is little reason to suppose they will not play their parts. Throughout the negotiation Japan has attempted to pin responsibility for Vichy's hesitations upon the warmonger, Britain, and sensational rumours have been circulated from Tokyo concerning an Anglo-Chinese alliance and Chinese aid to the British forces in Burma. These tales are—perhaps unfortunately—only imaginative inventions, but they do betray Japan's preoccupation with the possibility of Sino-Anglo-American co-operation. China remains, as ever, the main obstacle to Japanese successes in other spheres, and it is perhaps with this and Russian support of China in mind that the Japanese and their able collaborators in Berlin are working for a Russo-Japanese understanding. If the Russians thought that a temporary agreement of this sort would entice Japan further south, they might possibly concur. Signs of weakness on our part can only encourage both Japan and Russia, and in this contest Mr. Menzies' speech on Pacific relations was, perhaps, somewhat ill-timed. No one wishes for unnecessary suspicions in the Far East, but Japan's activities are in all conscience suspicious enough.

* * *

Land Use

It is still not clear where the functions of the Ministry of Works and Building will end and those of the wider Ministry-to-be of Reconstruction begin, or what the relation of either will be to the War Damage Commission. In the House of Lords last week Lord Reith shed some light. His task, it seems, is to go beyond bricks and mortar. It will embrace land. The central theme of his statement, in fact, was the "reconstruction of town and country" to co-ordinate industrial, agricultural and transport development; and it is a sign of the times that he was able to take central planning for granted. For over a generation, the advocates of a controlled system of land use which would provide for decent conditions of life, an efficient industry and a healthy agriculture have been swimming against a tide of ugly and wasteful urban and industrial growth.

They were cranks in garden cities. But time was on their side. Neither in beauty and healthfulness nor in convenience or even economy did towns and industries justify their unfettered progress; and on the eve of the war, the Barlow Commission wrote *finis* to wrong thinking. Depressed areas; congested cities; the destruction of rural wealth and country amenities: by then these were plain enough evils for the Commission to call, with some caution, for the community to do something about them. The war itself added pointed riders. People and industries began to move for safety. Transport creaked. Cities were bombed. Ideas, too, unfroze and the gospel of the cranks was seen to be something strangely like common sense. Lord Reith's first job is to furnish the conditions for building up what has been broken down. The mere allocation of labour and materials for building is a duty that will outlast the war. But, even if hopes are likely to run far beyond achievements, the researches of Lord Reith's Ministry into the redevelopment of Coventry, Bristol and Birmingham and into the rôle of compensation and land values in the process of restoration, based as they are on the conviction that the use of land henceforward will be guided by the State for the people, can put a solid bottom into the reconstructed society which Mr. Greenwood and his satellites, in consultation with other Ministers, are sketching out.

* * *

Protecting Members' Seats

As Mr Churchill had said that a division on the House of Commons Disqualification (Temporary Provisions) Bill would be regarded as a question of confidence in the Government, no division was made, and the Bill has now gone to the House of Lords. A great many members of the House of Commons are still uneasy, however, in spite of the decision to appoint a Select Committee to inquire into the whole problem of offices or places of profit under the Crown, both in normal times and during a war. In the two debates, it was generally agreed that the present position is full of anomalies, not the least of which is that the simple test of remuneration does not apply: a Steward of the Chiltern Hundreds, for instance, is unpaid, but the office is the classic cause of disqualification; members "resign" by accepting it. The two main objections to the Bill are that it might disfranchise constituencies and weaken the House of Commons in its essential function of criticism. But the argument of disfranchisement can hardly carry conviction at a time when Parliament has exceeded its normal span of years, when by-elections are suspended, when new Ministers, who had no expectation of, or wish for, a political career, have to be found seats, and when local grievances and desires must give way before the national interest; and the only reason for fearing any weakening in the power of the Commons to criticise the Executive would be if it were seriously thought that the Government might try to pack the House with nominees and placemen. Actually, as Mr Churchill said, "There never has been a Government which had less need to hire or suborn Members of Parliament to vote for them than this present Administration at this actual time." Any appointments made must, to be covered by the Bill, be in the public interest for the prosecution of the war, and a certificate to that effect must be obtained from the First Lord of the Treasury and laid before the House. There will, therefore, be ample opportunity for Parliament to watch for and condemn abuses.

* * *

Placemen?

The White Paper (Cmd. 6255) giving the extra-mural activities of members of both Houses of Parliament certainly lends no support to the view that assisting the Government in Whitehall precludes criticising the Government in Westminster. It includes Mr D. N. Pritt among the 150 names of members helping the Government in a civil capacity, and no one could say that Mr Pritt's membership of the Colonial Penal Advisory Committee has ever tempted him away from the Opposition lobby. The women members, with the exception of those with Ministerial duties, have been mobilised *en masse* to advise the Minister of Supply on salvage, but Miss Rathbone, to take only one example, voted against the Government after the debate on the *Daily Worker*.

Members on the Advisory Council on Aliens include some who have been most critical of the Government's internment policy. The fact is that at no time, but particularly not in war, will an able back-bencher be content with merely sitting and voting in the House of Commons, and his chances of Government office are slight, especially since the modern tendency is to shuffle Ministers about rather than to drop and replace them. If Parliament is to attract the best men and women, they must have the chance to display their talents, and the practice of employing women members on committees where feminine talent can be given scope, medical members on committees advising the Minister of Health, and business men either in advisory or executive posts in the production Ministries, helps to rectify the balance which is otherwise heavily weighted against the employment of brains. Nor can it be seriously contested that constituencies dislike their representatives to indulge in non-Parliamentary activities. From the earliest days of Parliamentary representation, boroughs tended to return as members persons of importance and quality who could be relied upon to stand up for local rights, and electors now must surely see that their interests are best served if their representatives are, in Mr Churchill's words, "active living personalities."

* * *

The Safety of the Union

The South African Government has struck at the Ox-wagon group. No Government servant, including railway workers, will in future be allowed to belong to this two-year-old organisation of racial extremists. This is not a question of democratic freedom. It was only confirmation of a supposed connection between the Ox-wagon group and the kindred racialism of Nazism that a recent raid on their headquarters discovered Nazi uniforms, arms and explosives; and it is obviously impossible in time of war to tolerate a para-military troop in line with the enemy. The claim of Dr Van Rensburg's followers is that the Ossewabrandwag (Ox-wagon sentinel) is purely cultural. Actually, even apart from its hidden military character, the group is in overt opposition to the war. It was the Ox-wagoners' attitude to recruitment which provoked soldiers on leave to the February riots in Johannesburg; and, although the soldiers were very properly punished for taking the law into their own hands, the impossibility of allowing the Ox-wagon group to continue scheming to take it out of the hands of Parliament and the people was made plainer than ever. Power was taken to deal with subversive associations and unauthorised drillings. The majority of General Smuts's numerous opponents, who also oppose the war, refuse to march with the Ox-wagon, and there will be widespread agreement in the Union that no community can foster within it the seeds of its own disruption.

* * *

War Claims Delay

Having passed the War Damage Bill, the House of Commons might well remind itself that the object of insurance is to obtain an indemnity for loss or damage,

INSURE WITH

7, CHANCERY LANE, LONDON, W.C. 2

and that a policy of insurance, however carefully drafted and beautifully printed, is of little value unless claims are settled promptly and reasonably. It is necessary to emphasise this elementary point because holders of Commodities Part 2 policies have had anything but a satisfactory experience in the handling of their claims. In a number of cases, months have passed even before an assessor called to look at the damaged goods, and the insured could do nothing but stand by the damage and grumble as he waited for the assessor's visit. Thereafter there is often a considerable delay before any payment is made on the assessor's report, and more months go by with the insured out of his money and often seriously embarrassed. What is happening at the Government end all this time nobody knows. The claims are like a river which disappears underground, but will probably come to the surface again in God's good time. There are not enough firms of assessors being employed, and there is no reason why the numbers should not be increased by surveyors not usually engaged on fire claims. There may be a hold up at the Board of Trade after the assessor has reported. There is believed to be a considerable hold up after that at the Treasury. Nor is this a special instance. Claims for ships and cargoes totally lost six months ago are only now being settled. No insurance company could keep going for five years if it treated its fire claims as the Government has been treating these claims for air-raid damage.

Muzzles for the Muses

The British Broadcasting Corporation is noted for the benevolent despotism and self-conscious respectability which are characteristic of an institution which, from small beginnings, has got on in the world. Nevertheless, it comes as a shock to learn that the strict supervision which has hitherto been mainly confined to the manners and morals of the Corporation's own staff has now been extended to the "politics" of its hired performers. The programme of the recent so-called Peace Convention was drawn in sufficiently general terms to attract the signatures of a remarkably diverse collection of possibly generous minded but certainly most indiscriminating people, including a batch of actors, band leaders, musicians, producers and authors who are well known on the stage and over the wireless. The ukase has gone forth. They are not to broadcast again. It will be admitted that the suppression of anti-war activities is necessary in wartime, and it would at once be conceded that the B.B.C., holding as it does a monopoly of the air, would have the right, even the duty, of refusing to permit the broadcasting of anti-war speeches or propaganda. But these are not speakers. Nor, so far as can be ascertained, are they propagandists or active politicians in any way. Over the air, they are performers pure and simple—some of them artists of distinction—and the fact that they may be sadly woolly-minded in their off time hardly seems the concern of the B.B.C. It may well be, of course, that the B.B.C. has not been a free agent in this matter. But, even if official wires have been pulled, the necessity of suppressing speech and opinion in wartime is too unfortunate for petty oppressions to be indulged in when they are neither necessary nor reasonable; and all the B.B.C. has done in this campaign, which began with a stupid ban on the famous if pacific conductor of the Glasgow Orpheus Choir, is to bring the Corporation into line with the self-important private firms and local authorities who have taken upon themselves the privilege of exercising a tyrannical intolerance which the Government itself, on behalf of the community, has expressly repudiated.

The Price War

It has always been the aim of trade associations to make price-cutting a crime. Trade journals and association officials are now pointing out that the war has almost done this by limiting supplies and imposing quotas. The results of the harsher side of war have been twofold. Bombing has driven small price-cutters out of business because of loss of business or stocks. But it has made traffic in stolen goods much easier, so that the one corner in which price-cutting can still flourish is criminal in law as well as in the eyes of "respectable" traders. The *Chemist and Druggist* calls

for constant vigilance, nevertheless, on the part of the Proprietary Articles Trade Association in maintaining prices and margins; and the community will expect equal vigilance by its representatives to see that consumers do not suffer from this commercial clean-up.

Loyalties Again

A Note in *The Economist* last week pointed to the practical problems arising from the fact that the Home Guard is enrolled on a voluntary basis and not enlisted under orders. The same difficulties arise in the case of the Women's Services. The ATS, WRNS, and WAAF are full-time bodies, but, like the Home Guard, the only contractual obligation of their members is to give notice before they leave. They can drift away after expensive training. They cannot be disciplined against their will because they can always resign. In general, there has been surprisingly little wastage; but their position, as auxiliaries to the fighting men, is unsatisfactory and anomalous. It is now being openly discussed by ATS high command whether they should not be enlisted and be placed under military law. Certain medical benefits, open now to serving men, would then accrue to the women; and it would be no more unfair to make the change now than it was to embody the men's territorial and auxiliary services when the war started.

The Statistical Black-Out

The Parliamentary Secretary to the Board of Trade announced in the House of Commons at the end of last week that no further statistics of the overseas trade of the United Kingdom would be published for the duration of the war. The reason given is that even in the attenuated form in which the figures have been issued for the past eighteen months they provide information of value to the enemy. The truth of this must necessarily be accepted. But has the value of the information to the British public also been assessed and a balance struck—or has it been lightly assumed that the only argument for publication is a long-standing tradition of no present value? The services rendered to the common cause by informed public opinion in the economic sphere have been too great and too frequent to require any fresh emphasis. It may well be that more good than harm would be done, on balance, by risking a little benefit to the enemy if thereby the pressure of constructive criticism on the domestic war effort can be maintained. The overseas trade figures have possibly not been the most informative of the scanty series of figures remaining since the outbreak of the war. But the argument that has been used to suppress them could equally be applied to almost every remaining fact and figure. There are already signs of irritation in the Treasury with public discussion of the Budgetary position. Are the Exchequer returns to be the next victim?

Shorter Notes

The capture of Kufra by the Free French was a notable achievement. The attacking forces were few in number and had to face the hardships of a 500-mile desert march on scanty rations. Nevertheless, the few officers with their 100 Senegalese have captured both the fort and about 1,000 prisoners.

Except in special circumstances, 75 per cent. of the advances made by the Government to local authorities, whose income is insufficient, by reason of the war, for their purposes, will be considered as a grant and will not be repayable. The total sum advanced amounts to £362,000. Applications are also under consideration from the 28 Metropolitan boroughs and 5 other authorities. Joint representations have also been received from 9 county boroughs which have suffered severely from air raids.

It has been decided to extend summer time by one hour for three and a half months, from May 3rd to August 9th. This will mean that on the longest day the black-out period in London will not start till 10.57 p.m. and will end at 5.12 the next morning.

THE WORLD OVERSEAS

Unrest in the Netherlands

(By a Dutch Correspondent)

March 3rd

THE decline in the Dutch standard of living continues. Many sources of income have dried up; for instance, the total amount of dividend in various forms, which was put at Fl. 122 millions (about £30 millions) in 1939, was estimated to have fallen to one-third in 1940; and the yield of the most important fishing market, Ymuiden, which was Fl. 6,600,000 in 1939, has amounted to barely Fl. 1,000,000 since the invasion. But the fall in the standard of living finds its sharpest expression in the growing shortage of all kinds of commodities of general use. The consumption of bread has fallen by 15 per cent. and of coffee and tea by no less than 60 per cent. The amount of notes in circulation is still rising, so that there are more and more potential buyers of less and less commodities. Despite an extremely elaborate system of rationing—the bread card alone is almost a yard long—black markets are expanding to such an extent that the Dutch Commissioner for Prices and Wages has had to create five special inspectorates to trace offences. To offset inflation the Germans are trying to "sterilise" the floating purchasing power. The old income tax has been replaced by a new wage tax under which the total amount raised is considerably increased. For instance, unmarried people with a yearly income of £200, who used to pay £10 income tax, have now to pay £15 wage tax. The same figures for married couples with two children are, however, £6 and £3. Unmarried men earning £650 a year, who formerly paid £65 income tax, now pay £150 wage tax. The same figures for married men with two children are £60 and £68. The raising of higher taxes is one means of offsetting inflation. Another is the issue of semi-forced loans. In January a ten-year loan of Fl. 500 millions was issued bearing 4 per cent. interest. If it had not been fully subscribed, a forced 2½ per cent. loan would have been issued.

Traffic conditions have improved but are by no means satisfactory. During the invasion of Holland 1,400 barges were sunk. Some 600 have been repaired, but the severe winter has reduced canal traffic to a minimum, at a moment when traffic by rail is more and more curtailed. The use of petrol for private purposes is strictly forbidden. No further permits are issued for the installation of wood-gas generators in motor cars, as wood and timber are very scarce.

If the situation in the big towns is difficult, the farmers are hardly in a better position. The drastic reduction of the number of poultry from 22 million to 7 million was a severe blow for the small farmer. All farmers alike are heavily hit by the requisitioning of about 25,000 horses. The prices of horticultural products have risen and exports to Germany are on the increase, but the position of the producers has deteriorated, as all State subsidies have been stopped. It is important to note in this respect that the guilders has undergone a further devaluation in recent months, as the Germans have decided to raise Dutch prices to the same level as the German.

Financial and material difficulties hamper the reconstruction of the devastated parts of the country. The plans for the reconstruction of Rotterdam, where more than 70,000 people lost their homes, are not yet complete. The compensation scheme for those who have lost everything they possessed has given rise to grave complaints and much discontent. Only the value for sale on May 9th—the day before the invasion—is compensated. This, to cite only one example, amounts to 27 per cent. of the costs of actual reconstruction in the case of Middelburg, where the Germans destroyed the lovely centre of the city by ruthless air bombardment.

If they had not the hope of a German defeat, the outlook for the Jews would indeed be gloomy. As it is, their

troubles are increasing. Seyss Inquart decided in October that the appointment of Jews to new posts in the civil service was forbidden. In November, all Jews were dismissed from the civil service—it was against this measure that the students of Leyden and Delft went on strike which resulted in the closing of both universities. In December it was forbidden for all persons of German "blood" to render personal services in households of Jews or where Jews were resident. On January 14th a special registration of all Jews was announced, and it is clear that, given sufficient time, the Germans will enforce the ruthless Nuremberg laws upon the Dutch Jews.

The decline of the standard of living and, especially, the growing cultural oppression have only led to an intensification of the hatred against the Germans and the Dutch Nazis, their willing tools. The *Nationaal-Socialistische Beweging* of Ir. Mussert still gets the full support of the Germans in its attempts to beat the stubborn Dutch into submission. The number of N.S.B. organisations is increasing, and they are always exact counterparts of the German ones. Its Agricultural Front is intended as the nucleus of a Dutch *Reichsnährstand*. Furthermore, a Students' Front has been set up. On many recent occasions, Mussert has declared that he would attain power in 1941. It is possible that the Germans will give him the same position as Major Quisling occupies in Norway, but, if so, the Dutch "Führer" will be in the same precarious position as his Norwegian colleague.

Troublesome Subjects

The members of most of the former political parties maintain a completely passive attitude. But even those who think that the occupation does not necessarily entail complete passivity are wholeheartedly anti-N.S.B. This applies in the first place to the Netherlands Union, *de Nederlandsche Unie*, led by the triumvirate—Lint-horst Homan, De Quay and Einthoven. Some months ago, its totalitarian programme was criticised unfavourably in this Correspondence, and it is only fair now to state that the Netherlands Union has developed into a centre of resistance against the Germans and the N.S.B. It has already more than 700,000 members, but its activities are severely curtailed by the Germans. It has not been permitted to form a Youth Organisation of its

own or a Defence Organisation, nor may it organise big meetings, and it is in order to avoid the dissolution of the movement that the triumvirate has been forced to make many verbal and other declarations of loyalty to the German occupier.

In fact, the Dutch are proving more and more troublesome to the Germans. This applies to the 90,000 or more Dutch unemployed who are forced to work in Germany, 5,300 of whom had returned upon their own initiative by December 1st. It applies no less to the people as a whole. More and more people are convicted on the charge of distributing seditious pamphlets, of listening to foreign broadcasts or of "offending" the German people and its "Führer." In December the first two death sentences were announced on a charge of sabotage. When in January three motor cars of the German *Wehrmacht* were "damaged" at The Hague, a fine of £1,000 was imposed upon a few people who were supposed "to have viewed the action with satisfaction." Last week, serious strikes and disturbances occurred in North Holland. Martial law was declared, and the Germans have imposed heavy fines on the cities of Amsterdam, Hilversum and Zaandam.

But the most irritating thing to the German mind must be the stubborn confidence of the Dutch in an early Allied victory. In an extensive report from Holland in the *Essener National Zeitung* (January 6th) the Dutchman was introduced as *Mijnheer Kannietverstaan*, "Mr Cannotunderstand," who still foolishly believes in a British victory. In a speech at Amsterdam on January 18th, Röver, *Gauleiter* of Weser-Ems, warned the Dutch, saying: "Those who still believe in an English victory are completely crazy." On the same day the *Deutsche Zeitung in den Niederlanden* wrote: "We cannot understand what the Dutch are still waiting for. Germany's victory is a question of fact for anyone who has an open eye for realities."

These German utterances indicate the true sentiments of the overwhelming majority of the Dutch people. Indeed, this majority is perhaps apt to a certain over-optimism. It is reliably reported from Holland that people are sure of a complete German defeat in the coming summer. *Radio Orange*, the Dutch Government broadcast, has warned the Dutch that this over-optimism has perhaps been aroused by the Germans themselves, who are hoping to exploit the disappointment when the deliverance of Europe from the Nazi scourge takes rather longer. It is, indeed, one of the greatest difficulties of propaganda to the enslaved countries to ensure as far as possible that the whole people rises in revolt, not at the first, but at the best, opportunity.

Currency War in China

[FROM OUR SHANGHAI CORRESPONDENT]

January 20th

A NEW phase in paper money circulation by puppet regimes in China opened in January, 1941, with the inauguration at Nanking of Wang Ching-wei's Central Reserve Bank, which immediately started another currency war at Shanghai. The new bank embarked upon the issue of Wang dollar notes, printed in Japan, and declared legal tender for the Japanese-occupied areas of Kiangsu, Chekiang and Anhwei Provinces in Central China. The first week's issue of the new notes aggregated W\$6,400,000, and compared but poorly with the Ch\$2,000 millions of genuine Chinese currency circulating in Central China, but it was higher than the maximum issue reached within the twenty months of its existence by Shanghai's Japanese sponsored Hua Hsing dollar notes. In the hinterland of Shanghai, Wang Ching-wei officials and soldiers force the new money, in which they are being paid, upon the population, and Wang dollars are quick to trickle into the Western-administered areas of Shanghai, where the Central Reserve Bank opened a branch office on January 20th. Here at Shanghai Wang money may be used as legal tender in the French Concession Courts taken over by Nanking, and in payment of Customs duties as well as of all taxes, fees and dues exacted by the Nanking regime.

Wang's Central Reserve Bank claims a W\$100 millions paid-up capital, whereof 40 per cent. is in gold and foreign exchange, but in the absence of clear accounting and trustworthy auditing this is not believed in Shanghai banking circles. The Nanking Government decreed that Wang money should rate at par with genuine Chinese

national currency; though the former is not freely convertible at the latter's exchange rate and the Chungking Government has ostracised Wang dollars. The British, American and Chinese banks refuse acceptance of, and the opening of accounts in, Wang dollars, while Chinese exchange firms trade them at a 15 per cent. discount against national currency. Yet Nanking brings strong pressure to bear upon Shanghai Chinese business, and the probabilities are that in the long run the new puppet money will force its way into Shanghai in much the same way as the Peiping F.R.B. puppet currency was forced upon Tientsin. The Chinese National Government has ceased all support of the Shanghai exchange market, and threatens with one or all of three counter-measures—a lowering of Shanghai exchange rates, inconvertibility of Chinese national currency and the issue of new convertible gold notes, and finally the freezing—in co-operation with Washington and London—of all Shanghai balances in Anglo-Saxon banks, with outgoings in foreign exchange to be subjected to a strict permit system.

Counter Attack

Chungking has, in fact, decided to prevent Wang Ching-wei, if not from acquiring with his new money substantial amounts of Chinese national currency, at least from selling the latter against foreign exchange derived from Chungking's reserves. Undoubtedly, the accumulation of foreign exchange at the Chinese national dollar's expense is one of the two chief aims of the Wang paper money issue. The other is the acquisition of easy revenue. Japanese military and business circles for a long time opposed Wang's monetary venture, but Tokyo gave its consent as one of the prices of Wang's signature beneath the treaties between Japan and Nanking of November 30, 1940. However, Wang's note issue has been temporarily limited by Japanese military authorities to a total of W\$300 millions, and is allowed to circulate only in the three Lower Yangtze Valley Provinces. The Japanese military refuse access to Wang dollars in Hankow and all Hupeh, and also maintain throughout the Yangtze Valley the circulation of almost MY500 millions of their military yen, now rating at Ch\$1.60 and constituting another serious obstacle to Wang Ching-wei's currency enterprise.

Influent Japanese military quarters continue to consider Wang's Nanking regime and its note issue as one of Tokyo's unlucky experiments, doomed to failure, and, therefore, are opposed to allowing him a free hand. Wang, on the other hand, attempts to overwhelm Shanghai and thus to qualify for more Japanese support, and for a revocation of the restrictions now imposed on his regime and his bank. In case Chungking should take one of the counter-measures under consideration, Wang threatens with an enforcement of complete foreign trade and exchange control at Shanghai after the North China pattern, a measure anticipated and authorised in the Nanking treaties of November 30th.

Anti-Inflation Policy in Jugoslavia

[BY A CORRESPONDENT]

February 24th

THE Jugoslav National Bank appears to be taking stronger measures for the defence of the dinar. Dr Radosavljevic, who has been appointed Governor of the Bank, was Governor from 1935 to 1939 and only agreed to come back now on condition that a stronger currency policy should be adopted.

Dr Radosavljevic is especially opposed to the heavy and increasing State demands on the National Bank. Before agreeing to accept the governorship again, he had some discussions with the Finance Minister with the object of obtaining guarantees in this respect. A special committee was constituted to deal with this matter. At the same time, the rise in prices is to be checked by a more stringent credit policy. The price control board was recently attached to the newly-created Ministry of Supply, and its chairman, Professor Javanovic, was appointed a member of the board of the National Bank.

It is not yet clear how the Finance Minister will obtain the greatly increased sums required for the army and for munitions, nor whether internal loans can make up for the reduction in the help to be had from the National Bank.

German Europe

Shorter Notices

"Economic Fragments." Essays in Monetary Theory. By D. H. Robertson, P. S. King (London). 234 pages. 11s. 6d. net.

Hermann Goering Reorganisation. — In 1937 the Hermann Goering Works were founded with the relatively small capital of Rm.5 millions. They were intended for the exploitation of low-grade German iron ore after the private industry had refused to bear the risks of high cost production. In 1938 the capital was increased to Rm.400 millions, and an astounding process of expansion into the biggest vertical concern in Germany began. The Austrian Alpine Montan, the Reichswerke Linz, the armament works, Rheinmetall, coal and iron ore mines, building and shipping companies in Czechoslovakia and in Poland were added, when the blast furnaces in Salzgitter began operation in 1939 and 1940. At the end of 1940, the concern had developed into an unwieldy agglomeration of different industries in different countries. The whole complex mass of subsidiaries and requisitioned plants, factories and transport companies has now been reorganised. There is first the holding company, named *Reichswerke H. Goering*, presided over by Goering and managed by Secretary of State Körner. The producing, manufacturing and other companies have been grouped as follows: coal, ore mines and iron and steel works form one group under the name of *Reichswerke für Berg und Hüttenbetriebe*; armaments and machine works; and all the shipping companies chiefly engaged in the Danube shipping. These three groups form the largest German armament concern, employing some 600,000 workers in Germany. Shortly after the reorganisation the Alpine Montan, which formerly belonged to the *Vereinigte Stahlwerke*, the biggest private coal and steel producer in Germany, increased its capital from Rm.40 millions to Rm.180 millions.

Foreign Workers in Agriculture. — At the beginning of the war, the shortage of workers in Germany's agriculture was officially estimated at 700,000. In the middle of January, 1941, the *Reichsarbeitsblatt*, the German Labour Gazette, stated that since the beginning of the war, 1,390,000 foreign workers had been employed in Germany's agriculture. Of these 828,700 are Polish and French prisoners of war, and the rest comprises 469,000 Polish civilians, 47,000 Italians, 32,000 Slovaks and small numbers of Hungarians, Yugoslavs, Dutchmen, and Flemish workers from France and Belgium. Employing prisoners of war is naturally a temporary measure, and is coupled with an intensive training scheme for skilled agricultural workers, especially for the dairy industry. A special scheme has been developed which will ensure that all agricultural workers now serving in the Army will return to their occupation.

Oilseeds in Denmark. — Normally, Denmark consumed roughly 90,000 tons of vegetable oils annually, all imported from overseas. Denmark had a large oil crushing industry with an output of vegetable oils exceeding her consumption. A plan has now been made for cultivating oilseeds on a large scale sufficient to cover Danish home demand. It is planned to cultivate 300,000 hectares with demand. It is planned to cultivate 300,000 hectares with demand. It is planned to cultivate 300,000 hectares with demand. It is planned to cultivate 300,000 hectares with demand.

Coal, Iron and Steel in Belgium. — In October, 1940, the Belgian coal mines reported an output of 2,540,000 tons against 2,230,000 tons in September. In April, 1940, output reached the record figure of 2,990,000 tons. Output per man-shift has hardly changed from September to October. It amounted to 736 kilogrammes, which is considerably lower than in 1939. The number of workers in October, 1940, was 126,521. Pig iron and steel output is still far from normal. Output of pig iron in October, 1940, amounted to 116,300 tons against 255,900 tons in October, 1939. During the first 10 months output of pig iron amounted to 1.5 million tons against 2.5 million in the corresponding period of 1939. The output of steel ingots for the same periods was 1.55 million tons and 2.43 million tons respectively.

THE BUSINESS WORLD

The Stock Exchange in War

IN time of peace, the Stock Exchange performs three or four main functions. It furnishes an apparatus by which savings can be invested in a form attractive to the saver and can be "dissaved" if he desires. It canalises the flow of capital into industry or national or local Government service. This it does directly through the "new issue market" and indirectly through the mechanism it provides for speculation, which is especially valuable in enabling new discoveries and inventions to be commercially developed. And it plays an important part in foreign exchange and the settlement of international indebtedness.

In war-time, the activities of the Stock Exchange in all these departments have been seriously cribbed, cabined and confined. So far as the last-mentioned is concerned, they have, indeed, virtually ceased. Thanks to foreign exchange control, to "trading with the enemy" ordinances, to censorship and postal delays and to shipping risks, London has for the time being practically ceased to be an international market in securities. As for the settlement of Britain's debts to other countries, while for a time the services of the Stock Exchange were available for the sale abroad of American dollar and other overseas securities, on condition that the foreign currency proceeds were placed at the disposal of the British Government, this type of business has now practically come to an end.

The Government, by requisitioning from their owners British holdings of many hundreds of different American and Canadian bonds and shares and itself undertaking their sale, has by-passed the Stock Exchange, though this institution has of course enjoyed the not inconsiderable solatium of being entrusted by the ex-owners of these holdings with the reinvestment of the bulk of the proceeds of the sales. As our great national holdings of dollar securities have now been very largely liquidated, it must be long after the conclusion of peace before any considerable London market in them can be restored.

The other main functions of the Stock Exchange—those concerned with the collection and investment of savings—have of course suffered less catastrophic disturbance from the war. But, even here, the disturbance is far from negligible. Save for Government loans the new issue market has virtually ceased to function. Except with Treasury consent, which is rarely given, new capital issues are forbidden. Even the industrial capital required for essential war purposes is commonly provided through other channels than the Stock Exchange. Moreover, the Government's policy of limiting industrial profits and of generally weighting the scales against investment in ordinary shares has hit the Stock Exchange in its most sensitive spot. With Excess Profits Tax at 100 per cent, industrial ordinaries are reduced, at the best, to the status of non-cumulative fixed interest securities. Shorn of their equity rights and consequently of their speculative attractions, it is small wonder that both the investors' interest and the Stock Exchange turnover in ordinary shares have dwindled to small proportions.

