The control of particular prices, as distinct from control of the general price level and of certain "strategic" prices like the price of transport, fuel and labour, will not prevent inflation—especially when its intention is, not to peg prices at a given level, but to prevent margins from rising, or, in other words, to prevent prices from rising more than higher costs or lower turnover can justify. But it can prevent profiteering and injustice. It has been evident for some time, and not least to the Central Price Regulation Committee themselves, that the power to control prices under the Prices of Goods Act does not go far enough. The working of the Limitation of Supplies Orders has bred a variety of commission transactions between registered firms and other traders, by which actual increases in price have been concealed. Middlemen and speculators have intervened in short markets to make open or hidden gains; and, in the field of effective price control itself, the need has increasingly been realised of pegging all the interrelated range of wholesale and retail prices, right back from the shop to the manufacturer. A new Bill to be introduced by the President of the Board of Trade will be designed to check all profiteers, commission agents, middlemen and speculators alike, as well as to make official control over margins, wholesale, retail and manufacturing, comprehensive enough to be effective. Nothing is yet known of the machinery of administration and—still more important—of enforcement; and it is worth noting that there is nothing sacrosanct about margins, and that the preservation of the margins of, say, August, 1939, as maxima, may simply do the work of monopolists or restrictionists for them.

* * *

The Distribution of Coal

In its eighth report of the present session the Select Committee on National Expenditure has made public its recommendations for an improvement in the distribution of coal. After making due allowance for all the difficulties caused by the war, the Committee does not hesitate to attribute local shortages to faulty organisation. Transport can and must do a better job; the delay in releasing wagons can no longer be tolerated

and, if necessary, the movement of coal must take precedence over that of passengers and of less important commodities. The Government's programme for creating dumps near centres of consumption before the last winter was only half fulfilled; this must not be allowed to happen this summer if serious shortages, detrimental to the war effort, are to be avoided next winter. The "geographical balance" in the output of coal must be improved. And as some pits are short of labour while others cannot give full employment, the mining population must be redistributed, if necessary by compulsion. Again, there is scope for much closer co-operation between coal merchants for the purpose of pooling stocks of household coal, labour and transport. No one would wish to deny that the various methods of improvement suggested by the Select Committee are all very difficult to carry out. But the criticism that can fairly be made of the handling of the coal problem in the past twelve months is that insufficient effort and imagination have been put into the task of surmounting difficulties.

*

The Need for Better Transport

In examining the causes of local coal shortages the Select Committee has been impressed by the vital rôle played by transport in war. As the report points out, delays in transport slow down the war effort in the factory, and a further report is promised "upon the broader and more general aspects of transport as a whole, including roads and canals." Meanwhile, there have been reports in the Press of a proposal to secure better rail transport by interposing a new holding company between the existing companies and their stockholders. This proposal, if it exists, has probably emerged from the efforts to find some satisfactory alternative to the present financial agreement between the companies and the Government. The alternative to constant increases in charges is, of course, a subsidy from public funds, and the Ministry of Transport may think that some form of centralised control is a necessary preliminary to the use of public funds. But even if such a scheme contributed to a solution of the purely financial problem, it would have to go a long way further before it contributed anything to the physical problem of transport. A mere reshuffling of accounts or the creation of new jobs with new titles will not solve the transport problem. Its solution cannot be found by a juggling with figures. Great Britain's transport system as such is excellent: it is both capacious and flexible. If the best use has hitherto not been made of the existing facilities it is largely because the element of competition between them, which may be appropriate to the peacetime conditions of transport, when the supply exceeds the demand, has been allowed to be projected into the scarcity conditions of war. The first and most important condition of the full utilisation of the means of transport is to regard them as so much interchangeable carrying capacity and not as railways, road haulage, coastal shipping and canals, each with its special "preserve." The second step—and this cannot be taken without the first—must be the rationing of transport by the complete enforcement of a system of allocation and priorities analogous to that employed in distribution of steel and other scarce commodities.

Genuine Savings

Few speeches in any war weapons week have been so apt as one made by Lord Stamp a week ago. He did not exhort the people of Egham to save. He urged their duty not to consume. His starting point was the Lease and Lend Act, which, he said, was no "soft option," making it possible to get all munitions of war "on tick" while the scanty supply of dollars is used for other purchases. On the contrary, the counterpart to American generosity is the British obligation to buy nothing with dollars which can be done without and to pay outright for as many munitions as possible. Lord Stamp's plea, which was based also on the shortage of shipping space, was Empire-wide. In the Dominions and Colonies they require neither dollars nor ships for their food and need no food rations, but there is room for "self-denial" in other imports. This is the crux of war-time savings—not what sums of money are deposited, in misleading totals, in particular depositories, but what real subtractions are made from consumption.

Vichy Works for Germany

Two foodships, carrying 13,500 tons of flour, are to pass through the British blockade as a free gift from the American people to the French in unoccupied France. Distribution will be supervised by the American Red Cross. The British Government has made it clear that its permission has been granted for these two ships only and that there is no idea of establishing a precedent. On the contrary, the whole question of Admiral Darlan's threat to convoy foodships is still under consideration. In the meantime, evidence of the extent of Franco-German collaboration continues to accumulate. It has now been disclosed that Germany's "generous" gift of 200,000 tons of wheat was part of a barter deal between occupied and unoccupied France, under which wheat, sugar, bran and potatoes are to be exchanged for livestock, oil, salt, vegetables, cheese and wine. Then there is the question of war work under the Monthoire policy. Admiral Darlan saw representatives of German industry on his recent visit to Paris, and the extent to which French industry in unoccupied France is working for the German war machine is obviously relevant to the question of further mitigations of the blockade. Neutral sources have already reported repeated occasions on which organised labour has refused to co-operate in the Monthoire policy to the extent of making munitions, and it is known that aeroplane parts are among the articles manufactured. Even Vichy admits that lifeboats, lighters and barges are being made, but refuses to admit their military relevance—which in the case of barges at least will cause a wry smile in Britain. Moreover, Vichy admits that rolling stock is under construction. Now two-thirds of France's railway equipment was annexed in occupied France and much of it has gone to Germany. There is no guarantee that replacements will not go the same way. Germany's traffic problem is acute, and an extra truck can be more valuable than an extra gun. It is impossible in total war to distinguish absolutely between goods which are and those which are not useful to the war effort. Vichy France, in short, is part of the war effort designed to defeat Britain. It is fantastic that Britain should be required to accept the principle of assisting to feed its workers.

* * *

Hopes for a "Newer Order"

News has recently been released of the extent to which the Polish and Czech Governments in this country have advanced along the road of co-operation, and, in the midst of the unrelieved picture of slavery and exploitation presented by Germany's "new order," it is comforting to record any factor pointing towards the shape of better things to come. The states of modern Europe, internally and internationally, had proved that in the anarchy of class interests and nationalist rivalries, they could not achieve stability and peace. Nazism is the nemesis, with its imposition of the internal unity of the Gestapo and the external unity of the *Herrenvolk*. This tyranny is like the strait-waistcoat into which the self destructive or homicidal maniac is thrust. It is hateful in itself and it is no cure; but so long as the patient continues in delirium, removing the strait-waistcoat will have little effect. The real question is whether the patient can throw off his mania; and in the agreement between the Poles and the Czechs that their post-war relations shall be based upon confederation and the fullest economic co-operation, there are the first signs that, after all, the disease of Europe is not incurable. Joint commissions are already exploring the possibilities of collaboration, and both the Poles and the Czechs have expressed their desire to see their confederation serve as the growing point of a more ambitious organism.

New Model Aircraft

Lord Beaverbrook's broadcast on Sunday rose above all reports of "trouble" in his Ministry. To the Secretary of State for Air he paid the highest tributes, and for the rest he took the solid and assuring achievements of the researchers—who work for him and not for Sir Archibald Sinclair—as his theme. It was not perhaps a surprise to learn that production in February was a new monthly record or that the total of bombers and fighters now "ready for immediate operations" had never been equalled in British aviation. It is the first duty of the Ministry of Aircraft Production, while the nation's resources are still far from fully employed in

war work, to maintain the curve of output steeply upward—too steeply for February's lack of days to counteract it; and in the only comparable year of war aviation, 1918, there were very many fewer fighting planes actually available than the total of separate airframes and engines. But six new types of aircraft are in production, with two more coming on. The Hurricane, Spitfire, Whitley and Wellington gave quality the final say in crucial struggles last year, and it is plain that the next tests against the *Luftwaffe* will be decided by technical comparisons even more than by numbers. After a year and a half of war, new types in every command are needed if the lead that was a salvation is to be held and lengthened; and if the new machines equal their forbears in two ways—in fitness for their appointed tasks in the Cabinet's plan of hardening defence and spreading attack as well as in individual quality—the strategists will have done justice to the remarkable researchers and designers whom the Minister so properly praised.

* * *

Applying Sanctions

In the recruitment of women for war factories, so long as direct conscription is not adopted, the important point is to weight the scales of "free choice" in favour of the war factories. Employed women are being advised not to volunteer. Unemployed women, however, are being pressed to enlist; and an important case under the Unemployment Insurance Act has just been decided. A button-hole machinist had moved to be near her husband in the Forces, and was out of work. She drew unemployment benefit until she refused to apply for a munitions job 200 miles away, when the local officer discontinued payment. The court of referees then reversed this decision, judging that the work proposed was "unsuitable" and that the wages offered were "inadequate." Finally, the umpire upheld the original local decision: the work was not unsuitable; the difference in wages between war work and machining button-holes was irrelevant; and the wife's plea that she wished to be near her husband was beside the point. In principle, it is hard to question the general doctrine behind this ruling, which solely concerned the title to benefit—though it is surely very remarkable that no equally important work could be found for the woman nearer to Morpeth than 200 miles. She was, of course, fully entitled to be with her husband and to choose her war work; but she could not have her cake and eat it, draw benefit and refuse employment. The significance of the case, however, is wider than this. For one thing, it illustrates one of the greatest obstacles to voluntary recruitment, namely, that war work, especially for women, is less well paid than much civilian work, and is therefore not "attractive"; under unemployment insurance, with its war-time relaxations, the "suitability" of the work offered and the "inadequacy" of the pay may be irrelevant, provided it is war work and "the rate for the job" is offered; but in the process of mobilisation by voluntary means, these points are crucial. For another, it exemplifies the imperative necessity of disrupting family ties as little as possible—as well as providing yet another example of the pressing need for vacancy officers of skill, understanding and discernment at the exchanges.

* * *

Keeping up Contacts

No problem of post-war reconstruction is more important than export trade. Lord Forbes, a member of the Willingdon Mission to South America, chairman of the National General Export Merchants' Group and a member of the Industrial and Export Council of the Board of Trade, has drawn attention to some obvious dangers. He spoke of Brazil, whose current problem, in common with other South American countries, is the loss of European markets. There is a risk, particularly if the war drags on, that the resources of countries like Brazil may be developed to such an extent that they approach self-sufficiency. Brazil has potentialities as a great industrial country. The production of steel there is now 140,000 tons per annum and of iron 160,000 tons, charcoal being the fuel used, while an American steel company is assisting in the construction of new steel works with a capacity of 500,000 tons a year. Again, Brazil is able to make motor-car tyres from domestic raw

materials, to satisfy 85 per cent. of home consumption, and has found a market for them in South Africa. Brazil's other raw materials include nickel, manganese, titanium, rubber, cotton, bauxite and vegetable oils; and lack of capital is the only reason for their being as yet undeveloped. Lord Forres suggested that the process of development might take about twenty-five years—sufficient time, if plans are made ready now, to allow Britain a due share in it. Experience in engineering, in producing capital goods, industrial plant, railways and shipping: none of these British assets should be lost in wartime; it is rather in the sphere of the production of consumption goods that belligerent countries suffer. The Willingdon Mission has presumably made these points to the South Americans: that the British market will be open after the war; that British goods and capital will be available; and that it is only because Britain is the vanguard of the fight for liberty that South Americans have had to suffer loss of markets and supplies. The aim is to keep the door open; and, in the meantime, it is imperative for plans to be formulated for fostering the renewal of trade. The Brazilian-German barter trade has also been cut off by the war. But in the past it gave Brazil appreciable advantages, and its methods must be countered. The pre-war obstacle of unstable exchanges must be surmounted. New trade agreements must be devised. During the war, potential established markets, Lord Forres urged, must be studied, and their changes, developments and requirements noted. Contact must be kept with the customer—by personal visits, Press publicity, the wireless and the cinema. It is imperative that, when the war is over, British trade, industry and finance shall be prepared at once to take part in the prosperous development of South America.

* * *

Cut Rations

It is the aim of the Ministry of Food to extend communal feeding, but there are still some questions unsettled. The economies of bulk catering and bulk cooking are obvious, not merely in terms of money but in the quantities used, and the introduction of communal feeding could be employed either to make rations go further or to enable existing rations to be reduced. Either objective is, of course, legitimate, and in many instances of communal feeding which are outside the rationing scheme, such as industrial canteens and restaurants, the target should be to make as little food as possible go as far as possible. But at the moment, in a number of catering establishments where there is a hard core of more or less permanent residents in addition to a few casual guests, there is some sense of grievance. Ration books are surrendered and rations are drawn not per head but *en bloc* according to the number of meals served in a previous period. The actual allocation of butter, sugar, bacon, meat and tea per head is very much below the personal ration allowed to individuals living at home, and the view is expressed that communal feeding is, in fact, being penalised rather than encouraged. The matter is not, of course, very important. All that is happening is that the benefits of communal feeding in these instances are accruing to the community in general instead of to the individuals who feed communally, and it is probable that, in most cases, these people are feeding as well with their cut rations under communal conditions as they could at home with their full supplies. The argument is, however, that the knowledge that communal feeding may mean reduced rations, and not simply a better use of existing rations, is calculated to be a deterrent to communal schemes. This argument is not wholly unsound. If communal feeding is intended as a device to reduce rations wherever possible, in the national interest, and if this is necessary, then it should be extended by every means possible to bring as many people as possible back into line on the lower level. The view that every citizen has an equal right to his full ration, however ill or well he may use it, will not die easily.

* * *

Food and the Family

The figures revealed by the 1937-38 investigations of the Ministry of Labour of expenditure on foodstuffs gave a clear indication of the rôle which different kinds of food play in the budget of a household of an average size of 3.77 persons and with a total weekly expenditure

of about 85s. a week. Some 34s. a week was spent on food, and ranged according to their cash importance, the most important items were *meat* (beef, veal, mutton, lamb and pork), *milk*, *bread*, *butter*, *bacon*, *ham*, etc., and *eggs*. To throw some light on the present wartime position, three and a half years later, the expenditure on these foods can be compared with the rise in prices which has taken place since the war started—remembering however that food prices vary every year from season to season:—

	Weekly expenditure of the 85s. family (3.77 persons) (1937-38.)		Percentage increase of prices on Feb. 1st, 1941, compared with Sept. 1st, 1939.	
	s.	d.	%	
Meat	4	8½	18	
Milk	3	0½	31	
Bread	2	8½	3	
Butter	2	5½	19	
Bacon	1	11	23	
Eggs	1	10½	72	(fresh)

The most important items of the family's food budget, which make up about 50 per cent of their total expenditure on food, have not been hit with undue severity by the rise in prices; but, unfortunately, the matter does not rest here. It is not simply a question of prices, but of physical supply as well. Supplies of meat, bacon, and butter are rationed and it is difficult to get eggs. To make up their wartime diet, the family must look, not simply to those kinds of food whose prices have not increased very much, but also to those of which adequate supplies are actually available. Cost is, of course, a limiting factor, but some of the staple foods mentioned have been so strictly rationed that, even with the increase in the price of the supplies of those that can be got, there is some money left over, some "saving" to be disbursed on other foods. There is fish, for instance, the expenditure on which in the 1937-38 budgets was only 1s. 4½d.; though a good part of this may have been spent on the cheapest kinds of fish, this sum is still small. Unfortunately, though fish is not rationed, its price has risen on the average 87 per cent—almost the largest increase between September, 1939, and February, 1941.

* * *

New Foods for Old

The problem, when the usual articles of diet are either scarce or too costly, is to find substitutes which have hitherto taken an over-small place in the family diet. One obvious alternative is cheese. The expenditure on cheese was only 8½d. for the whole family which spent 85s. a week in the Ministry's survey, and its price has risen 30 per cent. But this again is difficult to get; it has been doled out by retailers in informal rations, and is now to be formally rationed. A better chance of "making-up" seems to exist in the case of potatoes and vegetables. The expenditure on potatoes was only 1s. 1½d. This is small, and corresponds to not quite 14 lb. a week, which is amazingly little compared with other countries—though in such comparisons it should be remembered that the price of potatoes in this country is always relatively high (1d. a pound in a normal winter compared with 5s. a cwt. in peacetime Germany) because of the much superior British quality. Even so, there is plenty of room for expanding potato consumption in Britain. Again, the consumption of vegetables, at 1s. 4½d., is also small. This deserves the special attention of Lord Woolton. The abundance of, say, cheap cabbages which the growers have claimed has not flooded the retail markets, and it has been suggested that the desire of the wholesale and retail trade to dispose of the higher-priced vegetables, such as brussels sprouts or cauliflowers, has stemmed the flow of the cheaper grades of vegetables such as cabbages and carrots. Another substitute or "makeweight" is milk, a very valuable food. But, in this case, the sum spent was already high—3s. a week—and, even if there were not the promised difficulties in feeding dairy herds, it is doubtful whether the 85s. family would be disposed to increase its consumption very much. The choice, in remoulding the family diet, then, is plain; either food expenditure must be expanded in the direction of the cheaper foods of which too little has hitherto been consumed; or to spend more, over and above what can be spent on the restricted supplies of rationed foods, on more expensive foods as long as they still remain unrationed. Not a little will depend on the skill of the housewife to combine the

scarce foods, the expensive ones, and those available at cheap prices, in the form of pies and puddings, soups and other mixed dishes. The French *pot au feu*, which combines a scrap of beef with a quantity of potatoes, carrots and green vegetables, and the Italian *Minestrone* are examples. The former was originally a peasant dish; and it may be necessary and wise during the war to go back to some of the old rural traditions of cooking.

* * *

Compensation for War Damage

The War Damage Bill received the Royal Assent on March 26th. In its original form it had two major defects. The first, the discrimination against the owners of wholly destroyed property has been partly rectified in that the War Damage Commission will have some discretion in taking account of a rise in prices. The only concession made by the Government on the second matter—the inadequate provisions for placing part of the burden of contributions on mortgagees—was to raise to £150 the upper limit of the value of property in respect of which any mortgagee's contribution can be required. Although Lord Maugham pointed out in the House of Lords on March 13th that the failure of the Bill to provide for equal treatment between mortgagor and mortgagee was "a serious blot" on the scheme, his plea was rejected by the Lord Chancellor on the general ground that the Chancellor of the Exchequer had come to the conclusion that it was the best that could be devised. As the Act only covers the damage done during the first two years of war, and is therefore due to expire at the end of August, it is to be hoped that the remaining defects will be eliminated when it comes up for renewal in the autumn. Another measure, the Liabilities (War-Time Adjustment) Bill, introduced by the Lord Chancellor into the House of Lords on March 25th, is designed to mitigate hardship arising from another kind of war damage. Its purpose is to prevent destitution and bankruptcy among business and professional people who have been rendered unable to meet their liabilities as a direct result of the war, and through no fault of their own, and it provides for a scheme whereby debtors and creditors—with the assistance of liabilities adjust-

ment officers to be appointed under the scheme—can be brought together to negotiate a settlement of the latter's claims without recourse to the courts of law. Some such machinery is obviously necessary, not to relieve debtors at the expense of creditors—in any case many debtors are also creditors—but to straighten out the financial relations between individuals in so far as they have been upset by the war.

Shorter Notes

The Isle of Man (Detention) Bill, which has passed its second reading in the House of Commons, enables aliens or British subjects, detained under the Home Secretary's emergency powers, to be transferred to the Isle of Man. There is at present no provision under the law whereby British subjects or non-enemy aliens may be sent outside the United Kingdom—which does not include the Isle of Man—but there is no such difficulty about enemy aliens, for they are detained under the Prerogative.

*

In the House of Commons last week, Mr Churchill said that the BBC had climbed down over the ban on persons who attended the People's Convention. Such persons will not, in future, be debarred from giving broadcast performances. On the other hand, the BBC has not reconsidered its dismissal of two skilled technicians who are conscientious objectors, and the Prime Minister has endorsed its decision. Since the rights of conscientious objectors are secured by law, and the tribunals frequently only grant exemption from military service on condition that the objector does work of national importance—in the case of one of the BBC technicians he had been told to remain at his job—this attitude is very unfortunate. The reason given—that the technicians' work was highly confidential and responsible—seems to presume that conscientious objectors are necessarily spies.

*

The number of road deaths in February was 689, an increase of 65 per cent. over February last year, only 52 less than in January, and only 100 less than the total number of air-raid deaths in February.

THE WORLD OVERSEAS

Economic Control by the Japanese Army

(From Our Shanghai Correspondent)

February 5th.

IN Japanese-occupied China, the Japanese military have assumed complete economic control in the past twelve months. Today they dominate not only the semi-official Japanese development companies and their 30 odd subsidiary companies, but also the manufacturing industries and all lines of trade which originally had been reserved for private Japanese interests. The result is the complete absence in these areas not only of Chinese, but also of Japanese, private economic initiative and investment. The pre-war Japanese manufacturing industries in occupied China, and the Chinese enterprises which these industries expropriated, are all now strictly regulated by the Japanese military machine. Outside Shanghai and Tientsin, these industries have to sell their products within the limits of volume quotas and maximum prices fixed by the military. The volume and prices of their supply of Chinese raw materials and fuel are equally regulated by the military. Exchange in the open Shanghai market for the purchase of foreign supplies may be purchased only through Japanese banks under a permit system operated by the Tokyo Finance Ministry's Shanghai delegate. Exchange proceeds from exports abroad obtained by these industries must be surrendered to the Yokohama Specie Bank. Finally, also, the distribution of profits by these industries is strictly controlled;

part of the profits have to be "lent" to the military for the duration of the China war.

The bulk of the trade between occupied China and Japan has been made the monopoly of a series of import and export organizations in both Japan and China, which are supposed to include the legitimate Japanese interests concerned. At the China end, these organizations are supervised by the Japanese military. All products imported from Japan have to be sold through these organizations at prices fixed by the military, and against Peiping F.R.B. puppet currency in North China and Japanese military yen in Central China, respectively. The difference between the 14d. official Tokyo rate and the 5d. open China market rate for Bank of Japan yen, which for years bestowed extraordinary profits upon Japanese private importers in occupied China, is now appropriated by the military through the levy on this trade of new special exchange difference taxes.

The numerous Japanese private firms engaged in Chinese internal trade, purchasing Chinese produce in one area and selling in another region of occupied China, are also now all under Japanese military control. They all not only have to abide by volume and price regulations, but have to cede fixed shares of their profits to various Japanese military commands. In the hinterland of Shanghai, most of these formerly extremely

prosperous companies have completely lost their independence and are reduced to profit-gathering mainly for the military.

The development companies and their subsidiaries are today merely semi-military institutions. The development funds of over 300 million yen, which they raised last year through the placing of debentures with Government banks in Japan, were mostly spent upon military enterprises, especially on the construction of new military communications. No genuine economic development work is being undertaken. Book profits shown by the majority of these firms' subsidiaries merely result from the undervaluation of expropriated Chinese property, as well as the disregard of proper amortization and reservation. Real profits have been harvested only in the monopolist exploitation of old-established business lines such as the Shanghai raw silk and fish markets.

Small Return

The parts of China best developed in former times have been in the power of the Japanese military for over three years. Although Japan's economic domination of occupied China is greater than ever, its yield to Japan is lower than ever. Japan sells less in China than before the start of the invasion, and at the same time gets less Chinese supplies than before. Except for monthly shipments of some 400,000 tons of coal, Chinese supplies are insignificant for Japan's economy. Official Japanese "development work" in China is but auxiliary war activity. Chances of profitable investment in occupied China for Japanese private capital have disappeared.

Complete Japanese military control has made occupied China's whole economy subsidiary to the various Japanese Army commands in China proper. The control is serving the immediate purposes of assisting Japan's fighting forces in fighting the Chinese, and of providing them with some pocket-money apart from the war funds raised by the Tokyo Government. Moreover, the control is being used to help in transforming occupied China proper into another Japanese Army Reservation of the Manchurian and Korean types by excluding or subjugating all other Japanese, and, of course, all Western, interests.

Decline in American Agriculture

[FROM OUR NEW YORK CORRESPONDENT]

February 22nd

THERE is a general disposition, in America as well as abroad, to think of the United States as primarily an agricultural country. The 1940 census is a reminder that, not only is this no longer true, but it has not been true for a generation. The general structure of America is profoundly altered from that of, say, 1914, as illustrated by the census of 1910.

In 1910, the population was a little over 90 millions, of whom 50 millions were classed as rural—that is, living on farms or in communities of under 2,500. In 1940, the total population had passed 130 millions, of whom less than 60 millions were rural and over 70 millions were urban. That is, in these thirty years, the total population had grown by 40 millions, but over three-fourths of this increase was in urban communities.

Politically speaking, the balance of power has definitely shifted from the country to the city. In the south, and in the sparsely settled States of the west, the majority of the population is still rural; elsewhere, in most States, the majority of the population is urban. In 1930, some twenty-nine States classed a majority of their populations as rural, and these States would have contributed fifty-eight of the ninety-six senators. The 1940 data are not yet published, but would not have altered this fact materially. But as these are States of small population, the great majority of the members of the House represent city constituencies. In 1910, both Houses decidedly represented rural constituencies.

By no means all the rural population is concerned with farming; on the other hand, the smaller urban communities are directly dependent on farming. The census distribution is, therefore, not entirely indicative of agricultural interest. As to the farms themselves, the census of 1940 counted 6,096,789 farms, a decline of 200,000 farms for the decade. The

acreage in farms, however, increased from 987 millions to 1,061 millions. This gives an average of 177 acres per farm, and, with all the variations in local conditions, it is surprising that the majority of farms run so near the average. In the east, the typical farm runs nearer 100 acres, and further west nearer 200 acres. At the extremes are the truck farms and the ranches.

Drop in Farm Values

The value of all farm land and buildings was given as \$34,000 millions in 1940, compared with \$48,000 millions in 1930, a decline of nearly 30 per cent. In 1920, the value was given as \$66,000 millions, or almost \$70 an acre. The 1940 value was something over \$30 an acre. In 1940, farm buildings were valued at \$10,000 millions, and implements at \$3,000 millions.

On these farms, about one-third (322 million acres) were under crops; another third was under pasture, fallow and woodland; and the final third was unspecified.

The general problems of American agriculture are not the problems of an export surplus. The "export surplus" problem is concentrated in a few crops—wheat, cotton and tobacco. These are localised and politically expressive; nor is their solution obvious. Much of the wheat is grown on land that will produce no other marketable crop; it could be converted into grazing, but not readily in the unit sizes in which it is held. Most of the cotton land is capable of other uses, but its conversion would require a complete change of local habits.

The agricultural problem, which, as can be seen, cut the value of farms in two between the boom of 1920 and the early depression of 1930, and which, in spite of an urban recovery, had taken another 30 per cent. of the value between 1930 and 1940, is essentially a domestic problem. As yet, the farmer has got almost nothing out of the war boom that has restored to the urban worker conditions equal to or exceeding those of the New Era.

Depression in Jamaica

[BY A CORRESPONDENT]

March 20th

THE almost unreserved welcome which has been given to the proposed new constitution for Jamaica should not obscure the fact that the Colony is, economically, in a very bad way indeed. The plight of the banana industry is well known, but the effect of this and other factors on the island's whole financial and economic position has not been fully realised.

Even before the British Government placed a ban on imports of bananas into the United Kingdom from last December, banana exports had fallen off considerably, with the result that, in the first nine months of 1940, Jamaica's total export trade was only £2,392,000, compared with £3,960,000 in the first nine months of 1939. In the same period, however, imports, though they fell considerably in volume, were in value about stationary at some £4,500,000. Exports are, therefore, only equal to about a half of the value of imports, and it is most unlikely that Jamaica will be able, under present circumstances, to maintain its tourist industry to an extent anything like enough to offset the effect on its balance of payments of the large import surplus.

One reason why the cost of imports has risen considerably is that, in order to conserve American and Canadian dollars, trade control has been imposed, which means that all imports must come from sterling areas in spite of the problems of shipping and supply. Many applications for imports from Canada have been refused, and the restriction on imports makes it difficult to develop local industries.

Nevertheless, attempts are being made to increase local manufactures. A few factories have been established for the manufacture of cement, starch and condensed milk, although permission to import wood-working machinery from the United States for furniture manufacture was refused. The Government is also trying to increase the local production of food. A corn meal factory has been started which aims at supplying the entire local demand, and the food controller is exercising strict control over imports of corn meal, flour and peas. Moreover, local use is being made of the unexportable banana. Banana meal is being mixed with flour for bread; dried bananas are to become a regular item of

diet; cooked bananas are to be served as vegetables; and bananas are distributed free, or at nominal prices—this, however, has unfortunately dislocated the market for other foodstuffs which the peasants were encouraged to grow on the outbreak of war.

Falling Revenue

A serious consequence of the policy of self-sufficiency, is that a decline in imports means a loss to the Government of Customs revenue, which normally accounts for about half of the Colony's total revenue. Last year, the Government was faced with a mounting deficit; and income-tax was increased to bring in another £200,000, while a surtax was introduced and additions were made to estate duties, stamp duties, customs and excise. But further taxation is likely in the next Budget, as revenue is falling short of the estimates.

Another problem for the Government is the rising cost of living. Between the beginning of the war and October, 1940, the cost-of-living index rose by 25 per cent., while for food alone the rise was 30 per cent. Wages, on the other hand, are still at their pre-war level in most industries, but it is expected that the revelations of the cost-of-living survey will hasten the active operation of the Minimum Wage Law which was passed two years ago. A Wages Advisory Board has recently been set up, under the law, in the sugar industry; one of its first tasks is to tackle the deadlock between the Sugar Manufacturers Association and the trade unions arising from the question of the correct allocation between workers and manufacturers, respectively, of the increase in price, amounting to £1 7s. 6d. per ton, which the Imperial Government has granted for the 1940-41 crop.

There appear to be two possibilities of help for Jamaica in its present troubles. One is that Great Britain will give more financial help, either by a direct subvention or by extending crop purchases. In particular, it is hoped that help will be given in respect of the 120,000-200,000 surplus boxes of grapefruit; and it is also being widely suggested that the Ministry of Food should relax the import ban in favour of dried bananas, which are said to need only 5 per cent. of the shipping space taken by bananas on the stem. The other possibility of improvement lies in the construction of naval bases for the United States, which would help to solve the unemployment problem. On the other hand, the bases are giving rise to problems themselves, for land speculation is taking place in the neighbourhood of the proposed sites, and the question of compensation to displaced landowners and their employees will have to be settled.

The Falange Faces Opposition

[BY A SPANISH CORRESPONDENT]

March 7th

RECENT reports from Spain all tell of strengthening opposition to the Falangists. Criticism is now quite open, and party discipline is relaxing. The mere existence of a vast mass of opposition, however inactive, is one of the most powerful forces now ranged against any plans the Germans may have. The failure of the Falange to bring any sort of order into the economic chaos, together with the demagogic policy of its more radical elements, is damping the ardour of some of its supporters, and there is evidence that in aristocratic and industrial circles there are spreading only disillusionment for the present and despair for the future. Moreover, many enlightened Catholics—both clergy and laity—are wondering if they have gone too far in militant support of a totalitarian regime.

But if there is disharmony in the Franco ranks, they are all at one against democracy, the Conservatives harking back to the old type of absolutism, the Falangists worshipping its modern form—totalitarianism.

The Falangists now stand between the silent resistance of the old democratic elements, on the one hand, and the growing dissatisfaction of the Conservative classes on the other. No positive move can be expected from either side of the opposition at this stage, partly owing to the war. Nor, of course, can it be supposed that there is any general desire for things to be as they were before General Franco's victory.

The economic situation is going from bad to worse because no plan for reconstruction has been put into effective operation. Only a fraction of industry is working. Transport is breaking down. Villages and small towns destroyed during the war have been left as they were. People have drifted steadily to the towns, leaving the fields untended; and this, with the lack of fertilisers, has meant crops below normal. It is said there is now more hunger in Spain than in any other country in Europe.

Although the extreme Falangists blame the food shortage on the British "blockade," some Spaniards appreciate Great Britain's continued efforts to assist economic recovery by various trade and payment agreements and by providing facilities for shipping wheat and other foodstuffs to Spain. The American Red Cross is also doing important work in this connection. But while the effects of these measures will undoubtedly be felt for what they are worth, the political implications are largely missed because the Spanish papers have never given them sufficient publicity.

For some time now the Falangist Press has been attacking the well-to-do classes, who are variously accused of leading too easy a life, of thinking only of the material interests of their own class, of sabotaging the National-Syndicalist revolution, or of illicit dealing with foodstuffs and profiteering out of the starvation of others. For these and other alleged offences heavy fines—amounting to several million pesetas—have been imposed upon wealthy business men, and 40 per cent. of the fine goes to the informer. In other cases the culprits—280 of them during December—have been sent to labour battalions. The main object of this demagogic campaign is to give some sort of satisfaction—as they cannot give food—to a restless and hungry people.

Hostility Admitted

A portent of the growing tension in the situation is to be found in a speech delivered in Madrid on December 31st by Sr. Salvador Merino, National Chief of the Falangist Syndicates (trade unions). He said that "all kinds of intrigues were being launched against the Falange, even from within its own ranks," and candidly admitted "an atmosphere as hostile as, or even more so, than in July, 1936." He blamed this on the Conservative elements, then turned upon the workers for being in sympathy with the Republicans, and concluded by stating that although the Falangists were only a minority, they were determined to use the power they had seized to apply the principles of the National-Syndicalist revolution.

This latter statement is in accordance with Falangist policy since the Civil War. Before it broke out, the various Conservative elements, which united with the Falangists to form the backbone of General Franco's movement, agreed to sink their political differences until victory was won. The Falangists, however, have seized power and used it for their own advantage, and the recent trend of Spanish politics has been no more than a succession of manoeuvres by the Falange to eliminate their former allies.

This struggle for supremacy has been clearly reflected in the changes in the Cabinet. Formed in August, 1939, it was intended to represent a balance of political forces. Unity of action was its declared aim, but observers realised that this was only being achieved by forcing things into a Falangist mould. General Franco was himself Premier, and there were fourteen other Ministers. Three civilians and one army officer were not members of the National Council of the Falange. The other ten—four civilians (Srs. Serrano Suñer, Bilbao, Sanchez Mazas and Gamero del Castillo), five army officers and an admiral—were members either of the Political Junta or the National Council. Sanchez Mazas and Gamero del Castillo were Ministers without portfolio and represented the Party. Another and more important link between

FAMOUS SINCE 1795

OTARD'S
COGNAC BRANDY

Cabinet and Party was General Muñoz Grande, Secretary-General of the party and *ex officio* in the Cabinet.

It is noteworthy that the Ministers who were not members of the Political Junta were those for Finance, Agriculture and Labour, Industry and Trade, and Public Works, that is, the whole economic life of the country. Obviously, General Franco was trying to conciliate the people representing economic interests, who had not much faith in the National-Syndicalist revolution.

After a few months changes began. General Muñoz Grande was dismissed from the secretaryship of the Party and so from the Cabinet. The arrangement had been that all officers were automatically members of the Party, which had thus had political control of the Army. As compensation, the key post of secretary had been given to a General, and his dismissal pointed to friction between the Falange and the Army. Sr. Gamero del Castillo became acting secretary. He is a young man—about 29—an ardent Falangist, strongly pro-German (having studied law and philosophy in Freiburg and Bonn) and the most outstanding figure in the Falange after General Franco and Sr. Serrano Suñer.

Then General Vigon, Chief of the Supreme General Staff, was installed at the Air Ministry in place of General Yagüe, who even during the Civil War had come under suspicion because of some of his remarks about German and Italian assistance.

The next to go was Sr. Sanchez Mazas, one of the Falangist Ministers without portfolio. He was an "Old Shirt" (one of the original little band of Falangists) and vice-president of the Political Junta, but not a member of Sr. Serrano Suñer's personal coterie.

Another important change followed close upon Sr. Serrano Suñer's mission to Berlin; only a week after his return he took over the Foreign Office from Colonel Beigbeder—a step for which the Falange Party had long been clamouring, accusing the Minister of not being sufficiently pro-Axis. Then Sr. Carceller, another member of the Berlin mission, replaced Colonel Alarcon de la Lastra at the Ministry of Industry and Trade.

In December, Sr. Serrano Suñer tried to persuade General Franco to dismiss the Ministers of Finance, Agriculture and Labour, and Public Works, and merge these offices, together with Industry and Trade, into a single Ministry under Sr. Carceller. But this proposal met with such an outcry that it has been dropped for the moment.

On January 18th, Sr. Gamero del Castillo openly admitted that there was friction between the Falange and other elements, and advocated that the Falange, with the support of the Army, should seize full control of the State and the Cabinet. *Arriba*, the paper representing the views of the Falangist headquarters, remarked, however, that political changes must be postponed until the food problem is solved.

On the other hand, new governors, chosen from the Falangist inner ring, have been appointed to Madrid and Barcelona.

Dominion-Provincial Relations in Canada

[BY A CORRESPONDENT]

March 14th

THE recent presentation to the Canadian Parliament of non-war estimates for 1941-42, with their provision for provincial subsidies, recalls the fiasco which took place in January over the Conference on the Rowell-Sirois Report. The Rowell-Sirois Commission had, it is true, been concerned with the balance of powers between the Dominion and Provinces in the widest sense, but it was generally agreed that the main problem was financial and the Commission's chief—and most thorny—recommendations dealt with the question of Dominion-Provincial finance.

Under the constitution the Provincial governments had the duty of incurring certain kinds of expenditure and the right to raise certain kinds of revenue, but since the great slump the expenditure has increased by leaps and bounds, principally on unemployment relief, while the revenue has fallen dismally. As a result, the Dominion has been forced to make large grants, totalling over \$300 millions, to the most hardly hit districts and,

even so, a good deal of Provincial debt in the prairie regions has been unable to yield any interest. The Commission's main recommendations involve an important increase in the powers and resources of the Dominion Government. It is proposed that the Dominion shall assume full responsibility for the relief of all employable unemployed; that it shall take over all direct and guaranteed Provincial debt, whether dead-weight or revenue producing; that it shall provide "national adjustment grants" for the Provinces where the necessity arises. On the other hand, it is proposed that the Provinces shall cease to be the collectors of personal income tax, corporation tax and succession duty, all of which shall be levied by the Dominion Government.

On a broad view, unemployment should be a national responsibility, because its quality is determined by the Federal Government's fiscal policy. Contributory unemployment insurance has only recently been introduced and hitherto it has covered the lesser part of the unemployed, so that centralisation would provide an opportunity for a more widely-based scheme. Once this burden was placed on the Dominion, the Provinces would be free to devote their whole attention to the considerable fields of social welfare still remaining under their care.

The recommendations regarding the taking over of Provincial debts are complicated by arrangements for the Provinces to make certain payments to the Dominion Government, based on the interest which they receive on their investments, and there are separate provisions for Quebec Province, where there are large municipal debts. A unification of all this indebtedness would permit a conversion to lower interest rates, and there would also be a saving on ordinary management expenses.

The taking over of these liabilities would saddle the Dominion with a heavy burden, and the proposal that the levying of the main taxes shall be transferred to the Dominion is a necessary corollary. The economies of unified control should prove considerable, if only by simplifying the present unbelievable complexity of the Corporation taxes in a country where there are nine sets of Provincial company laws and Dominion legislation as well.

If these sources of revenue are withdrawn from the Provinces, they will be left in possession of little else beyond local rates and vehicle duties. As one of the objects of the Commission was to arrange for the future well-being of the Provinces, the report recommends the disbursement to needy areas of National Administration Grants in such a manner that "every Province can provide for its people services of an average Canadian standard." More closely defined, this means that every Province should be placed in a position to balance its budget after providing its citizens with an average Canadian standard of services and after taxing its citizens at an average Canadian standard of severity. The report proceeds to explain in considerable detail what services are to be regarded as essential and what periods are to be taken as a basis for fixing "average" standards. The Commission considers that at the present time only six out of the nine Provinces require a National Administration Grant, but it is recommended that the position be reviewed every five years by an independent finance commission.

In addition to these grants, the giving of emergency grants to badly-hit Provinces is considered necessary, though here a yearly revision is advised. At the moment, Saskatchewan, whose finances are in a very bad state, is the only government suggested as standing in need of such aid.

Although there may well be room for disagreement over individual recommendations of the Commission, there was general agreement over its main outlines, and disappointment and contempt were expressed that the Conference in January between Federal Ministers and Provincial Premiers ended in an unedifying squabble. It is possible that it would have been difficult to put the proposals into effect in wartime, which was why Mr Mackenzie King advocated them so half-heartedly, but far they should be implemented when peace returns. As it was, Mr Hepburn, Premier of Ontario, announced, on the first morning, the unqualified opposition of his Ministry to the proposals, and a similar stand was taken by Mr Aberhart, of Alberta. Most of the blame for the breakdown of the Conference probably attaches to these two Premiers, but the Canadian Press allocated a great deal to Mr Mackenzie King for his maladroit handling of the affair, which has certainly contributed to the growing dissatisfaction with his Government in the country as a whole.

THE BUSINESS WORLD

The Price of Raw Materials

RAW materials, conversion costs and profits: these, broadly, are the three main ingredients that make up the prices of finished goods. The prices of raw materials and the cost of converting them into finished goods have shown a substantial, though far from uniform, rise since the outbreak of war, but the general trend of net profits as distinct from gross profits, as reflected in *The Economist* index, has been slightly downwards. The proportions in which the three ingredients contribute to the price of finished goods vary considerably between different industries and between different products of the same industry. But there can be no doubt that the rise in the prices of basic industrial raw materials—the Board of Trade index advanced by 70 per cent between August, 1939, and February, 1941—has contributed substantially to that of finished goods since the outbreak of war.

Although the prices of basic products have been strongly influenced by Government policy, and the majority of them are subject to direct or indirect control, it is useful, in an analysis of the causes of the rise, to distinguish between imported and home-produced materials. Apart from world supply and demand, the prices of imported materials are influenced by the Government's buying policy, by the sources of supply, by the cost of transporting them to this country, and by movements in exchange rates. Those of home-produced materials have been influenced, not only by the rise in wages, in the cost of equipment and transport and by changes in profits, but also by the size of the output required by the Government.

To take first the prices of imported materials. After a slight rise consequent upon the outbreak of war, world market prices, as reflected by the index of raw materials calculated by the American Bureau of Labour Statistics, showed surprisingly little change. In the absence of the customary quarterly indices it is not possible to quote the average rise in the price of British imports, but in the following table the American indices are compared with the basic materials component of the Board of Trade's index of wholesale prices. Although this index includes a number of home-produced materials it is probably roughly representative of the general trend of import prices:—

INDICES OF RAW MATERIAL PRICES.

(August, 1939=100)

	U.K. (Board of Trade)	U.S.A. (Bureau of Labour Statistics)
1939 August	100	100
December	143	110
1941 February	170	111†
† December, 1940.		

The comparative stability of raw material prices on the world market is due very largely to the operation of the British blockade which cut off from overseas supplies, first Germany and, after June, when consumption in the United States began to advance more rapidly, almost the whole of the other Continental countries. But in view of the enormous prospective expansion in America's intake of industrial raw materials, the trend of world market prices is likely to be upwards this year.

Since world market prices, as measured by the American index, have risen by only about 11 per cent since the outbreak of war, the advance in British prices must have been due entirely to higher transport costs, the fall in the sterling-dollar exchange rate and the Government's buying policy. While it is impossible to assess the influence of each of these three factors on the general level of raw material prices, it is pertinent to remember that the 16 per cent rise in the sterling price of the U.S. dollar occurred soon after the outbreak of

war and therefore did not affect prices in 1940. Although the main advance in freight rates also took place in the last four months of 1939, these must have shown a further increase in the past year; moreover, as a result of the collapse of France and the virtual cessation of trade with the Continent, which formerly supplied some 30 per cent (by value) of Great Britain's imports, the Government has had to secure supplies from more distant sources and generally at a higher price. The approximate rise in the prices of a number of important materials since the outbreak of war is shown below:—

INDICES OF RAW MATERIAL PRICES
(August, 1939=100)

	U.K.		U.S.A.	
	December, 1939.	February, 1941.	December, 1939.	February, 1941.
Cotton.....	160	156	122	119
Wool.....	121	167	95	97
Motor Spirit.....	121	135	118	125
Rubber.....	133	148	119	114
Copper.....	124	124	109	112
Lead.....	156	156	126	153
Spelter.....	177	177	103	108
Tin.....	108	148		

Supplies and prices of the majority of imported raw materials were controlled soon after the outbreak of war. Rubber, tin and cotton were important exceptions, though the latter will now be added to the list of controlled commodities, for the Government has decided to become the sole importer of cotton. In the great majority of cases, the Government is securing supplies by means of bulk purchases, but the nature of its contracts show wide divergences. So far as Empire products are concerned, some of them have been bought for the duration of the war, while others have been secured by shorter, but renewable, contracts. Again, some products have been purchased at pre-war prices, adjustable for increases in costs, while others have been bought at fixed prices showing a substantial increase over pre-war levels. For example, the Government has bought the wool clips of Australia and New Zealand for the duration of the war and one year after at a price showing an increase of about 30 per cent over the pre-war level. This agreement was later extended to South Africa. Empire-produced non-ferrous metals have been purchased approximately at pre-war prices, but it is understood that adjustments may be made for increases in costs. Of certain colonial products, such as cocoa, the Government has bought the whole crop, though only part can actually be used; for this uneconomic method of purchasing has been designed to prevent destitution in territories that depended largely on Continental markets. Most purchases outside the Empire have also been made on a bulk basis, often at world market prices. The prices of imported steel and timber, which must now be drawn largely from North America, are appreciably higher than before the war when supplies were obtained chiefly from the Continent. In the case of petrol, purchases are reported to be made through the oil companies at the "Gulf" price. In view of differences in circumstances, divergences in the methods of purchase could hardly have been avoided, though mistakes have no doubt been made here and there, reflected in the disparity between the movement of prices here and in America which can probably not be explained in full by the rise in the sterling price of the U.S. dollar and the increase in transport costs.

The prices of the majority of home-produced materials have also shown a substantial advance, though, as in the case of imports, the rate of increase since the beginning of the war has been anything but uniform. Costs of production have been influenced considerably by the rise in wages, which form a substantial proportion of total costs in the production of primary products, by the in-

crease in the prices of equipment, such as timber in coal-mining, and by the rise in transport costs. Apart from these general factors, the prices of individual commodities have been raised by circumstances special to each, such as a fall in turnover or the need for an increase in output.

The 34 per cent rise in coal prices—the principal home-produced raw material—between August, 1939, and February, 1941, has been caused very largely by the increase in wages and other costs; the levy of 3d. per ton of coal produced, imposed at the beginning of January to compensate individual coal-mines for loss of trade caused by the fall in exports, has contributed only a fraction of the increase. Steel prices have advanced by 41 per cent, but the greater part of this rise has been due to the increased cost of imported materials. The rise in cement prices by 21 per cent, too, can be attributed largely to higher costs. It is in agriculture that the prices of basic materials have shown the heaviest increase; thus, the Ministry of Agriculture's index of the prices of farm crops rose by no less than 66 per cent between August,

1939, and September, 1940. A large part of this increase is due to the raising of minimum weekly wage rates by an average of 12s. to 48s. in July, 1940, but an additional and very important price-raising factor has been the encouragement of the extension of cultivation by the fixing of prices "remunerative" to farmers. As in the case of imported raw materials, Government policy at home has been dictated chiefly by needs.

In general, the Government, in its raw material purchasing policy, both at home and abroad, has been influenced more by the need to secure adequate supplies than by considerations of price. And, as a result, the prices paid have no doubt often been higher than they would have been if economy had been the chief criterion. Thanks to the stability of world prices, however, the prices that have had to be paid for overseas supplies have not been excessive. But if a more marked advance is to be avoided in the future, closer collaboration between the British and American Governments, which will soon be the principal buyers of raw materials on the world markets, seems essential.

Finance and Banking

Big Money Turnover

The position in the short loan market during the past week has been far from static. The turnover of funds has been exceptional, and though the volume of bank cash has at all times been adequate, the individual banks' experiences have varied considerably and conditions have proved distinctly patchy. The Treasury payments on the India stocks have proved an appreciable factor in the market. Part of the funds accumulated for this purpose had for some weeks past been employed in the short loan market and was abruptly withdrawn on Saturday of last week. Its percolation back to the market has proved a fairly sluggish process, and this contributed to the somewhat difficult conditions experienced in the first part of the week. Revenue payments have again been heavy, but their effect, as shown by the latest Exchequer returns, has been more than offset by the record level of Government expenditure. By Thursday whatever signs of tighter credit may have appeared earlier in the week had completely disappeared. The Bank return explains this by showing a jump of £39,130,000 in Discounts and Advances, which no doubt represents temporary accommodation to the India Council granted in connection with the repayments of vested India Government securities. Of this no less than £23,410,000 went to swell bankers' deposits during the week, bringing them up to the comfortable level of £118,597,000.

* * *

Treasury Bill Tactics

The scope for movement and tactics in the discount market, as it now functions, is sufficiently restricted to make such manoeuvring as was evident at last week's tender for Treasury bills noteworthy. It has certainly provided a most fruitful source of market discussion during the past week. The syndicate appears to have got some intimation that the official "outside" applications for bills would fall off appreciably at last Friday's tenders—an assumption which was borne out by the drop in the total applications from the previous week's high figure of £153,845,000 to £131,595,000. Consequently, the syndicate decided that this would be a good opportunity of getting the effective application price for the 92-day bill back to £99 14s. 10d., thus restoring the profit margin to around $\frac{1}{2}$ per cent., as against the wholly negligible figure earned on bills obtained at the previous three tenders. The unofficial outside applicants fell into the trap (if it was a consciously placed trap) with the most unsuspecting innocence. The fact that they were tendering for bills maturing in the last week of June must have removed any doubt about the possibility of a reduction in the syndicate's price of application. The trap was moreover given some spikes by the promise of fairly difficult short loan conditions this week. Most "outsiders" applied for their bills at £99 14s. 11d. and obtained a much larger allotment than has come

their way for many months past. Their reaction to the outcome of the tender was quickly seen in the keen efforts made towards the end of last week to sell bills for forward delivery. Some of these applicants have been appreciably inconvenienced by the ample volume of bills to be taken up by them this week. Most of the banks have been making up, and though there has generally been some outlet for bills, money has been sufficiently "patchy" to cause rates ranging up to $1\frac{1}{2}$ per cent. to be paid by certain quarters. The syndicate, for its part, had to be content with an allotment of merely 17 per cent. With its outside competitors uncomfortably stuffed with bills, the syndicate is obviously well placed for this week's tender, which will no doubt be concentrated on the June 30 maturity.

* * *

Shanghai Exchange Nominal

The past week has proved one of some difficulty for the Chinese dollar. The quotation for it in the Shanghai market has been nominal at 3 $\frac{1}{2}$ d., while the Far-Eastern banks in London have adjusted their rate to 3d. 3 $\frac{1}{4}$ d. The Shanghai market has apparently been dominated by fears of a serious collapse in the Chungking dollar rate. These fears are prompted, first, by the knowledge of the difficulties being encountered in the discussions between Chinese, American and British representatives to formulate a scheme for the continued functioning of the Chinese Stabilisation Fund. In the second place, the Shanghai market has had visible and audible evidence of the more violent phase into which the Chinese currency war has entered. Bombs have this week wrecked the Shanghai offices of the two banks under Chungking Government control, the Bank of China and the Central Bank of China. These outrages are part of the plan of operation for driving the Chungking dollar out of circulation in the Shanghai district and thus for depriving the Chinese Stabilisation Fund of the facilities for control provided by what is by far the most important of the Far Eastern exchange markets. The difficulties that face the Tripartite negotiations can readily be appreciated. The Chungking dollar needs support, since the Government does not retain more than a small fraction of the foreign exchange proceeds of Chinese export trade. But as long as the Shanghai market retains its present freedom and as long as competing and interchangeable domestic currencies circulate, there is evident danger of direct help given to one of these currencies, the Chungking dollar, by unconditional dollar and sterling credits, merely feeding the exchange reserves of the Central Reserve Bank of the Nanking puppet Government. The solution of that particular problem presents considerable difficulties. Until they have been overcome, the Chinese exchange situation must obviously remain precarious—"serious but not critical" seem to be the appropriate adjectives. Meanwhile, it would be erroneous

THE ECONOMIST

TRADE SUPPLEMENT

MARCH 29, 1941

In view of the need to economise paper the Trade Supplement, published monthly until the end of 1940, will in future be published quarterly in the last week of March, June, September and December.

The Trend of Business

THE first quarter of 1941, which was comparatively free from air raids, has witnessed further progress in Great Britain's economic mobilisation.

The reserve of unemployed on which the war industries have hitherto been able to draw has now been almost exhausted. The number of unemployed registered in Great Britain fell from 705,000 on December 9th to 581,000 on February 10th; of these only 200,000 were wholly unemployed men and something like one-half of them were probably "between jobs." In future the war industries will therefore have to secure their labour requirements from unessential and overstaffed occupations. To this end, the Government has asked the consumers' goods industries to concentrate the reduced volume of output into fewer factories; this measure is expected to release 500,000 to 750,000 persons for war work. In addition, the Government has decided to comb out of unessential occupations men over military age and women over twenty years old; and it has curtailed the movement of labour out of essential industries by restricting the right of workers to leave their jobs and of employers to dismiss their workers.

In view of the reduced level of shipping losses between the middle of December and February, the intake of essential raw materials has been fairly substantial, thus rendering possible a further increase in the output of munitions. Supplies of steel and other metals have on the whole been adequate for all essential needs. The flow of raw materials to the steel furnaces has been sufficient to enable them to

operate not far short of capacity; and as the domestic output of steel has been heavily supplemented by imports from America, there has been no shortage for vital purposes. The heavy intake of essential materials has needs compelled a curtailment in imports of cotton and other commodities that are used largely in the manufacture of consumers' goods. And the output of cotton and wool textiles and of other civilian goods has been further diminished. But even at the reduced level of output, supplies are ample for all essential requirements.

The average daily value of retail trade, as measured by the Bank of England's index, has been only slightly lower than a year ago; in January it was 0.3 per cent lower than in the corresponding month in 1940. Sales of merchandise other than food showed a reduction of 8.8 per cent from the figure for January, 1940. The volume of sales has shown a more marked shrinkage, but the scope for further reductions remains substantial.

Transport during the winter months has not been fully adequate to needs; there have been all too many reports of delays at ports, of the late arrival of materials at factories. But these difficulties have been due to the inadequate utilisation of facilities, rather than to a serious shortage of carrying capacity.

On the whole, the first three months of the current year have been spent to good purpose. But economic mobilisation is still far from complete and the need for speed in bringing the process to completion remains pressing.

British Industrial Developments

COAL

In many districts the coal mining industry is suffering from shortage of labour. After the loss of European markets steps were taken to reduce the consequent unemployment by encouraging miners to leave the industry, and now that the industrial demand for coal has so greatly increased it is becoming difficult to meet it. One authority estimates that, manned as it is at present, the industry could not increase its output by more than 5 per cent if every colliery in the country worked full time. The question of transport also continues to hamper the disposal of coal. In South Wales the wagons available under the rationing scheme introduced in January are said to cover less than 60 per cent of the colliery commitments to customers outside the district. Yorkshire mineowners have taken strong action to secure the quicker return of empty wagons, and this has had a noticeable effect in reducing short time. The Durham position has been greatly improved by an increase in seaborne trade. In some districts production is inadequate to meet the industrial demand, but priority orders are being well met.

IRON AND STEEL

Activity in the iron and steel industry has continued at a high level; indeed the flow of raw materials to the steel furnaces has been sufficient to enable them to operate close to capacity. The increase in the output of domestic iron ore and in the collection of scrap has helped to offset the loss of Continental raw materials. In order to ensure a large supply of scrap in coming months the survey of resources begun last year is to be extended to the remainder of the country, i.e., western England, the Home Counties, west Midlands and East Anglia. In addition to the domestic output of steel, heavy tonnages continue to arrive from the United States. Total supplies, in fact, are very large; but so is the demand. And in order to meet all essential requirements it has been found necessary to reduce further allocations for less essential purposes during the second quarter of the year.

CHEMICALS

There has been continued activity in all sections of the chemical market, although in some directions actual quantities on offer for new business were, of course, restricted by the limited supplies available for other than priority needs. Export inquiry has in most cases been in excess of available supplies. The tone of the pharmaceutical and fine chemicals markets remains steady, with no changes to record in the price position. There has been a good demand for most of the coal tar products, prices remaining firm.

FOOTWEAR

The main preoccupation of the footwear trade appears to be with the problem of meeting civilian demands in the face of a shortage of materials which is becoming more marked. The position is likely to be aggravated when the new contracts for service boots are made, as these are expected to be larger than the previous batch. Even for service requirements, though demands have been met, some difficulty has occasionally been experienced in finding the requisite materials.

LINEN

Strong representations by all sections of the industry stressing the vital necessity of maintaining connection with overseas markets have resulted in the release of slightly increased quantities of raw material for certified fabric contracts to "hard" currency countries. High current costs militate against anything in the nature of bulk sales to overseas markets, so the concession gives little actual relief or assistance to producers completely barred from manufacturing for the home trade. Government orders, confined of necessity to relatively restricted quantities of yarn and cloth, offer insufficient alternatives to the normal potential capacity of existing plants.

COTTON

The most striking development in the industry has been the decision that the Controller is to be responsible in future for all imports of raw cotton, and that all supplies will be distributed

by the Government. This means the closing of the Liverpool futures market at the end of March. A company is being formed of members of the Liverpool and Manchester Cotton Associations to assist the Government in classifying and distributing material. Spinners' licences for the use of raw cotton were reduced at the beginning of March, and a further reduction will take place from April 1st to 50 per cent of capacity. Under the concentration scheme it is expected that of the 500 spinning mills and 800 weaving sheds about 200 mills and 300 sheds will be closed. Government requirements will receive first consideration, and then exports, but very little material will be available for ordinary civilian use. Business on ordinary lines has been impossible, partly owing to the withdrawal of preference certificates. Numerous spinners and manufacturers have refused to sell on any terms whatever. A feature of interest has been the further big deal in white cambrics for Java, the orders amounting to 10,000,000 yards. Yarns made from American cotton have been very difficult to buy, and trade has been largely confined to Government contracts. Spinning production, owing to the shortage of raw cotton and operatives, has been further reduced to 65 per cent of capacity.

JUTE

The main concern of the jute industry is the supply of raw jute, for unless fresh supplies are forthcoming from India there will be very little material available by the summer months.

Business Developments Overseas

UNITED STATES

With the passage of the Lease and Lend Act and the virtual certainty of an appropriation of \$7,000,000,000 for its implementation, the United States is rapidly switching over from a peace to a war economy. In spite of the fact that this coincides with the transfer of over a million men into the services this transformation is causing less disturbance than might have been expected, and the labour shortage is being gradually overcome. Labour disputes have been numerous and the public, increasingly impatient of trade unions, has been demanding drastic steps to prevent strikes. The marked success, so far, of the mediation machinery recently set up by the President may, however, it is hoped, render these unnecessary. Increasing Government control over industry is inevitable; already there have been imposed certain restraints on the flow of materials and on the increase in prices, though there seems to be some inclination on the part of Government purchase departments to try indirect control by substituting cheaper materials for those whose prices they consider unreasonable. It is recognised that only a part of the projected expenditure can be met out of taxation, and that there will have to be Government borrowing. The new taxation is expected to bear heavily on the middle incomes, including the higher ranges of wage-earners. All the business indices are moving more or less steadily upward.

BRITISH EMPIRE

CANADA.—Business activity continued to rise during December and employment reached a record level. The increase in Government orders for the iron and steel and automotive industries offset the seasonal decline, itself less than usual, in the food and clothing industries. There was a further increase in constructional activity. The Chairman of the Wartime Requirements Board has tabled a report according to which seven out of ten departments of war supply are progressing satisfactorily. Automotive equipment production is described as "100 per cent perfect," shipbuilding progress is "good," and there is praise for the rapidity with which aerodromes have been constructed for the Empire Training Scheme. The difficulties of organisation and provision of tools for the munitions industries have been largely surmounted, but Canada is dependent on the United States for 80 per cent of her machine tools, and some which are needed for important work have not even been ordered. Some technical difficulties in the production of bombs have not yet been surmounted; aircraft is produced at much greater cost than in the United States, partly for lack of efficient planning; and it appears that the position in respect of the production of tanks is not nearly as satisfactory as it had been represented—according to this report it will be very many months before they begin to appear. On the other hand the forecast is that all constructional enterprises now on hand for the Government will be completed by July 1st.

AUSTRALIA.—Rural production conditions are now good, except in Western Australia, where rain is urgently needed. The wool clip is expected to be nearly as large as last year, though not of such good quality. There are good export surpluses of butter and meat. The munitions and building industries are expanding rapidly. The Budget provides for £A186 millions of direct war expenditure, and it is proposed to obtain £A150 millions by taxation.

SOUTH AFRICA.—The Budget, presented in March, showed both revenue and expenditure higher than the original estimates owing to the increase in industrial activity during the year. Further considerable increases in expenditure and taxation are

Mills and factories may be compelled to close down without waiting for concentration. The Jute Controller has just intimated to manufacturers that he cannot allow them to make or sell any further lots of sandbags, while yarn and cloth can be bought only for essential purposes. Buyers must apply to the Jute Control for certificates of approval to purchase, but their problem is to find sellers, as spinners and manufacturers are not inclined to sell for forward in view of the uncertainty of supplies.

WOOL

The unexpectedly severe cut in the March-June wool ration is likely to encourage speedy plans for concentration. While the position of individual firms differs, the ration provides on the average for somewhat less than half normal day-time running of mills. There is no restriction whatever in raw material for either fabric exports or service clothing needs, and those mills engaged upon Government contracts are working at something like capacity. Not every mill, however, is balanced for this type of production nor is machinery readily adaptable. Some restriction in the weight of yarn to be made available for export orders is anticipated, but it is believed that the reason for this is the concentration on the shipping of fully manufactured goods. Broadly, it can be said that whilst the position is far from comfortable in the industry, there is confidence that vital needs will continue to be satisfied and hardship reasonably ameliorated.

LATIN AMERICA

The year ended in Argentina with an export balance of 71,000,000 pesos, compared with an import balance of 235,000,000 pesos in 1939. In January, 1941, an import balance of nearly 20,000,000 pesos was re-established, but compared with January, 1940, imports fell in value by 50 per cent and exports by 46 per cent. In January, 1941, for the first time in modern history, Brazil ousted Britain from the second place as supplier to Argentina; the United States still headed the list. Surplus stocks of grain are still Argentina's chief problem. The new crops of wheat, linseed and maize are being bought by the Government at basic prices. Old maize is being sold by the Government at very low prices, and the authorities have appealed to consumers to devise all possible means of using maize to assist in disposing of the surplus of some 6,500,000 metric tons for which there is no export market.

Sterling exchange in Chile and Peru is still stringent, with the supply dependent upon British Government purchases of agricultural products.

GERMANY AND GERMAN EUROPE

During the winter 1940-41 Germany's manufacturing industry concentrated on the output of machinery, aeroplanes, ships and railway material, especially locomotives and rolling stock. The shortage of workers and particularly of skilled workers continued. Under the terms of the "Prolonged Four Year Plan" a new drive has begun for the expansion of the coal, iron and steel, electricity, light metals and chemical industries, and also for such substitute industries as synthetic oil, rubber and textile fibres. The industries of Alsace-Lorraine and Luxembourg have been incorporated in the economic administration of the Reich. The heavy industries in occupied countries, as well as in dependent countries such as Hungary and Roumania, have been brought into close contact with German industry. In Lorraine, Luxembourg, Belgium and Holland the coal and iron industries have nearly reached pre-occupation output, but this has not yet happened in occupied France. For each of the occupied and the key industries, and some are already in operation. The second new factor is the placing of war orders with manufacturing industries in occupied countries. There are also reports that export orders received from Russia and other neutral countries are executed by industries in occupied countries. The new industrial centres in Eastern Germany and Poland are slowly taking shape. Poland are rapidly being expanded. Official sources indicate that Germany's foreign trade with Continental countries exceeded pre-war levels at the end of 1940. The new trade agreements with Russia, Sweden and Italy aim at considerable increases in the volume of trade. The multilateral clearing system under German control is being enforced wherever Germany's control is effective, and at present eleven countries transact their clearings through the Central Clearing Institute in Berlin. There is a marked contrast between the development of the price levels in Germany and that in the occupied and dependent countries. The indices of wholesale prices and the cost of living in Germany remained stable after a slow but steady advance during 1940. In the Balkan countries the increases in wholesale price indices from January, 1940 to 1941, ranged from 18 per cent to 65 per cent. The occupied countries showed similar advances.

iums dropping from 57.2 per cent. to 40.5 per cent. A rise in marine premiums is in accordance with market forecasts, and it remains to be seen whether the business will ultimately prove profitable.

In the final table, (compiled from the directors' report) the allocation of the profits from the various branches is exhibited. The directors have considered it prudent to transfer to investment reserve, additional reserve, and contingency funds an aggregate of £6,600,000, which leaves only £856,856 remaining from the profits of £7,456,856. Of this remaining item £533,808 is absorbed by bonuses to the outdoor staff, which presumably are a normal part of the agents' remuneration and, therefore, not susceptible of too elastic treatment. In the circumstances the directors' decision to declare no reversionary bonuses this year is fully justified, and interim bonuses have been reduced to £1 per cent and 16s. per cent in the ordinary and industrial branches respectively against maximum bonus rates of £1 14s. per cent and £1 4s. last year and £2 6s. and £1 12s. the previous year. Dividends for the year on the A shares are lower at 10s. 9.78 pence, against 11s. 5.56 pence; on the B shares the dividend remains at 2s. per share. These dividends are free of income tax, and in order to meet them and the bonuses to outdoor staff, already referred to, it has been necessary to raise £585,000 from the special contingency fund (in accordance with Article 135 of the Articles of Association) plus an income tax adjustment of £207,144, a total of £792,144. In the balance-sheet the assets aggregate nearly £365,000,000, against £354,000,000. British Government securities amount to £95,300,000, an increase of £17,000,000. The values of Stock Exchange securities generally have been compared with market prices on December 31, 1940, and on the basis of such prices it is certified that the assets, less the investment reserve and contingency funds taken into account, are in the aggregate in excess of the value stated.

The affairs of the "Prudential" approved societies are referred to by the chairman in his statement. Membership has increased substantially, now exceeding four and a quarter millions, and a total of over £4,000,000 was paid in benefits.

United Kingdom Provident; Scottish Life; Scottish Temperance and General.—The accompanying tables summarize the principal items from the 1940 accounts of these three Offices. The *United Kingdom Provident* became a hundred years old on November 9th, 1940, and the Chairman (Sir Ernest Benn) was able in his interesting review to point to a century's good work and to a satisfactory statement of accounts. The reduction in new business is only slightly below the average for all offices, notwithstanding that in the circumstances of the past year it has been thought unwise to press for new business. The aggregate premium income is but slightly affected by the decline in new business, and the fall in net interest is in accordance with the general trend. Although claims by death are substantially increased, the Chairman was able to say that they represent only 87 per cent. and 98 per cent. of expectation in numbers and amounts respectively, including all war claims which the institution has been called upon to meet. Commission and expenses are down, owing to reduced commissions on new business; in connection with expenses it is worth noting that the institution has set up a reserve of £45,200 for war damage insurance contributions. In the balance-sheet Stock Exchange securities are taken at the values at which they stood on December 31st, 1938, being the date of the last valuation, and at cost price in the case of investments since made; on market quotations at the end of 1940 they showed a depreciation covered by the investment contingency reserve of £1,000,000. The

* £585,000 adjusted for income-tax.

institution is interested in real estate as ground landlords, mortgagees, freeholders and leaseholders to the extent of some £10,000,000, and it is pleasing to learn that the proportion of this property partly damaged or wholly destroyed by bombs and fires is only in the neighbourhood of 2 per cent. or 3 per cent. No interim bonuses are being paid, the board taking the view that war and bonuses are incompatible. During the year the fire, accident and general business in the United Kingdom of the Dominion of Canada General Insurance Company was taken over and a subsidiary office formed, known as the United Kingdom Fire and Accident Company Limited, to conduct these classes of insurance.

The *Scottish Life* shows a rather heavy fall in new business, but premium income is well maintained. In regard to the slight increase in death claims, the chairman stated at the meeting that these were well within expectation, notwithstanding the inclusion of a number directly due to the war. The marked drop in expense ratio is due largely to reduced commission and also to a fall of £6,000 in expenses. In the balance-sheet there is an increase of nearly £500,000 in British Government securities, the chairman indicating that the proceeds of matured investments, of securities requisitioned by the Government, and of certain other sales have been devoted almost exclusively to the purchase of new Government issues. Stock Exchange securities generally and fixed assets appear at or below cost, with a certificate to the effect that in the belief of the signatories the assets set forth in the balance-sheet are in the aggregate fully of the value stated. The quinquennial valuation was made

as at the end of 1940 on the same basis as five years previously, namely, for life assurance contracts the British Offices' A1924/29 Mortality Table at 2½ per cent. interest, and for annuity contracts the British Offices' Annuity Tables at 3 per cent. interest. The surplus amounted to £829,794, and the directors have declared a bonus addition to fully participating policies at the rate of £1 per cent. per annum (slightly under half the previous rate) at a cost of £382,868. The balance of £346,005 is being carried forward as an undivided surplus, and is stated to be far in excess of the sum which would be required to pass from a 2½ per cent. to a 2½ per cent. valuation. Interim bonuses will be at the rate of £1 per cent. subject to alteration by resolution of the directors at any time.

In regard to the *Scottish Temperance and General*, here again a substantial fall in new business has had but little effect on premiums. The balance-sheet shows an increase of £174,000 in British Government securities, representing practically the whole of the investments made during the year. Stock Exchange securities in general stand at or below the values at which they were taken at the date of the last valuation on December 31st, 1937, any stocks since acquired having been entered at or under cost price. No provision is made for depreciation. The chairman stated that depreciation is largely covered by undivided profits in the life and other departments of the business and that should it still exist at the end of 1942 (next valuation date) the matter will be dealt with. Meanwhile the directors consider it prudent to make no payment of interim bonus.