It might be thought that the Stock Exchange would have found compensation in an increased turnover in the gilt-edged market, due to the ever-increasing flow of savings into Government loans raised for the financing of the war. This, however, is not the case. The Stock

Exchange has played its part in stimulating the flow of private savings into successive war loans, but the service of acting as intermediary in the subscription of such loans involves no great volume of work and it must be admitted that the present policy of issuing war loans by the "on tap" method provides less revenue for the Stock Exchange than the old fixed-amount fixed-subscription-period method.

Add to these general considerations militating against an active Stock Exchange, the special deterrents to business which in recent months have resulted from military events in and around these islands—particularly the intensive bombing of our big towns, the serious dislocation of telephone and transport services and their psychological repercussions—and we have a sufficient explanation of the present state of the Stock Exchange, which is that of an institution working at well under 50 per cent. of capacity, with most of its constituent firms either running at a loss or precariously making ends meet.

But enough of this dismal tale. What of the future? Is that any brighter? It is not easy to believe that for the duration of the war it is very bright. Stock Exchange activity is notoriously subject to violent and sudden fluctuations and there should be ups as well as downs in the future. A substantial recovery of turnover might well follow the modification of the 100 per cent. Excess Profits Tax, which many people expect to find a place in the coming Budget. Any step which in a measure restored the traditional attractions of the ordinary share—its equity and its inflation-dodging quality—would obviously stimulate public interest in such shares, even though (as would almost certainly be the case) the relief took a form which precluded any increase in dividend rates during the war.

On the other hand, it seems more than probable that the developments of war finance may in the near future impose fresh restrictions upon Stock Exchange activity. The adoption of anything in the nature of a compulsory savings plan would be almost bound to do so. Savings now invested through the Stock Exchange would automatically pass directly into, and be immobilised in, the Government securities established for the purpose. If, as some experts think, attempts were made on a large scale to evade the incidence of the compulsory saving plan by the selling of existing security holdings, it might even become necessary to introduce a system of permits without which sales of securities on the Stock Exchange would be forbidden. That would add yet further to the spate of forms and formalities, the only major activity the Exchange has enjoyed during the war, and it would threaten to sweep away what remains of profit in the business. It is impossible to foresee to what lengths of financial control we may be driven before the war is over.

Some people might argue that the maintenance of a Stock Exchange at all will be found to be a dispensable luxury. That, however, seems rather an extreme view. Even under war conditions, there are many cases in which serious inconvenience and even hardship would arise were individuals denied all possibility of realising investments. In not a few instances punctual payment of taxes would become impossible, whilst, of course, the closing of the Stock Exchange would necessarily preclude the receipt by the Exchequer in cash form of a large proportion of the £80,000,000 annual revenue from

Death Duties. Traditionally, too, the existence of a freely functioning Stock Exchange is an element in the maintenance of public morale. No excessive weight, no doubt, should be assigned to that argument, but it is nevertheless significant that even the totalitarian powers find it desirable to keep their Bourses working and to encourage the reopening under suitable control of the Bourses in occupied territories.

Let us, at any rate, close on a more hopeful note. The Stock Exchange authorities have found it possible even amid the distractions of war to formulate measures of reform which will go a good long way towards remedying the worst abuses with which the pre-war Stock Exchange could be charged. The cutting of the commission rebates to agents is justified by the war-time increase in costs and makes the scheme palatable to members. But it is not the fundamental feature of the scheme. That consists in the unification of Stock Exchange practice throughout the country, and in particular in the regulations and control of the whole agency system, with a view to eliminating altogether that irresponsible and undesirable element which is so largely to blame for the orgies of uncontrolled speculation, which have been a recurring feature of stock market experience.

With the bringing under control of the Stock Exchange "agent" the way is paved for a tightening up of the qualifications for membership of the Exchanges themselves. The Throgmorton Street authorities have been at pains to emphasise that the new reforms "have

nothing to do with the war," since the discussions which have culminated in them were initiated long before the war. Yet in effect the Stock Exchange is making a commendably early start with its post-war reconstruction.

We do not know what place will be assigned in the post-war economy to the security markets. Their precise scope will depend on many factors, including of course respective weights given to collectivism and private enterprise. Presumably there will for many years be greater economic control from the centre than there was before the war and a greater field of nationally operated enterprise. Presumably there will be a further concentration of industry into large units. If so, there will be less room for speculation on the Stock Exchange than hitherto. That would accord with the current trend of public opinion, which rightly condemns the excesses too frequently witnessed in the past, though one ventures the hope that the object will be rather to curb than to kill speculation, lest the gambler instinct be driven into underground and insanitary channels.

It looks, therefore, as though the post-war Stock Exchange would be an institution in which purely speculative dealings will play a smaller and investment a larger part than heretofore. In view of the predominance of speculative dealings in the past, that probably means a reduced total turnover. It means, too, or should mean, corresponding changes within the organisation, fewer Stock Exchange members and still fewer but larger firms, and a higher standard of professional competence—less quantity and better quality in fact.

Finance and Banking

Back to Abundance

Conditions in the money market have, during the past week, reverted to their former abundance. Although the banks were called upon to pay £20,000,000 in Treasury deposits after an interval of six weeks, these new payments only equalled the amount maturing during the week and, on this score, the bank cash position has been left unaffected. There appears to have been a temporary lull in the transfer of tax moneys, and Government deposits at the Bank of England are down by £2,898,000 over the week to last Wednesday and have fallen to the exceptionally low total of £11,737,000. The shift of funds to bankers' deposits has been further swollen by an increase of £4,114,000 in the total of "other securities." The rise in bankers' deposits for the past week amounts to £3,659,000, carrying their total to the comfortable figure of £125,381,000. The rise in this item would have been greater but for a somewhat unexpected increase of £4,030,000 in the active note circulation. The previous return had shown an increase which was held to represent the greater part of the end-of-month expansion in the circulation. This latest expansion suggests that the secular trend in the note circulation has recently taken a sharp upward turn.

* * *

The Dollar Cost of War

After the confusing array of estimates of British losses of gold and dollar investments since the beginning of the war to which we have recently been served from America, it is refreshing to receive the official data recently presented by Mr Morgenthau to the House of Representatives Foreign Affairs Committee. The following table shows the reduction in the gold and dollar exchange assets of the United Kingdom over the first sixteen months of war. The figures given are those of the British Treasury except for the estimate of private dollar balances which is taken from U.S. Treasury sources:—

	In million dollars	
	Aug. 31, 1939	Dec. 31, 1940
Gold	2,038	292
Official dollar balances	50	54
Private dollar balances	545	305
Marketable U.S. securities	950	616
Direct and miscellaneous investments in U.S.	900	900
Total gold and dollar exchange assets	4,483	2,167

How this net loss of \$2,316 millions has occurred is shown in great detail in a table compiled by the U.S.

Treasury, the Department of Commerce and the Federal Reserve Board on the basis of figures supplied by the British Treasury. This table, given in somewhat abbreviated form, is as follows:—

	In million U.S. dollars
GOLD AND DOLLAR EXPENDITURE	
Payments to U.S. by U.K. on Government account	1,380
For private merchandise imports, shipping, etc.	902
Payments to U.S. by Empire countries other than U.K. and Canada	483
Payments by Empire excluding Canada to countries other than U.S. but requiring dollars or gold	775
Withdrawal of capital	735
Miscellaneous	71
Total gold and dollar requirements	4,346
GOLD AND DOLLAR RECEIPTS	
Receipts from U.S. by U.K. for merchandise, freights, etc.	345
Receipts from U.S. by Empire countries excluding U.K. and Canada	670
Dollar receipts from Empire countries excluding Canada from areas outside U.S.	50
Receipts from sale of Empire gold (new production and disharding)	965
Total gold and dollar receipts by Empire countries excluding Canada	2,030
Total drain of gold and dollar resources of British Empire excluding Canada	2,316

To complete the picture, the following details should be given of the gold and dollar transactions over the same sixteen months period between Canada and Newfoundland on the one hand and the rest of the Empire on the other:—

	In million U.S. dollars
Payments to Canada by other Empire countries	930
Receipts from Canada on merchandise and invisible account	375
British Empire deficit with Canada	555
Canadian repatriation of British held securities	330
Gold payments by British Empire countries to Canada	225

These tables show what a painful reality lies in the fact that Canada is in the dollar and not in the sterling area. Our losses of gold and securities to Canada during these sixteen months were nearly one-quarter of our corresponding losses to the United States. The figures relating to our accounts with the United States are conservatively drawn, since the Governmental payments include an

item of \$570 millions in respect of goods not yet delivered. Another item of \$150 millions is in respect of capital assistance to American firms, and should not, therefore, be classed with payments for merchandise imports. The "capital" item in the outgoings includes a sum of \$300 millions withdrawn by Americans and others from sterling countries through the sale of free sterling to American importers. This is the first official estimate we have had of the turnover of the free sterling-dollar market during the whole of its existence. It confirms the impression always held that at no time can the turnover in this market have approached the volume of transactions in the official market, though in retrospect the breach in our gold and dollar resources caused by the overlong tolerated existence of the free market must none the less be deemed regrettably large.

Record Treasury Bill Applications

Last week's tender for Treasury bills saw the applications at the highest figure ever recorded—£160,470,000. The applications three months previously also reached the exceptionally high level of £152,230,000, a figure surpassed only by last week's total. It is therefore evident that heavy maturities of Treasury bills held in semi-official quarters have just been renewed. Faced with this keen competition for bills—a competition which cannot be beaten, since these sterling area holdings of Treasury bills must be renewed regardless of the rate earned on them—the market syndicate had to be content with an allotment of only 15 per cent. of its quota, the lowest figure recorded for over a year. The growth in the competition of sterling area funds for investment in Treasury bills over the past year may be roughly measured by the reduced allotments of bills to this discount market. Taking the syndicate quota of £65,000,000 and applying to it the allotment obtained in each of the past thirteen weeks, the total of Treasury bills now outstanding and originally obtained by the discount market at the weekly tender is about £251,000,000. At the corresponding time of last year the comparable figure was £372,000,000. It may be assumed that over the intervening twelve months the applications for Treasury bills from London banks and firms outside the discount market syndicate (the "outside" applicants) have fallen appreciably. The applications from sterling area central banks and currency authorities are, therefore, responsible for more than the falling off in bills allotted to the discount market. The position, from the point of view of the market syndicate, will be appreciably relieved after March 24 next, when £90,000,000 of Indian Reserve Bank funds, which are presumably invested in Treasury bills at present, will have to be withdrawn from the market in order to pay for the India Government stocks covered by the recent vesting order. So considerable a cut in the floating supply of sterling funds seeking short term investments should react appreciably on the allotments of Treasury bills to the discount market proper.

Chinese Exchange Precautions

News received from Chungking this week suggests that the centre of the Chinese Stabilisation Fund's operations may be shifted from Shanghai to the new inland capital of the Chinese Republic. To Western minds, the move seems to have been long overdue. Admittedly the Oriental subtlety, which can still regard the Sino-Japanese war as an "incident" and which has contrived some kind of working arrangement between the occupying Japanese authorities and the Chinese Customs, has hitherto taken in its stride the minor feat of conducting the operations of the Chinese Government's Stabilisation Fund from a Japanese controlled centre. But the difficulties of this particular arrangement have recently multiplied, partly owing to the inauguration of Wang Ching-wei's currency last January (described in an article from our Shanghai Correspondent on page 308), while the threat of hostile developments in the Pacific obviously counselled the wisdom of shifting part of the Stabilisation Fund's operations to Chungking. In this centre, the Central Bank of China, which acts as one of the agents of the Stabilisation Fund, will now buy and sell foreign exchange both at the official rate (for Government business) and at market rates. The headquarters of the Stabilisation Fund committee will remain

at Hongkong, but it will now have Chungking as well as Shanghai and Hongkong as one of its alternative centres of operation. The open market rate remains steady at around 3½d.

Dearer Mail Transfers to South Africa

From the beginning of this week the buying rate in London for bills on South Africa payable at sight was raised from £101 5s. 6d. to £101 8s. per £100 (South African). The basic telegraphic transfer rate remains unchanged at £101, and the latest alteration in the mail transfer rate has only been made to correspond with the longer average time now taken by mails between the two countries. The widening of the margin between the T.T. and the sight rate is merely intended to cover the interest on the additional period during which the buying bank in London will be out of its money. The balance of payments between South Africa and the United Kingdom appears on the external evidence of the Reserve Bank of South Africa's sterling assets, to be running against the Union—a surprising movement if we take into consideration the sales of South African gold which are now made direct to the Bank of England acting for the Treasury. The Reserve Bank's sterling assets stood at £7,096,000 on the outbreak of the war, and rose to a peak of £8,995,000 last summer. They were then depleted by the redemption of the £7,900,000 sterling loan last July. But the declining trend of these figures has continued persistently, and the latest return available, dated January 17th, shows sterling assets of £502,848 only.

Repatriating South African Capital

It is difficult to reconcile this movement with the fact that we are purchasing the bulk of South Africa's gold production, which is now running at the rate of about £110,000,000 a year. One important factor in the balance of payments between this country and the Dominion is the persistent repatriation to South Africa of South African gold mining shares previously held by British investors. The arbitrage in Kaffir shares between London and the Cape has for many months past been of a "one way" character, and, apart from these open market transactions, a considerable transfer of capital between the two centres appears to have been effected on the initiative of the gold mining finance houses. From the point of view of South Africa it is certainly good business to buy out the British capital invested in her gold mines from the proceeds of her sales of gold to the British Treasury. But it is doubtful if this factor alone can account for the dwindling of the Reserve Bank's sterling assets in the face of the substantial sales of gold—to say nothing of diamonds, wool, and other produce—which have been made by the Union. Part, at least, of the gold operations may be settled through direct inter-Governmental accounts which are not reflected in the Reserve Bank's figures.

India's Sterling Reserves

The Finance Member of the Government of India referred, in the course of his recent budget speech, to the impending utilisation of accumulated sterling reserves to repatriate the £90,000,000 of sterling debt covered by the last Vesting Order. He pointed out that the operation would reduce the Government's overseas obligations to the extent of well over £3,000,000 annually. Its completion, he said, would still leave the sterling reserves of the Government in the neighbourhood of £60,000,000, a figure almost exactly the average maintained during the last full pre-war year. The Finance Member showed by this estimate that an appreciable part of the Indian sterling securities which have now been vested have already been repatriated as a result of the plans made last year to issue the rupee counterpart of any India Government sterling security. The latest Reserve Bank of India return, dated February 21st, shows balances abroad and sterling securities held in the Issue and Banking departments at the equivalent of £43,100,000. It is evident, therefore, that the sterling to be disbursed by the Indian Government in respect of the securities to be repatriated will be some £7,000,000 less than the nominal amount of these issues now outstanding.

Investment

Rationalisation by Decree

The Government's decision to concentrate production in a smaller number of factories working full time, instead of in a larger number running at part capacity, is a move in the right direction which is long overdue. Its object is primarily to free labour for the war effort, and, as it is an essential step to this end, it must be accepted by the investor, however unfortunate or inequitable its results may be. That they will be inequitable is certain, for one of the principal criteria in deciding whether a company shall work or close will be the state of labour supply in its district. For investors in general, that must be taken as a "bull" point since it increases our war potential, but at the moment it does little more than substitute one set of uncertainties for another. Except for the expert, it is very difficult to say, outside a few obvious leaders, what firms will close down, nor is it clear when, or how much, compensation will be payable. Beyond the fact that direct Government subsidy is excluded, everything is fluid and will remain so until each industry has made its arrangements. It cannot even be assumed with certainty that the total net profit available from any industry will be increased by the measure, and a ruling as to the application of E.P.T. will be an essential factor in determining what part of profit is retained for compensation to the unfortunate and remuneration of shareholders in the concerns which continue to operate. The immediate effect on share prices has been slight, partly because the move has been discounted by the selective buying whose start was mentioned in *The Economist* of January 25th. It seems certain, however, that, until the outlook clears, equities are likely to be rather depressed, outside the restricted circle of obvious leaders, who, themselves, may not altogether escape.

Selective Recession

As compared with a year before, when almost every class of security, fixed interest and equity alike, was rising rapidly, the month just ended has made a rather poor showing. There is, however, nothing in the very moderate recession in prices, which it brought to most securities, to cause surprise, still less despondency. The chart of weekly averages of *The Financial News* indices, appearing below, presents in fact a more "normal"

FIXED-INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935 = 100)
Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

appearance in the past few months than the rather exaggerated movements of the first year of war. It was suggested in *The Economist* as long ago as November 23rd that stock markets were entering a new phase; that the effects of changes in national policy with regard to the supply of materials and labour would henceforth be more important, and that E.P.T., while it might in some cases cushion the effect of falling earn-

ings upon dividends would tend increasingly to cut into net figures. The implication was that any future rises would be highly selective, except in so far as they were merely a reaction to a fall in the real rate of interest. Since then, the yield on 2½ per cent. Consols has fallen from 3.31 to 3.25 per cent. and that on industrial equities from 6.69 to 6.40 per cent. according to *The Actuaries' Investment Index*. The rise in the past month in the latter figure is from 6.26, not a very substantial response to the spread of war, the now chronic uncertainty as to the policy of the men of Vichy, and the many doubts as to what the next few months will bring in new imposts and restrictions on industry.

Cautious Reinvestment

Actually, the proportion of the month's decline which can properly be attributed to these causes is relatively small. The aggregate loss in value is somewhat over 4 per cent., according to *The Financial News*, and rather under 3½ per cent., if *The Actuaries' figure* is taken. The details of the latter show that over half the decline is due to sharp setbacks in cotton shares, and in gas and railway stocks. These three items account for some 10 per cent. of the total index, and they have

fallen by about that percentage. More moderate declines in bank and insurance shares are only partially offset by a rise in investment trust equities, which, after the customary time lag, are now entering on a period of improvement, the rise being shared by the debenture stocks of the group. Other changes are small in amount, but it is worth noting that both home corporations and industrial preferences have appreciated against the trend of gilt-edged, thus further reducing the yield

TYPEWRITERS FOR NATIONAL SERVICE

H.M. Stationery Office ask all owners of typewriters to offer for purchase any which they can spare. These are urgently required for work of National importance. Offers of machines not more than 15 years old and in good working order should be made at once to:—

THE DIRECTOR OF SUPPLIES (S3E),
H.M. Stationery Office, Princes Street, S.W.1.
State name of maker, model and whether you wish to sell or loan.

margins. Incidentally, the first-class corporations, covered by this index, are now well above the levels of a year ago, while miscellaneous industrial debentures and preference shares are on the point of making good the falls of the spring. All these changes have special explanations which have much more to do with the general development of Government policy than with events on any battle front. Since these developments appear to be on the lines of securing a real increase in our war effort, it must be assumed that, however unfortunate for certain classes of share, they are good for investors as a whole. This supposition finds some reflection in the fact that it remains very difficult to buy any considerable amount of stock without forcing up the price. Holders of the recently vested dollar stocks are investing the proceeds very slowly. Whether the private individuals, who must hold a substantial part of the India loans, to be paid off in a fortnight's time, will be equally patient is doubtful, but these will, probably, look to a mixture of gilt-edged and second-line fixed-interest stocks for replacement, thus affording little support to equities.

* * *

Broker and Client

The proposals for Stock Exchange reform, commented on in *The Economist* of February 15, have been given a sufficiently good reception to encourage the publication of a scheme, whose adoption *in toto* would have very important effects. This is for the concentration of all settlement and accounting in a special department of the London Exchange, leaving the broker free to act solely as an expert in investment. It would, when in full operation, result in very material saving, to be used either to reduce commissions or to improve service. It would, however, also mean that all communications to the client, apart from the giving of advice and the taking of orders, would come, not from his broker, but from an unknown official, who would, by definition, deal with many more individuals than the broker, and who would find it difficult, to say the least, to keep track of the very special requirements of individual clients. It may be said at once that this scheme, in its fullest form, is far from having secured official sanction. It will require a good deal of education of clients—and indeed of brokers—before it can become acceptable, or even workable. The scheme was first put forward for use in the event of an emergency and some of its provisions would be useful in such a context. Some will also fit in well with the famine of suitable employees, which threatens to become acute. This may well expedite the adoption of changes on the lines of those of the past two decades which, unnoticed by the investor, have helped to prevent a rise in charges, but it is very doubtful whether anything like the full advantages of even a partial centralisation of accounting could be reaped in war-time, when the substitution of machines for ledger clerks might well prove impossible. Such changes need call for no real sacrifice by investors, but they would be facilitated by a greater attention to detail in giving orders. There is plenty of room for improvement in the brokers' service, but progress entails the co-operation of both company managements and clients.

Company Notes

Courtaulds' Preliminary

Courtaulds' preliminary statement for 1940 shows a further encouraging advance from the setback of 1938. Net profits, after depreciation and fees, but before taxation, have risen from £2,572,512 to £3,291,392. An increase in tax liability, which is up from £991,257 to £1,764,808, has more than kept pace with higher revenue and, with a net payment of £230,000 on preference capital, the surplus for ordinary stock is reduced from £1,321,255 to £1,296,584. This sum, however, represents an increase in the earned rate from 8.2 to 9.4 per cent. The allocation to contingencies is increased from £161,939 to £185,737 and the carry forward is slightly higher at £323,007, against £316,160. Detailed comment must wait upon the issue of the report, especially on the treatment of Continental investments, but it is clear that, taxation apart, the rise in costs has been rigidly controlled by the company during the past year, and that output has very substantially increased. In the current year, much

will depend upon the extent to which communication with the company's export markets can be ensured and on Government policy regarding its investments in the United States. The company's scientific staff is actively

pursuing the production possibilities of new types of fabric, and it is possible that further significant strides will be made away from dependence on cotton and woollen textiles. At 27s. 10½d. ex dividend, the £1 ordinary stock yields £5 14s. 9d. per cent.

* * *

Electricity Supply

It is to be expected that provincial and home counties electric supply companies will have made a relatively better showing during the past year than those situated in London, where both evacuation and bomb damage have affected revenue. In fact, no very marked contrast is provided by the accounts of *City of London Electric Lighting* and *Midland Counties Electric Supply*, both of which present their reports for the calendar year 1940. Gross revenue of the former company from sales of current declined from £870,579 to £856,377; while receipts of the latter from subsidiaries, including traction companies, fell from £396,976 to £365,400. With a moderate increase in both cases in generating and management costs, net profits of *City of London* amount to £77,079 against £103,759, and, after reducing the total ordinary dividend from 7½ to 7 per cent., and meeting 1 per cent. of this payment from reserve, the carry-forward declined from £106,010 to £100,289. *Midland Counties Electric* sustained a setback in equity surplus only from £228,627 to £212,342, which, grossed up at the higher standard rate of tax, is equivalent to a rate of 12.3 against 11.7 per cent. Thus, the 8 per cent. ordinary dividend, which is maintained, is amply covered and, after allocating £70,000 against £71,435 to reserve, the carry-forward is raised from £16,854 to £20,696. The stability of earnings maintained by both concerns during war is a good omen for further progress of the electric supply industry when peace is restored. The market distinguishes sharply between their prospects, however, for *Midland Counties* £1 ordinary stock, at 88s. 6d. ex dividend, yields £4 15s. 5d. per cent., while *City of London* £1 ordinary stock is quoted ex dividend at par.

* * *

The Barker Group

After the dismal results forecast and realised so far by the leading London department stores, the decision of *John Barker* to maintain the ordinary dividend at the 10 per cent. paid in the previous year must be doubly welcome to shareholders. The net profits figure provided in the preliminary statement does, of course, show a sharp reduction from £306,664 to £196,897. After meeting the usual allocation of £10,000 to staff funds and the service on preference capital, the surplus for ordinary dividend is, consequently, reduced from £250,489 to an estimated £140,722. In 1939-40, however, the 10 per cent. dividend was covered by an earned rate of 29.4 per cent., and, after the decline of the past year, a rate of 14.7 per cent. still provides an adequate margin. After reserving £30,000 for general purposes, the carry-forward is almost unchanged at £205,823. Since building has ceased, no allocation is made to reserve for rebuilding of premises against £100,000 in the previous year. But for this a drastic cut in dividend would have been probable. To some extent, no doubt, the Kensington High Street

shops profited last year from loss of business by Oxford Street stores, and their immunity from bomb damage has permitted the maintenance of reserves. It is also possible that the very high level of stocks a year ago played its part in the result. Despite the relatively satisfactory revenue earned last year, it is clear that income must be increasingly affected by limitation of supplies and by rising taxation. So far, the company has been able to adapt itself readily to changing conditions, and the £1 ordinary shares, at 27s. 6d., offer the satisfactory yield of £7 5s. 5d. per cent.

* * *

Two Oil Reports

Since the outbreak of war, the accounts of oil companies have tended to appear increasingly late, and it is, therefore, scarcely surprising to find that, of the two latest reports, that of *Anglo-Ecuadorian Oilfields* relates to the year ending June 30, 1940, and that of *Canadian Eagle Oil* to the calendar year 1939. *Anglo-Ecuadorian* enjoyed a satisfactory rise in net trading income, after United Kingdom taxation, from £274,450 to £341,847 and in total income from £297,201 to £362,057, thus reversing the declining trend of the three previous years. Moreover, the figure for net operating income is struck after deduction of £40,000 for contingencies. The equity surplus, at £215,456 against £170,141, an increase from 12.1 to 17.6 per cent., provides generous cover for the 10 per cent. dividend, and, after the allocation of £50,000 to general reserve, the carry-forward is still £15,456 higher at £112,504. The most important balance-sheet changes at the end of June last were reductions in debtors and in cash holdings, the funds released helping to raise investments in British and Dominion Government securities by nearly £100,000 to £615,825. The *Canadian Eagle* accounts for 1939 show a fall in income from dividends of some £158,257 to £521,135. Of the decline, £105,000 is represented by deduction of British income tax. The net fall in total income is less severe, since a modest profit has been made from oil trading operations, due mainly to *Canadian Eagle* control of the crude output of certain Venezuelan oilfields. Thus, gross income amounts to £553,705 against £611,413, and the free surplus shows a decline only from £403,245 to £374,164, thanks to a redistribution of management expenses within the group. The ordinary shareholders receive 6d. a share, as in the two previous years, and the carry-forward is raised from £425,210 to £436,140. Substantially lower oil stocks and higher debtors in the balance sheet are accounted for by sales of *Eagle Oil* and *Shipping* oil stocks, in the United Kingdom at the

outbreak of war, to the Petroleum Board. The proceeds of this sale have been placed to reserve to provide for repurchase on the liquidation of the Board. The exploration work of the company in South America has been considerably reduced since the outbreak of war, and the purchase and sale of oil agreements between *Eagle Oil* and *Shipping* and *Mexican Eagle Oil* remain in abeyance pending the release of the properties of the latter company by the Mexican Government. The *Anglo-Ecuadorian* £1 ordinary stock, at 19s., yields £10 10s. 6d. per cent., while *Canadian Eagle* ordinary shares of no par value stand at 8s. 10½d., returning £5 13s. 2d.

* * *

United Serdang Recovery

A considerable improvement is shown by United Serdang earnings for the year to August 31, 1940, which, before taxation, have risen from £179,161 to £344,026. After allocation of £30,000, against £35,000, for taxation reserve and of £25,000, against nil, for estate depreciation, the equity surplus shows an increase from £71,193 to £131,108, and the ordinary dividend is raised from 5 to 9 per cent., the level distributed in 1937-38.

	Years ended August 31.		
	1938	1939	1940
Profits	£ 226,082	£ 179,161	£ 344,026

Estate and plant deprecn.	43,666	24,812	35,490
Tax reserve and N.D.C.	30,500	43,500	39,000
Ordinary stock:—			
Earned	129,715	71,193	131,108
Paid	128,095	71,164	128,095
Earned %	9.2	5.0	9.9
Paid %	9	5	9
Carry forward	94,544	94,574	97,587

The better trading results of the past year are mainly due, as is pointed out by the chairman, Mr. H. Eric Miller, in his speech circulated with the report, to the higher exportable crop of rubber and to the improvement in the average net sale price from 8.73d. to 10.49d. per lb. The company is, of course, hampered by scarcity of shipping space and by loss of continental markets, in particular for palm oil. Despite increasing taxation, a reasonable margin of profit should be assured, at least while the prosecution of the war continues to necessitate a high rate of rubber absorption. The liquidation of stocks in the post-war world must depend upon future agreement between the Rubber Reserve Company and the International Rubber Regulation Committee. United Serdang 2s. ordinary stock, at 1s. 11d., yields £9 7s. 5d. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

DESPITE disquieting news from the Balkans and the announcement that unessential factories at home are to be closed down, markets showed considerable resistance, both before the week-end and during the past week. This has been particularly true of the gilt-edged market. Among industrial equities, all sections suffered a number of small losses, and business was on a very modest scale. Commodity markets were also quiet, and the oil market showed some weakness on account of its geographical interest in Balkan developments.

*

Price changes have been few in the gilt-edged market, which showed great firmness in face of various alarms. In fact, 2½ per cent. Consols gained ½ on both the first two days of the week, and Local Loans also improved by the same amount. There was support for 4 per cent. Funding on Tuesday, and Indian issues were steadily in demand. In the foreign bond market, pessimistic trade forecasts continued to cause depression in Brazilian bonds, while on Monday Japanese issues were mainly 1 point lower. Later in the week this loss was partially made good. Belgian 4½ per cent. bonds were sold, easing 1½ points

on Tuesday, but there was considerable interest in Austrian 4½ per cent. and Czech 8 per cent. loans.

*

Selling of home rail stocks continued to be the rule. A number of preference issues were quoted lower, but the brunt of the movement was taken by the junior issues. Thus, Great Western ordinary lost ½ point on Monday, followed by ½ point the next day, while Southern preferred shed 1 point, followed by ½ point. Among foreign rails, Canadian Pacific ordinary moved uncertainly.

*

The conspicuous feature of the industrial market was the small amount of business passing. Price movements on the whole tended downward, but no very marked movement took place in response to the Board of Trade announcement of an active policy for closing down unessential works. Despite the fact that few market leaders can be directly affected, uncertainty as to the implications of the scheme, especially in respect of compensation, led to falls in such important issues as Courtaulds, which had been buoyant on the profits figures, B.A.'s., Guinness, and Woolworths. Before the announcement, the tobacco leaders showed a general weakness, and the textile group, excepting Courtaulds, was de-

pressed. Shipping and electrical supply shares were in demand, but, among general industrials, such leading issues as I.C.I., Dunlops and Lever and Unilever were sold in a small way.

*

In the kaffir market, the tone was firm, despite a paucity of business and a few notable declines. West Wit Areas lost ground on balance, and losses were sustained by Sub Nigel, "Sallies" and Grootvlei. The loss of ½ by Crown Mines, before the week-end, was made good during the current week. Other mining markets remained quietly firm, though Rhokana, among copper companies, eased ½ on Tuesday. There was

Industry and Trade

Cotton Industry's Problems

The affairs of the cotton industry throw an interesting sidelight on the problems raised by the proposals for concentrating production announced this week by the President of the Board of Trade. Some three weeks ago the Cotton Controller warned the spinning and manufacturing employers and the trade unions concerned that owing to the heavy demands on shipping the amount of raw cotton available during the next few months would have to be severely reduced, and he suggested that the representatives of the industry should formulate some scheme for reducing production. It was generally agreed amongst the interests affected that the curtailment of output should be on a spread-over basis, but it was then reported that this proposal was not acceptable to the Controller. In the middle of last week the Controller advised individual spinners concerning the licences for the use of cotton that would be available during this month. Employers fully engaged on Government contracts secured practically a full allowance, while firms engaged on the manufacture of goods for home civilian use were given a very small supply; and it was realised by the industry that, in most sections, a substantial amount of machinery would have to stand idle, while some mills would have to be stopped. For the time being fresh business has been brought to a standstill, for, in consequence of the curtailment of cotton supplies, delivery dates for existing orders have been

pushed further ahead. It is estimated in Lancashire that some thousands of operatives will be released for the Forces and munition work, but the trade unions are afraid that there might be a time-lag between the cessation of employment in the mills and the absorption into armament factories. The employers are concerned with the effect upon their financial position, and it is held that some scheme of compensation should be arranged for the owners of mills that are compelled to close down. In a statement issued on Wednesday, the Cotton Board suggested that the Controller should suspend the issue of new priority directions for a brief period except for urgent orders, and that operatives thrown out of work this month should not be treated as ordinary unemployed, but drafted to other cotton employment or reserved for it. The Board further suggested that a compensation scheme to be prepared jointly by the Board and the Employers Organisations and submitted to the Government. In the meantime, discussions continue to take place between the Controller and the directors of the Liverpool and Manchester Cotton Associations with regard to the decision of the Ministry of Supply that the Government should in future be the sole importer of raw cotton. It has been suggested that if it is not possible to use the old-established merchanting organisation, then Liverpool and Manchester firms should work on a commission basis as a temporary measure.

(Continued from page 315)

little business among tea or rubber shares, though such price changes as occurred were mainly for the worse. Allied Sumatra and Anglo-Dutch both suffered small losses. At the beginning of the week the oil market was down on news of the German invasion of Bulgaria. Losses of $\frac{1}{2}$ were suffered by Shell Transport and Burmah oil ordinary, while Anglo-Iranian ordinary was $\frac{1}{4}$ lower. A firmer tone prevailed later in the week, though there was some selling of Trinidad issues.

New York

BOTH before the week-end and during the current week, the undertone on Wall Street was nervous and business was at a minimum. Encouragement which investors drew from the settlement of the Bethlehem Steel strike before last week's close was short-lived, and the predominant influence remained that of foreign political developments. Sentiment was depressed by the entry of German troops into Bulgaria, and disquieted by continued tension in the Far East. On Tuesday, big orders for Woolworths and U.S. Steel and a number of smaller investment buying encouraged a moderate rally. This movement was not continued in mid-week, despite a firm opening.

The Iron Age estimates steel mill activity at 98 per cent. of capacity against 97 per cent. in the previous week.

Shorter Comments

Canadian Pacific Railway.—Gross earnings, January, 1941, \$14,685,000 (\$12,245,000); net earnings, \$2,666,000 (\$1,829,000).

Abbey Road Building Society.—Profit 1940, £1,396,849 (£1,514,829). Dividends to shareholders, £1,271,589 (£1,348,090). Reserve Fund No. 1, Nil (£200,000). Reserve Fund No. 2, £9,731 (£9,811). Carry forward, £252,338 (£103,509). Advances, 1940, £714,745 (£6,280,668). Total assets, £49,835,096 (£51,401,462). Shareholders received 3½ per cent. tax free from January to August 31st, 1940, and 3 per cent., tax free, from September to December 31st, 1940.

Celanese Corporation of America.—Net sales, 1940, reached record of \$44,510,651 (\$35,478,947). Tax provision, \$5,424,954 (\$2,363,782). Net earnings, \$6,376,896 (\$6,374,100). Cash dividends on common stock, \$1.25 (50 cents). Scrip dividends ½ shares for each 100 held. Earned surplus forward increased by \$2,104,408 to \$12,048,828.

Metal Industries Ltd.—Metal Industries will proceed with the acquisition of the Ordinary and Preference shares of Sentinel Wagon Works. Metal Industries offered 4s. 3d. for each 6s. Preference share and 2s. 3d. for each 2s. Ordinary share.

International Paint and Compositions.—Net profit, 1940, £208,145 (£208,823). Ordinary dividend remains at 20 per cent. for year.

Rise in Shipping Costs

The war has brought a substantial increase in the cost of operating merchant ships and, consequently, in freight rates. So far as wages are concerned, these were increased by £2 per month for officers and by £3 per month for crews on March 1st, 1940. A further advance of £2 per month for both officers and crews was granted on January 1st, 1941, in order to reduce the gap between the wages paid on British and allied ships. Although the monthly rate of pay for A.B.'s has risen by 83.2 per cent. over the pre-war wage of £9 12s. 6d. In addition to the increase in wage costs, the price of stores, provisions and repairs has shown a marked rise. The cost of marine insurance has also recorded a heavy increase, though the excess over the rates ruling in September, 1939, is refunded to shipowners by the Ministry of Shipping. The cost of war risk insurance, which is borne by the Government in the case of requisitioned vessels, has risen from 2 per cent. for 91 days, or 8 per cent. per annum, at the outbreak of war to the current rate of 7 per cent. for 91 days or 28 per cent. per annum. As a result of the rise in costs, freight rates have been advanced considerably. While the tramp freight rates charged by the Ministry of Shipping are not published, the Chamber of Shipping estimated that those charged by neutral owners last year averaged 113 per cent. more than in 1939.

Income from Shipping Services

The annual report of the Chamber of Shipping, published last week, contains the usual estimate of the value of the export of shipping services. In the table below, the export of shipping services in recent years is shown side by side with the excess of merchandise imports over exports:—

	Excess of Imports over Exports		Export of Shipping Services	
	£ million	% of import surplus	Total £ million	% of import surplus
1929	382	130	34	34
1931	407	80	20	20
1937	432	115	30	30
1938	387	90	23	23
1939	400	100	25	25
1940	661	200	30	30

The estimated increase in the total of gross freights, less expenditure abroad, between 1939 and 1940 has been substantial; indeed, the value of the export of shipping services covered nearly one-third of Great Britain's adverse balance of trade last year. True, shipping costs, as is shown in the previous note, have recorded a marked advance since the outbreak of war, but these were chiefly met in the United Kingdom.

A New Salvage Campaign

The Controller of Salvage is appealing for an increased effort by housewives to save and sort their waste-paper, metal, bones, rags, foodwaste and torch batteries. Last year 800,000 tons of waste material, enough to make 100 shiploads, were salvaged and sold for £2,200,000. It included 250,000 tons or 40 shiploads of paper, enough metal to build 16,000 tanks, and enough kitchen waste to feed 100,000 pigs. Mr. Judd, however, is of opinion that more could be done, and he is going to extend the principle of compulsion to the smaller urban districts with populations between 5,000 and 10,000. To the 28 unpaid district advisers are to be added 65 assistants; area transport officers are to help councils, and 30 plants for concentrating kitchen waste into and pig and poultry food are to be established. The Ministry of Supply hopes that it will not be necessary to make it a penal offence for housewives not to separate waste paper, metal and bones, but it complains that far too much waste paper is at present spoilt by being thrown away with other refuse. Before applying compulsion to housewives the Ministry would be well advised to apply more detailed compulsion to local authorities, not merely to carry out their salvage duties, but to make it clear to housewives that they are carrying them out. It is by no means easy for a busy housewife to maintain some five different receptacles and sort out everything as she

throws it away, and she can only be expected to take this trouble if she is satisfied that it will not be rendered nugatory by the dustman or at a later stage of disposal. Some dustmen tell housewives that they need not sort their rubbish as that will be done at the depot, and the housewife is left wondering whether this is true or is merely a labour-saving excuse. It might be well if each council circularised its householders direct, telling them exactly what it wished them to do and explaining why. The Controller of Salvage can hardly hope to stop people using their waste paper to light fires, but they would be much more careful to save the remainder if they had the assurance of their own local authority that it really was used again. There are rumours that the paper manufacturers have more waste paper offered to them than they can profitably handle, and similar rumours about scrap metal crop up from time to time. The salvage campaign should include an effort by the Controller to keep abreast of such gossip. Untrue stories should be denied as soon as they begin to circulate, and the foundation for those which are true should be as promptly removed.

Documentary Films for the Export Trade

Although the use of documentary films in trade promotion began before the war, it is likely to be used increasingly for this purpose in the future. The British Council, in co-operation with the Board of Trade Press Office, is prepared to sponsor the production and showing of documentary films dealing with industries engaged in the export trade. For some years the British Council has used films in its work of making British life and achievements better known abroad, and this experience should be of great value to the export trade. It is proposed that the general theme of the films should show the enterprise, technical progress and resources of British industry. The object of the films is to provide a background for our exports as a means of creating an interest in them; treatment would aim at creating and holding the interest of general audiences. A film would be sponsored only if the Films Committee of the British Council were satisfied that the subject would lend itself to sympathetic treatment. By the arrangement made with the Board of Trade, the Council would be willing to bear about four-fifths of the costs of making a film for an Export Group, or the industry it represents, if the Group agreed to contribute the remaining one-fifth. The Council would supervise production and bear all costs of distribution. The Council is in a position to arrange wide theatre and non-theatre showing abroad through both commercial and other channels. There is every hope, with the weight of British Council experience behind it, that this experiment in assisting British industry abroad should succeed.

Milk Production Costs

The Oxford Institute of Agricultural Economics has just published a pamphlet summarising its report on the costs of milk production from October, 1938, to September, 1939. It shows that until the trend was reversed by war conditions, a decrease in these costs was in progress. Returns were obtained from 382 wholesale and 47 retail producers, and from 123 producers of

COSTS OF MILK PRODUCTION PER GALLON, 1938-39

382 Wholesale, 123 Graded and 47 Producer-retailer Farms

	Foods	Labour	Misc.	Herd Re- place- ment	Gross Farm Cost	Credits	Net Farm Cost
Wholesale	d. 5.05	d. 2.18	d. 1.24	d. 0.98	d. 10.35	d. 0.88	d. 9.40
Graded	d. 6.65	d. 2.51	d. 1.68	d. 0.88	d. 11.72	d. 0.98	d. 10.74
Producer-retailer	d. 6.17	d. 2.90	d. 1.52	d. 1.35	d. 11.94	d. 0.89	d. 11.05

tuberculin-tested milk, referred to as the "graded" producers. The average number of cows per head in each of these categories was 32, 30 and 37 respectively, and the total quantity of milk produced was 11,807,000 gallons, of which 55.1 per cent. was produced in the summer. The cost of production of summer milk was 4.87d. or 40.41 per cent. lower than that of winter milk

in the wholesale group; 5.12d. or 37.54 per cent. in the graded and 4.3d. or 33.41 per cent. in the producer-retailer group. Gross and net farm costs were 1d. per gallon lower than in the preceding year in the wholesale and producer-retailer groups and 1½d. per gallon in the graded group, where they were lower than ever before. Indeed the decline in the comparative costs of producing tuberculin-tested milk is one of the features of this last pre-war year, and augurs well for the future. It will be seen from the table on page 317 that the graded producers' gross and net farm costs were actually lower in 1938-39 than those of producer-retailers. The decline in the quantities of food consumed, and especially of concentrates, was greatest in the graded group, probably because the production of premium milk is being increasingly undertaken by average producers working under ordinary commercial conditions. The average yield per cow per day was 1.77 gallons in the wholesale group, 1.71 gallons in the graded and 1.84 gallons in the producer-retailer group. Unhappily in the winter 1939-40 the reduction in milk costs was not maintained. The cost both per cow and per gallon of all foods in the wholesale group was higher than in either of the two preceding winters, and so were all other costs, while the yield per cow fell from 1.58 to 1.50 gallons per day. Figures for the whole year are not yet available, but it seems unlikely that yields can have been maintained in the face of the shortage of concentrates, and the rise in costs seems likely to continue as part of the general rise in the price level.

Retail Sales in January

The average daily value of total sales over the counter in January, as recorded in this week's *Board of Trade Journal*, was virtually the same as a year earlier; it showed a decline of only 0.3 per cent. As the accompanying table shows, the rise in the value of food sales, which accounted for 62 per cent. of the total turnover, offset a fairly substantial fall in non-food sales.

	Percentage Change from preceding Year	
	Food and Perishables	Other Merchandise
1940		
August	+ 5.4	+21.0

In view of the rise in food prices during the past year, the volume of sales last January was probably well below the level of a year ago. In the case of other merchandise, the decline in the volume of sales must have been very considerable, for a large proportion of the goods sold were no doubt subject to purchase tax. The value of stocks (at cost) of non-food merchandise at the end of January was 20.2 per cent. higher than a year ago; but their volume was probably appreciably smaller.

COMMODITY AND INDUSTRY NEWS

Tin prices showed another sharp drop on February 27th, falling by £5 5s. to £5 10s. to £264 10s.—£265 per ton standard cash. Since then fluctuations have been within narrower margins and prices for cash and futures have tended to be closer together. On Wednesday the price per ton of standard cash closed at £266 10s. to £266 15s., while the three months quotation was £266 5s. to £266 10s. The wholesale prices of bacon were revised with effect from March 3rd. The price of Wiltshire cut sides rose from £5 13s. 6d. to £6 5s. 6d. per cwt. and for gammons and hams the rise was from £5 18s. to £6 11s. 6d. per cwt. Details of the advance in retail prices are expected to be announced before March 10th. A further reduction of 2s. 6d. per 120 in the price of eggs is promised after Easter, but it is expected that this will be the last reduction to be made this year.

Feeding-Stuffs Ration Halved.—In a statement made by Mr. Tom Williams, M.P., Parliamentary Secretary to the Minister of Agriculture, he announced that the feeding-stuffs situation, especially as far as cereals are concerned, was so serious that it would be necessary to make a further reduction in supplies on April 1st. Poultry-keepers are the chief victims of the shortage and the ration to be supplied in April will be sufficient to feed only one-sixth of pre-war laying flocks of poultry. It is considered desirable, in view of the shortage of feeding-stuffs, that pigs should be marketed at lighter weights during the next few months, so as to reduce the number of pigs to accord with the decreased supplies of feeding-stuffs. To encourage farmers to make this reduction, the prices of certain classes of pigs were raised on March 3rd, though it is announced that they will be lowered on April 28th, and again on June 16th. The unit value of feeding-stuffs ration coupons is to be reduced from 1 cwt. to ½ cwt., although additional supplementary coupons are to be issued to mitigate the effect of this reduction to dairy herds, working horses, approved pedigree animals and selected poultry stock. Farmers selling home-grown grain will receive sufficient coupons to give replacement on a ton-for-ton basis.

Reduction in Cotton Supplies.—Business has been thoroughly disorganised by the reduction in the amount of raw cotton allowed to spinners. It is understood that broadly speaking licences

for March have been cut by 30 per cent., compared with February. Mills entirely engaged on Government contracts have received a full allotment, but production for export and the home trade is bound to be severely reduced. Numerous spinners of yarn have refused to sell, but some fair lines have been put through in fine Egyptian qualities. A large demand has been met with in piece goods, but here again contracts have been few and far between as most manufacturers have refused to sell. Some Government orders have been given out, but business in goods for ordinary civilian use has been at a standstill.

Oils and Fats Prices Unchanged.—Official maximum prices of controlled vegetable oils, marine oils and animal fats in operation during February are to be continued throughout March without alteration. In conjunction with minor changes in preceding months, this provides a certain degree of stability not unwelcome to the manufacturing industry. Edible oils required by manufacturers of margarine and cooking compounds are in good supply. The calls upon them, however, may not be so heavy in the near future as a result of the increase in the proportion of butter in the fats ration operating from March 10th.

Coffee Prices Fixed.—The Minister of Food has made an Order controlling the retail price of coffee from March 31st. The maximum price for dearer blends is to be 2s. 8d. per lb., but retailers must also stock cheaper blends at not more than 1s. 8d. per lb. Unroasted coffee beans may be sold at 2d. per lb. less. The wholesale price is not controlled, but has been rising steadily. At the beginning of the year the price of Costa Rica, medium to good, was £85 to £115 per cwt., while on March 4th it was £30 higher at £115 to £145 per cwt.

Smaller Newspapers.—The consumption of newsprint is to be reduced once more from March 16th, and it is likely that further cuts will be made in the course of the next three months. The effect of the present cut will be to limit the penny daily paper to 32 pages for six issues, and other papers will have their allocations reduced accordingly. This decision of the Newsprint Supply Company has been taken at the request of the Government in order to make further reductions in imports of pulp, pulpwood and newsprint.

COMPANY MEETINGS

BORAX CONSOLIDATED

IMPROVED RESULTS

AGRICULTURAL DEVELOPMENTS

MR D. ABEL SMITH'S ADDRESS

The forty-third ordinary general meeting of Borax Consolidated, Ltd., was held, on the 4th instant, at Winchester House, Old Broad Street, E.C. Mr. D. Abel Smith (the chairman) presided.

The chairman, in moving the adoption of the report and accounts, said: The profit and loss account in its new form clearly shows all the chargeable disbursements, which now include the pensions and grants reserve, provision for depreciation of buildings and plant, debenture interest and premium on the debenture sinking fund policy. After their deduction the net profit for the year under review amounts to £265,823, representing an increase of £38,504 over last year. Adding to the above profit the amount brought forward from 1939, the total to be dealt with is £517,170. From this we have to deduct provision for British taxation £150,437, consisting of an appropriation of £75,000 from profits, together with the sum of £75,437 to be deducted from the dividends paid and proposed. This leaves a balance of £366,733.

THE DIVIDENDS

We have already paid the sum of £44,000, less income-tax, on the 5½ per cent. cumulative preference stock. Also an interim dividend of 8 per cent. on the preferred ordinary stock was declared on November 12, 1940, and paid on December 7, 1940, absorbing £18,000, less income-tax, and we now propose the payment of a final dividend of 3 per cent. on the preferred ordinary stock, which will absorb a further £18,000, and to pay a dividend of 7½ per cent. on the deferred ordinary stock, representing the sum of £97,500, less income-tax. These dividends, subject to the resolution being passed, will be paid to the stockholders on March 18th. After providing for these payments amounting, less income-tax, to £102,063, the balance to be carried forward is £264,670, an increase of £18,323 on the previous year.

BALANCE-SHEET ITEMS

We have written off from the buildings, plant, etc., account the sum of £74,988. The buildings and plant have been maintained in good repair out of revenue.

The capital amortisation fund now stands at £428,190, representing to-day's surrender value of our policies with the Sun Life Assurance Company for the redemption of the first debenture stock.

You will notice a new item, war contingency reserve—£50,000, which takes the place of the special reserve account for like amount figuring in our previous balance-sheet, a sum which had been set aside in 1937 under exceptional circumstances to meet abnormal conditions. These have now arisen, and we have to envisage the possible depreciation of assets in subsidiary companies situated in territory at present occupied by the enemy.

We have made full provision to cover floating assets, viz., stocks and debts in enemy and enemy-occupied territory, but we think it a wise precaution to earmark the above sum of £50,000 in case of damage or prejudice to the fixed assets so situated, and are of opinion that the aforesaid sum should prove full cover for the land, plant and buildings involved.

The next item, taxation reserve, £276,511, amply covers the company's liability to British taxation. While a growing and heavy burden, we must, however, consider ourselves fortunate in earning the profit shown and contributing our share to the sinews of war until British victory is assured.

Turning to the assets side of the balance-sheet you will find a number of slight variations accounted for by trade exigencies. The principal item to show an increase is that of stock at mines, factories, warehouses, etc., which is up by £170,000. A proportion of this is accounted for by the increased costs of freight

and war risk insurance, but the main cause is the necessity under present conditions of carrying far larger stocks of both crude and refined material, distributed over a number of strategic points to ensure under all circumstances regular supplies to our customers. These stocks are taken at cost or under and consist of material in current demand. The increase represents a necessary and wise precaution in our business interests.

In common with other trading concerns, we have had to face increasing difficulties during the past year, but the diversity and elasticity of our trade has again been proved in the steady demand from the many industries dependent upon us, as also by the application of our products in several new directions.

BORAX IN AGRICULTURE

With regard to agriculture, the closing of several continental markets, which had shown great promise prior to the war, has delayed what might have proved a notable increase in the world sales for this purpose. There is scope for a better appreciation of the value of Boron as a plant food and of the need for its inclusion in properly balanced fertilisers as distinct from its unquestioned utility to cure specific Boron-deficiency diseases. The United States and Canada have given a lead in this direction and the outlook continues very promising.

Regarding our investment in the United States Potash Company, the mines continue to develop in a most satisfactory way, and the business is growing in strength under the same enterprising but prudent management. While present conditions prevail that company will play a more and more prominent part in the supply of a vital fertiliser to meet their domestic requirements. The investment, which to-day yields a very satisfactory return, should further increase steadily in value as that business develops.

THE CURRENT YEAR

The conditions are too obscure to hazard any prediction. It must be borne in mind that the past year's accounts include eight months of trading with certain countries not then occupied by the enemy. We have since had to deal with more restricted markets, and trade conditions are necessarily dependent upon current events. So far as practicable we are endeavouring to lighten the calls for shipping space on this country by supplying direct from our American factory to a number of overseas markets. Suffice it to say that for the five months since September 30th our general trade has continued satisfactory. The stocks of our products in enemy and enemy-occupied countries must be so depleted that directly the war is over and the work of restoration starts we anticipate being called to meet large immediate requirements and to restore the substantial reserve stocks normally held by our former buyers.

Prices for refined material were advanced in December, 1939, and June, 1940, to cover a proportion of the increased costs incurred mainly through higher ocean freights and war risk insurance.

One of our managing directors, Mr F. Lesser, will be leaving very shortly in connection with our interests in the United States and South America.

Our staff War Savings group, which was instituted in the early days of the savings campaign, is being supported 100 per cent. at our head office and is receiving substantial and increasing support from the workers in the factory.

The report was unanimously adopted, and it was agreed to place the sum of £5,000 at Lord Beaverbrook's disposal for the purchase of a "Spitfire" in token of the magnificent services which the R.A.F. have rendered.

MANCHESTER SHIP CANAL COMPANY

SATISFACTORY REVENUE POSITION

The annual meeting of shareholders in the Manchester Ship Canal Company was held, on the 28th ultimo, in Manchester.

Sir Frederick J. West, who presided, in the course of his speech, said:—

The dividends your board recommend are the same as those paid last year, namely, 3½ per cent. on the Manchester Ship Canal Corporation 3½ per centum preference stock, 3 per cent. on the preference shares, 1½ per cent. on the ordinary shares. The net revenue for the year was £869,462.

Expenditure on Ship Canal, Bridgewater Canals, and railways totals £1,326,670, which is less than it would have been had we been able to effect renewals and carry out repairs on the basis of a normal year. In order that the accounts should not show a false position in this respect, and to enable us to provide for the carrying out of necessary work at a future date without burdening that period with the cost, we have provided an amount of £125,000 in these accounts under the heading of "deferred maintenance."

Whilst this is a policy which will commend itself to shareholders on the grounds of prudence alone, the course adopted is one which is essential if the company is to benefit in its excess profits computation from the allowance granted for deferred repairs and renewals—it being made a condition of such allowance that the amounts claimed be reserved out of current profits and eventually applied in making good the deferred maintenance.

Shareholders will be glad to know that if the full amount of this reserve is allowed in the Excess Profits Tax computation, the effect will be to cancel out the charge against revenue, leaving the balance available for dividends unchanged.

WAR DAMAGE COMPENSATION

The War Damage Bill is the measure at present being considered by Parliament to provide compensation for damage to property caused by enemy action. Whilst the rate of premium indicated for movable assets applies to the company, the contributions payable and the basis of compensation for buildings and immovable property belonging to public utility undertakings (amongst which your company ranks) are to be the subject of separate legislation.

For this reason and because amendments may be made in the Bill before it becomes law, it is not possible to assess the company's actual liability. Thus, the provision of £50,000 shown in the accounts under the heading of "miscellaneous charges" can only be considered as forming the nucleus of a reserve against which contributions payable will be charged, and which will be subject to adjustment when the actual liability is known.

SUBSTANTIAL TAXATION PROVISION

Shareholders will have noticed the substantial amount—£245,000—which has had to be provided under this heading. This covers the estimated liability for income tax and Excess Profits Tax. The latter represents, on average, an effective liability of 90 per cent. for the year 1940, as the duty was 60 per cent. for the first three months and 100 per cent. for the remaining nine months of the year. It will, unless some change is made, be at the rate of 100 per cent. for the year 1941.

Many chairmen of large undertakings have already referred to the desirability of a reduction in order to provide a reserve the better to face the many problems of post-war reconstruction. For my own part, I would associate myself with the views addressed to the Chancellor of the Exchequer by the Federation of British Industries, urging a reduction to 80 per cent., with the proviso that the balance must be retained in the business or applied to such purposes as may be approved by the Treasury.

This brings me to the end of my remarks affecting the revenue position of the company, which I feel sure you will agree must be regarded as satisfactory.

Whilst we have had new problems to deal with and exceptional expenditure to face, we are continuing the policy we have followed for some years—that of looking ahead in order to strengthen the position of the undertaking—a policy which is of the utmost importance in view of the uncertainties of the future. The report was adopted.

KILLINGHALL TIN LIMITED

INCREASED DIVIDEND

The eleventh annual general meeting of Killinghall Tin Limited was held, on the 28th ultimo, in Oxford.

Mr W. Arthur Addinsell, the chairman, said in the course of his address: Current assets total £62,646, against liabilities of £5,419 only. The net profit amounted to £32,858 (as against £13,762 for the previous year) after payment of £14,022 in royalty to the F.M.S. Government.

While the year's results can be regarded as satisfactory, it is a matter for regret that the dredge was working in low-grade ground and the output of ore was insufficient to utilise the whole of the quota available. We were, however, fortunate in securing £4,788 for the surplus rights.

When the quota release was raised to 100 per cent. rights became unsaleable and part of our quota had to be surrendered. Happily there has been an improvement in ground values in recent months. I anticipate the results for the quarter ending March 31st next will show an appreciable advance.

It is gratifying to recommend a final dividend which will make 20 per cent. for the year, compared with 5 per cent. in the previous year. Your directors consider it prudent to place £3,500 to taxation reserve, and to write off £665, the expenses of acquiring a sub-lease over an additional 104 acres in 1938, of which £654 was paid to the F.M.S. Government for premium and survey fees.

The tin-producing industry is passing through a period of prosperity which we all realise results from abnormal conditions, and no one can foreshadow how long this state of affairs will continue. We can, however, derive satisfaction that from the profits earned substantial contributions are being made to the Empire's war effort by way of taxation.

The report and accounts were unanimously adopted.

PADANG LANGKAT RUBBER ESTATES, LIMITED

IMPROVED PRICES REALISED

The eighth ordinary general meeting of this company was held, on the 4th instant, in London.

The chairman, in the course of moving the adoption of the report and accounts, said: The quantity of rubber which the company was permitted to export for the period covered by the accounts was 1,334,128 lb., a considerable increase compared with the exportable allowance of 821,836 lb. for the previous financial year. The crop harvested for the season was 1,124,000 lb. and the unexportable stock at the close of the financial year was 245,530 lb., compared with the rather heavy stock of 455,658 lb. brought forward at the close of the previous season, which had been built up during the period of low releases. Your directors decided to reduce stocks in view of the larger exportable releases permitted. The unexportable stock of 245,530 lb. has been taken into account at estate cost. The average gross sale price realised was 11.18d. per pound, which compares with 8.27d. per pound in the previous year. The estate expenditure amounted to £21,835 on the production of 1,124,000 lb. rubber, compared with expenditure of £15,808 in relation to the production of 969,000 lb. of rubber in the previous year. The result of the year's working is a profit of £24,796. The board recommends the payment of a dividend of 7½ per cent., less income-tax.

The condition of the estates is reported to be satisfactory. Our replanting programme proceeds steadily; 572 acres have been replanted and a further 215 acres have been put in hand for replanting during the current financial year.

The report and accounts were unanimously adopted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes. In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8 Boulevard Street, E.C.4.

J. A. McLEOD, President.

H. D. BURNS, Assistant General Manager.

Auditors' Report to the Shareholders:
We have examined the above General Statement of Liabilities and Assets as at December 31st, 1940, and compared it with the books at the Chief Office and with the certified returns from the Branches. The Bank's investments and cash on hand at the Chief Office and at the Toronto and Montreal Branches were confirmed by us at the close of business on December 31st, 1940. We have obtained all the information and explanations that we have required, and in our opinion the transactions of the Bank which have come under our notice have been within the powers of the Bank. We report that in our opinion the above statement discloses the true condition of the Bank and is as shown by the books of the Bank.

TORONTO, CANADA, 14th January, 1941.
The Bank of Nova Scotia conducts a general banking business. Fully equipped for Exchange, Collection and Letter of Credit Transactions. Particular attention is devoted to business with Canada, Newfoundland and the West Indies, where branches of the Bank have long been established—293 Branches in all.

LONDON OFFICE: 108 OLD BROAD STREET, E.C.2.

E. C. MACLEOD, Manager.

Calling the Roll

"MR BEVIN Calls Up the Girls." Monday's headlines were hardly accurate. The new Registration for Employment Order will lay upon all subjects, men and women, the obligation to register for work of national importance; and within the next few weeks men of 41 and 42 and women of 20 and 21 will be summoned under the Order. But they will not be "called up." They will put down their names and experience. They will be interviewed and told of the various kinds of war work available. They will be "advised" and "given the opportunity" to join up.

The purpose, then, is to stimulate volunteering by making it plain to individuals where their duty lies. An important obstacle to volunteering hitherto, apart from material considerations, has been the disinclination of many people to believe that the appeal for volunteers could be addressed to them personally, when they were already working hard in other employments. Now, as new groups of men and women are called upon to register, this illusion—of employers as well as staffs—will be dispelled. By personal interview, it will be possible to bring applicants into touch with the posts for which they are best fitted. The new procedure, which will be operated by national service officers of the Ministry of Labour and National Service, is a wide wartime extension of the vacancy work for which the employment exchanges were set up a generation ago; and it will succeed or fail through the responsible officer's ability and insight—neither of which is normally remarkable in the ordinary vacancy officials of most exchanges. The obligation to serve is now laid upon all citizens, but the first task is to find war employment for the workers who will be made idle by

the "concentration" of civilian industries. Many of the registers after the first national ones for age-groups will be local, in districts where the staple industries have been drastically cut down.