Investment

Treasury and Municipal Stocks

The second reading of the Public Works Loans Bill has thrown no fresh light on the methods to be adopted for the conversion of maturing municipal loans, and there continues to be much speculation as to the form the new offers will take. There is considerable doubt in the market as to whether individual authorities will offer such terms as they think fit, or whether the whole sum of £32,750,000—Captain Crookshank puts the maximum at £34,000,000—will be dealt with in two or three major operations. There is also the question whether some, at least, of the corporations will not wish to borrow for a short term of years rather than for 15 to 20. In view of the practice of controlling all issues of trustee status before the war, it seems extremely probable that the Treasury will insist upon all the offers being cast in one mould. If they were ordinary issues to the public, this might mean paying rather more in interest than would otherwise be necessary, but, with the Government a firm underwriter of any balance not taken in conversion, the Treasury can put forward whatever scheme suits it best. They can also decide, if they so wish, to concentrate the whole operation on two or three dates. That the Treasury will elect to institute central borrowing for local authorities at this juncture seems more than doubtful. It is perhaps not generally appreciated that only a moderate percentage of municipal borrowing takes place through the issue of stock exchange securities. A return, relating to end March, 1940, for virtually all local authorities in England and Wales, showed total loan debt of £1,679,890,000, of which £637,490,940 was in stocks, and an almost equal amount in mortgages, other than Public Works Loan Board mortgages, which were placed at some £280 to £300 millions. These three items account for 92 per cent of the total, while stocks alone cover less than 38 per cent. It would be reasonably easy to centralise public issues, when such are permitted, but very difficult to deal with over-the-counter mortgages, and there seems little point in tackling only the minor item. As to the borrowing period, the average paid for 15 to 20-year loans over the past 50 years or so has been around 3½ per cent and borrowing for 20 years at anything like 3½ per cent would almost certainly be considered good business. The issue of loans on equal terms for all has already been fought out, and it is a surprising fact that present quotations continue to reflect pre-war preferences at least as much as the influences of compulsory evacuation and the "Blitz." On the whole, it is perhaps probable that there will be no marked change in procedure. In any case, holders who are not attracted by the offer of 3½ per cent stock at a small discount should begin looking for alternatives. The decision of Birkenhead to redeem half its outstanding stock has little effect on the general position, since few of the corporations have the option of partial repayment. Owing to a transposition of figures the average rate of interest on the £32,750,000 of stock convertible, was given last week as 4.45 instead of 5.44 per cent.

Rayon Concentration

For some years past, the market for rayon shares has enjoyed periods of excitement at the prospect of a fusion between the two leading manufacturers, Courtaulds and British Celanese. Shortly before the war, it seemed probable, perhaps for the first time, that a very close alliance, if not an amalgamation, would be secured. War raised problems of a fiscal nature which caused the plan to fall through, but, in revealing this last March, Mr Courtauld stated that alternatives were being explored. Now there comes a conjunction of forced restriction of sales, official demands for concentration, and—best of all for the holder of British Celanese—a

very large addition to the already adequate cash resources of Courtaulds, as a result of the sale of Viscose Corporation. The argument in favour of amalgamation has always been plausible, but its practicability must depend on the terms demanded by British Celanese, whose ordinary capital is largely in private hands. So large a proportion of the total output of the country comes from the two firms, that the complete closing of the few others would not save them from a considerable measure of restriction, and those who suggest that more economical operation would result from a complete fusion are probably justified. The re-emergence of the idea has had the not unusual, but illogical, effect of depressing the shares of the putative buyer and raising those of the seller. Courtaulds ordinary, which had improved over 5s. on the Viscose sale, fell back some 2s. to 30s., while Celanese 10s. ordinary, which have received no dividend in 20 years, rose 9d. to 4s., and the 20s. 7½ per cent second cumulative preference, with some ten years arrears of dividend, improved 6d. to 10s. 6d. In view of the history of the company, and of the general uncertainty of the future, these prices seem unduly high and it is difficult to see the board of Courtaulds offering anything like a fancy price to get rid of a competitor whose financial position is inferior to their own. This is rendered even more improbable by the existence of agreements throughout the rayon industry for fixing prices of yarns and fibres and of other working arrangements, which a year ago were described as functioning with complete satisfaction to all concerned. In all the circumstances, concentration in rayon should not present insurmountable difficulties, even without a fusion of Courtaulds and British Celanese which would create a virtual monopoly. On the basis of current prices, it would cost something under £8,250,000 to acquire the whole share and loan capital, and it is virtually certain that no such cash payment would be permitted without severe restrictions on its use. Control would be obtained for £3,250,000, but Courtaulds might well object to retaining in being £2,500,000 preference capital carrying as high a rate as 7 per cent.

A Courtaulds Valuation

A report, which although unconfirmed, is believed to be soundly based, suggests that the price the Treasury is to receive for the Viscose Corporation is \$150,000,000, on the basis of which it is evident that the receipt of Courtaulds should be at least £33,000,000, after allowing for 5 per cent retained in the U.S.A. and certain expenses. Without accepting this figure as authoritative, it is interesting to make a rather more detailed valuation of the ordinary capital upon this basis. The accounts at the end of last year showed floating assets of £17,500,000, against which there were creditors of under £4,000,000 and provisions for staff pensions and contingencies to a total of £1,742,000, leaving a net figure of £12,000,000. Deducting £8,000,000 for the preference capital and adding £33,000,000 of cash there remains a cover of £37,000,000 for £24,000,000 of ordinary capital, or 30s. 10d. per unit, now quoted at 30s. This valuation takes no credit at all for fixed assets valued, probably on a conservative basis, at £9,425,000, or for the company's interests in Canada and in continental Europe, nor, apparently in such growing concerns as British Cellophane and Nylon Spinners. The immediate outlook is, of course, poor, but recovery may be expected in the measure that increase in output is permitted. If the figure of cash receipts suggested is reliable it would, with existing investments, even if placed in 2½ per cent bonds, yield an income sufficient to cover the preference dividend and leave almost 2½ per cent for the ordinary. If this figure is considered extravagant, the other extreme of receipts, the £20,000,000 given last week would give a return of 1½ per cent on the ordinary and provide a cover of cash and

liquid assets for their full nominal value, leaving 10s. per unit to be covered by trade investments and fixed assets. Even this figure makes little allowance for post-war recovery.

Electrical Equipment Results

The results of two leading electrical engineering and equipment companies, *Associated Electrical Industries* and *British Insulated Cables*, show good progress in 1940. Profits of the former concern are substantially higher, before tax. There is a small reduction in the amount earned for equity from £409,086 to £395,360, but the rate is up by 0.6 at 13.9 per cent. *British Insulated* realised a small rise in total profits after tax, but, with a substantially higher depreciation provision, the earned rate is slightly reduced from 28.8 to 28.7 per cent. Both companies have adequately covered ordinary dividends, which are maintained at 10 per cent for *Associated Electrical* and at 20 per cent for *British Insulated*. The following table provides a comparative analysis of profits over the past two years:

	Associated Electrical Equipment		British Insulated Cable	
	1939	1940	1939	1940

* And after tax for British Insulated Cable.

† £100,000 to War Contingencies for British Insulated Cable in 1939 and 1940.

The speech of the acting chairman of *British Insulated*, Mr T. H. Martin-Harvey, which is circulated with the report, points out that the provision of extra depreciation of £51,005 is due to the necessity of operating the company's plant under war conditions. The directors have brought the total of War Contingencies Reserve, which they consider must be still further increased, to £200,000, and have also made full provision for the company's estimated liability under the War Damage Bill. Expenditure on plant and buildings amounted to £224,516, although the application of depreciation reveals a rise in the value of this item in the balance-sheet of only £14,894 to £1,974,752. Cash holdings are sharply reduced from £630,520 to £93,760, thereby financing a rise in stocks from £1,588,580 to £2,108,731. All but £1,500 of the company's debenture stock has now been surrendered for redemption and no interest has been payable on the residue since January 4, 1940. The consolidated balance-sheet of *Associated Electrical Industries*, on the other hand, shows cash holdings which have more than doubled at £1,342,543, while stock is over £2,000,000 higher at £9,003,496, rises which are financed mainly by an increase of some £2,800,000 in creditors to £10,829,848. The £1 ordinary stocks of the two companies offer sound yields, *Associated Electrical* £1 stock giving £5 3s. 11d. per cent at the current price of 38s. 6d., while *British Insulated*, at 81s. 3d. ex dividend, offers £4 18s. 6d. per cent.

★ ★ ★

Lampport and Holt Record Earnings

The realisation, for the calendar year 1940, of the highest total profits, after taxation, earned since Lampport and Holt started operation under the present management in 1934 is an indication that very adequate profits can be obtained from full use of tonnage under the Government requisition scheme. Total earnings amount to £198,095, against £121,694 in 1939 and

£187,082 in 1937, the previous best year. With an allocation of £40,000 for depreciation of fleet, against £100,000 in 1937, the surplus for ordinary stock stands at £147,392 against £85,349 in 1939, when the previous highest equity earnings were realised, and represents a rate of 24.3 against 11.5 per cent. After repeating the 6 per cent dividend, the carry forward is up from £61,443 to £155,267. The directors report the loss of three vessels from enemy action during the year and the principal changes in the balance-sheet are associated with this development, and, with the assumption by the Ministry of Shipping of responsibility for new building. As a result, there is a fall in fixed assets, including tonnage building, of some £266,000 on the year, and the appearance of a tonnage replacement reserve of £261,356. In consequence of these changes, there is an increase in the excess of floating assets over current liabilities of £622,000, in round figures. In particular, despite the repayment of a loan totalling £126,000 and the acquisition of Government and other securities to the tune of £100,040, cash holdings are up from £218,725 to £841,654. Moreover, the company has £29,600 standing to its credit on Government tonnage replacement account. After the recent rally in shipping share prices, the 6s. 8d. stock units, at 7s. 1½d. ex dividend, offer a yield of £5 12s. 4d. per cent.

★ ★ ★

Cammell Laird and Hadfields

Both these companies, which are intimately concerned in the output of munitions, have made good progress during 1940. Despite an increasing tendency to veil the movement of gross earnings from the investor by non-disclosure of depreciation and tax provisions, it is clear that, in both cases, total earnings last year were substantially above those for 1939. Thus, *Hadfields'* profits, struck after tax and depreciation, amount to £297,496, against £302,368. The balance-sheet shows provision for taxation and contingencies of £994,920, against £727,085. After meeting normal prior charges, the equity surplus is very slightly reduced at £251,859, against £255,523, representing a rise in the earned rate from 35.1 to 40.6 per cent, and, after meeting the usual 22½ per cent ordinary dividend, the carry forward is increased from £475,802 to £588,167. The *Cammell Laird* accounts tell much the same tale. Profits, net of tax and depreciation, are actually rather higher at £266,116, against £250,851, and the balance-sheet shows that depreciation was increased from £55,662 to £69,863. It cannot be too strongly deplored that the directors find it necessary to withhold the tax provision, which in 1939 amounted to £300,000. With an available surplus of £241,852, against £225,394, the 10 per cent ordinary dividend was covered by a rate of 23.7, against 18.7 per cent, and, after providing £100,000 for reserve as in the three previous years, the carry forward reaches a new high level for the decade at £104,813, against £65,029. It is encouraging that *English Steel*, in which *Cammell Laird* is substantially interested, has secured a rise in profits after tax from £891,074 to £912,497. Since depreciation is increased by £50,000 to £400,000, the surplus for dividends is slightly reduced. The absence of a consolidated statement is regrettable. The balance-sheets of both companies show a large excess of floating assets over current liabilities, but it is not clear why *Hadfields*, with gilt-edged holdings of £687,237, should continue to run a bank loan, whose amount is now disclosed at £390,651. Yields are generous. The 5s. ordinary stock of *Cammell Laird*, at 6s. 6d., yields £7 13s. 7d. per cent. *Hadfields'* 10s. shares, at 21s. 6d., offer £10 9s. per cent.

★ ★ ★

British Aluminium Profits

In 1940, British Aluminium total profits slipped back from the record figure of £1,075,796, which was reached in the previous year, to £912,211, a decline which must be attributed to rising costs and to separation from the company's continental subsidiaries, as well as to tax demands. With a cut in the ordinary dividend from 12½ to 10 per cent, covered by earnings of 16.9 per cent, and an allocation of £100,000 against £150,000, to general reserve, the carry forward is, however, once more increased to £194,796. The following table provides a

detailed analysis of the trend of profits over the past three years:

	Years ended December 31		
	1938	1939	1940
Total profits	909,851	1,075,796	912,211
Income tax	50,000	175,000	150,000
Directors' fees	27,181	28,250	29,055
Depreciation	50,000	50,000	50,000
Debt service	175,000	175,000	175,000
Preference dividend	90,000	90,000	90,000
Ordinary stock:—			
Earned	517,670	557,546	418,156
Paid	375,000	375,000	300,000
Earned %	19.1	21.9	16.9
Paid %	12½	12½	10
Reserve account	100,000	150,000	100,000†
Carry forward	144,094	176,640	194,796
† £500,000 taken from Reserve to cover losses in France and Norway.			
As is indicated in the speech of the chairman, Mr. R. W. Cooper, circulated with the report, the company is now			

HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong. The liability of Members is limited to the extent and in manner prescribed by Ordinance No. 6 of 1929 of the Colony.)

ONE HUNDRED AND TWENTY-FIFTH REPORT OF THE BOARD OF DIRECTORS to the Ordinary Yearly General Meeting of Shareholders, held at the Offices of The Hongkong and Shanghai Banking Corporation, 1 Queen's Road Central, Hongkong, on Wednesday, the 26th February, 1941, at 12 noon.

TO THE SHAREHOLDERS OF THE HONGKONG AND SHANGHAI BANKING CORPORATION

LADIES AND GENTLEMEN.—The Directors have now to submit to you a General Statement of the affairs of the Bank and Balance Sheet for the year ending 31st December, 1940.

The net profits for the year, together with \$3,411,329.55, balance brought forward from last account, after paying all charges, deducting interest paid and due, and making provision for bad and doubtful accounts and contingencies, amount to \$17,411,199.54.

The Directors recommend writing off Bank Premises Account the sum of \$1,000,000. After deducting \$1,000,000, the Interim Dividend of £2 10s. 0d. per Share, paid on 12th August last, viz.: £400,000 at 1s. 2½d. = \$6,453,781.51, and remuneration to Directors, there remains for appropriation \$9,876,745.77, out of which the Directors recommend the payment of a Final Dividend of £2 10s. 0d. per Share, viz.: £400,000, which, at 1s. 2½d., the rate of the day, will absorb \$6,453,781.51.

The Balance, \$3,422,964.26, to be carried to New Profit and Loss Account.

The sterling equivalents of the Assets and Liabilities are shown at 1s. 2½d., the rate ruling on the last day of the year.

DIRECTORS

During the year Mr. H. V. WILKINSON and Mr. D. F. LANDALE resigned their seats on leaving the Colony, and Mr. L. J. DAVIES and the Hon. Mr. J. J. PATERSON joined the Board in their stead.

The Hon. Mr. J. J. PATERSON has been elected Chairman for the year 1941, with Mr. W. H. LOCK as Deputy Chairman.

The Hon. Mr. A. L. SHIELDS, the Hon. Mr. T. E. PEARCE and Mr. K. S. MORRISON retire in rotation, but being eligible for re-election, offer themselves accordingly.

AUDITORS

The Accounts have been audited by Mr. JOHN FLEMING, C.A., and Mr. H. R. FORSYTH, C.A., who offer themselves for re-election.

J. J. PATERSON,
Chairman.

HONGKONG, 11th February, 1941.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

DURING the past week, markets have shown themselves more than usually sensitive to rumours regarding the Balkan situation. Favourable reports have been the signal for substantial buying of leading gilt-edged and home rail issues, aided on the technical side by the release of payments on the requisitioned India stocks. Momentary optimism, however, did not spread to the industrial or commodity markets which remained rather dull with little business passing, a condition to which the gilt-edged market returned toward the end of the week, following unmistakable evidence of German penetration of Yugoslavia.

★

After the previous Friday's quiet close in the *gilt-edged* market, with 3½ per cent War Loan down ½ and both 2½ and 4 per cent Funding lower by ½, prices staged a significant recovery at the opening of the present week. On Monday, the most noticeable improvements were rises of ½ for 2½ per cent Consols and Local Loans; of ½ for 4 per cent Consols and 4 per cent Funding and of 4 points for Bank stock. Later, the upward movement was temporarily checked, though prices generally remained firm, sentiment being encouraged by lower shipping losses and by the resignation of Marshal Graziani, while in midweek, 5½ per cent War Loan touched a new high level for more than four years at 104½. In the *foreign bond* market, there was renewed demand for Brazilian Funding issues, but few other stocks found favour. Greek issues suffered a number of losses of ½ point and the German Potash loans eased the same amount on Monday. Chinese issues remained firm, but certain Japanese bonds, including the 6 per cent issue of 1924 and the 4 per cent issue of 1889, were lower on balance.

★

Enthusiasm for the *senior home rail* issues was the most notable feature of last week's stock market activity. "Brums" and London Transport were most in demand, London Transport 5 per cent "B" stock rising 2 points on Tuesday. Southern 5 per cent preference was also in demand and there was some enquiry for LMS ordinary and Southern preferred. There was little activity among foreign rails. Canadian Pacific preference moved uncertainly, losing ½ before the week-end which they subsequently recovered.

★

In the *industrial* market, interest centred round the rumoured possibility of a merger between Courtaulds and British Celanese. Consequently, Courtaulds started the week with a loss of 1s. 3d., while British Celanese improved 9d., but later, speculative interest receded. Breweries were a weak section, a large number of issues, including Bass and Mitchells and Butlers, losing 1s. at the beginning of the week, when Ind Coope was 1s. 6d. lower. Heavy industrials were not dealt in in a large way and there were few significant changes. Among general industrials, "Emmies," Boots and ICI all suffered moderate losses, but Associated Portland Cement, Brazilian Traction and International Nickel returned to favour. There was also a further revival of interest in the shipping section.

★

The demand for *kaffirs* was alternately stimulated by optimistic reports from the Cape and depressed by the

submission of the Yugoslav Government. Crown Mines and Springs found support and, before the week-end, Sub Nigel gained ½, when, among copper shares, Rhokana also improved ½. This rally was, however, followed by a fall of ½ on Monday, when, in the *diamond* market, De Beers deferred rose by the same amount. There was little business in the *rubber* market, although Anglo-Dutch showed to advantage. In the oil market, transactions were concentrated on preference issues and Anglo-Iranian found support, as did also Shell Transport ordinary.

★

Elections to office at the first meeting in 1941-42 of the Committee for General Purposes of the Stock Exchange, London, resulted in the return of Mr Robert Barclay Pearson as chairman; of Mr. Robert Pelham Wilkinson as deputy-chairman and of Mr Arthur Louis Francis Green as secretary. There is widespread regret at the failure of Mr W. B. Morison to obtain a seat. This implies no disagreement whatever with the new regulations, in whose formation he played a prominent part.

New York

In a week in which sentiment was overcast by anxiety regarding developments in the Balkans and by the continuation of labour trouble at the Bethlehem Steel Works, price movements on Wall Street were predominantly narrow and irregular. After the week-end, some selective buying was evident and a few issues in the steel, motor and shipbuilding sections gained fractionally. Later in the week, the tone was increasingly subdued, though a good demand for rail stocks was maintained, thanks to record car-loading figures. In midweek, the tone was again subdued and irregular.

The *Iron Age* estimates steel mill activity at 100 per cent of capacity, against 99.5 per cent in the previous week.

CONVERSIONS AND REPAYMENTS

Birkenhead Corporation.—This corporation will repay on July 1, 1941, one half of every holding of the outstanding £654,923 4½ per cent Redeemable Stock 1940-1960.

Industry and Trade

Scrap and Steel Supplies

On July 27th last year Mr. Herbert Morrison, then Minister of Supply, announced that a comprehensive survey was to be made by the Steel Control in collaboration with the surveyors of the local authorities of all heavy iron and steel scrap in the form of railings, lerelect factories, pitheads and other obsolete structures. In view of the vital need of ensuring a continuous flow of raw materials to the steel furnaces, eight months would seem to have been more than adequate for the completion of this survey. Yet it is reported that the survey is still incomplete and that supplies in some twenty counties—in western England, the Home Counties, the west Midlands and East Anglia—have still to be scheduled. While it appears that the survey is now to be completed, the delay seems incomprehensible. True, raw material supplies—ore and scrap—have hitherto been adequate for the maintenance of steel production at a high level. But if the current rate of output is to be maintained and if provision is to be made for contingencies, it is essential to make sure well in advance that the requisite supplies of scrap will be available.

★ ★ ★

Concentration in Cotton Trade

As a first step towards the concentration of production in the cotton industry, some 80 out of a total of 550 spinning mills will be closed next week and their 24,000 operatives released for war work as a result of the exhaustion of their raw material supplies. The process is likely to continue, for a further 80 mills, which have received only a small allocation of raw cotton for April to enable them to complete orders on hand, are expected to be closed early in May. At the one end of the scale are those—chiefly spinners of fine and medium yarns—who have been told that they will get no more cotton until the position improves. At the other end are the producers of coarse yarns which are needed for Government and vital export work. These have been allocated the same amount of cotton for April as for March, while some have had their supplies increased. This applies especially to the Royton and Oldham districts which are already turning out yarn for the war effort at high pressure. In cases where they are short of labour for maximum production, they will be able to recruit from operatives released from closed mills. Combines have been affected as well as individual firms. For instance, one combine will have to close 20 per cent of its mills immediately and will be producing at only 50 per cent of capacity from next May. Spinners with reduced rations will be allowed to pool their resources and produce in some of their mills while closing others. Those which are kept open must be run at capacity and contribute towards the maintenance of those which are closed. Part-time working will be permitted only as a temporary measure and firms will not be encouraged to delay the process of concentration. The weaving branch will not be affected for a few weeks, but manufacturers will not be able to accept new orders for export until they know whether they can obtain the necessary yarn.

★ ★ ★

Improvement in North-East Coal Trade

Despite the dislocation in transport caused by the severe snowstorm of some three weeks ago, from the effects of which the North-East has not yet completely recovered, the coal trade in all its departments has shown considerable improvement. In consequence, throughout the whole of this coal area there is now a desire to increase production by opening more seams. There is, however, a shortage of suitable miners, as so many have left the district to train for work in munition factories. It has been estimated that in Durham, which has suffered more than Northumberland from the collapse of European markets, 16,000 men have left the mining industry and found work elsewhere. There are now only some 4,000 miners idle, but it is known that these men are not altogether suitable for the employment that is available. This improved position is attributed principally to the greater increase in the shipment trade brought about by the better supply of tonnage directed to North-East ports. There

has been a large arrival of tonnage loading "bunkers only," also there are shipments to foreign coaling stations and this district has some trade with South America and Egypt. Greater use has been made of sea-borne traffic to relieve rail congestion. There is no doubt that much larger quantities of North-East coal would be acceptable by consumers in Lancashire and the South, even at the considerably higher price than that of their local coal, but with the rail transport difficulties it is being found imperative to adhere strictly to the "priority" list, so that in Lancashire only those consumers engaged upon war production are obtaining regular supplies.

★ ★ ★

Rural Budgets

The *Ministry of Labour Gazette* for February contains a third article in the series on working-class budgets. This time the budgets were collected, not directly, but through the National Federation of Women's Institutes. They were furnished by 366 families for one week in each of the months October, 1937, January, April and July, 1938. The families all lived in rural villages, and in most cases the head of the family was an agricultural worker, but a small number of other workers was included. The families without children were under-represented, so that the average composition of the family was 4.25, whereas in the collection of purely agricultural budgets, obtained directly by the Ministry of Labour, it was 3.79. The budgets all came from England and Wales, whereas the official inquiry covered Scotland and Northern Ireland. In spite of these differences, the correspondence between the figures obtained in the two surveys is most striking. The main results of all three inquiries are tabulated below:—

DISTRIBUTION OF WEEKLY EXPENDITURE PER HOUSEHOLD

	Industrial		Agricultural		Rural	
	s. d.	%	s. d.	%	s. d.	%
Rent	10 10	12.5	4 9	8.2	4 7	8.1
Food	34 1	39.6	27 9	47.9	28 1	49.5
Clothing	9 4	10.8	5 10	10.0	5 3	9.3
Fuel and Light	6 5	7.4	4 11	8.6	4 9	8.4
Other Items	25 7	29.7	14 8	25.3	14 0	24.7
Total	86 3	100	57 11	100	56 8	100

The figures for food do not include the value of home-grown produce or of food provided by employers, which latter is estimated to have averaged about 10½d. per family per week. This inquiry does not add very much to the result of the last, but it provides very satisfactory independent confirmation of its substantial accuracy.

Priority for Munitions in America

Although the United States still has a substantial margin of unused manufacturing capacity, competition for materials and machinery between producers of civilian goods and munitions is bound to hamper the fulfilment of the armaments programme unless steps are taken in good time to give war factories the first call upon vital supplies. The difficulty appears to have been foreseen, for the Office of Production Management has already devised the machinery of a priority organisation to be directed by Mr E. R. Stettinius, jun. Priority certificates are to be issued by the Army and Navy Munitions Board, and the priority organisation of the Office of Production Management is to ensure their application with as little disturbance as possible to ordinary production. Industry has been classified into five groups—minerals and metals, chemicals, commercial aircraft, tools and equipment, and general products; executives have been appointed to each of them to operate the scheme. It appears that the authority of the priority executives is derived chiefly from that of the President in his capacity as Commander-in-Chief of the Armed Forces, but also from the Selective Service Act and other recent laws. But as the expansion of the munition sector of industry gathers momentum it may not be possible to ensure it adequate supplies without more than a little disturbance to "ordinary produc-

tion." In fact, the rationing of essential materials will become as essential in America as it is in Great Britain if her capacity to produce the tools of war is to be developed to the full.

Price Control in America

Despite a sharp contraction in producers' stocks, United States prices of copper and spelter have been kept stable at 12 cents and 7.25 cents per lb. respectively since the end of September last. In normal times the depletion of stocks would certainly have raised prices by leaps and bounds. The fact that a rise has been prevented is mainly due to the intervention of Mr Leon Henderson, the member of the Defence Advisory Commission in charge of prices, who last September issued a warning to producers that he would take stern measures in case of further increases. In the meantime the United States Government has strengthened its hold on the prices of the two metals. As regards copper, it has contracted for the purchase of 235,000 tons of Chilean copper and will enter into further buying orders within the next few weeks in order to secure all necessary supplies at the present price. In spelter the Defence Advisory Commission concluded an arrangement with the trade last week under which both producers and traders pledged themselves to sell only to genuine consumers in order to eliminate speculators. Under the same arrangement the present price was reaffirmed as adequate and fair by both producers and consumers. Copper and spelter, however, are not the only products for which measures have been taken to keep prices down. In the case of tungsten ore the United States Government has recently begun to release large tonnages from its stocks to defence works whose own reserves are exhausted. It has been announced that releases have only been made to prevent these consumers from entering the open market and forcing up prices. As regards iron and steel scrap, for which indirect price stabilisation is extremely difficult owing to the lack of uniformity in the commodity, a maximum price schedule is being prepared by the Defence Advisory Commission to prevent prices from rising above \$20 per ton, free Pittsburgh. It is likely that similar measures will gradually be taken for the majority of other raw materials required in the production of arms. The prevention of speculative rises in raw material prices not only keeps arms production costs down, but constitutes also a striking example to private producers in the United States. In the past the majority of United States raw material producers always showed a bias for high or rather too high prices. In some cases, amongst which copper is the most outstanding, this policy has virtually undermined the United States' predominant position on the international market. As the country's producers will probably fare well under the existing controlled and semi-controlled prices, they may well learn from their present experience that larger sales at lower prices can secure better results than lower sales at higher prices. But it remains to be seen whether the Government's powers are sufficient to prevent rises in price when situations of great scarcity arise.

Tin Quota to Remain at 130 per cent.

The results of the meeting of the International Tin Committee on March 20th were announced too late for comment in last week's issue of *The Economist*. First,

the Committee decided—presumably in the knowledge that America will continue the accumulation of special emergency stocks after the end of June—to maintain the quota at 130 per cent of the basic tonnages for the third and fourth quarters of the current year. Secondly, it recommended to the Governments concerned that the control scheme should be renewed for a further period of five years from the beginning of 1942. At the same time, it suggested a revision of the basic tonnages on the basis of one year's output at the present quota in order to bring them more into line with the actual capacity of the various countries. This would involve a reduction in Bolivia's basic annual tonnage from 46,000 to 40,000 tons and an increase in those of Malaya and the Dutch East Indies from 77,000 to 88,000 tons and from 39,000 to 50,000 tons respectively. Since these decisions were not unexpected, they had little effect on prices.

Improvements in Oil Technology

A further notable advance in the petroleum refiner's art is revealed in the recent announcement of an improved process for the manufacture of petrol from heavy oils. Petrol is produced from crude petroleum jointly with a number of other products, but the quantity which can be obtained by straight distillation of the raw material falls far short of present-day needs. Had it been impossible to solve this problem, petrol would have been far more expensive than it is in fact the case; for there would have been large quantities of by-products for which no market could be found. A solution was found by the invention of the cracking process, the commercial importance of which dates from the early 'twenties. Cracking—the disintegration of the heavier and less valuable products, gas and fuel oil, into much-needed petrol—was originally accomplished by the application of great heat and high pressure. A more recent advance was the invention of catalytic cracking, i.e., cracking in the presence of an agent which, while itself undergoing no chemical change, facilitated and accelerated the process of disintegration. Besides enabling much lower temperatures and pressures to be used (thus considerably reducing costs) the catalytic agent speeded up the process and enabled a greater output of better quality petrol to be obtained. Unfortunately, however, operations had still to be interrupted every half-hour or so for the regeneration of the catalyst, which soon becomes coated with a carbon deposit. The regeneration requires fairly expensive equipment and entails a considerable loss of time. The method just invented employs what is described as a revolutionary technique in which the catalyst, instead of being in solid lumps in the still, flows like a liquid and is continuously regenerated. The result is a considerable reduction in capital cost and in operating expenses, a saving of time and the production of petrol of a more uniform quality. Construction of three plants using this fluid catalytic process, each with a capacity of 300,000 tons a year, has been commenced in the United States by the Standard group, owners of the process. Patent rights are being made available to the whole oil industry under a licensing system and there seems little doubt that before long this method of cracking will supersede all others. Even higher qualities of petrol will then be available with no increase in price.

COMMODITY AND INDUSTRY NEWS

The tin quota is to remain unchanged at 130 per cent. of standard tonnages for the third and fourth quarters of this year. In a Note on this page we discuss the International Tin Committee's recommendation that the scheme should be continued for a further period after January 1st, 1942. The London Rubber Trade Association has appointed a special sub-committee to undertake a thorough survey of all the factors in the present situation with reference to the rubber market. Rubber prices are very firm, closing on Wednesday at 14½d. per lb. smoked sheet. Cotton has not exceeded its record price of last week, but was maintained at a higher level than of late; Wednesday's closing price was 8.92 per lb. for American middlings. Moody's index of American commodity prices (December 31st, 1931=100) has risen steadily

during the week and on Wednesday was 183.7. Sir Cecil Weir, speaking at Leicester to hosiery manufacturers from all parts of the country, suggested that brand names should be suspended for the duration of the concentration of the industry, and that they should be replaced by standard or war brands.

The Cotton Purchasing Agents.—It is announced that the company which is to buy, classify and distribute raw cotton as agents for the Government is to have eight directors, of whom five will be members of the Liverpool Cotton Association and three of the Manchester Cotton Association. Some dissatisfaction has been expressed with the number, which is thought to be too small, and representations are likely to be made on this subject. The company is to be paid

£500,000 a year for its services. None of this money is to be used to compensate firms which will have to close down.

Home-grown Flax.—To compensate for the loss of overseas sources of flax the Ministry of Supply prepared a programme for a large increase in flax acreage in Great Britain and Northern Ireland. It is intended to set up two new flax processing units in Scotland, each of which will be able to deal with the crop from 2,000 acres. In Central Scotland good crops were grown last year, the yield averaging 2½ tons per acre, while a few crops yielded over 4 tons per acre. The crop is very suitable for new, ploughed grassland and is an approved crop under the £2 per acre grassland subsidy scheme. Flax-pulling machine

COMPANY MEETINGS

THE HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong. The liability of members is limited to the extent and in manner prescribed by Ordinance No. 6 of 1929 of the Colony.)

ECONOMIC SITUATION IN THE FAR EAST

NATIONAL GOVERNMENT'S IMPORTANT PROBLEMS

THE HON. J. J. PATERSON'S ADDRESS

The ordinary yearly general meeting of the shareholders of The Hongkong and Shanghai Banking Corporation was held in Hongkong on the 26th ultimo.

The Hon. Mr J. J. Paterson presided.

The chief manager read the notice convening the meeting.

The chairman, in the course of his speech, said:—The net profits for the year amount to \$13,999,869.99, an increase of about \$7 lacs compared with the previous year.

After deducting the interim dividend paid at 1s. 2½d. and directors' remuneration, and including \$3,411,329.55 brought forward from last year, there remains for distribution \$10,576,745.77, which it is proposed to deal with as follows:—

To pay a final dividend of £2 10s. per share,	
subject to deduction of income-tax ...	\$6,453,781.51
Transfer to bank premises account ...	\$1,000,000.00
Carry forward to new account ...	\$3,422,964.26
	\$10,576,745.77

Our London office is carrying on unscathed in the direct line of the war, and the fall of France, of course, meant the withdrawal of the British members of our staff at Lyons; otherwise our branch offices have not been affected. Here in Hongkong, in Shanghai, and in Singapore, where our three main offices are situated, results have been satisfactory in spite of abnormal conditions.

VALUE OF CHINA'S TRADE

The foreign trade figures for China in 1940 are at first sight amazing, even allowing for inflated war-time prices of goods and for exchange depreciation. But for many reasons, some of which were mentioned here last year, it is almost impossible to make a reliable estimate of the real value of China's trade in terms of gold or sterling currencies. Smuggling, exchange and trade controls, unrecorded imports and exports (which must have reached big proportions), variations in the methods of valuing goods, the employment of special exchange rates linking imports to exports and so on all affect the issue. One even finds considerable difficulty in dealing with a single port like Shanghai; some of the anomalies disappear, but other complications arise.

One unhealthy feature stands out clearly. Shanghai last year imported from abroad large quantities of native products which the hinterland can normally provide. For example, not only in value but also in quantities, the imports to that port of rice, cotton, coal, tobacco, sugar, flour and artificial silk in 1940 were all higher than in 1936, the last normal year. In that year cotton, cereals, tobacco, and coal accounted for only 13 per cent. of import values. In 1940 they accounted for over 51 per cent. Meanwhile the export position is clouded over by monopolies, controls, and extraneous influences which naturally have a serious effect on the balance of trade and on currency exchange.

FOREIGN CREDITS AND LOANS

In view of their bearing on exchange and trade balances, I should here mention the various credits and loans which China has received during the year from foreign sources. Detailed particulars have not been made public, but you must be aware that such loans were made chiefly for political reasons. The published announcement dealing with the most recent of the United States loans showed that the donors were desirous that "arrangements for purposes of monetary protection and management" (the words actually used) should be completed. That is satisfactory so far as it goes, but that is all the information which is at present available.

The Shanghai foreign exchange market in 1940 fluctuated between a high mark of 4½d. and 8½ U.S. cents, which points were touched in January, and a low mark of 3d. and 4½d. U.S. cents in May. The year ended with rates about 3½d. and 5½d. U.S. cents. The stabilisation fund continued to carry out its stabilising operations as necessary and, considering that the proceeds of exports are being largely monopolised both by the authorities in the occupied and unoccupied parts of China, it is remarkable that the value of the Chinese currency has been maintained with so little difficulty.

The establishment of the new Central Reserve Bank in Nanking on January 6, 1941, and in Shanghai on January 20th had little serious effect on the Shanghai exchange market, but it cannot be gainsaid that the establishment of this bank, coupled with the existing currency situation in North China, has made for uneasiness, since it is feared that further measures may follow. All the leading banking interests in the Far East lay stress on the importance of the continuation of the existing free market at Shanghai. Any rash action, precipitating its closure or tending to its restriction, whether from Chungking or Nanking, might result in unfortunate reactions not only in Shanghai itself but also in China generally.

CHINESE MARITIME CUSTOMS REVENUE

The record revenue collection of the Chinese Maritime Customs has been welcomed perhaps too effusively by those who have not studied the situation sufficiently carefully. Although a record in terms of Chinese dollars, the figure of 475 millions represents only about £7½ millions at the average rate of the year, whereas the previous year's collection of 381 millions was equivalent to about £8½ millions, and the average value in sterling over the 10 years prior to the Sino-Japanese conflict was no less than £19 millions.

Moreover, owing to the continuance of the Sino-Japanese conflict, the position of the foreign loans has in no way improved in the past year. Quotas in Chinese dollars are still set aside by the National Government in the Central Bank of China to cover their estimated shares of both the Customs and Salt Loans. These quotas are based on the proportion for which unoccupied China might be regarded as liable if quotas were also provided by the occupied parts of China. It must be remembered that such sums are estimated by working out the amount of Chinese dollars due, at the former official sterling rate of 1s. 2½d., to meet scheduled loan payments. Actually the sums deposited in the Central Bank of China last year averaged only about 11 per cent. of the sums so due.

CUSTOMS FUNDS DEPOSITED IN THE YOKOHAMA SPECIE BANK

Various unofficial statements have been made by members of the Nanking régime to the effect that a portion of the Customs funds deposited in the Yokohama Specie Bank in occupied ports has similarly been earmarked for foreign loan payments, but so far as we are aware such statements have never been confirmed. Last year your chairman estimated that \$380 million lay in the Yokohama Specie Bank on Customs account. By now that figure must have been doubled, but if and when the dollar quotas are released to the Chinese Government by the Yokohama Specie Bank there will still remain the exchange problem—that is to say, the problem of how to obtain the requisite amount of foreign currencies. There has, however, been no repudiation of the pre-conflict foreign issues, neither by the Chinese Government nor by the authorities controlling the Customs funds in the occupied areas, and the problem of exchange may not be so difficult for China as for other countries when the world gets back to normal.

One beacon of hope to bondholders is the continuance of the Customs Administration in the form in which it has existed for so many years, under the able guidance of Sir Frederick Maze, the Inspector-General. Fortunately it seems to have been generally realised that undue interference with the established principles of the Customs Administration would result in unfavourable repercussions which would outweigh possible advantages. There is to my mind little doubt that Sir Frederick Maze himself is largely responsible for this satisfactory state of affairs, and his eminent services will no doubt be more clearly recognised when the smoke of conflict clears away.

THE SALT ADMINISTRATION

The Salt Administration is, unfortunately, by no means so well placed as the Customs Administration. In the areas it controls it has had its task cut out to ensure that adequate supplies of salt are distributed to the unoccupied areas of China. Meanwhile in occupied China little information has been made public as to how salt revenues are collected and employed. It appears, however, that Japanese-controlled salt companies have monopolies in the production and distribution of salt, and that Japan is now taking large quantities of salt from North China to replace supplies from elsewhere which have been cut off as a result of the war.

THE PEKING-MUKDEN RAILWAY LOAN

Alone of all the Chinese railway loans the Peking-Mukden Railway Loan (known as the Chinese Imperial Railway Five per Cent. Gold Loan of 1899) is still up to date with coupon and amortisation payments, and its earnings remain excellent. The Manchurian authorities have, however, found difficulty in obtaining sterling exchange. Some of the British railway staff have been paid off, but their treatment was decidedly niggardly and caused a good deal of dissatisfaction.

In West China progress has been made on the early stages of the railways running north and west of Kunming, but the severance of communications with Indo-China naturally cut off the only feasible route for the supply of heavy materials. Some work has been done on the Hengyang-Kweilin Railway and also on the western end of the Lunghai line. The railways under the control of Japanese companies—namely, the Central China Railway Company, south of the Yangtze (but excluding the railways centred on Hankow) and the North China Railway Company, north of the Yellow River—are apparently operating with a fair amount of regularity. However, the railway bondholders are also unlikely to receive consideration until political conditions become normal.

THE NORTH CHINA DEVELOPMENT COMPANY

In addition to the Japanese-controlled railway companies in East and North China, you are, of course, aware that a whole network of Japanese-operated companies are active in those areas. The North China Development Company is a large controlling concern operating 18 subsidiary companies (there may be more by now). These control transportation, wharves, cotton growing, mining, salt production, telegraphs, telephones, power stations, and so on. The Central China Development Company concerns itself with similar operations in the Yangtze Valley, and in addition with silk production and filatures, river and coastal steamships, fish marketing, and real estate. Many, if not most, of these companies have monopoly trading rights; some of them make profits but others are handicapped by shortage of equipment and local difficulties.

I will not elaborate the obvious effect of these developments on foreign firms. You may have read an illuminating statement published a little time ago by the Tientsin American Chamber of Commerce commenting on the much quoted phrase of Mr Matsuoka, "We shut the open door nowhere to none." Other organisations, both British and American, have been equally frank, and I need do no more than refer you to the last annual report of the China Association, and to the speech of the chairman at the last annual meeting of the Shanghai British Chamber of Commerce.

RIISING COST OF LIVING IN SHANGHAI

This is not the occasion to refer in detail to Shanghai's municipal and other problems, but I feel that you wish me to say how much we sympathise with that great city in its embarrass-

ments and with the chairman and secretary-general of the Shanghai Municipal Council, who have both narrowly escaped the hands of assassins during the past year. Restrictions on the movement from the interior of rice, that very important item in the Chinese diet, and of other native produce, which were potent factors in causing exchange to fall, have driven up the cost of living over 250 points since January, 1940; the price of rice increased 120 per cent. in the year and over 600 per cent. since the Sino-Japanese conflict commenced in 1937. This has naturally led to higher costs all round and particularly to demands for increases of pay and so brought financial embarrassment to the Municipal Council.

The latter's powers of taxation being restricted by the Shanghai Land Regulations, they have been forced to ask authority from ratepayers for a considerable increase in rates rather than to adopt other forms of taxation or subsidies. I am afraid that a proper solution of the Shanghai problem in all its aspects can only come when the political problems of the Far East are solved. In the meantime let us hope that there will be a realisation of the vital importance on humanitarian and common-sense grounds of reasonable compromise for the maintenance of peace, order, and the livelihood of the large population of that cosmopolitan city.

HONGKONG—ECONOMY THE WATCHWORD

Last year your chairman expressed uneasiness at certain aspects of the financial situation of this Colony, and urged the employment of economy. I am satisfied that the new budget has been kept down to reasonable proportions, considering the onerous but necessary expenditure on defence measures and the services unavoidably incurred through the influx of Chinese. But we must continually remember that Hongkong is very susceptible to outside influences, such as the situation *vis-à-vis* China, Japan, Indo-China, the shortage of tonnage, movements of population, and so on. It is therefore of importance that fresh commitments should be scrutinized with great care, and that economy should be the watchword on all sides.

It is, however, only right that Hongkong should remit to the Home Government whatever contribution to the war effort it can spare, and last year it played its proper part in remitting £200,000 out of revenue, and a further £200,000 from the profits of the exchange fund. In addition, there is of course the bomber fund, now totalling about £100,000, which has been raised by voluntary subscription through the *South China Morning Post* and *Hongkong Telegraph*. This is apart from the considerable expenditure borne by the Colony for local defences. It amounts to a contribution we can be proud of, but which should be continued on the same scale.

As regards other countries, Malaya gives the brightest picture. Tin and rubber exporters have had a very good year, and this has, of course, brought prosperity to the many concerns (including banks) which are directly or indirectly concerned with these two important products. It must not, however, be forgotten that the present prosperity of producers is due largely to the purchases made by the United States Government for their war reserve stocks, and these purchases will not go on for ever.

The report and accounts were unanimously adopted.

FOREIGN EXCHANGE CONTROL IN PRACTICE

The series of special articles explaining the detailed processes involved in putting the Exchange Regulations into practice, now in course of publication in *The Financial News*, will shortly be republished in pamphlet form (price 6d.) in response to many requests.

The review covers the whole field of practical Foreign Exchange control, and will be of invaluable assistance to branch bank officials.

Orders should be addressed to The Publisher, *The Financial News*, 20 Bishopsgate, E.C.2.

BRITANNIC ASSURANCE COMPANY, LIMITED

STRENGTHENED VALUATION BASES

£363,000 ALLOCATED TO POLICYHOLDERS

MR J. A. JEFFERSON'S STATEMENT

The seventy-fifth annual general meeting of the Britannic Assurance Company, Limited, was held, on the 21st instant, in Birmingham, Mr J. A. Jefferson, F.I.A., chairman and general manager, presiding. His statement, which had previously been circulated to the shareholders, was as follows:—

Last year I pointed out to you that the effects of war are adverse to life assurance institutions, which are bound to experience heavier claims, bear heavier expenses, and suffer heavier taxation. You will not be surprised, therefore, to learn that in valuing our liabilities in both branches this year we have taken a cautious view of the future by strengthening the valuation bases.

While we have strongly supported the Government in its War Savings Movement, and are still continuing actively to do so, I want you to realise the difficult position of a progressive life office, with rapidly accumulating funds. These funds are derived mainly from the premiums on long-term contracts based on the earning of a rate of interest of 3½ per cent. *net*; one does not need to possess the mind of a professor of economics to see that there must be a limit to the proportion of its funds which an assurance company can afford to have invested at 2½ per cent. *gross*. To bring the matter home to you more forcibly I would point out that whilst our funds have doubled since 1928 our net interest income has increased by only one-half.

THE REVENUE ACCOUNTS

The total income was £7,086,000. The premium income amounted to £5,537,000. Gross interest was £1,537,000 and net interest was £1,179,000. Total death claims at £1,679,000 showed an advance of £172,000, while maturities at £1,542,000 increased by £410,000. Since the inception of the company it has paid over £55,000,000 in claims, and it is interesting to mention that during 1940 the total sums assured in force passed the £100,000,000 mark.

The net result of the year's working was an addition to the funds of £1,547,000, bringing them up to £35,240,000.

ORDINARY BRANCH

During 1940 the funds increased by £318,000 to £12,692,000. The premium income was £1,422,000. The death claims at £267,000 included claims arising directly from the war amounting to £32,000. Claims under maturing policies advanced by the large sum of £247,000 to £925,000. The net new sums assured totalled £2,099,000, and were 82 per cent of the previous year's total, a percentage which was well above the average of all offices.

Despite an increase of nearly £11,000 in the gross interest, there was a drop of over £11,000 in the net interest, the net rate of interest being 3½ ls. 8d. per cent. In this branch alone the liability for income tax has more than doubled in the last five years, the extra liability being the equivalent of the cost of a reversionary bonus on with-profit policies of 10s. per cent.

INDUSTRIAL BRANCH

The total funds stand at £18,604,000. The premium income amounted to £4,105,000. The premiums collected during the year represented 19s. 10d. in the £ of those falling due, the highest rate we have ever attained. The lapsing has been at a rate well below normal.

The gross rate of interest earned on the funds was £4 19s. 8d. per cent. The net rate earned was £3 19s. 8d. per cent.

Death claims amounted to £1,411,000. War claims have been increasing and during 1940 amounted to £38,000. During the year we paid £617,000 in respect of maturing endowment policies. Surrenders paid totalled £75,000, a decrease of £32,000, which followed a reduction of £22,000 during 1939.

The expense rate for the year was 29.76 per cent, which was

0.30 per cent only in excess of the figure for 1939. I am sure you will agree that, having regard to the allowances we are paying to members of our staff serving with His Majesty's Forces, and to increased costs generally, the increase is a modest one.

During the year many more of our agents joined the Forces and we appointed a large number of women to take their places. We now have about one thousand women agents in our service. We have been able to continue our policy of increasing the debits of our agents, thereby increasing their earnings.

VALUATION OF ASSETS

Again I am proud to be able to report that our investment reserve funds, now amounting to £2,250,000, are still intact. Our Stock Exchange securities valued at middle market prices on December 31st last still disclosed in the aggregate an appreciation on their book values.

Turning now to the balance sheet, I wish you to note the increase of £1,860,000 in British Government securities. You will observe that this increase is larger than our total increase in funds during the year, and as the amount has all been invested in the Government's new war issues we can say that the Britannic is making its full contribution to the War Savings Movement.

VALUATION OF LIABILITIES

In the Britannic ordinary branch the with-profit business formerly valued at 2½ per cent. was valued at 2½ per cent. The surplus disclosed after this strengthening of the bases was £408,431, inclusive of £196,345 brought forward from 1939. The directors have transferred £50,000 to the ordinary branch investment reserve fund, bringing it up to £750,000, and have allocated £162,908 to policyholders to provide a reversionary bonus of £1 per cent on the sum assured to with-profit policies and have carried forward a substantial balance of £172,428.

In the Britannic industrial branch, not only has the rate of interest assumed in the valuation been reduced to 2½ per cent, but a more recent mortality table, the English Life No. 10 (Males), has been substituted for the English Life No. 8 (Males) Table. The surplus disclosed was £710,167, inclusive of £181,110 brought forward from 1939. The directors have made allocations of £180,000 each to policyholders and to profit and loss account, and have transferred £90,000 to the staff pension fund. £100,000 has also been added to the industrial branch investment reserve fund, bringing it up to £1,500,000. Finally, £160,167 has been carried forward undivided to 1941. The directors are gratified that notwithstanding war conditions it has not been found necessary to withdraw or even modify the bonus scheme.

Taken as a whole the valuation results show that the company is in a very strong financial position, and that every possible precaution has been taken by the directors to enable the company to face all eventualities.

The directors again express their thanks to all members of the indoor and outdoor staffs for their efficient services and helpful co-operation during 1940, and especially in dealing with the many difficulties arising from the war. That these were successfully overcome the accounts show clearly, and I am pleased to say that the feelings of goodwill existing between the directors and all sections of the staff have continued.

The report was unanimously adopted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8, Boulevard Street, E.C.4.

PEARL ASSURANCE

COMPANY LIMITED

FACTS AND FIGURES

from the Statement by

SIR GEORGE TILLEY, F.C.I.I.

President and Chairman of the Company
on the Annual Report and Balance Sheet
for the year ending 31st December, 1940.

FUNDS £112,389,143
INCOME £19,931,244

INVESTMENTS

The funds show an increase of £3,970,368. The market value of the investments exceeded the price at which they stand in the balance sheet.

LIFE BRANCHES

In the Ordinary Branch sums assured under new policies issued during the year amounted to over £5,700,000. Premium income in the Industrial Branch exceeded £9,520,000, an increase of £177,000.

FIRE AND GENERAL

In these Branches the premium income exceeded £1,652,000.

BONUSES

In the Ordinary Branch a bonus of £1 per £100 assured was declared on policies entitled to participate in full profits that become claims by death or maturity during 1941. In the Industrial Branch a bonus has been declared on policies, with certain exceptions, effected before 1st January 1934 that become claims by death or maturity during 1941. Up to date a total sum of over £6,800,000 has been allocated for bonuses to policyholders in this Branch.

**TOTAL CLAIMS PAID
EXCEED £146,000,000**

Chief Offices: High Holborn, London, W.C.1

NATIONAL PROVIDENT INSTITUTION

STRONG FINANCIAL POSITION

The annual meeting of the National Provident Institution was held, on the 25th instant, in London.

Mr Robert E. Dickinson (the chairman) said that during the whole of the period under review they had been at war. The institution, in common with other life assurance offices, had experienced a substantial reduction in the new business figures to which they had been accustomed, and so long as the war lasted they must look forward to a continuance of that state of affairs. One of the results of their reduced new business activities was that the premium income for the past year showed a reduction as compared with that of the previous year.

The gross yield on their life assurance and annuity fund had been substantially maintained, but that was largely due to the fact that at the end of 1939 they had set aside £200,000 as a contingency reserve, and, if the yield were measured on the total funds, including that reserve, it would show a fall, as might naturally be expected. The net yield was affected by the burden of income tax, in spite of the fact that the Government had granted them a special relief. For the past year their net rate of interest was £3 11s. 5d. per cent., a reduction of 8s. 7d. per cent.

During the year under review they had invested no less than £550,000 in new Government War Loans. The rate of interest they would earn on such investments must be low, and that in turn must affect adversely their trading profits. As regarded their Stock Exchange securities, a year ago he was able to assure members that in the aggregate those securities were fully worth the value at which they stood in the books, and it was very gratifying that, in spite of the happenings of the past year, they were still able to give that assurance.

Their financial strength was indeed great, though their current profits were necessarily on a reduced scale, and the Board had decided that the rates of interim bonus announced last year to be payable on policies becoming claims by death or by survival should be continued.

The report was unanimously adopted.

ANGLO-FRENCH EXPLORATION COMPANY, LIMITED

A SATISFACTORY RESULT

The fifty-first ordinary general meeting of this company was held, on the 26th instant, in London.

Mr F. A. Robinson (the chairman) said that their investments in other companies stood at £832,787, and it was a very satisfactory feature that approximately 97 per cent. were quoted on the Stock Exchange. The market value of the quoted securities at December 31st was £729,966, whilst the unquoted were valued by the directors at £24,988, so that there was a difference between the book cost and the valuation of £77,833, which was, of course, amply covered by the reserve. The result of the year was a profit of £47,266, which was slightly in excess of the previous year. After adding the balance brought forward, the amount available was £75,815. They were writing off £13,650 on account of depreciation of certain holdings. The dividend of 5 per cent. would absorb £39,375 and allow £22,790 to be carried forward.

The total net valuation of the company's assets amounted to £859,383, or a surplus of £109,383, and they were of the opinion that under present conditions the surplus was not unsatisfactory. The gold mining industry of the Transvaal continued to make good progress, the dividends declared for the year 1940 amounting to over £21,000,000 despite the still higher taxation which the industry had been called upon to bear. During 1940 the "special contribution" was raised to 11 per cent., and it was now to be increased to 16 per cent. In addition, dividends accruing to shareholders not resident in the Union of South Africa were to be taxed at the rate of 1s. in the £.

The Apex (Trinidad) Oilfields had increased its profits by £137,568 to £393,617 for the year ended September 30, 1940. The dividend was maintained at 30 per cent. The Anglo-Burma Tin Company had made a profit for the year ended June 30, 1940, of £23,327, which enabled it to pay dividends totalling 25 per cent. The Anglo-French Company had continued to receive satisfactory returns from their other tin holdings.

The report was unanimously adopted.

ASHANTI GOLDFIELDS CORPORATION, LIMITED

OUTPUT MAINTAINED IN SPITE OF DIFFICULTIES

The forty-fourth annual general meeting of the Ashanti Goldfields Corporation, Limited, was held in London on the 25th instant, Mr. J. H. Batty (chairman) presiding.

In his statement the chairman mentioned that there was a reserve for taxation purposes of £537,260, which included the £800,000 set aside out of profits this year. The company had spent some £33,000 on improving the power plant and on extending the power station buildings, including the new compressor station at south shaft. There had been considerable improvements in the sanitary conditions on the property, and also additional bungalows for Europeans and native hutments in the new native village. The new European club was now completed and very much appreciated by the staff. So far as labour allowed, progress was being made in the erection of the new treatment plant, but this work was dependent on the number of European fitters available. Practically all the material for this plant had been shipped.

The share investment in other companies totalled £662,660, being approximately the same as in the previous year. The cash and bullion total, together £696,000, was slightly higher than last year. He might mention that the company had assisted the Government by paying some £400,000 to the commissioner of taxes in advance. In the present accounts only £100,000 of this amount was included, the other £300,000 having been paid out at a later date. The company had paid to the Gold Coast Government £114,746 in royalty and £241,000 in export duty on gold premium. These sums were quite apart from what might be due by the corporation here for income tax and excess profits tax assessment.

WORKINGS OF EXCESS PROFITS TAX

For the latter the standard of profit allowed under the Finance Acts of 1939 and 1940 in arriving at the assessment for Excess Profits Tax, as far as could be ascertained at present, had reduced the profits available for distribution to shareholders by about 15 per cent. The standard year was based on the results obtained during the calendar years 1935-6-7. It so happened that in order to provide funds to enable an increased output to be produced the company had increased its capital from £1,000,000 to £1,250,000 in January, 1939.

Very rightly the Government had taken, and was continuing to take, steps to raise the wages of the workers to meet the increased cost of living. But he felt that the small investors who formed the bulk of the investing public were being inequitably treated. This lack of equity was even more noticeable in the case of the Bibiani Company, about which he would be speaking later in the day.

He felt, too, that this Excess Profits Tax in its present 100 per cent form would fail in its ostensible purpose, i.e., to increase revenue and check rising prices. For by removing ordinary individual incentive to industrial efficiency it would tend to encourage needless expenditure and less care in work and management.

Turning to the mining operations, the technical progress of the mines had been fully dealt with in the reports of the general manager and the London Consultant's Review, which read in conjunction with each other gave a comprehensive outline of the year's operations. On the lower levels of the mine exploration on No. 28 level had been very satisfactory. In the southern section of the mine developments had thrown more light upon the upward extension of both the Cote d'Or and Obuasi South reefs, and encouraged the belief that a considerable tonnage of good ore remained to be opened up in this area also.

Turning to the treatment side, it would be of great advantage to the company if the full output could be handled in the central treatment plant and so make it possible to close down the pilot treatment plant. This should effect economies in labour and stores.

After so many years of uninterrupted service it was a little disappointing to have to call a halt—even a temporary one—to the company's programme of expansion. The mine was, however, in very good order with an abundantly strong ore reserve, and the management felt confident of being able to maintain the present monthly throughput of 19,000 tons for an output of 22,000 ozs.

Lord Luke (deputy-chairman) seconded the resolution adopting the report and accounts, which was carried.

BIBIANI (1927) LIMITED

PENALISING EFFECTS OF EXCESS PROFITS TAX

Presiding at the fourteenth annual general meeting of Bibiani (1927), Limited, held in London on the 25th instant, Mr J. H. Batty (chairman) said that the total quantity of ore treated for the year rose by 147,648 tons to 321,550 tons, yielding 100,768 ozs., an increase of 44,529 ozs. over the previous year. In spite of the difficulties inseparable from running-in a new plant, extractions were actually a little higher than for the previous year. As had been forecast, only a limited amount of development had been attempted, and the ore reserves still stood at nearly 2½ million tons of 7.2 dwt. ore. This was a very strong position.

DEPLORABLE EFFECT OF E.P.T.

He felt compelled to make some reference to the deplorable effect on the company's fortune of the Excess Profits Tax. The company found itself especially penalised by this tax in its present form. He therefore proposed to give a short history of its operations since its inception, which would recall the resolute and persevering efforts of the board to bring the company to its present state of production and "apparent success." He said "apparent success" since it was uncomfortable and disconcerting to reflect that perseverance in effort and prudence in finance had had no other effect than to put the company in the deplorable position of having to deplete ore reserves at a faster rate without any increased return to shareholders to balance this shortening of the life of the mine.

Bibiani (1927), Limited, was registered in April, 1927, with a capital of £12,000, which, in order to provide the capital for development, had since been raised to £500,000. All of this capital except shares to the value of £6,000 was represented by cash, many of the shares having been issued at a premium which was justly warranted by the prospects of the mine as its development progressed.

PRE-WAR PROFITS RE-INVESTED IN THE MINE

Shareholders realised that the development of a big and unusual mine like Bibiani—in order to assess its true value—must be rather a long business. They were encouraged to wait and to see most of such slender profits as were being made re-invested year after year in the business, in order to maintain its financial strength, rather than prematurely inflate the capital by going to the public for all the capital required.

In 1935 it was decided that a new plant to treat 1,000 tons per day should be designed. To pay for this the capital of the company was increased to £500,000 by the creation of 300,000 additional ordinary shares of 4s. each, 250,000 of which were offered to shareholders at 20s. each in February, 1936, the remaining 250,000 shares being issued at the same price in February, 1938.

Including capital, share premium and profits re-invested in the development and equipment of the mine, the total outlay by shareholders now amounted to about £1,250,000. It was not until January, 1936, however, that after waiting for nearly nine years, shareholders received their first reward in the form of a maiden dividend of 12½ per cent. on its nominal capital.

TAX—OR CAPITAL LEVY

By the summer of 1939 the new plant was in partial operation, and shareholders were looking forward to at last receiving a just reward for their enterprise and patience—when war was declared.

The market value of the shares at this time was firm at 26s., as the published monthly returns were confirming the expectations of the new plant which he had foreshadowed in his address to the shareholders at previous annual meetings.

In fixing the years 1933, 1936 and 1937 as the basis on which the E.P.T. was to be assessed, he submitted that the shareholders of this company were unduly penalised, and that the tax operated, in the cases of Bibiani and mining companies similarly situated, like a capital levy on the ore reserves, which were being depleted at a much higher rate than in any previous years.

The report was adopted.

LANCASHIRE STEEL CORPORATION, LIMITED

DIVIDEND OF 7 PER CENT ON "A" AND "B" ORDINARY SHARES

The eleventh ordinary general meeting of shareholders of the Lancashire Steel Corporation, Limited, was held, on 24th instant, at the registered office, Bewsey Road, Warrington.

Mr John E. James (the chairman and managing director) presided.

After moving the adoption of the directors' report and accounts for the year to December 31, 1940, the chairman stated that as the accounts were, he thought, self-explanatory, he did not propose to comment on them in detail. He pointed out, however, that after meeting all charges and making any reserves the directors considered desirable, it had been possible for the corporation to pay the full dividend (less tax) on the two classes of preference shares, and to recommend to shareholders payment of a dividend of 7 per cent (less tax) for the year on the "A" and "B" ordinary shares.

He informed the meeting that since the last annual meeting of the shareholders the board had elected Mr Robert Crichton, C.B.E., who had had wide experience in the iron and steel industry, to fill the vacancy arising on the death of the late Earl of Crawford and Balcarres, K.T., and expressed his pleasure that Mr Crichton had consented to become a full-time member of the board.

In paying tribute to the work of the employees and members of the staffs of the corporation and its subsidiary companies, the chairman stated that groups under the National Savings Scheme had been in operation in the works of the various companies since the spring of 1940, and that that movement, which had been of such value to the country in the financing of the war, had been supported by both works and staff employees.

The accounts and report were unanimously adopted.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

REVIEW OF ACTIVITIES

The following is a summary of the statement by Mr T. A. Eades, vice-chairman and managing director of the Automatic Telephone and Electric Company, Limited, circulated with the directors' report and accounts for 1940.

The chairman of the board, Sir Alexander Roger, had been appointed to lead a British Government Mission to Delhi to investigate war-time production facilities in India, and they regretted his absence (the first in twenty-one years) from the coming-of-age general meeting of the company to be held on April 1, 1941.

Many new problems had been encountered during the year, but the factory output had been maintained and orders had reached a high level. Work in progress had increased and stocks generally were higher. Recurring increases in production costs had caused a reduction in both trading and net profits. The profit on trading, dividends on investments, etc., was £238,056, compared with £276,249 in 1939. With the balance brought forward of £167,802, there was available £405,854. Of that £50,388 was applied to depreciation of fixed assets, and after providing for directors' fees and for dividends already paid during 1940 on preference and ordinary capital, there was left £317,466, compared with £327,818 in 1939. They proposed to transfer £40,000 to "War Contingencies and Taxation Reserve," and recommended a further dividend of 7 per cent. on the ordinary stock, making 10 per cent. for the year, and also a cash bonus of 2½ per cent; and a dividend of 10 per cent with a cash bonus of 2½ per cent on the deferred stock and shares. There would then remain to be carried forward £167,422.

Much had been said and written regarding E.P.T., and it was hoped that the Chancellor of the Exchequer would find it possible to announce some welcome amendments. The wide spread feeling which the Press of recent date had exhibited against a 100 per cent tax revealed many thoughtful suggestions, all calculated to assist the Chancellor, both now and in the future, when industry must be strong enough to shoulder continued heavy burdens.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended March 22nd, 1941, total ordinary revenue was £39,447,000, against ordinary expenditure of £102,646,000 and issues to sinking funds of £145,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £2,382,401,000 against £718,498,000 (including defence loan issues) for the corresponding period a year ago.

* Government debt is £11,015,100; capital, £14,553,000. † Fiduciary issue raised from £380 millions to £630 million on June 11, 1940.

(Continued from page 422)

will be hired out by the Ministry of Supply on a variety of terms. Prices to the grower per ton will vary according to grade from £6 to £11 and the Ministry of Supply will be the purchaser.

Vegetable Oils and Oilseeds.—Imports of oilseeds are adequate to enable mills to continue the production of oils and cake. The Control has taken moderate quantities of Bombay linseed and substantial quantities of Indian ground nuts, and is inviting offers of more of the latter. Shipment of old crop Argentine linseed continues to be slow, but operations for sowing the new crop are proceeding under favourable weather and soil conditions. United States farmers have reported their intention to put under linseed 3,341,000 acres, an increase of 17 per cent compared with that proposed last spring. Some 3,228,000 acres were actually harvested last season, yielding 778,000 tons. The second estimate of the linseed crop in India is 2,907,000 acres compared with the final estimate of 3,083,000 acres for last season. The coupon rationing scheme of oilcakes and meals for cattle is in operation, but the stupendous task of assessment and distribution of coupons has proved adverse to smooth working and delays are frequent.

The Duce has even more serious reasons for hesitation. Italy, even more than Germany, is Yugoslavia's immediate enemy. If Germany were to launch an invasion, the Yugoslavs would hardly resist the temptation of driving the hard-pressed Italians in Albania into the sea. It is therefore not surprising that there are rumours from Rome of Italian "mediation." Italy is, however, in much the same position as Yugoslavia. Nothing the Duce does now can really affect the German decision. It is even arguable that in pure exasperation at Italy's ineptitude the Germans would be prepared to pass over the threat to the isolated Italian armies in Albania.

The decision rests with Berlin, and there is evidence that they do not find it easy to reach one. The week's uncertainties have been covered by a smoke screen of propaganda, designed to test the metal of the Simovitch Ministry and to prepare German public opinion for a new enemy if invasion should prove to be the outcome. The old atrocity stories—with the adjective Yugoslav substituted for Czech or Pole—have been pulled out of Dr Goebbels' bottom drawer. More ominous is the quiet departure of German and Italian officials and reports that the documents at the German Legation have been destroyed. The evidence, on the whole, suggests that Germany has decided on war, but is still uncertain over the timing of invasion. The victory at Matapan by which Britain's communications between Egypt and the Balkans have been secured is still creating an unfavourable psychological background for aggressive action. The Germans may wish to wait until they have put an end—if they can—to the sequence of Axis reverses.

While Germany still hesitates, it is fortunate that British diplomacy is so strongly and actively represented in the actual war zone. Mr Eden's Near Eastern journey has already been singularly fruitful. Now he has the chance to increase Germany's discomfiture

still further. In this context the attitude of Turkey will possibly be decisive. Ever since Italy's entry into the war the Turks have seen hostilities creep closer and closer to their "zone of security." They have not been intimidated by the growing danger, but their's has been a passive courage of holding firm rather than an active intention to avert further disaster. With the Germans in Bulgaria, Turkey's own frontiers are on the verge of war, and it is at the eleventh hour that the Yugoslav *coup d'état* has recreated the possibility of collective defence.

Hitherto Russia's attitude has had an inhibiting effect upon Turkish diplomacy. Now, however, Russia has given Turkey a guarantee that it will not add to Turkey's embarrassment if the country is involved in a war in defence of its territory, and the Turks can interpret this as a reasonable assurance that a collective move of Balkan defence will be included by Russia in the category of "defensive war." That Germany is perturbed by Russia's attitude is illustrated by the spate of

rumours which have been flowing from Axis sources in the last week. All the reports point in the same direction—to an imminent German onslaught on Russia—and they suggest that Germany is trying to frighten the Soviets back into their old rôle *vis-à-vis* Turkey.

The task before British diplomacy is obvious. It is to ensure that wherever the Germans decide to strike—against Yugoslavia or Greece or Turkey—the attack on one shall be regarded as an attack on all. The Turks' greatest temptation—to hold aloof should the first German attack be launched against Salonika or Croatia—must be countered by firm diplomacy on Mr Eden's part. If the Turks proved to be the first victims, they would expect co-operation from Britain and Greece. They must be reminded that the only basis for such a hope is a reasonable Turkish *quid pro quo*.

The Future of Politics

MINISTERS of all parties are now agreed that they should remain in office for at least three years after the war. Three years, it is argued, will be necessary for reconstruction, which should be a matter for agreement between the parties and not for faction; and this general premise is backed by a triple salvo of arguments. It is claimed, first, that party politics would be no more relevant or effective in the post-war emergency than they would be in the war itself; secondly, that the post-armistice election of 1918 was a disaster because the electors' choice was too confused by the proximity of the war and its revolutionary aftermath in other countries; and, thirdly, that a deliberate return to the "petty and frustrated" political manoeuvring of the decade before the war would be an unpardonable surrender of the present national unity.

The Government's point of view can easily be understood. No leader in modern times has held the nation's confidence as Mr Churchill does; the formation of his Cabinet last spring broke a deadlock which had dammed the course of British politics all through the MacDonald-Baldwin-Chamberlain era. Moreover, the experience of winning one war but losing

the peace is still too fresh for conflict and drift to be lightly risked again when this war is over. Agreement on the first stages of reconstruction will be indispensable. Nevertheless, there are dangers in this unanimity of opinion among Ministers about their future. For one thing, it is a poor argument to say that because war must be fought without parties, reconstruction must be party-less, too. Reconstruction is not a matter of a single struggle and a final victory; its term is not 3 years but 33 and more; and the character and composition of all the governments of the next decades will be as important to the community as the make-up of the one which draws up the treaties and mobilises the peace effort.

Indeed, the men who keep the peace will have an even more crucial task than those who make it—that is the lesson of 1918-39—and the real question to be answered when the fighting stops is not what post-war government will enable the immediately with the least disturbance, but what system of political practice will ensure that all the successive governments of the new peace know and apply the real wishes of the majority of the people. War is a

single-ended, ultra-technical, and irrational business; how it is to be won must be the exclusive affair of a trusted Cabinet. Peace is a matter of choice between different paths; and the choice must be made by the people themselves.