It would not be enough, of course, simply to point out their duty to individuals and inform them of the openings for employment. It must also be made possible for them to move. Many will be set free by "concentration" in the civilian factory trades; many more could, and should, be released by similar measures in distribution, the service trades and commerce. But there are still certain material obstacles to transfer into war work. Most recruits require training; many of them will have to move to new places of work; not a few, especially women, will find their new employment unfamiliar and uncomfortable. At the training centres, Mr Bevin has announced, men who now receive 31s. or 34s. a week will start with 60s. 6d. a week and, if they pass each monthly test of their progress, they will be paid 75s. 6d. in their final four weeks; women trainees will be given 38s. a week, with the chance of rising to 47s. There will be free fares for workers taking up distant employment, and allowances for rent, rates, mortgage interest and even storage of furniture, when it is not possible to terminate existing liabilities.

Finally, an approach is to be made to establishing decent conditions of work for women. There has been an "enormous wastage" in war factories because no adjustments have been made in their methods and facilities to meet the needs of women workers; and employers are now being pressed to make changes. A great deal will depend upon the skill of factory wel-

fare officers, many more of whom should now be women; and the Minister would do well to remember that the spread between the wages of unskilled women in Government-controlled factories and the wages they can get elsewhere in civilian work is one material obstacle to voluntary recruitment which no mere welfare arrangements can dispose of.

Mr Bevin is feeling his way towards what have been called "the conditions of service"—measures to make sure that no one can benefit by remaining out of one or the other of the front lines or lose by taking the path of duty. Only by this means can the voluntary method of industrial enlistment be made to bring in the regiments required. Certain physical obstacles to recruitment would be common to any scheme, compulsory or voluntary. It is not possible for mothers to leave young families, or for low-paid workers, women and young persons to travel long distances daily to their jobs—a problem which crops up acutely when works in towns are decentralised and scattered about the surrounding countryside. But there are other obstacles, social obstacles they might be called, which are at their height in a voluntary scheme. Nor is it entirely a consciousness of class or status which inclines directors, managers, successful business men, professional people, and "intellectuals" to shrink from war service. They may have heavy financial commitments; they may be right when they claim that their abilities could be put to better use than at a lathe or in a works stores.

In principle at least, it is a virtue of the procedure by registration and interview that it will be possible to look round for square holes for square pegs. After the interview, each individual will be told whether or not he is "expected" to volunteer. If he is, he will be asked to notify the authorities when he has found work of national importance. His choice will be as free as possible, and he will be given time to make it. Even so, there will be inhibitions. The flow is likely to be sluggish, and it is hard to escape the view that further steps are needed—steps to widen the stream of volunteers by squeezing out redundant labour in still more trades and steps to remove, by a much broader system of compensation than has yet been devised, the financial bogeys which dispose a man to cling on to his business, his livelihood, his household and the maintenance of his family. They must neither be excuses for evading service nor obstacles to enlistment.

The truth is that voluntary mobilisation is only practicable in a war economy if it is made easy and attractive to enlist and correspondingly difficult and detrimental to do anything else. The "free" market for labour must be thoroughly rigged. The important point about this plan for registration is that, while the freest possible choice of jobs is preserved, it must be compulsory to make some choice, and—since time is the essence of Mr Bevin's and the nation's contract—preferably in a given time. Moreover, there must be no undue generosity. The first function of the interviews being to inform individuals whether they will be "expected" to do work of national importance, it must be taken for granted that every individual is expected to do so, unless he or she can offer proof to the contrary. Any system which sets out to discover whether the individual is better fitted for war work or for the job he already has will be a sheer waste of time and organisation. It may be assumed that poets and stockbrokers are better poets and stockbrokers than they will be war workers. Their obligation to become war workers still remains, unless it can be demonstrated that, in the calculus of the war effort, the particular poetry or stockbroking they are individually responsible for is indispensable.

In fact, the basis of the new plan must be that every individual who can be spared must be ready to go and must go when required; and it is for the State, arranging the nation's activities in order of urgency, to say whether any particular individual can be spared or not. Until this year, with some exceptions, dis-

crimination between dispensable and indispensable persons—for military service—was rough and ready. Individuals were not reserved because of the work they individually were doing; they were reserved in occupational categories, according to their qualifications or according to the work the firms they were employed by were doing. Now, when industrial mobilisation has been added to military conscription, the test is more precise. Men of non-military age and women will be judged by personal interview. Presumably, it will not be enough for them to say that their employers are doing essential work. They will have to prove that they are essential persons. Moreover, it will conversely be possible for them to claim that they individually are indispensable, even though their firms may not actually be doing war work.

In the vast category of men of military age, however, the test remains less discerning. Many more men are to be released for service or for transfer to other work of more national importance, it is true, but the new Schedule of Reserved Occupations will simply be the old one with higher ages of reservation. It will still be possible for individuals who could actually be spared to stay in reserved occupations, while men who can far less easily be dispensed with are called up from those that are not reserved. There is to be a new category of "protected" work, covering such vital activities as shipbuilding and engineering, in which the ages for reservation will be low. But it is the occupation a man is in and not the job he is actually doing that is protected, and inevitably there will be some men, even in these trades, who could be spared and replaced by women—while, in other, admittedly less important trades, key men may be called up. In the Civil Service and, it is claimed, in the Forces, too, this problem is being tackled, the case of each civil servant is being examined on its merits; and the Forces have been admonished to "comb their tails in order to magnify their teeth"—to replace men wherever possible by women and so free more combatants. In industry, it appears that the enormous task of investigation by tribunals is unwelcome; but only by bringing mobilisation down to the individual case can it be made both efficient and fair.

Slowly and painfully but with sureness, Mr Bevin has produced the outlines of a flexible plan for the effective use of labour as requirements grow. Everything now depends on its administration. If everyone who registers and is not exempted is compelled to volunteer within a stated time; if the numbers of men and women called upon to register, locally and nationally, are kept in step with the anticipated needs of the war factories and training centres; and if those who volunteer are compelled, by the new Essential Work Order, to remain at their posts, the absence of more open compulsion may be no hindrance. It is in equity that the hardest problems will be found. It is reasonable to make the first call upon factory trained workers who have been displaced or are unemployed, though it would be common sense, economically and technically, to dilute the intake of experienced women with less skilled recruits. But the unemployed must not be steadily seconded for the war effort while the "unoccupied" or leisured stand idly by. It is not the use made of the most promising material that will tell in the end, but the use made of the most unpromising—"the marginal woman." It is reasonable, too, to call most heavily on labour in the industrial areas where their services are needed. But the need to spread the burden nationally will remain pressing. In the case of young women of 20 and 21, those outside the factory districts will be advised to join the women's Services. The case of professional and business men is not so easy, though Mr Bevin has remarked that, after training, these men could do valuable "heavy work." One thing is certain: discrimination, however accidental, must be pared to a minimum. The contrast between "conscribed" Forces and "free" civilians is anomalous and provocative enough, and it must not be established among the civilians themselves.

The Blockade

THERE have been signs in recent weeks that the cumulative effect of the British blockade is giving the Nazis food for anxious thought. The invaluable Italian leak of the first nine months has gone, the neutral fringe of Europe with its protective territorial waters has gone, the Eastern Mediterranean is closed. Vladivostok is already at the limit of its capacity. It is therefore hardly surprising that desperate efforts are being made to drill another outlet through the wall of steel.

The policy of Great Britain has hitherto been perfectly consistent. Occupied territory is German territory for which the Nazis must take full responsibility. The neutral countries still remaining—Sweden, Switzerland, Spain, Portugal—are allowed to import food according to a rigid computation of their production and their consumption and the gap which must be covered by supplies from overseas.

Unoccupied France is clearly in a category by itself. The Vichy Government claims neutral status, points to an alarming deficit and demands the right to import sufficient foodstuffs to feed its people, threatening to resort to "armed neutrality" and to convoy its own merchantmen if the British detain the food ships. Yet what are we to say of the neutral rights of a country whose normal food supplies have been requisitioned practically in their entirety by the enemy? Clearly it creates a pretty problem in international law—though not a new one, for in 1918 Germany presented the Allies with a somewhat similar dilemma in Poland. However, it is not the legal aspect of Vichy's neutrality that is in question. It is the fact of neutrality itself.

The contention that Vichy France is neutral cannot be allowed to pass. At Monthoire last October a policy of full economic collaboration with Germany was agreed upon, and neither the actions nor the public pronouncements of the Darlan administration can be reconciled with neutrality. The speech in which Admiral Darlan announced the "necessity" of convoying French ships was a masterpiece of disingenuousness. To lay the blame for food shortages at Britain's door and to express "gratitude" to the Nazis (who are draining away £827 millions from France in annual costs of occupation) for a mere 200,000 tons of wheat, filched from occupied France, was entirely malicious. And in Washington M. Henry Haye's denunciation of British policy as "outrageous" was grossly unjust, since it was coupled with no reference to the outrageousness of Germany's policy of occupation and loot.

That in the bitterness of defeat and in the anxieties created by their false and impossible position, the statesmen of Vichy should permit themselves to vilify their old ally is a matter for regret only. Graver issues are raised by the extent of economic collaboration, which, behind the elaborate mime of the Laval affair, has been steadily increasing since October last. The most serious aspects of it are German infiltration in North Africa and the extent to which Marseilles has replaced "non-belligerent" Italy as the principal leak in the blockade. It seems likely that, with Vichy's consent, Germans have replaced the Italian Disarmament Commissions and are using their privileges to permeate French North Africa with experts, technicians, agents, even tourists—in a word, the usual harbingers of a Nazi advance. Their immediate military task may well be to take over the North African bases on the Atlantic seaboard. Their economic task is to ensure that the varied and often extremely valuable resources of North Africa are earmarked for the German Reich.

The position of Marseilles is closely connected with the Nazis' general strategy in North Africa. A certain number of ships passing through Gibraltar are

seized and held by the British Contraband Control officers. But there is increasing evidence to show that the Axis commissioners at Marseilles seize a large proportion of the supplies brought in by the ships released at Gibraltar and by other ships reaching France from North Africa's Mediterranean ports. To quote a Swiss newspaper: "All ships which . . . arrive are examined by the Italo-German Commission. The victor . . . has force behind him, and this force is employed in requisitioning about 60 per cent. of the raw materials and foodstuffs which are destined for France. It is true that this requisitioning does not take place without protests, recriminations and even threats, but this is useless against the will of the conquerors." It is against this background that Britain's "outrageous policy" and Admiral Darlan's "gratitude" must be set.

In spite of these unquestioned facts, pressure is being brought to bear on the British Government to loosen the blockade to the extent of admitting foodships. The issues must be examined coolly and the British people must endeavour to avoid hot feelings of indignation over the dilemma into which German duplicity and French complicity have led them. The proposed loosening of the blockade would undoubtedly be a grave break with all Britain's previous policy—and indeed with that of France herself until June, 1940. It goes counter to everything that has been said or written in this country on the subject. It is tactically a dangerous move. Whenever, in former dealings with Italy and with the neutrals, any question of mitigating the blockade was brought up, German propaganda took full advantage of it further to weaken the whole policy. Nor should the effect on opinion in occupied territory be forgotten. The British contention is that Vichy's freedom of action is practically negligible. If food ships were despatched to unoccupied France, it can be imagined what play the Germans would make with such weakness in Belgium and Holland.

Again, the argument frequently put forward that food must be sent in order to prevent a great revulsion of feeling in Europe against Britain and her "hunger blockade" runs counter to all the evidence. One of the reasons why the Nazis have become more exacting in their recent demands on France is precisely because they realise that the game of collaboration is proving a fiasco in face of the hostility of the great majority of the population. The French people are not fools. They know who has robbed the *potager*. They feel no "gratitude" to the invader who digs up their potatoes in the morning and sells a few back at night. It would be disastrous if British and American statesmen were hypnotised into timid action in the mistaken belief that the outlook at Vichy is that of France.

Yet there are clearly powerful forces at work which have made it impossible for Britain to pursue a consistent policy and to expose the true nature of Vichy's threats and demands. American sympathy for the people of France is as strong as that of Great Britain, and it is not altogether alive to the potential dangers of the policy which is under discussion between the British and American authorities. It should therefore be made clear that if food ships are to go to Marseilles, Germany must inevitably receive indirect assistance. Even if none of the food supplied goes to Germany, the Nazis can at least take back the 200,000 tons of wheat they have "generously" supplied and be quit of the responsibility of feeding Vichy France, which, like unoccupied France, is working for the Reich.

If, therefore, it is found expedient to pursue the policy of sending food in spite of a definite measure of indirect assistance given to the enemy, there must be no weakening on the question of direct assistance, and the new policy should be so designed that, in return for the food ships, the present leakage through North

Africa and Marseilles would come to an absolute end. If this were achieved, it might be possible, by admitting a supervised trickle, to do away with the present uncontrolled stream.

Safeguards have of course been suggested. An American commission would see that the food was distributed in Vichy France only; another commission might be installed in Marseilles; there are some suggestions that Vichy should put an end to German infiltration in North Africa. These provisions are on the right lines. The only doubt is whether they can go far enough. Since it is of Britain that the sacrifice is asked, it is surely reasonable that she should be given representation on the commissions of control. Anglo-American commissions in Vichy France and North Africa would go far to ensure that the purpose of their joint policy—that of feeding Frenchmen without directly assisting the Nazis—was properly achieved.

When the British conditions are stated thus, it becomes clear that they have but a slight chance of acceptance at Vichy. The Darlan administration

speaks for Germany, and Germany in her *Transocean* transmission has already forecast that Britain will pursue a "Machiavellian" policy by making the conditions under which food may be sent so severe that Admiral Darlan must of necessity refuse them. So he must if the purpose of his policy is not to feed France but to assist Germany. There is an inevitable incompatibility between any policy which Britain on the one hand and Germany on the other can accept. Britain will not on that account demand less. It is for the men of Vichy to prove that they are not the mouthpieces, tools and accomplices of the Nazi Reich.

The crux is, of course, the attitude of America. Great Britain can only assume that the Americans are as anxious as the British themselves "to finish the job." If sentiment demands the feeding of France, let it at least be combined with political realism. Britain is alive and sympathetic to the sufferings of Europe, but surely at this point it does not need repeating that the quickest way and the only way to relieve Europe is to win the war.

Profits, Savings and Inflation

SINCE the beginning of the New Year a series of articles in *The Economist* on the Budgetary problem has dealt in some detail with the general dimensions of the task that faces the Chancellor of the Exchequer, with the likely effect upon it of the change in American policy and with the scope for additional taxation upon the ordinary income of the people. It remains, to complete the picture, to deal with the two very closely related questions of taxes on extraordinary incomes—that is, on excess profits and excess incomes—and of the possible extent of Government borrowing of savings. Wars can hardly be fought without some incomes or profits being increased. Some industries and professions are very much more active in wartime than in peacetime, and even if the aggregate of incomes were unaltered there would be some individual persons or firms whose incomes were increased and were therefore capable of bearing increased taxation. When to this dislocating effect of war there is added a tendency for the aggregate of incomes to rise, because of a fall in the value of money, the number and size of "excess" incomes increases very rapidly. This is a source of revenue which no wartime Chancellor of the Exchequer can afford to ignore, even if public opinion would allow him to.

The present Excess Profits Tax is much the most drastic attempt to levy on wartime increases in incomes of which there is any record.* It is never easy to define what are excess profits, and even the most perfect and complex system must give rise to some marginal injustices. These inequities are naturally intensified with every increase in the rate of charge, and with EPT levied at 100 per cent., some of them become really serious. If, in the forthcoming Budget, EPT is to be left at 100 per cent. or at some comparably onerous figure, a substantial number of technical defects will have to be put right. The treatment of immature firms is only one example of a provision that appears to be working contrary to common equity. Perhaps the second most important defect is the method of assessing the tax on firms exploiting wasting assets, which is still unduly severe, even after last year's concessions.

These technical amendments of EPT are not, how-

ever, all that is needed to convert it into a good tax. It has become quite clear that the rate of 100 per cent. is operating against the public interest—even against the narrowest interest of the Exchequer. To say that it removes the incentive of gain without which business will not function is to put an unnecessarily unworthy appearance on the true state of affairs. Most business managements are prepared in wartime to respond to incentives other than profits. But there are many forms of activity—in export, for example—which a firm cannot afford to undertake if it has to shoulder the whole risk of loss without any possibility of gain. The very heavy burden of EPT runs some risk of depleting British industry of its liquid capital, with results that may be very damaging after the war. In retrospect, it is easy to see that 100 per cent. EPT was a mistake, which would not be repeated to-day.

It remains to find means of remedying the mistake. Simply to reduce the rate from 100 per cent. to 75 per cent. or 66½ per cent. might give rise to political dispute. Moreover, the Chancellor needs all the money he can get; it would be better to devise a means of increasing the yield of EPT while diminishing its unfairness. The best means would probably be to keep the rate at 100 per cent. but to provide that, say, a quarter of the sums collected should be regarded as lent to the Government. Bonds would be issued for the amounts thus "lent," bearing either no interest at all or a very low rate. It would have to be provided, of course, that the funds thus standing to the credit of EPT payers could not be spent, except for good cause, until after the war, but this could be achieved in a number of different ways. A scheme of this sort, while keeping the rate of tax at 100 per cent., would restore the incentive of profit—though only in the hereafter. The yield of the tax would not be reduced; and all the advantages that were claimed by Mr Keynes for the release, in a post-war depression, of "deferred pay" would apply with even greater force to the release of funds direct to industry.

Excess profits are not, of course, the only variety of excess incomes and an Excess Income Tax has frequently been proposed. The balance of advantage and disadvantage with such a tax is harder to strike than is apparent at first sight. On the whole, it would seem best to conclude that its advisability would turn on the yield to be expected; which again would turn on the degree of inflation to be expected. It is a possible shot in the Chancellor's locker; but perhaps it will stay there this year.

Even a very carefully designed system of taxation on excess profits and incomes cannot entirely prevent the emergence of war fortunes if there is a general fall in the value of money. This is not so

much because of the difficulty of devising entirely watertight definitions, but because the foundation of war fortunes is usually accretions to capital rather than excess profits. For this reason the second line of attack on war wealth is the levy on capital in its various manifestations. The most recent proposals are those made by the Labour Party a year ago for an annually recurring tax on all property. In some versions of the proposals, the rate to be levied rose for the largest properties as high as 4 per cent. per annum of the capital value, and there was, of course, no suggestion that such a levy could be paid out of the income from the property. Proposals such as this seem to be based upon a fundamental fallacy. War-time inflation, it is true, gives rise to large increases in the wealth of certain property owners. But property owners as a class suffer severely from it. According to Mr Colin Clark's calculations, rent interest and profits between them took 44.9 per cent. of the national income in 1911. In 1924, in spite of the war fortunes, the figure had fallen to 32.5 per cent., and in 1929 it was still lower, at 31.6 per cent. The Labour proposals, in order to levy on a number of individuals who are enriched by war, would impose very stiff additional taxation on a class who are differentially injured by war. It is arguable that the British tax system as it stood in 1939 did not discriminate against incomes from property as much as it should have done. But the argument, insofar as it applies to property as a whole, is weakened rather than strengthened by war and inflation. If increased taxation on property has not been acceptable to the electorate before the war, it should be still less acceptable during the war and immediately after an inflation of prices. The variety of property taxation for which war and its corollaries do provide a justification is taxation on war-time increases in property, not on property itself. And if there are technical difficulties in a levy on increases in wealth (admirably discussed in the book referred to in the footnote), that can be no justification for a different and much less equitable proposal.

If there is to be war-created wealth and if it cannot be taken away from its owners during the war, the least that can be done is to see that it is not over-remunerated in the interim. In this war, the public has from the start clearly grasped and approved the distinction between "genuine" savings, which it is right to remunerate with interest rates of up to 3 per cent., and created credit, which should be borrowed by the Treasury at no more than the cost of handling. The difficulty arises in defining "genuine" savings. If credit is being created for the benefit of the Exchequer, it is easy to identify it as

such at the moment of its creation. But in the second stage, after it has been paid out by the Exchequer and reappeared in some firm's or individual's income, it is no longer identifiable. The greater the degree of inflation, the more individuals will be able to "save"—and the smaller will be the "genuine" proportion of the whole. The only sound principle is that a real rate of interest should be paid for those additional savings, and those only, which result from a reduction in some individual person's or firm's consumption below the pre-war level. All the rest is merely inflation coming round for the second time.

The National Savings Campaign, with its wholly admirable energy and persistence, is going badly off the rails on this point. Most of its propaganda lays emphasis merely on the total of money subscribed. War Weapons Weeks are already leading to the subscription of newly created credit by local branches of the banks—a clear contravention of the principle. There is also a tendency to bless with the patriotic label private individuals' subscriptions to War Loan which represent no genuine abstinence from consumption at all. The whole cast of Savings propaganda needs to be quite radically altered. The individual should be told that his duty is to reduce his consumption by every possible means. He should have the lesson driven home to him on every hoarding that every act of consumption uses shipping space and labour—the two scarcest of commodities. Once he has economised as much as he can, it matters very little what happens to the money he saves thereby. The saving once done, it is of no advantage to the State to pile up enormous figures of subscriptions to Savings Certificates and War Loan. Indeed, it is to the State's advantage not to borrow at 2½ per cent. or 3 per cent. if it can raise the money more cheaply, and the truly patriotic citizen is he who, having reduced his consumption to the absolute minimum, leaves his spare money in the bank. Essentially, Lord Kindersley's task is to preach economy—and to keep subscriptions to Savings Certificates and War Loan down to the minimum. The greater the part that the creation of credit plays in the financing of the Government, the greater will be the necessity for insisting that to invest money so as to secure any return at all is a privilege to be reserved for those who can prove they deserve it, not a duty to be urged on the generality.

It is doubtful whether the National Savings Movement sees its duty in this light. But it is hardly doubtful that if, in savings as in other departments of war economics, money-thinking is allowed to obscure real-thinking, the result will be confusion of purpose and waste of resources.

Conditions in the Copperbelt

NORTHERN RHODESIA has for some time been regarded as one of the most backward of British territories in Africa. In spite of possessing its rich copperfield, the Colony is very poor, even by colonial standards; the land still in the possession of the natives is deteriorating rapidly, while large tracts reserved for Europeans lie empty and unused. The reserved for Europeans lie empty and unused. The strikes and rioting which took place on the copperbelt a year ago must, therefore, be regarded as a symptom of a deeper *malaise* than a wage dispute between the mines and the African workers.

In fact, except for an error of judgment at Nkana, where it was decided to hold the usual pay parade in the presence of an excitable crowd, the copper mines have been exonerated, by the Commission which investigated the disturbances, from blame for the riot and bloodshed. But the report of the Commission shows that it was not altogether satisfied with the conditions of the African workers or the relations between them and the Europeans. The Africans did not strike for the same wages as the Europeans, but

during the inquiry they claimed that their work entitled them to a higher wage than they receive at present. This contention was accepted by the Commission, and its recommendation that the basic starting wage of 12s. 6d. and 22s. 6d. a month for surface and underground workers, respectively, should be raised by 2s. 6d., has in turn been accepted by the Northern Rhodesian Government and the copper companies. They have also decided to classify African labour into grades, with higher rates for the higher grades. Moreover, increases are given in accordance with length of employment, while there are payments for overtime and bonuses for efficiency.

But no description of African wage rates is complete which leaves out payment in kind. The African worker is given free housing in compounds, near the mine, and free rations for himself and his family. In future, every worker will be given essential clothing on engagement and, in addition, a replacement allowance. Careful attention is paid to his health. He is medically examined and weighed on engagement, and is then

* A book entitled "The Taxation of War Wealth," by J. R. Hicks, U. K. Hicks and L. Rostas (Oxford: The Clarendon Press. 304 pages) has been published at a most appropriate moment. Professor and Mrs Hicks and Dr Rostas have not only compiled a great deal of information on experiments in excess profits taxes and capital levies in a variety of countries, they have appended a discussion of the functions and problems of such taxes which should serve very greatly to illuminate practical controversies. The book is an example of the best type of economic research, combining the scientific approach with actuality.

weighed at monthly intervals; if he loses weight he is sent to the medical officer for examination and treatment. Free treatment is given at the mines' hospitals for the worker and his dependants. The chief deficiencies found by the Commission with regard to welfare are crowded housing conditions, especially for families—which, however, are already being remedied—and a lack of adequate education and recreation facilities—which the Government and the companies have between them agreed to improve. In fact, it is possible to say that the copper companies, by African standards, and, indeed, some European standards as well, are good employers, so far at least as the welfare of their employees is concerned.

It is necessary to stress this because there is too frequent a tendency to brand the mining companies with "capitalist exploitation" of native labour, and to make crude comparisons between gross profits, native wages and dividends. In any extractive industry, the dividends paid when once the mines are in operation are always higher than in manufacturing industry. There are two reasons for this: first, the long period when capital is being sunk without a return; and, secondly, the fact that a mine is a wasting asset and that dividends represent to some extent a return of capital (though this latter element should not be over-emphasised in the case of Rhodesian copper, where the reserves are large). In the particular case of the copperbelt companies, there is the further circumstance that they are the technical leaders of the world copper industry. Even if the relative cost of labour were left aside, their costs of production would be low, and to deny a high return on their capital to those who increase the efficiency of an industry would be to impose one more obstacle to the technical progress on which the standard of living of the whole world depends.

In the light of all the facts, the record of the three Rhodesian copper companies is not one of shareholders' rapacity. The Rhokana Corporation was registered as early as 1923, Roan Antelope in 1927, and Mufulira in 1930. No profits at all were earned until 1932, and the full profit-earning stage was not reached until 1937. To date, some £22 millions have been invested in the industry, and the sum total of the gross trading profits (after allowing for depreciation of plant, etc.) that have been earned over the whole period of the industry's existence, which extends over 18 years, is only some £25 millions. Not all of this, by any means, went to those who provided the capital. Taxation has taken well over £7 millions (differing accounting methods make it difficult to say exactly how much) and the shareholders' portion after taxation, whether in dividends or reserves, has been substantially less than £17 millions.

If the companies are good employers, if they are paying the highest wages in the colony, if the yield on their investment is not excessive, to place the blame on them for the unsatisfactory position of the African native is merely an attempt to escape from the real difficulties with a shout of "capitalist extortion." There is doubtless room for higher wages and for more expenditure on welfare, but to insist that industry in Northern Rhodesia should be run primarily for the benefit of the natives would be to give them a privilege that the wage-earners of Great Britain itself do not enjoy. Indeed, if a charge is to lie against anyone for taking too much money out of Northern Rhodesia for too little return, it must lie against the Imperial British Government. The companies are registered in the United Kingdom and the working of the double taxation arrangements with Northern Rhodesia ensure that rather more than half of the total sum paid in taxation by the industry comes to London. In 1939-40 the Imperial Exchequer's receipts were probably rather more than two-thirds of those of the shareholders.

The real difficulty, however, lies not in the respective shares of the Colony and the United Kingdom in the revenue from the Colony's chief asset, but in the attitude of the companies, on the one hand, and the

Government, on the other, to the industrialisation of the African. The concern of the mine managements for his welfare is undoubted, but they never regard him as anything more than a supply of labour. The Commission considers that the Africans claim that they can do the work of Europeans is unjustified at this stage, but it recognises that they will progress and recommends that consultation should take place between the Government and the European workers' trade union on what positions the African worker should be encouraged to regard as within his grasp. No satisfactory reply has been given to this recommendation.

Unlike the companies, the Government, in accordance with the mainspring of British colonial policy, recognises the potentialities of the African, however backward he may be at the moment. But it considers that these potentialities—by which is meant potentialities for governing—can best be fulfilled by keeping the African in his tribe and allowing him to progress only on the basis of his local culture and inheritance. This, however, frequently means, especially in Northern Rhodesia, that economically he does not progress at all—the native on the copper mine has a higher standard of living than his fellow tribesman left behind. It is this principle of preserving the tribe that has caused the Northern Rhodesian Government to say that it cannot agree to a permanent industrialised native population on the copperbelt. Thus we have the paradoxical situation of the companies improving the health and economic position of the native but denying him the right to equality with Europeans, while the Government holds out to him unlimited rights but keeps him materially backward.

The African has made such genuine progress under British "indirect rule" that criticism of it must be expressed with great hesitation. Moreover, the very real evils arising from the breakdown of tribal life in Africa have too often been stressed by visiting Commissions and others to be ignored. But it is legitimate to ask whether it must be preserved at the price of perpetual poverty, whether the practice of allowing natives to work on the mines and in the towns of Rhodesia and the Union at all has not already broken it down to a large extent, and, if this is so, whether the best solution is not to accept it. The African is fundamentally an agriculturist and a communalist, and clearly he must only be industrialised with care. But it is perhaps possible for him to live and work in industry without rebelling against his natural instincts. Already, in the copper mine compounds, members of the same tribe elect an "Elder" to represent them, and it may be that the "Elder" system, which the Commission recommends should be encouraged instead of the formation of trade unions, can replace the background formerly supplied by the village and the chief. And there seems no reason why, as the Commission also recommends, the native workers on the copperbelt should not be encouraged to have their own small plots of land, in which their wives could work as they do in the native villages.

But whether this is a solution or not, the fact remains that the Government may eventually have to choose between preserving the tribe and industrialising the native. If it chooses the latter—and in a country like Northern Rhodesia, where the only real asset must be exploited by European capital, the choice seems inevitable—the companies must agree to give the African equal opportunities for advancement with the European. And at all costs steps must be taken to prevent unemployment and labour problems arising from a copper slump. But the present system, by which the natives are encouraged to return to their tribes after a year or eighteen months, seems to get the worst of both worlds. It discourages the companies and the Government from having a permanent labour policy which will suit the African; at the same time it gives the intelligent Africans a tantalising glimpse of a life which they cannot enjoy and tends to make all of them restless and discontented.

NOTES OF THE WEEK

Good News from America

President Roosevelt's speech, delivered on the Ides of March, has had a heartening effect wherever in the world men still love freedom. In it he pledged the American people to a "total effort" in this war. Sacrifices will be made in the common cause, the idea of "business as usual" which haunted Britain's war economy so long will be banished, the American nation will dedicate itself "from here on to a constantly increasing tempo of production," and the term of effort, sacrifice and dedication will be victory for the cause of Democracy. The British people have gained as their ally the most powerful industrial nation in the world and the American help is theirs until they have "finished the American help is theirs until they have 'finished the job.'" The President's speech with its promise of food, "the whole range of munitions of war," together with "the necessities for transporting them across the seas," gave expression to the facts of a tremendous week of activity. The Appropriation Bill to give effect to the Lease and Lend Bill to the tune of £1,750 millions is passing through Congress. Existing stocks—including ships—are already on their way to this country. Mr. Harriman, the President's special representative, has arrived in London to expedite all matters connected with war supplies. The help promised, the relief after months of waiting, the opening horizons of co-operation in peace and war, encourage the British people to see in them the promise of the day when, in Mr. Churchill's words, "the British Empire and the United States will share together the solemn but splendid duties which are the crown of victory." But after their first natural fervour of gratitude and relief, the British people must avoid their habitual failing of seeing in the reasons why victory is likely an assurance that the war will win itself. The blockade, an internal collapse in Germany, the Maginot Line—all these have served their day. It would be unwise to add "American help" to the long list. A great part of the promised war supplies will not reach this country for months to come. In the meantime, the U-boat campaign will take a deadly toll of incoming cargoes. Escort vessels remain a serious problem, even when the ships released by America are taken into account. For months yet, indeed to the very end, the British people must continue to save themselves by their own exertions. Nor must they assume that all controversial issues between the great allies have now been settled. Nevertheless, while entering this caveat, Britain can afford to rejoice with a grateful heart.

* * *

The Coming of Spring

Two facts have emerged from the renewal of bombing since the return of reasonably good flying weather. The first is that the Germans have apparently learned a lesson from the poor results of their wasteful large-scale raids last year. It is not so much that their aim has improved—the damage done to non-military objectives at Bristol and on Clydeside has been quite in the old style—but their intentions seem to be more specific. The *Luftwaffe's* targets now are mainly ports and docks—with only an occasional return to old habits and the bombing of Central London, which is too far from the Port for this to be simply bad shooting, and of course the usual operational forays against aerodromes. The attacks on Clydeside are an important reminder that the points where the sea-ways join the ocean routes themselves, and while the small toll taken by actual destruction is still a measure of the failure of aerial bombardment to justify its advance press notices, delays in crowded harbours can cause grave inconvenience. When the enemy bombers are ringing the changes on the Bristol Channel, Merseyside and the Clyde, there is really no excuse either for the authorities to stand on ceremony or for workpeople to appeal to custom while there are ships to be cleared and goods to be moved. Britain has put fresh types of bombing planes into the air for new and heavy raids on Germany. The second moral of the latest attacks by air is the improvement in night defences. Over Britain, the nights of the full moon were

"field days" for gunners, fighters and "other devices," and while German losses here appear, even proportionately, to have been considerably heavier than the British losses over Germany, it seems that once again, as so often in the history of warfare, methods of defence are overhauling the attacker on all air fronts—except, apart from Malta, in the Mediterranean, where the Italians' genius for defence is proving even less substantial than their flair for the offensive. The biggest battles are presumably still to come when the second spring of the war really breaks; then there will undoubtedly be savage raiding by both combatants. But the steady betterment of defences suggests what many observers have been convinced of for some time, that is, that air power will only be decisive in resistance. It remains true that aircraft gain no ground, and against any kind of resolute defence air attacks, in isolation from the other arms, do not, in terms of war, do decisive damage.

* * *

Taking the Strain

In the week ended March 9th sinkings of British and Allied ships totalled 98,832 tons. The disturbing size of this total is more important than the fact that it was some 50,000 tons below the previous week's total and not much more than half the enemy's claim; and in his speech on Tuesday, welcoming the new United States Ambassador, Mr. Churchill made no bones about the fact that the Battle of the Atlantic, against far-flung raiders and bombers as well as submarines, is a matter of life and death. The defences are meeting the shock. Mr. Churchill was able to announce, for the first time since October, 1939, news of three U-boats sunk for certain on a single day. Sir Percy Noble has been appointed Commander-in-Chief, Western Approaches, which is now a separate command, and—no less significant—Rear-Admiral Arthur L. St. G. Lyster, who commanded the Mediterranean aircraft-carriers at the time of Taranto, has been made Chief of Naval Air Services. There have been many discussions lately about the best means to combat this spring offensive, and especially about the nature, numbers and functions of air patrols, and it is to be hoped that these two men have come to their critical task with the right plans drafted.

* * *

The Balkans Wait

There are a variety of reasons to explain last week's lull in the Balkans and different observers are free to interpret it according to their native optimism—or lack of it. It may well be due to the weather. An early burst of delusive spring weather brought the Nazi divisions into Bulgaria. It has been followed by a cold spell and rain. There is also the problem of getting the Germans to their battle-stations and ensuring that when the blow is finally struck it falls with customary German

efficiency. Bulgaria is not the best equipped country from the military point of view and Germany's lines of communication are long and vulnerable. It is, however, on the diplomatic situation that the optimists base their hopes. It is fairly obvious that Hitler did not wish to fight the Greeks and that his general experience with small peoples suggested that the mere arrival of German divisions on the Greek frontier would do the trick. It is worth noting that the German arrival coincided with a big Italian offensive in Albania—under the personal guidance, it appears, of the Duce—and the double blow was intended to compel Greece to capitulate. The next steps would then have been easy. Yugoslavia, encircled, would have joined the Axis, Britain would have been excluded, and Turkey, disillusioned by the fate of her friends, would have come to terms. Unhappily for the Germans, the Greeks were

unperturbed and smashed the Italian offensive with heavy losses to the enemy. Hitler is undoubtedly left in an unhappy quandary. His relations with Yugoslavia and Turkey, which were planned to settle themselves after the collapse of Greece, must now be settled before further steps against Greece are undertaken. Turkey, while avoiding commitments, has given a dramatic demonstration of solidarity with Britain in the Eden-Sarajoglu meeting at Nicosia, and the Yugoslavs, who must have seemed fair game to the Nazi sportsmen, have quietly mobilised and adopted so assured a tone that Germany's earlier demands for the passage of troops and full co-operation with the Axis have been watered down to neutrality and economic collaboration—which Germany enjoys already. The Balkan situation remains perilous enough for the Allies, but Hitler, too, is finding the path none too smooth.

The Nazis in the Middle East

It is clear from German activities in the Middle East that Britain's successes in North Africa and Greece's unexpected stand have not altered the Nazis' general strategic plan in this area. This is not extraordinary since it turns on the first necessity of war—oil. For the time being, Germany's Middle Eastern tactic resembles the policy pursued in the Balkans before it became necessary to advance to military occupation. It proceeds on two planes, economic infiltration and political disintegration. In the economic field, the occupation of Varna and Constanza undoubtedly forwards Germany's Black Sea commerce. In Turkey, the virtual breaking off of economic relations of September, 1939,

has been, step by step, revised. To-day Germany is buying £T5 millions' worth of Turkish tobacco. A trade delegation has visited Izmir and Germany hopes to arrange an important barter agreement covering Turkish dates and raisins. The Germans have the largest share in Iran's foreign trade; their colony has grown to 25,000 in the last year, most of them "commercial travellers," and there are at least 2,000 "technicians" connected with road and railway works. Others are prospecting for oil. Again, in Syria, a party of "archæologists," led by Baron von Oppenheim (of all unlikely names), has discovered a surprising number of Khalti relics in the neighbourhood of Syria's potential oil districts. But in Syria and Iraq Germany's action is political rather than economic. In Iraq, the extremist Iraqi nationalists, with *al-Istiqlal* as their mouthpiece, accept their news from Axis sources, lose no opportunity of denouncing British imperialism, or of calling for Arab independence. However, the Axis has not apparently been able to win these extremists for the idea that German imperialism is preferable to British. In Syria, the country is in a ferment between the Vichy officials giving grudging support to the officials of the Axis—M Puaux was probably dismissed for insufficient "co-operation," a growing section of the army and bureaucracy who support De Gaulle, and the nationalists who demand independence. Economic shortage completes the picture, and sporadic rioting and arrests are its symptoms. The waters are troubled enough, and these are notoriously the waters in which Hitler prefers to fish.

Dollars, American and Canadian

The fact that the passage of the Aid for Democracy Act (*né* Lease and Lend) has not absolved the British Treasury from the necessity of increasing its supply of dollars by every possible means has been emphatically underlined by the news that the holding of shares in the American Viscose Corporation, owned by Courtaulds, Ltd., has been sold on behalf of the Treasury to an American syndicate who are to make a public issue of the shares. American Viscose is one of the earliest and most successful examples of direct British enterprise in American industry and, however good the monetary bargain, there will be a great deal of sympathy with Courtaulds over the loss of their child. It is, indeed, a sad event, though not one that is to be regretted, since it comes at a most appropriate hour to demonstrate that Great Britain is still ready for sacrifices of any kind to provide the sinews of war. There are already signs that the Lease and Lend programme is to be interpreted broadly—large transfers of cotton and tobacco are apparently on the agenda—but the shortage of dollars is as acute as ever. The appearance in the estimates of British dollar needs which have been published recently in the United States of substantial sums paid to Canada has naturally given rise to some discussion in this country. As was remarked in *The Economist* last week, "it is somewhat anomalous that a neutral should be providing munitions free of cash payment while gold or American dollars are still being paid to a belligerent." But it would be wrong to read into this anomaly, as is being done in some quarters, a suggestion that there is any hoarding of gold by Canada or any lack of financial co-operation at Ottawa. The gold or American dollars paid to Canada by the United Kingdom are needed to settle Canada's own adverse balance with the United States, a balance swollen by imports of raw materials and machinery for the rapidly growing Canadian armament programme. If Canada could obtain these commodities on lease-and-lend terms, the necessity would, of course, disappear. But the difficulties that have to be surmounted do not include any lack of co-operation on Canada's part, and it is a pity that the publication of partial statistics should have given rise to a false impression.

Minds Across the Sea

The representation of the British and American Governments in each other's capital is rapidly and happily growing. Mr Winant, the new Ambassador, has been welcomed by the Pilgrims. He was accompanied by Mr Benjamin Cohen, one of the acutest minds in the New Deal and a very close associate of Mr Roosevelt; and he has been followed by Mr W. A. Harriman, who

is to act as the President's "defence expediter." At the same time, Mr Anthony Biddle has come to London as Ambassador or Minister to the Governments-in-Exile. This, together with the existing staff of the Embassy and the shifting population of special missions, constitutes by far the strongest diplomatic team that the United States has had in any foreign capital since the days of the Paris Peace Conference. At the other end of the cable, in Washington, Lord Halifax has recently been given three most valuable reinforcements. Sir Arthur Salter is going out on a mission that will mainly be concerned with the supply of merchant shipping; Mr R. H. Brand, who is already in Washington, is to represent the Ministry of Food; and Professor Noel Hall is to take charge of the economic warfare work of the Embassy. Thus the Ambassador, himself a member of the War Cabinet, will now be supported by the unprecedented number of three Ministers in the Embassy (Mr Butler, Sir Gerald Campbell and Professor Hall), by two Privy Councillors (Mr Purvis and Sir Arthur Salter) and by other Heads of Mission of the calibre of Mr Brand, Sir Clive Baillieu (Supply), Mr Morris Wilson (Aircraft Production) and Sir Frederick Phillips (Treasury). All this is very much to the good; these two Embassies can never again be regarded as ordinary diplomatic posts.

Two Masters

The layman can say little useful about aircraft design and manufacture, but many thoughtful citizens have been rightly disturbed by recent stories of friction between the Air Ministry and the Ministry of Aircraft Production, and by reports of resignations. In the Commons debates last week and this on the Air Estimates, these tales have been put in a soberer perspective. The chief figure involved, Sir Henry Tizard—the *doyen* of aeronautical research who "found it impossible (as one Member put it) to work at MAP"—is coming back to work. Sir Charles Bruce-Gardner, who had been somewhat ambiguously placed in the Ministry as chief executive of the Society of British Aircraft Constructors, has returned to his employers. Only Air Marshal Sir John Salmond, who was Director of Armament Production at MAP, is still absent and unexplained. The point is that, administratively, MAP is an anomaly. After Dunkirk, simply because of the lamentable failure of output to keep pace with war needs, an *ad hoc* Ministry to put aircraft first was a necessity. Its job was to deliver the goods, and history will record Lord Beaverbrook's success. Since September, the scene has altered. The need is no longer simply to speed up production. Quantitative superiority remains the target, but out of the dramatic events of the past six months, crucial questions of quality—or, more precisely, of type—have arisen; and there are two Ministries, instead of one, involved in their answer. It is not so much a question of friction between MAP and the Air Ministry as one of sovereignty. On the face of it, it would seem obvious that the Air Ministry, within the frame of the Cabinet and its Defence organisation, should decide such issues as the ratio in production between fighters and bombers and the new types to be turned out in bulk—just as the War Office should make its requisition for co-operating and carrying planes, and the Admiralty for fleet arm machines. MAP is a supply department with the title of Ministry, and its function is production not policy; it should be, as one Member said last week, the Air Ministry's "fag." Actually, however, development and research are focussed at MAP—for what are, admittedly, sound practical reasons—just as the "technical and scientific people" of the War Office are at the Ministry of Supply; and Lord Beaverbrook is hardly the man to be anyone's fag. Last year's crisis called for energy and resolute individualism, just as perhaps shipbuilding and the clearing of ports do at present. Now, at what is probably the turning point of the air war, it is co-operation in a common programme of defence and victory that is called for; and without judging any of the technical matters involved—or even knowing what exactly is going on—it is possible for the layman to decide that the present system of "diarchy" by these two Ministries is pregnant with perils.

Berbera Retaken

There is still little to report from Libya. The RAF have delivered some punishing attacks on Tripoli where

units of the *Luftwaffe* are stationed. In Eritrea, after a lull, fighting has flared up again at Keren, but the attacks appear to have been launched by the Italians in an attempt to break the noose which the encircling British forces are drawing tighter. In Abyssinia, the advance of Imperial and Patriot troops continues on all fronts, but the forces operating in the southern sector are encountering less opposition and greater progress is being made. The stroke of the week was undoubtedly the recapture of Berbera, capital of British Somaliland. The attack was launched by landing parties under cover of a naval and air bombardment and Somalis and Arabs took a prominent part in the engagement. The Italians captured were in a state of very low moral, and their equipment suggested that the Italians have now completely abandoned any attempt to relieve their outlying garrisons. The mopping-up of the colony should not take long, and it is satisfactory to recall that its occupation by the Italians has lasted only seven months.

Clydeside Again

Mr Bevin's scheme to speed up work in docks is to be applied to Clydeside. On March 22nd the dockers there were scheduled to register and become, in effect, employees of the Ministry of Transport, with the benefits of a guaranteed weekly wage, generous overtime rates and regular employment. Unfortunately, the trade union representatives of 4,000 Glasgow dockers say their men will not come in. Apparently, neither the visit of the King nor the visit—the first one—of the *Luftwaffe* has altered their view, which is not shared by their 600 colleagues at Greenock, that the plan is impracticable, and that they are doing by their present arrangements all that can be done. This contrast to the eager acceptance of the scheme by the dockers on Merseyside is fiddling while Rome burns—or, rather, while the enemy bombers made a syncope progression, night by night, from port to port—with a vengeance. It is possible that some of the dockers' misgivings are quite genuine. The Clyde and the Mersey are not on all fours, and it would be foolish to set these Clydesiders down simply as Communist saboteurs when the part played by the Communist few is, as always, only to fan the flames. Moreover, only a fifth of the dockers were at the meeting which voted for rejection. But in alliance with the merchant seamen who take "impracticable" risks every hour of the day, these dockers hold the life of the nation in their hands, and if Mr Bevin considers that his scheme is essential, he has power to enforce it—and the duty to do so. Indeed, the urgency of the day is no less than it was when a military director of all forms of transport was placed over the French ports which fed the Allied armies twenty-five years ago—and it is not only in dock labour that the present means of moving goods are faulty.

If Hitler Comes

Over last week-end, the Government issued the text of the leaflet, shortly to be distributed to every household, on what to do in an invasion. "Stay put" has been defined as staying in one's district, but otherwise carrying on a normal life—unless fighting breaks out in the neighbourhood, in which case people are advised to stay indoors until the battle is over. The police and air-raid wardens will be the normal source of advice and orders; but it is possible that the public will have to take orders from the military or Home

THE WORLD OVERSEAS

Labour in the Defence Programme

(From Our Washington Correspondent)

February 19th

SOME estimate of labour's position at this stage of the defence effort is now possible. The basic statistics give a preliminary indication of recent changes. In December, 1940, total non-agricultural employment stood at 37.2 millions, compared with 35.8 millions in the preceding December, 28.3 millions in the year 1932 and 36.7 millions in the year 1929. Average weekly earnings in all manufacturing industries were \$27.89 for December, 1940; they were \$26.26 in the preceding December. In busy 1937 they were \$24.95. On the base 1935-39 = 100, the index of the cost of goods purchased by wage-earners and lower-salaried workers in the large cities—food, clothing, rent, fuel, etc.—stood at 100.7 in December, 1940, compared with 99.6 in the preceding December, 92.4 in the year 1933 and 122.5 in the year 1929.

The story behind the statistics of these shifts contains a number of new chapters. During the long decade of under-employment, jobs had been scarce in the construction and the durable goods fields—the two fields of most greatly quickened activity under the defence programme. Apprenticeships had been few, retirements and shifts to other occupations many. By midsummer, a nation that for years had been primarily concerned with unemployment had become primarily concerned with employment. That did not mean that unemployment had disappeared—according to kerbside statistics, there are some 5.5 million persons still unemployed, of whom about half are probably employable. But it did mean that, in certain categories, the nation faced scarcity rather than surplus. It did mean that the main job of the still rather young U.S. Employment Service suddenly began to correspond to its title. It did mean that, instead of careful measures—as, for instance, in the Tennessee Valley Authority—to avoid being besieged by workers on the road in search of a job, transfers of workers had to be arranged to staff many of the big new products.

In a number of categories the existing quantity of skill is being increased by supplement and by dilution. Short vocational courses are preparing youngsters in the high schools, on-the-job training and "up-grading" is being done in the plants. For the latter purpose, the Labour Division of the Defence Commission has divided the country into twenty-two industrial districts; in more than forty cities, a member of their staff, assisted by a panel drawn from labour and management, is forwarding this job.

Up to the present, the bottlenecks are localised and relatively few. But with the completion of the many plants now in the construction stage, pressure for highly-skilled mechanics will be sharply stepped up, and present methods of supply may require revision.

The current firmness in wages is in part—so far as concerns certain categories of skilled workers—a reflection of scarcity. In larger part, it is a reflection of the social legislation of the past eight years, and the require-

ment that compliance with this legislation should be a condition of receiving defence contracts. Four basic laws are included in these safeguards: the Walsh-Healy Act, providing for determination by the U.S. Department of Labour of a minimum wage rate on contracts over \$10,000; the Wagner Act, recognising the right to collective bargaining; the Fair Labour Standards Act, containing minimum wage and maximum hour provisions; and the Davis-Bacon Act, requiring the payment of prevailing wages on Government construction projects. A test of these provisions has just been terminated in respect of a contract for the manufacture of trucks, the award of which to the Ford Motor Company was withdrawn—after considerable discussion back and forth in Army Procurement and the Defence Commission—because Mr Ford, an outstanding opponent of labour organisation, declined to accept the conditions.

Board and Lodging

Among living costs, the main squeeze arising out of the new distribution of economic effort has to do with housing. The pressure of increased purchasing power caused food prices to advance 2.4 per cent. between December, 1939, and December, 1940, but about twenty foods are currently declared to be in surplus by the Secretary of Agriculture and therefore available for distribution through the Stamp Plan. But to the cumulative housing shortage—during the second half of the 1920's in 257 selected cities accommodation was provided for about 325,000 families annually; during the second half of the 1930's, for about 148,000—is now added an acute need for workers' homes in certain localities, near shipbuilding yards, aeroplane plants, etc., where the number of employees has been doubled and trebled in the course of a few months.

Construction around these sites is projected and in process under both public and private auspices, but the position on February 8th of public defence housing construction for civilian industrial workers—funds allocated for 68,432 units, 530 units completed—shows about where the matter stands.

A major difference between the position of labour in the current effort and in 1917-19 is the difference in the degree of organisation in defence industries. The coming of "industrial" unionism, with its inclusion of unskilled and semi-skilled, as well as skilled, workers in the union ranks, and the extension, under the Wagner Act, of organisation into such industries as automobiles, steel, textiles, rubber, glass, shipbuilding, electrical equipment, public utilities, aircraft, have greatly changed the picture of collective bargaining. Anti-union strongholds such as Ford and Bethlehem are coming to be exceptional.

The current three-way split in labour's forces, however, greatly lessens the force of organised labour. In spite of rank-and-file desire for unity, it became clear last autumn, at the time of the American Federation of Labour and Congress of Industrial Organisations' conventions, that a formula for unity was not a present possibility; the best obtainable arrangement was a precarious for-the-duration truce. At the CIO convention and the right took on major proportions.

Sponsoring Mr Willkie's candidacy during the last weeks of the campaign, when the tide appeared to have taken a Republican turn, Mr Lewis announced that he would resign if Mr Roosevelt were re-elected—thereby, as someone remarked, putting the country under the necessity of selecting two presidents, one for the nation and one for the CIO. Mr Lewis's opposition to involvement in the war, shared by the Communist wings of

various CIO. unions, and Mr Hillman's collaboration with the Roosevelt programme as a member of the Defence Advisory Commission, have deeply divided the CIO. for months. The convention merely glossed over that division, Mr Lewis's successor, Mr Philip Murray, long-time member of the United Mine Workers and able head of the Steel Workers Organising Committee, has not yet indicated where he stands.

Few Strikes

Recently, strikes in defence industries have been making headlines, and in conservative quarters growls about the conscription of labour are heard. As a matter of fact, strikes have been surprisingly few. In 1937, when a business upturn brought re-employment on a scale considerably less than the present, 4,740 strikes, involving 1,860,621 workers, caused 28,424,857 man-days of idleness. In 1939, there were 2,613 strikes, by 1,170,962 workers, lasting 17,812,219 man-days. For this past year, by contrast, the total is 2,450 strikes, 575,000 workers, 6,500,000 man-days idle. It is also interesting to compare these figures with those for 1916, with 3,789 strikes and 1,599,917 workers out, and 1917 with 4,450 strikes and 1,227,254 workers out.

The reason that there have not been more strikes lies, in part, in the machinery for settling disputes contained in various collective contracts, many of which have been recently renewed, and, in part, in the efforts of the Conciliation Service of the U.S. Department of Labour and the work of the Labour Relations Section of the Defence Commission, whose representatives have forestalled most of the 300 threatened stoppages since the beginning of the defence programme and helped the quick termination of such as have occurred.

Criticisms of the King Ministry

[FROM OUR OTTAWA CORRESPONDENT]

February 18th

THE Federal Parliament of Canada re-assembled on February 17th after an adjournment of about ten weeks. The Minister of Finance presented to the House of Commons ordinary non-war estimates for the fiscal year 1941-42 totalling \$433,131,000, which were classified as follows: ordinary account, \$417,103,000; capital account, \$3,453,000; special account, \$11,042,000; and Government-owned enterprises \$1,533,000. These figures represent a reduction of \$18,120,000 compared with the estimates for the current fiscal year, and it has been achieved in spite of increases totalling about \$25 millions, of which the most important items are \$10,700,000 for the new scheme of unemployment insurance and \$2,750,000 for the decennial census. He placed the total amount of the uncontrollable expenditures at \$268,102,732, of which \$151 millions were allocated to interest on debt and the balance to items such as war pensions, provincial subsidies, old-age pensions, etc.; he claimed that since the war began net savings of \$92 millions had been effected to reduce the controllable expenditures to roughly \$164 millions. He explained that the interest on the public debt had increased \$6,934,000 during the present fiscal year and would mount further next year. His most comforting disclosure was a forecast that the deficit of the Canadian National Railway system would be completely eliminated in the coming fiscal year and no provision is being made for it.

The King Ministry can count upon the co-operation of all the Opposition groups on all vital issues, but it can also expect a continuous barrage of criticism about the more unsatisfactory features of its war administration. For some time past Ottawa has been full of stories of serious friction and dissensions between certain Ministers and high officials and rumours of impending resignations. The chief storm centre of the rumours is the Ministry of Munitions and Supply, and there have apparently been acute differences of opinion on fundamental policies between Mr Howe, the Minister in charge of this department, and Mr H. R. Macmillan, a prominent business man from British Columbia, who is Chairman of the Wartime Requirements Board. Mr Macmillan has

To the careful investor

3% DEFENCE BONDS

invite your closest
investigation!

The careful investor insists that any security into which he is asked to put money shall pass the most searching examination. Defence Bonds stand up to any enquiry; the more critical it is, the more their merits stand out—but you can hold only £1,000

What interest do Defence Bonds pay?	3% per annum from date of purchase paid on May 1st and November 1st. Interest is liable to Income Tax, but tax not deducted at source.
How can I buy Defence Bonds?	In £5 units, or multiples of £5, from any Bank, Trustee Savings Bank, Post Office or Stockbroker, or by instalments, using 2/6 Savings Stamps, through any Savings Group.
Is my capital safe?	The British Government undertake to repay your capital in full at the end of seven years or at any time on 6 months' notice.
Do I get any premium when my Bonds are repaid?	For every £5 which you hold for its full life of 7 years you will get back £5.1.0.
Can I realise my capital readily in an emergency?	In case of private emergency you can cash your Bonds immediately, subject to a deduction equal to six months' interest.

THE BUSINESS WORLD

Wheat Supplies in 1940-41

THE war has played havoc with the international wheat trade. European Continental imports from overseas are restricted by the British blockade; Great Britain's supplies are menaced by the Nazis' attempt to cut her sea communications; and the great exporting countries, left with unsold surpluses, have been compelled to underpin growers' incomes by means of minimum prices and other devices. The war has also rendered it more difficult to appraise the wheat supply position with any degree of accuracy, but its main features are outlined in the latest issue of *Wheat Studies*, published by the Food Institute of Stanford University, California.

World supplies of wheat during the season ended July 1941 appear to be substantially higher than in preceding crop years. The distribution of these supplies (which include unsold stocks carried over from the preceding seasons) is shown below:—

WORLD WHEAT SUPPLIES (EXCL. U.S.S.R.)
(Million bushels)

Crop Year	North America	Australia Argentina	Europe			World (excl. U.S.S.R.) (b)
			Lower Danube(a)	Other countries	Total	
1935-36	1,260	428	336	1,623	1,959	4,525
1936-37	1,115	504	418	1,392	1,810	4,266
1937-38	1,176	481	401	1,306	1,797	4,370
1938-39	1,470	645	502	1,576	2,078	5,178
1939-40	1,628	610	529	1,631	2,160	5,378
1940-41	1,954	568	385	1,540	1,925	5,482

(a) Hungary, Yugoslavia, Rumania, Bulgaria. (b) Incl. other countries and net exports of U.S.S.R.

The large exporting countries are faced with a serious surplus problem. For the second year in succession Canada has had a very large crop, estimated at 551 million bushels, against 521 million in 1939 and 360 million in 1938. The United States, too, has had a fairly heavy crop, and, at 817 million bushels, it showed an increase of 66 millions over the previous year's. Argentina produced some 276 million bushels, against a poor crop of 119½ millions harvested in 1939-40, but Australia's harvest, at 92 million bushels, was a failure, and compares unfavourably with the yield of 210 million bushels in the previous season. The combined harvests of these four large exporting countries rose from 1,602 million bushels in 1939-40 to 1,736 millions in 1940-41. If the carry-over from the previous season is added, the combined wheat supplies of North America, Australia, and Argentina in 1940-41 amount to 2,522 million bushels, against 2,238 millions in 1939-40 and 2,115 millions in 1938-39. In every one of the four large exporting countries, the Government has had to

come to the assistance of the farmers by sustaining the market. Nevertheless, the prices realised in 1940 were substantially lower than in the preceding year in Canada, the United States, and Argentina. In Canada the average price—No. 3 Northern Manitoba—fell from 76.4 cents in 1939 to 67.7 cents per bushel in 1940; in the United States it declined from 98.3 cents to 83.0 cents per bushel for No. 2 hard winter wheat; and in Argentina it was reduced from 7.63 pesos to 6.75 pesos per quintal.

If anything, the quantity of wheat that these four countries will be able to export in the current season will be smaller than in 1939-40. During the first five months of the current season, from August to December, 1940, their net exports of wheat and flour were only 140 million bushels, against 200 millions during the corresponding period in 1939 and 169 millions in 1938. True, it is essential that large stocks should be available for distribution in Europe on the conclusion of peace. But the granaries are already bursting, and as the end of the war is not yet in sight the accumulation of further stocks seems as undesirable as it is unnecessary. The solution clearly lies in collaboration between the four major exporting countries. If, with the assistance of American finance, they can agree on a programme designed to limit production and to control the disposal of surplus stocks, there is no reason why the problem could not be solved. Isolated action, on the other hand, may lead merely to a further disorganisation of the market, to a collapse in prices and to political unrest in some of the countries concerned.

In contrast to the exporting countries, Great Britain's problem is how to bring adequate supplies of wheat into the country. According to *Wheat Studies*, the output of wheat in the British Isles amounted to some 74 million bushels in 1940, against 71 millions in 1939 and an average of 71 millions during the five years 1934-38. The same source estimates the United Kingdom's imports at 222 million bushels during the season ended July 1940, against 230 millions in 1938-39 and 195 millions in 1937-38. Present stocks of wheat are understood to be still substantial, while, in an emergency, it should be possible to make up a deficiency in wheat supplies by an increase in the consumption of home-grown potatoes, which are in ample supply. But the supplies of wheat, like those of other foods, of raw materials and of munitions from America depend on the defeat of the Nazi blockade, and however favourably the Battle of the Atlantic may proceed, Great Britain will clearly not be able to relieve the world wheat market of its surpluses.

The Continent's problem is similar to Great Britain's in that Nazi-controlled countries are subject to blockade. But the European mainland is much less dependent on imports of grain than the British Isles and, in the Northern countries at any rate, wheat is not as important a constituent of bread as in this country. Even before the war, Germany's rye consumption equalled that of wheat.