The other arguments are no more sound. The election of 1918, which is being made the chief bogey, is no precedent. Unwisely, it was held 5 weeks after the armistice, before the war had ended. There was a red and green tide of revolt against established institutions flowing over most of Europe; and Bolshevism was in spate in Russia. It is true that, in these conditions, unreasoning fears and still warmer hatreds probably played too large a part on the hustings and at the polls. But it is worth noting that the vengeful demands of the "hard-faced business men" who were elected accord better, in the present view of some of the very people who are now using that election as a reason for extending the life of the present Parliament, with the way in which a militant Germany should be treated than the more generous attitude that might have been adopted by, say, 1914 Liberals would. In any case, to protest against the next election being delayed until 3 years after the war is not to say that the people should go to the polls 3 or 5 weeks after the armistice. Until the men and women have come back from the war, from the forces, and from the factories, the nation will not be ready.

Finally, there is the argument from the unhappy experience of the 'thirties. Party politics were petty then because they were frustrated, indecisive because they never sought a decision on the real issues of current government; and the immediate future of the present Parliament and the present Government is important precisely because the whole future of party politics is involved. Before the war, the cleavage between the parties had become unreal. Ostensibly, it was Conservatism *v.* Socialism. Actually, this was never an issue. The Labour Party had no real wish to be Socialist in more than voice, and no practical inclination therefore to be subjected to the test of government. Like the Conservatives, its personnel was in fact split across by the deep crosscut of the division between the narrow sectionalism of the trade unions—which was akin and parallel to the sectionalism of the Tory business men whose shortsight dominated the counsels of the Baldwin and Chamberlain Governments—and the broader aspirations of the few among its progressive members who preferred the interests of the community at large to the interests of a section or the "ideology" of a sect.

This was the real issue. It is the gulf between the "Particularism" of business men, industrialists, farmers and trade unionists, and the "Community" of the younger National Conservatives who followed Mr Churchill against Mr Chamberlain, of an able handful of Liberals, of Labour men with broad minds, and of thoughtful men of no party at all. It is this sturdy preference for the community and the consumer, against the separate interests and privileges of producers, distributors and cliques that bridges the best elements of all parties. The strength of the bridge is the welfare and independence of the individual citizen, not the mass or the lump. It is inevitable that the post-war state should be more interventionist than ever before. But it must intervene to free the citizen, not to protect the clique or *claque*. It is Particularism *v.* the Commonwealth that is the question; and the crime of the parties before the war was that, with Particularism in charge on both sides, every answer but one was suffocated.

It has been well-tested doctrine at least since Burke that it is faction not party that offends the national interest. The plea for the Commonwealth is based on tradition and not on restlessness or revolt. It is not enough to say that the country must have an unopposed administration to carry through an agreed programme of reconstruction. The most important point is what kind of reconstruction; and many people

who would follow Churchill to the death in war would not unreservedly trust Churchill *cum* Attlee, Greenwood, the FBI and the TUC to lead them to a freer and fairer life in peace. It is the people who must choose; they cannot make their choice until a new alignment of parties gives them the chance to discuss and decide upon the alternatives of Particularism and the Commonwealth; and any agreed programme between the present Ministers and their party followings must tend to burke this discussion and blur this clear-cut choice.

The central issue in reconstruction is the basis on which the State is to be organised. Will industry be organised in such a way as to produce the maximum of profits and wages for its staffs or so as to produce the maximum of goods and services for the community? Will trade be organised so as to produce the maximum of protection for its vested interests or so as to furnish the greatest possible flow of goods for consumption? Will education and social welfare be organised as a charitable excrescence on the community's activities, marking off clique from clique, or as the means of providing the community with the maximum of able, enterprising and healthy leaders and citizens? These questions must be answered before any rebuilt Britain can surely stand. And before they can be answered they must be posed and discussed. They must be put clearly before the people as the paramount issues and they must pass through the mill of popular and political debate. The function of parties is to pick the right agenda and to state the rival cases; and for a generation they have failed to do this. The questions are not new; the need to answer them has stimulated the advance of Parliamentary democracy since Disraeli conceived his Young England and *The Economist* was founded as an Anti-Corn Law newspaper—a rôle in which, by mischance, it may find itself again at its centenary two years from now. The present parties, singly or in "sacred unity," will inevitably let the answers go the worst way by default.

To state the problem is not to solve it. An election 3 weeks, 3 months, or 3 years after the armistice would be run with these parties and by their powerful machines. An early election would be a coupon affair returning a majority of supporters of the present deadlock. What difference would it make? Very little immediate difference, perhaps, in either men or measures. But it might begin the process of restoring politics to life and health. It might start the reformation of ideas and policies and the reshaping of party lines. It might begin the weeding and rejuvenation of Parliament's membership. It might steadily bring to the light of discussion and criticism the real issues that are at stake; and it might produce a Parliament in a decade or two, or less, which could carry on a decade of reconstruction worthily. It would be an act of faith—faith in the British instinct for political wisdom and in the capacity of the people, not only to choose the way, but also to produce leaders at present unseen.

To lay down now that the present unreal parties, in fortuitous alliance, and the present over-age Parliament shall in any event remain undisturbed for 3 years after the war is really an act of cowardice. At least it shows little faith. The House of Commons is 5½ years old. At the end of the war it may be 7 or 8; at the end of the Three Year Plan it may be 10 years of age or more. It will be ossified and discredited. Democracy cannot be rejuvenated by a new Rump. No one knows what conditions at home and abroad will be when the war ends; and it would be as foolish to fix an early date for the first election as a late one. But it should be realised that lateness will not be a virtue; and, on the other side, that the sooner the traditional modes of British politics are restored to convalescence, the greater will be the chances of that dynamic revival of British democracy upon which the quality of reconstruction will depend and for which, only half-articulately, the bulk of the British people are already looking.

Methods of Concentration

THE policy of concentrating the output of restricted industries into the smallest possible number of plants, so as to release the maximum possible quantity of man-power, machinery and factory space, has received a very general welcome both in the country and in last week's debate in the House of Commons. The practical problems raised by it are admittedly numerous and difficult; but it is accepted that the civil section of the national economy must be compressed by every possible means if the fullest resources are to be put into the winning of the war. There was a refreshing willingness in the debate to take the principle for accepted and to discuss the methods of its application.

The President of the Board of Trade has been slow in realising—or at least in emphasising in public statements—that the community has a strong interest in the methods by which concentration is achieved as well as in the fact of its achievement. The tenor of his original announcement was that the initiative and the choice of methods would be left to the discretion of industries, who might have been forgiven if they assumed that it was only in the event of their failure to agree among themselves that the Board would intervene to use its mandatory powers. This was clearly a false position: no community can remain indifferent to the methods by which its industries are organised, and Captain Lyttelton was very well advised to correct the impression that had been created. The Board of Trade would be assuming too heavy a burden of detailed work if it were to indicate to each industry just how it should concentrate itself. But it can, and should, lay down certain general directions about the methods that should be followed and those that, in the public interest, should be avoided.

The details of technique and structure vary widely from industry to industry. But in spite of the manifold possibilities of detailed variation there are only five main types of method by which concentration can be effected. The first is the *merger*; that is, the permanent concentration both of ownership and production. This could be effected either by the nucleus firm or firms buying the business of the closed-down firms or by the creation of a holding company to unite the ownership of all plants in the industry. In either case, the distinction between nucleus firms and closed-down firms would disappear; there would only be one or more nucleus firms, owning a number of plants, of which some would be working and some closed down. The second method is that of *levy and compensation*. By this method the selected nucleus firms would take the whole available trade and make such profit out of it as they could. A predetermined levy would be imposed upon them in order to raise funds for paying fixed compensation to those firms that stay out of business. The nucleus firms would have no obligation other than the payment of the levy towards the closed-down firms, and the closed-down firms would have no right other than the receipt of compensation to share in the fortunes of the industry. The third method, that of *transfer of quotas*, is a variant of the second. By this method, a quota of production would be fixed for every firm in order to ensure it its pre-war proportion of any business that is permitted. (This has already been done in a very large number of industries.) The nucleus firms would then purchase the quotas of those which are to close down. The main difference between this and the second method would be that greater scope would be allowed for individual bargaining.

The fourth method may be described as that of *pooling*. By this method all the firms in an industry join in a pool to operate the nucleus plant. For example, a company might be formed in which all the firms in the industry would hold shares in proportion

to their pre-war standing in the industry; the nucleus plant would then be leased by its owners to the new company, or operated at cost for the account of the new company, which would thus receive, and distribute to its members, all the profits of the industry. (In current discussion, this device has been referred to as that of the holding company. But the description is misleading, since a holding company is a device by which ownership and control can be concentrated while operation remains scattered; what is here described is the exact opposite, a concentration of operation while the financial interest in the profits earned and, to some extent, the power of control, remain dispersed.) This form of organisation would clearly be particularly suitable for an industry in which trade marks and brands are of importance. It would obviously be unfair if the nucleus firm were allowed to produce its own brands while others disappeared; a pooling scheme makes it possible for all peacetime brands to disappear simultaneously. Finally, the fifth method is that of the *agency agreement*, by which the nucleus firm produces the articles as the agent of the closed-down firms, which buy them at cost and sell them to the public through their accustomed channels. The "closed-down" firms, by this method, remain in commercial being, and only the physical production is concentrated.

What is the public interest at stake in the choice between these methods? The ends that the Government should seek are that as little damage as possible should be done to the peacetime efficiency of the industries affected, and that, so far as possible, no one engaged in an industry should be permanently prejudiced by the sacrifices he is now called upon to make for the community. Both these ends will be served if, in drawing up schemes of concentration, paramount attention is paid to the possibility of unscrambling the omelette after the war. Reversibility should be the watchword. Discussion tends to be prejudiced by the fact that the wartime process of concentration resembles the peacetime process of sterilising surplus capacity. But the resemblance is deceptive. These are not depressed industries in peacetime; on the contrary, they—the makers of luxuries and semi-luxuries for the home consumer—are one of the most prosperous and most rapidly expanding sectors of the national economy. The bonds that compel their contraction in time of war should be such as can be instantly snapped when men and materials are once more available. It would be a disaster if wartime concentration were to leave any legacy of peacetime restrictionism. Moreover, these industries, as the President of the Board of Trade pointed out, do not normally lend themselves to production in large units. Concentration may be possible in wartime when brands can be pooled and the consumer's choice can be limited; but in peacetime variety and competition are the essence of a consumers' goods industry. The position of the small firm is also much more likely to be safeguarded—and it is much more likely to assent to schemes of wartime concentration which must necessarily tend to favour the larger units—if there is a reasonable assurance of complete and speedy return to the *status quo ante*. The object must therefore be to change as little as possible the structure of the industry, to keep as many firms as possible in commercial and financial activity, even if their production is concentrated, to look with disfavour on any arrangement that cuts firms off from their sales outlets, from current knowledge of the trade or from interest in its profits, to frown on any plan that creates, however temporarily, a class of industrial *rentiers*.

Judged by these principles—which are, broadly, those that the President of the Board of Trade laid

down in last week's debate—it is easy to see that the order in which the five varieties of method have been arranged above is an ascending order of desirability. The agency agreement is the best of all methods from the point of view of the community, with the pooling scheme second. The transferable quota method has the disadvantage that it tends to exclude closed-down firms from any but a rather indirect connection with the course of trade and profits; but it is, of all methods, the easiest to arrange, and for that reason may be considered to be admissible. The levy and compensation method is not to be desired, especially when the burden of the levy would fall on the consumer, and it should be conceded only in exceptional cases, such as industries where there is reason to suspect a permanent excess of capacity. The permanent merger should never be considered a satisfactory method of achieving temporary concentration. It is a great advance from the preliminary announcement to know not only that the Board of Trade accepts this order of preference but also that the Board is giving "very close direction as to the lines on which industry should proceed." The structure of British industry for decades to come will inevitably be affected by the ways in which concentration is now achieved, and it will be well worth while to take additional care over the methods of concentration now if by so doing dangers for the future can be avoided.

One of these dangers is that comprehensively known as "monopoly"—perhaps too comprehensively, since there seems to have been some misunderstanding in the House of Commons about the exact nature of the danger. Captain Lyttelton was able, without much difficulty, to show that so long as the schemes of concentration are reversible, there is no danger of a single firm being found after the war in sole control of an industry. That is true; but it does not exactly meet the point. The single large monopolistic firm—such as

Unilever or ICI—has its dangers; but at least those who are in control cannot evade their social obligations, nor are they prevented from pursuing a dynamic and progressive policy. The greater danger lies in the growing influence of what the common law knows (and used to condemn) as "agreements in restraint of trade" which, without securing whatever technical economies there may be in large-scale production, stifle the progressive elements in an industry, hamstringing competition and, under the plea of seeking "protection" and "security" give stability preference over progress. This tendency is already far too strong in British industry, and it is inevitable that any demonstration of the feasibility of "agreements in concentration of trade" during the war should increase the tendency towards "agreements in restraint of trade" after the war is over. It is difficult to see what precautions can be taken on this point at present; it is inherent in any policy of concentration. But it increases the urgency of placing the whole question of freedom v. combination in British industry on the agenda for post-war reconstruction. That minds are stirring in this direction was shown in the course of the debate by Sir George Schuster, who urged that "those who are engaged in private business should take a wider conception of the public duties which are put upon them in carrying out their activities." Very surprisingly, however, Sir George went on to maintain that this social conscience would be developed if a wider scope were given to Chambers of Commerce and trade associations. It is possible to agree entirely with Sir George's aspiration while remaining obstinately cynical about the means he suggests for carrying it out. But whatever the means of attaining a proper balance between individual freedom and social order in the sphere of industry, the problem is one of the most urgent that will face the country after the war. It should be constantly borne in mind in devising schemes of wartime concentration.

Before the Budget

THE financial year 1940-41 has closed without any last-minute surprises. The revenue was slightly larger than either the estimates or the yield that seemed probable three months ago, while expenditure continued at the high level reached after the New Year. The figures will be found on page 469 and in the tables of the vestigial Budget Supplement that is printed on the next three pages. The total expenditure of £3,867 millions was almost exactly £400 millions more than Sir Kingsley Wood's estimate in his Supplementary Budget of last July, and £1,200 millions more than Lord Simon's estimate last April. (It may be worth recording that *The Economist's* guess of last July was within £140 millions, or about 3½ per cent, of the eventual figure.) The rate of expenditure has been steadily rising over the financial year; the figures for the four quarters, expressed as an annual and also as a daily rate (and adjusted for the slight variation in the length of the quarter and for the uneven incidence of debt expenditure), are as follows:—

April-June, 1940...	£2,706 millions p.a. or £7.4 millions per diem
July-Sept., 1940...	£3,718 " " £10.2 " " "
October-Dec., 1940	£4,261 " " £11.7 " " "
January-Mar., 1941	£4,860 " " £13.3 " " "

The biggest increase, it will be noticed, came between the first and second quarters; thereafter the rate of increase has been very steady, in spite of any slackening that may have been imposed on expenditure in North America by the approaching exhaustion of the dollar reserves.

A number of the revenue items make interesting comparisons with the estimates. Thus income tax is £18 millions more than was expected, while surtax is nearly £6 millions below the estimate. A similar divergence is shown by Customs and Excise, the former

being £4 millions below the estimate and the latter £11 millions above. Purchase tax is included in the Excise figure, and it is to be hoped that the Chancellor will reveal how much it has produced in this first trial period. The tenacity of the car-driving habit continues to surprise the authorities, and motor vehicle duties have brought in £3 millions more than the estimate and £4 millions more than last year. NDC and EPT between them have also exceeded the expectation by a handsome margin.

The eventual deficit was £2,458 millions. This amount, together with sinking fund payments, repayments of debt and miscellaneous issues—a total of £2,684 millions—was financed by the issue of £1,320 millions of debt to the public in War Loan, Savings Certificates, etc., by an increase of £1,329 millions in floating debt (including Treasury deposits) and by the creation of a net amount of £85 millions of "other debt."

The problem of moving forward from the completed returns for the past year to estimates for the coming year is made more than usually difficult, not only by the uncertainties of physical output and monetary value, but also by the accounting problem resulting from the Lease-and-Lend Act. British Exchequer returns have always been strictly cash accounts—that is, they are records of cash received and expended, and since the receipt of leased-and-lent munitions involves no cash payment, the most natural method of treatment would be to make no mention of them in the Budgetary accounts. This is the course of action on which the Chancellor of the Exchequer has most probably decided. But a liability is accumulating against the United Kingdom in the books of the United States

(Continued on p. 441)

BUDGET FIGURES

It has been the custom of The Economist for many years to collect together, shortly before the Budget is presented to Parliament, facts and figures relating to the national finances. This year paper rationing has compelled severe cuts in the explanatory matter. Most of the tables, however, which have appeared in former years are given below, although in some cases they cannot be completed owing either to the secrecy surrounding most of the expenditure items or to the delay in publishing some of the sources of the figures.

Revenue

TABLE 1.—REVENUE (EXCHEQUER RECEIPTS)
(£ millions)

	1913-14	1929-30	1937-38	1938-39	1939-40	1940-41

Heavy oil (road fuel)	...	69.8	92.1

* 1928-29. † Quantities produced, including waste.

TABLE 4.—CUSTOMS AND EXCISE DUTIES—NET RECEIPTS

Details of the yield of customs and excise duties in 1939-40 are given in the following table. The tax changes, which account for the increase in the spirits, beer, wine,

sugar, and tobacco revenue, were given in last year's Budget Supplement, published in *The Economist* of April 13, 1940. In April, 1939, the duty for "living" entertainments was reduced, which, together with the effects of the war, accounts for the smaller yield in 1939-40. In July, 1940, however, the scale of duties for all entertainments was raised; this was estimated to increase the yield to £9 millions in 1940-41 and £11,200,000 in a full year.

(£ thousands)

	1913-14	1929-30	1936-37	1937-38	1938-39	1939-40

* Motor spirit duty, repealed 1921. † Including British wine, table waters, cider and perry, coffee and chicory, dried or preserved fruits, railway passenger duty, patent medicines, other licences, and miscellaneous. ‡ Safeguarding abnormal importations, hops, and (1936-37) onwards beef and veal.

TABLE 5.—INCOME TAX RATE AND ALLOWANCES

	Years ended March 31			
	1938	1939	1940	1941
Standard rate in £	5s. 6d.	5s. 6d.	7s. 6d.*	8s. 6d.*
Personal allowance: Single	£100	£100	£100	£100
Married	£180	£180	£180	£170
Each child	£60	£60	£60	£50
Earned income allowance: Proportion	1/5th	1/5th	1/5th	1/6th
Maximum allowance	£300	£300	£300	£250
Fraction of standard rate charged on first part of taxable income	1/3rd on £135	10/33rds on £135	1/3rd on £135	10/17ths† on £165

* In September, 1939, standard rate raised from 5s. 6d. to 7s. 6d. for 1939-40 and to 8s. 6d. for 1940-41; in July, 1940, standard rate raised to 8s. 6d. for 1940-41.

† In September, 1939, the reduced rate of tax raised from one-third to one-half of standard rate for 1940-41; in July, 1940, the reduced rate raised to 5s.

TABLE 6.—INCOME TAX AND SURTAX

This table shows the amount of tax actually payable by specimen incomes. It compares the amounts payable since the changes in income tax and surtax made in the Budget of last July with the amounts in force on the outbreak of war. The table does not take into account further reliefs, such as for life assurance premiums, to which the taxpayer may be entitled.

Total Actual Income •	1939-40†: Standard 5s. 6d.				1940-41: Standard 8s. 6d.			
	Single	Married		Single	Married			
		No child	3 children		No child	3 children

TABLE 9.—DEFENCE EXPENDITURE (INCLUDING ISSUES FROM LOANS)

Supply expenditure for 1940-41 has not been allocated among the different services, and it is not, therefore, possible to give the exact total spent on defence. Table 10, however, gives the net estimates for purely civil expenditure in 1940-41, civil defence and the war services of civil departments being excluded. Subtracting the total from the supply expenditure leaves, therefore, a figure for war expenditure in the neighbourhood of 3,200 millions.

	(£ millions)

TABLE 10.—CIVIL AND REVENUE DEPARTMENTS NET EXPENDITURE† EXCLUDING CIVIL DEFENCE

This table gives estimates of purely civil expenditure for 1940-41 and 1941-42, compared with the amounts actually spent in the two previous years. The chief change in the estimates compared with the amounts spent is in the pensions item. This is due to the taking over by the State from the public assistance authorities of the responsibility for supplementary pensions to needy

pensioners. The change came into force last August. The fall in unemployment is responsible for the only other big change, which is in the reduction in the estimate for unemployment assistance in 1941-42.

TABLE 12.—THE COST OF SOCIAL SERVICES

The latest available figures for expenditure on public social services by central and local authorities appeared in *Hansard* of February 5th, from which the following table has been compiled. The expenditure figures include payments out of taxes and rates, and also contributions by the persons benefiting in the case of the contributory schemes. Many persons shown in the second column as receiving benefits do so under two or more of the Acts mentioned in the first column and are, therefore, accounted for more than once.

Service	Great Britain		Total number of persons directly benefiting from the expenditure	
	1937-38	1938-39	1937-38	1938-39
Unemployment Insurance and Assistance Acts:—	£'000	£'000

* Numbers given are of insured persons. † Calendar years 1938 and 1939 respectively. (a) Including agricultural scheme. (b) Including Contributory Pensions Acts. (c) Relating to hospitals and to treatment of diseases, and to maternity and child welfare work and midwives. (d) i.e. Physical Training and Recreation Act, Approved Schools Act, and Lunacy and Mental Deficiency Acts.

TABLE 13.—FINANCING EXPENDITURE

The following table gives a summary of the Exchequer returns for the financial year 1940-41, and shows the respective shares of revenue and borrowing in meeting the total expenditure. It will be noted that the difference, amounting to £2,684 millions, between ordinary revenue on the one hand, and total expenditure (including sinking funds and repayment of debt) and miscellaneous issues, etc., on the other, was met as to £1,320 millions by borrowing from the public, £1,329 millions by borrowing from the money market, and £35 millions by "other debt."

(£'000)		(£'000)

TABLE 15.—NET INDEBTEDNESS OF THE STATE

This table gives the net total of the internal debt after allowing for the accrued interest on national savings certificates, which is not included in the figure of principal given in the previous table, and after deducting Exchequer balances at the Banks of England and Ireland at the end of the financial year and the State's estimated assets. The largest single item of the latter total is the £575 millions of the Exchange Equalisation Account; it also includes the Suez Canal shares (£32 millions); India and Burma—outstanding liability for 5 per cent War Loan (£16.7 millions); Land Settlement loans outstanding (£13 millions); issues to Czechoslovakia (£6 millions); and other items.

(Continued from page 437)

Treasury for munitions thus transferred, and though the liability is not to be discharged in money, it is valued in money. A very strict accountant might argue that the proper course for the Chancellor to pursue would be to enter on the expenditure side of his accounts a suspense fund to which could be paid the sterling equivalent of the dollar items entered in Washington. By this means the full cost of the war would appear in the British Budget, even though part of it was only a contingent liability.

The choice between these two methods will make a very big difference to the expenditure estimates that the Chancellor makes next week. The difference is not, however, likely to be as much as the £1,750 millions that Congress has just appropriated. An American appropriation is something very different from a British estimate; the probability is that the £1,750 millions includes items of a capital nature that would not be charged up to Great Britain; other nations share in the benefits of the Act; and the appropriation is for a period of fifteen months at least. It will not be legitimate to take the Chancellor's estimate for expenditure at home, to add £1,750 millions on to this and proclaim the total as the measure of the armaments to be available in twelve months.

The figure that the Chancellor puts on the total of expenditure, other than leased-and-lent munitions, will determine the nature of the Budget. Total expenditure in the last three months has been at the rate of over £4,800 millions; in the first three weeks of March (excluding the heavy payments in the last days of the year) it was running at the rate of over £5,300 millions. How much of these figures represented the purchase of goods that will now come under Lease-and-Lend arrangements it is, of course, impossible for the outsider to say, but a rate of £800 millions a year would seem to be a very generous estimate for British expenditure in the United States in the three months just elapsed. If so, the current rate of expenditure *ex* Lease-and-Lend—that is, the probable basis of next year's expenditure figures—can hardly be put much below £4,000 millions. How much of an increase above the current rate must be allowed for the whole of the year just beginning is another matter on which the layman has little guidance to help him; but the figure of £4,500 millions for 1941-42 which has already appeared in *The Economist* begins to look like the reverse of an over-statement. It has been the consistent policy both of Lord Simon and of Sir Kingsley Wood to underestimate the probable expenditure, and the Chancellor may well choose to plan his Budget on a lower figure.

But by this time the House of Commons and the public have learned to add several hundreds of millions to any Budget estimate of expenditure.

The other controversial figure that dominates current discussion will not appear in the Budget accounts at all. This is the so-called "gap," the excess of expenditure over the sum of revenue, drafts on external capital and "genuine" domestic savings. If expenditure is £4,500 millions and revenue, on the basis of the existing taxes, is £1,700 millions at most (a very generous figure), the deficit will be £2,800 millions. It has been suggested in *The Economist* that, in this case, the "gap" may be as much as £1,600 to £1,800 millions. The Lord Chancellor has already indicated that the Treasury considers this figure to be too high, but that there is a "gap" of some size can hardly be denied, nor can the duty of closing it as far as possible be evaded. This is the justification for the changes in taxation that the Chancellor is expected to announce. The extension of surtax to cover all incomes over £1,500—instead of the present limit of £2,000—which was provided for twelve months ago will come into force in the course of the year. Some change in EPT, in answer to the striking unanimity of dislike for the present arrangements (which are criticised in detail in an article on page 450), is also a fairly safe prophecy. Beyond that, all is guess-work—until next week. It has been suggested in these columns that the two best means of raising substantial sums would be an Excise duty on services and a new flat-rate tax on all but the smallest incomes, but if the Chancellor has been thinking along these lines, no hint of it has leaked out. These would be attempts to bring in sums to be measured in nine figures; but there is a very wide range of smaller items from which the Chancellor may make his choice. The stamp duties have not been touched for some years. There is a case—strong at any time, but stronger than ever at present—for a duty on advertisements. The private motorist could pay more for his petrol—though the motor transport industry hardly could. Some of the Customs and Excise duties could bear still further increases. And—if the Chancellor rejects the proposal of a reformed income tax designed to fall more heavily on the middle incomes which now bear the lightest burden—there is always the possibility of an increase in the standard rate of income tax. Wherever his choice may light, it is to be hoped that the Chancellor will not stay his hand because of any lingering doubt whether heavier tax burdens would be accepted. No War Budget yet has come up to the taxpayer's apprehensions—or his willingness to pay.

NOTES OF THE WEEK

Victory in the Mediterranean

Mr. Matsuoka's Axis visits have been fantastically ill-timed. He left Hitler and his Balkan "new order" in sorry disarray in Berlin and arrived in Rome in time to learn of the Duce's disasters in *mare nostrum*. The chronicle of Italy's defeats is losing any element of novelty, but the extent of the latest disaster—the destruction off Cape Matapan of four cruisers and three destroyers and severe damage to a battleship, two more cruisers and a destroyer, without casualty or scratch inflicted on Admiral Cunningham's forces and with the loss of only one aircraft—distinguishes it even from Taranto. It is as total a defeat as has yet been inflicted in this total war. The success of British aircraft against the *Vittorio Veneto*, Italy's most modern 35,000-ton battleship, may be held to confirm Italy's confident thesis that aircraft have revolutionised modern naval warfare. However, the contest was not sufficiently balanced to draw absolute conclusions. The Italians did not intend to give fight. To that extent, the action was not a full-dress naval engagement. Yet one factor does emerge. No modern fleet can avoid courting disaster if it lacks an air arm. Aircraft carriers may be cumbersome and offer an easy target, but their planes play an essential part in locating the position of enemy forces. Italy's whole strategy—admittedly one of flight—was nullified by her ignorance of the position of the British fleet. At the same time, the British fleet air arm was able to achieve a neat piece of co-ordination by reducing the *Vittorio Veneto*'s escaping speed from 30 to 15 knots, and thus enabling the British fleet to catch up with the crippled battleship and its attendant cruisers and destroyers. Their fate within short range of the heavy guns of the three British battleships was a tragic commentary on the Fascist dream of empire. With one volley, millions of lire extorted from an impoverished people went blazing to the bottom. And with their savings went their sons—"not," in Admiral Cunningham's words, "a very pleasant spectacle."

* * *

After Matapan

In estimating the consequences of the battle of Matapan it is important to remember that the whole Italian fleet has *not* been destroyed. If the recorded losses are set against the Italian fleet of June, 1940, probably 112 destroyers and motor torpedo boats, 4 large cruisers mounting 8-in guns, 10 smaller cruisers with 6-in guns and 92 submarines are still intact. Two battleships of the Cavour class probably remain in action, while two have been heavily damaged. The fate of the modern Littorio 35,000 tons class is uncertain. In this class, two were unfinished in May, 1940, and it is not known whether they are in service yet. One was torpedoed at Taranto and probably disabled. The *Swordfish* aircraft torpedoed another on November 27th and the *Vittorio Veneto* was crippled at Matapan, but either the *Veneto* or a sister ship may have been attacked twice, and a remaining four in this class is therefore an uncertain estimate. Numbers, however, are no guide to the offensive spirit of the Italian Navy. The Italians themselves probably do not want to fight, but the possibility that Germany is preparing to play a direct part is suggested by the presence of German officers and engineers among the survivors of Matapan. But whether or not Germany chooses to take over the Italian fleet, Great Britain's superiority is established, the lines of communication with Greece are assured and Sir Andrew Cunningham has units to spare for other duties. At the other end of the Mediterranean, Admiral Darlan has chosen to challenge the British blockade with the fire of his shore batteries. The wish to call Vichy's bluff can, since Matapan, be matched by the ability to do so. The chaotic distribution of the French fleet—with some units operating with the British, and others disabled at Oran and Dakar, still others immobilised at Alexandria and Martinique—makes a calculation of Admiral Darlan's effective strength in the Mediterranean impossible. But even the most favourable interpretation does not suggest a force sufficient to challenge the weight and experience of Admiral Cunningham's forces.

The Atlantic Struggle

In the week ended March 23rd, 59,141 tons of British, Allied and neutral shipping were sunk by enemy action. It was widely believed that the German spring offensive started late in February when, in the week ended March 2nd, 141,000 tons were lost, and it has been a relief that sinkings have since remained well below that figure. The totals announced each week are, of course, provisional, and may be revised up or down. The fate of many ships may not be known until they are long overdue in port, or until attempts to salvage or repair them have failed; other ships may turn up after they have been written off as lost. The following table shows the original announcements and subsequent amendments since the beginning of the year:—

Week ended	Original Figure 000 gross tons	After Subsequent Amendments 000 gross tons	Week ended	Original Figure 000 gross tons	After Subsequent Amendments 000 gross tons
Jan. 5	15	15	Feb. 16	38	54
" 12	30	30	" 23	61	69
" 19	58	120	Mar. 2	148	141
" 26	34	34	" 9	99	99
Feb. 2	57	80	" 16	72	95
" 9	30	33	" 23	59	...

The most important revisions have been upwards; the weeks of January 19th, February 2nd and March 16th are striking examples. Not a few ships are damaged, but not sunk. Mr. Bevin has appealed for a speed-up of 30 per cent in ship repairing. A ship damaged is not a ship lost; but it is a ship out of action for some time; and if it does not make a home port, it is a cargo undelivered. It can still be said that the rate of loss shows no sign of a "break-through" by the enemy. Nevertheless it is gravely high, and cannot go on undiminished without serious hindrance to the war effort—quite apart from the loss of actual tonnage. It is the flow of imports that counts, and it would be a pity, perhaps, if the welcome news of measures to supplement the total tonnage available were to obscure the fact that the criterion of success or failure in the Battle of the Atlantic is the arrival, week by week, of ships and cargoes.

Sunday Theatres

Only one of the many Orders issued under the Emergency Powers (Defence) Acts can fairly be said to have aimed at an increase in the liberties of the subject. And this is the only one that has been annulled by an adverse vote of the House of Commons. This was the remarkable result of the vote taken on Tuesday on the question of the opening of theatres and music-halls on Sundays. The Home Secretary's Order might have been considered harmless enough; it merely empowered local authorities, if they saw fit, to license theatres to open on Sundays and simplified the procedure for opening cinemas. If the Government believed, as Mr. Morrison said they did, that the Order was right and that it would help to keep the people cheerful and happy, "a factor which will materially help in the prosecution of the war," they should have put the Whips on. But the vote was left free, with the result that less than half the House took part in the division; 144 members voted against the Order and 136 for it. The division lists are worth a close examination. Of the 144 members of the majority, the ages of 108 are given in "Who's Who" and average 59 years; more than half are over 60. Another peculiarity is apparent: of the members sitting for English constituencies who voted in the majority, roughly three-quarters were Conservatives, and of these again about three-quarters sit for country constituencies or boast the recreations of a country gentleman, whereas of the members for Scottish, Welsh and Irish constituencies two-thirds came from what was until last year the Opposition. This chance majority was, in fact, made up of the more elderly and leisured representatives of the English squirearchy and of the Scottish, Welsh and Irish Nonconformists. The arguments made by the majority were the usual mixture of apocalyptic nonsense and special pleading. No member made any convincing attempt to explain how the Sabbath is better kept by compelling the soldier or workman to spend his leisure on the streets or in the pub than by letting him go to a

theatre or cinema. None tried to show how it could be reconciled with democratic practice for those who do not want to go to the theatre on Sundays to stop those who do. On the whole it was a disgraceful exhibition and the best possible argument for dissolving the 1935 Parliament at the earliest convenient moment.

Darlan's Challenge

It is clear that the claim of unoccupied France to preferential treatment is rapidly becoming completely inadmissible. The duplicity and provocation of Vichy's attitude have been well illustrated in the events of the last weeks, which culminated last Sunday in a French attack on British warships off the coast of Algeria. It hardly needs repeating that sixty per cent or more of the goods arriving at Marseilles are requisitioned by Axis commissioners, and Admiral Darlan's recent boast that French trade is normal again and that goods are arriving from every part of the French Empire means in fact that the French merchant navy is bringing in vital supplies to Germany from every quarter of the globe. It is sometimes forgotten in England that over a quarter of a million tons of British and Allied shipping has lain since June in French harbours. It follows that the merchant fleet of which Admiral Darlan boasts is in part forfeit to Britain until the tonnage is handed back. Nor is Franco-German collaboration a question of the sea only. Vichy's system of land communications is also acting as a feeder of the Reich. In the first three months of 1941 alone 45,000 tons of lead, 30,000 tons of bauxite, 10,000 tons of aluminium, 30,000 tons of wool, apart from cereals, fodder and fruit, went from Vichy France to Germany. With these facts in mind British naval authorities intercepted four French merchantmen which were known to be carrying war supplies, including rubber, and were being convoyed by a French destroyer through the Straits. The convoy used Spanish territorial waters to pass Gibraltar, and when on their leaving protected waters the British ships approached, French shore batteries on the Algerian coast opened fire. In a commendable but perhaps mistaken desire to avoid hostilities, the British forces, while returning the fire of the shore batteries, did not fire on the merchantmen and allowed them to reach the Algerian port of Nemours. The issue is perfectly clear. Britain's belligerent rights entitle her to the right of search, and under international law the French merchantmen should have submitted to it. But by their action and by using Spanish territorial waters to avoid the contraband control at Gibraltar, they proved both that they were evading the law and were ready to challenge British rights.

* * *

The Future of the Blockade

Admiral Darlan's challenge raises, in an acute form, the whole question of the blockade. Hitherto the official policy of the British Government has been that of total blockade. Even the two food ships conceded to American public opinion were declared to be an exception. Now—as was to be expected—this concession has produced more effrontery and more open provocation. The British Government has therefore only three courses open to it—either to agree with Vichy that unoccupied France is genuinely neutral and continue an ineffectual blockade or to admit that a total blockade cannot be enforced, or fully to enforce the blockade. The first course can no longer be pursued. Admiral Darlan's open willingness to collaborate with Germany and his threat to do so with force if necessary must put an end to the policy of drift which has characterised the working of the blockade in recent months. The choice is therefore between enforcing a total blockade and admitting that a total blockade is no longer the policy of the Ministry of Economic Warfare. Obviously there are dangers in a course of total enforcement. It is not in Britain's interests to see the Italian naval losses made good by France. Yet it is certain that the most bellicose interpretation must be read into Admiral Darlan's threats? It is possible that his truculence is designed to reassure the Germans rather than to frighten the British. Nor is it certain that a people who fought so unwillingly against the Germans can now be drawn into hostilities on Germany's side against their former ally. If, however, in spite of the added strength given to the British Mediterranean forces by the victory of Matapan, and in spite of the undoubted sympathy of the great majority of the French people for the Allied cause, the British authorities decide to abandon the policy of total blockade, it is essential that the extent

of the break with past practice and the gravity of the decision should be brought home to the British public. It is a time-honoured custom that those Ministers who are most fully identified with a particular policy should, when that policy is abandoned against their better judgment, mark their disagreement by resignation. No one has more keenly upheld and widely extolled the full working of the blockade than the present Minister of Economic Warfare. Dr. Dalton was also one of Mr. Cross's keenest critics in the early days of the blockade. If the total blockade is to be abandoned, it will be within his power, by making the appropriate parliamentary gesture, to put the gravity of the issue before the country.

* * *

Germans in Morocco

Some of the clearest evidence of Admiral Darlan's complicity in Germany's war strategy against Great Britain is to be found not in Metropolitan France but in the North and West African Colonies. Germany's policy in Morocco has obviously been worked out with great skill, and the Germans have been careful not to compromise their plans by precipitate action. In the first months after the French collapse, while the authority and prestige of Marshal Pétain in France and of Generals Weygand and Noguès in Africa were at their greatest, the Axis Powers behaved with restraint. An Italian Disarmament Commission did tour the country, but its demands were moderate. Neither Germany nor Italy wished at that time to do anything to compromise the Vichy regime, since its authority was Germany's best bulwark against the rising tide of sympathy for Free France. Any step which had, at that time, suggested friction between Vichy and Berlin or pressure on Marshal Pétain might well have caused General Weygand and General Noguès to put an end to their mood of inertia and indecision, bred of the French collapse, and declare themselves for further resistance. This phase came to an end with the Italian disasters at the turn of the year and the coming to power of the ambitious, anglophobe Darlan administration. The Admiral had already given two of his creatures, Admirals Esteven and Abrial, office in North Africa, and their readiness for Axis co-operation nullified the hesitations of the Generals. In January, the Italian Disarmament Commission, rendered ineffective by Taranto and the Wavell campaigns, was replaced by a new German Commission under Herr Auer, whose task was officially described—with the assent of Vichy—to be that of controlling the "administrative, economic, and political life of the Moroccan Protectorate in all matters directly or indirectly related to the war and the armistice." These functions have been interpreted in the widest sense, and cover both official and widespread underground activity. Officially and with the connivance of the cowed French authorities, the Germans have requisitioned military supplies, oil, raw materials; they have occupied the airfields, and are prospecting for others; they have established control stations at Port Lyautey, Meknes, Marrakesh, and Agadir; and the Commission itself occupies four large hotels at Casablanca. Any protests from patriotic officials on the spot are quashed at Vichy. At the same time, trained German

THE WORLD OVERSEAS

The Passing of Lease and Lend

(From Our Washington Correspondent)

March 13th

IN the debate in Congress on the Lease and Lend Bill, the Administration employed for the second time the strategy adopted by the President after his election last November. The campaign had made clear the preference of the majority in the nation for the party which voters believed would carry forward the more vigorous policy with regard to the war. There was a general belief that the President would therefore take immediate action after November 5th. At the time when both friends and enemies expected action, the President went to the Caribbean, and December was well into the calendar when he got back. On his return, popular impatience was such that the right to petition was being used freely. Crucial executive orders were then released.

The Lease and Lend Bill was before Congress fifty-eight days. At the hearings, witnesses from Lindbergh to Willkie were summoned to give both sides of the picture. But in the debate, especially in the Senate, the speeches of the Bill's proponents were short. Senators Wheeler, Nye, Johnson, Holman and Clark, who spoke hour after hour, had the floor to themselves—and not only the floor but most of the seats. Again, public sentiment accumulated on the outside. True, there were news-making descents on Washington; for instance, by the members of the Mothers' Crusade, who staged a sit-down picket before the office of war-favouring Senator Glass—and were rewarded with the comment that their conduct was indeed fishwifely. And there were floods of telegrams and letters against the Bill that set in motion the perennial cycle of tracing them back to their alleged senders and discovering what proportion were genuine, and what proportion had been prepared with the aid of the telephone book.

But all the time everyone knew that a large proportion of both the country and Congress favoured the Bill. Slogans appeared to the effect that "While Wheeler is taking the floor, Hitler is taking Bulgaria." As the hours of speechmaking lengthened, the factory origin of the speeches became increasingly clear; various columnists and journals hazarded identification of trade-marks, citing parallel anti-Semitic and anti-British paragraphs by Nazi spokesmen. Cartoons showed the Fuehrer warmly commending the isolationists. At last, Senator Wheeler said: "The Administration has the votes to put through the Bill and I see no reason why we should prolong the debate." The roll-call gave the Administration two to one.

The similarity of strategy in the two cases seems to indicate a belief on the part of the President that time lost when major decisions are made is time gained for the execution of those decisions, owing to the solidifying of public opinion in advance of the act. It will take the next few months to show whether or not that judgment has been correct. (A hint that the President may have been right were the statements of Senators Vandenberg and Wiley on the morrow of the vote, in which they

emphasised that all but a mere half-dozen Senators were heartily in favour of giving aid to Britain; that the subject recently under discussion was not the giving of aid but the form in which aid should be given.)

Isolationisms

Meanwhile, it is possible to list several current results of the debate. There are varieties of isolationism. Some of the isolationism current in the country has nothing to do with the issue—it is merely one manifestation of antagonism to Roosevelt on the part of those Republicans to whom the New Deal is the enemy—those Republicans whom Mr Willkie attempted to read out of their own party in his Lincoln Day speech on the obligation of the Opposition to supply criticism that is constructive as well as critical.

Distinguishable from this is the isolationism of the generation that gave the concept its name; whose members have dominated our legislative attitude on foreign affairs for the two decades since, by a margin of seven votes, they prevented ratification of the League in 1920. Theirs is a long record: from the defeat of the League, through the Kellogg Pact and the defeat of the Court, to the Johnson Act and the neutrality legislation of recent years. The revision of the neutrality legislation in 1939 was a preliminary indication that present world forces cannot be treated by the application of neat verbal patterns. The proposal for a \$2,000 millions credit, which the younger opposition through Senator Taft attempted to substitute for the Lease and Lend Bill, would have amounted to a repeal of the Johnson Act. With all the hours at their disposal, the traditional isolationists could not make a case. Almost certainly, the debate did permanent damage to their long negation.

Apart from what it did to isolationist prestige, the debate served to raise for preliminary discussion a number of further questions. Administration spokesmen presented the Lease and Lend Bill as a means of keeping the United States out of the military phases of the war. Their case was made along some such lines as these: this Bill enables the country to serve effectively as the arsenal of democracy; Hitler's way of life and the democratic way are incompatible; the British are fighting Hitler; in upholding Britain we help to maintain democracy, and we keep from our shores a war that would otherwise shortly be brought here.

A main thesis of the Administration has, therefore, been that this is a measure to keep us out of war. The Opposition, on the other hand, has insisted that passage of the Bill means war. As a result, the debate has given the country an opportunity not specifically provided by the Bill to consider whether we mean aid to Britain short of war or aid to Britain short of nothing.

The amendments proposed at various stages of the debate likewise brought up points of future agenda. Amendments were offered: to restrict the disposition of American armed forces to the western hemisphere and thereby prevent the sending of a future AEF; to limit the amount of naval material to be transferred; to forbid the use of American convoys. These amendments were all defeated, on the ground that to pass them would increase the confidence of the dictators by indicating limited confidence in the President. It was pointed out that the Navy is unlikely to strip itself; that the current need of the democracies abroad is not man-power but material; that the President is on record against convoys. The Act as it stands, therefore, contains certain powers which the debate implied would not be used. This is a situation which will almost certainly require future clarification.

Meanwhile, the political machinery has been provided for production and transfer of war equipment on a scale commensurate with the requirements of total war. The next phases of the test are economic.

Balkan Communications

[BY A CORRESPONDENT]

March 31st

COMMUNICATIONS are a weakness of the Balkan economy even at the best of times. In wartime, on the peacetime load of this precarious transport system is superimposed the burden of an additional 40 per cent of exports, which is normally carried by sea, and, since last autumn, a constant stream of German military traffic—the two movements running in opposite directions. Railway traffic is the most important. Its general weakness throughout the Balkans is that, except for a few sections, all lines are single-tracked and, with their inadequate rolling-stock, exposed to congestion. The main international artery is the route of the Orient Express: Vienna-Budapest-Belgrade-Sofia-Istanbul. With its two branches—Belgrade-Salonika and Budapest-Bucharest-Constantza—the principal connecting link between Germany and South-East Europe, and the significance of the fact that two of the three main lines run through Yugoslavia should not be lost from view.

There exists no direct railway communication between Bulgaria and Greece, a gap of twenty miles separating the respective termini at Petrich and Vetren. Direct traffic between Roumania and Bulgaria must be ferried across the Danube between Giurgiu and Ruse.

In internal railway systems Yugoslavia is relatively best served, with railways which are supplemented by a river and canal system. On the other hand, communications with the Dalmatian coast are still inadequate and maintained mainly by narrow-gauge railway. The defects of the Roumanian railway system are largely of a more general order, such as insufficient co-ordination between the Old Kingdom and the other territories, bad repair of the lines and of rolling-stock. In Bulgaria, the network is very thin, its total length being about 2,000 miles, or one mile per 35 square miles of territory. Its direction weakness in the present situation is that the hinterland with its harbour outlets. There is only one main line running north-south: Ruschuk-Stara Zagora-Plodiv.

The road system follows in the main the railways. The most important is the transcontinental motor road running along the historic highway Belgrade-Sofia-Istanbul and parallel to the Orient Express route. From it a branch starts at Ederne and runs due south to Dedegatch and thence to Salonika. The main road from Bulgaria to Greece runs down the Struma valley; the

secondary roads, three in number, are unsuitable for heavy traffic. Yugoslavia and Greece are linked by two main roads; the principal road running Belgrade-Skoplje-Monastir-Florina-Salonika, and the Vardar road branching off from it south of Skoplje and leading similarly to Salonika.

The Danube Artery

A third important medium of transport, and one which has gained special significance for Germany during the war, is river traffic—in particular, transport on the Danube. Before the war, most of the bulky exports to Germany, especially oil, were sent on the much cheaper sea route. Now, shipping space for river traffic is short, which adds to the limitations imposed by nature. The Danube is navigable, on the average, only for nine months of the year and, from the bottleneck of the Iron Gate upwards, only for vessels not exceeding 650 tons. The scarcity of tonnage is particularly felt in tankers, of which the total Danube fleet in the summer of 1940 was stated by authoritative Roumanian sources to be 278 tons, with a capacity of 1.6 million barrels. Such a capacity could carry no more than one million tons a year, which includes shipments to other riverain countries, notably Yugoslavia. Germany has been making strenuous efforts to expand oil-carrying capacity on the Danube and some observers estimate that this may be doubled in the present year.

Another handicap of the Danube is its vulnerability. Traffic from Bulgaria and Roumania is dependent on a restricted number of ports, situated on the Lower Danube. On the Bulgarian side, the only Danube port of importance is Ruschuk, all the other ports lacking proper installations. Even the port of Ruschuk—which is, incidentally, an important railhead—has a limited capacity, its maximum peacetime traffic not exceeding 220,000 tons per year. Its counterpart on the Roumanian shore, Giurgiu, is Roumania's Danube oil port, connected by pipe-line with the oil region. Both this fact and its position on the principal line of communication between Roumania and Bulgaria, give it an outstanding significance. The other two principal Danube ports, Galatz and Braila, are situated on the "Maritime Danube," and their main function is normally the loading of sea-borne exports, Galatz for timber and Braila for cereals.

Of the Black Sea ports under German control, Constantza is by far the most important. It has good harbour installations, including oil tanks with a storage capacity of 250,000 tons, and, like Giurgiu, a pipe-line connection with the oil region. Varna, formerly an important grain port, has been neglected during recent years; but the Germans have been busy re-equipping it for unloading of Russian oil and other shipments.

Several points emerge. Perhaps the most significant is the fact that such commanding points in the Balkan communication system as Belgrade, Nish, Salonika, Ederne and Istanbul—to give only the most important—are outside German control. The communications on which Germany relies are not only sparse and overburdened, but present many vulnerable points. All these factors impose serious limitations on Germany, whether she intends to use the Balkans as war granaries or as operational bases, and it remains to be seen if they can be used as both at the same time.

Eire's Growing Supply Difficulties

[FROM OUR DUBLIN CORRESPONDENT]

March 28th

THE position in regard to the supply of wheat continues to give rise to a good deal of anxiety. The weather conditions have been unfavourable for sowing winter wheat, and an energetic campaign for spring sowing is being conducted. The success of the attempt to augment the output of wheat depends, to a great extent, upon the weather during the summer, but larger supplies of less sensitive crops, such as potatoes, will also be available. Meanwhile drastic steps are being taken to economise existing stocks. The extraction of flour has been

increased to 95 per cent, sales of flour by millers have been restricted, the feeding of wheat and flour to livestock has been prohibited, and the sale of bread in hotels and restaurants has been severely rationed. In the existing conditions at sea it would be foolish to place much reliance on importing wheat, but steps are being taken to do all that is possible in this direction.

A company is being formed to acquire ships, by purchase or charter, and an Irish Minister has flown to the United States with the object of obtaining supplies. While these steps must be approved, it would be unwise to hope for too much as the result of the mere possession of ships. Indeed, members of the Government have, on several occasions, warned the public of the limitations of the benefits conferred by acquiring a mercantile marine. Assuming that ships could be purchased, their possession would not guarantee access to supplies of foodstuffs and raw materials which are urgently demanded by the belligerents. Even if cargoes could be obtained, there is no guarantee that they would reach Ireland in safety. Already nine Irish ships have perished in the war. If the ships were unarmed, they would be defenceless against attack, while to arm them would be to endanger the neutrality of Eire. The experience of Norway in the last war and of Sweden in this war proves that the possession of a mercantile marine does not enable a neutral country to maintain supplies in a period of widespread blockade.

A Central Bank

It has been announced that the Government is about to introduce a bill to establish a Central Bank. It is legitimate to assume that this bill will embody the recommendations of the Banking Commission which reported in 1938 in favour of such a bank. The main proposal of the Commission was that the functions of the Currency Commission should be extended in several directions. Great emphasis was laid on the need for constant consultation between the Government and the Central Bank on all matters of economic policy that might have monetary repercussions. It was also recommended that the new Central Bank should have power to rediscount certain narrowly defined types of domestic assets, but that Treasury bills should not be considered eligible for this purpose. The Commission refused to recommend that the commercial banks should be compelled to hold minimum reserves in the Central Bank or that the Government account should be transferred to the new bank from the Bank of Ireland.

Higher Army Estimates

The estimates for the coming financial year amount to £35,322,791. The original estimate for last year was £30,511,359, but supplementary estimates amounting to more than £4,000,000 were introduced during the year. The estimate for the Army is £8,313,328, which is an increase of £1,404,498 over the expenditure in the current year. It is useless to speculate how this huge expenditure will be financed. The yield of many taxes has been reduced by the war, and will be reduced still further unless conditions improve beyond all reasonable expectation. It is profoundly to be hoped that the Minister for Finance will not break the back of the direct taxpayer by raising income tax to the British level, which would cause additional unemployment. A retrospective excess profits tax might be worth considering, as a good deal of profiteering has taken place during the war, but the main reliance will have to be placed on borrowing. The national credit is still sound, and it is obviously a lesser evil to increase the public debt than to load the taxpayer with impossible burdens.

Switzerland's Coal Shortage

[FROM OUR GENEVA CORRESPONDENT]

March 2nd.

THE Swiss winter is not yet ended, and coal for domestic heating is already scarce. Switzerland in normal times needs 350,000 truck loads of coal for her own consumption; 150,000 truck loads are required for heating, 100,000 for industry, and 70,000 for gas production. In normal years, nearly 53 per cent came from Germany, 16 per cent from France, 13 per cent from Holland, 7 per cent from Britain, 4 per cent from Belgium, and the remaining 7 per cent from Poland, U.S.A. and other countries. Since last winter, all sources of coal supplies—except Germany and Yugoslavia—were one after the other cut off, and Switzerland had to rely solely on German imports. These totalled 87,000 truck loads for 1940-41, and the deficit was about 180,000 truck loads, thanks to the stores accumulated during 1939 and the beginning of 1940. Measures were, therefore, taken last winter to cut down private coal consumption so as to enable the normal working of industry. The allowance of coal for heating was reduced to 60 per cent of normal needs; and home resources were used to the utmost, but electricity, wood and peat could not fill the gap. The result was that new restrictions were made for the present winter, when private houses were only allowed 40 per cent of normal consumption. December and January were abnormally cold; and although work-shops, offices and schools are closed on Saturdays, although school Christmas holidays were lengthened, and although heating was calculated to maintain a temperature of 60 deg. Fahrenheit at the highest in two rooms, and 45 deg. in the others, stocks dwindled rapidly and the Government made it clear that no further coal rations would be allowed. A small extra allowance was nevertheless made, but at the same time it was announced that heating would everywhere be stopped on March 15th.

Trade with Germany

According to an agreement concluded last autumn, Germany undertakes to deliver about one million tons of coal to Switzerland at a price higher by nearly 50 per cent than the current price in Germany. Part of it is to be paid in gold and another part in land products such as cattle, pigs, cheese and other dairy products. The agreement should to some extent ease the situation of cattle breeders, as, owing to the stoppage of fodder imports, the slaughtering of about one-third of the cows and of one-fifth of the pigs had been contemplated. German coal deliveries were fairly regular for some time, but in December they were stopped, and Swiss importers were informed that coal and coke deliveries would provisionally cease for an indefinite period unless the Swiss railways could place all the necessary rolling stock at Germany's disposal. The Swiss had hitherto supplied only a proportion of the necessary trucks and were reluctant to send more to Germany. They apparently complied with Germany's desire and supplied her with more rolling stock. Deliveries have begun again, but on a small scale, and if they cannot be increased there will be a shortage next winter, with the result that further restrictions will be necessary.

Dearth of coal is only one of the hardships the Swiss are suffering. At present, each person is entitled in a month to 24 oz. of flour, maize and semola, 16½ oz. of wheat and barley products, 26½ oz. of fat and oil, 24 oz. of sugar, 16½ oz. of rice, 16½ oz. of macaroni, 8 oz. of dried peas and beans, and 9½ oz. of butter; the sale of meat, fresh milk and cheese remains unrestricted.

A new and great effort is to be made to increase home production and to double the area under cultivation. The present 440,000 acres under cultivation enable the feeding of half the population, and it is estimated that another 300,000 or 400,000 acres may be added. Thanks to the increase in the cultivated area decided in 1939, the yield of agriculture, which was 1,289 million francs in 1939, rose to 1,491 millions in 1940, and it is expected to exceed 2,000 millions in 1941. The main difficulty is the lack of labour. The Government has consequently issued a decree enabling it to make land work compulsory for several classes of persons: the unemployed; persons who have no special activity but are physically fit; and those who have some knowledge of land work.

Repression in Czechoslovakia

[BY A CZECH CORRESPONDENT]

March 26th.

AFTER an economic and racial drive against the Jews, the Germans arrested their intelligentsia and are proceeding against the "legionaries." The latest step is a system of terrorisation of civil servants, to assure the Nazis unquestioned mastery of the administration.

The Jews are very much impoverished, and hardly any Jewish shops remain. Cases of the blackmailing of Jews by Nazis are very common. In Prague and Brno, Jewish members of the community, including the old and infirm, have had to sweep up the streets. Jewish children are excluded from all schools, both elementary and secondary, and the Ministry of Education has forbidden Czech teachers to give private lessons to Jewish children.

The most striking attempt to break the Czech spirit is the blow against the legionaries. During the last war, 150,000 Czechoslovaks fought in the Allied armies against the Central Powers. When the Czechoslovak Republic was founded they became national heroes, obtained prominent positions and were organised into a powerful association. After the occupation of Czechoslovakia, they did not cease to be the backbone of resistance against the Nazis. The Germans called them "serfs of Jewish - plutocratic - Britishers, who deserted the Austrian-Hungarian Empire to fight the Germans," and accused them, probably quite correctly, of representing the same anti-German spirit as in 1914-18. Their central building, "Bajkal," and all the other property of the organisation, was confiscated and delivered to the Nazis.

After the drive against the Jews and the legionaries came a campaign aimed at control of the civil service. An order provides for the immediate dismissal of any civil servant who is not sufficiently "public spirited," in other words, who does not work for the Germans. Consequently, every civil servant is in constant fear of losing his position by a careless word. What applies to the 300,000 civil servants also applies to the 500,000 privately-employed clerks, who are under the supervision of Nazi Commissioners, and to the 2,000,000 workers, who are still allowed to have their shop stewards—but only if these are Nazis. This new device, therefore, keeps the whole nation, from the puppet Government to the worker, under constant pressure.

The Germanisation of Czechoslovak industry has been furthered considerably by the recent transfer to the Prague Union Bank of the capital of the important *Berg und Hüttenwerke* mining and foundries joint-stock company, which was owned by the *Union Européenne Industrielle et Financière* in Paris. The Czech Union Bank in Prague, the spearhead of German economic penetration in the Protectorate since October, 1938, is to be regarded merely as a Prague branch of the to be regarded merely as a Prague branch of the *Berg und Hüttenwerke*, which was held by the former leading Czech *Zivnostenska Banka*, was already transferred to the Czech Union Bank last year. The collapse of France enabled the Germans to take possession of the French holdings of Czech companies.

While the well-to-do classes complain that the food rations are not sufficient for them, poor families cannot even obtain the complete ration to which they have a right, as a result of the high prices, which have risen by as much as 150 per cent compared with last year. The bonuses granted by law are not sufficient to make up for the discrepancy in price.

Burma and the War

[BY A CORRESPONDENT]

March 21st.

WITH an area equalling that of Metropolitan France and a population exceeding sixteen millions, Burma is making a noteworthy contribution towards the war. The Chiefs of the Shan States, like the Indian Princes, placed their resources at the service of his Majesty as soon as war was declared. Burma is providing for the effective defence of her 2,000-mile long land frontier, along China,

Thailand and French Indo-China, and extensive coastline. She is also diverting her energies to increasing the output of such products as are valuable for the prosecution of the war.

Burma has acquired additional strategic importance in the last year or two. Wedged between two of the most densely populated and least bellicose countries in the world—India and China—she was at peace with her neighbours and the outside world. With the advent of aerial warfare, with Japan's attack on China and eyes on the South Sea possessions, tension is knocking at Burma's land frontiers. The entire cost of her defence was met from her own resources. Four years ago her Defence Services cost Rs.1,26,67,000, and the Frontier Force another Rs.54,00,000 annually. With the outbreak of war, defence expenditure has increased. Including capital outlay on aviation, military estimates for 1940-41 exceed Rs.3 crores. The four regular battalions of the Burma Rifles have been augmented in strength and a fifth one is being formed. Also, a number of technical units—Army Signals, Animal Transport Company and ancillary units—have been raised. The Burma Auxiliary Force includes four infantry battalions, and a brigade of artillery, which is also responsible for manning the coastal batteries and anti-aircraft defences. The Territorial Force now comprises three battalions. Furthermore, Burma possesses a naval patrol craft and an Auxiliary Air Unit. In addition, there are six irregular battalions of the Burma Frontier Force and a seventh unit is now being constituted. The Burma War Donation Fund, inaugurated in March, 1940, now exceeds £200,000. Part of this sum has been used in the purchase of the Burma Fighter Squadron of the RAF.

With the creation of the Defence Council the country's vast and varied resources are being mobilised for war purposes. The principal crops include paddy, oilseeds, maize, wheat and cotton, while rubber and tea constitute the leading plantation products. Nearly half the total area of Burma is under forests yielding teak, whose hardness and durability and importance for ship-building are well known. No Empire country east of Suez produces such a comprehensive range of mineral products indispensable for war. The value of Burma's mineral and metal production has expanded more than three-fold since the last war, from Rs.3,33,33,000 (1914-18 average) to over Rs.10,13,33,000 (1934-38 average). After Trinidad, Burma is the leading producer of petroleum in the Empire. She is the principal supplier of aviation petrol and lubricating oil for the RAF units operating east of Suez. The Bawdin mines in the Northern Shan States account for large tonnages of lead, zinc, copper, and silver, and smaller quantities of nickel and cobalt. As during the last war Burma is supplying the bulk of Allied tungsten requirements and far from negligible tonnages of tin.

Burma Exports (1939-40)		
Value in Lakhs of Rupees (1 Lakh = £7,500)		Rs. (Lakhs)
Paddy	3,048,664 tons.....	24,10.23
Mineral oil	222 million gallons	12,05.57
Metals and ores	139,424 tons	6,19.50
Teak	224,438 c. tons	3,11.00
Rubber	9,970 tons	50.01

China's Lifeline

Chungking breathes through Burma. This road is important for the shipment of exports from China—tungsten, antimony, tin, mercury, tung oil, etc., to finance war imports—trucks, petrol, arms, munitions, war chemicals and medical supplies. Since the Burma Road was reopened last October the flow of traffic has increased markedly. At first only 40 trucks, carrying a cargo of about 100 tons, exclusive of petrol, were daily using the highway. By mid-January nearly 160 trucks, carrying a cargo of 450 tons, were daily using the new route.

THE BUSINESS WORLD

EPT and Reconstruction

SINCE the case against EPT in its present form was examined in *The Economist* early in November, the publication of some hundreds of company accounts and the strictures of an almost equal number of company chairmen have helped to confirm the conclusions then reached. At a time when a large section of industry was pushing its plant and personnel to ever greater efforts in the national service, and when a further substantial proportion was still reaping the benefits of restocking sales, an appreciable rise in earnings has gone parallel with a fall in distributable profits. For reports published during 1940, a rise of 9.2 per cent in the gross figure becomes a fall of almost 2 per cent in the net figure, although, during a substantial part of the period covered, EPT was at 60 per cent. Actually, the effect of the tax was greater than appears, for there is a growing practice of publishing even the gross figure after both EPT and depreciation. The lack of reliable figures for the latter charge makes it difficult to arrive at a just conclusion as to how far company managements are sacrificing future financial strength to a desire to limit dividend reductions. All that can be said with any certainty is that, where depreciation is shown, it is usually higher on the year, but that the rise frequently appears very moderate, as some of the companies are certainly working their plant both longer, and under less ideal conditions, than was the case in 1938-39. This would seem to mean that liquid capital is already beginning to run down, and will run down still more rapidly with the tax at its maximum unless dividends are severely cut.

It is clear that a depletion of working capital is inevitable unless either the company has a favourable basic period for EPT, or the board is prepared to cut dividends considerably. It is true that there is a special allowance under EPT for renewals on plant put to war purposes, and that this may be extended so as to rank as a permissible deduction in calculating Income Tax. But the maximum is 10 per cent, not a high figure for machinery which may be working twenty-four hours a day, seven days a week. Further, the special allowance does not apply to machinery installed prior to January, 1937, that is to say to a very large part of industry's normal equipment. Nor is this all, for the percentages are calculated on cost. Replacement value, when replacement is possible, has already risen substantially, and the indications are that the rise in prices will go further yet. In fact, EPT at 100 per cent—whose effect upon distributable profits has yet to be seen—coupled with inflationary finance, threatens to leave large sections of British industry, not only with much plant out of date, worn out, or redundant, but without the funds to replace or convert it. Considerable capital consumption is inevitable in total war, and it is far from being the case that EPT will be solely responsible for this condition. It does, however, affect a group of industries on which the country relies, not only for reconstruction at home, but for the restoration of its export trade. These include iron and steel, engineering, electrical equipment, motors and aircraft, certain sections of the cotton industry—where one year's profits only are affected—and, to some extent, shipping and shipbuilding.

It can, of course, be argued that finance is a secondary consideration; that the Government, having taken the money out of industry to meet its war needs, can put it back again when the time comes, and that the need for industry to obtain finance will enable the authorities to see that the most desirable projects have priority. What the public attitude towards Government control of industry will be after the war, it is hard to say at this distance of time. That there will be more control than before the war is highly probable. But the prospect

of all projects of capital expenditure waiting upon official sanction is too alarming to contemplate. The tasks which will have to be performed will call for the minimum of delay and a high degree of both initiative and boldness. However possible it might be in theory to plan industrial rehabilitation so as to meet domestic needs, foreign trade must involve the taking of many risks, and in many industries it will be impossible wholly to dissociate the one activity from the other. To achieve the best results at the earliest possible date, it is desirable that industry should have at its disposal securities which can be sold, or pledged, in order to tide over the period when the public as a whole may have little inclination to put its savings into concerns which have to prove their ability to make good in the changed conditions. If a post-war depression is to be avoided, wartime financial policy must take account of that intention from the start. Already, opportunities which would have favoured a rapid revival of private demand—such as Mr. Keynes' compulsory savings—have been neglected, and there can be no doubt that to deprive industry of liquid resources, at a time when heavy capital outlays will be called for, will greatly delay the change-over. If official control is necessary, it can be effected through the machinery of priorities already in existence. This is in no sense a plea for allowing industry to accumulate huge reserves with which to launch into new and untried fields, but merely a suggestion that liquid resources should be maintained at a level which will permit the restoration of physical capital to its pre-war condition.

If it were necessary to base the argument for some variation of EPT, as at present administered, solely on its ill-effects on a large section of industry, the case would be strong enough. But experience of the past few months goes a long way to confirm the views expressed in *The Economist*, and elsewhere, that the removal of all incentive to maximum profits leads, inevitably, to some laxity in keeping down costs even if, in the circumstances of the hour, patriotism, or the spirit of self-preservation, urges the manager to over-work plant, despite the fact that to do so, after allowing for higher wear and tear, means a smaller net return. The time is fast approaching when virtually all production will be for Government account or for private necessities, the cost of which helps to determine wage bills and the pricing of service contracts. The mere mathematics of the position suggest strongly that a reduction in tax would advantage the Exchequer. An example, rather oversimplified it is true, may help to put the matter in perspective. On the unlikely assumption that a firm makes as much as 20 per cent profit on turnover, before tax, and that, at the existing level of earnings, one-third is taken in EPT, the Treasury would make a profit on the change if a reduction in the tax from 100 to 85 per cent were a sufficient inducement to cause the management to resist a 2 per cent rise in costs—or effect an equivalent reduction—on the further assumption that the whole of the product were sold, directly or indirectly, to the Government. It need hardly be said that if, in this connection, either the rate of profit or the share taken in EPT is lower, the profit to the Chancellor on making the change is greater. On the whole, it may be taken as established that the claims of many accountants that the full 100 per cent EPT actually costs the Government money are reasonable. So evident is it that no loss can occur from a reduction of the rate that it is hard not to see, in any effort to retain the full rate, a confusion of thought as to the effect of allowing industry to retain a claim for materials and labour at some future date—to be determined by the authorities—and the effect which the emergence of

such a claim would have now on the superior demands of the services and the export market. It is the same lack of clear thinking which withholds immediate compensation for air-raid damage, because it is not usually desirable that workers and supplies should, at once, be made available for replacement.

In addition to these national considerations, which are of the first importance, there remain a host of inequities as between one industry and another, between the new and progressive firm and the established group, between the extractive and plantations industries, and so on, which call, even in wartime, for more consideration than they have yet received. Of the mass of complaints made public, and suggestions for their cure, a very high percentage is concerned with the need for adjustment of some detail, but the desired result is always to enable the payer of the tax to retain a larger proportion of his earnings, it being frequently explicitly stated that in no case would such sums be available for distribution or spending in wartime.

It is probable that the original intention in imposing the tax was as much to take the profit out of war as to increase revenue. Actually, in its existing form, it tends

to make a maximum war effort of no present advantage and a grave threat to the future of some of the firms concerned. This threat applies to the whole livelihood of their employees as well as to the income of shareholders, not a few of whom are industrial workers. It is possible that a solution could be found by a lengthy series of adjustments, but this would involve a costly expenditure of time by Government servants and a delay which is undesirable. It would be more expeditious and therefore, in the circumstances, more expedient, to adopt the suggestion, made in *The Economist* in November last, namely, a flat rate cut in the tax to 85 or 80 per cent, the amounts so retained to be blocked, normally until after the war, and in any case until permission to spend them had been granted. Such a measure would not reduce the flow of funds into the Exchequer, except where permission was given, and it can scarcely be denied that it would help to keep down prices. Industries would be assured, if profits sufficed, of accumulating some reserve against the effects of war strain on their plant and toward the finance of post-war adjustments, upon whose speedy completion the avoidance of a period of depression largely depends.

Finance and Banking

The Turn of the Quarter

The turn of the quarter was attended by a decided spasm of stringency in the short loan market. The banks had been drained of cash in the last days of the financial year by substantial transfers of tax money. They were, therefore, unwilling to buy bills or to extend their short loan accommodation to the discount market. The market, for its part, had concentrated its applications at last week's tender for Treasury bills on the June 30 maturities, which had to be taken up and paid for on Monday, the last day of the quarter. As the market syndicate obtained an allotment of 28 per cent of its application—as compared with 17 per cent. the previous week—the amount of bills which it had to take up on Monday was considerable. The position on that day was further strained by some calling of funds by overseas banks. The discount market was therefore forced to seek relief in moderate sales of bills to the official buyer, who took early June maturities at 1 per cent. Official assistance was also required on Tuesday, as the dividend moneys disbursed on that day had not percolated sufficiently to affect the short loan position. On that day the official buyer took some late May as well as early June maturities. By Wednesday the position was easing appreciably, and in the afternoon the discount market was again able to obtain $\frac{3}{4}$ per cent. The Bank return, however, still reflects a decidedly taut position. The repayment of advances made to the India Council in connection with the repatriation of India Government stocks had begun, and the item of discounts and advances show a reduction of £3,461,000, still leaving advances above its normal level at £36,814,000. As, in addition, Government securities show a slight drop and the note circulation is £3,146,000 higher, bankers' deposits find themselves no less than £17,144,000 down on the week at the comparatively low level of £101,452,000. The further repayment of temporary accommodation to the India Council will probably exert a contractionist influence on the volume of bank cash for the next week or so, but there is ample scope in the present level of Government securities for appropriate neutralising operations.