Last year's Continental wheat crops showed a reduction from the yield secured in 1939. *Wheat Studies* gives the following estimates:—

CONTINENTAL WHEAT PRODUCTION (Million bushels)			
	1934-38 average	1939	1940
Danube basin (old boundaries) (a) ...	302	454	300
Baltic (b) and Soviet Poland ...	52	57	45
Neutrals (c) and Greece ...	217	209	198
Italy ...	267	293	208
Germany and conquered areas (d) ...	628	627	515
Total ...	1,526	1,640	1,226

(a) Hungary, Yugoslavia, Rumania, Bulgaria.
(b) Estonia, Latvia, Lithuania.
(c) Spain, Portugal, Sweden, Finland, Switzerland.
(d) Greater Germany, Norway, Denmark, Holland, Belgium and all of France.

Crops were undoubtedly lower in 1940 than in 1939 in the majority, if not in all, the Continental countries; and, except in Germany where they are rigidly controlled, average prices were generally higher. But actual supplies available in 1940-41 probably did not show a proportionate decline, for, as a result of the accumulation of emergency stocks, carry-overs into the current season must have been higher than a year earlier. The European rye, barley and oat crops are believed to have shown a smaller reduction than the wheat harvest, while in the Danubian countries an excellent maize crop appears to have partly offset the reduced wheat yield. The potato harvest is reported to have been satisfactory and will no doubt be used to make up deficiencies in bread grains. In Germany, the most important producer of potatoes, the crop appears to have given a yield larger than in 1939 and almost equal to the record harvest of 1937. So far as grains and potatoes are concerned, the total supplies at the command of the Nazis appear to be adequate to the essential needs of Germany and of the countries under her control. Indeed, the problem seems to be one of distribution rather than of a serious general shortage. Given the willingness to share available grains and potatoes and the requisite transport facilities, there is no reason why the Continent should starve before this year's harvests are brought in, though, as in Great Britain, the quality of the diet is likely to suffer. The considered opinion of the writers of *Wheat Studies* is:—

"If the German Government should set itself the task of supplying an adequate number of food calories to the entire population of the Axis-controlled territory of Europe ex-Danube, the task might possibly be performed satisfactorily during the current crop year. . . ."

Such an authoritative opinion should allay the fears of a well-meaning American public. If the people in occupied territories are made to starve, they must blame the callousness of the Nazis. So far as the remaining Continental neutrals are concerned, these will presumably continue to be allowed to import essential supplies of wheat and of other foodstuffs under the British navicert system.

Finance and Banking

Large Treasury Deposit Payments

Credit has become progressively scarcer this week and by Thursday all the large banks had withdrawn from the market as buyers of bills. The banks have again had to make heavy tax transfers, and their cash position has been considerably affected by the £40,000,000 Treasury deposit payments which they were called upon to make this week. This is £30,000,000 in excess of maturities and thus equals the highest net weekly payments since this new form of borrowing was instituted. One of the clearing banks made up its March balance-sheet this week and this fact also helped to disturb the credit position. Fortunately the market has been a meagre seller of bills following its small allotment at last week's tender and the scarcity of bank cash—reflected in the Bank return in a further fall in bankers' deposits by £14,929,000 to £95,187,000—has not made itself appreciably felt. It is interesting to note that the exodus of funds responsible for this exceptional paucity of bank cash has not gone to swell public deposits—which remain substantially unchanged at around £14,000,000—but to pay off Government debt. The fall of £16,450,000 in Government securities suggests a more conscious deflationary move than would a corresponding immobilisation of funds in Government accounts.

Treasury Bills Under 1 Per Cent.

For the first time since August, 1939, the Treasury bill rate has dipped below 1 per cent. The £65 millions of bills tendered for on Friday of last week were issued at an average rate of 19s. 11.79d. per cent. This fall of the average below the clearing banks' minimum money and bill-buying rates must be regarded as the immediate result of the discount market syndicate's attempt, begun a fortnight ago, to obtain larger allotments of bills by cutting the rate. The market's tenders did not bear direct responsibility for the drop in the rate below 1 per cent., since the syndicate would obviously stop its com-

So far as information is available Germany does not appear to have been unduly concerned with the sharing of bread grains on an equitable basis. In Germany, the ration is reported to be liberal. It provides for a weekly allowance of 85 ounces to "normal consumers," 119 ounces to grain-producing farmers, and 170 ounces to persons engaged on heavy work. Uniformly administered, these rations involve virtually no restriction on bread consumption. At the other end of the scale are Poland and Belgium, where bread purchases per head are restricted to about two-fifths to two-thirds of pre-war consumption. In all the other countries, the bread ration is between these two extremes, though almost everywhere the quality of the loaf has deteriorated, largely because of the admixture of other grains and, possibly, potatoes. Meanwhile, the Germans are devoting a good deal of energy to the increase in the production of foodstuffs in the current year. And as they are relying heavily on the use of forced labour and other devices designed to secure an increase in cultivation, it is possible that this year's grain harvest may exceed those of 1940 in some of the countries under their control.

In essence, the outlook for wheat is the same as that for sugar and other foodstuffs that are normally imported in large quantities by Europe. On the one hand, the large exporting countries, while holding substantial reserves for release to Europe and China after the war, are temporarily faced with heavy surpluses and low prices and with the consequent need for limiting output, preferably in collaboration with each other. Great Britain is temporarily compelled to reduce her intake of wheat; her tasks are to expand domestic production during the war and, in conjunction with the United States, to defeat the Nazis' attempt at cutting her sea communications. Nazi-controlled Europe, while forced to eat less wheaten bread, has sufficient grains and potatoes to carry it through this season without wholesale starvation, always provided that Germany is willing to shoulder her responsibilities towards the women and children in the countries she has so wantonly overrun.

petition for bills short of the point at which it began to run or resell its bill at a loss. But the cut in the syndicate rate for bills to something under one-sixty-fourth over 1 per cent. has impelled the official outside applicants to go one better in order to make sure of satisfying their requirements. Thus, last Friday, there must have been appreciable applications at £99 15s. 1d. for the 92-day bills in order to bring the average rate of discount under 1 per cent. The syndicate emerged from the tender with an allotment of 24 per cent. only. On that allotment, and at the rate obtained by the market, the total profit on the week's turnover in Treasury bills would be about £300. That will not go far towards covering the overhead expenses of the whole discount market. The market is more than ever dependent on the profits which it is earning on running its bond positions—particularly on the Conversion 2 per cents., with which it is so plentifully stocked.

Conversion Ban on the Discount Market

The partial removal of the ban on the conversion of municipal loans is likely to prove of some interest to

NEEDS**

Head Offices:
LIVERPOOL LONDON
North John St. Lombard St.

the discount market. The search for interesting short-dated securities in the immediate pre-war period had led the market to acquire fair lines of the 4½ to 6 per cent. loans whose first optional maturity fell in 1940. The confident assumption was naturally made that these loans would be repaid at the first possible opportunity and that the purchase of such stock was a thoroughly justified discount market operation. The war and the ban on conversion operations upset these calculations, but caused no perturbation to the market. The stocks in question, bearing interest at rates ranging up to 6 per cent., began to give magnificent yields when allowed to run appreciably beyond their first redemption date, and the market has no doubt done very well out of this particular miscarriage of its plans. Since the conversion ban came into effect, it may be assumed that no additional purchases of such stocks have been made by the market. But it is interesting to note that this obstacle is now removed. All the loans in question can again be regarded as genuine shorts and as being eligible for discount market portfolios. It is, however, equally evident that it would not suit the convenience of the authorities to see a substantial proportion of the outstanding amount of these municipal loans acquired by holders who intended to run them as a short and to demand cash on maturity. The special provision for satisfying non-assented holders out of the Local Loans Fund was not inserted in the Treasury's plan for lifting the conversion ban in the special interests of money market houses. The authorities have not yet announced any restrictions against dealings in the maturing loans designed to avoid their wholesale acquisition by short-term holders. Perhaps they rely upon the memories of the compulsory conversion of the Conversion 4½'s held by the discount market to provide the required deterrent.

U.K. Orders in U.S.A.

The surprisingly full documentation on the position, present and prospective, of British gold and dollar assets has now been further enriched by a statement on British orders in the United States, submitted to Congress by Mr Harold Smith, the Budget Director. He pointed out that British Government orders were outstanding to the tune of \$2,700 millions, of which \$1,682 millions had already been paid for. The remaining liability for outstanding orders must clearly strain the available dollar balances of the Treasury, but, according to Mr Harold Smith's statement, relief may come by utilising part of the \$7,000 millions British aid appropriation under the Lease and Lend Act to pay for British orders placed before that legislation was enacted.

Chinese Exchanges

The exchange value of the Chinese dollar has shown renewed signs of weakness in the past few days and is plumbing fresh depths at around 3½d. Active assistance from the Chinese Stabilisation Fund has not recently been apparent. This may be due partly to the fact that the technical arrangements for switching the centre of official dealings between Shanghai, Hongkong and Chungking are far from completed. Another reason for the recent passive policy of the Control is probably to be found in the difficulties which have attended the operation of the recent £5,000,000 British credit to

China. Last December it was announced that Britain had arranged in principle to give China fresh credits totalling £10,000,000, of which half was to be made immediately available to the Chinese Stabilisation Fund. The operation of this £5,000,000 credit had, however, to be restricted in view of Britain's growing shortage of gold and U.S. dollars. Consequently, the amounts thus placed at the disposal of the Chinese Stabilisation Fund had to be specifically allocated for purchases within the sterling area and did not become available to swell the *masse de manœuvre* at the disposal of the Chinese authorities for operations in the free market of Shanghai. Negotiations are still proceeding for preventing sterling help to the Chinese Stabilisation Fund from feeding the Shanghai market, which remains the main loophole through the network of sterling exchange control. A solution of the problem may ultimately be found in a payments agreement with China, operated on the familiar technique of special accounts, but giving the Chinese holders of sterling greater latitude in the utilisation of these funds than is normally granted to the neutral countries with which such arrangements now operate. It should be evident by now that the task of supporting the Chinese dollar in what remains of the free markets must be in the main shouldered by the United States. The recent \$100,000,000 credit granted by the United States to China on the morrow of Japan's signature of the Treaty of Nanking, with its puppet government in China, shows that this responsibility is in fact being accepted. It suggests, moreover, that the Chinese Stabilisation Fund must be far from exhaustion, and that the recent weakness of the Shanghai rate is more a matter of conscious policy than unwilling and powerless acquiescence.

Mendelssohn Echoes

Echoes of the failure of Mendelssohn and Co., of Amsterdam, muffled and long delayed in their passage from German occupied territory, have reached London this week. The statement of assets and liabilities has been finally computed and details of the settlement announced by the liquidators. The deficit shown in this statement is not so serious as had at first been estimated. It amounts to Fl.23,692,313, compared with the figure of Fl.40,504,486, which appeared in the statement of assets and liabilities filed on October 31, 1939, in Amsterdam. The liabilities ranking on that date were put at Fl. 135,127,379. That figure may be assumed to have remained materially unchanged, and it is in the higher valuation of assets that must be found the reason for the substantial reduction in the deficiency. On the basis of the statement of claims filed in Amsterdam in October, 1939, secured creditors ranked for Fl.47,906,760. They will, of course, be paid in full. On the basis of the latest figure of the deficiency, the unsecured creditors should receive about 73 per cent. of the nominal amounts due to them. Creditors in guilders are being paid in Amsterdam, while those whose claims are expressed in foreign currencies are also to be paid in guilders at the pre-invasion rates—1.83½ to the U.S. dollar, 43.67 to 100 Swiss francs, 44.85½ to 100 Swedish crowns, 75.35½ to 100 reichsmarks and 7.46 to the pound sterling. The initial payments are to be made on a sliding scale under which creditors for Fl.1,000 and under will be paid in full, and those for over Fl.25,000 will receive immediately 50 per cent. of their claim.

Colonial Franc Rate

Two financial agreements have been signed this week between the British Government and the Free French authorities. They provide for the grant of credits necessary to finance the Free French forces and settle the rate of exchange between the French colonial franc and sterling. The rate chosen is 176.62½, which was the parity of the French franc in terms of sterling before the Franco-German armistice. The exchange agreement follows the lines of similar arrangements with Britain's other Allies. It provides considerable freedom in the use of the exchange proceeds of the French colonies' export trade. The bulk of their trade is expected to be transacted with the sterling area. But the colonies will be able to dispose freely of the other foreign exchange proceeds of their export trade and gold production. The external payments of the colonies will be under the control of the Council of Defence of the French Empire, which will be in a position to use the surplus of one territory to cover the deficit of another.

Investment

A Sentimental Rise

Mr Roosevelt's speech of a week ago, some evidence of success for British diplomacy in the Balkans, fresh reverses for Italian arms in Greece, and Mr Bevin's further disclosures as to plans for mobilising labour, probably all played a part in bringing about the general firmness of markets with which the week opened. The movement has been tailing off, and it is really rather surprising that there should be any net improvement, since company results, now coming forward, are none too encouraging. As the year progresses, accounts tend to contain nothing for the period of relative prosperity prior to June last, while they will shortly cover a period during the whole of which E.P.T. was at the full rate. These facts must have some effect, but, even if all goes as well as at present, it is not improbable that the new tendency to look ahead rather than backward will affect the investor's view of equities. It is tempting to argue that this has happened in the past week, but in point of fact the rise was almost entirely sentimental. The amount of business behind it is less than ever, and all that is established is that a moderate recovery has done little to bring in sellers. The next few weeks are likely to be of critical importance in determining the nature and scope of the next major move in prices. They should throw considerable light on the position of the Balkans, and on our ability to meet the U-boat menace, on the one hand, and the effects of the Budget and industrial concentration on the other. Meanwhile, the underlying financial factor continues to be the need for re-investment, with, behind it again, the prospect of a growing volume of unspendable income.

Municipal Conversions

The statement of the Chancellor, in reply to a question in the House on Tuesday, that the time had now come when facilities could be given for the exercise of conversion rights by local authorities on loans carrying interest over 4 per cent., puts an end to a ban which has run for fifteen months. During 1940, a score or so of towns and counties had the option of converting loans to a total of some £35,250,000, carrying interest between 4½ and 6 per cent. For reasons which have always been obscure, the Treasury considered that to offer new stock for cash or conversion would be harmful to its own borrowing operations, and decreed that repayment could only be effected out of accumulated reserves, with the result that, until the L.C.C. operation of end-January, which is not complete until April 1st, virtually all borrowers continued to pay high rates on stock whose average maturity date was September last. Including the L.C.C. issue, some £17,250,000 was repaid, leaving the £18,000,000 still to be dealt with. To this has to be added £15,000,000, whose earliest repayment dates fall between August 1st and October 1st next, a total of £32,750,000. The following table lists the stocks affected:

£ Mn.	Stock	Date	£ Mn.	Stock	Due
2-0	Corporation of London 4½	1940-85	0-6	Newport 6	1940-60
0-7	Birkenhead 4½	1940-60	1-0	Plymouth 6	1940-50
1-6	Bradford 4½	1940-60	1-0	Portsmouth 6	1940-50
0-5	Brighton 6	1940-60	0-5	Reading 6	1940-50
1-5	Bristol 6	1940-60	0-5	Swansea 6	1940-60
0-75	Derby 6	1940-60	3-0	Walsall 4½	1941-61
1-5	Essex 6	1940-60	3-0	Birmingham 5½	1941-61
0-65	Gateshead 6	1940-60	3-5	Hull 8	1941-61
0-5	Hastings 4½	1940-60	2-0	Liverpool 5½	1941-61
1-5	Kent 6	1940-60	0-5	Sheffield 5½	1941-61
2-0	Middlesex 6	1940-60	0-5	Stoke-on-Trent 5*	1941-61

* Repayable 1 August. * At any time on six months' notice. † Repayable 1 October.

As a minimum of three months' notice has to be given for all the 1940 maturities, it seems doubtful whether the whole can be dealt with by the end of the summer. Even now that the ban is lifted, the Treasury persists in its refusal to permit corporation issues for cash and in its refusal to include, in the forthcoming Sir Kingsley Wood intends to include, in the forthcoming

Public Works Loans Bill, power for the Treasury to make loans out of the Local Loans Fund up to the amount required to repay unconverted stock. It is a little difficult to understand why it should be of advantage to the Government to increase the supply of its own stock and reduce that of the local authorities, and the result will presumably be a further narrowing of the price and yield margin between the two classes, probably by a rise in corporation stock quotations. The main point is that local authorities are to be relieved of a burden, and that stockholders will have to seek new investments. Of the maturing stocks, some £12,000,000 carry 6 per cent., £9,000,000 5½ per cent., and £6,000,000 5 per cent., and the whole £32,750,000 an average of just under 4.45 per cent. It seems not improbable that, unless some fresh blow to equities is in preparation, part of the money released will go into that section of the market in the first instance.

Viscose Corporation Sale

The news of the sale of virtually the whole of the Courtauld interest in the American Viscose Corporation, a concern which they have built up over the past quarter of a century, can scarcely have come as a surprise to shareholders. It is now almost two months since Sir Edward Peacock went to America to negotiate such sales, and while some may feel that it should be possible to arrange for the pledging of assets, rather than their outright sale, the Government's policy has been clearly announced. So far, there is no clear indication what the company will receive for their holding, but the Treasury is to obtain £10 millions forthwith, and the view is expressed that the total realised will be well above £24 millions. The sterling price to be paid to Courtaulds is to be the subject of negotiations between the Treasury and the company, and, failing agreement, will be submitted to arbitration. The company will no doubt be justified in arguing that their subsidiary is being sold in a buyer's market and that they should receive more than the sterling equivalent of the dollar price. It would, however, be safer to place a conservative figure on their prospects and assume something of the order of £20 millions. Spread over the ordinary capital of 24 million units of 20s., this means 16s. 8d. per unit. It is, therefore, scarcely surprising that the price of the shares actually rose on the news by 4s. to 31s., despite the fact that the sale is, on any long view, a loss for the shareholders. The possibility that there will be a return of capital in the near future is being canvassed, but it is doubtful whether a repayment on the scale of even half the purchase price would find official favour. Probably a substantial part of the money will prove very useful after the war for the extension of the uses of rayon, nylon and other products, and the reconstruction of continental subsidiaries. Meanwhile, the pure supposition of a £20 million receipt gives a value of only 14s. 4d. per unit to the equity in the home business, the Canadian company and the numerous other subsidiaries, which would seem a conservative valuation, even with a period of wartime depression in prospect. It is impossible to assess the contribution which the Viscose Corporation has made to past profits, but some of Courtaulds' best results were secured before it reached the stage of paying dividends.

New High Level

The total of small savings reached a new high level for the year at £14,793,000 in the week ending March 11, surpassing the previous best total for 1941, that contributed in the week ending February 25th, by some £922,000. No true comparison is possible with the total for the corresponding week of 1940, which is shown as £6,535,000, exclusive of the increase in the balance due to Post Office Savings Bank depositors, but the March 11 figure, exclusive of the increase in the Post Office

TYPEWRITERS FOR NATIONAL SERVICE

H.M. Stationery Office ask all owners of typewriters to offer for purchase any which they can spare. These are urgently required for work of National importance. Offers of machines not more than 15 years old and in good working order should be made at once to:—

THE DIRECTOR OF SUPPLIES (S3E),
H.M. Stationery Office, Princes Street, S.W.1.
State name of maker, model and whether you wish to sell or loan.

balance, amounts to £9,145,000. It is not easy to assess the significance of the latest improvement in the small savings total, which is of course still below the figures of £15,730,000 and £16,106,000 for the last two weeks of November, 1940. The obvious conclusion is, of course, that the record of small savings during the current year is not such as to provide any prospect that Lord Kindersley's ambition for doubling last year's savings total of £475 millions during the current savings year will be realised. In fact, fluctuations of a few millions in the contribution to the war effort made by small savers are of little moment. The increase on the year remains a meagre portion of the rise in the wage bill it is designed to cover. Despite all possible stimulus, the weekly totals remain disappointingly low, and the public is moved to self-congratulation by the advertisement of meaningless new high levels. The prosecution of the war necessitates the transfer from private expenditure of a very high proportion of the national income. The present anti-social implications of unessential private spending—the effect on the price level and the hindrance to the change-over from peace to war production, which is only just gathering momentum—are by now well known. There is no avoiding the conclusion that the present combination of taxation and voluntary savings is not an effective means of restricting expenditure. And it is certain that, unless spending is effectively curtailed, the next increases in taxation will be met mainly at the expense of the voluntary thrift campaign.

Taxing Non-Residents

Holders of "Kaffirs," although exercising their privilege of grumbling at the further increase in taxation imposed in the Union budget at the end of last week, may compliment themselves on having escaped comparatively lightly with a rise from 11 to 16 per cent. in the special war levy. The amount they are called upon to provide is little more than 25 per cent. of the total increase in tax revenue provided for and means about a 10 per cent. increase in the taxation they pay. In a number of cases, it will be possible to offset this by working a very slightly higher grade of ore and the reduction in total dividends should not be substantial. In fact, were it not for political uncertainties, the shares might well stand higher, except for those of old mines, which will be unable to adjust the grade of ore. The decision of the Union Government to impose a discriminatory tax of 5 per cent. on the dividends of non-resident holders of all South African shares, is, however, quite a different matter. The yield of the tax is small, and the burden not extravagant, but the principle of taxing the absentee capitalist has a strong flavour of economic nationalism, which is particularly obnoxious when aimed at a country which has gone out of its way to foster South African trade, even during the present war emergency.

Company Notes

International Nickel Prospects

According to a cabled summary, the profits of the International Nickel Company of Canada, after all expenses including depreciation, but before deducting taxes, was U.S. \$56,675,475, which compares with \$48,169,587 for 1939, and is a high record except for 1937, when the amount exceeded \$60,650,000. Unfortunately, the story made familiar by United Kingdom results is repeated, but with rather less emphasis, and, after meeting income and franchise taxes, the net amount is \$35,544,772, compared with \$36,847,466, the tax appropriation being equivalent to \$1.45 per common share, against \$0.78 in 1939, and \$0.55 in the previous year. The corresponding figures for net earnings on the equity shares are \$2.30, \$2.39 and \$2.09 respectively. The results reflect the great expansion, first of our own, and later of U.S. war production, and one is left to suppose that only the more urgent peace-time requirements can be fulfilled. The prospect is that, in war or peace, so long as the wheels of industry are kept busy, there will be ample demand for nickel. Unfortunately, the outlook for the shareholder depends largely upon whether and when the Treasury decides to requisition his holding. Prior to the publication of the results, the

London price stood some 6½ points above London parity of the New York quotation. It improved further on the news and the margin widened to 7 points; it is almost as wide against Montreal. This argues a conviction that the shares will not be taken over, but figures, recently revealed, of this country's payments to Canada and the Dominion's to the United States suggest strongly that views on the matter may have to be adjusted. At 39½ ex dividend the return is just over 5 per cent. on the \$2 dividend paid for 1940, a yield which discounts a modest revival of distributable profits.

Special Steel Results

The preliminary statement of *Vickers* for 1940 indicates a wholly satisfactory year's progress. After provision for taxation at the higher standard rate, net profits are reduced only from £1,192,041 to £1,119,120. The allocation to contingencies reserve is maintained at £250,000, and, after repeating the 10 per cent. total payment on ordinary stock, the carry forward is up from £480,188 to £651,821. Clearly, the company has been working to capacity during the past year, and profit margins appear to have kept well abreast of rising costs and taxation. The full accounts of the *Firth-Brown* enterprise also show satisfactory results. The tax-free dividend is cut from a total of 17½ to 12½ per cent. for 1940, thus affecting a small saving in the total required for distribution, and the company has, in consequence, been able to raise the carry forward from £129,182 to £141,453. Total profits, after provision for tax and contingencies, show an expected decline from £712,581 to £619,647, due almost entirely to the demands of E.P.T., and the directors have had to provide £41,000 for additional taxation on the previous year's earnings. The depreciation provision is also higher at £175,000, against £150,000, thus causing a reduction in the surplus for ordinary capital from 29.9 to 19.7 per cent. tax free. The balance-sheet provides evidence of the increase in the company's productive activity last year. Stocks and work in progress stand at £1,920,721, against £1,324,300, while debtors show a normal rise from £875,623 to £1,457,534. Repayment of a temporary loan of £15,000 and the liquidation of £191,736 in British Government securities partially finances a higher total of cash at bank and in hand, at £664,246, against £289,537. The increase in creditors, including tax provision, amounts to £1,594,347, thus more than doubling the previous year's total at £3,020,138. The £1 ordinary *Firth-Brown* shares, at 61s. 3d. ex dividend, offer a tax-free yield of £4 1s. 7d. per cent., equivalent to £7 1s. 9d. per cent. less tax. *Vickers* 10s. ordinary stock, at 15s., yields £6 16s. 4d. per cent.

Further Electric Power Earnings

In a note in *The Economist* of a week ago, which discussed a number of electric power reports, it was pointed out that the earning capacity of the industry had suffered relatively little from war conditions, and that the impact of taxation is by far the most important influence in restricting equity surpluses. This impression is confirmed by the reports of three more leading companies for the calendar year 1940, *British Power and Light*, *Clyde Valley Electrical Power* and *Lancashire Electric Light and Power*. In the case of the first company, which has, of course, substantial interests in the London area, total consolidated revenue rose from £1,063,539 to £1,299,742. The holding company's tax liability increased from £88,250 to £127,500, and, with a decline in the available surplus from £104,215 to £85,768, representing a rate of 7.3 against 7.7 per cent., the directors have reduced the total ordinary payment from 7 to 6 per cent. and have thus been able to raise the carry-forward. Total net profits of *Clyde Valley* at £978,490 are supplied on a basis not strictly comparable with those of 1939. The charge for taxation increased from £204,277 to £354,215, and the equity surplus is reduced from £269,901 to £252,594, at which level it provides scant cover for the ordinary dividend, maintained at 8 per cent., which absorbs £252,000. Trading profits of *Lancashire Electric* and subsidiaries showed a moderate increase from £602,504 to £617,143, and here, too, the story moves in the same pattern. Increases in tax liability and also in depreciation provision, though only on a small scale, were sufficient to eliminate the

THE PENNSYLVANIA RAILROAD

SUMMARY OF ANNUAL REPORT FOR 1940

THE 94th Annual Report of the Pennsylvania Railroad Company covering operations for 1940 will be presented to the stockholders at the annual meeting on April 8, 1941. Operating revenues increased \$46,662,630 or 10.8% over 1939. Operating expenses increased \$31,553,843 or 10.3%. Taxes increased \$3,789,341 or 9.5%. Net income was \$46,238,250, an increase of \$14,205,725. Surplus was \$36,896,665, equal to 5.60% (\$2.80 per share) upon the outstanding Capital Stock (par \$50) as compared with 3.52% (\$1.76 per share) in 1939.

OPERATING RESULTS

	1940	1939
TOTAL OPERATING REVENUES WERE.....	\$477,593,408	\$430,930,778
TOTAL OPERATING EXPENSES WERE.....	338,454,678	306,900,835

Industry and Trade

Rationing of Wool Manufactures

The Limitation of Supplies (Woven Textiles) (No. 7) Order brings the method of restricting woollen goods into line with that of other textiles by the control of sales to retailers. Hitherto, apart from hosiery and other goods specified in the November Limitation of Supplies Order, woollen goods were only controlled by the rationing of the raw material. Now, supplies of wool piece-goods and made-up goods during the period March 15th to September 30th are to be restricted to 30 per cent. of the quantity supplied in the period April 1st to September 30, 1939. This corresponds (except that the period is two weeks shorter) to quotas of 20 per cent. for cotton, linen and silk, and 40 per cent. for rayon. The changes in these quotas are shown below:—

QUOTAS FOR PIECE-GOODS AND MADE-UP GOODS (Bases: April–September, 1939, and October, 1939–March, 1940)				
	Cotton	Rayon	Linen	Wool
April–September, 1940	75	75	25	...
October, 1940–March, 1941	37½	66½	25	...
April–September, 1941	20	40	20	30

It seems rational to have all these textiles on the same footing, and the method of control at the retail end allows of a more considered direction of available supplies. It has also been announced that the existing fixed prices for wool and tops will remain in force till the end of June for materials required for the home trade, till August 15th for materials required for the yarn export trade, and till October 15th for materials for the production of fabrics for export. This decision should assist the trade in negotiating new business.

Waste of Tonnage

The principal criticisms of war-time shipping policy which appear in the annual report of the Liverpool Steam Ship Owners' Association had been made before, and have already been discussed in *The Economist*. There is, however, a matter of practice rather than of policy to which the report calls attention, which is highly disquieting because it is indicative of a slackness evidently very widespread among Government departments. Goods despatched by the various departments of state for consignment abroad frequently arrive, it is said, without previous advice, with inaccurate labels, or even with no labels at all, at the wrong berth, with cover notes lacking many of the essential particulars, and sometimes even without any indication of destination. More than once the suppliers have sent with the goods an advice concerning arrangements which proved to be entirely without foundation. This sort of thing is productive of just the sort of shipping delay which does the Nazis' own blockade work for them. Isolated incidents of this kind may be unavoidable; but if they occur frequently they indicate slackness among individuals or faulty organisation which cannot be allowed to continue.

Confectionery Control

The confectionery industry is forming two "war-time associations," one for the cocoa and chocolate branch of the industry, and one for the sugar confectionery side, to act as a channel of consultation with the Ministry of Food and to administer price control. Manufacturers will be required to join them, and the Food Ministry will be represented on them. Price control committees set up by the associations, with cost panels to advise them, will fix prices to be approved by the Minister. Wholesalers' and retailers' margins will be fixed in consultation with the appropriate associations. In order to increase the proportion of production in the lower-priced categories, the products of each branch of the industry will be classified into four groups, according to the prices charged last September. In March–April the proportion of production in the highest-priced group (Category IV) is to be reduced by two-fifths from the July–September, 1940, proportions, that in Category III by one-fifth; the proportion in Category II will be unchanged, except in special circumstances, while the balance of production will be added to Category I. It is hoped by this means to secure the fairest possible dis-

tribution of the limited supplies of confectionery whose manufacture can still be permitted.

Control of Cold Storage Industry

On January 17th the Ministry of Food announced its decision to extend its control over the cold storage industry. The terms recently negotiated between the Ministry and representatives of the industry provide for a levy on the more profitable concerns to enable the less fortunate ones to maintain operations. The former will be permitted to retain the direct costs of operating their plant, a rent allowance of 3d. per cubic foot of controlled storage space, a further 6d. per cubic foot, and 25 per cent. of the balance of the net profit made. The remainder of the net profit is to be paid into a Cold Storage Account controlled by the Minister of Food. This Account, which will have to bear the cost of administering the scheme, will be used to make up to stores that do not earn it a sum equal to their direct costs, a rent allowance of 3d., plus a further 2d., per cubic foot of controlled cold storage space. This is an ingenious scheme to prevent the closing down of plant for lack of finance.

Jigs, Tools and Gauges

An adequate supply of jigs, tools and gauges is essential to the expansion in the output of munitions. They enable many jobs in engineering to be done almost automatically by semi-skilled labour, which otherwise have to be carried out by highly-skilled workers by more complicated processes, often taking from ten to fifty times longer. According to a memorandum recently published by the Institution of Production Engineers the supply of these tools has not received the attention which is warranted by their importance in the war effort. Among others, the following remedies are therefore suggested. First, the tool-making industry should be accorded a high degree of priority in the allocation of labour, materials and machinery. Secondly, the Government should subsidise the expansion of the manufacturing capacity of efficient tool making firms. Thirdly, toolmakers who are not properly equipped or unable, for financial reasons, to make the best use of their resources should come under Government control. Fourthly, the Government should insist that concerns having their own tool rooms should meet their requirements as far as possible. Finally, if these measures should fail to produce the desired results, the setting-up of a "shadow" tool-making organisation should be considered. In view of the vital part played by small tools, the recommendations contained in this memorandum appear to merit careful consideration.

Lower Coastal Freight Rates

In view of the general upward movement of the prices of goods and services since the beginning of the war, it is satisfactory to learn that coastal shipping freight rates are to be reduced shortly as a result of a reduction in the war risk premium. It was found that the war damage to coastal vessels has been smaller than that suffered in the ocean trades and that consequently a separate rating of the risk was justified. As coastal tramp shipping has not been requisitioned, the shipowners have had to pay the war risk premium—which is paid by the Government in the case of requisitioned ships—and, at a rate corresponding to 28 per cent. per annum, this has been a very heavy burden. Coastal tramp freights are fixed by the Ministry of Shipping on the same general principles in regard to profits as have been laid down for requisitioned ships—i.e. an allowance for depreciation and interest at the rate of 10 per cent. per annum on the value of the ship. The reduction in war risk premium for coastal tramps is expected to bring a decline of 15 to 20 per cent. in freight rates; presumably, this will also apply to requisitioned coastal liners. Before the war the tramp tonnage engaged in coastal trade was estimated at about 750,000 gross tons and the volume of goods carried at some 80 million

tons per annum. The tonnage of liners engaged in coastal trade was then approximately one-third of the tramp tonnage.

Industrial Disputes in the United States

Now that democracy has its arsenal on the other side of the Atlantic, statistics of time lost by labour disputes in America are no longer of a purely academic interest. It is encouraging to learn from the *Economic Record* of the National Industrial Conference Board, that the number of strikes begun in 1940 was the smallest since 1936; the number of workers involved the smallest since 1932; and the number of man-days idle the smallest since 1930. The figures are as follows:—

EMPLOYMENT AND STRIKES IN THE UNITED STATES				
	Millions Employed	Strikes Beginning in Period	Thousand Workers Involved	Thousand Man-days Lost
1929	47.9	921	289	5,352
1930	45.2	637	183	3,317
1931	41.6	810	342	6,893
1932	37.7	841	324	10,502
1933	38.1	1,695	1,168	16,872
1934	41.0	1,856	1,467	19,592
1935	42.4	2,014	1,117	15,456
1936	44.8	2,172	789	13,902
1937	46.6	4,740	1,861	28,425
1938	43.6	2,772	688	9,148
1939	45.3	2,613	1,171	17,812
1940	47.0	2,450	575	6,500

Source: National Industrial Conference Board.

Less satisfactory is the fact that there was an upward tendency during the year in both the number and the severity of strikes. Moreover, the general indications for January, 1941, are that most of the strikes during that month were in plants working on defence contracts. On March 19th, however, President Roosevelt took steps to counteract this tendency by the creation of a National Defence Mediation Board to assist in the settlement of disputes in the defence industries.

COMMODITY AND INDUSTRY NEWS

Tan Liverpool cotton futures market will be closed at the end of the month. On March 19th the price of American middling cotton was 9.06d. per lb., the highest level since January 1940. It is supposed that the International Tin Committee, at its meeting on March 20th, discussed the continuation of the restriction scheme and the quota, but details were not available in time to be reported in this issue. Further measures have been introduced by the Minister of Food to increase the supply of seed potatoes for planting this season. The maximum price of cocoa butter has been fixed at 1s. 5½d. per lb., ex factory or warehouse, by an Order which came into operation on March 17th. This Order replaces the arrangements in force under the "Standstill" Order and takes into consideration the recent increase in the price of raw cocoa.

Liverpool Cotton Market to be Closed.—At its meeting on March 18th, the Liverpool Cotton Association agreed to accept the Government's decision in regard to the importation and ownership of cotton. The cotton futures market is to be closed at the end of the month, and purchases and distribution of raw cotton are to be dealt with for the Government by a company formed from representatives of the Liverpool and Manchester cotton associations. In their resolution, the Liverpool Cotton Association "desire formally to place on record their protest against the decision made, believing that many of the changes which are fore-shadowed are unnecessary and against the best interests of the cotton industry generally." However, they "give their assurance that they will co-operate loyally in carrying out the duties under the scheme."

Oilseed Market.—The oilseed market is more active than it has been for some

time. The Control is inviting further offers of Bombay linseed at recent limits, plus a special contribution to shippers, and requires further large quantities of Indian ground nuts, shipment April–June, late prices being indicated with varying special contributions added. India's new crop of linseed will soon be ready for shipment to this country.

Increase in Hay Prices.—The Hay (Control and Maximum Prices) Order 1941, increasing the maximum price of hay on sale by a grower in Great Britain by £2 per ton, came into force on March 17th. The new order forbids a grower to sell hay except to a consumer or to a licensed approved buyer of hay, makes the sale of hay by weight compulsory with certain exceptions, and controls sales of hay by auction. The price structure at the various stages of sale has been changed by the new Order in that the same maximum price now applies to all sales by a grower. Previously there was a higher maximum price for sales by a grower to a consumer than for sales by a grower to a merchant. In the case of meadow hay in stacks, the new prices vary between £7 10s. and £8 5s. per ton. It is hoped by this rise to encourage farmers who have hay to spare to put it on the market so that those who are short may benefit.

Further Rationing.—A new scheme of rationing a group of interchangeable foodstuffs has been brought into operation this week. The group is preserves, consisting of jam, marmalade, syrup and treacle, and the ration is a guaranteed minimum of 8 oz. per calendar month. After May 1st, by when it is hoped that supplies will be adjusted, retailers will be permitted to distribute whatever supplies they may receive above the minimum requirements of their customers. The implications of this new departure in

U.S. Aluminium Production

The output of aluminium, so essential in the manufacture of aircraft, is being rapidly expanded in the United States. According to the United States Bureau of Mines, production rose from 146,000 tons in 1939 to 184,000 tons in 1940. Moreover, the Aluminum Company of America decided last year to carry out a programme of expansion involving an outlay of \$150 millions on new factories, mills, machinery, dams, power projects and other items. By the middle of 1942 production is expected to exceed the annual rate of 700 million lb. (312,500 tons). In the view of Mr E. R. Stettinius, Jr., the output of virgin and secondary aluminium and the fabricating facilities of the industry will be able to take care of the British and American aircraft construction programmes for the next two years. By this spring American production is expected to exceed domestic consumption, and it should therefore be possible to increase exports to Great Britain. An open general licence for aluminium exports to this country has already been issued. The expansion in the output of aluminium has brought a marked increase in the demand for bauxite, the raw material of the industry. Domestic supplies, which are derived chiefly from Arkansas, increased from 375,000 tons (dried bauxite equivalent) in 1939 to 438,000 long tons in 1940. A further marked increase is expected in 1941, especially as production in Alabama, Georgia and Virginia may reach larger proportions. In addition to the domestic supply, large quantities have to be imported. Last year America's imports of bauxite reached 531,884 tons in the first eleven months, against 520,179 tons during the whole of 1939. Simultaneously, 75,750 tons (against 51,635 tons) were exported from the United States. While Dutch Guiana (Surinam) supplied 97 per cent. and British Guiana 3 per cent. of the imports, the great bulk of the exports was sent to Canada. The bauxite output of both British and Dutch Guiana has been increased fivefold within the past five years, and is still expanding at a rapid rate. As the Guianas are able to supply the growing American needs, no interference of production through a shortage of bauxite is expected.

rationing are discussed on page 374. Consumers must register with retailers before March 29th for the rationing of cheese. Arrangements are to be made for

COMPANY MEETINGS

CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

REVIEW OF PAST YEAR'S OPERATIONS

STATEMENT BY MR V. A. GRANTHAM

The following is a summary of the statement by the chairman (Mr V. A. Grantham) to be submitted at the eighty-seventh ordinary general meeting of The Chartered Bank of India, Australia and China on April 2, 1941.

As war-time conditions may make it difficult for shareholders to attend our annual meeting, I have decided to give them the information regarding the past year's working of the Chartered Bank to which they are entitled, in the form of this printed statement which is being sent to them with the balance-sheet.

I should be lacking in my duty if I did not draw the shareholders' attention to the work of the staff both in London and abroad. The work they have had to do during the past year has been such as to call for the exercise of their best qualities, and has had to be performed, in many cases, in conditions of acute personal discomfort and difficulty. The board gladly recognises the efficiency, endurance and loyalty that have so signally contributed to the year's results, and I feel sure that the shareholders will wish to associate themselves with the board in this expression of appreciation.

In this connection I would like to add that political conditions in the Far East have at times caused us considerable anxiety, and our thoughts have been concerned not only with our business but with the personal safety of our staff. I can assure you that this matter has at all times received our closest consideration.

GENERAL

In normal times it has been the custom for the chairman to give in his speech an exhaustive review of trading conditions throughout the East; having regard, however, to the very abnormal times through which we are now passing, I am sure you will agree with me that there can be no point either in dealing at length with the past or in attempting anything in the way of a forecast as to what will happen to trade and commerce generally—even in the near future.

The main concern of the shareholders is to know how the bank has fared in these very difficult times and how we stand to-day, and I propose, therefore, to deal with the main features disclosed in the bank's balance-sheet and to add a few words with regard to matters of more general interest.

THE BANK'S BALANCE SHEET

A year ago my predecessor drew your attention to the effect of the war, with its resultant control of exchange and trade, on the business of a bank such as ours, engaged largely in the finance of international trade. Great as these disturbances then were, few can have foreseen how rapidly the war was to extend. The overrunning of Europe has brought us new problems of exchange and control closely affecting many of our branches in the Far East.

A secondary result has been the still longer period taken by the mails from our agencies, which has prevented us from receiving information in time to enable a balance-sheet to be presented to you in the usual form. The two items of the balance-sheet mainly affected by this are bills payable and bills of exchange, and we have had to work upon figures wired by our agencies with a consequent variation in the auditors' certificate.

I now come to the profit and loss account, and I am glad to say the result is better than in either of the previous two years. The figure is £400,159 15s. 10d., and we are fortunate in not having had to provide this year for depreciation on securities and other exceptional items. Needless to say, all necessary provisions have been made as well as those for taxation, both at home and abroad, and, in these days, this item of taxation is particularly heavy. Many of our branches bear local taxation, for which we do not obtain any relief when computing our liability to British taxation, so that some of our profits are in a sense doubly taxed.

The interim dividend paid last October absorbed £150,000, and it is proposed to pay a final dividend of 10 per cent. per annum for the half-year to December 31st last, costing a further

£150,000, to transfer £50,000 to the officers' pension fund, to write off premises account £50,000, and to carry forward the balance of £182,602 9s. 11d.

CONDITIONS IN THE EAST

In last year's review it was regarded as a heartening feature that recognition of the necessity for exports from this country had become almost general, and, despite the closure of many European markets, the export figures achieved during 1940 were impressive. In a total war, however, the principal role of exports must be to increase this country's ability to import the sinews of war, and the co-ordination of the country's export policy with the industrial war effort is now in progress.

The extension of this policy to all the countries within the sterling area has become of paramount importance, due to the necessity of conserving shipping space, and is leading to severe curtailment of overseas trade already affected by the war and by the danger of the extension of the war, in all the spheres in which the Bank operates.

In India the effect has been far-reaching, leading to restricted cultivation and production of many staple products. India's financial strength, however, is clearly shown in the recent redemptions of sterling loans in the London market and as an offset to the temporary loss of overseas markets for some of her products, the war is giving a great impetus to her industrial production. The meetings of the Roger Committee in Delhi are significant. India is, of course, primarily an agricultural country, but the war is hastening her entry into industrial production hitherto untouched by her, and we may expect her to derive benefit from this in years to come.

The special war-time demand for rubber and tin has brought an era of prosperity to Malaya.

The importance of a free and independent China as a stabilising factor in the Far East is being increasingly recognised, and her unweakened resistance, after nearly four years of war, reflects her determination to attain this end. Japan is now in possession of almost all China's sea-board, and international trade, mainly centred in Shanghai, is subject to ever-increasing restriction and control. Nevertheless, the volume maintained last year was considerable, but Japan's adherence to the Tripartite Pact and the threat of extended hostilities in the Far East has brought about further curtailment.

Japan's internal economy continues to be dominated by the immense burden of providing finance for her military requirements. This preoccupation, with all its far-reaching consequences and her continued involvement in the war in China, is hindering her ability to benefit from the greatly increased opportunities for peaceful trading, which, due to the absorption of other great trading nations in the struggle in Europe, would have been hers had normal relations with the outside world been maintained.

FUTURE PROSPECTS

While it is impossible, in the present unsettled state of the world, to know what may be in store for us, I may perhaps be permitted to conclude on a note of confidence. We have a fine business built up on sound foundations and widely spread, and while it must be borne in mind that a number of our branches are situated in countries that are uncomfortably near to the centre of events in the Far East, it is comforting to note that these branches have, up to now, been able to return satisfactory results and that our total figure of profit shows an improvement over that of 1939.

We have made full provision for every contingency up to date, and if adverse circumstances should arise at any particular point the shareholders may rest assured that every step has been taken in advance to minimise the effect of such circumstances.

We are fortunate in having a strong balance-sheet, and we may reasonably expect our business to stand up to any strain that may be put upon it.

THE BANK OF AUSTRALASIA

PROFIT AND DIVIDEND MAINTAINED

STRONG FINANCIAL POSITION

MR EDMUND GODWARD'S STATEMENT

The following is the statement by the chairman, Mr. Edmund Godward, circulated with the report of the directors and the balance-sheet of the Bank of Australasia for the year to October 14, 1940:

Throughout the financial year dealt with in the accounts the bank has been working under war conditions, and how these have affected Australia and New Zealand will be referred to later.

Your balance-sheet and profit and loss account are before you, and you will no doubt wish to have comparisons and explanations of the differences arising between the figures for 1939 and 1940. It will be seen that the aggregate total has risen from £56,222,000 to £59,365,000, which is a record figure, and the increase is accounted for by the augmentation of current accounts by £4,300,000. In such times as these, when Governments are spending heavily, one would naturally expect a large expansion under this heading. The large credits necessary to carry out the magnificent war efforts by Australia and New Zealand are spent principally on wages and payment for war material, and when disbursed the proceeds find their way through various channels to the trading banks as current accounts. To cover the credits the Government have to make public issues, and loans to the extent of £66,000,000 have been floated internally by Australia mainly for war purposes since the outbreak. Fixed deposits have fallen during the year by £764,000, the majority of the withdrawals probably having been for subscription to war loans.

Consequent upon the large increase in our total deposits it will be seen that our liquid assets have considerably strengthened, our cash balances having increased by £2,547,000, and our Australian and New Zealand Government securities, etc., have also been added to by £1,386,000. At the date of our balance-sheet we held in cash balances and securities (all but a small proportion of the latter being Government obligations) an amount equal to 45.54 per cent. of our total deposits, against 39.66 per cent. in October, 1939, and the proportion of our cash balances to total deposits has risen from 11.43 per cent. to 16.23 per cent.

ADVANCES

It will be seen that our advances have decreased from £36,534,000 to £35,798,000. This is probably largely due to the action of the Australian and New Zealand Governments in taking over the financing of the exportation of primary products. Moreover, the Government rightly controls bank advances to the end that they may be utilised for purposes of national interest.

Bank premises show an increase of £39,000, but expenditure has been restricted to what was considered essential to the maintenance of our business efficiency.

Turning to our internal liabilities, your capital of £4,500,000 remains the same, but you will notice that our reserve fund has been increased by £25,000 to £2,500,000. The £25,000 has been provided, not from current profits, but from a sum set aside many years ago to meet a contingency for which it did not become necessary to provide. Your directors thought the opportunity might now be taken to make your reserves up to the round figure of £2½ millions.

PROFIT AND LOSS ACCOUNT

Turning to your profit and loss account, the profit for the year, after the usual appropriations have been made, comes to approximately the same figure as last year, viz., £1,500,000. There has been a saving of £12,000 in salaries, due mostly to a number of the staff having joined the colours and who draw only a portion of their salaries during their war service. The only increase of £11,000 in general expenses in London has been caused almost entirely by the bank having to carry on its business on this side mostly in the country while still having to pay overheads in London and cost of provision for air raid precautions to comply with the Act.

Rates and taxes have increased by £36,000, and they will continue to increase. The war must be financed, and this is not the time to grumble, however much one was inclined to do so in pre-war days. Although our dividends are fortunately undiminished in the gross, but are subject to much higher income tax which decreases our personal income, all have to do their best to economise still further, for no one who has watched the evils of inflation in other countries wants it to ruin our Empire after the war has been brought to a successful conclusion.

TRADE CONDITIONS

The bank is able to pay the same gross dividend as last year, not only notwithstanding the large increase in taxation and overheads, but in spite of the fact that a large part of Australia has, throughout our financial year, been suffering from severe drought, which fortunately has been broken thoroughly since 1941 started. Of course, both Australia and New Zealand have benefited by the prices paid by the Imperial Government for such products as have been taken over. Wool, for instance, was appraised at just under 13½d. per lb. against the average price of just under 10½d. per lb. in the previous year. Against this must be put the increased cost of labour and the farmers' overhead costs. Last year Australia's wool cheque amounted to £65½ million sterling and that of New Zealand some £15 million sterling. It is not expected that last year's high level of production will be maintained in Australia, the official estimate of the 1940-41 clip being 3½ million bales, including 153,000 bales of skin wool, as compared with 3,600,000 bales in 1939-40.

The seasonal carry-over of wheat at June 30th last was 125,000,000 bushels. The chairman of the Wheat Board announced that out of 195,700,000 bushels of wheat delivered to the Board, 23,200,000 bushels remained unsold on December 31st. Latest estimates for 1940-41 indicate a wheat crop of 82,400,000 bushels.

The latest weather news is contained in the following cable received a few days ago from our superintendent:

"Season's conditions Australia and New Zealand now on the whole generally satisfactory, except Western Australia, where dry conditions prevail."

EXTENSION OF SECONDARY INDUSTRIES

As a result of the war Australia has been presented with a great opportunity to extend her secondary industries, not only in furthering her own interests in becoming more independent and self-reliant, but in order that she may supply essential war needs and be in a better position to manufacture for export to other countries after the war. War production has reached a high level, and the expenditure in this direction by the Commonwealth Government has greatly increased business activity.

The Federal Treasurer has lately introduced a record budget. Commonwealth Government expenditure from all sources is estimated at £276 millions (Aust.), of which £143 millions will be war expenditure in Australia. War expenditure overseas is estimated to be £43 millions.

As evidence of the determined measures taken by the Government it might be well to mention that the Commonwealth budget will absorb about 80 per cent. of the national income. With the State budgets added, total public expenditure in Australia in the current financial year is likely to be nearly 50 per cent. of the national income.

At our general meetings a vote of thanks to our staff, both overseas and in London, has always been passed. Perhaps, therefore, it would not be inappropriate to mention here that this year the difficult conditions under which the bank's work has been carried on entitle the staff to a very cordial vote of thanks, to your superintendent, Mr. Healy, and his staff in Australia, and to Mr. Cowan and his staff in London and Cobham, where work has not been entirely devoid of unwelcome excitement.

LONDON BRICK COMPANY, LIMITED

INCREASED TRADING PROFIT

The forty-first annual ordinary general meeting of the London Brick Company, Ltd., was held on the 18th instant in London.

Sir P. Malcolm Stewart, Bt., chairman of the company, in the course of his speech, said that the profit from trading amounted to £337,319, an increase on the previous year of £21,827, and interest and income from investments were down by £3,847. The total revenue at £354,325 was up by £17,981.

The year now reviewed had opened under the most unfavourable conditions. In addition to the adverse effects of the abnormal severity of the weather a collapse of the already poor demand was early experienced. However, to keep their staff and employees together and to provide for future contingencies, they had pursued a policy of producing to the maximum extent possible until such time as all stacking grounds became filled. Then a number of works had had to be closed down, no fewer than 250 millions of bricks having been put into stock. Whilst those conditions continued unsatisfactory trading results were recorded. They had prevailed until there was a marked increase of demand for factory construction and defence work and a belated demand for shelters and A.R.P. work.

PRODUCTION

By the end of the year the vast accumulation of stocks had been disposed of, apart from their floating stock of special bricks. That change, unlooked for in suddenness and magnitude, had justified the programme of production embarked on at a time when costly sand-filled jute sacks were preferred to bricks and shelter construction appeared to be all but dormant. Further, it had transformed the trading conditions and made possible the unexpected payment of an interim dividend at the end of last year.

The volume of production during the past year was unsatisfactory, and although it was exceeded by the deliveries, both showed a marked decline on the figures of 1939. The interruption to normal working caused by having to close and then to reopen works had not been costly, but placed a considerable strain on their works' executives, who had handled the situation well.

On the sales side of the business they had passed from a period of dearth of orders to a demand which, as stated, not only absorbed their production but had cleared the company's heavy stocks. They had generally been successful in keeping orders of high priority satisfactorily supplied. The Pressed Brick Makers Association had worked harmoniously where concerted action had been called for. It had been in close touch with the Director of Bricks of the Ministry of Works and Buildings, who was responsible for their industry.

WAGES AND LABOUR CONDITIONS

Under the ægis of the Pressed Brick Makers Association a piece of good constructive work had been done in August of last year through the formation of a National Conciliation Board, which fixed the rates of wages and the conditions of labour for their industry. That was a definite step forward, it was of immediate value, and as membership was on a 50-50 basis of representation of employers and the trade unions, there was a good prospect of a happy and harmonious solution of any problems that might arise affecting the workers engaged in the industry.

His forecast of the prospects for the current financial year must obviously be hedged with caution. Whilst it was probable that the demand might absorb for a time such production of bricks as could be attained, it must be borne in mind that they were faced with increasing difficulties of production, and it would be no easy task to maintain their present degree of efficiency. Assuming the strength of the existing demand continued, which he anticipated, then the results would depend upon their successfully maintaining their present rate of production, which so far showed an improvement on that attained last year. Provided they could achieve that and that they escaped the consequences of any of the direct major effects of the war, then they should be in a position to submit to shareholders when they next met results not less favourable than those obtained in the past year.

The report and accounts were unanimously adopted.

BOVRIL, LIMITED

NEED FOR ENCOURAGING SMALL INVESTORS

LORD LUKE'S SPEECH

Presiding at the forty-fourth annual general meeting of Bovril, Limited, held, on the 14th instant, in London, the Lord Luke, K.B.E. (chairman), in the course of his speech, said that although quite apart from Government orders the Bovril sales were much in excess of those in 1939, the increased cost of all materials and expenses (with the exception of advertising, which was reduced) resulted in the profit on trading being £21,200 down. Wages were, of course, up, and war commodity insurance was a much larger item this year. On the other hand, the company had not increased the selling price of Bovril, thus maintaining the same policy as during the last war, when the selling price remained unaltered.

As they already knew, the company's profit for the year 1940 was £263,860, to which had to be added the carry-forward from the previous year, £83,699, making a total of £347,559.

Out of the balance available, after meeting the fixed dividends, the company recommended a dividend of 5½ per cent. on the deferred shares, making, with the interim, 8 per cent. for the year, and suggested that £30,000 should be placed to reserve, leaving £33,809 to be carried forward to next year.

THRIFT AND THE SMALL SHAREHOLDERS

Lord Luke said he was glad to see that Lord Stamp spoke up for railway shareholders at the Midland meeting. Small investors with their thrifty habits were probably 80 per cent. of all the investors in this country; 80 per cent. of Bovril's 15,000 shareholders had holdings of 300 shares or less. These investors had in many cases holdings in other concerns, and in these difficult days for companies they did not get much of an average return, especially after taxation had taken its share. This was very unfortunate, for if there was one habit that should be encouraged now and in the hard years to come it was thrift.

EVERYBODY A FOOD SPECIALIST

He expected they would remember the witty doctor's definition of the difference between the general practitioner and the specialist—the G.P. being a man who knew less and less about more and more, while the specialist knew more and more about less and less.

In this sense he thought it could be said that we were all becoming food specialists nowadays. The quantity of some of our foods might be growing less and less, but—thanks to the experts of the Ministry of Food and others—we knew more and more about making the most, and the best, of the still very ample supplies that the merchant service and the Navy risked so much to bring us.

In this connection Bovril was proving of real and unique value on the kitchen front. Beef was a food rich in protein.

The flavour of Bovril was the concentrated flavour of beef retained in all its goodness, and available for making any less attractive dish appetising and tasty. It might not be generally realised just how concentrated this goodness was. In fact, it took no less than forty pounds of fresh beef to produce one pound of the essential beef flavour in Bovril. This was the explanation of the fact that very little was enough to enliven and enrich dishes made from the less expensive cuts of meat—or even completely meatless dishes—with the appetising flavour that belonged to beef alone.

TAKING A REEF IN THE SALES

As an increase in Bovril sales had become an inconvenience, it was something of a nuisance that sales had almost run away with the company of late. That they should have to try to reduce sales seemed a little topsy-turvy, but no one had any idea of the impediments that cropped up daily in the way of production.

If, as Lord Luke hoped, the war was over by the time of the next annual meeting, he would have pleasure in telling them some stories of the astounding difficulties surmounted by what remained of their staff and workpeople.

SCOTTISH POWER COMPANY, LIMITED

SERVICES WELL MAINTAINED

The thirty-first annual general meeting of the Scottish Power Company, Limited, was held, on the 14th instant, in Edinburgh.

Mr George Balfour, M.P. (the chairman), in the course of his remarks, said: I am glad to be in a position to-day to meet the members of this company with the directors' report and accounts which justify the opinion I expressed in my cautious forecast a year ago.

You will be interested to know that we increased our maximum demand, units sold and number of consumers, notwithstanding having to limit our activities to essential services.

One important matter I must mention relates to our capacity to supply post-war requirements when victory is ours. At the present time we must confine ourselves to winning the war, but we must be ready to act at once when the war draws to an end and men are being released from military duties. Planning ahead is essential, and especially in the case of our Grampian Hydro Electric property—so much so that three years ago at our annual general meeting I referred to the need for planning in advance for additional sources of supply.

POST-WAR REQUIREMENTS

The arrangements for the provision of additional water rights, to the north of our existing developments, were promptly completed. An application to Parliament would have been made in 1939, but owing to the outbreak of war we delayed the application. The time has now come, however, when, if we are not to be seriously hampered in providing for post-war requirements, we must take preliminary steps, and accordingly the Grampian Company has made an application to Parliament for the necessary powers to develop these additional water resources.

The forecast of three years ago, to which I have just referred, was correct, and we shall urgently require increased plant capacity to enable us to supply the additional demand, including provision for the development in the Highland area in which the new water power is located. The company will at all times give prior claim to any and all demands in the area and contiguous to the area in which the new development is situated. Indeed, it is the great desire of my colleagues and myself, when power is available, to tempt industry into the sparsely populated Highland district. You will remember that two years ago we offered to assist parties who wished to establish small industries in the Highlands.

SATISFACTORY OPERATION OF PLANTS

All our hydro-electric and steam plants operated satisfactorily throughout the year and our services were well maintained, as you have no doubt judged from what I have already said. I would remind you that we reduced our domestic charges in the June quarter, 1939, and I am glad to say we have been able to maintain the reduced charge and even look forward to further reductions after the war. The chief bugbear, as I have often mentioned before, is the uncertainty of the valuation for local rates. It is not sufficiently well known that this charge for rates has ultimately to be borne by the consumer. We cannot deflect energy to these matters meantime, but I hope when victory is achieved we shall be able to smooth out these difficulties on a sound and equitable basis.

We now supply all the cities, towns and boroughs within an area of nearly 13,000 square miles either in bulk or by direct distribution, except six, which includes two large cities. The six cities and towns which we do not supply have a total population of a little under 500,000, serving about 100,000 consumers in a total area of about 123 square miles, whereas the population in our area is 1,000,000 scattered over 13,000 square miles with nearly 100,000 consumers connected. In the six cities and towns we do not supply the aggregate population averages 4,000 per square mile, varying from over 15,000 to 2,000 per square mile. In the area we supply the population averages under 80 per square mile, and our distribution services run from the north of England to the north of Scotland.

The report and accounts were unanimously adopted, and it was resolved that a final dividend of 5½ per cent., less tax, be paid on the ordinary stock, making 8 per cent., less tax, for the year.

METROPOLITAN ELECTRIC SUPPLY COMPANY, LIMITED

SUPPLIES MAINTAINED

The fifty-fourth ordinary general meeting of the Metropolitan Electric Supply Co., Ltd., was held on the 19th instant in London.

Mr. George Balfour, M.P. (the chairman of the company), who presided, said that, briefly expressed, business during the year had been well maintained except in the London areas, where they, in common with others, had suffered considerable diminution in consumption due to evacuation and other causes. In view of the irritating conditions under which they worked it was a satisfaction to the directors and staff that, notwithstanding all the stirring events of the time, they were able to report that supplies to all their consumers had been properly maintained throughout the year.

The receipts shown in the London area had amounted to £518,875, compared with £539,826 in 1939 and £562,380 in 1938; on the other side of the account expenditure had increased £16,385, and he asked shareholders specially to note that rent, rates and taxes had increased from £48,907 to £70,201, making with the increase in the western area a total increase of £41,394. Total receipts in the western area had amounted to £1,552,144, compared with £1,226,103. Regarding subsidiary companies, the services of all had been satisfactorily maintained throughout the year, and all those subsidiary companies were not only operating efficiently up to date but showing satisfactory results.

With regard to the rating position he would mention that last year they had paid a total sum of £211,293 in local rates in all the companies owned and worked by this company, and the magnitude of that figure would impress when he mentioned that the total net sum paid to debenture and shareholders of the company was only £188,201.

From the balance available of £277,653 the directors recommend payment of a final dividend of 5 per cent. on the ordinary stock, making 8 per cent. for the year, and leaving to carry forward £127,653.

The report and accounts were unanimously adopted.