More Treasury Bills

Last week's Treasury bill tender was made noteworthy for two reasons. In the first place, the bills tendered for included the June 30th maturities, on which the market naturally concentrated its applications. More important was the revelation that the amount to be offered for tender on Friday of this week would be increased to £70 millions. The maximum on offer at the weekly tenders had remained unchanged at £65 millions ever since May 10, 1940, and it had been very widely assumed in the market that the consequent limit of £845 millions of Treasury bills issued through the tender would remain the effective "ceiling" for this part of the

floating debt. With the introduction of the Treasury deposits in July last, the tender issue of Treasury bills ceased to provide the elastic element in the floating debt, that position being usurped by the new form of direct borrowing from the banks. Had it not been for the creation of this alternative form of short-term finance the issue of Treasury bills would have had to expand considerably, and the authorities probably believed that the discount market, which still provides the principal channel for feeding the banks with bills, did not deserve the profits that would accrue from the increase.

The question which has been widely asked this week is whether the increase in the amount of bills to be offered indicates a fundamental change of policy and is the signal for a return to a more elastic bill issue than has prevailed over the past ten months. The market would be well advised to moderate its hopes in this respect. It is probable that the increase in the amount of bills to be offered has been made in response to the known fact of the large increase which has recently occurred in the official outside demand for bills. It is, however, somewhat paradoxical that the increase in the supply of these bills should coincide with the departure of a considerable amount of Indian Reserve Bank money previously employed in the short loan and discount markets but now absorbed by the repatriation of India Government sterling securities. The market syndicate, whose applications for bills will increase with the rise in the total of bills on offer, should thus receive a two-fold benefit—from the increase in the volume of bills on offer and from some reduction in the official outside competition for them. The near future, however, is likely to

show that Treasury deposits will remain the truly elastic element in the floating debt.

* * *

Floating Debt Changes

The Exchequer return showing the floating debt position at the close of the financial year does not provide accurate material for a comparison of changes in its constituent elements over the previous month. The return gives the position at the close of business on Monday last, and the latest changes in the debt position are thus obscured by the uneven incidence of Treasury bill and Treasury deposit payments and maturities over the week. It may, for example, be assumed that the bulk of this week's bills had been paid for by the time the return was drawn up, while the week's maturities were more evenly spread over the week. It follows that the amount of bills outstanding on March 31 was temporarily swollen by anything between £45,000,000 and £55,000,000. In the light of this, the actual decrease of about £3,000,000 in the total of Treasury bills outstanding over the month of March seems to indicate an appreciable reduction in the outstanding volume of bills issued through the tap. A similar reduction occurred towards the end of March, 1940, when the movement could be more accurately measured as weekly returns of the floating debt position were still published at the time. The same vitiating factor affects a comparison of the Treasury deposits total. This has risen over the month by £74,500,000 to £429,500,000, while if a tally of weekly issues and maturities is taken, the amount outstanding over the four weeks ended March 29 should have increased by £50,000,000 only. The Exchequer was thus well provided with funds over the turn of the financial year and there was no need for recourse to borrowing from the Bank. The usual monthly table showing the respective contributions of revenue and borrowing to financing expenditure will be found in the Budget Supplement on page 440.

* * *

Rupee Fluctuations

After sixteen months of complete stability there was a small disturbance in the rupee-sterling rate on Monday of this week, and since then the rate has be-

haved in a manner almost reminiscent of a free market. The rate had been held steady since October, 1939, at 1s. 5½d.-1s. 6½d., thus giving a middle rate equal to the statutory parity of 1s. 6d. On Monday last the middle rate was brought down to 1s. 5 59/64d. and the spread between buying and selling prices fixed by the Reserve Bank widened from ¼d. to ½d. Since then the middle price has risen to 1s. 5 63/64d. with a spread of ¾d. These are movements which would pass almost unnoticed under normal market conditions. They are brought into prominence, first, because of the long-established rigid stability they have disturbed, and, secondly, because in these days of exchange control a shift of rates is a matter of conscious policy on the part of the authorities and not the answer of a free market to the interplay of demand and supply. The reason which led the Reserve Bank of India to make this adjustment in its sterling rates appears to have been a sudden demand for sterling from Indian investors after the completion of the operation begun with the Vesting Order on a number of India Government sterling securities. As a result of this Order certain investors in India who previously held sterling securities found themselves with rupees. Since the reasons for their previous purchases of sterling securities presumably still held good, they immediately proceeded to convert their rupees into sterling preparatory to reinvesting these funds in the London market. Faced with this non-commercial demand for sterling, the Reserve Bank both lowered its rate and widened the spread against the potential buyers. There was an element of harsh dealing in this manoeuvre, since the operators concerned were in the first place compelled to sell their sterling securities and accept repayment at the previous official rate of exchange. Then, as soon as they wished to undo the operation, the rate was moved against them. The fact that this should have been done is a token of the Indian authorities' desire to discourage such a movement of capital, though, again, this seems surprising, in view of the substantial creditor balance at which India's account of international payments—and in particular sterling payments—is still running. It should be stressed that despite shipping and other difficulties India's balance of payments, both with the rest of the Empire and with the dollar area, remains active. The recent movement in the rupee rate is, therefore, contrary to the underlying trend of the market.

Easy Money and Budget Fears

Uncertainties as to what the forthcoming Budget, now imminent, will produce, and of the effects of inten-

FIXED-INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935=100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

sified national effort, aided by a fuller realisation of the results of EPT, continued throughout the month of March to contend for the determination of market senti-

ment with the consequences of plentiful supplies of short money and of disbursements and dividend payments to the individual investor. During the early part of the month, political and military developments were on the whole adverse, but it is improbable that they played any substantial part in determining price levels. It is significant that such recovery as followed the Yugoslav revolt lasted scarcely forty-eight hours and that victories over Italy, on land and sea, failed to prolong it appreciably, in face of the attitude of Vichy France. In these circumstances, it is scarcely surprising that, to the extent that financial factors triumphed over others, the effect was visible mainly in fixed-interest stocks. The indices both of *The Financial News*, which appear above, and of *The Institute of Actuaries*, of which the salient points are tabulated below, show recoveries in the funds more than outweighing the slight reverse of February, and a continuance of the decline in equities, which in that month succeeded on a seven months' improvement. Actually, the fixed-interest index of *The Financial News* is at its highest since the end of August, 1938, which was, incidentally, the same as the level a year before. The recession in equities on the month was slight and has already been made good in part.

* * *

Closing Margins

The renewed improvement in the Funds, carrying the "irredeemables" and 3½ per cent War Loan, which can no longer be included in that class, to the highest levels for over four years, has gone hand in hand with a

further narrowing of the margin between gilt-edged stocks and most other fixed-interest securities. This tendency, however, stops short of industrial preferences, among which only those of the distributive section show a decline in yield. The figures extracted from *The Actuaries' Investment Index*, and given below, bring out these movements as well as some of the principal changes in equities.

TOTAL INDUSTRIAL (159)	59.3	50.8	49.1	48.6	9.01	6.26	6.42

The fall in total equities on the month is very much less than that of February, and there are a number of improvements against the general trend. These include insurance, investment trust and aircraft shares, as well as home rail and shipping equities. It is also interesting to note a resumption of the rise in electrical equipment, which suffered a reverse in February on fears of curtailment of domestic demand, just as they did in September last, when export trade was threatened with contraction. The changes of the month, whether up or down, are, however, too moderate to form the base for any but tentative conclusions. It is probable that, with the budget out of the way, there will be a recrudescence of the recent tendency to invest in equities of companies whose post-war prospects appear good, provided that the immediate outlook is not too depressing for their particular trade.

Closer Working in Steel Industry

That there is room for closer co-operation, even in an industry as closely integrated as steel, is well known, and what promises to be an important development in this direction has just been made known. The announcement took the innocent form of new appointments to the boards of Stewarts and Lloyds and The United Steel Companies, which result in Sir Walter Benton Jones, chairman of the latter, sitting on the board of the former, while Mr Alan Macdiarmid, chairman of Stewarts, and Mr Richard Summers, who occupies that post on John Summers, become directors of United Steel. The two concerns last named were already co-operating in the erection by John Summers of a new American strip mill, and the changes, as well as the appointment of Mr Neville Rollason, Managing Director of John Summers, to that post on United Steel, point to further tightening of the alliance. The entry of Stewarts and Lloyds into this field is, however, a new and important departure. It greatly extends their sphere of interest, which had already been widened by the acquisition of Stanton Iron in October, 1939. Through their alliance with Tube Investments, and their subsidiaries throughout the Empire, excluding Canada, this concern now has influence in a very wide geographical area over many important sections of the trade.

The First Quarter's Capital Issues

The tables of capital issues, compiled each quarter by *The Economist*, reveal an even greater subjection of the market to Government requirements than in the corresponding quarter of 1940. Aggregate issues are slightly below those of the previous year, and, calculated on the "new basis," which includes issues by permission to deal, the total has declined from £376,838,800 to £380,254,200, while the figure of Government issues is down from £371,825,000 to £327,344,300. Other issues amount to some £2,900,000 against some

HALIFAX BUILDING SOCIETY

LARGEST IN THE WORLD

£5,000,000. Of Government borrowing, the most substantial item is £139,000,000 in the second series of 2½ per cent National War Bonds. Three per cent Savings Bonds have yielded nearly £77,400,000; 3 per cent Defence Bonds nearly £51,000,000, and Savings Certificates some £44,600,000. Outside the sphere of Government borrowing, the only important issue has been the Broken Hill offer, to shareholders only, of £2,500,000. Clearly, the Government is experiencing no competition in its endeavour to draw upon new savings. The only question to which the first quarter's figures give rise is whether the total of Government issues is adequate.

Municipal Conversion Terms

The Treasury has now announced its decision as to the means by which the conversion of some £32,500,000 of stocks of local authorities, carrying optional redemption rights, is to be dealt with. As was suggested in *The Economist* of March 29th, no attempt is to be made to substitute a single joint issue for the separate loans, but, as was the case even before the war, the terms of all offers are to be identical. Also a further step has been taken by massing the offers at two points in time, instead of allowing them to be spread, more or less evenly, over a period of months. The plan, as at present disclosed, is that all local authorities, desiring to exercise their rights of conversion, are to date their announcements as from May 1st, giving either three or six months' notice to present holders, as is required by the terms of issue. Making allowance for a partial repayment in cash, already announced by Birkenhead, and the inclusion of two port stocks, this would appear to mean that some

£26,000,000 will be dealt with on August 1st, and about £9,000,000 on November 1st. The first section will include all the loans with maturity dates 1940-60, and, it would seem, the 5 per cent stocks 1941-61 of Hull and Liverpool, while the latter covers the 5½ per cent stocks 1941-61 of Birmingham, Liverpool and Sheffield and the 5 per cent stock 1941-51 of Stoke-on-Trent. While no official intimation has been given as to the exact terms on which all these offers are to be made it is highly probable that they will take the form of stock of relatively long life, carrying interest at 3½ per cent and issued at par. Two corporations, the City of London and Hull, have already made applications to convert.

Company Notes

Vickers Group

Accounts of the Vickers group for 1940 necessarily provide scant information of the past year's industrial record. The profit figure disclosed by the holding company, *Vickers Limited*, shows a decline, after tax, from £1,260,711—adjusted for tax on preference dividends—to £1,188,651, on a comparable basis. As in the two previous years, the ordinary shareholders receive 10 per cent, while the carry-forward is raised from £480,188 to £651,821, after allocating £250,000 to contingencies reserve, and the rate of ordinary earnings is up from 20.2 to 21.9 per cent. *Vickers-Armstrongs*, one of the operating concerns, is declaring a dividend of 7 per cent tax free, covered by earnings of 7.6 per cent tax free, on ordinary capital, the first payment in its history. Profits, after tax and ARP expenditure, are up from £1,778,143 to £1,963,527, and the depreciation provision is higher by £250,000 at £1,000,000. The results of *English Steel* have already been discussed in *The Economist* of March 29, 1941, in connection with the *Cammell Laird* accounts. The directors report that *Metropolitan Cammell Carriage* has repaid the outstanding debenture stock, shown in the balance-sheet of the holding company at £450,565 at the end of December, 1939. Reserves of the holding company still stand at £3,000,000 against fixed assets which are reduced from nearly £11,000,000 to some £10,500,000. The *Vickers-Armstrongs* balance-sheet shows a striking rise in stocks and work in progress of some £14,000,000 to £46,882,267 and in cash holdings from £213,045 to £1,648,372. Among liabilities, the total of creditors, taxation and contingencies has almost doubled at £14,348,293, while instalments on account of contracts are up from £26,792,458 to £36,252,353. There is no doubt that the group is working at high pressure to meet the demands of the service departments, as the chairman, Mr A. A. Jamieson, indicates in the course of his preliminary statement. The market offers a yield on the *Vickers* 10s. ordinary stock of £6 13s. 4d. per cent at the current price of 15s. ex dividend.

* * *

Home and Colonial Group

The full accounts of the *Home and Colonial Stores* and its two wholly-owned subsidiaries *Meadow Dairy* and *Lipton*, for the fifty-two weeks to January 4, 1941, are analysed in the table appearing on page 456. The set-back in profits after EPT, which resulted in a deficit for ordinary capital of £89,115 in the case of *Home and Colonial* and of £20,417 in the case of *Lipton*, is due predominantly to the weight of taxation, and the trading profits of the whole group, after depreciation but before tax, declined only from £992,833 to £849,948, against a total of £548,763 in 1938-39. Two of the three concerns are paying no dividend on ordinary shares, while *Meadow Dairy*, which fared best, is distributing the usual 5 per cent on ordinary shares. *Maypole Dairy* pay 4, against 7 per cent. *Lipton* only secured a credit in the carry-forward of £8,961 against £9,378 by transferring £20,000 from contingencies reserve, and *Home and Colonial* was forced to make a draft on general reserve of £48,000 to meet war damage contributions. It is significant that although none of the concerns appear to suffer from any shortage of liquid capital, the large excess of current assets has been reduced by some 8½ per cent. *Lipton* shows a rise in cash holdings in the balance sheet from £192,740 to £219,221 after repayment of a bank overdraft of £8,877, while the *Home and Colonial* balance sheet shows a rise in cash from £185,162 to £282,328.

THE PRUDENTIAL ASSURANCE CO. LTD.

Points from the Directors' Report and the Statement issued to the Shareholders by the Chairman

SIR EDGAR HORNE, Bart.

The 92nd ANNUAL GENERAL MEETING was held at Holborn Bars, London, E.C.1, 3rd April, 1941

ASSETS AND INCOME. The assets of the Company are now £364,854,580, of which over 93 per cent. are invested in the United Kingdom and the Empire. The income during 1940 was £56,048,786.

ORDINARY BRANCH. The net new sums assured were £20,945,502. On participating policies a bonus of £1 per cent. will be paid on claims arising by death or maturity of endowment during 1941.

INDUSTRIAL BRANCH. The premiums received were £25,178,307, being an increase of £1,368,273.

On participating policies a bonus of 16s. per cent. will be paid on claims arising by death or maturity of endowment during 1941.

GENERAL BRANCH. The premiums received were £2,422,474 arising from Fire, Sickness and Accident, Employers' Liability, Marine, Motor Insurance, etc.

APPROVED SOCIETIES. The total amount expended on benefits was nearly £4,600,000.

* Gross profits after EPT.
† Before deduction of £48,000 debited to General Reserve for war damage contribution.

In his annual review circulated with the report, the chairman, Sir George Schuster, points out that provision has in all cases been made for estimated tax liabilities of the group, but that, in fact, an appeal against the form of assessment has been lodged, and that there is some possibility of adjustment. Sir George puts forward a strong plea against assessment on the peculiarly disadvantageous EPT position of the group and also against disallowance of numerous heavy expenses in assessment for income tax. He also draws attention to the ridiculous position that, whereas the *Home and Colonial* would have been well placed in applying for an alternative standard, had they bought the subsidiaries outright, it is in a weak one by virtue of the fact that it acquired control by a purchase of shares, and that, in consequence, nothing is allowable for the cost of goodwill. The *Home and Colonial* 4s. ordinary shares declined from 2s. 9d. to 2s. 4½d. on news of the passing of the ordinary dividend.

THE STOCK EXCHANGES

London

Note: all dealings are for cash.

OPTIMISM, resulting from the excellent news in all theatres of war, found its greatest outlet, both before the week-end and on Monday in further rises for the funds and a buoyant home rail market. After moderate profit-taking, these stocks became more subdued and the upward movement was confined to selective buying of certain leading industrials, with breweries still depressed by budget fears. In general, the industrial market treated the improvement in the fortunes of war with the same stolid impassivity with which it has faced bad news.

*

In the gilt-edged market news of the coup d'état in Yugoslavia helped to raise 3½ per cent War Loan to 105½ on Friday, March 28, the highest level since 1937. Other significant rises were ½ for 3½ per cent Conversion and ½ for 4 per cent Consols and Local Loans. Further rises on Monday were largely cancelled by late profit taking, which continued on Tuesday when a large number of issues, including 2½ and 4 per cent Consols, 3 and 3½ per cent Conversion and 3½ per cent War Loan, lost ½. In mid-week, too, there were a number of losses in the order of ½. The foreign bond market remained firm throughout, Greek loans enjoying spectacular rises after the transformation of the Balkan situation. Thus, 7 per cent bonds improved 2½ before the week-end, followed by 2 points on Monday, thus bringing the price to 23. Egyptian Unified was also in demand, and a confident assessment of the influence of Balkan developments on Mr. Matsuo's conclusions encouraged many rises in Japanese issues. On Monday, the 5 per cent bonds of 1907 gained 1½ and the 6 per cent stock of 1924 ½ point. Later in the week, Czech and Belgian bonds reversed pre-week-end losses.

*

Last week's boom in home rail stocks lasted until Monday, when Southern 5

per cent guaranteed preference gained 2½ and Great Western 5 per cent consolidated guaranteed, 1½ points. There was also a continuation of the steady fractional gains in ordinary issues. The next day, despite profit-taking, in which Southern preferred lost 1 point and LMS ordinary ½, there was further buying of "Brum" senior issues. In mid-week the market ruled mainly quiet. The foreign rail market was characterised by a steady demand for Canadian Pacific preference and by a number of small gains among Argentine railways, in which BAGS was prominent.

*

The industrial market moved somewhat irregularly. Electrical equipment shares attracted attention and Associated Electrical Industries, British Insulated Cables, English Electric and Siemens all realised moderate gains. In the heavy industrial group, United Steel was consistently in demand. Stewarts and Lloyds deferred improved before the week-end, but later in the week eased somewhat in company with BSA and Babcock and Wilcox. The tobacco leaders were cheerful despite Budget fears, BATS and Imps staging gains of ½, though a number of breweries, including Watney deferred and Ind Coope, lost 1s. Brazilian Traction and Associated Portland Cement advanced, among miscellaneous industrials, and, in the textile section, Courtaulds and British Celanese moved irregularly in sympathy.

*

Kaffirs remained firm throughout the week, but showed a somewhat disappointing response to the encouraging war news. "Sallies" were in demand, rising ½ on Monday followed by ½ the next day, and there were also improvements in Crown Mines, Daggas and East Daggas and Grootvlei. Among tin shares, Mawchi and Tronoh gained a few pence, and, in the diamond market, De Beers deferred again put on ½ on Monday. There was still little activity among rubber shares, apart from small

British Oil and Cake Mills

In the calendar year 1940, British Oil and Cake Mills, which is now a controlled undertaking, working exclusively under the direction of the Ministry of Food, realised a further satisfactory increase in gross profits from £811,520 to £859,403 after depreciation, the highest level for the past decade. After the creation of a tax reserve of £25,000 and the payment of tax liabilities of £53,415, against £50,232, and after the allocation of £34,500 for estimated contributions under the War Damage Bill, the surplus earned for ordinary capital is reduced from £330,565 to £315,875, representing a rate of 9.0 against 9.7 per cent. The dividend is maintained at the 9 per cent distributed in the two previous years, despite the narrow margin, leaving the carry-forward slightly higher at £77,054 against £76,179. The vital social importance of the company's activities is clear at the present time, but the difficulty of obtaining raw materials must be expected to place a definite restraint on the upward movement of total earnings, from which taxation and war damage contributions will exact an increasingly heavy toll. The rise in stocks of raw materials from £406,428 to £665,073 is a welcome feature of the balance sheet. The reduction in both creditors and debtors, the latter by as much as £356,998 to £591,908, suggests that the company's official business has met with prompt payment, making possible a reduction in claims owing and an increase in cash holdings from £176,610 to £253,831. The ordinary capital is, of course, held exclusively by Lever and Unilever, which is undertaking responsibility for EPT on the earnings of its subsidiaries. The £1 cumulative preferred ordinary stock, carrying a dividend of 12½ per cent, at the current price of 38s. 1½d., offers a yield of £6 11s. 2d. per cent, the dividend being almost thrice covered by earnings.

setbacks for Malayalam and Rubber Trust at the end of last week. Oil shares were cheerful on hopes of a modification of EPT, a factor which served to raise Trinidad Petroleum Developments by ½ daily, and Trinidad Leaseholds were also quoted higher. Other issues remained more subdued, though before the week-end the ordinary shares of Anglo-Iranian, Shell Transport and Burmah Oil all improved.

New York

BEFORE the week-end, business declined to the extremely low level at which it continued during the present week. The undertone remained firm, and price movements, which were narrow, included many fractional gains for steel, rail and motor issues. Buyers, though encouraged by news of the British naval victory, remained cautious, and the continuance of U.S.A. labour disputes was a discouraging factor. Aircraft issues were somewhat depressed by rumours of working short time in view of shortage of raw materials.

In midweek, markets presented a somewhat nervous appearance and steel, rail and motor issues suffered moderate losses. The Iron Age estimates that steel mill activity is unchanged at 100 per cent of capacity.

(Continued on page 478)

Industry and Trade

The Need for More Coal

At a Conference of representatives of the Government and of the coal mining industry held in London on Thursday, March 27th, Sir John Anderson, the Lord President of the Council and the Chairman of the Cabinet Coal Committee, appealed for an increase in the national output at the rate of 25 million tons per annum. After a long discussion in which all the main economic aspects of the industry were surveyed a resolution was passed unanimously pledging the industry to put forth every effort of the national, district and pit organisations to secure the fulfilment of the Government programme. It would be idle to ignore the difficulties which must be surmounted if production is to be increased by something like 12½ per cent. The colliery owners are asking that there shall be no further drain on the man-power of the industry, that there shall be a more regular attendance of miners at work, and that transport facilities shall be adequate for the uninterrupted working of the pits; while the workmen, on the other hand, are asking for better wages as well as for effective safeguards against loss of shifts due to transport difficulties and want of trade. Moreover, the Mineworkers' Federation, at a meeting on April 2nd, decided to oppose the compulsory retention in, or return to, the industry of miners "unless satisfactory wage standards can be negotiated and some effective measure of workers' control of the industry is agreed upon." Action has already been taken by the District Conciliation Boards with a view to the improvement of local conditions directly affecting individual output. The industry had to face a similar problem last May, and under the direction of the Coal Production Council schemes were then drafted in many areas for raising production. The capitulation of France and the loss of nearly the whole of the European and Mediterranean export markets, however, removed the need for more coal, but the schemes are still available and capable of at least partial application in the present emergency. The problem, unfortunately, is being complicated by the agitation in some of the coalfields for a guaranteed working week or a guaranteed weekly minimum wage. It might, perhaps, be expedient temporarily to adopt this device, subject to necessary safeguards, if it carried with it the guarantee of a larger output; but it would be unwise to disregard the grievous effects on output of guaranteed minimum wages during the closing years of the last war.

* * *

Concentration in Cotton Trade

For the purpose of carrying out the slimming process in the cotton industry mills have been grouped into three categories. These are the nucleus mills which will continue to run, the mills that will be closed down shortly, and the mills that will be kept running temporarily and will later be grouped into one or the other of the first two categories. In order to assist in the solution of the labour problems arising from the closing of mills, the local advisory committees are to be appointed. These committees, which will consist of three representatives of the employers, an equal number of the operatives and of the manager of the local employment exchange, will advise the Central Consultative Committee on matters of principle, and the local employment exchanges, local employers, trade unions, and operatives changes, local employers, trade unions, and operatives on individual problems; the committees, in turn, will be kept informed by the Consultative Committee on the policy pursued by the industry as a whole. By this means it is hoped to facilitate the redistribution of labour in the national interest.

* * *

Cotton Prices and Margins

By the Control of the Cotton Industry (No. 19) Order, stocks of raw cotton in this country (except those in the hands of consumers) and all arrivals on or after April 1st will be requisitioned by the Government. Pending the formation of the company which is to undertake the purchase and distribution of cotton on behalf

of the cotton controller, the Liverpool and Manchester cotton associations have agreed to assist the controller by arranging for their members to release cotton to spinners in accordance with his instructions. Until further notice raw cotton prices will be maintained at the official maximum prices for March 31st, before the suspension of the futures market. By the Control of the Cotton Industry (No. 20) Order, the prices of American type yarns are to be determined by adding the prescribed margins to the price of raw cotton on March 31st. Until a comprehensive price schedule has been worked out, spinners of Egyptian-type yarn are required to base their yarn prices on the last cotton quotation available, adjusted for changes in the valuation for control purposes between the date of that quotation and March 31st.

* * *

Wool Export Organisation

The National Wool Textile Export Corporation has begun to survey its field of operations, and some of its plans were outlined last week by Mr. W. Thow Munro, chairman of its Trade Promotion Committee. An agreement on collaboration has already been reached with the International Wool Secretariat, to prevent overlapping and to increase the sum of money available for trade promotion. The Export Corporation itself is financed by the one-tenth per cent levy on purchases of wool supplied by the Wool Control for processing in the United Kingdom, but this is not expected to yield more than £100,000 a year. The Corporation covers all manufactures into which wool enters, ranging from carpets to knitting yarns. Committees are to be set up to deal with these diverse manufactures, each of which has its own problems. The Men's Apparel Council was the first to be set up, with the object of maintaining and extending London's position in leading men's fashions. It is hoped to form a similar body to deal with women's fashions, concentrating on the tailor-made type of fashion in which this country excels. America is the immediate concern of the Corporation. Great Britain provides only 1 per cent of the woollen goods consumed in the United States, and the aim is to increase this to 5 per cent. The United States market has a special value as a "prestige" market—once captured, other American countries follow. In view of the shortage of shipping space, the export of high-grade qualities should be the chief concern of the Corporation. Indeed, it is likely that large stocks of merino wools are available for the export trade, as Service requirements can be fulfilled from cross-bred materials, and the home civil market is restricted. The exporter succeeds only in so far as he knows his market, and for this reason one of the main functions

BANK OF LONDON & SOUTH AMERICA LIMITED

Affords a complete international banking service through its branches in

ARGENTINA, URUGUAY, PARAGUAY
CHILE, COLOMBIA, ECUADOR
GUATEMALA, NICARAGUA, PERU

of the Export Corporation is to study markets. What knowledge already exists is used to influence exports to meet the known demands, but the reports of the liaison officers who are being appointed should bring to light much information of the greatest assistance to designers and manufacturers. It should also be remembered that advertising can create demand for the goods we are best able to supply. The work of the National Wool Textile Export Corporation is still in an early stage, but it should be of considerable assistance to the export trade.

Retail Sales

In view of the importance of the distributive trades as a reservoir of war workers and of the consequent need for "concentration" in the industry, emphasized by the President of the Board of Trade in the House of Commons on Thursday last week, the returns relating to the average daily value of retail sales, compiled by the Bank of England from a representative sample, are of special interest. The table on page 467 shows the trend of sales in recent months by districts and by commodities. The value of sales of food and other goods compared with the same month in the preceding year is shown below from August, 1940:—

Percentage Changes from Preceding Year		
	Food and Perishables	Other Merchandise
1940 August	+ 5.4	+21.0
September	+11.5	+ 6.7
October	+ 5.2	+20.9
November	+ 0.3	+ 1.3
December	+ 0.8	+ 6.7
1941 January	+ 5.8	+ 8.8
February	+ 3.5	+ 1.8

While the fall in the volume of sales should facilitate concentration, the maintenance of the value of sales, which prevented a corresponding fall in profits, should ease the financial difficulties of the slimming process.

Record Nickel Production

According to the United States Bureau of Mines, world production of nickel amounted to 121,000 metric tons in 1939, against 115,500 tons in the preceding year. Simultaneously, world consumption advanced from 102,000 tons to 128,000 tons. In both cases the 1939 figures were the highest ever reached. In 1940 both production and consumption are estimated to have advanced by 10 per cent, although towards the end of 1940 the rise in production was slightly more marked than that of consumption. Since the outbreak of war America and Great Britain have been responsible for over 85 per cent of the world's nickel absorption, and in both countries the great bulk of consumption was accounted for by the armament industries. Nevertheless, allocations for vital civilian uses were continued, and some nickel was also sold under licence by the Canadian Government to civilian consumers outside the United States and Great Britain. Continental European countries, however, were cut off from overseas supplies, and as the small output of Greece has suffered from the war and the newly-developed mine at Petsamo in Northern Finland is not yet in operation—

COMMODITY AND INDUSTRY NEWS

The highlight of the week has been the removal of cotton from the trio of important commodities whose prices had been left free; only tin and rubber remain, though there are fears that they also may be controlled in the future. News of plans for the concentration of industry is scarce, though some cotton mills have already closed down and a census is being taken in the wool industry of the number of operatives and hours worked. The Government has decided that the maximum price of mixed (or "dredged") corn grown in 1941 shall be 13s. 6d. per cwt. It is announced that the £2 per acre grassland ploughing grants which were due to expire on March 31st have been extended to March 31, 1942.

Raw Cotton Prices.—The control price of cotton is the one at which the

Liverpool futures market finally closed on March 31—9.24d. per lb. for American middling. This is a higher price than has been obtained since January of last year, and it is to remain in force, at any rate until the end of this month. The increase appears to have been a reflection of the American rise which took place on March 28 and 29.

Tin and Rubber.—Licences for this month for tin exports to the United States and other destinations, show no appreciable change from previous months. On Wednesday tin prices reached a lower level than they have done for two weeks, at £268-£280 10s. per ton standard cash, with the three months forward price at £265-£265 5s. The trend of prices has been downwards, as was expected on the easier situation in the Far East.

Rubber prices, on the other hand, continue firm, closing on Wednesday at 14½d. per lb. spot smoked sheet. The level maintained during the past two weeks is the highest for some years. There are fears in the market that official control may be imposed, and the special sub-committee appointed by the London Rubber Trade Association is likely to seek means whereby this can be avoided.

Quota for Upper Leather.—The Control of Leather (No. 2) Order, 1941, Direction No. 3, limits the amount of upper leather that can be acquired without licence during the period April 1 to June 30, 1941, to 75 per cent. of the quantity acquired during the corresponding period in 1940. The Order

COMPANY MEETINGS

BANK OF SCOTLAND

SATISFACTORY RESULTS DESPITE YEAR'S DIFFICULTIES

STRONG AND LIQUID POSITION

LORD ELPHINSTONE'S ADDRESS

The annual general meeting of the proprietors of the Bank of Scotland was held within the Head Office, Edinburgh, on Tuesday, 1st instant. The Right Honourable Lord Elphinstone, K.T., Governor of the Bank, presided.

In submitting the directors' report, the chairman said: My Lord, Ladies and Gentlemen,—I assume that, as usual, we may hold as read the report by the court of directors of the affairs of the Bank as at February 28th last, a copy of which you have all no doubt received.

The directors much regret the loss by death during the year of Sir Robert Boothby, K.B.E., an esteemed colleague who had given valuable service to the Bank as a member of the board since August, 1922.

The year under review has been a difficult one for all, and as a bank we, like every other section of the community, have had to adapt ourselves to the changing conditions imposed by the war upon the life of the country. We have given our full share of support in financing the country's war needs.

THE BANK'S BALANCE SHEET

You will see that the deposits, which stand at £47,596,106, show an increase of £5,458,990 over the figures of a year ago. This is in large measure due to the expenditure by the Government for general war purposes which comes back to the banks from the recipients in the form of deposits. Another contributing cause of the increase is the restriction of supplies in many trades under conditions of war economy, which means that large sums which normally would be invested by businesses in stock in trade are at the moment lying in the hands of the banks.

The note circulation at £4,884,527 shows an increase of £893,285. This also is largely the result of heavy Government disbursements.

The changes in drafts issued and acceptances do not call for comment.

LIQUID ASSETS

The liquid position of the Bank has been well maintained. Cash, bank balances, documents in transitu, money at call, and short notice and bills discounted (including £250,000 of Treasury Bills) amount to £13,491,117, as against our liabilities to the public of £57,996,568. In addition we show as a further liquid asset this year a new item in Treasury deposit receipts, of which we held £5,000,000. As you are no doubt aware, the Treasury during the year instituted this new method of borrowing the surplus deposits of the banks. The deposit of borrowing the surplus deposits of the banks. The deposit of borrowing the surplus deposits of the banks. The deposit of borrowing the surplus deposits of the banks. There are also our investments, which amount to £29,289,722, giving in all a total of £47,780,840 in liquid assets against our liabilities to the public.

ADVANCES

Our advances at £9,617,247 show a decrease of £891,179.

As in the case of the increase in our deposits the decrease in our advances is due in large measure to war-time conditions. While we are giving extended accommodation to those concerned with the production and distribution of war supplies, as, for example, to manufacturers of armaments, to farmers

for the cultivation of additional land, and to contractors engaged in completing works of defence, the fact that the Government is itself financing directly so many of the national war activities besides restricting the holding of stocks of merchandise for home consumption, has on the other hand limited the borrowing needs of many of our customers. The result as indicated is that the total of our advances shows a decrease. All bad and doubtful debts have been fully provided for. Our investments, as was to be expected, show an increase and stand at £29,289,722. The market value of the investments is considerably in excess of the value in our books.

BANK PREMISES AND HERITABLE PROPERTY

While war conditions have continued to prevent the carrying out of certain contemplated reconstruction at some of our branches, the Bank's property all over the country has been maintained in good condition. The whole properties of the Bank stand in our books at £477,900, a figure which is much below the actual value.

RESULTS FOR THE YEAR

At £253,905 the net profits are £20,643 under those of last year. We are living in abnormal times, and these have brought heavily increased expenses, including among other items those due to staff remuneration and taxation. In addition, the curtailment of our advances and the small rates earned on much of our liquid funds have contributed to the decrease in profits.

	£
The nett profits are	253,905
Add: The balance from last year	153,467
	407,372
Deduct:	
Applied to reserve for contingencies	£70,000
Transferred to Trustees for officers' pension fund	30,000
Dividend at 11 per cent. per annum, less income tax	151,800
	251,800
Leaving to be carried forward	£155,572

BANK STAFF

Of the men on the staff of the Bank 403 have left for military service. That number represents 34 per cent. of our entire staff of men at the outbreak of war, and the indications are that we are likely to lose many more men in the near future. It is with regret that we record that out of this number three have made the supreme sacrifice, and we pay a tribute of honour to their memory. Nine are prisoners of war and eleven have been discharged from the Army as unfit for further service on account of wounds and other causes, and have been reinstated in the Bank's service. One has received the Military Cross for bravery in action, and we offer him our congratulations. To all of our staff, both men and women, on National Service we send greetings from this meeting.

Our remaining permanent staff and our temporary staff have responded admirably to the task of carrying on the essential services the Bank affords to the public under difficult conditions, and to them we express our thanks and appreciation.

Most of these, in addition to their Bank duties, are engaged in their well-earned spare time in voluntary work with one or other of the branches of National Service, and we appreciate with gratitude their devotion to duty and their service to the country.

A special word must be said regarding the staffs of our London offices. In the trying time which they have passed through since the autumn they have carried on their duties with courage and cheerfulness which call forth our admiration and thanks. We much regret that one of their number lost his life in a raid on London in January.

DIVIDEND

I now have pleasure in moving that the report and balance-sheet, as submitted, be adopted, and that a dividend for the past half-year at the rate of 12 per cent. per annum, less income tax, be now declared payable on 15th current, making with the dividend paid in October last 11 per cent. for the year, less income tax.

The motion was agreed to.

The Lord Elphinstone, K.T., and The Lord Henry Scott were unanimously re-elected Governor and Deputy-Governor respectively for the current year.

Mr William Whitelaw, LL.D., and Mr John Parker Watson, W.S., were re-elected ordinary directors.

Mr H. L. Usher, C.A., and Mr R. Arthur Morrison, C.A., were reappointed to conduct the audit of the Bank's books for the current year, and a vote of thanks to the chairman terminated the meeting.

BRITISH ALUMINIUM COMPANY, LIMITED

WORKING TO CAPACITY

At the annual meeting of the British Aluminium Co., Ltd., held at Shrewsbury on the 28th ultimo, Mr R. W. Cooper (chairman of the company) said that the whole of their efforts were being devoted to fulfilling Government requirements. All their establishments were operating to the fullest extent and considerable additions had been made. All their products were essential for munitions of war. In common with other industrialists they regarded with apprehension the effect of the Excess Profits Tax at the present level of 100 per cent. While fully recognising the national need for taxation on a high scale, the rate of this tax left no scope for expenditure essential in any progressive business, and it was depleting liquid resources. They felt that the urgent necessity for revision, in the interests of the future welfare of the country should be recognised. Any proportion which might be freed should not be used for distribution in dividends but retained in the business. The normal rates for depreciation allowed by the Inland Revenue were quite insufficient under existing conditions. Plant and machinery were being operated continuously, giving rise to exceptional wear and tear, and heavy replacements were called for at a cost much in excess of the depreciation allowances. They hoped and believed that this important question would receive sympathetic consideration.

NORWEGIAN AND FRENCH ASSETS

The invasion of Norway and France had deprived them for the time being of their interests in those countries, and it was impossible to say what the value of their assets in these enemy controlled territories might be at the end of the war. They had transferred £100,000 out of the profits of the year to the reserve account, raising it to £2,950,000, and they had taken the precaution of earmarking £500,000 of that account against these assets, fully covering the value at which they stood in the books. They had in addition left upstanding in the accounts the amounts they owed to these subsidiary and associated companies in current account at the date the enemy invaded Norway and France. Dealing with other items in the accounts, he said that capital expenditure during the year amounted to £224,091. Investments in subsidiary companies increased by £51,289 to

£6,185,516, and in allied companies by £287,860 to £1,288,638. Securities were £140,000 higher by purchase of Government bonds. Stocks at £745,208 showed a decrease of £42,719. Cash at £900,652 was reduced by £343,222, but sundry debtors had increased by £472,581 to £1,276,732. The trading profit, after reserving for Excess Profits Tax, amounted to £900,602, as against £1,058,772 in the previous year. Interest and dividends received were lower by £5,415, and the total profit for the year was £912,211, as against £1,075,796, a reduction of £163,585. They recommended a final dividend of 7 per cent. on the ordinary stock, making 10 per cent. for the year.

About 100 of the staff and 700 other employees were in the armed forces; a considerable number had been lent to Government departments, and many were enrolled in the Home Guard and Civil Defence. The much depleted staff and employees had particularly strenuous work and had responded wholeheartedly. National Savings Groups had been established at their head office and all their works.

The report was adopted.

GOODE DURRANT AND MURRAY, LIMITED

The forty-second ordinary general meeting of Goode Durrant and Murray, Ltd., was held on the 31st ultimo at Hindhead, Surrey. Mr J. Hewitt, who presided, said: I must express the Board's regret at the delay in producing the company's balance-sheet for the year ended July 20, 1940, the necessary documents for the completion of which had not arrived from Australia. Furthermore, we were faced with the knowledge that the Australian Government were about to introduce new taxation, and since that time additional taxation has been imposed. Unfortunately, we were unable to earn sufficient profit entirely to wipe out the debit balance of £32,758 brought forward from 1939. This, however, has now been reduced to £13,746, and we have every reason to hope that during the present year this debit will be entirely eliminated. Our stocks show an increase of £102,085, due to the rise in value of merchandise and to the greater quantity of goods taken into stock before the commencement of the season. Our increased turnover is reflected in the increase in sundry debtors and bills receivable.

The balance of the debt due to us by the C.T.C. Bazaars (S.A.), Ltd., is £146,260, after deducting £25,811, the amount received as a distribution of 3s. in the £. Since the date of this balance-sheet a further dividend of 2s. in the £, amounting to £17,207, has been received, and at the present moment negotiations are proceeding for a Debenture issue by the C.T.C. Bazaars (S.A.), Ltd., which should result in a further distribution of 10s. in the £ to all the creditors. Your directors feel that, providing no dislocation of trading in Australia is experienced, a further definite improvement in the company's balance-sheet for the current trading period should result.

The report was unanimously adopted.

To Overseas Readers

Overseas readers may find that, in the disturbed conditions of wartime, *The Economist* does not reach them quickly enough, or that they require more detailed information on individual markets or special topics than can be compressed within the limited space permitted by the necessity to economise paper.

The attention of our readers is therefore drawn to *The Economist's* Intelligence Branch, which is prepared to meet the need for a rapid and objective appraisal of commodity markets, industrial prospects, political factors and other topics of vital concern to the business man. These special services consist of regular cables or mail reports, or both. They are designed to meet individual requirements and are confidential and exclusive to each client.

Enquiries should be addressed to the

Intelligence Branch,

THE HOME AND COLONIAL STORES, LIMITED

SATISFACTORY TRADING RESULTS

INEQUITABLE TAXATION OF COMMERCIAL UNDERTAKINGS

PLEA FOR EXPERT AND IMPARTIAL INQUIRY

SIR GEORGE SCHUSTER'S ANNUAL REVIEW

The forty-sixth ordinary general meeting of the Home and Colonial Stores, Limited, will be held in London on April 25th.

The following is a summary of the statement which will be issued by the chairman of the company, Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P., in lieu of a full speech:—

TRADING RESULTS

The trading profits for the past year can, in the circumstances which have prevailed, be regarded as distinctly satisfactory. The consolidated group trading results included—subsidiaries, together with receipts from other holdings and investments. These show that the group trading profits for the last three years after providing for allocations for depreciation, renewals, etc., but before providing for taxation, worked out as follows:—

	£
1938	548,763
1939	992,833
1940	849,948

As I explained last year, the results for the first nine months of 1939 showed that the reorganisation plan started at the end of 1935 was beginning to bear fruit, and although in the last three months profits were swollen as a result of the very heavy public buying at the beginning of the war, we should even without this have had a very good year. For 1940 conditions have been much affected by war measures, rationing and Government control. Nevertheless, the results confirm our view that if it had not been for the war our reorganisation would have proved its success and profits might well have been appreciably higher than those actually earned. The provision, however, for taxation has been so heavy that, although we were able in 1938 to pay 3 per cent. on the ordinary shares and strengthen our group reserves and carry-forward by £86,000, for 1940 with trading profits £300,000 higher we can pay no ordinary dividend and can only meet our prior charges by depleting our reserve by about £48,000. I shall deal fully with the taxation position in a later paragraph.

As to the future trading prospects it is difficult to make any reliable forecast. Our power to earn profits depends entirely on the availability of supplies and Government policy as regards rationing and price control. It seems safe to predict that conditions will be more difficult in 1941 than they have been in 1940.

ADMINISTRATIVE AND STAFF ARRANGEMENTS

The chairman went on to state that administrative arrangements, including alternative office accommodation, had worked satisfactorily, while the directors wished to record their appreciation of the splendid way in which the staff at head offices, warehouses, factories and branches had carried out their duties in war conditions. There had been substantial changes in the composition of the branch staff. Taking all the associated companies together, up to the end of 1940 7,725 male employees had left their service, of whom 6,000 were enrolled in H.M. Forces. In replacement 6,250 women employees had been recruited and trained. The companies were at all times willing to help the national effort, but he hoped that the Government would make it clear that women who had replaced men in the

important business of food distribution would be encouraged to remain in their occupation until there was a realised and urgent demand for munition work and all other sources had been exhausted.

NUMBER OF BRANCHES

In view of the contraction of business, a policy of judicious concentration had been carried out, and the companies of the group had closed in all about 140 branches since the beginning of the war. He trusted that if the President of the Board of Trade proceeded with the concentration of the retail trade on the lines of the plans for the concentration of industry, account would be taken of the concentration which these companies had already effected.

TAXATION POSITION

The chairman proceeded to review the taxation position, explaining that final assessments for Excess Profits Tax and income tax had not yet been made and that the company's liability was still under discussion. While they hoped that these discussions might be favourable, nevertheless the figures provided in the accounts were based on advice received as to the interpretation of the existing provisions.

"I wish to emphasise," the chairman proceeded, "that I make the following observations in no spirit of complaint against heavy burdens. Heavy burdens are necessary at this time, since the money has to be found for the national effort and there must be no complaint by any section of the community against bearing its fair share. But I venture to think that the experience of our company indicates that in some respects the methods by which taxes are at present assessed and levied on commercial undertakings may in the long run prove contrary to the national interest."

HEAVY DRAIN ON CASH RESOURCES

"The position has been presented very clearly in the two analytical tables which are included in the directors' report. I have already given a comparison between 1938 and 1940 based on these tables. But perhaps a still more striking result is that in 1938 out of total group profits of £548,000 taxation provision took £188,000, leaving a net balance of £360,000 available for distribution or addition to reserve, while for 1940 out of profits of £850,000 no less than £712,000 was required for taxation, leaving a net free residue of only £138,000."

"I may add that, as already explained, the extra £300,000 earned in 1940 does not represent 'war profits'; that as a result of the taxation provisions it is only possible to meet our prior charges by drawing on reserve to the extent of £48,000; and, lastly, that the parent company and its two main subsidiaries have to provide £82,500 to meet the proportion of the estimated War Damage Contributions attributable to the period ending December 31, 1940. It is to the heavy drain on cash resources involved in these results that I wish to direct special attention."

EXCESS PROFITS TAX

The main reason for increase of taxation was, of course, Excess Profits Tax. It had been clear from the outset that this

would work out harshly in their case because the standard years, 1935-37, were the years of the company's reorganisation, when profits were abnormally low. In fact the average annual figure of group profits for these three years was about £470,000 less than the average for the preceding four years and about £500,000 less than for the subsequent three years. The possibility of such hard cases had been recognised in the Finance Act, which allowed for an appeal for an alternative standard which might be based on a rate of interest on the capital employed in the business. But here again this group was apparently in a specially unfortunate position. For the purpose of assessing its capital it had to bring in not the shares which it holds in its wholly owned subsidiaries (such as Lipton and Meadow) but the actual assets of such subsidiaries. An important element in the purchase price of the subsidiaries when acquired was payment for goodwill; but as the acquisition was effected not by a direct purchase of the undertaking from the shareholders but by a purchase of their shares, the goodwill was in effect paid for by paying a premium on the shares. As a result, goodwill was not shown as an asset in the balance-sheet. It had, however, in reality been paid for and ought to be included. If the goodwill asset were included there would be an improvement in the company's profit standard of about £180,000. This would substantially improve the position, though even then the standard would not be brought up to what might fairly be regarded as normal earning power. The company was pressing to be allowed to include the goodwill item in its capital, but it was questionable whether this could be done without amending legislation.

INCOME TAX

Income tax provisions as at present interpreted also operated very harshly on the company. The figures in the report showed that the company was making a reservation of £122,139 for income tax, this of course being additional to the tax to be borne by shareholders on the dividends paid out to them. The main reason necessitating this provision was that the Revenue authorities refused to treat as expenditure chargeable against profits a number of items which it was necessary to provide for before arriving at true profits. The amounts thus provided had been carefully calculated according to what was required to finance repairs, replacements and renewals and to maintain the value of the company's assets, and the provision did not represent an attempt to build up hidden reserves, but was no more than what ordinary prudence dictated. After explaining the nature of the disallowed items the chairman went on to state that the total net amount of these in the past year's accounts for the whole group amounted to about £141,000. The result of this disallowance was extremely onerous, for sufficient cash had to be earned to provide £141,000 after payment of income tax.

The problem of the income-tax burden on the "disallowed" items had, of course, always existed, but it had become very much more serious now that the tax had reached its present high rate. To illustrate this the following example might be taken. If the "disallowed" items were £150,000 and the rate of income tax was 5s. in the £, then it was necessary to earn profits of £200,000 to provide the net sum of £150,000. But if the tax was raised to 10s. then a gross sum of £300,000 had to be earned in order to provide the same net sum of £150,000. In other words, an additional £100,000 had to be earned. But with Excess Profits Tax at 100 per cent. there was no chance of earning any additional profits.

COMPULSORY WAR DAMAGE PREMIUM

The drain on the company's cash resources in taxation would be further increased by war damage contribution payments. The total required in contributions up to August 31, 1941, from the Home and Colonial Stores and its main subsidiaries were estimated at about £122,000. Of this, £82,500 represented the proportion payable up to the end of 1940 (£35,000 for Home and Colonial, £22,500 for Lipton, and £25,000 for Meadow). No complaint could be made about the Government scheme, but the fact that these contributions were not allowed as an expense deductible from profits before assessment of Excess

Profits Tax and income tax made it impossible for a company subjected to an Excess Profits Tax burden such as he had described to provide for these payments out of revenue except at the cost of failing to meet its prior charges. To provide a cash sum of £82,500 from taxed revenue with income tax at 8s. 6d. it would be necessary to earn an extra trading profit of £143,500. Excess Profits Tax, however, made this impossible. In the circumstances the directors proposed to make the provision from reserves and to review the position when the Government scheme was reconsidered after August 31, 1941.

INEQUITY OF TAXATION PROVISIONS

Proceeding, the chairman said: I have dealt with these matters at some length because I think it important that the shareholders and the public should realise what the present taxation provisions involve. There are two main points to be brought out. The first is that the Excess Profits Tax provisions are so framed as to work out in a most inequitable way as between one company and another. The second is that the combined effect of (a) Excess Profits Tax on its present basis, (b) the method by which liability for income tax is assessed, and (c) the compulsory levy of war damage contributions which are not allowed as a business expense, may be to drain the financial resources of business undertakings in a manner which may gravely prejudice their power to cope with the difficulties which will arise with the prolongation of the war and in the post-war period.

To ask the Government to give serious attention to these two points does not imply any unreadiness to accept a proper share in burdens necessary to finance the war. The burdens have got to be borne; but it cannot be right, nor in the long run can it be in the public interest, that these burdens should be distributed with clear inequity as between one particular undertaking and another.

A DANGEROUS AND FICTITIOUS SITUATION

It cannot be in the public interest that taxation should lead to unsound business. I wish to represent very emphatically that taxation methods should not be so framed as to make it impossible for efficiently conducted undertakings to maintain a sound financial structure by making adequate provision for repairs, replacements and renewals. It may be that in time of war it is in the public interest that actual expenditure on these purposes should be curtailed or deferred, and if, as might happen in some cases, surplus cash balances are built up as a result, there might well be compulsory provisions for the investment of these in Government securities. But if business undertakings are prevented from making proper financial provision year by year for normal repairs and replacements, then the whole economic enterprise of the country may find itself ultimately in a dangerously weak position which might even require State intervention on a large scale. I do not wish to exaggerate the effect of the existing measures, but, judging by our own position, I feel that there is strong ground for saying that to force business undertakings to make disbursements for tax payments on the present scale—which often can only be provided for by borrowing—must tend to create a fictitious and dangerous situation, fictitious in the sense that it is not providing genuine means for paying for the war and dangerous because it is likely to undermine the financial stability of the business structure of the country.

IMPARTIAL ENQUIRY URGED

There are many other issues, particularly the effects on efficiency and economy in operation of levying Excess Profits Tax at 100 per cent. These issues are of great importance, but I deliberately refrain from enlarging on them, partly because they have been much ventilated by others, and partly because they are not of such material significance in our own case as those which I have mentioned. Our object is to maintain the efficiency of our organisation and the support of the public, so that when we revert to normal conditions our capacity to maintain a good business (including the power to pay good wages and to earn reasonable dividends) remains intact. The

ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

GRATIFYING RESULTS

The forty-first annual general meeting of Associated Electrical Industries, Limited, was held, on the 1st instant, in London. Sir Felix J. C. Pole (the chairman) presiding.

The chairman, in the course of his speech, said: Dealing now with the accounts, you will see from the profit and loss account that the gross profit for the year was £1,709,695, compared with £1,470,263, an increase of £239,430 or 16.2 per cent. over the previous year. After charging £261,283, against £234,956, for depreciation of the plant, etc., of Metropolitan-Vickers Electrical Company, Limited, and £992,900, against £758,226 for taxation, the net profit was £21,571 lower at £455,512. You will note that we are nearing the million mark for taxation, having provided out of our profits £992,900, or 58.2 per cent., against 51.6 per cent. a year ago, an increase of £234,674.

As I have said, the net profit for the year was £455,512; to this has to be added £253,118, the balance brought forward from the previous year, making a total profit available for distribution of £708,630. From this we have again appropriated £100,000 to the dividend equalisation reserve account, increasing it to £400,000, as to which I may repeat what I have said at former meetings that our policy is to keep dividends on an even basis and thereby to retain the interest of a stable body of stockholders. The equalisation reserve now represents a little over 14 per cent. gross on our ordinary issued stock.

After providing for dividends on preferred stock £60,152, there remains £548,478, and your directors recommend a dividend on the ordinary stock of 10 per cent. per annum, less tax, leaving a balance to be carried forward of £265,472, as compared with £253,118 brought in from the previous year.

BALANCE-SHEET ITEMS

Dealing now with our balance-sheet: You will see that creditors, loans, accrued charges and reserves for contingencies (£5,488,567), and amounts owing by subsidiary companies (£123,814), a total of £5,612,381, show an increase of £1,737,074. The loan from bankers was paid off last year.

On the assets side shareholdings and debentures in subsidiary companies and investments other than in British Government securities total £4,208,436, a decrease of £111,281, the reduction being due mainly to writing down the book value of certain investments. The total book value of our investments, however, is very substantially below their real worth.

The stocks and materials on hand, debtors, etc., amounting to £6,550,323, show an increase of £1,181,849. Cash and British Government securities at £964,061 show an increase of £492,099.

We have again published a consolidated balance-sheet showing the position of the associated group as a single unit. The most important feature to which I should direct your attention is the strength of the group as reflected by the capital reserve account and the general reserves and profit and loss accounts, which items have increased by £220,240, to £3,552,851, a total which represents 72 per cent. on our ordinary capital.

DEEDS MORE IMPORTANT THAN WORDS

In present circumstances you will not expect me to say much about our activities. We are living in a time when deeds are more important than words. I may tell you, however, that when the Government urged manufacturers to speed up production there was a most gratifying and enthusiastic response at all the works. We are very busy, and our sole object now is to play our part in making the greatest contribution in our power towards winning the war. When peace is restored I am sure we shall be equally active in maintaining our position as leaders in the electrical manufacturing industry.

It is customary at our annual meeting to express thanks to our executive directors, officers, and all ranks and grades of employees. This year I feel that if possible we should do this even more heartily than usual, because most splendid service has been rendered throughout a trying year. Work has been well and cheerfully done, often in dangerous conditions, and I cannot speak too highly or sufficiently express appreciation of this.

The report and accounts were unanimously adopted.

fact that during the war the profits of the business go to the Government rather than to the shareholders—though keen sympathy is felt for the shareholders—does not influence our administration. What I have been pleading for is that the Government which has now in effect stepped into the position of being our sole ordinary shareholder should not force us to distribute to itself in cash far more than we know to be consistent with the prudent conduct of our business.

The points which I have raised concern the income-tax position just as much as Excess Profits Tax and their force will remain even if there should be some reduction in the latter. What, in conclusion, I wish very strongly to urge is that the Government should take steps to have an expert and impartial inquiry made into the effects of present taxation on the efficiency and stability of this country's manufacturing and trading organisation.

CONFIDENCE IN THE OUTLOOK

In conclusion the chairman said that they intended to do their utmost to maintain full payment of their prior charges, drawing on reserves if necessary, but that they regretted that in spite of very good trading profits the payment of a dividend on the ordinary shares had been impossible and appeared likely to remain so until the present taxation measures were modified. Looking ahead, however, the most important matter from the shareholders' point of view was to maintain the organisation and goodwill of the companies unimpaired and even to take advantage of war difficulties to improve it. That was the subject of their constant attention, and if that could be done the shareholders would reap the reward when the war was over, and that was in the long run of far more importance than the level of dividends during the war. In that spirit they felt that the shareholders could look forward to the ultimate future with cheerful confidence.

BEIRA RAILWAY COMPANY, LIMITED

INCREASED TONNAGE CARRIED

The fortieth ordinary general meeting of this Company was held, on the 1st instant, in London, Mr. Arthur E. Hadley, C.B.E. (the chairman), presiding.

The chairman, in the course of his speech, said: The gross revenue at £905,967 was £65,071 lower than that of the previous year, but as expenditure was also lower by £20,043 the net revenue declined by £45,023 only. This reduction in expenditure in face of an increased tonnage carried must be regarded as very satisfactory. The percentage of expenditure to receipts increased by only 1.2 per cent. to 49.9 per cent., which is still on the low side.

The decrease in gross revenue was principally due to the decline of import traffic, on which we get higher rates than on exports.

The net earnings from the line amounted to £453,005, a decrease of £45,023 on last year, to which I have already referred.

The result of the year's working is a surplus of £125,749, and, adding £47,785 brought forward from the previous year's account, there is a total available surplus of £173,534. It is proposed that a dividend of 2s. per share, less tax at 5s. 5d. in the pound, be paid, absorbing a gross amount of £105,000; that £20,000 be transferred to dividend equalisation reserve, making that reserve £100,000; and that the balance of £48,534 be carried forward to next account.

With respect to the current financial year, we have had up to the present traffic receipts for four months—October, 1940, to January, 1941. Net earnings for these four months amounted to £186,577, as compared with £148,304 in the previous year, or a decline of £11,727. There has been up till now little or no improvement in import traffic, but export traffic continues good. It is impossible for me in present conditions to foretell what may happen to traffics in the next few months, but an improvement in imports would make a substantial difference to our net receipts.

The report and accounts were unanimously adopted.

MAYPOLE DAIRY COMPANY, LIMITED

DIFFICULTIES OF WAR-TIME TRADING

PENALISING EFFECTS OF TAXATION

SIR GEORGE SCHUSTER'S REVIEW

The forty-third ordinary general meeting of the Maypole Dairy Company, Limited, will be held in London on the 25th instant.

The following is a summary of the statement which will be issued by the chairman of the company, Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P., in lieu of a speech:—

TRADING RESULTS

The trading profits for the past year may, considering the conditions which prevailed, be considered very satisfactory. The table set out in the directors' report shows in fact that the net trading profit for 1940, after making full provision for depreciation but before providing for taxation, was £393,531—an amount almost exactly equivalent to the profit for 1938, when the company was able to distribute a dividend of 9 per cent. on the deferred ordinary shares. I feel it right to explain, however, that many of the factors arising out of the war which affect the company's position only began to operate as the year progressed, and we find ourselves at the beginning of 1941 facing a situation of considerably greater restriction and difficulty than that which existed in the early part of 1940. The Maypole Company has always specialised in certain main lines—butter, margarine, cheese, eggs, tea and jam—and as specialists has attracted a very large trade in these commodities. Butter, margarine and tea were subjected to rationing during 1940. Cheese and jam are now to follow, while eggs have been in short supply, and the loss of the company's Danish stations has inevitably affected this section of the business. The company's field of trade has thus been much restricted by war conditions, and the full effect of these restrictions has not yet been felt.

NEW LINES INTRODUCED

As against this, a number of new lines have been introduced with encouraging results, though it is not to be expected that new lines, especially in present conditions, could in any sense replace the loss of turnover in the company's principal commodities. No opportunity is, however, being missed for replacing turnover lost on the standard lines.

The company's egg collecting and packing stations at Worcester, Preston and York have rendered useful service in helping to keep "Maypole" branches supplied with first-grade home-produced eggs. This service has proved especially helpful both to the company and its customers in view of the reduction in supplies of imported eggs.

The removal of a section of the head office staff to the provinces has now been followed by the transfer of practically the whole headquarters organisation to the provincial office. The arrangements have been well planned and are working most satisfactorily.

TRIBUTE TO STAFF

The company's staff (head office, inspection and branch staff) have as always done admirable work and have shown up especially well on occasions of air raids. Managers and staff have responded with willingness and enthusiasm to all special calls, while punctual attendances in spite of transport and other difficulties have been a notable feature. The directors feel sure that the shareholders will be glad to know how well the staff have served their interests.

The staff position generally has been affected by restriction in trade and the calling up of large numbers of male employees for service with H.M. Forces. While, therefore, on the one hand, close attention is being given to the call for rigid economy in expenditure, it has at the same time been necessary to make provision for the engagement and training of a large new female staff. By the end of 1940, 1,622 members of the Maypole staff (not including subsidiaries) had joined H.M. Forces. Altogether 2,520 members of the male staff have left the company's service since the beginning of the war and 1,122 have been added to the female staff, including those engaged just prior to September, 1939, in anticipation of the calling up of male staff.

BURDEN OF TAXATION

I have left until the end the matter of taxation, although in fact this has been far the most important factor affecting the profits available for distribution to shareholders. In order to show the situation clearly we have this year included with the directors' report and accounts two tables showing the results for the last three years in a way which brings out how the burden of taxation has increased. Perhaps the most striking fact brought out is in the second table in comparison between 1938 (the last complete pre-war year) and 1940. It happens that the net profit after providing for depreciation was almost exactly the same in the two years. In 1938 taxation payable by the company and its shareholders absorbed in round figures £133,000, leaving £262,000 available for the shareholders and for strengthening the company's reserves, whereas in 1940 provisions for taxation absorb £262,000, leaving a free residue of only £131,000. These figures, moreover, take no account of the cash required for compulsory War Damage contributions.

EXCESS PROFITS TAX

The most important item of increased taxation is the Excess Profits Tax. The company's position here is not a very fortunate one, as the average annual profit for the standard years (1936 and 1937) amounted to a figure definitely less than what could fairly be regarded as the company's earning power in normal conditions. The profits, therefore, which in our case attract Excess Profits Tax can hardly be said to represent true war profits. I have already called attention to the fact that the trading profits shown in the accounts for 1940 are almost exactly the same as those for 1938, and yet it is necessary to reserve £105,000 for Excess Profits Tax (calculating this at 90 per cent.—that is, on a basis of 60 per cent. for one quarter and 100 per cent. for the remaining three-quarters of the year). The company's assessment has not yet been finally agreed and is still under discussion. The directors are, however, advised that on an interpretation of the provisions which may be adopted this reserve of £105,000 is not excessive.

INCOME TAX

The company's position is also greatly affected by the way in which the Revenue authorities calculate the amount of profits liable to taxation, and this concerns not only Excess Profits Tax but income tax. As regards income tax, for example, shareholders who themselves have to pay the tax on that part of the profits which is distributed to them in dividends may find it difficult to understand why, in respect of 1940, it has been necessary for the directors to reserve a further

sum of £75,000 in the accounts to meet income-tax liabilities. The position is a complicated one; but it may be stated as follows. Income tax is not assessed on the profits of the business calculated in accordance with ordinary prudent commercial practice, as certain items of expenditure and other provisions which a business must debit to revenue if it is to maintain its liquid resources and show its capital assets at their correct current value are disallowed for purposes of income tax. The result is that tax is levied on a figure in excess of what the directors consider they can fairly represent as true profit. Apart from the question of war damage expenditure, which requires special explanation, the principal items of "disallowed" expenditure occur under the headings of amounts written off in respect of fittings of closed shops, depreciation of shop fittings in excess of renewals allowed, depreciation of properties and special expenditure in connection with A.R.P. shelters which is only partly recoverable by Government grant in certain special cases.

"DISALLOWED" EXPENDITURE

In the 1940 accounts the net amount which is likely to be "disallowed" is £61,766. This has a very important effect on the position with income tax at the present high rate of 8s. 6d.; direct tax on this sum at this rate amounts to £26,250, but the full effect can be more clearly seen by taking the actual figures in the 1940 accounts. After deducting from the net trading profit of £393,531 the sum of £105,000 reserved for Excess Profits Tax and £193,833 representing dividends paid or recommended, there remains a balance of £94,698, to which the shareholders might have looked for further dividend. Income tax, however, on this figure requires £40,248, while income tax on the disallowed items, as already stated, absorbs £26,250. Arrears of tax due to adjustments for past years call for a further £8,502. These three items together make up £75,000, which leaves a free balance of only £19,698, out of which £10,000 has to be set aside according to the articles for allocation to reserve, leaving a balance of £9,698, which is more than absorbed by the necessary allotment of £10,000 to the provident fund. The whole of the £94,698 is therefore absorbed—mainly by income tax requirements.

No public-spirited citizen can object to paying heavy taxes in present times, for the money required for the country's war effort must somehow or other be raised. It does, however, appear legitimate to question whether the present methods of levying taxes on commercial undertakings are not likely in the long run to be damaging to the country's interests. That question in the case of the Maypole Company arises particularly in connection with the way in which the provisions for refitting and maintaining the branch fixtures and fittings are treated. It is here that the most important item of disallowed expenditure occurs. For instance, in the case of expenditure on refitment and repairs to branch fittings the basis adopted by the Revenue Authorities in the case of this company is that only money actually spent in any year is to be allowed as expenditure. In 1940 much less than the average amount required has been spent, but further provision has been made in the accounts to cover the difference. The money will have to be spent at some time, and to leave the accumulated liability to be met out of possible earnings in some future year would be very unsound practice. We consider that a strong case can be made out for allowing such provisions as a deduction from profits for tax purposes, but it is understood that, although some measure of relief may be given for Excess Profits Tax, no relief will be allowed for income tax until the money is actually expended.

WAR DAMAGE COMPENSATION

In addition to the cash required for meeting tax liabilities, provision has also to be made for compulsory payments under the Government's War Damage Scheme. We estimate the total liability of the Maypole Company and its subsidiaries for contributions covering the period from the beginning of the war to August 31, 1941, to amount to £51,000. The proportion of this sum falling to the period up to the end of the last trading year would be about £35,000, which amount we are providing as a charge against reserve. According to the Government's

scheme, this item is not allowable as a deduction from revenue for the purpose of Excess Profits Tax and income tax. In the circumstances the directors have considered that, having regard to the provision already made in the accounts for repairs and renewals in excess of actual expenditure, it would have put an undue burden on the shareholders if they had in addition recommended providing the War Damage contribution from revenue as well. This is an occasion where the conservative policy which has been followed in the past as regards the distribution of profits appears to justify some recourse to reserves in order to maintain a small dividend on the deferred ordinary shares. The future, however, as regards War Damage is still uncertain and, if the war continues, the Government will have to reconsider its scheme after August 31, 1941. It may be necessary then for the directors to review the matter as regards future policy. I may add that during the past year emergency repairs have been carried out in the case of damaged branches, and the cost of these, amounting in all to about £7,000, has been debited to the accounts as a working expense. This sum, it is anticipated, will eventually be recovered as compensation under the Government scheme.

BOARD'S POLICY

In proposing the allocation of profits the directors have endeavoured fairly to meet the interests of the shareholders, and to go as far as possible without risking any undue weakening of the company's financial resources. We greatly regret that it has been necessary to make a cut in the dividend from 7 per cent. to 4 per cent., but this necessity is more than accounted for by the taxation position. The future may bring greater difficulties, but the directors feel that the most important point of all is to maintain the organisation and goodwill of the company unimpaired and even to improve it. If that can be done, the shareholders will reap the reward when the war is over, and that is of much greater importance than the level of earnings during the war. In that spirit we feel that the shareholders can look forward to the ultimate future with complete and cheerful confidence.

VICKERS LIMITED

SEVENTY-FOURTH ANNUAL GENERAL MEETING

The annual general meeting of Vickers Limited was held on the 3rd instant at Vickers House, Broadway, Westminster, presided over by Mr. A. A. Jamieson, the chairman of the company.

The chairman's statement, circulated with the accounts, contained the following remarks:—

I can give my assurance that the whole strength and energy of this group of companies are directed to ensure that punctual deliveries of our products are made to the Service Departments.

The accounts submitted are evidence that the business affairs of the company are in sound condition and only two items appear to require elucidation. Firstly, the Metropolitan-Cammell Company repaid the balance of debenture stock outstanding; secondly, the dividends on the preference stocks are shown this year after deduction of tax.

I desire to acknowledge the co-operation of the Service Departments in our efforts to carry on production in spite of the difficult conditions inevitably existing in war-time, and I record with real gratitude the courage and determination of those of our workpeople who have faced severe trials. The work of those employees who have given up their leisure to train themselves in A.R.P. duties has proved invaluable in emergency.

During the past year there have been many difficulties to overcome, but the staff and workpeople in this group of companies have proved that they are competent to foresee and to overcome difficulties which appeared to be truly formidable.

Schemes have been formulated for each of the works in order to encourage savings in War Savings Certificates, and more than 600,000 Certificates have been applied for through the medium of these schemes during 1940.

At the request of the Government the services of Sir Charles Craven were placed at their disposal in May; at my request he was released in November from his duties with the Government in order to resume his position with this organisation.

The report and accounts were unanimously adopted and the final dividend of 6 per cent. approved.

BRITISH INSULATED CABLES,
LIMITED

TRADING PROFIT MAINTAINED

The forty-fifth ordinary general meeting of British Insulated Cables, Limited, was held on the 1st instant, at Liverpool, Mr T. H. Martin-Harvey (acting chairman of the board and joint managing director) presiding.

Before proceeding with the business of the meeting, the acting chairman referred in sympathetic terms to the sudden death, on March 21 last, of Mr. J. McKay, a member of the board.

The following is a summary of the statement circulated with the directors' report and accounts: Before dealing with the accounts for 1940, there are several matters relating to personnel which call for special mention. The first is to record the absence of the chairman of the board, Sir Alexander Roger, in India, who deeply regrets his inability to be present at the annual meeting. The second is to refer to the death, in October last, of Mr G. H. Nisbett, deputy-chairman of the board. Mr T. H. Martin-Harvey and Mr W. Travis, both of whom joined the board in 1935, were appointed joint managing directors as from June 1, 1940.

PROFIT AND LOSS ACCOUNT

The profit and loss account for the year to December 31, 1940, shows that the profit on trading, dividends on investments, etc., after providing for taxation and contingent reserves adjustment, amounted to £786,232—a result which shows practically no change from the corresponding figures for 1939 and is considered by your directors to be satisfactory.