LANCASHIRE ELECTRIC LIGHT AND POWER COMPANY, LIMITED

SATISFACTORY OPERATIONS

The ordinary general meeting of the Lancashire Electric Light and Power Co., Ltd., was held on the 20th instant in London.

Mr. George Balfour, J.P., M.P., the chairman, first of all referred to the death of Mr. Alfred Shepherd, at one time chairman of the company and vice-chairman at the time of his death. Mr. Shepherd would be mourned by a wide circle of friends who knew and understood his sterling qualities and appreciated his genial Scottish character.

Notwithstanding the difficulties common to all they had every reason to be satisfied with last year's operations. Their subsidiary companies had increased their load, connected new business, and had sold more units than in the previous year notwithstanding the fact that they of necessity had limited their efforts to essential services and for the time being had abandoned the usual "business-getting" propaganda. They had not increased prices to consumers notwithstanding heavy increases in costs, the price of coal having increased nearly 50 per cent. in the last four years.

During these very difficult times, the Board had to be careful as to estimating their future from year to year under war conditions, and plan to be able to face with confidence any temporary falling-off in load after the war. Personally he did not anticipate any substantial drop, but it would be well to budget with that contingency in mind.

The gross profit of £256,549 was some £32,500 less than in 1939, accounted for by increased appropriations for income tax, depreciation and contingencies. There was an available balance of £101,634, from which the directors recommended the payment of an additional dividend at the rate of half per cent. on the 7 per cent. participating preference stock, making 7½ per cent. for the year, and of a final dividend of 5 per cent. on the ordinary stock, making, with the interim dividend, 7½ per cent. for the year, carrying forward £15,384.

The report was unanimously adopted.

BRITISH ASSETS TRUST, LIMITED

SUCCESSFUL RESULTS OF A DIFFICULT YEAR

MR A. W. ROBERTSON DURHAM'S REVIEW

The forty-third annual general meeting of the British Assets Trust, Ltd., was held in Edinburgh on Wednesday, March 19th, Mr A. W. Robertson Durham (chairman of the company) presiding.

In moving the adoption of the report and accounts the chairman said: Mr Basil G. Ivory is unable to be present to-day, as he is serving with H.M. Forces.

You will see that in the accounts now before you the previous year's comparable figures have been set out in the margin. It was felt that this would be a convenience to stockholders, and it is proposed to continue this practice in future.

INCREASED GROSS INCOME

The gross income for the past year amounted to £337,163, a very slight but satisfactory increase over the previous year's figure of £335,946. This figure includes the sum of approximately £3,858, before deduction of tax, received in respect of arrears of dividends and special dividends which might be considered to be of a non-recurring nature. On the payment side of the accounts there is little that calls for comment, the main difference being the large increase of income tax, which has risen from £109,072 to £130,744. After deducting management and other expenses, income tax, debenture interest and preference dividend there remains £48,454 available for the ordinary stock.

DIVIDEND AND BONUS

We recommend a dividend of 10 per cent. for the past year, and, in addition, a bonus of 2 per cent. Once again we are proposing to distribute 2 per cent. as a bonus and not as a regular dividend, as income prospects for the current year must be very uncertain and we cannot foresee how much may be available a year hence. This leaves a surplus of £15,184, and after the addition of £15,000 to the income reserve fund, which now amounts to £155,000, the sum carried forward is increased by £184.

From the balance-sheet you will see that we have again reduced the amount of terminable debentures outstanding, the reduction this year being from £483,257 to £450,707, and, in addition, deposits and loans are down by £45,000. We are very glad to be able to add once more to the income reserve fund, and, while we hope that it may not be necessary to encroach on this fund in the near future, it is comforting to have such a substantial reserve of this nature in existence.

INVESTMENT OF PROCEEDS OF AMERICAN AND CANADIAN STOCKS

The year has been one of great capital activity for the company. We have made new investments of approximately £1,428,000 during the period covered by the accounts. Practically the whole of this amount represents the proceeds of American and Canadian stocks which we have sold or which have been requisitioned by the Government; the sum received for the securities requisitioned amounted to approximately £970,000, and although many of the prices received were not entirely satisfactory, I am glad to say that on balance we realised a small capital profit. As you will see from the report we still have about 12 per cent. of our funds in U.S.A., but doubtless we shall hold few of these investments in a year's time.

(Continued from page 389)
certain agricultural workers and underground mine workers to receive a larger ration of cheese than other consumers. From the middle of April the consumption of milk will be reduced by one-seventh to increase the production of cheese and condensed milk. Caterers' supplies will be reduced, and bakers and flour confectioners will be required to dispense with its use. No restriction will be made on the supply to nursing and expectant mothers,

young children, invalids and hospitals.
Reduction in Poultry.—In view of the reduced amount of feeding-stuffs available for poultry, to encourage the culling of laying flocks of older hens, maximum producers' prices for United Kingdom boiling fowls were raised to 1s. 6d. per lb. from March 17th, and the retail price to 1s. 10d. To give producers of table poultry a reasonable opportunity to reduce their flocks and to encourage them to do so, maximum prices have been

fixed from March 17th for small chickens. For chickens weighing not more than 1½ lbs. rough plucked, untrussed and undressed, the producer is paid 3s. per bird, the wholesaler 3s. 2d., and the consumer pays 3s. 6d. The present maximum producers' prices will be reduced to a flat rate of 1s. 6d. per lb. on May 3rd for all poultry, including roasting chickens, ducks and geese. The promised reduction in egg prices of 2s. 6d. per 120 is to take effect from April 20th.

SHORTAGE OF SUITABLE INVESTMENTS

So far we have been able to reinvest our funds on satisfactory terms, but I am afraid that we shall have to face a reduction in our income when the balance of our American investments is realised, as it is becoming increasingly difficult to obtain stocks in any quantity, and yields are rapidly dwindling in the face of great competition for the small amount of stocks available. Increasing taxation on the one hand and limitation of production and restricted imports and exports on the other are also likely to lead to a reduction of income for the duration of the war.

We have made a valuation of our investments as usual, but in many cases prices are nominal, and too much importance should not be attached to the valuation. The table of distribution will, however, give some idea of how the money realised from American securities has been invested.

I hope that I shall be able to give you a satisfactory report in a year's time, but as 1941 is likely to have as many surprises as 1940 I shall make no forecast.

I move the adoption of the report and accounts, and payment of the dividend recommended therein.

The motion was seconded and adopted.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED

MR H. ERIC MILLER'S REVIEW

The thirty-third ordinary general meeting of the United Serdang (Sumatra) Rubber Plantations, Ltd., was held on March 20th in London. Mr H. Eric Miller (the chairman), who presided, after referring to the domestic affairs of the company, said: During the year 1940 the world supplies of crude rubber amounted to over 1,400,000 tons, and were by far the greatest volume yet put out by the producing industry.

U.S.A. absorption of rubber averaged about 150,000 tons a quarter during the first three quarters and increased to 168,000 tons during the fourth quarter, a total of 619,000 tons in 1940, against 592,000 tons during 1939. It is likely to show a further increase during 1941. Automobile output—the principal consumer of rubber—increased to 4.5 million vehicles against 3.6 million vehicles in 1939.

United Kingdom absorption is estimated at over 140,000 tons, and was more than 20,000 tons higher than in 1939.

The absorption of the Continent of Europe during the first quarter of 1940 appears to have been in the neighbourhood of 70,000 tons. After the capitulation of France and the entry of Italy into the war the Continental imports fell sharply, and during the last quarter of 1940 are unlikely to have exceeded 2,000 tons, except for such quantities as may have been transported via Siberia.

The absorption of the remaining countries, measured by their net imports, amounted to about 153,000 tons, against 131,000 tons in 1939.

With supplies exceeding 1,400,000 tons and real absorption in the neighbourhood of 1,050,000 tons, the stocks outside the regulated areas have increased by roughly 350,000 tons during the year.

The advice we in this country have been given to guide our actions in the event of invasion is not to panic but to stay put, and I think that this advice is logically applicable to holders of rubber shares. It seems to me foolish in the extreme for anyone to sacrifice his interest in this great industry.

The report and accounts were unanimously adopted.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended March 15th, 1941, total ordinary revenue was £45,814,000, against ordinary expenditure of £94,321,000 and issues to sinking funds of £145,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £2,319,063,000 against £693,690,000 (including defence loan issues) for the corresponding period a year ago.

to be at entire liberty to vote. But it would be a pity if matters were to go to quite those lengths. The Government must be consulted at every stage of the process of selection; but a better choice will be made if the initiative is left to those who know intimately both the office and the men.

What sort of a man should the Governor of the Bank be? In the past, the emphasis was laid on the necessity for him to be a financial technician; his most important and absorbing task was to manage the money market in days of delicate free markets and tiny gold reserves. This was one of Mr Norman's own specialities; but its importance has declined—both absolutely with the growth of rigidity and controls and the lapse of the gold standard, and even more relatively to the mass of problems of State with which no Governor before Mr Norman was ever concerned. The next Governor should be an economic statesman—as Mr Norman has been—rather than a financial expert. The change from gold standard to controlled sterling has also removed the previous necessity for the Governor to have an international bias in his experience. It is no longer his first commandment to husband the gold reserve, and therefore to be on constant watch for storm-signals in the foreign exchanges. If the Governor nowadays should have one dominating interest it should rather be in the finance of British industry. This is not to say that he should be what is known as an industrialist; but he should have some knowledge of industry and of its problems.

There is one more qualification which deserves specific mention. He should be a young man. There are several reasons for this, entirely apart from the general necessity that exists in every branch of our national life for lowering the average age of those who are in supreme control. The first of these special reasons is inherent in the choice of a permanent Governorship. Mr Norman himself entered on his long tenure when he was 48, and there would be very little

point in attempting to follow the precedent he has created if the new Governor could retain the office less than, say, ten years. If the Court were to nominate a sexagenarian, it would rightly be taken as a sign of failure to find a successor to Mr Norman. But there is another reason in favour of a young man that is even more decisive—though youth in this case is more a matter of attitude than of years. In monetary affairs more than in most matters there has been a revolution in thought and practice in the past ten years. But in monetary affairs more than in most matters, established habits of thought have in the past been not so much convictions that could be abandoned when circumstances alter, as articles of faith to be carried to the grave. For any banker or financier whose mind was set before 1931 it is almost impossible to change such beliefs as, for example, that exchange stability in a free market is the only natural state of the foreign exchanges, or that dear money has a higher ethical justification than cheap money. If our monetary policy is to have the elasticity it will need to seize every opportunity offered by a strange and turbulent world, it is essential that its supreme director should be a man whose mind had not been set before 1931, when the new monetary era began.

This is not the place—nor has the time yet come—to indulge in the pleasures of a guessing game. When the leader of a political party—a future Prime Minister—has to be chosen, the character and accomplishments of the candidates are rightly made the subject of nation-wide discussion. In the nature of the case, that cannot happen with the Governorship of the Bank, since familiarity to the public is not one of the requirements. But if the men cannot be canvassed, the qualifications for the office can be, and it is right that, even in the distractions of a war, thought should be given to a selection which may well be as momentous for the welfare of the country as any but that for the Premiership itself.

Jugoslavia Rebels

IN the early morning of March 27th the young King Peter of Yugoslavia took the Royal power into his own hands, placed M. Tsvetkovitch, the Prime Minister, and other Ministers under arrest, and called to the head of the Government General Simovitch, an Air Force officer known for his British sympathies. The news completely revolutionised a situation which, to all appearances, was passively conforming to the normal pattern of Balkan-Axis relations. Two days earlier, M. Tsvetkovitch and M. Cincar-Markovitch had signed the Tripartite Pact for Yugoslavia, apparently without reservations, and it is only when the nature of the Cabinet crisis which preceded their journey to Vienna and the general political situation which that crisis represented are fully understood that the courage and significance of the young King's action can be properly appreciated.

Until March 20th there seemed a reasonable prospect that Yugoslavia would stand firm. The Yugoslav army, a million strong, was fully mobilised, and the obvious candidate for Quisling-in-chief, Dr Stoyadinovitch, had been quietly handed over into British custody. On March 20th, at 9.30 in the evening, the Yugoslav Cabinet assembled to consider Germany's latest terms, and, after a stormy meeting, it was announced that four Ministers had resigned, that four others, including the Prime Minister, M. Tsvetkovitch, had preferred not to commit themselves to a vote, while a majority, largely composed of Croat Deputies, had agreed to accept the German terms.

This degree of opposition was only natural. Neither the terms offered by Hitler nor the temper of the country warranted submission. Hitler's conditions at first did, it is true, present a slightly modified version of the usual Axis formula, but "secret" terms in-

cluded an undertaking from Yugoslavia to permit the transit of German "war materials and hospital supplies" without right of search, a guarantee to put an end to anti-Axis activity and to bring Yugoslavia's economy into harmony with that of the Reich. In return, Germany undertook to take account of Yugoslavia's aspirations in the Aegean.

In making their stand, the dissenting Ministers had the clear support of the public opinion at least of Serbia. Feeling ran highest in the Army with its magnificent fighting record and the daily example of the Greeks to spur it on. Agitation in the country was strongest where soldiers were stationed, and the choice of General Simovitch to lead the new Government suggests that it was above all the weight of military opinion that finally won the day. But the civilians, too, were roused. The memory of 1914 and 1915 and the glorious resurrection of 1918 is not dead. The example of Greece is infectious. And behind Greece stands Britain and the United States and the great promise of "Lease and Lend."

For a day or two the pressure of public opinion was strong enough to prevent any solution of the Cabinet crisis, and it was not until March 24th that Prince Paul could find any politicians ready to take the place of the departed Ministers. The distracted population spent the interval demonstrating, petitioning and praying—to no avail. The Cabinet crisis was overcome, and at ten o'clock the same evening the Yugoslav delegation left Belgrade to sign, not a modified version of the Tripartite Pact, but the Pact itself as signed by Germany, Italy and Japan in September, 1940.

However, the Government's surrender seemed less surprising when it was set, not in the context of Serb public opinion, but against the background of Jugo-

slavia's problems as a whole. Economically the country is almost entirely dependent upon Germany, which now accounts for more than three-quarters of its foreign trade. Such concerns as *Jugo-Montan* are steadily acquiring a monopoly of Yugoslavia's valuable mineral reserves; German marketing associations have made great headway among the peasant co-operatives, organising their sales to Germany in return for seed, fertilisers and agricultural machinery. The war has only increased the dependence by transforming Europe into a German preserve and closing the seaways.

Strategically it could be argued that the question of Yugoslavia was settled when Germany completed the invasion of Bulgaria. Now Yugoslavia is surrounded by the Axis on every frontier save the common frontier with Greece. The Serb Army has a fine tradition, but its Air Force is small and obsolete, save for 200 Hurricanes. So, too, is the Navy. Although the hilly country of Serbia may favour the defenders, the risk of annihilation is great. But the King's gesture shows the Serbs remember that they have taken such a risk before.

The fundamental weakness of Yugoslavia's position was largely political, and it is as old as the Kingdom of Serbs, Croats and Slovenes. It was not until 1939 that anything like a satisfactory compromise was worked out between Serb nationalism and Croat separatism, and Croatia, condemned for twenty years to the rôle of a dissident minority, and trained through the centuries of its connection with Hungary to play the part to perfection, proved an ideal ground for the familiar Nazi tactic of disintegration. It was not simply the fact that Croatia on the flat northern plain would bear the first impact of an invading army. It was that Germany had known how to play on every dissident opinion and every separatist gesture among the various Croat groups. The Croat Ministers were probably thinking primarily of sparing their peasants from the consequences of war. Many Croat politicians may have been tempted by Nazi promises of expansion and power at the Serbs' expense. The extremist wing of Frankovici are openly pan-German. It is significant that the voting on the German terms tended to follow national lines, with the Croats as the supporters of the German view.

It is with these facts in mind that the dilemma facing Prince Paul and his Ministers must be assessed. In refusing Hitler's terms, they thought they would be faced not only with a war against Germany but also with a civil war against a Croatia misled by Nazi propaganda into rejecting Serb leadership. On the other hand, they probably argued that by temporising and attempting a compromise they could preserve the integrity of Yugoslavia and retain some measure of independence.

To understand the reasons which prompted the Ministers' decision does not, however, imply any condoning of it. The men who went to Vienna voluntarily accepted conditions of humiliation and

servitude. They decided to break not only with the heroic example of Greece, but also with their own tradition. In 1916 all was lost except honour. M. Tsetkovitch tried to save everything—with the same exception. They would doubtless urge in palliation of their conduct that in this crisis of March, 1941, the odds were too heavily against them and that this was the only possible decision. But the crisis itself was a product of their own past follies and mistakes. The distracted Regent reaped in this last fortnight the bitter harvest of his long toleration of Dr Stoyadinovitch and of the spineless policy of the Prime Minister now deposed. However grave were the difficulties they were to a great extent attributable to the policy—past and present—of the Regency.

Thus, the young king and his new advisers have arrested the drift towards enslavement at what can only with optimism still be called the eleventh hour. They have, in fact, taken office as the hour is actually striking. All the reasons which compelled the earlier government to submit have not been banished by King Peter's courageous gesture, and much that is not immediately understandable in the policy of the new regime is undoubtedly due to the overwhelming dangers and difficulties with which they are faced.

The retention of Dr Matchek, the Croat leader who voted for submission and of four other Croat leaders is undoubtedly explained by the paramount need to preserve the unity of the country. Similarly, the semi-official statement declaring that the *coup d'état* denotes no change in foreign policy reflects the Government's desire to avoid any extra provocation of Germany, over and above the enormous provocation of existing at all. King Peter is fighting to keep his country neutral, not to plunge it into war.

The decision of peace or war will not be taken in Belgrade. Nothing can disguise the fact that, for the Nazis, the disappearance of the Regency is a major diplomatic defeat. It has occurred at the most embarrassing moment conceivable, since Mr Matsuoka has arrived in Berlin to find not one more subservient nation hitched to the Nazi chariot, but a small country disavowing its Nazi overlords and rejecting their policy. Finally, it compels Hitler to choose between accepting King Peter's version of neutrality and plunging his Balkan back-garden into war. It will not be any consolation to the Nazis to remember that it was in part their anxiety to bring Yugoslavia into line before the arrival of Mr Matsuoka that led them into premature and hence disastrous action.

The line that British policy must take is obvious. The Yugoslavs are not to be hurried into making decisions and demonstrations of solidarity. At the same time, it must be made clear to them that any stand they make will be backed by all the military resources Great Britain can muster to their support. With the exception of this island, there is no theatre of war in which so much is at stake.

Farming for the Nation

THE twentieth in the series of reports from the Select Committee of the House of Commons on National Expenditure, first set up in 1939, was published last week as the sixth report of this session. It is a plea for effectiveness and forethought in the policy of the Ministry of Agriculture. In peacetime, as a farmer once put it, "grass is the biggest and most important crop in British agriculture;" more than three-quarters of farm lands, apart from "rough grazings," are either wholly permanent grassland or rigidly divided into permanent grass and arable; and the traditional policy of British farming is to rear animals on grass and cheap foreign feeds. In wartime, the scene must alter; and the task of wartime agricul-

tural policy is to father the necessary transformation.

It is well to insist on the difference in aim between peacetime and wartime agricultural policy, since no task is more delicate than to strike a balance between present necessity and possible future harm. In peacetime, the object of a sound agricultural policy should be to maintain a healthy farming industry in this country without either substantially increasing the cost of the people's food or harmfully disturbing the flow of foreign trade on which the wealth of the country so largely depends. It may be entirely sound in peacetime to use methods of cultivation that produce less food per acre if to do so is more profitable for the farmer and less expensive to the consumer;

but the New Deal, trade unions, unemployment insurance and social security have "come to stay." So, too, America is "Anglo-Saxon" and not. Apart from the French of Louisiana and South Carolina and the Germans of Texas and the Valley of Virginia, and, of course, the negroes (whose origin nevertheless is British), the South may be "Anglo-Saxon." But the Union is a melting-pot, with the "race-line" drawn differently in every part, against Irish and Catholics in New England and for them in Maryland, for the Scandinavians of Minnesota and North Dakota on the wheat plains and against them in the towns; and there are the negroes and the Jews, the "whipping boys" of "embittered poor men and women" in depressed cotton districts and city slums, of adventurers and clerical demagogues. In Illinois, with 380,000 negroes, there are twice as many negro lawyers, judges and justices as in seven more southerly States with 6 million negroes; and even in the North, in New York's Harlem, the negroes are charged high rents, paid low wages, and given few schools. In the South negroes are barred from citizenship and receive no even justice.

It is not a question of America but of the parts of America, not of the 48 States but of the half-dozen or so sections into which geography, economic activities, history, and race have divided its 3 million square miles. The South is the land of cotton. It was on the losing side in the Civil War. It has "the highest proportion of negroes, of members of evangelical churches, of illiterates, of murders, of drinkers of coca-cola, and of tenant farmers." The Middle West is bound by the "corn-hog cycle," the mountain States of Colorado, Idaho, Montana, Arizona, New Mexico and Nevada by silver, New England by its "barren soil, water-power and hard winters" and its "common educational, religious and political experiences." The political parties themselves are sectional; one party tends to dominate

all classes in each area—Democrats in cotton-growing Georgia and Republicans in textile New England; Democrats in the solid South and Republicans in the North and Middle West; Irish Democrats and Italian, French and negro Republicans. The party lines of tariffs and State's rights have gone; "the Republican party is the party to which Republicans belong and the Democratic party the party to which Democrats belong."

Yet America is a democratic republic—and a nation. It may be cloaked in fictions: a farmers' republic when it is not; a Protestant people when it is not church-going; a super-educated people when, except statistically, it is not; a federation of States with the power of government held in by "checks and balances" when it is really a congeries of regions with central power spreading swiftly; a "Germanic race" when it is a mirror of all Europe and parts of the other continents; a community of sturdy individualists when it moves and thinks and eats and dresses in masses; a land of liberty when the negro problem is no nearer to solution than it was two generations ago. But there is a free and united America behind the cloak. "American society, in those parts of America that are not already mummified, is not fixed enough to present real barriers for long, and all immigrant groups, with two exceptions, find themselves accepted for all practical purposes as soon as they are really Americanised." Mr Willkie, of pure German origin, was "more vigorous in his denunciations of Herr Hitler than were his Anglo-Saxon and Dutch rivals."

Professor Brogan's brilliant study may well be the beginning of a movement on both sides of the Atlantic to show the two countries as they really are, so that after the war, when it is realised again that they are foreign to each other, there may be no breakaway, but understanding. This book is not only the portrait of a people. It is the portrait of a nation—and a partner in the next generations.

NOTES OF THE WEEK

Russia and the War

Mr Matsuoka's colloquy with Stalin and the Russian guarantee to Turkey both raise the general issue of Russia's attitude towards the war. Theoretically—inasmuch as theory still counts for anything in Moscow—the war is a stroke of fortune. The Russians argue that the great capitalist Powers are exhausting themselves in the race to devote more and more of their resources to destruction, the peoples of the world, under the unbearable discipline of the bomber and the armament factory, are moving surely towards that frenzy for peace which created the Russian Revolution, and Russia, alone steering clear of the struggle, will have arms enough and purpose enough at the end of Armageddon to impose terms upon the prostrate world. This utopian prospect hinges however on one or two conditions, that no Power or group of Powers shall emerge unshattered from the conflict, and, more urgently, that Russia shall succeed in staying out. This is undoubtedly the question uppermost in Russian diplomacy. For the time being, there is nothing to be feared from the Far East. Mr Matsuoka, passing through Moscow on his way to Berlin, has nothing to offer and much to gain. If, as Japan's military activity in South China suggests, the Japanese imperial way is now to lead South, Mr Matsuoka must be ready for large concessions to secure a Russian undertaking not to take advantage of Japan's preoccupation elsewhere, while the Russians will be in a position to give and then keep or break the guarantee as they see fit. In the West, Russia's situation is not so happy. Soviet influence has been driven out of the Balkans and now the Dardanelles are threatened. The Russians are far too vulnerable to German attack to risk intervention themselves but they would naturally welcome an attempt on the part of Turkey and Turkey's ally, Britain, to defend the Straits

for them. Germany has been attempting to counter this hope by spreading reports of Russia's readiness to attack Turkey in the rear in the event of a German drive towards the Straits. The guarantee which binds Russia not to embarrass Turkey if she become involved in a defensive war is an interesting commentary on Russia's desire not to exasperate Germany yet to stiffen Turkey to defend the Straits.

Defence Debates in America

The pace with which American re-armament and aid to Britain is going forward has been fully maintained ever since the President first hatched the Lease and Lend Bill. The Bill appropriating \$7,000 millions was passed by the Senate even more quickly than by the House, and by an ever larger majority. Hardly a day passes without some new item of aid that is being sent or promised to Great Britain or some new declaration of sympathy and support. American diplomacy in Belgrade has been in open alliance with British. Visits of American naval squadrons to Sydney and Wellington were declarations of solidarity in the Pacific. Only on the subject of that naturally gives rise to lively regrets, there can be no food for Vichy France is there the slightest apparent divergence between the two Governments, and though hard feelings. At the present stage, re-armament is still largely in the planning stage. It is providing plenty of work in Washington and in some of the specialist sectors of industry; but it affects the public most, at this stage, as a new and absorbing peg on which all the current controversies of American public life can be re-hung. It is interesting to observe them re-appearing in their new guise one by one. There is, for example, the chronic three-cornered struggle between the AFL, the CIO and

the employers. On the whole, the advent of re-armament strengthens the hands of the employers, since interruption of the flow of production is a more serious offence now than formerly; but it also has its benefits for the workers if they harden their hearts and defy public opinion. The so-called "epidemic" of strikes is as yet a very tiny affair, but the odds are that it will grow, in spite of the President's new mediation board. Another old dispute that is appearing in a new form is the allegation that Big Business is bent on restriction. For the moment it is the steel industry that is most in question. Its critics allege that new capacity will have to be provided if the arms programme is to be carried through. The industry replies that with a capacity of some 85 million tons a year there is enough steel to make all the arms and supply quite a lot of the civil demand as well. The real question here is more fundamental than any matter of steel: it is whether there is to be any restriction of butter while the guns are made.

The War in Africa

The advance into Abyssinia goes forward satisfactorily. Negelli has fallen in the south, the columns advancing from Mogadishu have taken the Marda Pass on the way to Harar and have had men to spare to recapture Hargeisa in British Somaliland and join up with British forces advancing from Berbera. This move restores the whole of British Somaliland to British control. Further north in Eritrea the battle for Keren is entering its third week. The Italians are fighting stubbornly in the strongest possible strategic position and the fight for the heights is likely to be dogged and costly. On the other hand the strength of the resistance suggests that the Italians are staking everything on the

defence of Keren and that their collapse will be correspondingly complete once the ramparts have been stormed. There is still little to report from the Libyan front, but there is evidence to suggest that a new situation is developing there. Marshal Graziani has resigned, and although the name of his nominal successor, General Italo Gariboldi, is ostentatiously Italian, it is all too likely that the Germans have taken over the direction of the North African campaign. German reinforcements have arrived in Tripoli, and an armoured division is reported among them. German rumours of the recapture of El Agheila have now been officially confirmed, and although this advance post was lightly held by the British, the recapture suggests the Libyan war may flare up again—a factor which must be considered in General Wavell's plans for the distribution of his forces.

Sheep and Goats

Man-power policy is still a variegated scene. So far, compulsion has been kept for the armed forces, but now that too few volunteers have come forward to fill the gaps in whole-time civil defence, which some recent raids have made very evident, compulsion is to be extended. The new National Service Bill will replace the choice, which conscripts have hitherto had, to opt for civil

defence by the power to compel men called up to go into the police war reserve, the auxiliary fire service or first-aid parties. It has not been possible to fill the gaps either by voluntary means, despite pay of £3 10s. a week, with a subsistence allowance of 24s. 6d. if away from home, or from men of non-military age. Of the groups called up from now on—the 37s are to register on April 12th—only a small number will in fact be diverted from the armed forces, and they may volunteer in advance. Conscientious objectors, too, will be called upon, which should resolve an anomaly, since objectors exempted from military service on condition of going into civil defence have hitherto found it impossible to do so, since local authorities have refused to have them. In fire-watching, businesses compelled to take precautions have secured their watchers—though sometimes by paying salaries sufficient to bribe them from civil defence; but in the protection of houses and residences, the shadow of compulsion through registration has been so firmly set aside that the position remains vague and inequitable—and inefficient. Meanwhile, registration and volunteering remain the procedure for industrial mobilisation; and women in the age groups to register have been advised not to go into war work from their present jobs—which may be "useful"—until they are individually advised to do so. It is pointed out that very many of them will be advised to stay where they are. It is equally hard to assess the tempo of volunteering and the urgency and scale of the Government's industrial need for men and women. That the war effort needs millions more, however, is certain; and the experience of volunteering for whole-time civil defence, where the jobs were simply not attractive enough in pay and conditions to win recruits, should make the Government both disinclined to damp down enthusiasm and disposed to have plans for more compulsory means ready to hand.

Woman-Power Debate

The first full-dress debate on woman-power in the House of Commons was chiefly remarkable for the

EXECUTOR AND TRUSTEE BUSINESS CONDUCTED

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

unanimity of opinion voiced by the interested parties. The speeches of the women members, taken as a whole, raised two issues. The first was a forceful plea for "fair play" in the registration of women for war work; the second was an attempt to give practical guidance on the social problems raised by more general military and industrial employment of women. On the question of "fair play," it was urged that the admission of women citizens to equal responsibilities and duties, according to their ability, should carry in actual practice a guarantee of equal conditions and opportunities. The announcement by the Minister of Labour of differential rates of pay during training and of widely differing rates of compensation for injury, to which the Minister of Pensions was able to announce no amendment in the case of women gainfully employed, only confirmed an anxiety that in the matter of compulsory registration women are unlikely to be allowed to enjoy the smooth along with the rough. Of the practical problems involved, that of securing suitable interviewers for women recruits is among the most important. Mr. Bevin's scheme is a halfway house between individual approach and use of mass methods and there appears to be a real danger that it will contain the benefits of neither. The social problems raised by mobilising women centre in the difficulty of combining the best use of women's work with suitable conditions for child-birth and a sound child welfare policy. The women Members were agreed in rejecting Mr. Bevin's suggested scheme for the provision of child "mindes," urging that women engaged in looking after their own children should not be called up, but that where they are already engaged in gainful employment vigorous action should be taken for the provision of day-nurseries. There was little opposition to the principle of registration itself. While women Members were able to speak in this debate with special knowledge, as Members they represent constituencies of both sexes; and it should not be forgotten that the male Members, who mainly held their peace, also represent both men and women.