The amount brought forward from 1939 of £488,305, added to the profit for 1940 of £786,232, gives a total of £1,274,537. Depreciation of fixed assets absorbs £209,622, and, after providing for directors' remuneration, interest on debenture stock (which naturally shows a very substantial reduction as a result of the redemption of the debentures on January 4, 1940) and the dividends already declared and paid on the preference and ordinary capital, there is left available £988,699. Of this total it is proposed to transfer £100,000 to war contingencies reserve and to pay a final dividend of 10 per cent (less tax) on the ordinary stock, making, with the interim already paid, a total dividend for the fifteenth year in succession of 15 per cent (less tax). In addition your directors are pleased to recommend that for the sixth successive year a cash bonus of 5 per cent (less tax) be distributed on the ordinary stock. After making these appropriations, the balance left to be carried forward to 1941 is £488,699—a figure almost identical with that brought forward.

There are two items in the profit and loss account to which particular attention is drawn. The first is that depreciation of fixed assets in 1940 calls for £209,622, against £158,617 for the previous year, an increase of £51,005. Although the same basic rates of depreciation have been applied in both years, it has been necessary to provide in 1940 for the extra depreciation being suffered by certain of our assets as a result of operating under war conditions. The second is the transfer of a further £100,000 to war contingencies reserve account, bringing the total of the latter up to £200,000. The reasons for creating this reserve were given in the chairman's speech at the last annual general meeting, and after another year of war it is considered more than ever necessary to build up a substantial reserve under this head.

REVIEW OF COMPANY'S BUSINESS

In past years it has been the custom at the annual general meeting to refer to the more important matters connected with or affecting the company's business, and to give some indication of the outlook for the current year. It will be appreciated, however, that under existing conditions it would be inadvisable to give any detailed account of the activities of your company or to make any forecast of current results.

In conclusion, it is a pleasure to record that the company's staff and workpeople have responded magnificently to all calls made on them, and our special thanks are due to them for their loyal and unceasing efforts.

The report and accounts were unanimously adopted.

BRITISH ROPES, LIMITED

STRONG FINANCIAL POSITION

The nineteenth ordinary general meeting of this company was held on the 31st ultimo at Leeds.

Mr Herbert Smith (chairman and managing director) said that the imposition of an EPT rate of 100 per cent. had been the subject of much comment, and the opinion of many seemed to be that that tax took away the incentive to efficient management of a business. As far as their company was concerned, their profit standard had been fixed in years of development so that there was undoubtedly a certain amount of hardship. However, he saw no reason why they should not at least maintain their profit standard and the present rate of dividends, unless they were so unfortunate as to lose their productive assets through enemy action.

Their balance-sheet exhibited a strong and healthy position, and every effort would be made to retain that position during the dark days of wartime. He hoped that the existing structure would be left intact after the war, so that they might be in a position to face peacetime conditions with confidence.

Their various subsidiary companies, both at home and abroad, were fully occupied. Each one of them was employed, one way or another, in supplying Government requirements. Each company was recording larger profits than in previous years, but there again the incidence of taxation absorbed the major portion of that surplus.

Home trade during the year had continued at a high level, and while the company had done its full share in supplying the fighting services, it had also of necessity had to meet the demands of its peacetime customers, practically all of whom were dealing with urgent Government demands for their own services and products. The necessary restrictions on the export of steel goods had naturally stopped a large volume of export trade in steel wire and wire ropes, but the loss of that business had been more than made up by the Government demand for wartime requirements.

The report was adopted.

HOOVER, LIMITED

INCREASED TRADING PROFIT

The ordinary general meeting of Hoover, Ltd., was held, on the 31st ultimo, at the registered office, Perivale, Greenford. Mr. C. B. Colston (chairman and joint managing director) presided.

The chairman said: The accounts have been prepared in the same manner as in previous years. We have appropriated £150,000 for income tax and National Defence Contribution, which increases our reserve to £50,000 in excess of immediate requirements.

No transfer is being made to general reserve, which remains at £100,000, but we have appropriated the sum of £50,000 as a contingency fund.

The profit on trading for the year is £290,486, compared with £248,412 last year, which your directors regard as a very satisfactory achievement, and therefore recommend a final dividend of 11½ per cent. on the ordinary stock, which makes a dividend for the year of 15 per cent.

I feel I should explain in regard to our profit this year that in the early months of the year, when stocks of Hoover Cleaners were considerable, the demand for these cleaners was so great that we were able to effect a considerable reduction in our selling expenses.

Air-raid protection and our A.R.P. organisation has reached a higher standard of efficiency. Our War Savings Group is still playing its part and is carrying on its work energetically. Ever encouragement is given to our workers to contribute to War Savings.

The relationship of the company with its employees is very cordial, and your directors are very grateful to them for their untiring energies. I would like to thank all ranks for their devoted and loyal services. You will all be glad to hear that one of our employees suggested the presentation of a Spitfire to the Government; consequently a Spitfire Fund was started with the result that this company, on behalf of our worker presented a cheque last September to Lord Beaverbrook for £5,000.

The report was adopted.

MAPLE AND COMPANY, LIMITED

CENTENARY OF SUCCESSFUL BUSINESS

The annual general meeting of Maple and Company, Limited, was held, on the 28th ultimo, in London.

Mr C. C. Regnart (the president) said that 1941 heralded the centenary of Maples. It was a matter of extreme regret that, owing to existing conditions, the centenary could not be celebrated in a fitting manner, but they were hoping that at some future date they would be in a position to do so. He hoped it was gratifying to all that it was proposed to resume payment of dividends on the ordinary stock. The previous year's interruption had been the only one in the company's history, occasioned entirely by prevailing conditions. It was surprising, however, how a sound business could adapt itself to new conditions, and it was little short of amazing how new circumstances could be met, when the means and ability to make full use of them were available.

Maples was still a household word, and, despite war difficulties, they were convinced that the popularity of the company

had increased during the year, due to the wonderful reputation which Maples held, and that they had received a larger share of the available trade than ever before. They felt certain that the reasons were the large stocks they carried, the service they gave, and the resources they had at their disposal, enabling them to meet any public need. Maples had a vast stock, nearly all bought prior to the introduction of the purchase tax, and their customers still had the opportunity to purchase from the largest stock of furniture, carpets and furnishings in the world, free of purchase tax, all they might require to replenish their homes. The turnover had been the highest since 1920 and the numbers employed constituted a record. That would indicate the vast expansion of their trade, although the margin of net profit might be small.

Their branches had met with a reasonable measure of success. Their interests in South America had again yielded a reasonable return. On the other hand, they had no direct information in regard to their interests in France.

The report and accounts, with the recommendation of a dividend of 5 per cent. on the ordinary stock, was unanimously adopted.

(Continued from page 458)

applies to any person who is not a merchant, factor or importer of upper leather or a manufacturer or other producer of footwear. Arrangements are being made by the Director of Civilian Leather Supplies for the acquisition of upper leather by such persons to be subject to licence after June 30.

Furs and Velvets Exports.—A trade delegation under the auspices of the Fur Export Group is to take to Canada 600 models designed in Empire furs which have been processed and made up in London. These are to be chosen by Canadian buyers from 1,000 models which have been shown to the public at a London store. The Cotton Board announces that the export demand for velvets is very active at present. America and Canada are showing interest in British velveteens and corduroys for the first time since 1928, while business in Turkey and Argentina has been captured from Germany and Italy. Cotton velvet has a high conversion value, which makes it an excellent commodity for export.

Control of Fish.—Representatives of the fish trade have drawn up a scheme for the control of Icelandic cod, which the Ministry of Food has embodied in an Order. It is proposed to extend price control to all cod as soon as practicable and subsequently to other varieties of fish. The present scheme provides maximum prices payable at ports on first hand sales of Icelandic cod of 7s. per stone for cod with heads on, or 8s. 9d. per stone for headless cod, the difference in these prices being due to the loss of weight of the head. The Order also fixes maximum prices for sales to inland wholesalers, fish friers, retailers and to consumers. The price to consumers varies between 1s. and 2s. 2d. per lb.

Rations.—The rationing of cheese will begin on May 5, when the general ration will be 1 oz. per head per week. A special ration of 8 oz. per head per week

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the nine days ended March 31, 1941, total ordinary revenue was £52,362,000, against ordinary expenditure of £139,809,000 and issues to sinking funds of £5,514. Thus, including sinking fund allocations, the deficit accrued since April 1st is £2,475,421,000 against £771,981,000 (including defence loan issues) for the corresponding period a year ago.

chosen for closing the "gap" and, as has been indicated above, they deserve general approval. But to say this does not dispose of the wider question whether the Chancellor has correctly estimated the dimensions of the gap. It was to this question that the most interesting (and, for the occasion, unique) passages of his speech were devoted. Nor has the Chancellor limited discussion to the statement of his own views. He has taken the quite unprecedented course of issuing a White Paper giving estimates, in a wealth of detail, of all the elements necessary for an informed discussion of the question. It is quite safe to assert that no such analysis of the real character of wartime finance has ever before been issued in any country—least of all during the war itself. The White Paper* is a very welcome demonstration that there is at least one Government Department which does not believe in the unnecessary suppression of facts. It will be received with the enthusiastic gratitude of every student of public finance in wartime

THE BUDGET ACCOUNTS

IN giving his estimate of £4,207 millions for total ordinary expenditure in 1941-42, Sir Kingsley Wood emphasised that it was not comparable with previous estimates and Exchequer issues, since it excludes the value of supplies to be received from the United States under the Lease-and-Lend Act and payments to be made under existing orders there. It does, however, include expenditure in the Dominions and other foreign countries covered by the accumulation of sterling balances, etc.; if this is excluded, expenditure ("domestic expenditure") is estimated at £3,700 millions, compared with £2,055 millions for similar expenditure in the first year of war and an annual rate of £3,190 millions in the first half of the second year.

Revenue last year yielded nearly £49 millions more than the estimate. The largest item of this increase was the combined total of N.D.C. and E.P.T., but it is worth noting that income tax yielded nearly £13½ millions more than the estimate in spite of the new system, introduced during the year, of collection at source, which means that part of the tax due is not actually paid until after the end of the year. Purchase tax, on the other hand, yielded only £26 millions, £14 millions less than the estimate, owing mainly to the delay of three months in putting it into operation. The decline in foreign trade reduced the yield of duties under the Import Duties Act and the Ottawa Agreements by £20½ millions, and there were other small deficiencies in customs and excise. Nevertheless, the combined total of £529 millions is about £6,000,000 more than the estimate owing mainly to the beer and tobacco duties, which yielded £25½ millions and £15½ millions respectively more than their estimates.

On the basis of existing taxation, revenue for 1941-42 was

and by no one more than by the commentator who has hitherto struggled to make his contribution to public enlightenment with a pitifully inadequate supply of materials. Now that Sir Kingsley Wood has provided the straw, he can legitimately expect that fewer of the bricks will be hurled at his head.

The White Paper contains two sets of figures. One is an analysis of the sources of war finance which has been prepared in the Treasury (its authorship should not be hard to guess); the other is a series of estimates of the National Income which, in the Chancellor's words, "are the very valuable first-fruits of our new Central Statistical Office set up by the Prime Minister." These national income estimates are no less interesting than the other half of the White Paper. But they are perhaps less controversial; their connection with the vital problem of the "gap" is less direct; and they require discussion in some detail. For these reasons the review of this half of

estimated at £1,636 millions, leaving a Budget deficit of £2,571 millions. This figure is arrived at after reducing the estimated yield of a full year's purchase tax from £110 millions to £70 millions and making other allowances for the effect of limitation of supplies and lower foreign trade on customs and excise generally. The only large change in taxation is in the income tax. The standard rate is raised from 8s. 6d. to 10s., and the reduced rate applying to the first £165 of taxable income is raised from 5s. to 6s. 6d. The earned income allowance is reduced from one-sixth of earned income, with a maximum allowance of £250, to one-tenth, with a maximum allowance of £150. The personal allowances of £170 for a married taxpayer and £100 for a single taxpayer will be reduced to £140 and £80 respectively. The exemption limit of liability to income tax is to be £110 a year instead of £120, which will bring another 2 million persons within the tax. But the extra tax payable as a result of the reduction in the personal and earned income allowances will be credited to the taxpayer, after the war, in the Post Office Savings Bank. These proposals are estimated to increase the yield of income tax by £250 millions in a full year and £150 millions in the current year. The Chancellor has not availed himself of the possibility, for which Lord Simon cleared the way last year, of levying surtax on incomes between £1,500 and £2,000.

These are the only tax increases, and the only other tax change—apart from administrative changes in income tax, estate duties and E.P.T.—is the repeal of the medicine stamp duties, which will cost £640,000 this year and £840,000 in a full year. The estimated deficit—that is, the deficiency of revenue below the somewhat artificial Budgetary total of expenditure—is thus reduced to £2,421 millions.

EXPENDITURE (£'000)			
	July Budget Estimate, 1940-41*	Exchequer Issues, 1940-41	Estimate, 1941-42
Consolidated Fund Services :			
Interest and Management of National Debt	280,000	212,957	255,000
Payments to N. Ireland	9,400	9,699	9,200
Other Consolidated Fund Services	7,600	7,476	7,800
	247,000	230,132	272,000
Supply Services (excluding P.O. and Broadcasting) :			
Defence Token Votes	4	5	4
Civil Votes	421,202	402,320	418,733

Votes of Credit	3,300,000	3,220,000	3,500,000
	3,736,125	3,637,113	3,934,957
Total Ordinary Expenditure	3,983,125	3,867,245	4,206,957
Sinking Funds	...	17,043	...
Total	3,983,125	3,884,288	4,206,957
Self-Balancing Revenue and Expenditure :			
Post Office	81,722	81,722†	93,746†
Broadcasting	4,700	4,695	5,600
Total	86,422	86,417	99,346

* Including supplementary estimates. † In addition, £2,700,000 was issued to the Post Office from Votes of Credit in 1940-41 and £4,970,000 is estimated to be so issued in 1941-42.

the White Paper will be found in a separate article on page 489.

The estimate of the sources from which the war has been financed follows the method for estimating the "gap" that has become familiar in public discussion. The Chancellor made it quite clear what the inflationary "gap" is. It is the amount of the Government's expenditure against which there is no corresponding release of real resources of man-power or materials by some other member of the community. It is not, of course, the mere excess of expenditure over tax revenue. To arrive at it, not merely the tax revenue but a number of other factors have also to be deducted from expenditure. The first of these is the extent to which foreign capital assets are drawn upon; these capital assets can be converted into goods in foreign countries and there is therefore a real offset against the Government's expenditure. The second (and most obvious) is savings by private individuals arising as a result of their abstention from consumption. A third is drafts on domestic capital—the goods that are drawn out of stock are available for the Government to buy. Another is the extra-Budgetary receipts of the Government—in unemployment insurance contributions, in insurance premiums, etc. A final element is the amount of money put aside by taxpayers to meet approaching tax liabilities. The estimates for all these are shown below :—

	Year Sept., 1939 to Aug., 1940	Six Months Sept., 1940, to Feb., 1941	
	£mn.	£mn.	£mn.
1. Total Government Expenditure*	2,597	2,074	4,148
Offsets :			
2. Revenue	1,148	837	1,674
3. Draft on external capital	542	479	958
4. Draft on domestic capital	60	240	480
5. Extra-Budgetary receipts	113	90	180
6. Increase of tax accruals	140	-20	-40
7. Savings of local authorities, institutions and companies ...	272	131	262
8. Personal savings	320	320	640
9. Total offsets	2,595	2,077	4,154

* Less increase in Departmental and Exchequer Balances.

The totals, it will be noticed, are virtually the same—in fact, they have been estimated in such a way that they are bound to be identical. It is the Chancellor's contention that, in fact, there was no inflationary "gap" in either period. But the point to be grasped is that this contention is not established by the mere fact that the two sides balance. As the Chancellor himself said, "the national accounts will always balance," and even if there were a large volume of inflation of the crudest sort, it would show itself, not in an item specifically labelled "Inflation," but in a swelling of some of the other items, particularly Nos. 7 and 8 in the above table.

The White Paper figures cannot therefore be taken, as they stand, as a demonstration that there has been no "gap" in the recent past. Some of the figures for the six months to September, 1940, to February, 1941, look rather swollen when grossed up to an annual basis. For example, it is difficult to feel quite confident that drafts on domestic capital at the rate of £480 millions a year, or personal savings at the rate of £640 millions a year, would have been possible without some assistance from the creation of credit—particularly in view of the strong circumstantial evidence that credit was, and is, in fact, being created at a considerable rate. The conclusion must be one of some scepticism about the complete absence of a "gap" in the past six months, even though it must have been small, since the inflation would show itself in a rising total of the national income, and the actual rise in 1940 was small

* "An Analysis of the Sources of War Finance and an Estimate of the National Income and Expenditure in 1938 and 1940." Cmd. 6261. H.M. Stationery Office. 8d. net.

and explainable by other causes. Against this, however, it must be remembered that expenditure was steadily rising, that the six months' period for which the estimates are given extended to the end of February, and that some time-lag is inevitable. The scepticism must remain.

The next problem is to move forward from the recent past to the coming year. The first item, of course, is the expenditure. As the Chancellor explained, the passage of the Lease-and-Lend Act makes it inappropriate to include the value of munitions obtained in the United States. The Budgetary total of expenditure, £4,207 millions, is therefore a hybrid; it is neither comparable with last year's total (the Chancellor said that a comparable figure this year would be "far beyond" £5,000 millions), nor is it a figure of expenditure in the United Kingdom, since purchases in other overseas countries are still included. In these circumstances, the comparison is best based on "total domestic expenditure" which in the six months September to February was running at the annual rate of £3,190 millions (item 1 less item 3). For 1941-42 the Chancellor put it at £3,700 millions.

The first question that arises is whether this is enough. There are two causes of a rising total expenditure. One is a rising level of costs. Sir Kingsley Wood has accepted the principle that public money should be used to prevent any further rise in the cost of living, of fuel, or of transport. If, in accordance with his hopes, this can be translated into a similar stabilisation of wages, then he will have been justified in assuming that there will be no further rise in the level of costs, and consequently no expansion of expenditure from this cause. The hope is one that will be shared; but it is a rather sanguine one. Even if wages as a whole can be pegged, there are certain forms of highly desirable activity—training, women's munition work, some forms of heavy male labour—which will almost certainly have to increase the wages they offer. But even if the Chancellor were entirely successful, an increase of only £510 millions—only 16 per cent—seems disappointingly small for the second cause of rising expenditure—that is, rising production. It is impossible not to suspect that the old sin of under-estimation has again been committed, and that the eventual figure of domestic expenditure will be several hundreds of millions more than £3,700 millions.

On the basis of his own figure of £3,700 millions, the Chancellor estimated the prospective gap, before allowing for new taxation and increased saving, at £500 millions. The reasoning is easy to follow. Revenue on the pre-existing basis of taxation would bring in £1,636 millions, the other offsets, on the same basis as in the last six months, £1,522 millions—a total of £3,158 millions, leaving a gap of £542 millions. This the Chancellor proceeded to fill by his new taxation with its yield of £252 millions in a full year (but of only £150 millions in the current year), and by assuming an increase of between £200 and £300 millions in personal savings. This is unquestionably the way in which the sum should be done. But while the method can be accepted, there is more difficulty about accepting the figures. Two possible sources of "gap" have already been indicated: the possibility that there already was a gap of a few hundred millions in the past six months and the likelihood that the expenditure has been underestimated. It is difficult not to see a third piece of optimism in the belief that "genuine" personal savings, which were only some £150 millions in 1938, will have risen to between £840 and £940 millions in 1941-42. The Chancellor's belief that he has closed the gap represents the most optimistic view that can be taken of the position. It is possible to put against it the not unreasonably pessimistic view that there may be a "gap" in the coming year of several hundred—perhaps a thousand—millions.

Sir Kingsley Wood's Budget is thus one which, in its qualitative aspects, can be greeted with almost unqualified enthusiasm. And that is a great gain, even if scepticism about its quantitative details still obstinately lingers.

Impasse in India?

ON Tuesday, the Viceroy of India had a meeting with Sir Tej Bahadur Sapru, lawyer, landowner, and Liberal president of the recent Bombay conference of Indian moderates. This meeting may be a straw in the wind. It is now nearly a year and a half since the retirement from office of the Congress Ministries led to the suspension of the Indian Constitution in seven out of the eleven Provinces of British India. The war effort has grown; and both central and provincial government have gone on. But the political difficulties remain; and it cannot be said that the prospects are reassuring.

The immediate cause of the present trouble was the outbreak of war. India was declared to be at war without any attempt by the Viceroy or the British Government to associate India's political leaders with this decision. The terms of the Congress party for a vote in the Assembly in favour of the war would probably have been a Declaration of Independence and a Constituent Assembly. Mr. Gandhi's creed of non-violence would not have allowed him to sponsor active participation in the war. But behind this immediate cause of the trouble, the root of the problem is that the two chief Indian parties are pursuing irreconcilable ends. The Congress party seeks to make one party synonymous with the State. The Moslem League is determined to prevent the coming into existence of any Central Government which is predominantly Hindu. In recent months, this division has become more acute, for the Moslem League has committed itself to the demand for Moslem secession from Hindu India and for the creation of a Moslem "Pakistan" in the North-West.

Clearly, as long as the two main parties remain obstinately attached to these antithetical policies there is no hope of any constitutional settlement between them. There is indeed only one way in which India's political development can be brought back on an even keel; and that is by agreement and co-operation between Indian politicians. It was presumably the belief that day-to-day co-operation between Indian leaders in the "management" of Indian affairs might restore equilibrium that led to the Viceroy's famous offer of last August. This offer was to set up an enlarged Executive Council at the centre, which, though not responsible to the legislature, would be composed of the main party leaders. It went further. It was promised that representative Indians would have the opportunity of drawing up a new constitution after the war. Both Congress and the League rejected the offer. Although one section in Congress did work in August and September for a settlement on the basis of the offer—with a coalition Cabinet, responsible to the legislature and receiving full Congress support—the party's stand was still for independence. The whole process of discussion was clumsy and maladroit on both sides.

A chief trouble in these abortive months was the status of the Executive Council. In principle, the Executive Council is the pivot of Indian government, and the Viceroy was perfectly right in making its membership the basis of his offer. In practice, however, it is no more than a committee of departmental heads. It has ceased to discuss policy. In the eyes of Indians, membership of this body meant no effective increase in native control over Indian affairs. Some attempt was made, by the Viceroy in India and by Mr Amery in London, to sketch the status of the enlarged Council. Mr Amery suggested that an executive on the lines of the United States, chosen for a term of years and not directly responsible to the legislature, might suit India better than the English Cabinet system. But, in general, Indian opinion was that the proposal was too vague.

In November the Viceroy abandoned his attempt to enlarge the Council; and since then the Government of India appears to have decided that there is nothing to do but wait. It is useless to ignore that this policy of "masterly inactivity" has caused a wave of uneasiness among the non-official population in India. Their complaint is that, while the Government is deliberately holding its hand, there is being piled up in the country material for future trouble. There is a demand that the Government should take the initiative again in seeking a settlement. But it is only fair to recognise the many additional burdens thrown on the Government by the breakdown of the constitution and the task of organising India's war effort. The political problem is appallingly complex. Congress and the Moslem League are agreed only to differ and to oppose the Government.

Yet there is another side to the picture. No section of the opposition in India is pro-Nazi. It is parochial. It is far more concerned with India than with Europe or with the threat to India from Europe. But it is not hostile. Moreover, the present political leaders of Congress and the Moslem League are not all-India. They are much the biggest "parties." Their formal followings are a notable proportion of India's 400 million people; but, even where they follow, the extreme and intransigent attitude of their leaders is probably not the policy that they would voluntarily choose. Congress makes the mistake of assuming that it speaks for all Indians; the Moslem League makes the mistake of assuming that it speaks for all India's 90 million Moslems; the Government of India makes the mistake of assuming that Congress and the Moslem League are India. In fact, there is a middle opinion which has lately become somewhat more articulate; and, from time to time, there have been glimpses of a more conciliatory attitude even among the leaders of the two main parties. Neither is unconditionally opposed to participation in the war effort; and Congress has even expressed its willingness to serve in a "National Government" under a Moslem premier.

The great virtue of the Viceroy's offer is that it set the ball of discussion rolling among India's moderates, and attracted discussion to the status and powers of the Executive Council. The offer failed. The Viceroy said that it was useless to bring Indians into the Council unless they were representative, and by representative the Viceroy meant representative of the main parties. Congress replied that such a council would be useless unless it was responsible to the legislature. But the moderates, while ready to agree with the Viceroy that the Council should be responsible to the Crown and not to the legislature, believe that it is possible to make such a Council sufficiently representative of the common factors in Indian opinion to render it responsive to that opinion. In November a search began for a form of National Government or preponderantly Indian executive, within the framework of the Constitution, which would satisfy both official and the majority of Indian wishes. Mr Amery himself, Secretary of State for India, laid down as the British policy that the Indians must find a way out themselves. He said that, from the British point of view, the Viceroy's offer was the most that was practicable. In December, Sir Tej Bahadur Sapru, as a Liberal spokesman, suggested the formation of a National Executive, made up of non-official Indians, and including an Indian Defence Minister, to be responsible to the Crown. This was an honest attempt to explore and define the possibilities of the Viceroy's offer and to bring it into line with Indian sentiment—for all Indians, moderate or extremist, wanted a National Government of some sort. To the end of the year, however, the Viceroy remained pessi-

mistic. He reiterated that Dominion Status for India was still the objective of British policy; but he declared that "we had done everything in our power."

By now the situation was confused by the irresponsible and totally irrelevant anti-war movement organised by Mr Gandhi, which led to hundreds of regrettable arrests and to the general exacerbation of feeling. By February, over three thousand Indians, many of them eminent, had been tried, convicted and imprisoned; 700 were still detained without trial. This pointless clash and the uncompromising statements of Mr Gandhi and Mr Jinnah of the Moslem League stiffened the growing opinion that a settlement should be arranged. Moslems, Hindus, Nationalists, Liberals and the Provincial Premiers met to discuss; Mr Gandhi himself saw Sir Tej Bahadur Sapru in March; the National Liberals declared themselves for Dominion Status two years after the war. Last month's conference in Bombay was the climax of these discussions. In brief, it called for a Cabinet with non-official Indians holding all the portfolios, including Defence and Finance, responsible to the Crown, but responsive by its character and composition, not only to the legislature but to the bulk of Indian opinion.

There is a tendency for official opinion to regard the situation as hopeless. The Bombay programme tends to be dismissed as unreal because it ignores the conditions which have led to the present difficulties. It overlooks, it is claimed, the gulf between Congress and the Moslem League; and it forgets the refusal of these two parties to have anything to do with the Viceroy's offer—from which the Bombay programme, in a sense, has sprung. It is argued that, if the Government were to show signs of weakening before the pressure of opinion, here or in India, Congress would push its extreme demands and refuse any compromise. Congress and not the Viceroy, it is urged, must consider the Liberal plan first.

It is, of course, true that these Liberals, like Liberals in other countries, are relatively only a handful. Even though they may speak for India, in the

sense of putting out proposals which would satisfy the common factors in national, as distinct from purely partisan, aspirations—as, indeed, they do—they do not speak for any considerable organised body of Indians. They are not leaders. Their demand for the declaration of a time limit for Dominion Status will surely evoke as widespread a sympathy in this country as it does among the generality of Indians; but the official reply is that it is difficult to make a pledge now which the state of Indian politics might make it impossible to fulfil later on.

There is a feeling of disappointment in India as well as in Britain. "Masterly inactivity," however expedient, is not really a policy. Nor is it really any final justification to say that the problem seems scarcely soluble. Indeed, to the eternal loss of India and the British Commonwealth, it may not be soluble. Every item in the difficulties listed by official spokesmen must be admitted. But the British Raj cannot seem to sulk. It may be India's duty to solve India's problems; but it is the British Parliament's responsibility to aid in that solution, and no opportunity, however small, should be left untried. In this eddy of moderate opinion there may be an opportunity.

One thing at least the Viceroy can do, as he waits for Indian intransigence to wear itself down; and that is to set his own house in order. By his side, in June, he will have a new Reforms Commissioner in Mr H. V. Hodson, young, able, a former editor of the *Round Table* and one-time member of *The Economist's* editorial staff. An old Imperial air still hangs about the Government of India which the Constitution itself does not call for. It is shrouded in secrecy; and its Executive Council, the central element in the Constitution and in any workable reforms in the future, has been allowed to rust and languish. While it is a figurehead, the Council will attract no Nationalist members, on any terms. India wants the leadership which neither Congress nor the Liberals, for different reasons, can give. A Governor-General with the understanding of a Lord Irwin or a Lord Tweedsmuir might give that lead.

Hitler's New Front

ON April 6, 1941, about half an hour before the official Notes declaring war had been delivered to the governments of Greece and Yugoslavia, Germany invaded both countries. The pretext—that the Greeks and Yugoslavs had frustrated Germany's peaceful intentions by bringing the British into the Balkans and that German troops must now restore peace, order, and independence—barely merits recording. It is difficult to imagine for whose benefit these masterpieces of blatant falsehood are compiled. It must be a matter of profound indifference to the German people whether or no there is an excuse for each new chapter of slaughter, and the outside world has long since ceased to listen. The declaration of war was met in an undaunted spirit both in Greece and Yugoslavia, and was followed immediately by the announcement that British troops had arrived in Greece some weeks earlier in order to meet such an emergency.

The first attacks fell in the south, and it is clear that no Greek positions can long be held east of the Vardar. Western Thrace is already evacuated, and although small Greek forces in the Struma Valley have put up a fierce resistance, their flank has been turned by a German drive down the Strumitza and Vardar Valleys from Yugoslavia into Greece, where, after capturing Boiran, the Germans have forged ahead to Salonika. The speed of this move suggests that the Germans caught the Serbs unawares and that there was not enough time in the week before the outbreak of war properly to co-ordinate Greek and Yugoslav defence.

It is impossible to say yet how many troops have been cut off in the Struma Valley as a result of the German advance to Salonika. The Greek communiqués have spoken only of Greek forces and unofficial reports suggest that the British forces are massed on a line to the south-west of Salonika.

The news from Yugoslavia is discouraging. By forcing their way down the Morava and Vardar Valleys the Germans have taken Nis and Skopje, and it is difficult to see how the Yugoslavs can now prevent the Germans from driving a wedge between the Yugoslav armies, north and south. The military position in the west is more favourable. The Yugoslavs are advancing in Northern Albania. Scutari has already fallen, and another Yugoslav column is said to have crossed the Eastern frontier. Here possibly it can make contact with Greek forces between Pogradets and Lin, and their combined pressure should have awkward consequences for the Italians, already weakened by costly offensives and discouraged by their failure.

There have naturally been important diplomatic reactions to Hitler's latest act of aggression. The British Minister in Budapest has been withdrawn now that Hungary has become a base for an attack upon Britain's ally, Yugoslavia. That the Hungarians may be compelled to play more than a passive part is suggested by the suicide of their unhappy Prime Minister, Count Teleki, who saw no way of reconciling Germany's demands with even the nominal independence of his country.

The Turks have made no move, and the Treaty of Ankara has at last received its definitive interpreta-

tion. It guarantees Turkey in event of an attack upon Turkish territory but imposes no binding *quid pro quo*. The Turks are, it is true, performing some sort of negative rôle in that they keep one or two German divisions immobilised on the Turco-Bulgarian frontier, the strategic difficulties in the way of intervention, great in any case, have become insuperable with the German occupation of Dedeagach. It is also true that Turkish policy is very much under the influence of Russia, and the key to Turkey's attitude is to be found not in Ankara but in Moscow.

The Russians are obviously angry and perturbed at Germany's relentless advance towards the Dardanelles. They are equally anxious about their long, vulnerable frontier with the Reich. There are, from the Russian point of view, many disquieting signs that the Germans, foiled in their attempt to smash their Western front first, may be returning to their earlier plan of first settling accounts in the East. If this were their plan, the Balkan fighting might well be a limited campaign designed to free the German flank while the real drive would be yet to come—against the Straits and Turkey and against the Ukraine. Russia's recent diplomacy can be explained in terms of such preoccupations. The Russians are still anxious to avoid open provocation. They will not come to anyone's assistance, and they must at all costs keep their armies intact. They are equally anxious to ensure that Turkey will, on the one hand, preserve its strength for the defence of the Anatolian bridge to the Caucasus and on the other, fight when the German onslaught begins. Hence the guarantee to Turkey which specifically covers only a defensive war. In the Balkan peninsula, it is to Russia's interest that all possible resistance be offered immediately so that the Germans' preliminary campaign shall be as prolonged as possible. A great welcome was therefore given to the Simovitch régime in Yugoslavia, and Russia went as far as was com-

patible with giving no provocation to Germany in encouraging the enthusiastic pan-Slavism of the Serbs. This is probably the meaning of the Russian-Yugoslav Pact of Friendship and Non-aggression signed on the day of the German invasion.

Whatever the outcome of the Balkan war, it must not be forgotten that the very fact of a Balkan war entails a setback for the Nazis, and that every day it lasts is a day lost to them. Hitler has done all in his power to keep South-Eastern Europe out of war. The Balkan countries are sources of supply whose necessity to him has been vastly increased by the blockade. Balkan communications play a vital part in bringing the supplies not only of South-Eastern Europe, but of Soviet Russia to the Reich. Now the crops, the mining installations, the factories, the oil storage plants and refineries of the Balkans have been brought within range of the British bomber, while the roads and railways are congested with military traffic. As the range and power of British bombers increase and the devastation of war spreads, supplies and communications will be the first to suffer.

At the same time, while the original plans of the German High Command have not been published, it seems certain that the Balkan war has compelled Hitler to modify his general strategy. The concentrated attack on this country must be delayed, there has already been a diversion and dilution of Germany's military resources. All this is pure gain, whatever the outcome of the Balkan campaign. Losses are inevitable on its difficult terrain. The Germans have a great local superiority, and one at least of their adversaries, Greece has already borne the brunt of six months' exhausting struggle. It is as well, therefore, to bear in mind the concrete advantages the Allied cause has already gained in order to balance them against any reverses that are to come.

NOTES OF THE WEEK

Calling all Men?

The aim of manpower policy is now clear; its actual direction is less plain. The aim is to keep out of the Forces only those individuals who are indispensable men in indispensable work. The new Schedule of Reserved Occupations and Protected Work is intended to make the comb of calling-up finer. Until now, men of set ages have been reserved if they belonged to one of a list of "occupations". Now the ages for reservation in most occupations are to be raised in three stages—probably April, June and October; and, in addition, men in registered establishments in certain industries which are to be called "protected" will be reserved at a lower age. So far, this is still the principle of reserving men in occupational groups, with no specific regard to their actual tasks, though the protected groups are much smaller than the broad categories of the old Schedule. But the distinction is drawn, within the same industry or occupation, between men who are doing protected work and men who are not; not all men in protected establishments will be protected; and it is laid down, as a directive, that, even in armament work, young men should not be kept on in work which could be done by older men or women. Nevertheless, it remains doubtful whether the stated aim will in fact be attained. The point is that individual workers are still not being treated as individuals, but in groups. The possibility of dispensable men being kept in indispensable work has been fined down considerably; but, broadly, it is still left to individual employers to see to the national interest.

* * *

A Man's Job

The most cursory glance at the revised Schedule of Reserved Occupations and Protected Work shows that the old bogus principle of "occupation" has been widely retained. To take only one example (chosen strictly alphabetically), accountants and actuaries are still to be

reserved at 30 or 35. Actually, to make the new principle of individual selection effective, no accountant or actuary should be reserved at any military age unless it can be proved that he, individually, is an indispensable man in an indispensable job. True, there is now provision, on an individual basis, for the complementary task of ensuring that indispensable men in occupations which are not reserved—or not reserved at the ages of the individuals concerned—shall not be taken away; and the young women who are to register in age groups from this month onwards are to be individually interviewed. But the virtue of the selection interviews for women is now to be whittled down by the imposition upon them, too, of this detailed Schedule of Reserved Occupation, which will keep a large proportion of them away from registration altogether. Some people in most of the occupations listed are indispensable, but not by any manner of means all; and, if the full and effective mobilisation of labour that is spoken of is really to happen, there is a good case for scrapping the rough-and-ready principle of "reserved occupations" entirely, for both men and women. It is the individual and the work that he or she is individually doing that count.

* * *

Strikes in the U.S.A.

The strike in the bituminous coal industry and the threatened strike in the United States Steel Corporation's plants have been referred to mediation, but the long Allis Chalmers dispute is dragging on and the River Rouge strike against the Ford Company has caused the closing of other Ford plants. All these strikes and threatened strikes are in industries vitally concerned with national defence, and there is no doubt that public opinion is beginning to show impatience and irritation. The President is faced with a very awkward problem. The right of workers to organise has been written into the law; it has been championed by the President and

upheld by the Supreme Court. Where employers are resisting that right, they are undoubtedly breaking the law, and such is the reputation of United States' capital in its dealings with labour that there should be strong *a priori* sympathy with the position of the workers. It is significant that Mr Ford, one of the worst employers with regard to trade union rights, has used the expedient of securing a Federal Court injunction to prevent picketing by the CIO. It is a move which has a literally bloody record in United States industrial history, and is—and was intended to be—provocative. On the other hand, the workers are alienating all claim to public sympathy by both the violence with which they are conducting the strikes and the extent to which the stoppages are due to so-called "jurisdictional" disputes, that is to say, the competing claims of the AFL and the CIO to organise and direct the workers. The general public is not prepared to see the country's defence programme held up and the efficiency of America's help to Britain impaired by what is generally held to be a personal feud between Mr Philip Murray, of the CIO, and the veteran Mr William Green, of the AFL. Demand for presidential action is growing, and Mr Roosevelt is likely to be faced with the problem of enforcing a decision on men whose right to decide for themselves he has always upheld.

Benghazi Evacuated

The evacuation of Benghazi, followed by further German and Italian claims of an advance along the coast to Derna and Barce came as a sad disappointment to the British public. The speed and daring of General Wavell's advance captured people's imagination both in this country and across the Atlantic, and when General Wilson was made Governor of Cyrenaica the feeling was widespread that one phase of the African war had been brought to a successful end. With the original fall of Benghazi, however, the decision had to be made whether the Imperial forces in Cyrenaica were to complete the capture of Libya by advancing to Tripoli or whether the situation created by the occupation of Bulgaria by the Germans demanded the despatch of all possible men and materials to Greece. Since the decision to aid Greece and the despatch of troops to the Greek mainland unquestionably influenced Yugoslavia's fateful *coup d'état* and heartened the Greeks to continue their struggle against overwhelming odds, it cannot be said that the decision was wrong; least of all can the armchair strategists at home cry out against it and demand post-mortems now that the weakening of the Cyrenaican front is being exploited by the Germans. It is likely that the Imperial forces were surprised by the size and weight of the German attack, but in Cairo it has been rightly pointed out that in desert as in sea warfare, it is not the occupation of strategic points so much as the loss or capture of men and materials that is really decisive. The Italians lost over 150,000 men and vast stores of equipment. It cannot therefore be said that the Cyrenaican campaign was fought in vain. In the long run, too, it may be that, by tempting the Germans on to a front where their lines of communication are as difficult to maintain as those of Britain, a struggle may develop in which, faced with comparatively equal odds, the Imperial forces can break the legend of the German Army's invincibility as conclusively as their comrades in the R.A.F. have exploded the legend of the *Luftwaffe*.

* * *

After Addis Ababa

The Italian collapse in East Africa—which the fall of Addis Ababa and the subsequent fall of Massawa have brought within reasonable distance—will undoubtedly give the Allied High Command in Cairo much needed help in the difficult and hazardous game of timing and priorities. The claims on Britain's Middle Eastern forces are growing daily. Every soldier, every aeroplane, every tank spared from Abyssinia is needed to do the work of three in Greece or in Libya, and although events in the Balkans overshadowed the remarkably rapid drive which brought the Imperial troops into Addis Ababa, the collapse on this front may have decisive effects elsewhere. One consequence will be the opening of the Red Sea to American ships. True, this is a somewhat long-term consideration, but there is nothing to suggest that the crisis in the Middle East can be settled—by either side—with any speed, and to whatever sector of the potential Middle Eastern battlefields the struggle is car-

ried, reinforcements reaching the Suez Canal in American bottoms will mean an enormous reduction in the pressure on Allied shipping space. The immediate problems in Italian East Africa are on the one hand mopping-up operations between Adowa and Addis Ababa; on the other, care for the welfare of the Italian non-combatants. The Italians are always perfectly content to leave their people in British care, and it is fortunate that the Imperial forces have arrived in time—in Asmara, Direedawa and Addis Ababa—to prevent disorder. General Cunningham has not, however, received a *quid pro quo* from the Italians in the shape of surrender. Leaving their women and children to the safe keeping of the enemy, they have withdrawn to Dessie to prolong as far as possible the diversion of British resources from other fronts.

* * *

A War Transport Council

The volume of evidence showing that Great Britain is not making full use of the capacity and flexibility of transport is steadily growing. And as the inadequacy of transport as a whole is seriously impeding the war effort on the home front, the demand for a more enlightened policy has become more insistent. In its eighth report of the 1940-41 Session, the Select Committee on National Expenditure drew attention to the need for speeding up the movement of coal. In its tenth report, it laid bare the failure of transport adequately to second the effort of the merchant marine by the rapid clearance of goods at the ports. Other, if circumstantial, evidence suggests that munition factories are often hampered by the irregular delivery of essential materials and by their inability to move finished goods to their destination on schedule. It remains to be seen whether the War Transport Council, set up by the Minister of Transport to advise him on questions of policy, will solve the problem. According to a communiqué issued by the Ministry of Transport on April 5th action has hitherto been directed mainly "towards the strengthening and, where necessary, reorganisation of each separate section of transport."

And, since this work is now actively in hand, the Minister has decided "to embark on a new and important step, namely, the co-ordination of all forms of transport from a strategic point of view." The relation between the new Council and the Ministry is to be the same as that between the Board of Admiralty, the Army Council or the Air Council and the fighting departments. The list of its members is as impressive as the Ministry's communiqué is grandiloquent. It includes Lord Stamp (chairman of the L.M.S.), Sir A. G. Boscawen (chairman of the Transport Advisory Council), Mr J. F. Heaton (chairman of Thomas Tilling Ltd.), Lt.-Colonel Sir Maxwell Hicks (chairman of McNamara and Company Ltd. and Allied Transports Ltd.), Sir William Prescott (chairman of Lea Conservancy Board), Mr J. D. Ritchie (general manager of the Port of London Authority), Mr A. Deakin (acting general secretary of the Transport and General Workers' Union), and Mr W. P. Allen (general secretary to the Associated Society of Locomotive Engineers and Firemen). The Parliamentary Secretary, as well as the Permanent and Deputy Secretaries, to the Ministry of Transport will also serve on the Council. But the impressive character of the names is the Council's main weakness. It is a representative body, a federation of transport interests (each of which will wish to preserve its sovereign rights), not a unification of transport. It is doubtful whether such a body, however eminently constituted, will be able, first, to see the problem as a whole and regard and treat the various means of transport as so much interchangeable carrying capacity, and, secondly, to secure the rationing of facilities in accordance with a schedule of priorities. Indeed, there is a danger that the whole transport problem may once more be shelved behind the screen of the new Council, and that it may become a boundary commission demarcating the rights and functions of the various means of transport represented on it, instead of a joint executive to run them as one unit in the national interest.

Atlantic Casualties

At present, shipping losses are given out some ten days after the week concerned, and this haste to give out news, good or bad, is commendable. Actually, there is a strong case for delaying these announcements. It is true that this information is needed to counter the speedy publication of quite fictitious sea successes by the enemy. But the main aim is to give an accurate view of the course of the Atlantic battle, and the truth is that in ten days not enough is known about what has happened to particular ships to make the losses announced more than very rough and provisional. A Note in *The Economist* last week (on page 442) showed, since the New Year, the frequent wide divergence—which, in the present timetable, is quite unavoidable—between the original figures and subsequent announcements. This week—coupled with the announcement that British, Allied and neutral losses were 77,575 tons in the week ended March 30th—comes the information that the losses for the week ended March 16th—originally 72,000

tons and then raised to 95,000—are now known to have been 146,000; losses in the week ended February 23rd, originally 61,000 tons and raised to 69,000, are now 100,000. Obviously, the announcements should either be delayed by a further week or fortnight or they should be ostentatiously labelled "provisional," and much fuller publicity should be given in the Press and on the radio to the corrected figures—which, of course, are always promptly made known. The aim is a true picture, and it is the duty of the authorities and of the newspapers and the BBC to adjust the balance of their publicity accordingly. The situation at sea is bearable but serious, and the facts should be taken closely to heart by a public whose personal economy can ease the strain. The Forces are striking back with success. But a public, which is given in detail the encouraging news of the tremendous battering of Kiel (where U-boats are made) and told of the Admiralty's confidence in its defence measures, should not be allowed to have an attenuated impression of what is actually happening at sea.

The Land

Last Thursday's Commons' debate on food production was remarkable chiefly for the clarity of the statement made by the Minister of Agriculture, Mr R. S. Hudson, and for the weight of the criticism delivered by Mr Lloyd George. Both speakers devoted considerable time to an exposition of the seriousness of the present food position, indicated by the necessity of feeding some 6,750,000 more persons than in the last war from an area of arable land which had fallen by some 4,500,000 acres. Mr Lloyd George made effective reference to the comparative rate of sinkings in the first nineteen months of the Four Years' War and the present war—an argument which is reinforced by the latest announcements of shipping losses. By general consent, the failure to take all suggested steps for the reclamation of derelict land, the fertilisation of land freshly ploughed up—Mr Lloyd George made the disturbing statement that, despite substantial ploughing-up in 1939, the increase in output remained negligible—and the provision of additional machinery, especially in hill farms, is due to shortage of labour, machinery and fertilisers. And, in the delicate matter of competition in priorities between the Ministry of Agriculture and the Ministries of Labour, Supply, Shipping and the Service departments, it is still possible that insufficient weight is attached to Mr Hudson's claims. If serious food shortage is to be avoided, the output of home-grown food must be increased much more substantially than in 1939. In the background there remain the problems of British agriculture in normal peacetime conditions. Does the threat of blockade in war compel the adoption of a system which artificially bolsters agricultural production in time of peace? Does cheap food inevitably militate against security? Clearly, the solution of the problem depends on the prospect of post-war stability; but it would be a policy of despair to carry over into the post-war world agricultural ambitions and criteria dictated by the war.

Crisis in Iraq

The timing of the Iraqi coup d'état, by which the High Command has seized power and violated Iraq's constitutional and parliamentary system of government, confirms all earlier suspicions of Axis influence. It has come at a most embarrassing moment from the British standpoint, and if the Balkan campaign is in Hitler's plan a preliminary to more extensive activity in the Near East—say, at the expense of Turkey—the Allies may be faced there with an ugly military situation. The forces which are behind the new military dictatorship in Iraq—notably the pan-Arabian and anti-British attitude represented by the Mufti of Jerusalem—are also at work in Syria, and Axis propaganda has long been attempting to exacerbate local hostility against French and British "imperialism," and to argue that, with the Allies preoccupied elsewhere, now is the time to "throw off the yoke" and to achieve an independent pan-Arab Confederation. It is difficult to say how far the new regime in Iraq has swallowed the whole Nazi bait. The new government, led by Sayid Rashid el Gailani, has declared its determination to observe Iraq's treaty relations with Britain, but the tone of the Press and rumours that Iraqi troops have occupied an RAF airfield outside Baghdad suggests that Britain may have to face a serious challenge

in the Near East. However, it is not certain that the new regime commands universal support in Iraq. The Regent has retired to Basra, the centre of the Shiite sect, who form the majority of Iraq's population—the army clique at Baghdad are Sunnite—and has issued a proclamation denouncing the military coup. The blow fell when Parliament was in recess. It remains to be seen whether the members will take their exclusion without a struggle. Unfortunately, the Army appears to be united in its support of its superior officers, and in these days of war and rumours of war, this may be decisive.

Mr Matsuoka Goes Home

Mr Matsuoka is on his way back to Japan. His visit to the Axis capitals has not been uneventful, and it is difficult to picture what went on in his astute oriental mind behind the elaborate compliments and fervent protestations with which his oratory was sprinkled. The Germans gave him his marching orders, maintaining bluntly that Japan could no longer remain aloof, and the time for a drive south to Singapore had come. But there is nothing in the present situation to suggest that the time is ripe now than at any other period since the signature of the Axis Pact last September. Hitler's patience may, it is true, be exhausted, but Japan is neither small enough nor near enough to find this a compelling argument. Now, as before, the Japanese will make a realistic calculation of the risks and advantages entailed in a "forward" policy. The mood of the United States is infinitely more war-like than it was last autumn, and it is significant that there has been a joint meeting at Manila between President Quezon, Sir Robert Brooke-Popham, and the Dutch Foreign and Colonial Ministers. Germany has still no *quid pro quo* to offer in return for a Japanese diversion in the Pacific. The Russian question is also unsettled, and here, conceivably, the deterioration of Russo-German relations may help Japan. Ribbentrop could not persuade Russia to come to an understanding with Japan, but the German Army may provide more compelling reasons. If the Germans were to attack Russia, it would be worth some sacrifice on Russia's part to ensure that Japan's attention was turned elsewhere. Mr Matsuoka has at least found enough to discuss to prolong his return visit to Moscow from three days to a week. In the meantime, there have been a series of reverses in Central China and a further strengthening of conservative elements in Prince Konoe's Cabinet. Mr Ogura, the new Minister without portfolio in control of economic affairs, is not an advocate of totalitarian methods while Mr Hoshino, who has been superseded at the Planning Board, undoubtedly was. It is therefore possible that Mr Matsuoka will not find a very adventurous spirit prevalent on his return.

A Debt Discharged

The balance in the Unemployment Insurance Fund at the end of last December was £54½ millions, which the Unemployment Insurance Statutory Committee (as stated in their eighth report, just published) have decided to use to pay off the Unemployment Fund's debt of £38½ millions, holding the balance as a reserve. The view of employers' organisations was that insurance contributions should be reduced. The trade unions' view was that benefits should be increased; that the three days' waiting period before receiving benefit should be abolished; and that the so-called Anomalies Regulations affecting married women should be withdrawn. The view of the Beveridge Committee, as it is called, is that, since the Fund must be prepared to meet serious unemployment and dislocation after the war, the surpluses made in wartime must be held for the "rainy day"; they are not "disposable" to relieve contributions or augment benefits. It is true that the greater part of this year's surplus has been applied to pay off debt. But it would obviously have been anomalous to have carried, side by side, a large debt and a considerably larger credit balance; and repayment means an immediate gain to the Fund's income account of 8 per cent of the sum paid back. The question whether Parliament, in the Acts of 1934 and 1938, should have laid the debt arising from the depression period, when insurance broke down, upon the Fund is debatable, but not the Committee's business. In 1934 it was £100 millions. This year it has been paid off—in 1941, not 1971, as was originally arranged; and at the end of next December the credit balance

of the Fund, it is estimated, will be about £55 millions—"by no means an excessive provision for the loss . . . in the aftermath of war," if the war should end next year. It is quite impossible to cavil at the Committee's interpretation of its duty, though its acceptance of the present scales of benefit as sufficient in war conditions may be questioned. The hardship imposed by the waiting period on people thrown out of work by air raids is admitted. So, too, is the need to re-examine the regulations now that married women are being called back for war work. But it is Mr Bevin who has emergency powers to deal with these matters, not the Committee.

Down to Earth

Preparations for planning the use of land and the development of cities are gathering momentum. Early in the war, it was widely urged that the Royal Commission on the Geographical Distribution of the Industrial Population, which had just reported, should remain in being to watch the distortion by war conditions of the problems they had surveyed exhaustively. Now, in a Consultative Panel on Physical Planning appointed by the Minister of Works and Buildings, members of the Commission (including its chairman, Sir Montagu Barlow), together with several experts who put the shrewdest evidence before it, form the core. It is a splendid sign that this planning has every chance of starting with physical facts and not fancy theories. Test surveys are being made of Coventry, Birmingham and Bristol, all blitzed areas. The London County Council has been asked for a plan for London. The committee which was set up to consider ways of preventing speculation in bombed land—a problem of development and redevelopment which, in fact, goes far beyond bombed land—is to report almost at once. And the knowledge that Lord Reith's panel is, on the whole, made up either of the most hard-headed of architects and town planners or of the men who have delved most deeply into the social and economic problems of land use and urban growth is most encouraging.

Latin America and the Axis

Latin Americans, who attach great importance to international law and correctness of international procedure, have been deeply offended by the Axis attempts to damage or scuttle their own ships, and whatever popular ground Germans have gained for themselves by their propaganda—and it is very small—has been largely lost. Peru is a sufficient example of this. Two German ships attempted to escape from Callao, and on being intercepted, set fire to themselves; two more also scuttled themselves. But the government had evidently decided that the time had come to take general action; the office of the Transocean News Agency was closed, the *Lufthansa* Airline was given 90 days in which to wind up its operations, and during this period each aeroplane in flight is compelled to carry a Peruvian officer. The President of the Republic, in taking these measures, has not only had the full support of the Vice-President, whose admiration for the Allied cause is well known,

but that of the whole people. Meanwhile, it is known that in the neighbouring republic of Ecuador, the *Sedta*, the German airline, is under the close surveillance of the government, which is highly suspicious of its presence and activities. This suspicion was not abated recently when one of the company's machines flew over the disputed frontier zone between Peru and Ecuador, displaying the flags of both nations. This action, by an aeroplane belonging to a company domiciled in Ecuador, rightly roused protest. It was explained with becoming unction that the pilot had lost his way. It was more widely believed by the cynical that here was one more example of German fishing in troubled waters. What could have been gained by exacerbating this already troublesome dispute is difficult to see. Two conclusions are, however, fairly clear. Firstly, if the Germans are not very popular on the West Coast of South America, they have only themselves to thank. Secondly, the gaps left in these air communications provide a supporting argument for the general case for British airways in Latin America. For its broad justification this case rests upon other and more substantial grounds. Admittedly, any such schemes encounter almost insuperable financial obstacles in wartime; but if the future of passenger and mail transport and even certain types of freight carriage is in the air in Latin America, it seems lamentable that Great Britain, the pioneer of shipping and rail routes in that region, should lag behind. Italian, German, Dutch and French lines were, in 1939, in full activity and development; and Panamerican Airways controls a remarkable network of lines.

Holidays Ahead

The Government's decision to allow national holidays on Easter Sunday and Easter Monday was a pleasant surprise. After the cancellation of the Whitsun, August and Christmas Bank holidays last year it almost appeared that Bank holidays had been banished until the end of the war. The grant of the present mercy indicates no slackening in the production drive. It is rather in the best interests of higher output and it is provided that work is to be continued in cases where "requirements are sufficiently urgent." Indeed, this loophole will result in the withholding of the holiday from precisely those workers who most urgently need it and whose productive powers it is most important to sustain and fortify. Last year, the country drew on capital to the extent to which it exhausted reserves of drive and energy possessed by working men and women; while the short-term need was supremely urgent, this was inevitable. In January, the Select Committee on National Expenditure declared that a reduction in munition workers' hours should take place at once before their health was seriously affected—as it was in the last war. In 1917, it was proved that the reduction of munition workers' hours by a fifth would increase output. Absenteeism, which has been appreciable, is in part at least a sign of undue strain; and overtime is costly as well as strenuous. In 1941, the whole country is working for a long war and every consideration must be exercised, in the interests of production itself, to ensure that the labour force shall stay the course—and that it shall be assisted to maintain a maximum output over the whole period. The question of summer holidays in industry is still under consideration. Last year, broadly speaking, the industrial population took no holidays. Working longer hours, they passed straight from the strain imposed by the spring campaign and the French collapse to the strain of severe bombing during the autumn and winter. Some relaxation will have to be permitted during the summer, if fatigue and illness are not to reduce output during the crucial winter of 1941-42.

Gas Precautions

In the last few weeks the public has been urged to take the possibility of gas attacks seriously, and publicity campaigns and rehearsals have been taking place on a scale reminiscent of those for ARP in the months before air raids started. Following up Mr Morrison's broadcast of a fortnight ago, a pamphlet, giving full instructions on what to do in a gas attack, is being issued to every household. Attempts are being made, too, to encourage the public to carry their gas masks. The campaign will be useful, because although before the war the gas danger was grossly exaggerated—as,

indeed, were all the perilous consequences of aerial bombardment—the fact remains that on certain occasions in certain places gas may be used, and the facilities for dealing with it ought to be well known, available and in working order. But it would be the greatest mistake if the Government were to take the advice urged in many quarters that carrying gas masks should be made compulsory. Not only would compulsion be extremely difficult, if not impossible, to enforce, but it would cause great irritation and quite spoil the admirable good temper with which most people have treated air raids. The regulations of September, 1939, forbidding all forms of sport and entertainment all over the country were a great mistake. When raiding started in earnest, there was no need to reimpose them, for the people themselves quickly sized up the risks and decided which were worth taking. It may be argued that carrying the gas mask is a simple matter, although the experience of the Lost Property Office of London Transport proves quite otherwise. Nevertheless, air raids have shown that the personal danger element of ARP, such as sheltering and curfew, is essentially a case for empirical treatment. So let it be with gas.

War Damage: Correction

On page 444 of *The Economist* last week, it was stated that the War Damage Commission would begin its work in the provinces "in about six months." This, of course, should have read "in about six weeks."

Shorter Notes

It is bad news that a typhus epidemic has broken out in Spain. Fortunately, it has not reached serious dimensions—the number of cases in Madrid up to last week being about 300, with a death roll of 27, while there are smaller outbreaks reported from a few other towns—and the vaccine sent from America is proving successful. But typhus is a hunger plague, and, quite apart from humane considerations, if it were to spread across the frontier to France, the pressure on Britain to relax the blockade would become greater.

The regulations governing dependants' allowances for soldiers' dependants other than wives and children have been amended in accordance with the principles of the Determination of Needs Act. In future only the income of the dependant, and his or her wife or husband, and of any sub-dependants will be taken into account, instead of the resources of all members of the dependant's household.

When the second hour of summer time comes into force next month it will not, after all, affect the cow, for the time of milking will be governed, not by the new time, but by "ordinary" summer time. The latter will also apply to hours of work for farm labourers.

The demands on woman-power have emphasised the inferior status, in respect of pay and conditions of work, of the highly skilled woman's profession of nursing, and there is a prospective serious shortage of nurses in civilian hospitals. Since nursing is an occupation which women can hardly be compelled to take up, the only method to gain recruits is by improving the conditions vis-à-vis other jobs. Last week Mr Bevin announced an increase in the salaries of members of the Civil Nursing Reserve, and also a higher rate for those who wish to take up nursing as a life career. The latter will henceforward receive salaries of £40 a year with annual increments of £5. But there is no immediate prospect of putting nurses' salaries on a national basis like those of teachers, and it cannot be said that £40 a year compares favourably with the wages of domestic servants in many districts, even though it includes superannuation rights.

The Civil Defence Duties (Compulsory Enrolment) Order has now been applied to Manchester and certain towns in Kent and Sussex, as the number of volunteers for fire prevention duties in these places is insufficient to enable the local authorities to make adequate arrangements for fire prevention in areas not covered by the Fire Prevention (Business Premises) Order. It is to be hoped that the use of compulsion will not cause volunteers to resign in the belief that they will no longer be necessary.

THE WORLD OVERSEAS

Hongkong Faces a New Threat

[FROM OUR HONGKONG CORRESPONDENT]

March 11th

THIS colony has become so hardened to Japanese threats that the sudden alarm raised in Australia, Malaya and elsewhere recently came as a surprise. It has been obvious for some time that the Thailand-Indo-China border dispute was artificially created and that the rôle of mediator was adopted by Japan from ulterior motives. Further developments in her southward drive depend upon the situation in Europe, but the feeling here is that unless Japanese militarists "go mad dog" an attack on British territory is unlikely. With business flourishing, despite the blockade of the China coast, Hongkong has become somewhat complacent, but the military defence of the colony is in a high state of efficiency, and during the past year considerable progress has been made in civil defence. The problem of food reserves has been energetically tackled, and an extensive system of tunnels and shelters for protection against air raids is now nearing completion. It is gratifying to find that the educated Chinese are co-operating wholeheartedly with the local ARP, medical and police authorities; and although the large percentage of destitute refugees is a heavy burden on the community, there is no doubt that the colony is well prepared to withstand any hostile attack.

The Hongkong Government has been subjected to extensive criticism in regard to its financial policy as well as to the administration of certain departments. Unofficial members of the Legislative Council have shown an unusual keenness in debate, and their combined pressure has effected a reduction in the budgeted deficit from \$7½ millions to \$3,856,000. While there is certainly justification for check on extravagance, the unofficial opposition may discourage the efforts of Government officials to raise the standard of some of the public services which are admittedly low. Chinese tradition has many admirable features which have stood the test of time, but it possesses other features which must undoubtedly yield to the requirements of modern science. The process of change is painful; but with modern China rapidly forsaking the basis of the family unit tradition is losing ground, and it is unfortunate that the progress which enlightened Chinese opinion demands is hampered by financial limitations. The criticisms of Government administration are mainly due to the difficulties of adjusting existing departments to a war footing and of setting up new departments to cope with war requirements. As has been the case with the Ministry at home, some of the holders of office here lack drive and adaptability, but unlike their more illustrious opposite numbers they are sheltered by the rules of the Colonial Civil Service and cannot be called upon to make way for others more fitted to stand the strain of the present exceptional times.

Chiang-Kai-shek made a very full reference to the Communist Party's claims to special privileges when addressing the National People's Political Council which assembled in Chungking during the past week. The Communist leaders have been a thorn in the Generalissimo's flesh throughout the course of the war with Japan, but until recently he has been able to hide the trouble they have caused him. His patience has, however, been sorely tried, and he has now openly threatened to take stern action unless they obey the orders of the Central Government. It is difficult to make out what lies behind the dispute, for the published demands of the Communist Party throw little light on it. But it appears that the leaders of the party are insisting upon a much greater share of power, and as the Communist armies are an important part of the

country's defence, Chiang-Kai-shek is placed in a dilemma. He is, however, a past master at dealing with awkward situations, and he will strive his utmost to preserve the unity of China which he has achieved in so short a time and in such discouraging circumstances.

Portugal's Calamity—England's Opportunity

[FROM OUR LISBON CORRESPONDENT]

March 1st

As yet no exact estimate of the damage occasioned by recent storm and flood can be made. A figure of £5,000,000 has been mentioned; as an estimate it is conservative. Crops of figs and almonds, sardine boats and nets, olives, cereals and woodlands have gone; from the Algarves in the south right throughout the country into the Serra da Estrela and the Minho the cyclone swept, with torrential rains before and after its blast completing the ruin. The Government and people have behaved magnificently; relief work has begun; and subscriptions in aid of the many personal sufferers are pouring in.

It is, however, to the future that all thinking persons in Portugal look with the greatest anxiety. This will be a black year at best, but if Portugal cannot improve her trade by making the fullest use of the commodities she does export, both home-grown and colonial, it must culminate in deep disaster. On this account there is a general feeling that the recently concluded Anglo-Portuguese trade agreement ought to be put in force without delay. As *O Seculo* writes, in a leading article entitled "Not by words alone . . .," while kind words and expressions of sympathy by the British Press are most welcome, "England now has an opportunity to show by her deeds what her sympathy for her old and faithful ally is worth." Referring to the trade agreement, *O Seculo* says that while the diplomatic part of the business was speedily put through, the same cannot be said of the practical details. Day by day the position of the country grows more serious. "Is it on account of the exasperating delay characteristic of certain English bureaucratic organisms, apparently pleased at being able to interpose all sorts of obstacles to the realisation of the agreement, or are other causes at work of which we know nothing?"

Such an attitude is most regrettable, the paper continues, adding that it must be admitted that on more than one occasion the delays and the lack of understanding shown, both of their own and of other people's interests, by official departments, have made many steps, tardily taken, of no practical use. They have not even served to attenuate, much less remove, the impression of the ills they were designed to remedy.

THE COMMERCIAL BANK OF SCOTLAND LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL - - - £2,250,000
RESERVE FUND - - - £3,150,000

ESTABLISHED 1810

This is straight speaking, and British commercial opinion in Portugal wholly supports the *Seculo's* honest criticism. There is grave danger of Anglo-Portuguese trade relations becoming entangled in a ravelled net of ill-informed, if well-meaning, departmentalism, the key-note of which seems to be: do nothing and then nobody can say you did wrong. Departmentally this may be all right for the subordinates, who thereby hang on to their jobs whatever happens, but it is playing the very devil with British export trade, and, as the *Seculo* points out, it also alienates the sympathies of those who, however convinced they may be of the righteousness of Britain's cause, must eat to live and can only do so by retaining some part at least of a trade sadly diminished through no fault of their own.

The Deterioration of Hungary

[BY A CORRESPONDENT]

April 5th

THE suicide of Count Teleki, who did not feel able to carry on "his difficult and unhappy task," is a tragic revelation of the effect on patriotic statesmen of compliance with Hitler's demands. It emphasises, if emphasis is needed, that Hitler's "New Order" means political subservience and economic deterioration for the countries joining it. Hungary's economic position within its framework is, indeed, the same as that of all Balkan countries; she has to supply Germany with agricultural products and raw materials and to purchase from Germany as many manufactured goods as possible, thus destroying the industrialisation which has been pursued for many years.

That Germany's aim is to reduce Hungary to a purely agricultural country is shown by utterances of the German Press. For example, *Das Reich*, of February 23, 1941, writes that the development of the Hungarian industry is limited by its supply of raw materials and its markets. All the new factories built up since the Great War have a big demand for imported raw materials which is especially unfavourable felt in wartime. On the other hand, the formerly large exports of agricultural products have steadily decreased and the output of the flour mills is now 40 per cent of capacity. By the recent expansion of Hungary's territory, the raw material basis was enlarged by metals, coal, timber, etc. The territory itself, however, is no gain for the country's purchasing power, so that the outlet for industry has not been much increased. The possibilities of industrial development, therefore, are limited, although for armament reasons some branches (for example, an aluminium factory) have been developed already. Quite different—the article concludes—is the position of the export of processed agricultural products, such as tinned goods, which have a good market in Germany. In future, these and agricultural raw materials will make up the greater part of Hungary's export trade.

The war has deprived Hungary of part of her suppliers as well as her customers, although the occupation of Transylvania has provided her with some important raw materials. The increase in prices owing to higher import prices is one of the most critical social problems, because it causes a demand for higher wages. In the last months the lower and middle wages were increased, but so inadequately that they did not even compensate the increased prices of foodstuffs. This higher cost of living, however, is not the result only of higher import prices but also of the small harvest. This year, the area cultivated with winter wheat was 40 per cent smaller than in the previous year owing to the unfavourable weather conditions. In the previous year, the maize harvest was not even sufficient to secure the necessary foodstuffs. The result has been a fall in the number of livestock, and, therefore, there is to-day a shortage of milk and butter, meat and bacon. Ration cards, at first introduced with hesitation, are now increasingly decreed.

Since 1938, the Hungarian economy has been influenced considerably by the Five Year Plan for defence and economic improvement. This plan was effected in half its prescribed time; it not only put a strain on the financial capacity of the country, but it was also necessary to reduce the output of consumption goods in favour of the production of armaments. The investment

of 600 million pengoes, however, was not sufficient to finance the necessary armaments, and in the Budget for 1941 the expenditure of the Ministry of Defence is again by far the largest. The Five Year Plan mobilised a fifth to a quarter of the whole national income. The Government has covered three-quarters of this expenditure by higher taxes and duties. In the last financial year, however, expenditure had to be covered more and more by loans, especially since, after the occupation of Transylvania, there arose new tasks to be solved. The "Transylvania Loan" has been intended to mobilise small savings, but as these are not large enough to cover the considerable sums required, more claims on big capital will certainly be made.

Steady Production in America

[FROM OUR NEW YORK CORRESPONDENT]

March 19th

FOR the past four months production has been running rather evenly at a high level. The same may be said for construction, although in that industry seasonal influences are partially responsible for the apparent recession. Seasonal influences are also visible in the department store series. Employment in manufacturing in January was about 10 per cent above January, 1940. If the increase in manufacturing is typical of employment in general, one would infer that close to five million persons had been added to the employed during the past year. This inference would scarcely be justified; but there can be no doubt that the "reserves" of labour, as they were a year ago, have been considerably drawn down. It is also worth noting that, while factory employment was rising 10 per cent, payrolls were rising about 20 per cent. The following table shows the significance of that figure:—

	Factory Employment	Factory Payrolls
January 1937	105	95
1938	91	75
1939	95	85
1940	105	100
1941	115	120

Since the recession of 1938 there has been a general tendency for payrolls to rise faster than employment. Very likely this reflects the transition from part-time to full-time and over-time.

BUSINESS INDICES
1935-9=100 for industrial production
1923-5=100 for all other series
(Unadjusted for seasonal variation)

	Feb. '40	Dec. '40	Jan. '41	Feb. '41
Industrial production (total) 118	135	133	138	138
Manufactures (total)	114	130	137	142
Durable	121	162	161	168
Nondurable	108	120	117	121
Minerals	112	114	113	115
Construction contracts (total) 54	93	84	77	71
Residential	50	77	70	71
All other	58	106	95	81
Factory employment (total) 105.0	116.2	115.5	—	—
Durable goods	99.2	117.6	118.3	—
Nondurable goods	110.5	114.8	112.7	—
Factory payrolls (total) 99.3	122.4	120.7	—	—
Durable goods	97.8	131.6	131.9	—
Nondurable goods	101.0	112.1	108.0	—
Freight car loadings (total) 68	77	78	79	79
Department store sales	71	179	79	81
Department store stocks	68	66	64	—

One of the more remarkable features of the data is the widening discrepancy between payrolls and such indices of consumer purchases as department store sales. For a long time the index of payrolls and of department store sales ran neck and neck; the recent disparity probably means that the additional income is going into a variety of channels outside the department stores; something that might be called expenditures on amenities or "luxuries" as distinct from necessities.

Refunding in Process

To-day, the Treasury offered \$500 millions 11-13 year 2½ per cent bonds for cash subscription, and provided for the June 15th maturity of an equal amount of 1½ per

cent notes, by exchange for the new bonds or for two-year ½ per cent notes. Both issues are subject to full Federal taxation, while the maturing notes had been fully tax exempt. This is the second substantial offering of taxable securities. On the long-term bonds, the tax feature has this time been equated at about ½ per cent; on the notes, it is more difficult to state as the rate has been lifted and the maturity shortened. Supplementing issues of this type, the weekly offering of Treasury bills has been doubled, \$100 millions refunding the maturing issues and \$100 millions providing fresh money. These bills, formerly fully tax exempt and now fully taxable, continue to go at nominal rates. As has generally been true in recent years, the largest rate fluctuations have occurred in the notes.

Swiss Trade Recovers

[FROM OUR GENEVA CORRESPONDENT]

March 1st

DESPITE all handicaps Swiss foreign trade returns for 1940 were not so bad as was expected. Imports for the year totalled 1,863 million francs, and exports 1,315 millions, thus leaving a low adverse balance of 548 millions. It is the result, on the one hand, of the decrease in imports owing to transport difficulties, and, on the other hand, of the relatively favourable maintenance of exports. Information received concerning activity in industry is not bad at all, and, despite the partial demobilisation of the Army, unemployment has not risen noticeably. Swiss imports are always higher than exports, as the country possesses no raw materials and not enough foodstuffs, and the maintenance of exports is therefore necessary to assure the country's revictualing. The outstanding features of 1940 are that during the last three months exports exceeded imports, and that exports amounted in December to 143 million francs, the highest figure since October, 1938, when they were 134 millions.

Commercial exchanges, which were almost normal until June last, then showed a sharp decline, but they slowly recovered towards the end of the year. This is remarkable in view of the transport difficulties and the disappearance of one of Switzerland's markets, France.

A Swiss Navy?

At the beginning of the war Switzerland chartered a number of neutral ships, mainly Greek, for transporting her goods. These ships were flying the Swiss flag, and, though sometimes detained by the British control, they were nevertheless able regularly to bring their cargoes to the French and Italian ports and ship others there. The situation was changed after the Italian attack against Greece; new ships had to be found, and the question of sea transport reconsidered. The Swiss navy may be a reality in the near future, and no longer a practical joke. The Swiss Federal Government is examining the question of creating a Swiss mercantile marine and of getting the right to fly the Swiss flag on the seas and of getting the right to fly the Swiss flag on the seas recognised. Once the latter point is settled, Switzerland will be in a position to assure—with the untiring good will of Great Britain—the transport of her goods, thus enabling her trade and industry to work and her people to exist.

Balkan Communications

In the article on page 447 of last week's issue of *The Economist*, it was stated that the total Danube fleet of tankers in the summer of 1940 was stated by authoritative Roumanian sources to be 278 tons, with a capacity of 1.6 million barrels. This should have read 278 tankers, with a capacity of 1.6 million barrels.

German Europe

German Agriculture.—Official German sources estimate the fall in Greater Germany's cereal harvest in 1940 at 10 per cent. The actual harvest in the "Old Reich" might thus amount to 24.7 million metric tons, against 27.4 million tons in 1939. No comparable figures are available for Greater Germany, which now includes the Western Polish provinces, Alsace-Lorraine, Luxembourg, and Eupen-Malmedy. The root crops were, however, good.

ROOT CROPS IN GREATER GERMANY

(In million tons)

	Potatoes	Sugar Beet	Turnips	Mangolds and Swedes
1938	56.4	17.2	7.7	41.7
1939	56.3	13.4	6.8	39.5
1940	58.9	18.4	6.5	40.4
1940*	70.1	21.2	7.3	43.0

* Including the incorporated Polish provinces, called Danzig-West Prussia and Warthgau.

The stocks of cereals laid in before the war should be sufficient for the present bread rations until the new harvest begins; and more favourable weather, a better supply of machinery and labour (i.e., prisoners of war and foreign workers) will probably ensure a better harvest in 1941.

Ten commandments issued to farmers at the beginning of the spring season show the difficulties of the agricultural situation. Any decrease in the acreage under bread grain is forbidden, and the acreage under root crops, oilseeds, and vegetables is again to be extended. The ratio of home-grown feeding-stuffs must be increased. Where there is a shortage of workers, farmers have to form pools for the common use of horses, tractors, and agricultural machinery. The mechanisation programme has been extended, and it is claimed that the number of tractors delivered to farmers has greatly increased.

Since the census of livestock in December, 1939, no new figures have been published. After a temporary reduction in the number of pigs, a further expansion was begun, based on a more intensive collection of kitchen waste and a favourable potato crop. The number of pigs may now have again reached 29 millions, which was the census figure in December, 1939, for Greater Germany.

★

Europe's Contribution.—The incorporation of Western Poland, the conquest of the Western European countries and the subjugation of the four Balkan countries cannot provide any immediate improvement in Germany's agricultural situation—after the very heavy exports of dairy products from Denmark and Holland during the first months of the occupation. In fact, German Europe's agricultural problems, with the exception of Poland, Slovakia, and the four Balkan countries, which are exporting countries, are not different from Germany's domestic problems. Under normal circumstances, that is to say, Continental Europe relied for a third of its fat requirements on overseas resources, mainly oilseeds and marine oils. Net imports of bread grain amounted to 5.5 per cent of total consumption, and the deficiency in feeding grains amounted to 8 per cent. In potatoes, there was 100 per cent self-sufficiency, but net sugar imports may be estimated at 7 per cent of the total consumption.

German wartime agricultural policy, which now extends to all European continental countries, except the remaining neutrals and Greece, aims at 100 per cent self-sufficiency for their requirements under a complete system of rationing. It varies from country to country. In Denmark and Holland, whose meat and dairy exporting industries depend on imported feeding-stuffs, drastic changes are effected by curtailing the livestock population. In Belgium, normally a heavy importer of bread grain, the cultivation of cereals and root crops will be extended. In France, which is nearly self-sufficient in cereals and root crops, but normally dependent on the imports of 50 per cent of fat requirements, a large expansion in the cultivation of oilseeds and olives is laid down. In the annexed Polish provinces, large-scale agriculture is directly being organised by the Germans, aim-

ing at an increase in the yield of cereals per acre of 50 per cent or even 100 per cent. At the same time, these provinces are used for extending the cultivation of oilseeds and industrial crops.

Lastly, there remain the four Balkan countries, Hungary, Roumania, Yugoslavia, and Bulgaria. An important part of Roumania's agriculture was lost to Russia by the cession of Bessarabia and a part of the Bukovina.

Germany's policy is to reorganise agriculture over the entire Continent by concentrating the livestock industries in countries favoured for the production of feeding-stuffs, especially maize, barley, potatoes and sugar beet; that is to say, the countries of Eastern and South Eastern Europe. In Western Europe, a "balanced" agriculture, providing the total requirements of bread grain and the greater part of meat and fats, is envisaged. The immediate plans now being put into operation only attempt wartime self-sufficiency for each country under German rule, and the exportable surpluses of the Balkan countries will be requisitioned for the supply of Germany's deficiencies; these exportable surpluses, in fact, are distributed between Germany and Italy and some neutral countries according to a system of quotas settled at intervals by mixed committees of representatives of the countries and Germany. All this can only be done by imposing on the occupied and dependent countries Germany's peculiar and compulsory system of agricultural organisation.

★

Finance and Banking.—At the end of 1940, the disclosed national debt had increased from Rm. 37,300 millions on August 31, 1939, to Rm. 82,600 millions, or by 122 per cent. Total notes in circulation increased during the same period from Rm. 8,705 millions to Rm. 14,033 millions, or by 61 per cent. Total Reich revenue developed as follows, in 1,000 million Rm.:—

Twelve months April 1, 1938 to March 31, 1939	17.7
Nine months " " 1939 " " 1940	23.6
" " " " 1940 " " Dec. 31, 1940	20.4

For the whole financial year 1940-41 total revenue is estimated at Rm. 26,000 to 27,000 millions, and the financial year ended 1941-42 is estimated to yield Rm. 30,000 millions. The total national income of Greater Germany in 1940 is estimated at some Rm. 110,000 millions against Rm. 88,000 millions in 1938.

★

Banking.—German banks have entered on a new phase of territorial expansion in the incorporated territories of Austria, the Sudetenland, the Protectorate Bohemia-Moravia, the western provinces of Poland and in some of the occupied countries. Some relevant items of leading banks may be taken as representative.

	Berliner Handelsgesellschaft In million Rm.		Commerzbank	
	1939	1940	1939	1940
Total assets or liabilities	339.2	400.2	1,746.0	2,035.0
Bills	52.9	45.1	400.7	442.0
Treasury bills, etc.	85.8	146.0	370.0	809.9
Investments	45.7	50.9	122.3	330.0
Advances	102.2	102.7	652.4	486.0
Deposits and current accounts	268.4	338.0	1,266.0	1,717.0
Acceptances	25.0	13.9	155.0	121.0
Savings deposits	...	...	218.6	307.0

The increase in Treasury bills is part of the development of controlled finance. The influence of the war is shown in the increase in deposits, amounting to 26 per cent in 1940 against 12 per cent in 1939. The peculiar position of the Berliner Handelsgesellschaft, which is a kind of private central bank, prevented an actual decrease of advances; but the fall in acceptances is clearly due to the successive reductions in the interest rate. Of the investments of the Commerzbank 30 per cent in 1940, 83 per cent are Reich loans; they increased by 36.4 per cent in 1940. Deposits increased by 40.4 per cent and savings deposits by 40.4 per cent. The extended activities compelled the bank to increase its capital from Rm. 80 millions to Rm. 100 millions.

THE BUSINESS WORLD

The National Income

THE estimates of the national income contained in this week's White Paper provide information not only in fuller detail but more promptly than has hitherto been available. The main estimate is of the size and components of "net national income" for the two years 1938 and 1940 and also for each quarter of 1940 separately. These totals are shown (in millions of pounds) in the first line of the following table. The other sections of the table show, in percentages, the main constituents of the total of income and the main heads of expenditure:—

	1938		1940			
	Year	Year	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
Net national income	4,415	5,586	1,286	1,399	1,450	1,451
Rents	% 8	% 6½	% 7	% 6½	% 6½	% 6½
Profits and interest (before deduction of tax)	27	27	27	27½	27	26½
Salaries	22	20½	20½	20	20½	20½
Wages (including payments to armed forces and shop as- sistants' salaries)	41	44½	43½	44½	44½	45
Other income	2	1½	1½	1½	1½	1½
Consumption	77	64*	66	64	62	63
Expenditure of cen- tral and local government.....	19	53*	42	45	59	67
Net investment or disinvestment.....	4	-17*	-8	-9	-21	-30

* No figure given in White Paper; figure printed is average of four quarters.

These figures provide material for a whole series of studies in economic morphology; but for the moment two comments must suffice. The first is to point out the rapid increase in the share of wages in the national income under war conditions. The second is to underline the very large dimensions to which the disinvestment of capital can grow for short periods. The heavy figure shown for this item in the last two quarters, which permitted the total of private consumption and Government spending to rise to 130 per cent of the net national income, was presumably a reflection of the very rapid employment of the dollar reserves. In the nature of things, it could not continue for long; it is the exception that proves the rule that a belligerent must pay for war almost entirely out of income.

The comment on the figures which is likely to strike the layman most strongly is, however, the comparative smallness of the net national income. In the final quarter of 1940, it is given at the annual rate of £5,804 millions. But in that quarter the total of Government expenditure was at the annual rate of £4,261 millions; and though it must be remembered that part of that total was met out of the disinvestment of capital, it must also be remembered, on the other side, that the figure includes only the net result, not the gross operations of the Ministries of Food and Supply. Is it conceivable that the Government is already spending so high a proportion of the national income? And how are figures of the national income such as those given in the above table to be reconciled with the very much larger figures that have been current in public discussion?

The explanation lies in a confusion of definitions.

"National income" is a technical term of which the statisticians have never made as precise definitions as they should, and the figures contained in the White Paper enable the matter to be cleared up for the first time. Let us first set out all the ingredients that might enter into the national income under any of the possible definitions:—

	1938 (£ millions)	1940 (£ millions)
1. Net national income (as above)	4,415	5,586
2. Transfer incomes (i.e. incomes given without any current return, e.g., National Debt interest, old-age pensions, etc.)	490	494
3. Direct tax liabilities of individuals and net incomes of institutions	757	1,169
4. Depreciation allowances	400	400*
5. Indirect taxes and rates	643	868
6. Disinvestment of capital (in excess of depreciation allowances)	—	549

* No figure given in White Paper; assumed the same as in 1938.

It is possible to distinguish no less than six separate definitions of the national income, with two variants of some of them.

The first is the net national income as estimated in the White Paper. This is the value of the national output of goods and services, over and above those required to maintain and replace the national capital. There are two methods of valuation: the first at *factor cost* (that is, at what it costs to produce this output), the second at *market prices* (that is, at cost plus the indirect taxes and rates that have to be added in before the output can be sold). The first definition can thus be recorded as follows:—

	1938	1940
1a. Net national income at factor cost (Item 1 in above table) ..	4,415	5,586
1b. Net national income at market prices (Items 1+5) ..	5,058	6,454

Secondly, there is gross national income, which is the net figure with the addition of the depreciation allowances. The justification for using this definition, in some contexts, is that the goods and services used for main-

PROVISION FOR DEPENDANTS

There is no better way of providing for those dependent upon you than by effecting a Whole Life Assurance under *The Distinctive System* of this Institution, which combines Low Premiums with the right to share in the Surplus.

The Premiums may be paid throughout life or limited to a specified number, thus relieving the Assured in the later years when, owing to retirement, income may be reduced.

● Write for *The Distinctive System* booklet

The Scottish Provident Institution
HEAD OFFICE 6 St. Andrew Square, EDINBURGH
FUNDS EXCEED £25,000,000
Founded for Mutual Life Assurance in 1837

taining capital are currently produced and are available, at a pinch, to meet current expenditure:—

2a. Gross national income at factor cost (Items 1+4) ...	4,815	5,986
2b. Gross national income at market prices (Items 1+4+5) ...	5,458	6,854

Incomes that are enjoyed without any current return to the community, such as National Debt interest and old-age pensions, are not properly included in the national income. But they are subject to taxation and must therefore be added in if the figure required is the corpus of incomes on which the Government can levy:—

3. Net individual incomes (Items 1+2) ...	4,905	6,080
---	-------	-------

Still another figure is the total of net individual incomes *plus* depreciation. This is the *apparent* total of current output ("apparent" because it includes the double counting of the transfer incomes; "output" rather than "income" because it includes the current production needed to maintain capital). This figure is useful as a measure of the corpus of incomes on which the Government can levy if the maintenance of capital is neglected.

4. Gross individual incomes (Items 1+2+4) ...	5,305	6,480
---	-------	-------

For other purposes it may be desirable to know the sums of money that persons, as distinct from corporate bodies, have available to spend. To arrive at this figure, their direct tax liabilities and the net incomes of institutions (i.e., in the main, the undistributed profits of companies) must be deducted:—

5. Personal spendable incomes (Items 1+2-3) ...	4,148*	4,911*
---	--------	--------

The last variant is hardly "income" at all, but it is nevertheless a magnitude that is of particular relevance to the problems of war finance. It has already been pointed out in discussing gross national income that the goods and services which, in a normal year, are set aside for the maintenance of existing capital can be used for current needs in emergency. But this is not all; not only is it possible to postpone the replacement of capital, it is possible actually to draw on existing capital. This can be done by mobilising foreign assets, by using

* Footnote.—The White Paper gives estimates of the manner in which these sums were spent:—

	1938	1940
Food, drink and tobacco	1,648	1,973
Rent, rates, fuel and light, household goods and domestic service	959	991
Clothing and laundry	469	512
Private motor-vehicles	118	50
Other travel	169	164
Other goods and services	634	613
Gross personal savings	151	608
Total	4,148	4,911

Finance and Banking

Abundant Money

Abundance of funds has now returned to the money market. The early April dividends have trickled back to the general credit circulation, the transfers of tax moneys has, as usual, eased with the passing of the financial year, while on the other hand a heavy flood of Government expenditure continues to feed the supplies of credit. This week these supplies are being drawn upon to the extent of £20 millions by the excess of Treasury deposit payments over maturities, while a further £5 millions is being withdrawn by the similar excess of Treasury bill payments. But the underlying volume of bank cash is more than adequate to meet these calls, and the banks have again become insistent buyers of bills from the market. This return to abundance has had to overcome the continued drain on bank cash caused by the steady repayment of Bank of England accommodation to the India Council originally made in connection with the repatriation of India Government sterling loans. The operation for effecting this repayment evidently involved considerable open market purchases of bills for account of the India Council, the maturities chosen being those most nearly approximating to March 24th, the day on which the repayment had to be effected. It was, of course, found impossible to obtain the required

up the normal stocks of the country or by actually consuming fixed capital as when park railings are melted down to make shells. This last set of figures is, in short, a measure of the sum total of goods and services, whether of an income or of a capital nature, that the community can use to keep itself alive and to prosecute the war. (Since the chief use of this figure is to compare it with the figure of resources mobilised by the Government, and since the latter includes the yield of taxation on transfer incomes, it is convenient to include these also in the larger total, although this involves some sacrifice of logic):—

5a. Gross available resources at factor cost (Items 1+2+4+6) ...	5,305	7,029
5b. Gross available resources at market prices (Items 1+2+4+5+6) ...	5,948	7,897

There should be sufficient variety here to satisfy the most exacting. Discussion on the whole subject of national finance would be immensely clarified if it were always specified exactly which definition of the national income was being used. *The Economist* has sinned, with others, in this respect. The figures of national income that have been used in these columns since the beginning of the war have been based, rather roughly, on Mr Colin Clark's definition of gross national income, which is definition 2b above. The figure of £5,458 millions for 1938 derivable from the White Paper compares with the round figure of £6,000 millions at the outbreak of war (i.e. the annual rate prevailing in August, 1939) often used in these columns. Since the physical volume of output in the summer of 1939 appears to have been some 7 per cent higher than the average of 1938 and there was probably some increase in the level of prices and profits, it will be seen that correspondence is close.

It is questionable, however, whether gross national income is the correct figure to take when it is desired to show the activities of the Government as a proportion of some larger aggregate. This is particularly true when the total of Government expenditure includes foreign purchases financed out of foreign capital, since there is no corresponding item in gross national income. The correct comparison, it would seem, would be with either 5a or 5b—that is, with the total volume of goods and services of all kinds, income and capital, available for use. If this be accepted (and the larger of the two variants used), then it would appear that the total expenditure of the Government in 1940 absorbed about 42 per cent of the resources available, while only about one-sixth of those resources was transferred from the public to the Government by means of taxation.

amount of bills maturing on that very day, and when the moment for repayment arrived the India Council rediscounted at the Bank of England the whole of the bills in question which had not fallen due. Hence the jump of £39 millions in discounts and advances shown by the return covering the week to March 26th. As these bills mature, this item in the Bank return is gradually returning to its normal proportions.

Record Applications for Bills

The first tender for the £70 millions weekly offering of Treasury bills drew a record total of applications, despite the fact that the bills in question were the comparatively unattractive early July maturities. The total applied for was £164,680,000, an increase of about £16 millions on the previous week's figure and of over £4 millions on the previous record set up on February 28th last. The further increase in the applications for Treasury bills came as a surprise, coinciding as it did with the repayment of India sterling stocks, which is estimated to have absorbed about £55 millions of India Council money previously employed in the money and discount markets. It must not, however, be forgotten that the growth of Empire and other sterling area funds

in London is a movement which is acquiring steadily increasing momentum, despite the abrupt interruption in the progression caused by a repatriation operation such as that just completed by the Government of India. An increasingly important factor in this particular movement is being provided by Canada. The balance of payments of the sterling area as a whole with that Dominion remains severely adverse, and the recent evidence given on this point by the Canadian Minister of Finance strongly suggests that the Canadian Exchange Fund is already accumulating substantial sterling balances, only part of which will later be absorbed by further repatriations of Canadian securities held in this country.

Apart from this added demand for bills from Empire sources, the mere increase in the amount of bills on offer has involved a corresponding increase in the applications for bills made from the discount market. The syndicate's quota is now automatically adjusted to the amount of bills on offer, and this fact, therefore, accounts for £5 millions of the increased applications. This must be borne in mind when viewing the result of the tender from the syndicate's point of view. The percentage allotted at the syndicate's price of £99 14s. 11d. was 26 per cent, against 28 per cent in the previous week. For the market, therefore, the result of the tenders in each of these weeks was the same, since 28 per cent of £65 millions and 26 per cent of £70 millions both equal £18,200,000.

Clearing Banks' March Statements

Gap or no gap, the expansion in bank credit made further appreciable headway last month. The clearing bank statements for that month reveal an expansion of £55,491,000 in deposits, of which only £3,359,000 can be attributed to the duplicating effect of increased items in course of collection. The main stimulus to the expansion of bank credit was again provided by Treasury deposits, which rose £44,500,000 last month. All other asset items, other than bills discounted, show some increase. The fall of £15,704,000 in bills is a normal seasonal movement

Total assets	2,957.7	3,049.8	2,623.2	3,003.7	2,951.5	3,006.4

attributable in this case, not to the smaller amount of Treasury bills issued through the tender, but to the smaller allotments obtained by the discount market. The banks' investments show a further increase of £6,588,000—no doubt the product of participation by branches in War Weapons Weeks. Advances reverse their recent trend with a recovery of £8,543,000, of which part may be attributed to the customary accommodation granted for payment of taxes. The cash basis has been so controlled as to keep step with the further growth in bank credit, and at £287,842,000, showing an increase of £4,270,000 on the month, remains at about 10.4 per cent of deposits.

Cargo Insurance Rates

Last week's announcement of an increase in the war surcharges on marine cargo premiums has caused no surprise, for it was known that underwriters have not been faring well on their 1940 accounts. The history of cargo insurance in recent years shows that even before the outbreak of war the market was in a none too

healthy condition, largely because the lower level of international trade had created an excess of supply in relation to demand and consequent downward pressure on rates, with extended covers. A factor operating against the correction of this state of affairs was that during and after the Italo-Abyssinian war of 1935 the practice developed of insuring war risks, the premiums for which sweetened the cargo account as a whole, making underwriters more content to continue an unsatisfactory market situation than would otherwise have been the case. With the advent of war, this source of revenue disappeared, the bulk of the war risk business being taken over by the Government Office. At the same time underwriters found themselves faced with a substantial increase in the hazards covered by the standard policy; these hazards scarcely need recapitulation, for the perils of voyaging in convoy without lights, on unfamiliar routes and without the customary aids to navigation, speak for themselves. The only mitigating factor has been the more ready acceptance by consignees of goods arriving in damaged condition. To meet the additional risk, war surcharges were imposed in January, 1940, on all shipments within the combat area; after a few months the surcharges proved inadequate and were in consequence doubled last September. The present increases take effect on May 5th and represent in effect a redoubling of surcharges: for shipments to and from the United Kingdom and Eire and the Continent of Europe between North Russia and Gibraltar inclusive, together with Iceland, the surcharge will be 10s. per cent, rather lower rates operating for less hazardous voyages. These higher charges must be accepted with good grace by the interests concerned, since their justification is undisputed; it is, moreover, very important that the British marine market shall maintain its strong financial position, so that it may continue to furnish to merchants and ship-owners those facilities for which it is internationally famous.

Sterling Area Extended

An Order made last week under the Defence (Finance) Regulations admits to the sterling area the territories under the control of the Council of Defence of the French Empire, Iceland and the Faroe Islands. As it applies to the territories of the Free French Empire, the Order formalises the temporary arrangements made previously by which the local administrations of these territories were given financial assistance and the

Legal & General Life Policies

both participating and non-participating will in most cases

include War Risks within the United Kingdom

in respect of lives who are civilians at the time of completing the proposal

The Society is also prepared to consider War Risks abroad, each proposal being considered on its merits. Life Assurance is more necessary to-day than ever before—ask for full particulars now.

LEGAL & GENERAL ASSURANCE SOCIETY LIMITED

Chief Administration:
ALDWYCH HOUSE, ALDWYCH, LONDON, W.C.2

Branches in all principal Towns

Established 1836

General Manager: Vernon E. Boys Assets exceed £50,000,000

rate of exchange between their currency and sterling was fixed at 176½ francs to the £. It has inevitably taken time for the currency situation in these territories to emerge from the confusion in which they were plunged, first by the collapse of France, then by their adherence to the Free French authorities. The latest move shows that the authorities in question are well satisfied with the arrangements which have been made by Britain for supplying their immediate financial needs and that Britain for her part, is satisfied with the commercial and political security which they offer. The inclusion

of the territories in the sterling area automatically extends to them the general scheme of exchange control which operates in this country, and residents in those territories assume the appropriate rights and duties. The currency circulating in the Free French colonies will remain the West African franc, but it is evident that means must be devised for protecting it from the contagion of the Vichy and Paris francs. That will, no doubt, be achieved by some form of stamping of notes which will differentiate the Free French colonial currency from other franc notes.

INSURANCE NOTES

Pearl Assurance.—The figures in the first table have been extracted from the life revenue accounts of this important office. The accounts make a good showing, considering the difficult circumstances of the past year. The recession in new business in the ordinary branch was moderate, compared with the average for all offices, and in the industrial branch was quite small. Loss of premium income in the ordinary branch was amply made good by expansion in the industrial figures. Interest earnings displayed a downward tendency in keeping with the general trend, for the familiar reasons of larger investments in British Government securities and higher income tax. Death claims were affected by the war to the extent of over £50,000 in the ordinary branch and £100,000 in the industrial branch; the figures for the latter branch were also augmented by a minor influenza epidemic in the early months of 1940. Commission and expenses are up by reason inter alia of decentralisation, allowances to members of the staff in the forces and an improved basis of remuneration for the collecting staff.

In the second table are set forth the premium income and underwriting results of the various branches. The profits shown for the life branches are the surpluses earned during the year and are down for the reasons already cited; special reserves for war conditions aggregating £675,000, which were a charge on the 1939 surpluses, have been retained. Profits for the other branches are the actual profits and do not correspond with the transfers to and from the profit and loss account. Fire business is largely influenced by the United States portfolio,

the increase in premiums being mainly due to appreciation of the dollar in terms of sterling; the true loss of £83,885 is increased to £204,314 by a sum of £120,429 required to strengthen the unearned premium reserve from a 40 per cent to a 50 per cent basis. It is pleasing to learn that the fire business lost on the Continent of Europe has in some measure been made good by taking advantage of opportunities of securing business formerly held by German and Italian companies in other parts of the world. Among the other classes the heavy fall in premiums for the general branch, which includes "a great variety of risks in many parts of the world," is a result of the war; the underwriting balance represents a considerable improvement on 1939. Also noteworthy is the improvement in the motor vehicle account which has accompanied the substantial reduction in premium income following the general laying up of cars.

To the underwriting profits exhibited in the table must be added interest earnings on the "other branches" of £65,121, making total earnings for the year £2,038,782. Of this figure £250,000 is absorbed by transfers to staff pensions account and £50,000 by a reserve for national defence contribution. In common with the majority of offices the Pearl is following the prudent course of declaring no reversionary bonuses this year, but interim bonuses are being allowed at reduced rates in both the ordinary and industrial branches. These bonuses require only £82,144 (£24,975 for the ordinary branch and £57,169 for the industrial branch) so that the company is able to pay on the ordinary shares a dividend for

the year of 9s. per share, free of tax, compared with 10s. per share, free of tax, for the previous year, absorbing with the preference dividend £558,000, and at the same time greatly to strengthen the life funds by increasing the sums carried forward by £827,290 in the ordinary branch, and by £433,618 in the industrial branch.

The balance-sheet is a strong one. Stock Exchange securities stand at cost or under, and the chairman (Sir George Tilley) stated that the market value exceeds the balance-sheet prices, with the result that the investment reserve funds are retained. These reserves aggregate £6,450,000. Total assets amount to £114,719,000, an increase of £3,708,000.

The Pearl continues through the National Amalgamated Approved Society to play an important part in the administration of national health insurance. During the year membership increased and over 1,200,000 sickness and disablement benefits were paid as well as 38,000 maternity claims.

National Provident : Scottish Amicable : Scottish Equitable.—A table on the usual lines, giving extracts from the life revenue accounts of these three mutual offices, accompanies these notes.

The accounts of the *National Provident* reveal features which are in line with other comparable offices; the rather heavy fall in new business, with some reaction on premium income, and the further drop in interest earnings, are all part of the common story. Death claims include some £60,000 in respect of war deaths. Expenses show a reduction chiefly attributable to reduced new business. In the balance-sheet British Government securities are higher by £533,000. The contingency reserve for investments of £200,000 established last year has been retained, and the chairman (Mr. Robert E. Dickinson) informed the shareholders that the institution has already lost properties worth more than £50,000. Stock Exchange securities generally have been taken at or under the market selling prices on December 31st, 1939, the date of the last distribution of profits, or at or under cost price in the case of securities purchased since that date; the chairman in his speech gave an assurance that these securities are fully worth the value at which they stand in the books. The last triennial valuation at December 31st, 1939, disclosed a surplus of £896,000, after providing for the valuation of life assurance contracts on a 2½ per cent basis; no reversionary bonus was, however, declared, the undivided surplus being carried forward as a reserve against future contingencies. Interim bonuses are being maintained at the same rates as were announced last year, namely approximately two-thirds of the pre-war rate in respect of premiums for the triennium ending December 31st, 1939, and approximately one-half the pre-war rates for subsequent premiums.

The figures published by the *Scottish Amicable* likewise show movements common to similar offices, apart from the increase in premium income, which is due to the completion of several large group assurance and staff pension schemes.

Investment

The Budget in the Market

The effects of the Budget on the stock market have, so far, been slight, being restricted to a general raising of quotations which reflects relief, rather than adjustment of values to the prospective changes in taxation, except in such securities as tobacco and brewery shares. The result bears out the contention, advanced in *The Economist* of March 15th, that, apart from a possible adjustment of EPT, there would be little in the Chancellor's new proposals to affect share values directly. Any scheme of finance must, of course, have indirect effects, and certain features of the financial policy may have important repercussions. In the first place, while the method adopted is excellent, the extent of the demand made on the taxpayer seems to leave the way open for a considerable inflationary rise in prices. The fact that the method of keeping down prices of foodstuffs by subsidy is to be extended to other necessities, will merely

tend to accentuate the impact of the surplus demand on those prices not controlled, unless the public, in general, chooses the wiser part of going without rather than paying prices which are, by any normal standard, likely to be exaggerated. It is true that the extension of price fixing has for one of its aims the stabilisation of wages and that there will be some reduction in net individual incomes if this policy succeeds. Against this, there are, however, two facts to be set, namely, the prospective cut of perhaps 25 per cent in consumption output and the projected transfer of large numbers of people from idleness, or part-time employment, to full-time work, less the effect of transfers from factories to the forces, which should result in some increase in the total national wage bill. This combination contains the possibility of very considerable profits for a certain small section of industry, providing luxuries and quasi-luxuries, as well as necessities which are not covered by price control.

(Continued from page 492)

There is also a substantial addition to annuity considerations. Claims by death include £45,505 directly attributable to the war. The quinquennial investigation into the affairs of the society was made at December 31st last. A stringent valuation of the assets disclosed a depreciation of rather less than 3½ per cent.; this has been provided for by utilising the general reserve of £200,000 and £246,639 from revenue, so that the directors are in a position to certify that Stock Exchange securities have been taken at or under middle prices on December 31st, 1940, and that the assets are in the aggregate fully of the value stated. Liabilities have been valued on the same bases as were employed at December 31st, 1939, with interest at 2½ per cent. for life assurance contracts and 3 per cent. for annuities, the result being a surplus of £1,062,783. The prudent course has been adopted of declaring no reversionary bonuses. £250,000 will be placed to general reserve and £65,000 is being utilised for the payment of interim bonuses on policies which became claims between October 10th, 1939, and December 31st, 1940, and which have not so far received bonuses for the past quinquennium. The balance

of £747,783 is being carried forward as a provision against future contingencies, leaving the society in a strong position. Interim bonuses will be paid on policies becoming claims during the quinquennium commencing January 1, 1941, at the pre-war rate of 40s. per cent. per annum compound, but only in respect of premiums for the period between January 1, 1936, and October 9, 1939, inclusive.

A noteworthy feature of the accounts of the *Scottish Equitable* is the reduction in death claims, notwithstanding the inclusion of war claims totalling £22,550. In the balance-sheet British Government securities are higher by £451,000. Stock Exchange securities are taken (a) for investments made before the actuarial investigation of 1937, at or below the sums fixed at that time; and (b) for subsequent investments, at or below the purchase price. The chairman (Mr. Alfred A. Lawrie) stated that on December 31st there was a material hidden reserve in the difference between the balance-sheet figures and the market values of securities; there is also the reserve account of £250,000 and the carry forward from the last valuation of £173,093, as well as the year to year profits of the past three years, which are satisfactory.

Britannic Assurance.—This company's accounts are influenced by features similar to those operating with other industrial-cum-ordinary offices, as the extracts from the life accounts reproduced in the table make clear. New business in the ordinary branch manifests a less-than-average reduction, and the falling away in the industrial branch is in line with the figures of the *Prudential* and *Pearl*. Premium income is substantially maintained. The chairman (Mr. Jno. A. Jefferson) made some detailed references in his speech to the lower interest earnings; he indicated that the company is strongly supporting the War Savings movement, but that this brings certain difficulties, as the funds of the Company are derived mainly from premiums on long term contracts based on the earning of a rate of interest of 3½ per cent net; Mr. Jefferson added: "One does not need to possess the mind of a professor of economics to see that there must be a limit to the proportion of its funds which an assurance company can afford to have invested at 2½ per cent gross." Death claims include claims arising directly from the war, amounting to £32,000 in the ordinary branch and £38,165 in the industrial branch. The expense drop in the ordinary branch is entirely a result of the recession in new business.

The company has considered it wise to strengthen the valuation bases for both ordinary without-profit and industrial policies, the rate of interest now assumed being 2½ per cent in both cases, against 2½ per cent and 3 per cent respectively a year ago. The surpluses earned during the year were in the ordinary branch £215,530 (£192,205) and in the industrial branch £568,863 (£212,756); adding to these the profits of £1,000 in the capital redemption account and £9,390 in the general account (the business of which is wholly reinsured) the total sum available is £794,783. Of this £266,000 is absorbed as follows: Investment reserve £150,000, staff pension fund £100,000, and provision for national defence contribution £16,000. The *Britannic* has decided to maintain a reversionary bonus for ordinary branch policyholders (the rates being about half those ruling before the war), and the existing bonus scheme for industrial policyholders is continued unchanged; the cost of these bonuses is £363,059. Dividends on the ordinary shares are at the rate of 8s. per share, free of tax, against 9s. per share, free of tax, and including the dividends on the preference shares, absorb the sum of £177,775.

Stock Exchange securities stand in the balance-sheet at or below cost, and it is certified that the assets are in the aggregate fully of the value stated. The investment reserve funds amounting to £2,250,000 remain intact. Total assets increased from £34,194,000 to £35,765,000.

EPT Amendments

There is a tendency in some sections of the stock market to regard the amendments proposed in the administration of excess profits tax as of little real importance. They exceed the minimum requirements, put forward in *The Economist*, on more than one occasion between last October and the eve of the Budget, and we adhere to the view that a flat rate cut of 20 per cent, to be used after the war for reconstruction, meets all the fundamental objections of the tax as it was prior to last Monday. Special concessions may also be needed, and that on borrowed capital removes an anomaly, while the refund to mining companies is almost certainly expedient. That after these concessions the incidence of the tax remains inequitable is certainly true, but no individual or institution can claim perfect justice under war conditions. The fact that anomalies persist in no way detracts from the value of the changes, and few developments could be more consoling to shareholders than the assurance that they will have available a substantial nest egg for "the replacement of obsolete or unsatisfactory machinery . . . ; the scrapping or adaptation . . . of redundant installations; the extension of the export market"; to quote Sir Kingsley Wood's statement. To argue that the post-war refund does not ease the present position may not even be true; but to suggest, on that account, that it is of little value is to deny all merit to the practice of accumulating reserves. There appears to be some fear that such restrictions will be placed on the use of the funds reserved that their utility will be greatly reduced. Not only is there no evidence of any such intention in the Chancellor's statement, but to impose such restrictions would defeat his object. The measure substantially improves the status of the equity of all those concerns making considerable contributions under the tax. In some cases, this change should be reflected in higher prices, but it is not improbable that an adjustment, which had so much to recommend it from every point of view, has already been, to some extent, discounted.

Balkan Bonds

It can come as no surprise to the investing public that the Roumanian Government has announced its intention to suspend foreign debt service. Since the German occupation of Roumania this spring, and the complete subjection of her national economy to German requirements, the Roumanian Government has lacked both the foreign exchange and the political independence necessary to the transfer. The total outstanding of the three leading Roumanian issues quoted in London, the 4½ per cent Loan of 1913, the 4 per cent External Loan of 1922 and the 4 per cent Consolidation Loan of 1922, amounts to some £14,700,000, of which more than £12,000,000 is accounted for by the issue last named. In the year ending March 31, 1941, the Roumanian Government undertook to transfer 45 per cent of the interest due on the 4½ per cent bonds of 1913 and on the 4 per cent Consolidation Loan, 1922, and 60 per cent on the 4 per cent External Loan of 1922. In fact, no transfer was made and the present default is purely formal, since these issues have received no interest since end, 1939. The announcement has been discounted by the market for some weeks past, the 4½ per cent Loan of 1913 and the 4 per cent Consolidation Loan, 1922, both standing at 2½, and the 4 per cent External Loan, 1922, at 4. With the Bulgarian and Hungarian Governments already in default, and diplomatic relations broken off, the present outlook for the investor in Balkan securities is unpromising. The Greek Government is continuing payment at 43 per cent of interest due, and this, in view of the considerable stake in Greece still owned by British investors, is a factor of some importance. Of the two issues having the widest market in this country, the 7 per cent Refugee Loan, 1924, and the 6 per cent Stabilisation and Refugee Sterling Bonds, 1928, there is outstanding £9,356,000 and £3,970,680 respectively. The market price of the former loan is 20½, that of the latter 17½. The outcome of the present Balkan campaign is, of course, of vital significance for the future of debt payments in all the countries of south-eastern Europe, but it is to be feared that the spread of the war to this area, however favourable the outcome, will greatly increase the difficulty of obtaining foreign exchange, and, for the investor, economic ability to pay is scarcely less vital than political independence.

Company Notes

Cement Results

The full accounts of *Associated Portland Cement*, and the two leading undertakings controlled by it, *British Portland Cement* and *Alpha Cement*, all show reductions in profits after tax for the calendar year 1940. The accounts of the first two companies are analysed in detail in the following table. The total profits of *Alpha Cement*, after tax, declined only from £324,659 to £315,683, and there is every reason to suppose that gross revenue in all cases exceeded that of the previous year. All companies have maintained depreciation provisions at the 1939 level, and, since there has been no significant reduction in charges against profits, it has proved necessary to lower ordinary dividends, except that of *Alpha Cement*, which remains at 8½ per cent. In the case of *Associated Portland*, the fall from 15 to 10 per cent is due in part to the cut of the *British Portland* payment from 20 to 17½ per cent. All dividends were narrowly covered by available earnings.

	Assoc. Portland Cement		British Portland Cement	
	1939	1940	1939	1940
Profits*	£ 1,402,925	£ 1,200,548	£ 823,006	£ 734,816

Carry forward			220,569	

* Including interest and dividends declared to 3rd April.

The balance-sheet of *Associated Portland* shows an important rise in stocks from £574,551 to £815,143. Cash resources declined from £666,767 to £359,230 after the loan of £150,000 free of interest to the Treasury. Debtors and creditors show normal increases. For all three companies, the year opened with a period of comparative stagnation, due to the decline of private construction and bad weather, which was succeeded by a persistent flow of Government orders for fortification purposes after the collapse of France. It appears that, at the end of the year, stocks accumulated to the extent of more than 1,000,000 tons of cement and cement clinker in the industry as a whole, and that output is once more being slowed down. This state of affairs is described by the chairman, Sir P. Malcolm Stewart, in the course of his speech circulated with the accounts, in which he also makes a plea for just consideration of the record of the Cement Makers' Federation. No doubt the requirements of defence building in war and reconstruction in peace will ensure a steady flow of revenue to the group, both in the immediate and in the more distant future, but Sir Malcolm sees no early recovery in net revenue. The £1 ordinary stock of *Associated Portland Cement*, at 51s. 3d., offers a yield of £3 18s. per cent.

Union Corporation Results

That the published profits figure of Union Corporation for 1940, struck after tax, deduction of amounts applied in reduction of book value of investments, exchange differences, management commissions and bonuses, would show some decline on the 1939 figure was a foregone conclusion. In fact, the amount of the decline, which is only from £679,306 to £664,558, indicates that gross revenue from dividends and share dealing must have been well maintained last year. The total distribution of 64 per cent is repeated, although the free surplus, reduced from £618,297 to £611,513, does not completely cover the £616,000, gross, required for payment of dividend. The consequent draft on the carry-forward, however, reduces the total only from £126,638 to £122,151. The £36,324 expended on exploration during the year has, as in the three previous years, been charged directly to exploration reserve account, reducing the balance-sheet total of this fund to £110,996. The report lacks the customary tables of "Gold Consumption and Distribution" and of "Gold in Central Banks and Treasuries," but figures are provided for world output during 1940

and operating results are analysed of those South African Mining Companies in which Union Corporation is mainly interested. The balance-sheet shows a reduction in share and debenture holdings, other than in subsidiary companies, from £3,367,995 to £3,186,439, at which level the directors state that they are considerably below market valuation. The directors again state that they have provided for contingencies by reducing the book value of certain holdings below both cost and market valuation. An addition of over £1,000,000 to current, deposit and other accounts and accruing expenses, raising this item to £6,374,602, was re-invested at the date of the accounts. The Union Corporation 12s. 6d. ordinary shares, at 138s. 9d., offer a yield of £5 15s. 2d. per cent.

Metropolitan Electric Earnings

By one of those series of misfortunes, which, however incredible in retrospect, occur from time to time, a gross error crept into the comments on electric power results appearing on page 347 of *The Economist* of March 15th. As a result, it was made to appear that the Metro-amount earned for the ordinary capital of the Metropolitan Electric Supply Co. had fallen from a large credit for 1939 to a small debit for last year. This is incorrect; the net profits for 1940 available for the ordinary shareholders (including a sum of £2,181 arising from profit on the redemption of investments) were £238,698 or £83,091 less than in 1939. The correct figures are as follows:—

Company (years ended December 31)	Total profits	Earned for ordinary		Dividend	Ordinary stock (£1)	
		Amount	Rate		Price (ex div.)	Yield
Scottish Power:						
1938	747,300	479,615	17.4	8	35/8	4 10 2
1939	791,234	489,605	19.8	8		
1940	811,594	475,267	21.8	8		
North-Eastern Electric Supply:						
1938	1,509,880	433,518	8.7	7	28/-	5 0 0
1939	1,682,876	335,888	7.1	7		
1940	1,680,772	334,088	7.0	7		
Northampton Electric Light:						
1938	465,041	121,886	15.2	11*	41/3	4 17 0
1939	488,221	108,208	13.8	10

1938	1,707,021	353,582	11.8	10	32/3	4 10 3
1939	1,765,430	316,780	10.9	10		
1940	2,071,020	235,698	7.8	8		
Electrical Distribution of Yorkshire:						
1938	288,050†	199,545	18.3	9	36/8	4 10 4
1939	308,961	191,476	19.6	9		
1940	335,227	206,368	23.9	9		

* Including 1 per cent. special bonus. † Net revenue after tax.

In addition, the company's net revenue account shows an item of £6,658 transferred from Mains Reserve Account, which is not included in the figures given above. We take this opportunity of expressing regret for the company anxiety to stockholders or inconvenience to the company which may have been occasioned by the error.

British Oxygen Record Earnings

British Oxygen profits, after depreciation, reached the new record level of £1,364,944 for the calendar year 1940, against £883,961, the previous record figure, in 1939. The consolidated profit figure, before British income tax or depreciation, has risen from £1,887,995 to £1,897,508, and depreciation for the whole group is up from £422,053 to £451,108. The company's total tax provision is increased from £421,546 to £972,358, of which £134,100 in the previous year and £600,000 in the last year, represented reserve for EPT, income tax and war contingencies. Thus, after meeting the normal allocation to staff pensions and service on preference capital, the surplus for ordinary capital amounts to £806,313, against £872,810. There is no allocation to general reserve, which received £61,850 last year, but the EPT allocation conceals an appreciable nest-egg available after the war. The ordinary dividend of 15 per cent, paid on a capital increased to £3,461,102 by the previous year's 20 per cent capital bonus, compares with 17 per cent paid on the smaller capital, and is equivalent

to 18 per cent on that capital. It absorbs £312,364, against £318,709, both sums being shown net. Thus, the distribution is not completely covered by the free surplus of £306,313, and the carry forward is consequently reduced from £40,258 to £34,207. In the balance-sheet, the striking reduction in general reserve from £676,850 to £100,000 is accounted for by the distribution of the previous year's capital bonus. A decline in sums owing from subsidiary companies is mainly responsible for the reduction in investments in subsidiary, allied and other companies from £2,006,679 to £1,854,458. Creditors are up from £831,349 to £1,257,287, and debtors from £518,838 to £837,188, the difference financing a moderate rise in stocks from £672,533 to £731,161. Cash holdings are substantially higher at £467,886, against £54,634. There seems to be every reason to expect a continuation of the company's progress during the current year. The £1 ordinary stock, at 63s. 9d., yields £4 14s. per cent.

United Glass Bottle

The rise in United Glass Bottle total profits from £456,052 to £537,769 for the calendar year, 1940, is wholly encouraging, as is also the approximate stability of the equity surplus, which has declined only from £186,527 to £125,348, in both cases after deduction of ARP expenses, increased from £10,000 to £15,000. All general expenses are moderately higher, and the provision for tax is up from £150,000 to £240,000. None the less, the earned rate of 19.5 per cent provides ample cover for the total ordinary distribution, maintained at 12 per cent, and, after placing £25,000 to contingencies, against £50,000 to general reserve, the carry-forward is increased from £41,096 to £64,369. As the chairman, Sir Max J. Bonn, indicates in his speech, circulated with the report, the neutralisation of steadily rising costs—an increase in selling prices of 10 per cent was made

**Wanted

Adding & Listing Machines

Calculating Machines

These machines are required for use mainly in Aircraft and Armament Factories for the production of Payroll Records, Stores Accounts, Purchase Ledgers and Cost Records. Machines should be in good mechanical condition and offers showing make and model and whether available for Sale, Hire or Loan should be addressed to:

**H.M. STATIONERY OFFICE,
SUPPLIES DIVISION (S.3.),
PRINCES ST., LONDON, S.W.1**

only toward the end of the year—had been effected by economies realised from increased output. The chairman points out that the company, with its subsidiaries, is continuing to make a satisfactory contribution to the export trade and that the technical understanding with the Owens-Illinois Glass Company of America has been continued in a cordial atmosphere. The decision to reinforce the carry-forward, rather than to make a higher contribution to reserve, has been dictated by the knowledge that liquidity is essential with the existing uncertainty of trading conditions. The balance-sheet shows a small decline in cash from £209,420 to £170,951, but the company has acquired Government securities to the amount of £119,983, and in March subscribed £25,000 to the local war weapons week. Stocks are satisfactorily higher at £783,845 against £623,002, while debtors and creditors, including tax provision, show normal rises. General reserve, as before, stands at £500,000, against fixed plant of £1,285,773. The £1 ordinary shares, at 50s. ex dividend, offer a yield of £4 16s. per cent.

* * *

ICI Profits

It is clear that the decline in ICI net profits for the calendar year, 1940, as announced in the preliminary statement, of some £900,000 to £6,418,533 is due wholly to the rise in taxation. The directors state that the sum due in NDC and EPT increased from £2,500,000 to £5,600,000. The allocation to obsolescence and deprecia-

tion remains at £2,000,000 and the 8 per cent ordinary dividend is repeated.

	Years to December 31,		
	1938	1939	1940
	£	£	£
Profits after taxation	8,561,291	9,313,485	8,418,533
Central obsolescence and depreciation fund	1,500,000	2,000,000	2,000,000
Preference dividends	1,666,081	1,666,104	1,666,104
Ordinary stock:			
Earned	5,395,210	5,647,381	4,752,429
Paid	4,032,149	4,032,149	4,032,149
Earned %	11.6	13.0	10.7
Paid %	8	8	8
General reserve	1,125,000	1,375,000*	339,262*
Workers' Pensions	172,995	180,049	180,092
Carry forward	621,245	681,428	882,354

* In 1939, £1,000,000 and, in 1940, £339,262, to War Contingencies Reserve.

Thus, the surplus for ordinary capital is reduced from £5,647,381 to £4,752,429, representing an earned rate of 10.7 against 13.0 per cent, grossed up at the standard rate of tax for 1941-42, less Dominion income tax relief of 3d. in the £. The allocations to general and war contingencies reserves are reduced from £1,375,000 to £339,262, leaving sufficient, after deduction of £180,092 for workers' pensions, to raise the carry forward from £681,428 to £882,354. The £1 ordinary stock, at 29s. 6d., offers a yield of £5 10s. 5d. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

The firm tone in all sections of the market, which characterized dealings on Thursday of last week, was interrupted the next day by the imminence of the Budget and news of the evacuation of Benghazi. This week, sentiment was subdued by the critical state of military developments in the Balkans, although the absence of fresh duties on beer and tobacco encouraged buyers to favour these sections of the market, and the Budget as a whole received a favourable reception. On Tuesday, a short-lived but moderate rally was staged, from which the gilt-edged market and heavy industrials mainly profited. Home rails and the foreign bond market did not recover notably from the setback to all sections at the beginning of the week.

*

The gilt-edged market lost ground both immediately before and after the week-end. Two and a half and 4 per cent Consols eased $\frac{1}{8}$ on both days, while, on Monday, $3\frac{1}{2}$ per cent War Loan dropped $\frac{1}{8}$, and $2\frac{1}{2}$ and 3 per cent India stock $\frac{1}{8}$ point. The next day's recoveries were substantial, including rises of $\frac{1}{4}$ for $2\frac{1}{2}$ and 3 per cent Consols and $\frac{1}{8}$ for $3\frac{1}{2}$ per cent War Loan, but the improvement was not maintained in midweek, when fresh falls were occasioned by further moderate selling in an unwilling market. Following the extension of the war to the Balkans, the foreign bond market, naturally, lacked support. Despite recent optimism regarding the Far Eastern situation, Japanese bonds were consistently sold, after losses of 1 point by the majority of issues at the beginning of the week. Greek and Egyptian issues also suffered. Argentine bonds remained firm, and a number of excellent rises were realized by Brazilian Funding issues and by certain Chilean stocks.

*

The upward movement of home rails was interrupted toward the end of last week, when ordinary stocks suffered fractional losses and a number of marginal issues were also sold. This week, the market enjoyed a modest par-

ticipation in Tuesday's rally, in the course of which Great Western ordinary and Southern preferred ordinary both improved $\frac{1}{8}$ point. Among foreign rails, Canadian Pacific lost $\frac{1}{8}$ before the week-end and again on Tuesday, but there was considerable interest in Argentine rails.

*

There was no large turnover in the industrial market. Before the week-end, heavy industrials profited from pre-budget buying, and, during the current week, the brewery and tobacco groups were in demand. Indeed, on Tuesday, Guinness gained 3s. and Ind Coope 2s. 6d., while BATs, Carreras, and Gallaher were all $\frac{1}{4}$ higher. In sympathy with the general optimism of Tuesday, the heavy industrial group also returned to favour after suffering small but general losses at the beginning of the week, and improvements were realised by BSA, Dorman Long and Guest Keen. Associated Portland Cement and London Brick reacted on the publication of the cement group reports, but the textile group continued to show considerable firmness, with small regular gains for Courtaulds and Coats, until midweek, when Balkan developments caused a general moderate setback.

*

The kaffir market made a fairly rapid recovery from the setback occasioned by the evacuation of Benghazi, though, in common with other commodity markets, it derived no more than a passing rise from the Tuesday rally. In the course of this, Sub Nigel and West Wit Areas reversed a fall of $\frac{1}{8}$ suffered the previous day and Crown Mines a pre-week-end loss of $\frac{1}{8}$, while "Sallies" also improved $\frac{1}{8}$. The previous week's upward movement of tin and rubber shares was not continued, although these markets remained generally firm. In the oil market the most noticeable losses occurred in Trinidad issues, which have recently enjoyed substantial gains. The Tuesday rally produced widespread improvements, including $\frac{1}{8}$ for the ordinary issues of Shell Transport, Burmah and Lobitos, and $\frac{1}{8}$ for Trinidad Leaseholds, but news of the withdrawal from Salonika caused a definite setback in Shell and Burmah Oil.

New York

Up to Friday of last week a firm tone predominated on Wall Street. Turnover was considerable and there was a strong demand for rail and chemical issues. Before the week-end, and during the current week, sentiment turned dull on fears of renewed labour difficulties and anxiety regarding Balkan developments. On Monday the absence of definite news from the war zone was responsible for a number of fractional losses, mainly affecting steel and copper stocks. Then, and later in the week, rail, oil, chemical, and motor issues also suffered small losses and price movements continued to be irregular.

CONVERSIONS AND REPAYMENTS

Brandon's Putney Brewery.—This company will repay at par, on May 6th, £200,000 four per cent first mortgage debenture stock.

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS

In submitting to the Shareholders the Accounts of the Corporation for the year ended December 31st, 1940, the Directors state:—

The Accounts are drawn up in Union of South Africa currency, United Kingdom currency being taken at par.

The profit for the year is £811,512 14s. 6d., plus £126,637 18s. 6d. brought forward, making a total of £738,150 13s. 0d. A final dividend of five shillings and sixpence, United Kingdom currency per share was declared absorbing at par £423,500, making, with the interim dividend of two shillings and sixpence, a total of eight shillings, or £816,000 for the year. £122,160 13s. 0d. remains to be carried forward.

Those shareholders entitled to receive payment of the dividend in the Union of South Africa will be paid at par provided there is no material difference between the Union and United Kingdom currencies on the day the dividend is due, i.e., April 24th. Should there be any material difference between the two currencies on that date, payment will be made in Union currency calculated at the rate of exchange then ruling.

Exploration expenses incurred during the year amounting to £36,324 8s. 3d. have been charged directly to Exploration Reserve Account, leaving a balance of £110,096 6s. 10d. to be carried forward on that account.

Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st last, or, where no market price exists above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

GOLD INTERESTS

The operating results of EAST GEDULD MINES for the last two years are as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1939	1,829,000	£3,912,292 (42/9)	148s.	£1,435,976 (15/8)	£2,476,316 (27/1)	£1,215,000 (13/6)
1940	1,910,000	4,625,000 (48/5)	168s.	1,593,000 (16/8)	3,032,000 (31/0)	1,260,000 (14/0)

The ore reserves at December 31st last amounted to 15,200,000 tons assaying 5.2 dwt. per ton over 57 inches.

The operating results of GEDULD PROPRIETARY MINES for the last two years are as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1939	1,385,000	£2,340,341 (34/3)	148s.	£1,013,811 (14/10)	£1,326,530 (19/5)	£1,168,686 (16/0)
1940	1,370,000	2,630,000 (38/5)	168s.	1,218,000 (17/10)	1,412,000 (20/7)	1,095,643 (15/0)

In addition to the profits earned from its own operations, the Company received revenue from other sources amounting to £504,000, which figure includes £483,400 in respect of dividends received on its large shareholdings in East Geduld Mines and Grootvlei Proprietary Mines.

The ore reserves at December 31st last amounted to 9,000,000 tons assaying 4.5 dwt. per ton over 53 inches.

The operating results of THE GROOTVLEI PROPRIETARY MINES for the last two years are as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1939	947,500	£1,066,603 (22/6)	148s.	£1,086,603 (22/6)	£603,313 (12/9)	£408,750 (8/0)
1940	1,234,500	2,717,000 (44/0)	168s.	1,439,000 (23/4)	1,278,000 (20/8)	613,125 (4/6)

The ore reserves at December 31st last amounted to 7,500,000 tons assaying 5.2 dwt. per ton over 49 inches.

being brought into commission. As a consequence of the acquisition of the Palmietkui Company's 2,414 claims, the tonnage to be milled monthly will be higher than contemplated for Grootvlei alone. The Grootvlei Company's mining area is now 6,625 claims.

The operating results of MARIEVALE CONSOLIDATED MINES for 1940, the first full year, are as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1940	531,500	£1,153,000 (43/5)	168s.	£798,000 (30/0)	£355,000 (18/5)	£56,250 (—/3)

The ore reserves at December 31st last amounted to 2,000,000 tons assaying 5.7 dwt. per ton over 39 inches.

Distributions in 1940, amounting to 6d. per share, bringing the total Liquidation Distribution to date to 4s. 4 1/2d.

The operating results of VAN DYK CONSOLIDATED MINES for the last two years are as follows:—

	Tons milled	Gold output (and per ton)	Price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1939	1,026,000	£1,636,101 (35/9)	148s.	£1,171,551 (22/10)	£464,550 (12/11)	£412,500 (1/6)
1940	1,128,200	2,386,000 (42/3)	168s.	1,401,000 (24/10)	985,000 (17/5)	481,250 (1/9)

The ore reserves at December 31st last amounted to 3,100,000 tons assaying 5.4 dwt. per ton over 39 inches.

The profits of BRITISH ENKA ARTIFICIAL SILK COMPANY for 1940 have exceeded its E.P.T. standard. Co-operation has continued to the benefit of all the Companies in the industry.

ORANGE FREE STATE.—Since the close of the year the Corporation has purchased the mineral rights over an area of 4,024 morgen on farms adjoining the property of the Western Reefs Exploration & Development Company, Limited.

In the area north of the Sand River, Western Holdings, Limited, with whom the Corporation is collaborating, has completed its drilling programme. As a result of the work done, certain farms have been purchased and these have formed the subject of an application to the Government by Western Holdings, Limited, for a Prospecting and Mining Lease, the grant of which has been approved by the Government, subject to the conclusion of the necessary Lease Agreement.

In an area over which options have been more recently acquired by Western Holdings, Limited, and which lies further to the north, the Corporation, by arrangement with Western Holdings, Limited, has investigated that part lying east of Bothaville and north of Valsch River. The results obtained were discouraging and the options in that section of the area have been abandoned. Other portions of the area were still under investigation by Western Holdings, Limited, at the end of the year.

OTHER INTERESTS

BAY HALL TRUST.—Net profit for 1940 was £75,143, plus £71,567 brought forward, making £146,710 available. A dividend of 6 1/2 per cent. was again paid, absorbing £65,381, £10,000 was placed to the credit of Realisation Reserve Account and the balance of £71,329 carried forward. The Trust's investments as at December 31st last, at their current market prices, amounted to £1,717,371.

SAN FRANCISCO MINES OF MEXICO.—Accounts have not yet been published, but it is understood a small net loss has been made for the financial year to September 30th, 1940, owing to high taxation and the low base metal prices which prevailed. Modest profits are now being made as a result of improved metal prices.

SELECTION TRUST.—Paid a dividend of 7 1/2d. per unit of Ordinary Stock for the year ended March 31st, 1940. Its principal interests are in the American Metal Company, Consolidated African Selection Trust and Trepan Mines.

SOUTH AFRICAN PULP & PAPER INDUSTRIES.—During the year satisfactory progress was made in overcoming the initial technical difficulties encountered, and sufficient orders were received to keep the paper machines continuously occupied though not at maximum capacity. Small working profits commenced to be earned in March, 1940, and, after providing for depreciation, the net profit for the year amounted to £10,629, reducing the debit balance on Profit and Loss Account to £74,374.

RHODESIA AND WEST AFRICA.—The Northern Rhodesian copper mines increased their earnings but were affected by increased taxation. Consolidated African Selection Trust showed improved results from its diamond mining interests in West Africa.

COPIES OF THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED ON APPLICATION TO THE LONDON OFFICE, PRINCES HOUSE, 95 GRESHAM STREET, E.C.2.

OTARD'S
COGNAC BRANDY

The Chase National Bank.—Deposits on March 31st, 1941, reached record figure of \$3,617,530,000, compared with \$3,060,769,000 on March 30th, 1940. Total resources, \$3,890,245,000, against \$3,345,528,000, on March 30th, 1940. Capital, \$100,270,000 and surplus, \$100,270,000, both unchanged. Undivided profits, \$39,289,000, against \$30,217,000 on March 30th, 1940. Earnings 41 cents per share against 43 cents per share first quarter 1940.

disadvantage, for they have in Roumania an abundance of oil readily available. Indeed, so far as oil is concerned, their latest aggression will cost them virtually nothing, for they could not in any case have transported the whole of Roumania's output to the Reich this year. On the other hand, Roumania was also the natural supplier of Yugoslavia, which, having only a trifling output of its own, imported 160,000 tons of petroleum (mostly crude) from all sources in 1939. With the cutting of this supply line, the Yugoslavs will have to rely in the main upon British aid when their own oil reserves have been consumed. The Greeks are in much the same position. Their oil imports amounted to 390,000 tons in 1939—rather more than one-third coming from Roumania and the bulk of the remainder from the Dutch West Indies and the United States. That Britain is in a position to shoulder these commitments is not in doubt, for the quantities involved are relatively small and could easily be transported from Near Eastern producing centres. But this week's aggression underlines the urgent need for a determined attempt to disorganise the Nazis' oil supplies by the bombing of objectives such as the Ploesti oil refineries, the loading facilities at the Roumanian port of Giurgiu on the Danube, and the storage accommodation at Rustchuk, the Bulgarian port on the opposite shore.

* * *

Soya Bean Supplies

The soya bean can be used as a food, in the manufacture of soap and of products similar to those derived from mineral oil, for making paints, linoleum, synthetic rubber and many other commodities. Suitably processed, soya bean flour has been developed into a staple diet of the German army, and is even used in cakes and pastries. Germany and Japan have been the biggest importers chiefly from Manchukuo. World production in 1940 is estimated at 483.5 million bushels, against 477.5 millions in 1939, thus ensuring ample supplies for the world markets. According to "Foreign Crops and Markets," published by the American Department of

Agriculture, the trend of production has been as follows:

	1935	1937	1938	1939	1940
China.....	184,415	213,189	207,600	203,900	216,800
Manchukuo	141,793	159,907	157,445	144,952	140,817
U.S.A.	44,378	45,272	62,729	91,272	79,837
Hungary	(*)	(*)	(*)	125	194
Roumania.....	424	2,584	1,803	3,532	3,600
Yugoslavia	36	64	140	103	294
Bulgaria	(*)	419	246	613	1,451
Total world ...	410,500	466,000	478,000	477,500	483,500

N.B.—World production excludes Soviet Russia, but includes Chosen, Japan, the Dutch East Indies, and a number of smaller producers.
(*) No figures available.

Owing to drought, production in the United States decreased in 1940 in spite of an increase in acreage. The table shows that in the Danube countries the cultivation of soya beans is a new industry. It has been developed by Germany as a means of reducing her imports of oil-seeds from non-European countries, which constituted the greater part of her peace-time imports of fats, amounting to 45 per cent of her total requirements. Germany's supply position in 1940-41 will be difficult. The huge stocks laid in before the war will have been considerably decreased. By the cession of Bessarabia to Russia Germany lost control over roughly 80 per cent of Roumania's output of soya beans, and it is not known whether Russia will export Bessarabian soya beans to Germany. During 1939-40 supplies from Manchukuo reached Germany by the Siberian railway. In September, 1940, Manchukuo was reported to have come to an agreement with Germany providing for the supply of 11 million bushels during 1940-41. Assuming that this quantity could be shipped to Germany in the form of beans or in oil, that Russia would export Bessarabian beans, and that a further increase in cultivation in the Danubian countries would be achieved, Germany's imports in 1940-41 would roughly be equal to two-thirds of her imports of soya beans in 1938, which then provided some 10 per cent of the total fat imports of the Old Reich.

COMMODITY AND INDUSTRY NEWS

Rubber prices continue firm; the spot price of ribbed smoked sheet was 14½d. per lb. on Tuesday, compared with 14½d. a week ago. Changes in home trade quotas under the Limitation of Supplies (Miscellaneous) Order are discussed in a Note on page 498. The Cotton Importers and Distributors, the purchasing and distributing agents for the Government, is to have 16 directors, instead of eight as previously announced. The ten who are to come from the Liverpool Cotton Association have already been elected. The remaining six are to be elected from the Manchester Cotton Association. A national marketing company has been formed by the Minister of Food to ensure efficient distribution of vegetables.

Tin Statistics.—According to Messrs. A. Strauss & Co., Ltd.'s *Monthly Tin Bulletin*, world visible tin stocks during March fell from 44,053 tons to 39,971 tons. The record deliveries of 16,092 tons in the United States may partly account for this fall. A further cause is the falling off of production in the East; Malaya produced 10,845 tons in January and February of this year, compared with 12,864 in the same period in 1940. United Kingdom stocks fell from 4,244 tons to 3,008 tons. Tin prices have not shown much change this week. The closing price of standard cash on Tuesday was £268 10s.—£269 per ton, compared with £270—£270 5s. a week earlier, with the three months' figure at £265 15s.—£266, against £266 15s.—£267. Business in tins has been more active; exports up to 50 per cent. of existing stocks have been authorised up to May 31.

Cotton Trade.—Business has been small. The Controller has not been prepared to issue preference certificates for export, but some of the old contracts are now being proceeded with. It is expected

that more machinery will be required to meet the requirements of our allies in the Near East. Shippers of cloth are more anxious to place orders, but numerous manufacturers have not been willing sellers. Shipping merchants will not know how they stand until the quotas are available under the selective export policy which is discussed in a Note on page 498. Yarns have been sold in restricted quantities.

Compensation Experiment in Cotton.—As an experiment, Lancashire cotton spinners are starting a compensation scheme for the benefit of spinners whose mills are closed down under the concentration scheme. Firms working to full capacity will contribute 1½d. per spindle and those on part-time, 1½d. The closed firms will receive 1d. per spindle. The experiment is to last one month. About £7,500 a year would be contributed to the pool by a mill with 100,000 spindles.

Control of Rice Prices.—The Minister of Food made an Order which came into force on April 7, fixing maximum prices for rice on sales by millers or importers to wholesalers, primary to secondary wholesalers, on sales to retailers and by retail. An importer is defined as a person to whom rice is sold by the Minister. For sales by millers or importers, prices vary according to the description of the rice, from 25s. 4½d. per cwt. for Burma rice, to 44s. per cwt. for Patna rice. For sales between wholesalers, prices are 1s. 9d. higher, and the retailer will pay between 30s. 4½d. and 49s. Retail prices are fixed between 4½d. and 7d. per lb. Supplies of descriptions not covered by the Order are believed to be small and their price is left free.

COMPANY MEETINGS

REFUGE ASSURANCE COMPANY, LIMITED

ASSETS £74,600,000. INCOME EXCEEDS £13,100,000

LIFE ASSURANCE IN WARTIME

The seventy-seventh annual ordinary general meeting of the Refuge Assurance Company, Limited, was held, on Friday, April 4th, at the chief office of the company, Oxford Street, Manchester. Mr J. Wilcock Holgate (chairman of the company) presided.

The secretary (Mr J. W. Moss), having read the notice convening the meeting and the auditors' report, the chairman, in moving the adoption of the report and accounts, said:—
Gentlemen,—We meet once again under the clouds of war, and before I deal in detail with the accounts now before you I would like to tell you something of the difficulties in administration which the company has had to face, and of how we have endeavoured to overcome them.

Our first problem was naturally that of staff. At the end of 1939 the number of our employees serving with the Forces was 244, and this number has now been increased to 1,655, of whom 108 are from chief office and 1,552 from our field staff. In many of the latter cases the work is being carried on by the wives of the employees who have been called up, while good work is also being done by pensioners of the company who have returned temporarily to our service. As regards chief office, work is being cut down to a minimum, and here, for the first time, married women have been engaged on a temporary basis. Difficulties in transport and postal delays have occurred from time to time, but their efforts were overcome; and despite the enemy's attacks on areas in which so many policyholders of the company are to be found, contact has been maintained or restored, collection of premiums carried on, and payment of claims made as they arose. In cases where premises occupied by the company have been damaged, the situation has been dealt with immediately and the work of the company carried on with the minimum of interruption.

NECESSITY FOR LIFE ASSURANCE

In these days of total effort it is encouraging to reflect that not only in our private capacities but also in this business of life assurance we can play an important part in the national war effort. Even more in war than in peace life assurance is an essential part of the social and economic life of the nation. In this company alone we administer over 8,700,000 policies, arranging for the receipt of premiums, and in due course paying the claims; and, in fact, during 1940 we paid out in claims on the average £27,000 each working day. But that is not all. All over the country the need for new life assurance arises day by day, and in these times particularly and despite the necessary restrictive conditions, there is wide appreciation of the truth that only by life assurance can a man create immediately an estate for the protection of his dependants.

Practically the whole of the policies issued by this company prior to the war contained war restriction conditions. We have undertaken, however, for the time being (excluding certain temporary benefits) to pay war claims under such policies in full, while as regards policies issued after the outbreak of war the utmost benefit has been granted as regard war deaths compatible with the security of the general body of policyholders.

Life assurance is a form of saving which is of great assistance to the country's war finance in that so large a proportion of life assurance funds is invested in Government loans. This company alone in 1940 increased its holdings of British Government securities by over £8,500,000, and further investments of this nature have since been made and will continue to be made as opportunity arises.

As regards employees in the company's service at the out-

break of war and who are now with the Forces, we are happy to be able to maintain their pension rights and to make allowances to supplement their service pay and Government allowances. I am sure that their efficiency in their new sphere will at least not be diminished by the financial assistance thus provided; and I know that it will be your earnest hope, as it is my own, that good fortune and a safe return await them.

THE EFFECT OF WAR ON LIFE ASSURANCE

All this cannot be done without its effect on the company's finances. Although war deaths have so far been on nothing like the scale of 1914-18, the effect on our mortality experience in both branches has been evident. The investment of so much of the company's funds in low-yielding Government securities has reduced our interest income, while the granting of allowances to the staff, the effect of which is making itself increasingly felt, coupled with the additional expenses attaching to administration in wartime, including substantial sums on account of air-raid precautions, will have their inevitable effect on our expense ratios.

REVIEW OF THE YEAR

Bearing all this in mind, you will be glad to learn that so far we have been able to deal adequately with the problems presented to us, and in considering the following figures it must be remembered that in October, 1939, the company's industrial assurance business in Eire was transferred to the Industrial and Life Assurance Amalgamation Company, Limited, of Dublin, and that since that date no new business has been transacted in Eire in either branch.

Our total premium income decreased by £42,910 to £10,666,614 and our net interest income, at £2,491,222, was less than in 1939 by £70,642. Our total claims were £3,162,981, which included £4,750,971 by way of maturities alone. The aggregate surplus in both branches amounted to £2,459,574, and the total assets now stand at £74,606,552, having increased by £2,146,290 during the year.

INDUSTRIAL BRANCH

In the industrial branch our premium income amounted to £6,140,818, showing an increase of £63,699 over that of the previous year. The net interest income was £1,201,667, and the life assurance fund increased during the year by £1,259,746 after the transfer of £200,000 to the investments reserve fund, which now amounts to £2,450,000. The expense ratio shows a reduction, being 31.63, as against 32.07 in respect of 1939; but in this connection I should like to warn my hearers that a repetition of this experience during the present year is extremely unlikely, as the effect of our additional costs will become increasingly evident.

During the year the number of policies falling out of benefit through non-payment of premiums was gratifyingly low, and the average duration of the premium-paying policies on our books has again increased, being now twelve years and eleven months.

In this branch premiums are collected at the homes of our policyholders; and our percentage of collections is remarkably high, bearing in mind the difficulties encountered in bombed areas and attendant on the evacuation, and sometimes on the return and re-evacuation of policyholders. Contact in all such cases is immediately sought and is usually obtained with the minimum of delay, thereby securing to our policyholders the benefits arising from continuity of the service it is the aim of the company to provide.

INDUSTRIAL BRANCH VALUATION

The valuation was again made on a 2½ per cent. basis, and the resulting surplus, which includes £152,013 brought forward from the preceding year, was £852,178. The sum of £200,000 has been transferred to the investments reserve fund, and it is proposed to allocate to the shareholders £104,084, to carry forward £148,094, and to set aside £400,000 for allocation to policyholders by way of permanently increasing the sums assured by certain policies, and of making the payment of claim arising by death or survival of endowment terms during the ensuing year on the basis of the latest and most favourable scale of benefit as regards those policies which have not been placed permanently upon this latest scale by this or previous allocations of surplus, together with an addition of 2½ per cent. in respect of policies, with certain exceptions, dated prior to January 1, 1936.

ORDINARY BRANCH

In the ordinary branch the number of new policies issued was 32,038, as compared with 41,926 issued during the previous year. The new sums assured amounted to £4,873,322, a sum which represents 76 per cent. of the corresponding figure for 1939.

The ordinary branch premium income for the year was £4,525,796, and the net interest amounted to £1,289,555. The expense ratio was 12.60 as compared with 13.52 in respect of 1939, the decrease being largely attributable to the fall in new business; and the life assurance fund now amounts to £38,807,687, in addition to which there is an investments reserve fund of £2,250,000.

ORDINARY BRANCH VALUATION

Having regard to the fall in interest rates in recent years, and in particular to the consequent probability of a diminishing yield on our funds, it has been thought desirable to strengthen the basis of valuation in this branch. The net premium method was again employed, the rate of interest assumed, as previously, being 3 per cent., but in the case of participating policies 97½ per cent. only of the net premiums on the valuation basis has been valued. On this materially more stringent basis the resulting surplus is £1,607,395, which includes £1,269,858 brought forward from the preceding year. It is felt that the events of last year more than justified the modified form of bonus distribution adopted at our last meeting, and it is proposed that it be repeated, the sum of £75,744, including interim bonuses of £4,609 paid during the year, being allocated to policyholders to provide a bonus on participating policies which become claims by death or survival within the twelve months commencing March 20, 1941, at the rate of £1 per cent. on the sum assured in respect of each full year's premium due and paid in 1939 and 1940 respectively, the sum of £1,273,235 being carried forward to meet any contingencies which may arise out of the present world situation, or to be dealt with subsequently as the board may determine. The sum of £250,000 is transferred to the investments reserve fund, and the remainder, amounting to £8,416, is allocated to the shareholders.

INVESTMENTS

Turning to the balance sheets, perhaps the outstanding feature is the increase of £3,744,997 in our holdings of British Government securities. This increase is attributable mainly to investments in the new war loans, the total of these investments in itself considerably exceeding the growth in the funds during the year and indicating plainly the company's effort to play its part in financing the country's war requirements.

The total amount of the company's holdings of British Government securities now amounts to £30,193,321, and represents 40.47 per cent. of our total assets and 50.44 per cent. of our Stock Exchange securities. So high a proportion of the foregoing class of investment is not, of course, conducive to a high yield of interest on our funds, but it does possess some favourable features, one of which is that it is principally responsible for my being able to inform you that the aggregate value of our Stock Exchange securities, based on middle market prices, very materially appreciated during the year under review and exceeded considerably the figure at which they appear in

the balance sheets, the investments reserve funds being retained intact.

Notwithstanding that your board regard this as a satisfactory position, they have decided, in view of the uncertain outlook which unfortunately still prevails, to transfer £450,000 to the investments reserve funds which, on the passing of these accounts, will amount in the aggregate to £4,700,000.

As regards the interest yields per cent. on our assurance funds, in the industrial branch the gross yield has fallen from £4 12s. 5d. to £4 11s. 5d., and the net yield from £4 5s. 4d. to £4 3s. 4d. In the ordinary branch the gross yield is £4 13s. 1d. against £4 14s. 11d. in 1939, and the corresponding net yield £3 7s. 8d. compared with £3 12s. 7d. These yields, though unpalatable, are, I think, no worse than we might have expected having regard to the circumstances.

There has been little change in the geographical distribution of the investments as compared with the preceding year, as the following figures indicate:—

	1939	1940
	Per cent.	
Great Britain	84.71	86.85
Indian and Colonial	11.58	9.74
Foreign	3.71	3.41

NATIONAL HEALTH INSURANCE

Turning now to another branch of the company's activities, I have to report that on behalf of the National Amalgamated Approved Society we administer the National Health Insurance of a membership of 745,000. During the year payments of benefit were made amounting to £684,822, including £71,818 in respect of maternity benefits. In addition, the further considerable sum of £46,149 was received by Refuge members by way of non-cash benefits. The number of new members of the society obtained during the year by Refuge representatives was 59,218.

National Health Insurance has become an essential part of the social fabric of this country, and, despite the staff difficulties thrust upon us by war conditions, the services demanded by the insured persons must be maintained.

TRIBUTE TO STAFF

In conclusion, I wish to pay tribute to the efforts of the company's staff, both indoor and outdoor, during a year of intensified war. We were very conscious of the difficulties and dangers which have confronted them in varying degrees in the performance of their duties; but in every area the company's staff have continued to function—administration has been maintained, claims promptly paid, premiums collected, and dispersed policyholders discovered and linked up again with the company's services; and this despite the voluntary civil defence duties so freely undertaken by members of the staff. The whole personnel is passing through a testing time, but I know that Refuge men and women will face with confidence, and overcome, the problems which the future surely holds.

I am glad to say that our relations with the Chief Office Staff Council and the Refuge Field Staff Association continue to be most cordial.

Gentlemen, I have now much pleasure in moving the adoption of the annual report and accounts.

The report and accounts were adopted.

Messrs W. Proctor Smith and J. Wilcock Holgate were re-appointed directors.

Messrs Walton Watts and Company were reappointed auditors.

The meeting closed with a vote of thanks to the chairman.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8 Bouverie Street, E.C.4.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

CENTENARY YEAR

STRONG FINANCIAL POSITION

NEW "SAVE-TO-WIN" POLICY

A.R.P., A.F.S., AND THE HOME GUARD

ASSETS EXCEED £17,000,000

CLAIMS PAID EXCEED £31,000,000

The one hundredth annual general meeting of the members of the Wesleyan and General Assurance Society was held on the 1st instant, at the Central Hall, Corporation Street, Birmingham, Mr Arthur L. Hunt, F.S.S., F.C.I.I., the society's chairman and managing director, in the chair.

The joint manager and actuary (Mr D. R. Woodgate, M.Com., F.I.A.) presented the reports and statement of accounts for the year ended December 31, 1940.

The chairman, in moving the adoption of the reports, said:—

The society was, as you know, founded one hundred years ago. Its chief office has always been in the City of Birmingham, which at the time of the establishment of the society was a small country town. The city, during the century, has grown to become a great metropolis with over a million inhabitants carrying on a wide variety of trades, and the society has developed into a great insurance institutions serving one in every forty of the population of Great Britain, with district offices in all important centres and agencies in every part of the country.

CLAIMS

During the year the claims paid in all departments amounted to £1,768,560, which brings the total paid since the inception of the society to over thirty-one million pounds. War claims under life assurance policies effected before the outbreak of war have been met by payment of the full sum assured.

I should like to take this opportunity of informing all A.R.P. workers and members of the A.F.S. and the Home Guard that if they effect a with-profits policy in the ordinary department or a policy in the industrial department and pay the normal rate of premiums, they will be treated as favourably as other dependants will receive one-quarter of the sum assured and twice the premiums they have paid. These are very generous terms of which they will be well advised to take advantage.

With regard to the Home Guard, the directors decided in May, 1940, that, so long as the Home Guard remains as at present constituted, war claims under policies effected before the outbreak of war will be met in full without an extra premium being required. Also, as I have already indicated, members of the Home Guard now effecting policies will be treated in all respects as civilians.

ORDINARY DEPARTMENT

The surplus disclosed on valuation, together with £11,500 transferred from the industrial department, amounted to £183,074 8s. 9d., out of which the directors decided to apply £82,344 to provide a reversionary bonus at the rate of £1 per cent. of the sum assured on all with-profit policies. The directors also transferred £35,000 to general reserve and £11,020 to the staff pension Scheme fund and carried forward £54,710 8s. 9d.

In this department a new "Save-to-Win" policy has been introduced. This policy enables the assured to buy 3 per cent. Savings Bonds, 1955-65, by instalments over fifteen years and also gives life assurance protection to his dependants. By effecting a "Save-to-Win" policy the assured is directly assisting the war effort. If the assured completes his proposal during a local War Weapons Week, the Savings Bonds which the society buys on his behalf count in the local War Weapons Week total.

INDUSTRIAL DEPARTMENT

The premium income of the department increased by over £16,000. The surplus disclosed on valuation amounted to £229,047 3s. 11d., out of which the directors decided to apply

£20,000, together with the unexpended balance of previous allocations, for the benefit of industrial department policyholders by way of additions to the sums payable on claims arising by death or maturity on or before April 6, 1942. These additions are on the same scale as formerly, and vary from 2½ per cent. on policies of ten years' duration to 10 per cent. on policies of forty years' duration and over.

The directors also decided to transfer £50,000 to investments reserve, £20,000 (less income tax) to the ordinary department, £20,000 for the benefit of the outdoor staff, £53,980 to the staff pension scheme fund and to carry forward £65,067 3s. 11d.

FIRE, MOTOR VEHICLE, EMPLOYERS' LIABILITY AND GENERAL DEPARTMENTS

The premium income of these departments has suffered a reduction as a consequence of the war, but the departments have been operated at a small profit. This business is wholly re-insured, so that all claims are the liability of the re-insuring office. The funds of the departments have increased to £68,108 18s. 4d.

On the outbreak of war the society was appointed by the Board of Trade to act as agent in connection with the Government scheme for the insurance of commodities. The society, in common with other fire insurance offices, assists in working the scheme without profit. The Government makes an allowance to the society calculated to be sufficient to cover the administrative costs and is itself liable for all claims.

ASSETS

The assets of the society now appear in the balance sheet at £17,211,866, having increased by £470,333 in the year.

Over one-half of the assets are represented by Stock Exchange securities, of which 78 per cent. are securities in the United Kingdom. During the year £532,600 has been invested in the new war issues of British Government securities.

The market value of these Stock Exchange securities exceeds the value at which they stand in the society's books.

Mortgages on property represent nearly one-quarter of the assets. These include over 5,600 loans to enable policyholders to purchase the houses in which they live.

INCREASED FINANCIAL STRENGTH

The financial strength of the society has been increased by £92,965, after meeting war death claims out of revenue and after making special provision in the valuation for war mortality. The investments and general reserves, the surpluses carried forward and the fire and general funds now amount together to over £978,000, and this figure, in conjunction with a consideration of the stringent bases employed in the valuation of liabilities, is a measure of the society's financial strength.

I am particularly pleased to be able to disclose this excellent position in the society's centenary year. It shows that during the prosperous period of years through which the society has passed, the opportunity was taken of making provision for adverse circumstances. This was not done at the expense of policyowners or the staff, for whose benefit substantial allocations were made. In the ordinary department high rates of reversionary bonuses were declared for many years, and since 1927 industrial department policyowners have received allocations totalling over £740,000. The outdoor staff of the society also benefited by the allocation of cash sums since 1927, and a staff pension scheme was instituted in that year.

I am pleased to be able to state with confidence that the society is in a sound position to face the uncertainties of the future, and that it is entering upon its second century of existence in a better financial condition than ever before.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LIMITED

A DIFFICULT YEAR

SIR MALCOLM STEWART'S STATEMENT

The forty-second annual general meeting of the Associated Portland Cement Manufacturers, Limited, will be held at the Federation of British Industries, 21, Tothill Street, Westminster, S.W., on April 17th.

The following is an extract from the speech of the chairman, Sir P. Malcolm Stewart, Bt., O.B.E., D.L., LL.D., which has been circulated with the report and accounts.

The chairman, dealing with the accounts, states that the net profit for the year amounted to £539,648, as compared with £741,981 for the previous year. Two interim dividends of 5 per cent each on the ordinary stock in respect of the year have been paid, leaving £2,148 to be added to the carry forward which will then amount to £215,828.

He continues: Trading conditions during the early months of last year were unsatisfactory, deliveries being exceptionally low, influenced by the extreme severity of the weather experienced. Change came with startling suddenness. Three major events coincided and these brought about an abnormal demand, which proved to be short-lived. There was the acceleration of the Government factory construction programme, the heavy requirements for defence works, following the withdrawal of the B.E.F. from France, and also for A.R.P. work. Difficulty in giving prompt delivery, at the same time, to all these demands was much increased by the lack of adequate transport facilities, the slowing down of coastwise shipments in particular throwing an undue strain on rail and road services. The consequences of this passing phase of coincident occurrences caused alarm.

It was erroneously assumed in some quarters that there would be a serious shortage of cement. The situation was made worse by the well-intentioned institution by the Government of a cement coupon scheme, since withdrawn, which further held up deliveries despite the strenuous efforts of the Cement Makers' Federation to administer it. This was the position last autumn. What is the situation to-day? The industry holds in stock over one million tons of cement and cement clinker and it looks as though a number of important factories will be compelled to reduce production because their cement silos and warehouses are filled to capacity.

CEMENT MAKERS' FEDERATION

Since there would appear to be a considerable degree of ignorance as to the performance and policy of the Cement Makers' Federation, I will briefly refer to its war work and aims and to what it has accomplished in recent years. The Cement Makers' Federation, alive to the need for a small body that could take prompt action, shortly after the outbreak of hostilities appointed a War Executive Committee which has worked continuously, placing national interests first and giving all Government departments concerned the fullest help and support in dealing with the inevitable difficulties arising out of the war. That the Federation early realised the industry might be called upon to make an important contribution to the war effort is evidenced by the fact that in October, 1939, its Executive Committee passed a resolution urging all members to expand production to the utmost possible extent regardless of any consideration. But the determination of the industry to provide for the future was given effect to long before the outbreak of war. Between the years 1934 and 1938 it increased its annual production capacity by no less than two and a quarter million tons. This heavy expansion of capacity was mainly outside the Thames and Medway area and far exceeded any normal requirements due to growth of demand; indeed we were faced with the problems arising from over-production.

Let us now consider the results procured through the co-operation of the members of the Cement Makers' Federation. A weak industry, suffering from adversity and paying the lowest rates of wages, has been transformed into a prosperous industry paying good wages and making provision for the welfare of its workers. Some members instituted, many years ago, holidays

with pay, profit-sharing schemes, and more recently pension schemes. Rational control of the industry based on close co-operation has put the members of the Cement Makers' Federation in a position to make heavy expenditure on improvements in plant and process so as to secure a high degree of efficiency and to manufacture Portland Cement of much improved quality.

COSTS AND SELLING PRICE

I will give you a few figures relating to our group of companies. In the 15 years prior to the outbreak of war we reduced the average per ton cost of production by 32.3 per cent. During the period the cost of purchased materials was much increased. Let us see how the consumer has fared. Has he shared in the proceeds arising from reduced costs of production? He certainly has most substantially, since the net naked average price per ton received by us at works from the consumer was in the 15 years prewar reduced by 35 per cent. It goes without saying that this reduction in selling prices could not have been achieved had we not been able greatly to increase production and deliveries.

Let us now see how we have dealt with our employees, and this is of primary importance. Between 1925 and May, 1939, six advances in wages, totalling 12s. per week were granted by the National Joint Industrial Council. Further, thanks to the harmonious working between the manufacturers and the Trade Union delegates on the council, the industry has been free from strikes and lock-outs. At the same time a good return has been made to our stockholders and the financial position of the companies has been strengthened. Efficiency, the vital factor in industry, bringing low overhead charges and reduced costs of production, has been achieved despite the increased costs of materials and the advances in wages to our workers. Thus have the benefits accruing from co-operation through the Cement Makers' Federation been fairly shared. I have endeavoured to make clear the policy and performance of the Cement Makers' Federation through facts and figures given you.

POST-WAR PROBLEMS

The recent creation by the Government of the Ministry of Works and Buildings, with Lord Reith as Minister, is a step in the right direction towards solving the practical problems of reconstruction and planning. The industry welcomes Government control in war time, since we court investigation. The effective organisation of the Federation is considerably facilitating the task; indeed the greater the need for Government intervention in industry the greater the necessity for each industry to be well organised. This is an essential requirement if industrial reconstruction is to proceed smoothly.

Most of us are conscious that after the war we shall enter a period of far-reaching changes affecting our social and industrial life. We have to wait to see the shape these will take. Meanwhile, every nerve must be strained to make more effective our man power and material resources to secure an unchallengeable victory. This is not yet in sight, but the will to work and to win, sustained by the progress already achieved on sea, land and in the air, thanks to brilliant leadership and the indomitable courage of all Arms, gives calm and confident assurance of final triumph.

In these times it is obvious that any forecast must be hedged with caution. The year has opened disappointingly, the demand being weak. Despite the relatively better weather, as compared with the early months of 1940, we have only recently passed the very low deliveries then made. Transport and production may become more difficult and dislocated, but even if this does not happen I feel we shall be fortunate if the demand absorbs the tonnage produced. Thus, the present outlook does not warrant my leading you to look for the submission next year of results which will show an improvement on those now before you.

THE UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

TRIBUTE TO STAFF

SATISFACTORY RESULTS

EXPORT TRADE INCREASED

DIVIDEND MAINTAINED

SIR MAX J. BONN'S STATEMENT

The following statement by the chairman, Sir Max J. Bonn, has been issued to the shareholders of the United Glass Bottle Manufacturers, Limited.

Your directors deemed it a matter of general convenience that my necessarily brief observations should accompany the annual report and accounts for the financial year ended December 31, 1940. Thus the general meeting to be held on the 17th inst. will be called upon to transact formal business only.

The satisfactory figures now submitted for your approval do not adequately reflect the difficulties under which our factories have been working, some, fortunately, of a temporary nature only, others of a general character. It is therefore right that pride of place should be given to an expression of sincere appreciation and best thanks to the managers of the factories and to all members of the U.G.B. organisation. Their efforts and exertions have not been limited to their ordinary duties, but cover the wider field of additional service, which both self-interest and public spirit demand.

I know that it will give Mr T. C. Moorshead very special satisfaction to convey this message to all concerned, with which, I am sure, shareholders would wish to be associated.

Your business is becoming more markedly subordinate to the national effort, both by direct contribution and the effect on our customers of the Limitation of Supplies Orders.

If I deal more cursorily with the comparative figures, you will appreciate the need for greater reticence.

BALANCE SHEET ITEMS

Dealing with the assets side of the balance sheet, it will be observed that plant and machinery at £558,449 compare with £598,052 last year. The sum of £120,000 has been invested in National War Bonds, and during the St. Helens War Weapons Week in March this year we subscribed a further sum of £25,000. The "U.G.B." National Savings Group, which was formed in January, 1940, has received the continued support of our staff and works employees throughout the organisation. Cash at bankers, £170,951, shows a decrease of £88,469. Stocks, stores and packages are increased by £160,843 to £788,844. Debtors, including dividends due from subsidiary companies (since received) at £701,380 compare with £650,105. On the liability side of the account sundry creditors and provision for income tax, Excess Profits Tax, war damage insurances and contingencies at £758,999, show an increase of £204,801.

PROFIT AND LOSS ACCOUNT

The net profit for the year shown in the accounts is £236,345 (as against the previous year £248,443), to which is added the balance from last year, £41,096. After making various allocations, to which I shall refer later on, there remains available for distribution £193,251.

The dividend for the year, less income tax on the preference shares £51,809, and an interim dividend less income tax on the ordinary shares, £22,480, has been paid, and it is proposed to pay a final dividend on the ordinary shares of 6 per cent. less income tax, making 9½ per cent. for the year (same as last year) and a cash bonus of 2½ per cent. less income tax (same as last year) £54,594, and to carry forward a balance of £64,368.

SUBSIDIARY COMPANIES

The item "Dividends from subsidiary companies" consists mainly of the contribution we receive from British Bottles,

Limited. Once again they have worked in accordance with the key figure on which the merger was based, but have distributed only the same dividend as last year, less the heavier deduction for income tax.

Our Northern factories make an essential, though indirect, contribution to the export effort. As regards the export of empty bottles U.G.B. shows a further satisfactory increase.

Kork-N-Seal, Limited, have somewhat reduced their dividend, largely as a measure of precaution. During the year they moved some of their activities closer to their main consumers; pending the smoothing-out of the inevitable difficulties of physical transfer, it is only reasonable to expect some drop in net earnings.

INCREASED COSTS AND SELLING PRICES

Practically throughout the whole of the year our rising costs have been absorbed without any increase in our prices. This was solely possible thanks to the large volume and the increased velocity of our turnover and the economies resulting therefrom. Towards the end of the year, however, it became necessary to impose a further price increase of 10 per cent.

You will readily appreciate the difficulty in making strict comparisons with pre-war results; apart from the heavy surcharges—such as the increase in wages, raw materials, freights, etc., etc.—the cost of war risk insurance constitutes a heavy incidence. Provision for the back payment which will become due in respect of war risk insurance on buildings and plant has been made as a direct working charge.

You will observe the special reference in the amount charged for depreciation under the heading of "Depreciation of moulds." We have had to restrict our mould work more and more. Thus, it has been impossible to keep them at the normal U.G.B. standard of repair, the highest possible one. When we return to post-war practice we shall be confronted with heavy arrears for mould repair, and we have now started making the necessary provision.

ALLOCATION OF PROFITS

As regards the allocation of the net profit shown, those for debenture sinking fund, staff benevolent fund and air-raid precaution expenditure require no special comment.

Rather than add to general reserve, we have allocated £25,000 to contingency reserve and have increased the carry-forward by £23,272. We would ask you to regard this liquidity as an indication of the many uncertainties which may affect our production. So far, however, we have worked quite satisfactorily and in accordance with our anticipations, which envisaged some shrinkage from the abnormally high level of our general business during the last few years.

I am happy to be able to state that within the last few days we have had word from our friends, the Owens-Illinois Glass Company, offering to extend our technical understanding for a further period. Quite apart from its practical value, we regard it as a gesture significant of their desire, in common with the American people, to extend a helpful hand.

Once again we offer our best wishes to absent colleagues and to all other members of our organisation engaged on active service and civil defence, and look forward to the renewal of a more personal meeting with our shareholders.

HALIFAX BUILDING SOCIETY

STRONG LIQUID POSITION

The eighty-eighth annual general meeting of this society was held, on the 7th instant, in Halifax.

In moving the adoption of the report and statement of accounts, Brigadier-General Sir Edward N. Whitley, K.C.B., C.M.G., D.S.O., D.L., the president of the society, said:—

Just after our last annual meeting the land campaign opened on the continent of Europe with the invasion of Denmark and Norway, and ended two months later with the collapse of France. Neither the results of the land campaign nor the great air battles over this country in August and September, however, shook the confidence of our investing members or depositors, and the notices for withdrawal remained at all times easily within the amount of cash lying in the hands of our bankers. Indeed, throughout the whole period fresh investment money continued to come in.

WAR DAMAGE ACT

Turning to the effects of the war on our borrowing members, we cannot forget the tragedy to the individual member who has lost, in one moment, his or her home and all that it contained, and we welcomed the Government's promise of a scheme of compensation for war damage which has now been brought to fulfilment in the War Damage Act. This Act strengthens our position as mortgagees, and we have not felt it necessary to make any special provision in the year's accounts for war damage where it has occurred. It also confers benefits on our members whose property may have been damaged or destroyed by enemy action, and introduces a wholly new principle into the relations between lenders and borrowers. A borrower who has purchased his house with the aid of a loan from the society can, under certain conditions, now call upon the society to reimburse him a considerable proportion of the contribution which he has to make under the Act.

BURDEN OF TAXATION

There has been a tremendous increase in our income-tax liability, and this tax, together with our National Defence Contribution in the year of account, amounted to over one and a quarter million pounds. After paying interest to shareholders (£2,626,004) there remains a sum of £299,726 out of which we propose to pay a bonus of 5s. per cent. to the paid-up shareholders Class I and to the monthly subscription investing shareholders, leaving a balance to be carried forward to next year of £267,778.

The total reserve funds and undivided profit are now nearly £6,000,000, or almost 6 per cent. of the amount outstanding on our mortgage securities.

The liquid assets, which are represented by trustee investments repayable at par at fixed dates, and cash in hand or in the banks, have increased by £1,897,585 to £23,833,977 and include £1,760,000 of British Government securities, for which we have subscribed during the year as a contribution to the national needs, and we have directly channelled on behalf of our members and depositors a further sum of £2,304,000.

To sum up the accounts for the year in a sentence, we have increased our liquid assets, we have retained the confidence of our investors, and our borrowing members have again shown their determination to fulfil their obligations in the face of the difficulties and trials of total war.

MEMBERS' AVERAGE HOLDING

There is often a tendency to regard a building society as a wealthy corporation, and I think it is time to protest strongly against that point of view. Our members are, in the main, men of small means, the average amount standing to the credit of each of our investing members and depositors being £256, and it is unfair to treat them as if they held great accumulations of wealth.

In conclusion, the president extended the good wishes and thanks of the directors to the 235 members of the staff serving with the forces, and to the general managers, officials, branch managers and staff for carrying on under difficult conditions.

TELEPHONE AND GENERAL TRUST, LIMITED.

A SATISFACTORY RESULT

The fifteenth annual general meeting of the Telephone and General Trust, Limited, will be held at Maidenhead on the 21st instant.

The following is a summary of the statement of the acting chairman, Mr A. N. Rye, which has been circulated with the report and accounts.

The chairman of the company, Sir Alexander Roger, was called upon by the Ministry of Supply to lead a mission to India in the summer of last year, and had sent a cable expressing his deep regret at his inability to preside at the general meeting this year.

The profit for the year amounted to £114,287, an increase of £1,758. Including the amount brought forward, the total available for distribution was £176,856. Income tax accounted for £12,000, and, after providing for the 7 per cent preference dividend, an interim dividend of 3 per cent and a final of 5 per cent on the ordinary stock and a dividend of 8 per cent on the "A" ordinary shares, there was £68,196 to be carried forward against £62,569 brought in.

There was a reduction of £175,604 in debentures and loans to subsidiary companies and an increase of £121,463 in cash at call and at bank. Early in 1940 the Anglo-Portuguese Telephone Company was permitted to issue £200,000 of debenture stock, the proceeds of which were used to repay part of the trust's loan. Under present conditions they had deemed it desirable to maintain a more liquid cash position than was their usual practice.

A valuation of their securities at December 31, 1940, showed a depreciation of 10.6 per cent on the total investments of £2,420,262. That depreciation was more than covered by reserves and surplus.

Speaking generally, they had surmounted the difficulties of 1940 more successfully than he personally had thought probable, and had made a good start in 1941.

BRITISH TYRE AND RUBBER COMPANY, LIMITED

BURDEN OF E.P.T.

The annual general meeting of this company was held, on the 7th instant, in London.

Sir Walrond Sinclair, K.B.E. (chairman and managing director), in the course of his speech, said: The net profit for the year, subject to taxation, amounts to £318,506. Preference dividend paid for the year to May 31, 1940, was £13,500 net, premium and expenses on redemption of debenture stock £124, interim ordinary dividend of 3½ per cent £19,687, while there are transfers to contingencies reserve £40,000, amount written off goodwill, etc., £12,500, and allocation to general reserve £25,000. At the general meeting held on October 8, 1940, a further interim dividend of 4½ per cent, less tax, on ordinary shares, requiring £23,288, was authorised and subsequently paid, and the directors now recommend a cash bonus of 3 per cent, less tax.

While the dividend distribution, together with the bonus, has been maintained on the same basis as last year, the operation of the excess profits tax creates—and will create still more in future—a "ceiling" beyond which we cannot penetrate so long as it is maintained at 100 per cent. The accounts under review cover a period of six months of the E.P.T. rate at 60 per cent, and the second six months at 100 per cent, or, in other words, the average is 80 per cent, but if no change takes place our future profits—provided they are above a certain figure—will be subject to the full rate of 100 per cent.

The excess profits tax in our case means that there will be appropriation to the Exchequer of 100 per cent of all profits made above what is to us an artificial and arbitrary level calculated at a period dating considerably before hostilities broke out. Consequently the profit available for distribution to shareholders will be restricted to that arbitrary level.

The report and accounts were unanimously adopted.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

The One Hundred and Third Annual General Meeting of the Scottish Provident Institution was held in Edinburgh on Tuesday, the 8th instant, Mr A. W. M. Beveridge in the chair. Before dealing with the accounts, the chairman referred to the loss sustained through the deaths of Mr James Maxtone Graham and Mr Alfred Shepherd, directors, and of Sir Robert Boothby, manager of the Institution, and paid fitting tribute to their personality and their services over many years.

He continued as follows:—

The report deals with the first complete calendar year of the present war, and the figures show a further diminution in new business. Proposals were received for amounts totalling £1,725,120, and policies were issued for £1,547,922. Of this, £146,131 was reassured with other offices, leaving a net total of £1,401,791, which is 60 per cent. of the business for the previous year. In the case of five offices, which are covering civilian war risk without extra, the percentage is no more than 67½. Part of the decrease in our figures arises from our having withdrawn from the issue of temporary and other low-rated assurances and part from the reduction in the number of our inspectors, due to their being called up. Instead of four months of war, as in 1939, we have had twelve in 1940, and some of the effects are cumulative. More and more of the men of assuring ages—our potential policy-holders, are being absorbed into the forces.

The total funds stand at £25,326,301, which is £34,537 less than the corresponding figure for the previous year. The items producing this result have been variously affected by the war. Commission and expenses are lower. Past experience has been repeated in fewer surrenders of policies and fewer loans upon policies. Income tax payments have gone up by £29,763. Claims by death are up £22,737. Of the total death claims of £1,021,510, £82,667 due to death from enemy action arises in respect of policies issued before the war, under which we were covering war risks without receiving any extra premium, this sum being made up of £12,707 for civilians and £69,960 for members of the forces. For new entrants the practice of the Institution is now to restrict the liability in event of death occasioned by hostilities to a return of premiums paid or the surrender value, if that should be greater.

The rate of interest realised is £4 5s. 10d. gross (£4 8s. 6d. in 1939), and the net rate works out at £3 4s. 9d., as against £3 9s. 10d. last year. The further reduction in net yield is due in part to increased income tax, although the second Finance Act of 1940 limited the rate applicable to mutual life assurance offices to 7s. 6d. in the £. These yields are calculated on the total funds of the Institution, including the Investment Reserve Fund.

The greater portion of our funds having been invested in pre-war days, the yield last year, as I have said, was £3 4s. 9d. net, but as investments mature a lower rate must be looked for, since it is our normal policy to use new money to support the new war loans.

The depreciation at the end of 1939 of some 3½ per cent. in the aggregate market value of the Stock Exchange Securities, after taking the Investment Reserve Fund into account, had disappeared before the annual meeting in March of last year, but the events of May and June caused renewed weakness, so that at December 31, 1940, the depreciation was virtually the same as at the end of the previous year. The directors bore this in mind when they deemed it prudent to increase the Investment Reserve Fund by £750,000, making it up to £1,350,000.

In his speech last year the chairman stated that the Board reserved the right, under current conditions, to reconsider the position as regards intermediate bonuses, if circumstances should necessitate such a course. Keeping in mind the severity of air attack and the reduction which falling interest rates may make in the surplus at 1943 (out of which intermediate additions fall to be paid), the directors thought it well to suspend payment of them in respect of claims after December 31, 1940, whether by death or survivance.

To the officials at Head Office and Branches and to every member of the staff, I take this opportunity of expressing our thanks and appreciation.

With cheerful determination they are doing their utmost and overtaking whatever extra may fall to them of the work of the Institution.

The motion for the adoption of the report was seconded by Mr John Bartholomew, F.R.G.S., and carried unanimously.

The directorate was thereafter constituted and Mr Francis More, C.A., was reappointed auditor.

JOHN BARKER AND COMPANY, LIMITED

A SATISFACTORY PROFIT

The forty-eighth ordinary general meeting of John Barker and Company, Limited, was held, on the 8th instant, at 99-121 Kensington High Street, W.

Mr Trevor A. Bowewn, D.L., J.P., chairman and joint managing director, after paying a tribute to the life and work of the late Sir Sydney Skinner, who was chairman of the company up to the time of his death, said: Having in mind the many difficulties and trading problems which have arisen as a result of the war, the final net profit of £196,897 is satisfactory. I am well aware that there is a drop of £109,765 compared with last year; but you will, I feel sure, agree that we have emerged fairly well.

I am under no illusions with regard to the current year: it may well prove one of the most difficult in the company's experience. It has been well said that difficulties are made to be overcome, and all who serve your interests will do their best.

The difficulties relating to the "Limitation of Supplies" Act will undoubtedly operate in increasing measure during the current year; and already the further restricted quotas (reduced in many cases to as low as 25 and 33½ per cent of our pre-war figures) are being experienced. To this must be added the further burden of the Purchase Tax—16½ per cent in many cases and 33½ per cent in others on the wholesale price of specified goods, so increasing the price to the consumer. These matters are beyond our control. One bright spot, however, is that your board anticipated legislation of this kind and immediately took steps to increase the company's stocks of merchandise.

The final result is a net profit of £196,897, showing a decrease of £109,766. But for the circumstances obtaining during the year it would be a serious decline but you will appreciate why our final net profit has decreased by approximately one-third.

The directors recommend the payment of 10 per cent for the year on the ordinary shares, carrying forward £205,323, or a little more than we brought in.

The report was adopted.

To Overseas Readers

Overseas readers may find that, in the disturbed conditions of wartime, *The Economist* does not reach them quickly enough, or that they require more detailed information on individual markets or special topics than can be compressed within the limited space permitted by the necessity to economise paper.

The attention of our readers is therefore drawn to *The Economist's* Intelligence Branch, which is prepared to meet the need for a rapid and objective appraisal of commodity markets, industrial prospects, political factors and other topics of vital concern to the business man. These special services consist of regular cables or mail reports, or both. They are designed to meet individual requirements and are confidential and exclusive to each client.

Enquiries should be addressed to the

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the five days ended April 5, 1941, total ordinary revenue was £31,849,000, against ordinary expenditure of £38,358,000 and issues to sinking funds of £268,000 (against £5,514,000, not £5,514 as stated, last week). Thus, including sinking fund allocations, the deficit was £56,775,000 against £27,999,000 for the corresponding period a year ago.

REFUGE

ASSURANCE COMPANY LIMITED

Chief Office: Oxford Street, Manchester, 1.

Summary of Directors' Report for the year ended 31st December, 1940.

Total Income for the year, £13,192,498.

Total Assets at end of the year, £74,606,552.

Total Claims Paid in the year, £8,162,981. The Company has paid £133,337,630, in claims since its establishment.

The Total Assurances existing on December 31st, 1940, amounted to £82,055,091 in the Ordinary Branch and £118,099,919 in the Industrial Branch.

Ordinary Branch: Bonus of £1 per cent. for 1939 and 1940 declared on participating policies which become claims during the ensuing year. Surplus carried forward is £1,273,235.

Industrial Branch: £400,000 Profits allocated to Policyholders.

J. WILCOCK HOLGATE,
Chairman.

NOW READY

Published February 27, 1941.

55th Year

Containing detailed and more up-to-date information than any other book of reference

MINING YEAR BOOK 1941

COMPILED BY WALTER E. SKINNER

Price Twenty Shillings net.

Post free (Inland), 20s. 6d. Post free (Abroad), 21s. 6d.
860 pages. In Demy 8vo, bound in RED Cloth.

THE BOOK IS INVALUABLE TO EVERYBODY INTERESTED IN THE MINING INDUSTRY. ITS CONTENTS COMPRISING COMPLETE, UP-TO-DATE AND RELIABLE PARTICULARS CONCERNING 975 OF THE PRINCIPAL MINING COMPANIES OF THE WORLD.

Gold, Silver, Copper, Tin, Lead, Zinc, Diamond, and other Mines, Collieries, Exploration and Mining Finance Companies, arranged in alphabetical order.

PARTICULARS given of each Company include the Directors and other officials; date of establishment; seat of operations; description of property; plant erected or in course of erection; present working results; ore reserves; details of capital; dividends paid; and the financial position as disclosed by the latest accounts. Highest and lowest prices of the shares for the last three years; also latest price.

Directors (2,965) and Mining Engineers and Mine Managers (1,035), and their addresses and names of the Companies with which they are connected.

OBTAINABLE from all Booksellers,
or direct from the Publishers,

WALTER E. SKINNER, 15 Dowgate Hill, London, E.C.4,
AND
"FINANCIAL TIMES," 72 Coleman Street, London, E.C.2.

THE SOUTH AFRICAN JOURNAL OF ECONOMICS

(Published Quarterly for the Council of the Economic Society of South Africa)

Editors:

S. HERBERT FRANKEL R. LESLIE
Joint (Business) Editor: C. S. RICHARDS

Price: Six Shillings.

Approx. 100 pages.

CONTENTS OF VOL. 8, No. 4 DECEMBER, 1940

SPECIAL "WAR" NUMBER
SOME ECONOMIC AND ADMINISTRATIVE ASPECTS OF SOUTH AFRICA'S WAR EFFORT.

Prof. C. S. Richards

PROBLEMS OF RESOURCE TRANSFER IN WAR:

1. THE WAR AND THE BUDGET
J. N. Reedman and P. H. Guénault
2. EXCHANGE POLICY AND IMPORT CONTROL
J. N. Reedman
3. LABOUR SUPPLY
P. H. Guénault
4. PRICE CONTROL IN WARTIME
Prof. H. R. Burrows, I. G. Halliday and R. H. Smith.

THE WAR AND ITS EFFECT ON AGRICULTURAL PRICES AND SURPLUSES IN SOUTH AFRICA.

S. D. Neumark

STATE AND PRIVATE PROVISIONS FOR SOLDIERS' DEPENDANTS
Miss H. P. Pollak

Reviews: Union Official Publications: Recent Periodicals and New Books: Notes and Memoranda.

SINGLE COPIES at 6s. PER COPY. OBTAINABLE FROM THE CENTRAL NEWS AGENCY, LTD., AND ALL LEADING BOOKSELLERS—ORDERS FOR THIS SPECIAL "WAR" NUMBER (APPROX. 130 PAGES) SHOULD BE HANDED IMMEDIATELY TO THE CENTRAL NEWS AGENCY, LTD.

CURRENT STATISTICS

Five Fronts

THE spring campaigns have opened. Before the people of this country lie six grim months during which every resource of Germany's arms and propaganda will be devoted to crushing their resistance. For one more year the problem of Britain is not how to win the war but how not to lose it. Germany still enjoys a great preponderance of manpower and military equipment; the initiative still rests with the German General Staff; the conquest of Europe has put out in all directions from its strong compact defences. Against these advantages, Britain has, so far, only three to set—the promise of American help, the proved superiority of the RAF, and the ubiquity of British seapower. The winter victories have perhaps given the country the feeling of having turned the corner. It is a false feeling. The corner is barely in sight.

Goebbels has promised Great Britain a war on five fronts. Four at least are obvious. There is warfare in the Balkans and in North Africa. The Far East would soon blaze up if the Nazis had their way. The fourth front is, of course, the Battle for Britain, of which the first round was fought last autumn and which is for the time being focused on the Atlantic lifeline. On the other fronts Great Britain can lose battles and even armies. On the Atlantic front, the war itself can be lost.

On the two Near Eastern fronts, Balkan and African, it was doubtful at first which was the main thrust, the drive to Salonika or the sudden appearance of German mechanised columns outside Benghazi. It is now obvious that the North African situation is by far the more serious. While it is of crucial importance that

Britain and its Allies should keep a foothold on the Continent of Europe, the Balkan campaign is necessarily a side-show in the grand strategy of the war. The campaign itself, ultimately victorious or not, has already done its work in disturbing the fields, factories, railways and rivers of the Balkans, which play such an important part in Hitler's supply system. It is perhaps unfortunate that an apparent lack of long-distance bombers has prevented the Allies from doing more widespread damage; but there may be no harvest in Yugoslavia this year, the Jugoslavs have no doubt attended to the installations in their chrome and copper mines, and so long as the Balkan railways are carrying soldiers and equipment to the front, it is unlikely that there will be any great flow of foodstuffs and minerals to Germany.

There is only one guise in which the outcome of the Balkan war will affect non-Balkan countries. If the Germans were to end all resistance in Greece, it would release more men for the pressure campaign against Turkey. But the fate of Turkey probably depends, not on the Balkan war, but on the outcome of the North African battle. Here the threat is not only to Egypt but to the Canal Zone, to Palestine and to the oil lands of the Middle East. It seems clear that the British under-estimated the strength of the force the Germans could land by plane and ship in Libya. Nevertheless, the risk has to be taken if Greece was to be reinforced, and the speed with which the Germans have re-occupied Cyrenaica—with a British loss so far of only 2,000 prisoners—indicates the extent to which, even including the strong garrison at Tobruk, the British forces were reduced.

We have to admit that, given the weight, enterprise

and mobility of the German columns, a further advance is not impossible; but there are factors working against the Germans. Egypt is far more heavily garrisoned than was Cyrenaica, and men and materials have been set free by the collapse in Abyssinia. The British people have become healthily distrustful about the disadvantage to the German army of lengthening its lines of communications and the corresponding advantage gained by the British in shortening theirs. Nevertheless, communications and stores in Libya do present a very difficult problem. Even water must be carried, and while the British are retiring towards their rail-head at Mersa Matruh, the Germans have behind them mile upon mile of desert on which will shortly descend the torrid fury of an African summer.

The main German object is clearly to bring the Balkan and the North African fronts together into one Middle Eastern campaign. The ground has been prepared by the Rashid Ali coup in Iraq, and Syria is full of the same inflammable material of pan-Arabism and anti-Imperialism. To German troops advancing from the Balkans, both Turkey, with its army intact and

still some traces of fighting spirit left, and the impossible terrain of Anatolia would offer serious difficulties. But if the main weight of the attack were coming from Egypt, the Germans might well attempt an air-borne invasion of Syria and Iraq; the conditions prevailing in both countries are far from unfavourable.

The Far Eastern front is probably not so menacing as the Germans would have their enemies believe. If fear of Russia had been the operative factor in discouraging Japan from bringing its conception of a "sphere of co-prosperity" into the firing-line, then the Pact with Russia might have been the prelude to warfare. But it is British reinforcements at Singapore, the potential combination of British, Dutch, Australian and United States Pacific navies, and Japan's great economic dependence upon the United States that were, and still are, the real deterrents. It is difficult to see how the new Pact can affect any of these factors. However, if the new agreement is not a signal for war, it is a signal for a war of nerves. If Japan, by threatening a southward advance, can draw off vital British reserves and keep the United States preoccupied. Germany's purpose is served, and to this extent the Nazis are justified in claiming the Pact as a success for their diplomacy.

It is on the fourth front—the front of Britain and the Atlantic approaches—that a really decisive struggle is already joined. The factors favourable to Germany are obvious enough—control of air and submarine bases from Narvik to Bordeaux, the great strain on Britain's naval resources compared with the last war, in which Japan was an ally and the French navy was in the fight to the end, and the changed naval tactics of the Germans, who in this war are using their ships as commerce raiders and concentrating on combined bomber-submarine operations.

Against this can be set the help of the United States. Recently ten armed cutters were released for British use. More ships are to follow. Again, the decision to open the Red Sea to American shipping and the President's readiness to protect American merchant ships, will set free both tonnage and naval resources for the Atlantic route. Nevertheless, the whole situation remains extremely grave, and it is here that each citizen is a front-line fighter in the war against waste and extravagance. The home, or invasion, front is in all probability a function of the Atlantic struggle. The time to invade this country is after a campaign against its lifelines so successful that a starving and demoralised people is almost ready to sue for peace. In the same way, the bombing attacks on this country, which are now to a large extent directed systematically against the ports, are part of the attempt to destroy Britain's communications and vital imports. It is impossible to separate the Battle of Britain from the Battle of the Atlantic. Invasion is only a later stage in a campaign upon which Germany is already engaged.

If the threat of invasion does not constitute a separate front, we are left with the fifth front unallotted. Here, as in the Far East, it is only a question of potential fronts, and of these perhaps Gibraltar is the most likely. A move through Spain, coupled with an enforcement of Germany's existing control in Morocco, could have the effect of closing the Mediterranean and of completing Germany's conquest of the whole "arc" round Great Britain. Submarines and aircraft might then operate from bases as far out in the Atlantic as Dakar. Convoys coming from Australasia would be under Axis fire all up the coast of Africa. The Atlantic lifelines would be threatened from a new quarter. Unless the United States abandoned the policy of "combat zones," all direct contact between the Old and New Worlds would disappear.

It would be hard to believe that Hitler had overlooked so tempting an objective, and there are signs, especially in French and Spanish Morocco, that his plans are maturing fast. The German Disarmament Commission, acting in close co-operation with Darlan, is rapidly demobilising the army and undermining the authority of General Nogues and General Weygand. Its underground activities—support of the Moroccan Unity Party and of a rival claimant to the Sultanate—are creating a situation ripe for intervention and "protection." Germany's recent successes in Libya can only have strengthened the German position further west.

These, then, are the fronts on which the Nazis will wage deadly warfare throughout the coming summer. Their aim is to cut Great Britain off from its American sources of supply and to break British sea-power in the Atlantic, in the Mediterranean and the Far East. It is no coincidence that each of the fronts is aimed at straits or narrows where sea-power has least effect.—Dover, Gibraltar, the Dardanelles, Suez, Singapore. But of all these, it is on the Atlantic front that Britain must stake everything it has. Survival here is the essential preliminary to victory anywhere else. As Mr Churchill put it in the stirring peroration to his survey of the war delivered to the House last week:—

Once we have gained the Battle of the Atlantic and are certain of the constant flow of American supplies which has been prepared for us, then, however far Hitler may go or whatever new millions or scores of millions he may lap in misery, it is sure that, armed with the sword of retributive justice, we shall be on his track.

Evacuation and War Work

TO-DAY young women aged 20 are to create history by registering for national service, to be shortly followed by those aged 21. Now that Mr Bevin has successfully launched his man-power scheme and national registration of both men and women for employment in essential undertakings is under way, there is an opportunity to examine the position of evacuees. Official evacuation policy has throughout related only to certain priority classes of the population: to children of, or below, school age, accompanied or unaccompanied by their mothers; to the old and infirm; and to pregnant mothers. During last winter, however, and indeed until very recent weeks, advice and encouragement were devoted to an attempt to persuade all persons without essential ties to move out of the danger areas. A very considerable number did voluntarily remove themselves and, in many cases, children were accompanied by their mothers.

This policy has been materially affected by Mr Bevin's decision to set on foot the national registration of women for war work and to call upon all able-bodied citizens to volunteer for essential employment before their age groups are reached. The problem is no longer one of prevailing on unoccupied persons to live in districts where their presence does not impede the prosecution of the war: it is to eliminate the drones from society.

Most of the other problems of evacuation, chiefly social ones, have been discussed almost *ad nauseam*. Recently, the social and organisational problems were ably analysed in a report presented to the Minister of Health by a Committee under the chairmanship of Mr Geoffrey Shakespeare, M.P., and its recommendations were based upon considerable empirical evidence. Indeed, by now, such problems as the failure to provide cooking facilities, the London mother's partiality for fish and chips, the unpatriotic withholding of large mansions from billeting officers by a small number of wealthy people, and the strain upon the drains and sewers—all these have become almost commonplaces, and are receiving attention. The question which has not received much less attention, but which is certainly no less important, is that of how many evacuated persons have been removed from areas in which they had work into areas where they are not only unable to get work, but even need allowances to keep them.

It is true that priority classes recognised as suitable for evacuation include a majority for whom gainful employment is not possible, but the problem of work arises acutely in the case of mothers who accompany young children and children who have reached the school-leaving age. A very high proportion of working-class mothers normally continue to perform some type of money-earning service when their children are still quite young; and there is every reason to suppose that the nation is the poorer now for what is too often their enforced idleness in the country. The signatories of the Shakespeare Report appreciated this point from the social angle. "There is little doubt that regular work will do more than anything else to help the evacuated mother to settle down."

In addition, there are the unofficial evacuees known to the popular Press as "the good-time girls." In so far as the "girls" are outside the age groups so far affected by registration, insistent propaganda is needed to point out that their evacuation has no virtue and that their duty probably awaits them in some danger area. The fact is that the problems arising out of the evacuation of able-bodied adults are not easy to solve in isolation. If, however, they are considered in relation to another important redistribution of the population which is only

just beginning to gather force—that is, the mobilisation of additional workers to produce munitions—evacuation could be made considerably more profitable to the nation, in terms of labour, than it is now. The two movements are, in a sense, complementary. Mr Bevin's man-power scheme will require the transfer of workers from "safe" areas to "dangerous" areas. These transfers will leave many vacancies for small gardeners, domestic helps of all sorts, shop assistants and clerical workers in the areas where the evacuees have been received; and to consider evacuation and industrial mobilisation in separation, leaving their dovetailing to private initiative, may be needlessly wasteful. Labour—perhaps casual and part-time labour, but none the less labour—has been set free by the evacuation; and, as British labour as a whole becomes more fully mobilised, sound opportunities for the occupation of evacuees must occur.

But there is more than a problem of employment to be solved—for the evacuees themselves and for the whole community. The supply problems raised by sudden multiplication of the populations of smaller towns and villages are perhaps even harder to solve. One difficulty is the unstable nature of the swollen population. After a provincial town has been badly bombed, the neighbouring safe areas will be crowded out for a short time with a refugee population of daily workers who will travel up and down to work—if they can find any accommodation—until discomfort or a sense of returning security encourages them to brave the risks of the danger area again. It is clearly a matter of extreme difficulty to adapt the quotas of retailers' supplies to these very temporary shifts in the number of consumers to be served; and it is even a matter of some doubt whether this adjustment should be attempted at all. The relative plenty which, in bombed districts, may result from the temporary departure of residents is one of the few attractions to those sections of the population who are required to carry on in the national interest. On the other hand, something has to be done to bring supplies to "permanent" refugees; and it does seem likely that the adjustment of quotas to the presence of "permanents" has not been carried sufficiently far, since they are frequently discouraged and unsettled by local shortages.

The most fundamental question raised by evacuation is whether the balance of advantage, in dispersal and safety, outweighs the social friction and economic loss; and, on this point, it is even more difficult to give an unequivocal answer. As far as children and aged people are concerned, there is no doubt at all that evacuation is essential. Whether the evacuation of young able-bodied mothers is repaying either to them or to their country is much less certain. In so far as they are condemned to spend their days in homesick idleness, there seem to be strong grounds for believing that they would be better off at work somewhere, in some capacity, supposing that adequate care could be provided for their unaccompanied children. The matter is an individual and personal one, and there can be no cut and dried solution, the more so since Mr Bevin has very rightly decided that the mothers of small children are the last people who will be pressed into the factories. Much can be done by co-ordinating the solution to this problem with the general scheme for the productive use of all able-bodied men and women. No kind of evacuation should be allowed to cloak the responsibility of every citizen to labour for the cause; and it will be mere common-sense to bring them, with every sort of idler or wastefully employed person—dependent or independent—into the mobilisation scheme.

The New Order

HITLER occupied his first country in 1933. Germany fell to its Nazi conquerors and became the first field of experiment for Nazi economics. As we now know, their purpose was to create the greatest military machine of all time by subordinating all the processes of the community to the one purpose of creating the implements of war. The name coined for the new economy, *Wehrwirtschaft*, was a euphemism for the process of forging a ruthless instrument of aggressive power.

We are familiar with the methods. In the Labour Corps and in the fatigues of the concentration camp, forced labour returned. With the destruction of the Trade Unions went the workers' whole means of resistance and betterment. Longer hours were worked for smaller wages. The capitalist lost his substance through levies and taxes, or, in the case of political opponents and non-Aryans, by direct confiscation. And the whole community's reserves and savings were drawn into the armaments drive by the disappearance of many varieties of consumer goods and strict rationing of the others. Since nothing could be bought with the surplus, the citizen felt little compunction in lending his savings to the State. Even so, many loans were compulsory. A similar process was at work in Germany's pre-war foreign trade with weaker trading partners. The classic example is the Balkan market, from which Germany drained away real wealth—foodstuffs, raw materials—and settled the balance in unessential manufactures and obsolete arms.

It is the great merit of two or three recent and very valuable surveys* of conditions under the Nazis that they bring home the fact that "new order" is *Wehrwirtschaft* writ large. As Mr Wilson puts it, "The one and only German 'New Order' was born in 1933." Most of the methods are essentially the same. Forced labour has brought some two million workers from occupied territory into the Reich. Their status varies from the conditions of slavery endured by the Poles to the more privileged Dutch and Danish and Norwegian workers who appear to receive German rates of pay. Nevertheless, compulsion has almost invariably brought about the transfer, whether it is the direct registration for public works enforced in Poland and to a lesser extent in Czechoslovakia, or the fact that a worker's foodcard will depend upon his readiness to go to the Reich. Again, even when workers are not transferred from their own country, standards are deteriorating everywhere. Wages have been reduced in Norway by as much as 20 per cent, and a German newspaper stated quite frankly that in Denmark "the relation between living costs and wages which had been achieved by the Trade Unions has been abolished."

Exploitation by taxes, levies, forced loans and rationing is far more elaborate. Even the boldest outline of the methods employed by the Nazis gives an astonishing picture of the looters' ingenuity and science. There is, of course, direct confiscation at the expense of individuals—Jews, refugees, political suspects. In Holland this last category is generous enough, since it covers all who "have promoted, are promoting, or are likely to promote tendencies hostile to Germany." The confiscation of State property may well have been more rewarding. In Poland alone £600 million worth of ports, forests, and steel works have been swallowed up. The seizure of the gold and foreign exchange in occupied territory is another important item. Gold and State property alone must

amount to over £1,000 millions, total confiscations to thousands of millions more.

To confiscation must be added costs of occupation, taxes, forced loans and other expedients to the total of some £1,000 millions annually, and the various inflationary measures which have enabled Germany to cover a policy of straightforward plunder with a cloak of normal marketing. The old Balkan method has drained fats and grain and livestock and minerals from every occupied territory into the Reich, and to-day Germany is under an even lighter obligation than formerly to liquidate her debit balances. It is no longer even a question of mouth organs and aspirin. Payment can be made in devalued currency, or in German bonds, illusory claims on an equally illusory future.

Thus the methods of the "new order" are only the extension in space of the methods already perfected under *Wehrwirtschaft*. Nor is the immediate purpose of the "new order" very different from that of the old *Wehrwirtschaft*. The Nazis' aim is to keep intact the great German military machine; in other words, to gain the victory. It is a grim fact that Europe to-day is working to perpetuate its own enslavement and its contribution is anything but negligible. "Between a quarter and a sixth of the war effort being made and to be made against the Allies by Germany is probably the result of her conquests" and her current exploitation of them.

Beyond the immediate objective of a German victory, however, the shape of a permanent organisation of Europe is discernible. Just as *Wehrwirtschaft* was designed in the first place to ensure military power but at the same time to create the institutions and social pattern of the Nazi dictatorship, so the "new order" is not only a weapon for victory but a ground plan for a post-war organization in which the old hierarchy of exploitation will be preserved. The Germans are to be to Europe what the Nazis have already been to the Germans, a minority to whose interests the masses are ruthlessly subordinated.

The chief feature of the "new order" is the concentration of the Continent's industrial power inside the Reich. Of the principal industrial regions in Europe (excluding Great Britain and Russia) only Holland, Belgium, the Lyon zone in France, and Northern Italy lie outside the area already completely annexed to Germany, whose population includes 43 per cent of the Continent's industrial workers and only 19 per cent of the agriculturists. In the remainder of Continental Europe (excluding Russia) only 23 per cent of the population are engaged in industry, against 53 per cent in agriculture.

Germany's reasons are obvious enough. Average productivity per head—and therefore average income per head—is 60 to 100 per cent greater in industry than in agriculture, and a monopoly of heavy industry is also the best guarantee of a military dictatorship. Finally, with a monopoly of industrial output, the Nazis should be able to reduce the agricultural fringe of Europe to the level of colonial exploitation, fixing conditions of trade in the manner most advantageous to themselves, while their unified control of the Continent would put them into the strongest possible bargaining position with the outside world.

The realization of this grandiose plan of imperialism and servitude depends obviously on the outcome of the war. But even if it achieves its immediate objective of victory, the "new order" clearly has in it the seeds of perpetual conflict, wars without end. Europe itself would be unable to resist, short of a grand apostasy among the *Herrenvolk*. The creation of a fringe of agricultural states holds for the people of France, of Italy, above all of the South East,

a future of destitution in which there is no outlet in industry for the steady increase in population. And revolt does not spring from destitute peoples without arms.

It is in the wider sphere of Germany's relations with the outside world that the possibilities of conflict are legion. It may be argued that the resources of German Europe will be sufficient to maintain the master race in comfort and the subject peoples in working fettle. This is in itself doubtful. Many vital raw materials—among them oil—are not available in sufficient quantity, and Europe is only barely self-supporting in foodstuffs. For example, if dairy farming is to be restored on a large scale the fodder problem cannot be solved on a European basis alone. The Nazis, even if they content themselves with a moderate policy of sufficiency, will have to compete outside Europe for the supplies of the world. And there is nothing in their past history to suggest that moderation will content them for long.

Even if the most favourable outcome of this war from the German standpoint can be assumed, German Europe would be faced with the competition of the great industrial machines of the United States and Japan and the growing industrialism of Russia. The United States would not remain passive while the

Nazis proceeded to the economic conquest of the Latin American States, whose need to dispose of surpluses of raw materials would give the Nazis an admirable bargaining counter. Germany's future relations with Russia and Japan would be equally hazardous. However far the Germans were to degrade the standards of Europe, it is doubtful if they could compete with the low labour costs of Soviet Russia and the Far East.

It seems, then, that if German Europe is to function as a world dominating force it must ultimately swallow its more distant neighbours as it has already swallowed its immediate competitors in Europe. And here again there is evidence that "new order" is only *Wehrwirtschaft* on an ampler scale. *Wehrwirtschaft* led inevitably to war, since the absorption of the vital supplies of the German people into armaments entailed the necessity of recouping the loss of these supplies at the expense of weaker States. But the conquest of Europe has not restored the equilibrium. Germany's war machine must still be fuelled and now the forays must be directed towards a wider ring of neighbours. This, then, even given a German victory or an Anglo-German truce, is the future of warfare to which Hitler has dedicated the German people.

NOTES OF THE WEEK

The Battle for Egypt

Imperial troops conquered Cyrenaica in two months. The Germans retook it in about ten days. At first glance this appears to be a tremendous indictment of British dilatoriness or else an equally tremendous tribute to German drive and efficiency. The time taken is less significant than the number of prisoners captured. During the British advance 150,000 Italians fell to the advancing army. The Germans have captured only 2,000. In other words, the British advance was resisted by a

powerful army, whereas the Germans had only to face small garrisons and light covering troops. In spite of the original speed of the advance, there are signs that it is slowing down. Fighting still continues in the Sollum area, although it appears likely that the main British stand will be made round Mersa Matruh, where there is good water and a defence system 60 miles deep. The advantage of choosing a line so far back in Egypt is, of course, that the maximum strain will be put on the German lines of communication and the German commissariat will be faced with a maximum problem in the bringing up of vital supplies such as petrol and water. German reinforcements have first to negotiate the sea passage from Europe to Libya, and although much has undoubtedly slipped through, the sensational sinking on April 15th of a whole convoy—of 5 supply ships and 3 destroyers—with the loss to the British Navy of only one destroyer is a reminder of the hazards German convoys must run. When landed, the supplies must be brought up over bad roads and waterless desert, under the constant threat of air attack and, as the news from Sollum shows, of bombardment from the sea. It may be part of the British plan to hold Tobruk in force, reinforcing and re-equipping it from the sea. If such a stand were possible it would certainly have an inhibiting effect upon German strategy in the forward zone, and a few well-executed sorties might cause those in charge of reserves and reinforcements considerable embarrassment. Reports that German troops and

light tanks have been landed by plane at Kufra, in preparation for a drive against Khartoum or the Assuan Dam, are in keeping with previous evidence of Germany's ingenuity and audacity, and it is fortunate that complete collapse in Abyssinia has come in time to permit the despatch of reinforcements to the Sudan and to the battlefield in northern Egypt. The Duke of Aosta has at last sent a delegate to arrange the terms of his surrender. The diversion of men and materials to other fronts can therefore begin at once.

* * *

The Balkan Front

The news from the Balkans is as confused as the battle that is raging there. In Yugoslavia, organised resistance has ceased, although fighting will probably still continue in the mountains of Bosnia, Montenegro and South Serbia. There has been no official capitulation. It is rather that the German Army's deep thrusts to Sarajevo, Skopje and the Albanian frontier divided the Yugoslav forces and destroyed all communication between them. The Yugoslavs have fought bravely, and for some days the enemy was held beyond Nis and Skopje, but their courage was no match for Germany's weight of machines. The campaign as a whole is yet another illustration of the tragic insufficiency of small Power defences among the industrialised Titans of the modern world. Germany's plans for Yugoslavia are already taking shape. An "independent" Croatia has been set up under the anti-Serb Ustasi terrorist, Dr Ante Pavelitch. Dalmatia will probably be given to Italy, and there is talk of an independent Montenegro. The Hungarians are claiming the Novisad area, the Bulgarians have broken off diplomatic relations as a prelude no doubt to claiming Serbian Macedonia. Those who argue that the Yugoslavs could have purchased territorial integrity by submission forget the fate of Czechoslovakia and Rumania, both quiescent and both dismembered. Further south, on the Greek front, the Germans are gradually pushing back the Anglo-Greek forces, but resistance is strong and the defenders are taking a heavy toll of the invading army.

* * *

The Shopkeeper Army

It now appears, from the speech of the Parliamentary Secretary to the Board of Trade in the Commons last week, that the Government has no intention at

* *Europe Under Hitler*. The Royal Institute of International Affairs (Oxford University Press. 6d.). *Germany's "New Order"*. Duncan Wilson. (O.U.P. 8d.) *Hitler's "New Order" in Europe*. Paul Einzig. (Macmillan. 7s. 6d.)

present of organising the "slimming" of retail distribution. Captain Waterhouse spoke in familiar accents: "The Board of Trade is prepared to lead, but it cannot lead along a path for which the country is not ready"; the necessity has not yet arisen. He admitted that the limitation of supplies to retailers was now making inroads on their turnover. He suggested that many small shopkeepers, unable to raise prices to cover their losses, might sell out, invest the proceeds in Government securities and go into war work; and he admitted that it would be possible for groups of larger stores to concentrate their businesses in one set of premises—just as it would be possible, in fact, for groups of quite small shops, butchers, bakers, dairies, grocers and so on, serving the same narrow locality, to do the same. But the Government could take no responsibility either for individual hardship or for the way in which retail trade adjusted itself to the straitened circumstances. Here, as in the case of industry (wholly for a long time and partially still) the Government has no single policy on the concentration of activities and the complementary problem of compensation taken together. It is, of course, true that retail trade is very different from the industries to be telescoped under Government supervision. But the wartime need to set free the largest possible proportion of its millions of workers is especially pressing in the case of retailing—which is peculiarly divided, with great sharpness, between the essential task of furnishing necessities and the otiose function of providing goods and services which could well be spared. There is a notable pool of labour for war work in the retail trades, and the Government's policy, which looks at this problem simply as a question of material supplies, and not of labour, is simply to let retailing shrink haphazard without reference to the numbers of workers set free; indeed, the Schedule of Reserved Occupations for women, together with official utterances about the role of shop assistants in national morale, suggest that the maintenance of as much employment as possible in retailing is regarded as desirable. This is dangerous, slipshod doctrine. The plea of Mr. Butcher in the Commons that to shut down the chain stores would release more labour and floor space for the war effort than any other means may or may not be correct. But this approach is the right one. The purpose of cutting down non-essential occupations is to release all forms of resources for the war, not simply materials; and when the Government regards this problem in retail trade—as they did the parallel problem in industry for over six months—as one merely of thinning the flow of supplies, it is entirely overlooked that the material of which there is now most need is man power.

* * *

Waiting for Mr Bevin

Last week's Budget was a prologue. It remains, not only to collect the cash, but to stabilise prices—and eke out fairly, by physical and financial means, the "ration" of consumption that is to be allowed. The price of labour is wages. Between October, 1938, and July, 1940, according to the Ministry of Labour, wage rates rose 10 per cent on the average, but earnings rose 30 per cent, and according to the White Paper published last week the national wages bill (including military pay, which is generally lower than civilian earnings) was 36 per cent higher in 1940 than it was in 1938. The advance is uneven. While financial and budgetary stability is menaced by this swelling tide of purchasing power, when the supply of goods to purchase is dwindling, there are low-paid and ill-organised workers, people with fixed incomes, various classes of State-helped dependents, and households of many children who have fared quite otherwise; and it is probably a pity that the one item of the so-called Keynes plan, which found no echo in Sir Kingsley Wood's Budget, was family allowances. Mr. Bevin has gone on record as saying that he does not care what workers earn so long as they do the job. Under the Essential Work Orders, which prevent workers from being dismissed or retiring, in return for a guaranteed minimum weekly wage, they may be paid whether they are working or not—if the dock is empty, the pit idle or work in the shipyard held up. There will be no dissent from the principle that if a man is forbidden to withhold his labour he should be assured fair pay; and the application of the Order to, say, protected Government contractors will stop the poaching that still goes on. But the need for a comprehensive wages policy is even more urgent than it was.

Direct Taxation

The full implications of a ten shilling income tax are only slowly dawning on the taxpaying public. Sir Kingsley Wood mentioned in his Budget speech the remarkable fact that to enjoy a net income of £5,000 a year a gross income of £66,000 is required. Study of the tables of incidence published in the Financial Statement shows that, in effect, a maximum limit to net income has been imposed. To secure a net income of £2,000 needs a gross income of rather over £4,000 (the exact excess depending on the personal circumstances of the taxpayer); in 1937-38 there were about 35,000 incomes of this or larger amount. A net income of £3,000 requires a gross income of about £9,000—there are less than 10,000 people who can reach this level. The next step, to a net income of £4,000, requires a gross income of almost £30,000, of which there are only about 1,000. Out of a gross income of £100,000, rather less than £6,000 is left, while the rise to £150,000 gross contributes only £1,150 net. The upshot of these figures is that there is an effective limit to net income at about £4,000 per annum; only a few hundred persons can penetrate above this limit and the highest net income in the country cannot be more than about £7,000. (Moreover, if the income comes from investment, any provision for death duties must come out of "net" income.) The enactment of an "income ceiling" as a matter of principle might have aroused opposition, just as "deferred pay" did; Sir Kingsley Wood has very ingeniously secured both by pretending not to. Some figures given in answer to a question in the House of Commons last week illustrate the sections of the population from which the increased revenue is being drawn:—

Ranges of Income	No. of taxpayers	Yield in a Full Year of this year's increases in Income Tax	Average per taxpayer
£.		(£ million)	£
110-1,000	7,500,000	162	21.6
1,000-5,000	275,000	45	163
Over 5,000	25,000	24	960
Non-personal income	—	22	—

One of the minor mysteries of the Budget is the fate of the proposal to reduce the exemption limit for surtax from £2,000 to £1,500. It is true that Lord Simon described his proposal last year as an enabling measure only. But the language of the Finance (No. 1) Act, 1940, was mandatory: "Tax shall be charged . . . at such higher rates in respect of the excess over £1,500 as Parliament may hereafter determine." This seemed to be clear enough. But Sir Kingsley Wood made no mention of the matter in his speech and, though certainty must await the publication of the Finance Bill, it is understood that no surtax will be charged on the slice of income between £1,500 and £2,000 this year—in other words, the rate that "Parliament shall prescribe" is *nil*. This is a curious episode, and it is to be hoped that the Chancellor will explain his motives in the course of the debates.

* * *

The Russo-Japanese Pact

Japan has been angling for a Russo-Japanese Pact for about a year, and the possibility of an understanding was canvassed even earlier. The problem is why Russia chose this particular moment to sign a Treaty of Friendship and Neutrality. True, the Germans worked hard all through the winter to secure some such understanding, and went so far as to speak of Russia joining the Tripartite Pact and sharing in the "common task of world leadership." But blandishments and persuasion had little effect and it is possible that in their desire to see Japan's hands freed in the Far East the Germans tried the effect of a little coercion on the unwilling Kremlin. A spate of rumours, undoubtedly from Axis sources, flooded Europe with the tale that the turn of the Ukraine would come next, and the rumours were accompanied by provocative German troop movements. These moves appear to have had the desired effect. The Russian Government, determined to secure its Far Eastern frontier, was ready to negotiate on Mr Matsuoka's return to Moscow, and the Pact is the result. To this extent it must be recognised as a success for German diplomacy, even if the troubling of relations with Russia was a greater price than the Nazis would have preferred to pay. Yet the Pact does not by any means fulfil Germany's earlier expectations. There is

no question of co-operation with the "Triangle" Powers. Russia's neutrality is guaranteed only if Japan is attacked, and by no conceivable stretch of the imagination can it be supposed that Japan will be attacked. And Japan's guarantee of neutrality would be hard to square with the provisions of the Tripartite Pact if Russia and Germany were to be involved in war with each other. More significant than the Pact was perhaps the joint statement in which Russia recognised the *status quo* in Manchuria and Japan that in Outer Mongolia. This suggests that both states are ready to cut their losses in a long-disputed zone. It may suggest that Stalin's enthusiasm for the cause of Free China is finally extinguished.

* * *

Rearmament Organisation in America

The administrative framework within which the gigantic American armament programme is to be managed is beginning to take shape. The President cannot divest himself of his constitutional responsibilities for the whole executive branch of the Government, but there are many critics who believe he could carry the process of delegation somewhat further, and it is inevitable that as the problems and the details multiply an increasing degree of sub-division should be necessary. Something of the nature of a "War Cabinet" is already in being in the frequent conferences of the President with the Secretaries of State, of the Treasury, of War and of the Navy and with Mr Harry Hopkins, who has just been placed in charge of the supply of materials to foreign countries under the Lease-and-Lend Act. Production is in charge of the Office for Production Management which, in effect, consists of Mr William Knudsen and Mr Sidney Hillman, symbolising in their persons the alliance of Capital and Labour. The OPM has three main divisions—Production, which is Mr Knudsen's specific province; Purchasing, under Mr Donald Nelson, and Priorities, under Mr Edward Stettinius. A fourth P—Prices—can be said to have been added by the appointment last week of Mr Leon Henderson to be head of a new Office of Price Administration and Civilian Supply. The skeleton of a war economy is thus in existence. Hitherto, even decisions on priority and prices have been taken by agreement and it remains to be seen whether any more compulsory powers can be used in conditions that are still "short of war." Mr Hopkins' appointment to administer the Lease-and-Lend Act brings to an end the functions that Mr Morgenthau, the Secretary of the Treasury, has hitherto exercised as the main channel of communication between the various British purchasing missions and the United States Government. Mr Morgenthau has been a real friend to the common cause for which Britain is fighting and America is arming, and if he is now to hand over these functions it is reassuring that his successor is not only very close to the President and well-known for his energy, but is also fresh from a visit to London.

* * *

Atlantic Casualties

In future, merchant shipping losses will be announced monthly, probably towards the middle of the following month. There is no desire on the part of the authorities to conceal sinkings. They will still be published; and the monthly method will very largely avoid the difficulty of weekly announcements which for some time has been that, for lack of speedy information about the fate of ships, the original figures have frequently had to be drastically revised—usually upwards. Actually, of course, this difficulty could equally well have been avoided by merely delaying the weekly announcements by a week or fortnight; and it is hard to resist the impression that this is a somewhat unfortunate moment to change from weekly to monthly publication. The official explanation is twofold: first, that weekly figures give a distorted view—too optimistic if small and too pessimistic if large—of what is happening; and, secondly, that the collection of the figures in a single monthly total will foil the efforts of the enemy's intelligence to deduce what ships have been sunk and where. The first point is perhaps a trifle specious. The comparison of weekly figures over a period need not give a distorted view; rather the reverse. The information that the public wants—if it is politic to give it—is the course of events, because upon the flow of imports, week by week and day by day, the scale and continuity of the war effort depend—more even than upon the total of

tonnage at the Allies' disposal or of tonnage building in the world's yards. If the weekly figures have been misinterpreted, it has been because of their incompleteness, owing to being given out too soon, and, no less, because of the way in which they have been presented. Complete and intelligently commented upon, weekly figures can give a true picture. On the second point, the experts must, of course, have the last word. The desire to give full information to the public must give way to the need not to give any useful information to the enemy. But, if weekly announcements are "careless talk" now, they have been so all along, and it is not perhaps the happiest of coincidences that this change should have had to be made at a time when weekly losses have been running so high.

* * *

On the Busy Banks of Clyde

The Government scheme for dock labour, already in operation in a similar form on the Mersey, has not been accepted by the Glasgow dockers. But they are giving it a trial. Last week a ballot of the dockers confirmed the refusal of earlier meetings to admit the need for decasualisation to speed up the turn-round of ships. This week, however, having made their distaste plain, the dockers have signed on almost *en masse*, and fears that there might be a dispute, and even a stoppage of work, have been quite removed. The frankness of the Glasgow dockers has been matched by their loyalty, and it is only fair to recognise that their opposition to being taken into regular employment by the Ministry of Transport was not mere obstruction. Their belief was—and is—that the dock work of Clydeside could quite well be done under the old system of casual hirings and irregular employment; and it has been noticed this week that, so far, there has not in fact been sufficient work for all those who have signed on. On the other hand, all the men who have registered have received the minimum weekly pay which is now guaranteed, whether they have had jobs to do or not; and whatever the attractions may be—in busy times like these—of the freer and less regular ways that are traditional on the Clyde, the advantages of this measure of security will not be unnoticed. In brief, the dockers have decided to do nothing to hinder the war effort at what is probably its most vulnerable point. The scheme is to be tried for three months; and all the parties concerned—the Scottish Transport and General Workers' Union, the Ministries of Labour and Transport and the dockers themselves—are to be congratulated on an arrangement which will make it possible to find out whether, as Mr Bevin claims, the loading and unloading of ships can be speeded-up by a third or more. It certainly behoves the directors and staffs of more inland forms of transport, with the Government, to see that nothing in their sphere nullifies the degree of acceleration that may now be achieved at the ports.

* * *

Peace Aims

Complaint has been made in some partisan quarters that the Prime Minister should spend his time in these critical days discussing the amendment of the Trade Disputes and Trades Union Act of 1927 with the TUC. This surely is for Mr Churchill to decide. It is a fact, of course, that these discussions must necessarily be some-

what unreal just now. The 1927 Act, passed after the failure of the General Strike, is a burning grievance, and various attempts have been made, since mobilisation for war made the co-operation of labour imperative, to use amendment of the Act as a bargaining counter. By outlawing "sympathetic" strikes it seemed to stigmatise the movement of 1926 as "unconstitutional"; by substituting "contracting in" for "contracting out" in the payment of political levies, it placed apathy and inertia on the side of non-participation; and by restraints on picketing it restricted the technique of striking. But it was the prestige of the unions far more than the status of unionism that was affected. Since 1927 the abhorred Act has not in fact been burdensome on the unions; and in latter years they have flourished as never before. Now, in wartime, striking cannot be encouraged. Whether or not it is actually forbidden in essential work is not quite clear, though it is plainly laid down that disputes must be settled by arbitration if collective bargaining fails; the basic right of workers to withhold their labour is being widely withdrawn. The case for discussing the Act now is really that, as Mr Churchill said the other day, it will be a point of honour to reinstate free unionism after the emergency passes, and it is thus a peace aim, and not an aspect of war policy, that the Prime Minister has been talking over with the TUC.

* * *

Those who Live in Glass Houses

Following hard upon the assumption of the Hungarian premiership by the former Minister for Foreign Affairs, M. Barcza, came the news that Hungary, presumably at German instigation, had launched an attack upon her hard-pressed neighbour, Yugoslavia. In true Axis tradition, the first Hungarian war communiqué was published on Good Friday, and it was succeeded by official announcements that Hungarian troops occupied the region between the Danube and the Tisza on Saturday and had advanced as far as Novisad on Sunday last. From the Axis standpoint the Soviet rebuke administered by the Deputy Commissar for Foreign Affairs, M. Vishinsky, to the Hungarian Minister, simultaneously with the conclusion of the Russo-Japanese Neutrality Pact, is, for the moment, the only fly in the ointment. For the rest, the technique applied to the dimemberment of Czechoslovakia has been closely followed. Croatia is to form a "quising" state, similar to Slovakia, and Hungary once more receives her portion. Yet the form of the Russian rebuke contains a salutary warning that Hungary is the last nation that can afford to exploit the difficulties inherent in the government of minorities, "since in Hungary there are also substantial national minorities." This treacherous incursion, coming, as it does, only four months after the conclusion of a Pact of Friendship with Yugoslavia, will have fatal long-term results, not only for Hungary but for the peace of Central Europe as a whole. Hungary, like Bulgaria, has once more put herself out of court as far as the reconsideration of her irredentist claims are concerned. For more than twenty years peaceful co-operation of the States within central and south-eastern Europe has split on the rock of Hungarian grievances. By this ill-judged action, consideration of Hungary's claims, in the event of an Allied victory, must become infinitely remote, and public respect for her propagandists an increasingly rare phenomenon.

* * *

Conscientious Objectors—New Position

There are, at present, two classes of conscientious objectors recognised by law: those who object to being registered in the military service register; and those who object to performing military service. Presumably in accordance with which of these grounds is claimed and established, the tribunal can have the objector registered unconditionally as a conscientious objector or conditionally—the condition in the latter case being that, during the war, he must undertake work (specified by the tribunal) of a civil character and under civilian control. If a man objects to performing combatant duties, he is registered for non-combatant duties in military service, but is not registered as a conscientious objector. Under the new National Service Bill, however, anyone who has come, or will come, into this third category will in future be registered as a conscientious objector. Also under the new Bill, persons granted conditional exemption become liable to be called up for the

civil defence services—with the exception of the police war reserve, who may have to carry arms. In a great number of cases this will accord with the wishes of the objectors, whose trouble has frequently been the unwillingness of local authorities to employ them for civil defence, in flagrant contradiction of the expressed directions of the tribunal. For some objectors, however, the new legislation will mean great misery. Not a few conscientious objectors are emotionally unstable, and their claim to conscientious objection is really an attempt—a perfectly honest attempt—to rationalise a profound emotional objection to the horrors of war. Putting people like this into civil defence, where they may see far worse horrors than they might on the battlefield, may cause them acute mental distress. Moreover, some of those objectors who were granted exemption on condition that they remained at their jobs were content then not to appeal for unconditional exemption—which they might possibly have got. Now it is too late for them to appeal, and they find themselves faced with the possibility of being transferred from their jobs to do work which they may, conscientiously, consider too much akin to military service for them to perform it. Obviously, conscientious objection is an individual matter, and it is impossible to legislate for individuals. But it is to be hoped that in the administration of the new Bill sufficient leniency will be shown to prevent people from being put into work for which they are constitutionally unsuitable and where they would merely prove a nuisance to themselves and others.

* * *

No Consciences for Women

Somewhat illogically, it has been decided by Mr Bevin, and accepted without protest, that women shall not claim exemption from registration for war work on the grounds of conscientious objection. Since women have never been called upon to take life, the prime motive of conscientious objection does not arise in their case. But from a refusal to take life men are allowed to proceed to the opinion that war, which necessitates the taking of life, is unjustifiable and to have their claim not to help the war effort, either directly or indirectly, recognised at law. Women, on the other hand, are in much the same position as the conscientious objector registered for non-combatant duties; they can be conscripted for the women's branches of the fighting services or for work in a munitions factory. Yet, although the prime motive is lacking, there is no reason why women should not regard war with the same repugnance as the "absolute," or unconditional, conscientious objector—some, indeed, do. In practice, Mr Bevin's method of individual direction will probably prevent women from being placed in work to which they have a profound aversion—whether conscientious or not. And there certainly is no evidence of any demand among women for conscientious objectors' rights. But it is, at least, anomalous that what is usually known as the weaker, or gentle, sex should be denied the right of refusing to take any active part in the war effort, when it has been granted by law to men.

* * *

South America and the War

South American trade during the first months of 1940 was fairly buoyant, so that the trade returns for the complete year do not fully reflect the steep decline in exports over recent months due to the loss of European markets. Nevertheless, Argentina's total exports fell to 1,428 million pesos from 1,573 million pesos in 1939, and there was a surplus of imports of 70,824,000 pesos in place of an export surplus of 234,841,000 pesos. In January, 1941, Argentina re-established a favourable balance of nearly 20 million pesos, but this is poor consolation for a fall in value, compared with January, 1940, of 46 per cent in exports and 50 per cent in imports. Brazil's exports in 1940 fell to £32,004,000 (gold) from £37,298,000 in 1939, and the positive balance was only £1,575,000 (gold) against £5,497,000. The steep decline in shipments to Europe is shown by the following percentages of exports in 1940 to the European Continent (excluding Great Britain), compared with the ratios in the pre-war year of 1938 given in parentheses: Argentina, 24 per cent (44); Brazil, 16 per cent (43); Chile—ten months only and excluding nitrate—6 per cent (31); Peru, 4 per cent (24). The difficulties of obtaining goods from Europe have led to two

outstanding developments in South America: first, a great increase in inter-American trading (particularly with the U.S.A.); and, secondly, to increasing internal industrialisation which must eventually affect many import lines. Due to the blockade, imports from Germany are now virtually nil, while those from Japan, although increasing, still range only from about 2 to 6 per cent of total imports into the principal countries. Compared with 1938, imports in 1940 from Britain were fairly constant in total value at around 20 per cent in the case of Argentina and 9.5 per cent in Brazil, Chile and Peru. Against this, imports in 1940 from the U.S.A. were as follows, the ratios for 1938 being given in parentheses: Argentina, 29 per cent of total imports (17); Brazil, 52 per cent (24); Chile—ten months only—46.5 per cent of total imports (28); and Peru, 53 per cent (27). Already the State of Sao Paulo alone sends an increasing number of lines of manufactures to other South American countries, while, supported by enormous reserves of iron ore and coal, Brazil has established a National Steel Company which is expected eventually to make that country independent of imports of iron and steel. For the first time in modern history, Brazil in January, 1941, supplanted Great Britain in second place in Argentina's import list, which was headed by the U.S.A.

Vegetables for Sale

The interesting feature of Lord Woolton's latest experiment, the creation of a vegetable marketing company to stimulate the production and control the distribution of, initially, carrots and onions, is that its form is extra-departmental. After a period in which marketing boards were the bureaucratic fashion, there is a reversion to the semi-independent public utility formula, of which the BBC and London Transport provide the prototypes. The business of the new company and the necessity for its creation are clear. Price control, the disappearance of external sources of supply and internal transport difficulties have impaired the normal functioning of the vegetable market; now, a national price, a certain buyer and a distributor who takes account of need as well as of convenience, are social and economic necessities. The company is, in fact, to perform a function which is the reverse of rationing, but which is dictated by the same considerations—it is to ensure the just and desirable distribution of goods in plentiful supply. It will be a matter of the keenest interest to see how its performance compares with that of the Potato Marketing Board, a department engaged on a similar task. An important aspect of the work of the new company will be the storage of carrots and onions during the summer months for release in periods of shortage. The failure to extend the work of the company to cover the marketing of green vegetables is attributed to the perishable nature of these products. It must, however, be pointed out that even in the existing food crisis green vegetables are being wasted, and that it is the duty of the Ministry of Food to encourage the consumption of perishable vegetables at the expense of vegetables which can be stored. The carrot has been painstakingly popularised, but that multifarious British vegetable "greens" is still comparatively neglected. Indeed, it were better that the Ministry should provide instruction in rendering perishable vegetables palatable, than that it should concentrate popular interest unduly on the carrot and the wholesome spud, whose virtues have never been wholly hidden from the starch-loving British public.

* * *

The Need for More Coal

The Government has appealed to the coal-mining industry for an increase in output during the summer months to stave off any shortage during the next winter. In view of the heavy decline in exports, due to the loss of Continental markets last year, the industry should not find this impossible. Unfortunately, its capacity has been allowed to shrink, especially by the depletion of its labour force; and in order to stem this exodus of miners from the industry, the Government has decided to apply to it the Essential Work Order—which prohibits employers from dismissing workers and the latter from leaving their jobs, except by permission from the Ministry of Labour. The miners' first reaction to the Government's demand was to pass a resolution making the application of the Order conditional upon "some effective measure of workers' control of the industry." After further discussions with the Mines

Department, however, the Federation waived this condition, and, on Thursday last week, passed another resolution calling for the collaboration of the Mines Department "towards the establishment of a national board, with power to consider wages, or other matters affecting the industry." It is doubtful, however, whether the application of the Order will suffice to bring a 10 to 15 per cent expansion in output, in particular, whether it will lead to increased production per head, through a reduction in absenteeism, for example. Efforts must be concentrated primarily on speeding up output with the existing labour force; this may involve the transfer of unemployed miners to districts where there is a shortage. But if the desired increase in output cannot be achieved by the existing labour force, some of the miners who have been either called up or have taken employment in other industries will have to be recalled. The return to coal-mining of workers who have left the industry should be facilitated by a weekly minimum wage which is provided for in the Essential Work Order. Given a measure of goodwill, the output of coal can be raised to a level which will prevent the recurrence of a shortage.

* * *

Military Status

In wartime it is necessary, not only to bring men and women into war work, but also to keep them there. In industry the corollary of registration is the Essential Work Order forbidding employees to move or be moved. In the women's auxiliary Forces the corollary of registration and the mobilisation of young women is the new status of the ATS and WAAF. They are now to have full military status, and members will not be able to drift in and out at will. It will be impossible, for instance, for ATS clerks to vanish from their offices and return as civilians to do exactly the same jobs for much more pay—though in this actual case the outstanding feature is really the gap in pay between civilians and members of the Forces doing the same work side by side; a gap—applying to men as well as to women—which is evident in transport and other work as well as in offices. It is only right that women enrolled and trained should stay put, especially when a start is to be made to the mobilisation of all women for war work; and it only remains to list the special exceptions to the rule which will be needed. But the new status is not intended merely to prevent wastage. There are operational reasons. The range of women's duties in the Army and the Air Force is extending. In the present shortage of men to work and fight this is imperative, and full use cannot be made of the auxiliaries unless they are under military discipline like the soldiers and airmen they work with.

Head Office: WATER ST., LIVERPOOL, 2

600 BRANCHES

incomes which includes an interesting attempt to measure the assistance available from the various social services against the needs of three typical groups of families. The families examined are: A, a man and wife and three very small children; B, a widow with two children of school age; C, a couple of old age pensioners. Two standards of living are considered: the "poverty line standard," a slightly modified version of that used in the Social Survey of Merseyside, and barely sufficient to maintain physical efficiency; and the "human needs standard" which is mainly the same as that used by Rowntree, with the British Medical Association's nutrition report estimate substituted for the food item and the Merseyside Survey data for the rent estimate. The "human needs" standard permits of some expenditure on books, holidays and entertainments, and its cost for these families works out as follows:—

COST OF BASIC NEEDS OF REPRESENTATIVE FAMILIES,
OCTOBER, 1940.

	A		B		C	
	s.	d.	s.	d.	s.	d.
Food	27	8	22	6	16	10
Rent and rates	8	6	8	6	7	0
Clothing	11	1	6	3	5	7
Fuel and light	5	4	4	3	4	3
Sundries	13	5	7	0	4	8
	66	0	48	6	38	4

It is estimated that the average wage of an adult male in October, 1940, was somewhere between 70s. and 75s. per week, so that those families in Group A whose head earned not much less than the average should have been reasonably comfortably off as long as he was in full work.

The poverty line standard, which represents in effect a minimum subsistence level, is shown in the following table, where it is compared with the actual expenditure of three carefully selected families:

ACTUAL EXPENDITURE OF FAMILIES NEAR THE POVERTY LINE

Weekly cost of	A		B		C	
	Poverty line standard	Actual expenditure	Poverty line standard	Actual expenditure	Poverty line standard	Actual expenditure
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Food	21 11	22 0	14 2	11 3	9 9	14 11
Rent and rates	7 0	6 0	7 0	5 0	5 6	6 6
Clothing, cleaning and light	8 11	5 1	5 6	9 7½	3 2	1 0
Fuel	2 11	4 6	2 4	4 6	2 4	3 4½
Sundries	...	6 11	...	0 6	...	11 8½
Total	40 0	45 0	29 0	26 4½	20 9	37 6

Comparing this poverty line standard with the provision made by the various social services, the report states that at the specified date the sums to which a family of Group A would be entitled during the unemployment of the breadwinner were 41s., 39s. 9d. and 38s., according to whether he is drawing ordinary benefit, unemployment assistance or public assistance. That is to say, they get something approximating to their minimum needs. A widow in Group B, if she was an insured worker and had a widow's pension, would draw 36s. during unemployment. If she was uninsured, her pension and allowances as the widow of an insured worker only amounted to 18s. The normal public assistance scale in Liverpool for such a family was 28s. The most fortunate group were the old age pensioners of Group C, who might, with the addition of 12s. from the Assistance Board, have an income of 32s., but even this, though well above the poverty line, is nowhere near the human needs level.

War Against Rheumatism

It is probably not generally realised that rheumatism is one of the most destructive diseases with which this country is plagued. Cancer and tuberculosis are more spectacular in their effects, but as the principal cause of heart disease rheumatism is described by Lord Horder as a "wholesale killer," while the loss to England and Wales alone in wages, sick pay and cost of treatment is conservatively estimated at £25 millions a year. These facts have been put before the country by Lord Horder, in collaboration with the Empire Rheumatism Council, in an urgent plea for a national plan of action. He estimates that at least a million adults and 200,000 children are suffering from rheumatic disease in England and Wales, while the incidence in Scotland is still worse. In 1936 over a quarter of the prolonged absences from London County Council schools were due

to this cause. Apart from the LCC scheme for the treatment of patients of school age, far too little has been done. The causes of rheumatism are still very imperfectly understood; but Lord Horder gives some impressive statistics from various treatment centres here and in the United States, showing many patients either cured or very much improved. His purpose is to outline and urge the adoption of a bold national scheme. At present only one-tenth of the rheumatic population at the most can afford the necessary treatment. The plea is for specialised treatment centres in every region, with more widely distributed local treatment centres for dealing with the less difficult cases; and much can be done by the patient in his own home if he is properly taught how to administer the treatment. How seriously Lord Horder regards rheumatism in children is shown by the fact that, in advocating the extension of the LCC scheme throughout the country, he stipulates that the most important qualification of every school medical officer should be his ability to recognise rheumatism in its very early stages. The LCC can report no actual diminution of rheumatism in recent years, but it has succeeded in reducing the incidence of heart disease in its schools from 2 per cent to 0.77 per cent since 1926, and this is justification enough. The adoption *in toto* of Lord Horder's recommendations would be very expensive, but he claims that the tragic waste caused by rheumatic disease is, if possible, even more intolerable during war than in less difficult times.

Mr Hoover's Case

Criticism of the Hoover scheme for feeding the populations of certain German-occupied territories has led Mr Hoover to send a statement of his position to the *Times*. He will hardly conciliate his critics by dismissing the reasoned objections which have been raised in this country as "smear material," but the letter has at least the value that it makes public Mr Hoover's admission that only very stringent conditions—including strict neutral supervision and an end to German requisitioning—could make such a scheme in any way acceptable. In general Mr Hoover's letter leaves the controversy exactly where it was. For example, his statement that food sent to Belgium would "not support men working for Germany" is hard to reconcile with the facts. However, the chief indictment of his policy rests on his own statement that his aim is to give "no military advantage to either side." But the whole point of the British blockade is that it gives military advantage to Britain, and the British people will have to be given far more cogent reasons than those advanced by Mr Hoover if they are to abandon a policy which favours their victory for one which assumes that they are neutral in their own struggle.

Shorter Notes

At the moment of going to press, news comes that Lord and Lady Stamp have been killed as a result of enemy action. Even a bare recital of Lord Stamp's services to the community would require more space than can be found at the last moment and will have to wait until next week. Here he can be mourned only in the more intimate capacity of Chairman of the Trustees of *The Economist*. He will be very sorely missed.

A Bill has been introduced in the House of Lords giving the Lord Chancellor powers to deal with inefficient justices of the peace. A voluntary system of retirement from the bench, by which magistrates can be transferred to a supplemental list, has been in operation for about three years, and since November, 1940, it has been a condition of appointment of J.P.s that they should apply to be placed on the supplemental list on reaching the age of 75. Under the new Bill the voluntary system is retained, but the Lord Chancellor can direct that a J.P. should be transferred to the list if he considers it expedient that because of age, infirmity "or other like cause" the justice should cease to exercise judicial functions.

A Supplementary Agreement has been concluded between Great Britain and Spain and signed on April 7th. It provides for the advance of £2,500,000 to the Spanish Government. The greater part of the loan will be used for the purchase of foodstuffs and raw materials of which Spain is in urgent need.

THE WORLD OVERSEAS

Political Currents in Canada

(From Our Ottawa Correspondent)

March 21st

ALTHOUGH the King Ministry with its huge majority seems to be in a commanding position, there are visible portents of an impending political upheaval. For one thing, it is obvious that several Ministers are finding their labours a strain and are suffering in health, while for another, other Ministers are obviously inadequate for their offices. The demand for a National Government representative of all the parties has therefore revived and is being vigorously supported by influential papers like the *Toronto Globe and Mail* and the *Montreal Gazette*, while prominent Liberal papers such as the *Winnipeg Free Press* call for a drastic reorganisation of the Cabinet. Ministers, however, are still averse to sharing power with the leaders of other parties and take the ground that the mandate secured a year ago to administer the war effort still holds goods. To this the retort is made that this mandate was explicitly secured for a programme of limited participation in the war, before the seriousness of the threat to the existence of the British Commonwealth was realised, and that now, when a full national effort is called for, it can only be achieved under the leadership of a National Ministry.

In the House of Commons on February 24th, Mr Lapointe made a very maladroit attempt to squash the agitation for a National Ministry by declaring bluntly that his own Province of Quebec had such unhappy memories of the National Ministry formed in the last war that it was almost a crime to mention the words. But such a veto, pronounced by a French-Canadian Minister on behalf of the Province of Quebec, was almost bound to defeat its object, and the actual result has been not to suppress the demand for a National Government, but to intensify it, since throughout the English-speaking provinces of Canada there is a widespread feeling that the views of the French-Canadian element, who are suspected of not being very enthusiastic about the war, have already exercised too much influence in the councils of the King Ministry. The idea that Quebec should try to dictate to the rest of Canada what kind of government it should have does not find favour outside that province.

The Conservative Attitude

The agitation for a National Government is, however, encountering one serious obstacle in the disinclination of the leaders of the Conservative party to participate in the formation of such a Ministry. Mr R. B. Hanson, K.C., the temporary parliamentary leader of the party, has expressly intimated that he does not want to join the present Government or any Coalition Ministry, but prefers to stay in opposition and fill the rôle of vigilant critic. This statement was issued after careful deliberation and consultation with prominent Conservatives throughout the country; they evidently believe that the Liberal party, having insisted upon assuming sole responsibility for the administration of the war effort, will at the close of the present war be as gravely discredited as the Conservative party was at the close of the last war, and that at the next general election an opportunity will be presented to the Conservative party to repair its shattered fortunes. The decision has, therefore, been taken to remain in opposition and to reorganise and revitalise the party so that ultimately it can offer the prospect of an alternative Ministry.

Public opinion, on the other hand, remains in a state of widespread disquietude about the administrative efficiency of the King Ministry. Its apprehensions have been increased by the publication of a report made by

Mr H. R. Macmillan of Vancouver, an able businessman, who is chairman of the Wartime Requirements Board, upon the progress of the war programme. This report found progress satisfactory in seven out of the ten divisions of war supply. It described the production of automatic equipment as "100 per cent perfect," and said of shipbuilding that "performance is good." It had no criticisms to offer about the ambitious programmes for making shells and explosives, and declared that the difficulties of tooling up factories for shells and organising production had been largely surmounted. But the report disclosed that Canada is now dependent upon the United States for 80 per cent of the machine tools which are required and that tools required for important operations had not been ordered. Moreover, Mr Macmillan had no cheering account to offer about tank construction. The Canadian public had been led by Ministers to believe that arrangements for an output of tanks from Canadian factories on a substantial scale had been completed some time ago and that they would be rolling off the assembly lines some time this spring. But Mr Macmillan revealed that the plant, which is being erected by the Steel Company of Canada for the manufacture of armour plate needed for tanks, will not be completed until next June, and that the engines, transmissions and suspension units have not even been ordered, while no drawings have been received for gun mountings. The production of tanks in Canada is obviously some distance off, and Mr Howe, the Minister for Munitions and Supply, is now being accused of deceiving the public.

Concerning aircraft production the report had severe criticisms to offer, and the gist of his findings was that the production of aircraft in Canada was much more expensive per unit than in the United States, where mass production was possible, and that more efficient planning was necessary to make the most economical use of Canada's aircraft capacity.

Norway's Anniversary

[BY A CORRESPONDENT]

April 9th

It is just a year since Hitler invaded Norway and Denmark. Most Norwegians have decided to spend these days of sad memories by silently remaining indoors. A

chain letter is circulating all over the country suggesting that thirty minutes from 2 p.m. to 2.30 p.m. on April 9th should be devoted to Norway's fallen. "Norwegians, stay indoors this half-hour," it says. "Arrange that none need be in the streets, restaurants, or public places. Let the streets, tramways and shops be empty. Do not telephone or answer the telephone in this half-hour. Treat everybody with contempt who does not observe this half-hour for our dead. School children must not answer during this half-hour."

Chain letters of this kind or written and roneoed circulars passing from hand to hand have acquired tremendous popularity. The other day a well-known Oslo printing firm printed privately fifty thousand copies of the Bishop's pastoral letter appealing for resistance to the nazification of Norway. By the time the Germans tried to confiscate the letter 47,000 copies had already been distributed; these were rapidly stencilled and over half a million of them are now circulating all over the country.

Opposition to the Nazis, which can be said to represent some nine-tenths of the population, is to a considerable extent carried out in broad daylight, notwithstanding the ever-growing Nazi terrorism. Even schoolchildren have been imprisoned and deported. A special reformatory has been established "somewhere in Norway" for children whose conduct at school reveals hostility to the Nazis.

A curious sidelight on the situation is the spontaneous development of a national sense of humour—not a quality in which the Scandinavians normally excel. The Moellegaten prison, for instance, is now usually referred to as "Hotel Norge" and the people proudly say that its "guest book" indicates the extent to which the opposition embraces all parties and social strata. Paper banknotes of one and two kroner have been issued. The two kroner ones are known as a "Quisling" and the one kroner notes as an "Usling"—the latter word meaning "scoundrel" in Norwegian. If anybody asks why, the answer is that it takes a double "Usling" or scoundrel to make up a "Quisling." On posters with Quisling's name the letters "Q" and "i" are invariably crossed out—just leaving the Usling. The police minister, Jonas Lie, is generally referred to as "Judas Lie."

New postage stamps are being printed without King Haakon's portrait or the words Kongeriket Norge. But local wags say that Quisling dare not put his own face on them because instead of licking the back of such stamps the public would spit on their face.

Economic Distress

This flippancy is all the more surprising when it is realised that, in addition to political terrorism and national humiliation, the Norwegians are suffering genuine economic hardship. First of all, it is they who have to bear the cost of the German occupation, which was recently stated by Mr Butler to amount to an annual rate of £68,000,000, or Kr.1,200,000,000, which is equivalent to £25 per head of the population. But it does not include the financial burdens arising from the compulsion on occupied territories to supply Germany with more goods than they receive in return. A secret memorandum compiled by Norwegian economic experts on the spot estimates the value of these additional charges at some £28,000,000. The central clearing institute in Berlin regulates trade with occupied countries. Norway's exports to Germany are paid for in blocked marks. German soldiers' allowances in Norway are paid in Norwegian exchange, drawn on

Germany's account with the Bank of Norway. With this money the soldiers buy Norwegian goods and send them to Germany. German purchases of foodstuffs and raw materials in Norway are also paid for out of this account. As a result, there is a food shortage—most of the meat, butter, eggs, cheese and preserves going to Germany—an acute shortage of raw materials—which are used by the Germans for building barracks, soldiers' homes, aerodromes, military roads and new German controlled undertakings—and, finally, inflation.

Shortage of Essentials

The economic effects of German control are particularly disastrous in having brought about the shortage of the following essentials:

- (1) Coal. Germany has delivered only 10 per cent. of the supplies promised to Norwegian industries.
- (2) Petrol and oil. Oslo buses are now allowed 6,000 litres per month, against a normal consumption of 93,000 litres; there is also a desperate shortage of petrol for farm vehicles and the fishing fleet.
- (3) Cement and bricks. These are virtually monopolised by German construction work.

The paper industry has had to close down owing to the coal shortage, although activity in the pulp industry has continued on account of the growing demands for cellulose as cattle fodder. As a result there is considerable unemployment and short-time working. This applies to the soap, oil and fat trades, the match industry (which is working 38 hours a week), and many other branches of production or commerce are either closed down altogether or they are working short-time.

Norway has, of course, lost all her non-European markets, which before the war accounted for 50 per cent. of her trade. Now Norway is officially told by the *Völkischer Beobachter* (March 18th) that she can become self-sufficient by making use of her inexhaustible raw material—wood. Wood must be used not only for constructional works but also for the production of gas in place of petroleum. It has now been made clear that Norway's economy is to be exploited in the interest of Germany. Industries of no value to Germany are to be allowed to die. The shipping fleet will never return to its pre-war size. The Norwegians are told that the iron project (by which it was proposed that Norway should work up iron ore into pig-iron and semi-manufactured goods instead of exporting the raw materials) was too ambitious an enterprise to undertake. She should rather specialise in the production of raw materials, in this way finding a place in the German economic system.

German Exploitation

On the other hand, the Germans will themselves exploit those sections of Norwegian industry which are of value to them. These include the fishing industry—60 per cent of all Norwegian fish catches must be sent to Germany—which is especially wanted to supply oil to take the place of the whale oil now lost to Germany; the Norwegian mercantile fleet—what is left of it, since the vast majority, nearly 4,000,000 tons, is in the hands of the legal Government and in the service of the Allies; and Norwegian water power—which is the biggest exploitation planned by the Germans. Large new electrical installations are planned to provide power for new chemical and other factories, which will be built in Norway to provide materials for the German war machine. Electrical power will also be carried by cable to Germany. A typical plan is that for the exploitation of the great Aura waterfall near Kristiansund. A new township is to be built near the foot of the fall, and some 6,000 workers are to be transported there. The Norwegian State is to be asked to contribute 50 per cent of the cost of these new undertakings, although the benefits will of course be derived mainly by the Reich.

The Norwegians know full well that only an Allied victory can save them from utter ruin and total enslavement. They are sustained in their stubborn resistance to the German invaders by their firm belief in the triumph of right over wrong. Episodes like the recent Lofoten raid give them new courage, despite the terrorism that has followed. And they take pride in the fact that their greatest material national asset, some four million tons of shipping, is gallantly serving the Allied cause.

Balkan Scarcities

[BY A CORRESPONDENT]

April 12th.

In South-Eastern Europe—or elsewhere, for that matter—military occupation, economic collaboration and adherence to the Tripartite Pact are really only so many expressions for the same thing: complete submission to the German war colossus. In internal administration there may be some slight variations of control from country to country; economically, however, their position is one. As for outward signs of this common plight, all the countries involved are facing an increasing scarcity of imported raw materials. All had been accustomed, and more or less forced by lack of free exchange, to hand-to-mouth buying, and the outbreak of war found them with very slender reserves in 1939. In the early months of the war they were able to cover their current requirements within the quotas allotted by the Allied contraband control and mainly against corresponding deliveries of their own products, which were preferred very wisely in the event to payment in gold. Since last June, however, shipping difficulties and later a tightening of the blockade—no doubt not independent of political developments in the Balkans—have practically stopped overseas supplies. This affects in particular the well-developed textile industries in South Eastern Europe, which depend to a very large extent on imported raw material.

Still more serious and widespread are, of course, the direct effects of German exploitation. This, on the one hand, deprives the countries of South-Eastern Europe of their own produce; it is no longer a question of selling an export surplus, but a first charge on the whole production, to the extent of imposing severe rationing on home-grown food. On the other hand, Germany, and still less Italy, are unable to supply their import requirements, to replace previous deliveries from outside sources. It should be remembered that Germany, in supplying, say, 50 per cent of Rumania's total imports before the war, had not supplied 50 per cent of all classes of goods, but up to 100 per cent—and not infrequently even more—of that range of goods which she could produce for export. There is consequently little, if any, scope for expansion, while the turning over of industry to war production is bound to affect at least some classes of previous German deliveries, such as machinery. The scarcity of commodities in South-Eastern Europe extends, therefore, to overseas, home-produced, and even to those goods normally supplied by Germany.

The Path of Inflation

Nor is this the whole story. "Foreign trade" on such lines renders the countries of South-Eastern Europe large-scale creditors of their Axis partners, insofar as exports are not set against occupation costs or other charges. However, whether creditors, or plundered, on international account, they have to pay their home producers for the goods sent to Germany or consumed by her on the spot. The only possible method of paying is by the increase of the fiduciary issue, already swollen by the cost of military mobilisations and other extraordinary expenditure.

The combined effect of all these inflationary factors is a steep rise in the cost of living. Drastic regulations to stop the rise of prices result, more often than not, in the goods disappearing altogether from the open market.

There may be, at first sight, little unfamiliar or specific in this situation, as measured by the standards of Nazi-controlled Europe in 1941. There are, however, two important differences. One is the fact that the Balkan countries, with their inherently weak economic structure, are more liable to collapse than their Western counterparts. The other, perhaps less direct in effect but affecting the Germans more deeply than economic ruin in the occupied or semi-occupied countries, is the repercussion of the worsening economic situation on the peasant population—the backbone of the economy and, which is more important, the section in the economic system on which the Germans have to rely ultimately for their supplies.

The Balkan peasant is little interested in financial theories or in political doctrines. He has, however, a keen sense of economics, based on some very simple

facts. He tills his soil, keeps the bulk of its products for his own consumption and sells the remainder in exchange for the few simple necessities of life which he himself is unable to produce. He measures his "prosperity" by the exchange value of his surplus products in terms of the footwear, clothing, etc., which he can buy with them. On this reckoning, with the few goods within his short range of demand growing scarcer every day, the "price" fetched by the products must go on diminishing. This may easily have far-reaching implications, for the peasant, besides being the most conservative of consumers, is also the deadliest of saboteurs. After all, so far as the individual peasant is concerned, agricultural surplus is a flexible quantity. Moreover, the peasant in South-Eastern Europe has long memories, uninfluenced by day-to-day changes of political régime.

American Power Policy

[BY A CORRESPONDENT]

April 9th

REARMAMENT is helping in many directions to bring American business and the New Deal together. The New Dealers need the willing co-operation of business men, who, in their turn, are being brought to admit that there are some sorts of activity in which Government initiative and control are more appropriate than free private enterprise. This is particularly true in the case of electric power policy—though, in this case, the situation that is developing is less a compromise than a victory for the ideas that Mr. Roosevelt has always propagated. The victory is being achieved on two planes at once. On the constitutional plane, a recent decision of the Supreme Court has put the competence of the Federal Government beyond question. Its powers derive from the authority conferred by the Constitution on the United States over inter-State commerce and navigable waterways, and dispute has always raged over the extent to which the transmission of electricity can be regarded as inter-State commerce or its generation at dams can be considered a necessary part of the control of waterways. The Supreme Court decided these questions in the Government's favour by a 6 to 2 vote in a case in which the United States had contended not merely against a private power company but against 41 States as well.

Victory can also be said to have been secured on the economic plane. The strongest criticism raised against the Government's power projects in the past eight years has been on the score of their alleged redundancy; they were competing unfairly, it was said, with established private facilities fully capable of taking up the load. But it has been discovered with some suddenness that there is a risk of a power shortage. Generating capacity was increased by 1,792,000 kilowatts (or about 4½ per cent) in the course of 1940 and further expansion of 3.4 million kw. in 1941 and 2.3 million kw. in 1942 is planned. But even these rapid increases cannot keep pace with the demand. Output in 1940 was 11 per cent higher than in 1939 and the same rate of increase is being maintained. America's monthly consumption of power is now rather more than 12,500 million kw.h. Almost exactly one-third of the total is generated by water power.

Power for Industry

It is thus impossible to maintain that the power from the Government's dams will not be wanted. The con-

struction of a nation-wide grid still lies in the future, so that the new sources of power can contribute little to the power available in the old industrial districts. But the industries are following the power. The Tennessee Valley Authority provides power for nitrates and aluminium. The gigantic Grand Coulee dam in the State of Washington, in the far north-west corner of the country, was only opened last month, but already nearly one-tenth of its output is required by an aluminium plant. The Shasta dam of the Central Valley project in California will provide power for calcium carbide and ferro-alloys. Aluminium also provides the industrial justification for two other projects, the Santee-Cooper development in South Carolina, now nearing completion, and the proposed Arkansas Valley Authority, in the richest bauxite region. At the established dams, generating capacity is being extended. At Boulder Dam on the Colorado, for instance, the demand has already reached the volume that, in Mr. Hoover's day, was predicted for 1980. The President has seized the opportunity presented by the success of his power policy to resubmit to Congress the often-proposed and often-rejected St. Lawrence Waterway plan. This is a joint Canadian-American project, which will provide power for both countries as well as improving the navigation of the St. Lawrence. It still has powerful enemies in both countries and it will provide material for a stiff fight.

It would be a mistake, however, to conceive of these large schemes purely in terms of electric power, or even of electric power plus river navigation. Most of them are deliberate plans for regional regeneration. The objects of the Tennessee Valley Authority are well known, and it is intended that they should be reproduced in the "little TVA's," in the Arkansas Valley, in the Central Valley of California (with its neighbours, Nevada and Arizona) and in the Columbia Valley of Washington and Oregon. Thus the gigantic Grand Coulee dam, which has just begun operating, will provide irrigation for an area of hitherto barren land as large as several European countries. If the rearmament demand for power makes projects of this kind economically feasible, it will not all be waste effort.

Palestine's Industrial Progress

[FROM OUR JERUSALEM CORRESPONDENT]

March 1st

THE forced reduction in Palestine' imports, resulting from the war, has given a fillip to many local industries, which strive to produce goods hitherto imported and, if possible, also to export them to other countries of the Middle East. The efforts in that direction devolve upon private economy to a far greater extent than, say, in Great Britain, because Government help has until now been restricted to the administrative sphere. True, the powers of the Standing Committee for Commerce and Industry have been enlarged, but a more direct help in the form of advances, guarantees, insurance, etc., has been received from the Jewish Agency, which has been able to step in to a certain degree. In conjunction with the Anglo-Palestine Bank, the Jewish Agency has created out of one of the funds at its disposal a revolving fund for the purchase of raw materials from abroad. The procedure adopted is to provide a partial guarantee to the bank for imports, in a manner somewhat similar to that of the British Department of Overseas Trade for exports. Naturally, the amount at its disposal here is incomparably smaller.

The service rendered to the industrial community is nevertheless great, as only a very little amount of raw materials, used in manufacture in the country, can be obtained locally. From the point of view of the war effort, the fact that—as far as is known—no important establishment has had to close down owing to a total lack of raw materials is most important, especially as the term "raw materials" has here a meaning of its own. Our industries are still very young, and in their vertical sequence the lower grades are mostly missing. Therefore, for instance, the finer yarns, rods of metal, alloys, etc., are imported as "raw materials." Never-

theless, the Army Supply Departments have been able to place considerable orders with our factories, and their extent has risen in the last months, as deliveries have been satisfactory and demands have grown. Here, as well as in the relations of industry with its private customers, import conditions play an important rôle. In normal times, concerns were nearly always able to purchase "cif" with payment on, or even a certain time after, delivery. Now they must buy "fob," and payment must nearly always be made with the order, while delivery takes far longer than the normal time, not only on account of deviations, delays, etc., but also because the small and varied orders placed by our industrialists nearly always take more time to execute than would a bigger quantity of a single sort. The sums invested in such consignments are, therefore, tied up for a much longer time than formerly, which is another obstacle for our industries. That these industries are holding their own, and even progressing, in spite of the many difficulties can be demonstrated by a small exhibition of samples of textiles and kindred goods, which was held in Tel-Aviv for the benefit of foreign buyers. During the last few years parcels of ready-made ladies' clothing, etc., were being exported to some countries, especially South Africa, but the orders placed during the recent show by old and new clients, such as Egypt, were larger than hitherto. What is more important is that buyers expressed the desire for a repetition of the show for winter fashions, and it may well be that it will become a regular feature.

Trade Adjustments

The shifting of our commercial relations from countries overseas to those in neighbouring regions is very perceptible and easily explained. About half of our total imports, for instance, came from Germany, Italy and the countries now under German control, while the European continent was our second-best customer for citrus. The situation of the citrus industry naturally constitutes one of the most formidable worries, and it is significant for its seriousness that even very "small remedies" are being tried. One of them is the manufacture of "by-products," such as citric acid and oils. Another is the "citrus movement tax" introduced some weeks ago for the purpose of aiding growers by its proceeds. It is levied on each parcel leaving the groves, and is intended to increase the ruinous prices fetched in the cities. The proceeds have been semi-officially estimated at about £P30,000, and as the value of the crop in recent normal years was £P2½-3½ millions, the amount available for help, even without making deductions for expenses, will be negligible. The situation of the citrus industry is at present under consideration by a special body. Some form of help ought to be made speedily available, as neither the Arab nor the Jewish economy is able to sustain a total loss, or even the loss of the greater part, of the capital invested without running the danger of a major crisis. The situation is aggravated by the fact that there has been very little rain this winter, and that, as a consequence, orange groves are liable to suffer still more than grain fields. The latter brought a bumper crop last year, and a repetition of the phenomenon is most unlikely in the circumstances.

[It was announced in the House of Commons on April 9th that approval has been given to a scheme under which bank advances will be granted to growers to enable citrus groves to be maintained for 1941-42. The Government of Palestine has reimbursed the banks for their advances last year, since the virtual cessation of exports prevented growers from discharging their obligations. The area to be covered by the new advances will be limited to 170,000 dunams; only groves planted before the end of 1935—i.e. full-bearing trees—and in good condition will be considered; growers must be credit-worthy; and interest at the rate of 6 per cent will be payable, the first year's interest to be deducted when the advances are issued. The 1940-41 advances will be a first charge on the 1941-42 crop. In order to broaden the basis of farming in the citrus area, the Palestine Government will provide loans to an amount not exceeding £P100,000 to approved grove-owners for the acquisition of stock and poultry, for the purchase of seeds and fertilisers, etc.]

It should be noted that these "care and maintenance" advances are not comparable with crop purchases in other colonies. The maximum liability incurred by the Government over the two years, excluding the £P100,000 agricultural advances, is £P517,000, and this sum, on which the growers have to pay a high rate of interest, in no way compensates them, and the country, for the loss due to the cessation of exports, the value of which, as our correspondent points out, used to be between £P 2½ and 3½ millions a year.—EDITOR.]

Shorter Notices

The Jewish War Front. By V. Jabotinsky. (London: 1940). George Allen and Unwin. 7s. 6d.

It is in one of the last chapters of this remarkable book that the late Vladimir Jabotinsky, one of the very few outstanding Jewish men of action, quite casually stresses the essential point of the Jewish problem and its possible solution. The first of all Jewish demands ought to be addressed to the Jews themselves: the demand for a united front. The author's considered opinion is that a definite solution of the Jewish problem is vital, not only to the Jewish people, but also to the health of the world, and that any solution attempting to make some kind of "ghetto" comfortable with the soft soap of a questionable "equality of rights" would not bring a satisfactory solution at all. But is the Jewish state for which M. Jabotinsky is striving an indispensable presupposition for a satisfactory solution? The economic, financial, technical and organisational difficulties of evacuating and settling millions of people within a comparatively short time would be enormous. The British Government would take a grave risk in committing themselves to the establishment of a Jewish State—and nothing but a Jewish State—in Palestine, as their war aim.

"The City: The London Financial Markets." By Bernard Ellinger. P. S. King & Son, Ltd. 429 pages. Price 20s.

Interest in this book must be mainly of a historical nature, for the author describes, clearly and with a good deal of detail, the City as it stood on the outbreak of war. Since then, some of the institutions he discusses have either all but disappeared or else been transformed beyond recognition. Nevertheless, the book is of considerable interest in its picture of conditions in the City between two wars, and in its summary and analysis of the controversies over such subjects as nationalisation of the Bank of England and the joint-stock banks. The author is, perhaps, inclined to be too determined to clear the banks from the charges brought against them for his conclusions to be quite objective.

"The Bankers' Almanac and Year Book, 1940-41." Proprietors, Thomas Skinner & Co. (Publishers), Ltd., published jointly with Waterlow & Sons, Ltd. 2,222 pages. Price 50s. net.

The ninety-sixth issue of that valuable publication, the Bankers' Almanac, includes the balance sheets and other information of nearly 3,000 banking concerns. Its statistical material and general information on all matters affecting money and banking are as complete and useful as ever.

"The Anthracite Coal Industry of the Swansea District." By A. E. C. Hare. Social and Economic Survey of Swansea and District. Pamphlet No. 5. University of Wales Press Board. 84 pages. 1s.

Anthracite accounts for over two-thirds of the coal production of the Swansea area; 40 per cent. of the adult male industrially-employed population of the district are engaged in anthracite production; and 75 per cent. of the coal exported through the port of Swansea is anthracite. This pamphlet is an admirably clear account of the place occupied by Swansea in the world anthracite market, the organisation of the industry and its prospects for the future.

THE BUSINESS WORLD

Electric Power Companies

THE 1940 series of reports of the chief British electric power and supply companies may have a valedictory significance for stockholders, if the *decree nisi*, announced by the Minister of Information, is made absolute, and postponement of public utility accounts "by request" becomes a wartime rule. In that event, the figures will be the last statistical meal the investor in a deservedly popular share market is likely to have for some time, and he would do well, like the prophet before his forty days in the wilderness, to make the most of it.

The series is not quite complete, the returns of the London concerns—particularly the important "County Company"—being unavailable. The data, however, are sufficient to give a cross-section of results in many different areas of the country. Comment upon them must be restrained in the spirit of the new Government ruling, but it needs no subtle enemy intelligence system to suggest that last year's extensive movements of population, and of industrial activity and location, must have presented formidable problems to all the electricity generating and distributing organisations in this country.

Some questions, like the part played by the Grid system, and the measures successfully taken by individual companies to cope with physical difficulties in bombed areas, can only be adequately discussed when the war is over. But it is obvious that the chief factor in electric company profits—the load factor—varied widely from area to area last year, along lines which ran counter to those along which most companies had been planning their development during the preceding decade. The war came when the domestic and industrial electrification of Great Britain had made rapid progress, but was not near the end of its evolutionary stage. The following table shows the trend, since 1933, of net revenue of ten large concerns—three operating mainly in London, and the Home Counties, and seven in the Provinces and Scotland. Expansion, clearly, was a profitable process in the years immediately before the war:—

TREND OF NET REVENUE, 1933-40 (1933=100)

Company	1934	1935	1936	1937	1938	1939	1940
County of London	111	112	125	139	159	152	N.A.
Metropolitan	93	101	140	130	123	132	127
Northmet	112	116	125	133	143	131	N.A.
Northampton	92	93	99	117	129	135	150
Midland Counties	105	108	109	120	133	122	112
Lancashire	103	111	123	126	128	118	105
Yorkshire Electric	106	115	130	138	145	148	153
North-Eastern	108	109	123	140	157	158	168
Clyde Valley	114	124	132	166	181	199	195
Scottish Power	112	122	137	150	159	162	157

** Profit on sales of current, etc.

N.A. = Not available.

In the quinquennium ended 1938, the net revenue of the individual companies shown in the table rose by anything from one- to four-fifths. In 1939, which included the first four months of the war, the increase in net revenue was arrested in the London area and, on the whole, slowed down in the Provinces. In 1940, the difficulties of the companies in and near London were accentuated. Companies in other parts of the country had a more favourable, but rather mixed experience. Of the seven extra-London companies shown in the table, three reported an increase and four a drop in net receipts. The accounts issued to shareholders by the various concerns (which are usually holding companies) disclose an amount of detail which varies considerably from company to company. From the figures, however, of those concerns which show gross revenue and the chief heads of expenditure falling against it, it is clear that, among the big companies, only the London concerns have

suffered an appreciable setback in *gross* receipts. Comparing 1940 with 1938, the last full pre-war year, the Metropolitan Electric Company actually achieved an increase of 21 per cent in gross revenue, but this, as the chairman made clear at the annual meeting, was the resultant of a fall in receipts in the company's "London" area and a more than countervailing rise in its "Western" area, which lies outside the Metropolitan proper. In the case of the provincial companies, the expansion in gross receipts is impressive. Between 1938 and 1940, those of the Northampton company rose by 21 per cent, those of Yorkshire Electric Power Company by 23½ per cent, of North-Eastern Electrical by 11½ per cent, and of Clyde Valley Electrical Power by a figure which cannot have been less than 23 per cent, and was almost certainly more.

The increase in expenses, which more than offset this rise in numerous instances, was not common to all items. It was, in fact, largely concentrated on prime costs and on rates and taxes. Thus, the Metropolitan Company's cost of current rose, between 1938 and 1940, by 28 per cent. The generation expenses of the Northampton Company increased by 48 per cent, and the generation and distribution charges of the Yorkshire company by 46 per cent. Distribution expenses, on the other hand, have been fairly steady. Those of the Metropolitan company increased only slightly last year, while those of the Northampton company were no higher than in 1939 and only 10 per cent higher than in 1938. Management and general expenses, similarly, have not risen out of proportion to the increased work done, and though amounts set aside for depreciation have increased in some cases, the rate of expansion merely continues the normal peace-time trend. But rents, rates and taxes are substantially higher in every case, the rise in 1940 as compared with 1938 being, for the Metropolitan Company 74 per cent, for Northampton (rent and rates only) 44 per cent, and for Clyde Valley as much as 120 per cent. In short, even in the "prosperous" areas, the economies of an increased load have not always been enough to meet the higher operating costs and the exigence of the tax-gatherer, not to mention special requirements for A.R.P. and other expenditure.

As yet, however, the war has not seriously affected equity earnings, apart from those of the London companies. In practically every instance, the rate per cent earned, *before tax*, on ordinary shares was higher in 1940 than in 1939, and in some instances the rate of increase was quite considerable. This experience stands in sharp contrast to that of the last pre-war year, when the rate of net equity earnings declined in almost every instance.

TREND OF EQUITY EARNINGS (BEFORE TAX), 1933-40
PERCENTAGE RATE EARNED (1933=100)

	1934	1935	1936	1937	1938	1939	1940
County of London	83*	81*	109*	107	144	82†	N.A.
Metropolitan	92	108	140	131	110	107	76
Northmet	113	98	101	103	96	69	N.A.
Northampton	86	87	88	107	110	100	141
Midland Counties	101	106	109	115	138	138	145
Lancashire	100	108	115	101	107	96	100
Yorkshire Electric	80	84	96	110	84	78	133
North-Eastern	118	105	114	127	138	113	111
Clyde Valley	114	115	114	148	157	124	150
Scottish Power	105	115	116	128	138	167	173

* Before making provision for development expenditure. † On capital increased by approximately one-fifth. N.A. = Not available.

The percentage ordinary share earnings of practically all the provincial companies, "grossed up" for income tax, are running at a rate well above those of the majority

of pre-war years, though the increase is anything but uniform. For the time being, heavy capital expenditure on plans for further development, which practically all the companies had in hand before the war, are likely to be suspended. But capital invested in the pre-war period is becoming increasingly fruitful. As is shown by the table below, nearly all the companies whose results are being reviewed increased their ordinary capital substantially during the 1930's:—

PERCENTAGE GROWTH IN ORDINARY CAPITAL
(1940 compared 1933)

Company	Ord. Capital	Company	Ord. Capital
County of London	+24%	Lancashire	+81%
Metropolitan	+20%	Yorkshire Electric	+33%
North Met.	+52%	North-Eastern	Nil
Northampton	+20%	Clyde Valley	+50%
Midland Counties	Nil	Scottish Power	+19%

Electric supply company dividends have a merited reputation for stability, and the advent of war has not impaired it, except in the London area, where reductions have been practically universal. Our final table reveals that all the provincial companies are still paying dividends at pre-war rates before tax, with an ample and increased marking up of earnings in most instances.

Yields obtainable on electric supply company stocks, at present prices, are low enough to put these securities into the "gilt-edged equity" class, and there is no clearly marked differentiation, in this respect, between the London and non-London companies. The market, in fact, appears to be working on the assumption that the companies have by now largely adjusted themselves to war conditions, and that, while those in "distressed" areas are unlikely to suffer any really serious further worsening of their position, the outlook for the others

ORDINARY EARNINGS AND PRICES

Company	Earned for Ordinary (%)			Paid on Ordinary (%)			Present Price	Yield (%)
	1938	1939	1940	1938	1939	1940		
County of London	20.6	11.7	N.A.	10½	10½	8	s. d.	5.24
Metropolitan	11.8	10.9	7.7	10	10	8	30 6	4.96

Yorkshire Electric	8.1	7.6	12.9	8	8	8	38 1½	4.19
North-Eastern	8.7	7.1	7.0	7	7	7	27 5	5.09
Clyde Valley	11.3	8.9	10.8	8	8	8	35 0	4.37
Scottish Power	17.4	19.8	21.8	8	8	8	36 0	4.44

* Including 1% special bonus. † Approximately 7½%, after allowing for change in income-tax. N.A. = Not available.

is relatively reassuring. This, of course, suggests that the market is taking an optimistic view of such unknown factors as future war damage and the treatment likely to be meted out to the industry in the forthcoming Public Utility Damage Bill. But the gross revenue position seems, in general, secure for the duration. The power demands of the war programme are widely spread geographically. The end of the rise in costs may not yet be in sight, but the industry is highly efficient and, apart altogether from any further adjustment of its charges, it can look for new economies in marginal costs with every fresh increase in load. The spread of its services over many different classes of consumers has already stood it in good stead; for, outside the war-depressed districts, increased industrial demand has already more than compensated for reduced lighting demand owing to the black-out. Altogether, electric supply stocks seem to have a serious claim on the attention of equity investors who wish to combine a not ungenerous income during the war with excellent prospects when hostilities are over.

The Torrent of Liquidity

THE financial situations of well-nigh every country in the world, belligerent, non-belligerent and neutral alike, share one common characteristic: an exceptional abundance in the supply of short-term credit and in the means available for its investment. War is being waged and neutrality defended on cheap and abundant money. The explanation of this world-wide phenomenon is also one and universal. The torrent of liquidity gushes in every case from unbalanced Budgets. In only one country can a supplementary explanation be advanced, namely the chronic magnetic attraction for gold which has drawn to the United States about four-fifths of the world's reserves of the metal.

It is not difficult to understand the scale and universality with which Budgets are being unbalanced to-day. Never has belligerency been as expensive as it is in its present form of total war. Non-belligerency, as exemplified by the United States, is scarcely less costly. As for neutrality, never in previous wars have its virtues been so poorly rewarded as they are at present, with the trade of the world utterly disorganised, materials piling up in producing countries and prevented by blockades and counter-blockades from reaching their normal markets. The efforts required by total war have proved altogether too violent for the survival of budgetary orthodoxy. It has collapsed to the point at which we have come to regard as creditable the achievement of a 50 per cent cover of expenditure out of tax revenue, leaving the balance to be met by borrowing. The United States has lived on unbalanced Budgets since the beginning of the New Deal era, and the deficits must inevitably grow larger as the Lease-and-Lend Act gets into its stride. Neutral countries, such as the South American republics, are all struggling with the problem of unsold produce, which calls for subsidisation in one form or another, and has in nearly all cases wrecked budgetary equilibrium.

It remains to be explained why the consequent resort to the capital market should, in nearly all countries concerned, have taken so largely the form of short-term borrowing, with its customary direct approach to the banking system and the appropriate inflation of the credit structure. In the case of the belligerent countries,

the amounts to be borrowed have proved too large to be provided by public subscriptions to medium or long-term Government loans. The alternative and easy resort to direct short-term borrowing from the banks has proved inevitable and irresistible. The experiments made over the past decade in the technique of credit management have tended to predispose Treasuries towards greater use of the short-loan market. The now long-established independence of currencies from rigid gold parities has certainly removed some of the inhibitions which formerly might have deterred Governments and their financial advisers from excessive recourse to short-term borrowing and from the consequent manipulation of the volume and price of short-term credit. On the side of the demand for investments, there have been strong forces favouring this particular form of deficit financing. The uncertainties of the immediate outlook have created a "liquidity preference" which hard-pressed Governments have been only too willing to satisfy and press into service.

A few illustrations will serve to reveal the process at work. They may be drawn from the available data regarding the national finances and the banking position in the United Kingdom and Germany—the total belligerents—Japan, which is engaged in a mere "incident," the United States, a fully-fledged non-belligerent, and France, an ex-belligerent.

In each case cheap money is the order of the day. Great Britain began the war with a Bank rate of 4 per cent, but it was quickly brought back to 2 per cent. In Germany the Reichsbank rate is 3½ per cent, having been reduced from 4 per cent in April, 1940. In Japan the official discount rate has remained unchanged at 3.29 per cent since April, 1936. The discount rate of the Federal Reserve Bank of New York stands at 1 per cent, the lowest in the history of Bank rates. The Bank of France rate has remained undisturbed at 2 per cent since January, 1939.

In the United Kingdom, the floating debt has risen since the outbreak of the war by £1,646 millions, or rather more than half the shortfall of revenue below expenditure for that period, namely £3,024 millions. The expansion in the floating debt, however, considerably overstates the direct borrowing from the banking

system. No less than £750 millions of the increase represents the increase of Treasury bills issued through the tap, mainly to the Exchange Equalisation Account as the counterpart of gold losses, but also through the investment of other extra-budgetary funds. Moreover, of the rise of £345 millions in Treasury bills issued through the tender, an appreciable part has gone to sterling area central banks and other overseas issuing authorities which have been accumulating sterling. Though this may not be inflationary borrowing, it has contributed to the liquidity of the London money market. The remaining constituent of the increase in the floating debt is the £430 millions borrowed through Treasury deposits up to March 31st last. This direct borrowing from the banks provides the main counterpart of the increase of £463 millions in London Clearing Banks' deposits since the outbreak of the war. In the light of these figures, the dependence of the Exchequer on genuine short-term borrowing will be seen to have been comparatively moderate. Nevertheless, it is the growth in the floating debt which has provided the main factor in the expansion of bank credit. Since the outbreak of the war, and up to the end of March, bank deposits had risen by £419 millions. Treasury deposits, the new form of short-term direct borrowing from the banks, provided the counterpart to no less than £374 millions of this total.

In Germany, the recourse to short-term borrowing has been both absolutely and relatively greater than in this country. It is, moreover, of longer standing, since German national finances found their war footing about four years before the outbreak of the war. By 1938 the deficit had reached what by peace-time standards must be regarded as astronomic and certainly foreboding proportions. In the course of that year the national debt in Germany rose by Rm. 11,220 millions, of which Rm. 376 millions was floating debt. In 1939, the total debt rose by Rm. 21,240 millions, of which as much as Rm. 15,516 millions was borrowed on short term. In the first nine months of 1940, the total debt had risen by another Rm. 23,762 millions, of which Rm. 12,963 millions was added to the floating debt. The German money market has been sedulously nursed to ensure the ready absorption of these enormous issues of short-term paper, and the open market discount rate has been falling gradually, declining from an average of 2½ per cent for 1939 to around 2¼ per cent. The growth of bank deposits in Germany has outstripped the comparable movement in this country. In the course of 1940 the deposits of the Berliner Handelsgesellschaft and of the Commerzbank—two representative German banks—rose by 49 per cent, while over the same period German savings banks deposits increased by 30 per cent.

In Japan, the succession of budgetary deficits is of even longer standing than in Germany. Until quite recently, however, it has been covered mainly by medium and long-term borrowing, though admittedly this has been extracted in the main from a draconically regimented banking system. In 1938, the internal debt rose by Yen 4,548 millions, of which only a mere Yen 40 millions was in the form of floating debt. In 1939, the corresponding figures were Yen 5,544 millions and Yen 100 millions respectively. For the first seven months of last year the debt rose by Yen 3,300 millions, of which Yen 136 millions was added to the floating debt. The volume of banking credit has kept pace steadily with the budgetary deficit and the rise in the national debt. In 1938, commercial bank deposits averaged Yen 15,073 millions. By the end of 1939 they had risen to Yen 19,798 millions, and by the end of last September they stood at Yen 21,605 millions. Even more striking has been the rise in savings banks deposits, namely from an average of Yen 6,946 millions in 1938 to Yen 8,937 millions at the end of 1939 and Yen 11,042 millions at the end of last September.

In the United States the liquidity of the credit position must be explained in somewhat different terms. The potential of credit expansion in that country has been created by the persistent gold inflow. But, as in the case of the other countries discussed above, it is mainly the budgetary deficit which has translated that potential into the expansion of bank credit which has taken place since the New Deal started the long sequence of United States deficits. Recently, the impact of war orders by the Allies has been felt as an equally potent factor in the United States credit situation, and the consequent rise in bank loans to the armament industries will no doubt make further headway. Between June, 1933, and December, 1940, the national debt of the United States

rose from \$26,480 millions to \$44,458 millions. Over the same period the member banks' holdings of U.S. Government securities rose from \$6,887 millions to \$15,815 millions and their loans from \$12,858 millions to \$15,302 millions—by far the greater part of this last increase taking place in the last six months of this long period. Thus it is in the member banks' participations in successive Government issues that the mechanism of credit expansion has operated. But the basis for its operations has been laid by the large annual inflow of gold and the consequent expansion in member banks' reserve balances with the Federal Reserve Banks. At the end of 1940 the member banks had reserve balances of \$14,026 millions, of which \$6,615 millions were excess reserves. The best evidence of the consequent condition of over-liquidity in the money market is provided by the rates quoted for U.S. Government paper. The yield on three to five-year U.S. Treasury paper, which averaged 0.83 per cent in 1938, had fallen to an average of 0.50 per cent for 1940 and is now around 0.43 per cent. The market rate on three months' Treasury bills averaged 0.04 per cent in 1940 and has now fallen to 0.02 per cent.

All that need be done to describe the liquidity of the French credit situation is to draw attention to the recent increase in the limit of the Bank of France's advances to the State. At the time of the German invasion of France the limit of these advances stood at Frs. 45,000 millions. A further grant of Frs. 25,000 millions "for general purposes" was made on June 12th last. In August a further advance of Frs. 50,000 millions was granted to meet the costs of the German army of occupation. Since then the amount authorised has been successively raised to Frs. 65,000 millions, Frs. 73,000 millions, Frs. 85,000 millions and Frs. 100,000 millions. Given the economic prostration of the country, this particular form of credit expansion exceeds in its virulently inflationary implications any of the corresponding phenomena noted in the other countries mentioned.

The world-wide inflationary potential is, for the time being, held in fairly effective check. It is kept dormant by such factors as official controls of prices, of consumption, of alternative means of investments, of profits and dividends. It is also being neutralised by the inevitable deterrent of war to normal economic enterprise. But this vast growth in liquid investments cannot for ever be dammed up and kept isolated from the structure of world prices. The international growth of short-term debt, and indeed the larger growth in all fixed-interest-bearing debt, of which it forms a part, must make for eventual depreciation in the purchasing power of money on a scale larger even than has been evident since the outbreak of the war. It seems highly unlikely that after the end of this war we shall revert to the almost evenly matched cycles of inflation and deflation which characterised the nineteenth and the first four decades of the twentieth centuries. The pull of a metallic standard and of immutable mint parities has probably ceased to operate for ever. It is probable that we shall revert to the broad historical trend of monetary values, i.e. towards slow but steady depreciation of the purchasing power of money. The principal interruptions to this trend were those provided by the Dark Ages, when the discovery of fresh precious metals was almost at a standstill, and by the nineteenth and early twentieth centuries, when, with the gradual adoption of the gold standard, the fluctuating supply of gold became the main determinant of price movements. This more or less arbitrary influence on prices lost its power with the abandonment of the rigid parities of the former gold standard. At the close of this war there will be ample inflationary potential to carry further the gradual depreciation of money, and in the immense tasks of reconstruction there will be more than adequate material for harnessing that potential. On the other hand, there will be no desire "to look the dollar in the face," or other conventional monetary criterion to urge us on the road of contraction, retrenchment and deflation. The monetary history of the world provides, with the broad exceptions already mentioned, one long illustration of the safety valve of currency depreciation easing the load of debt which otherwise would have stifled all economic progress. Given the rate at which national debts are piling up the world over, the need for such indirect alleviation of the real weight of debt will be stronger at the end of this war than in any previous period in history. The task will then be to evolve practical methods of avoiding the disasters to which an over-rapid decline in the value of money has always given rise in the past.

Finance and Banking

Where the Treasury Bills Have Gone

The analysis of the sources of war finance contained in the White Paper issued this year with the customary Financial Statement provides valuable clues to the destination of the Treasury Bills issued through tender and tap in the first year of war and in the subsequent six months to February 28th last. The essential material may be summarised in the following table.

	In £ millions	
	Year to Aug. 31, 1940	Six months to Feb. 28, 1941
1. Increase in Treasury Bills held by the Market	458	—29
2. Increase in Fiduciary Issue	50	
3. Sales of pre-war Resources of Exchange Account	184	204
4. Sales of Overseas Capital Resources acquired by Treasury since outbreak of war	358	275
5. Increase of Overseas Balances in London		
6. Extra Budgetary Receipts of Public Departments other than Exchange Account	113	90
To these data may be added the following figures of changes in the Treasury Bill issue:		
7. Bills issued through tender	336	9
8. Tender Bills issued to market syndicate (included in item 7)	199	—136
9. Bills issued through tap	424	327

These figures shed light on many points which hitherto can only have been the subject of vague estimates. In the first place it will be seen that during the first year of war the Treasury Bills held by the market increased by appreciably more than the increase in the total of bills issued through the tender and that their expansion exceeded by an even greater margin the corresponding movement in bills issued to the discount market syndicate. The explanation is not to be sought in the growth of sterling area and other overseas funds in London, since their investment is included in the Treasury's table with the sale of overseas capital resources. The chief explanation of the divergence is probably to be found in the practice of feeding the clearing banks direct with bills issued originally through the tap, a practice which was being discontinued in the course of July and August with the initiation of the Treasury deposits scheme, but which must have left an important volume of such bills outstanding at the end of August, 1940. Similarly, the net fall in bills held by the market in the subsequent six months, when bills issued through the tender actually rose by a small amount, must be explained as a result of the running off of these bills and their replacement in the banks' assets by Treasury deposits. The part played by the discount market in canalising this supply of bills was considerable in the first year of war, but fell off appreciably in the subsequent six months.

No accurate attempt can be made to relate the various items in the above table, but their juxtaposition gives a clear picture of the distribution of the Treasury Bill issues over this period. The bills issued through the tap, in addition to feeding some of the banks' requirements in the first year of war, were also issued to the Issue Department when the fiduciary issue was raised by £50,000,000, and were being turned over to the Exchange Equalisation Account throughout this period, as its pre-war resources were gradually being expended. Part of these tap bills may also have provided for the investment of the other extra-budgetary receipts. The counterpart of sales of overseas assets acquired by the Treasury since the outbreak of the war will probably be found for the most part in public subscriptions to the Government's medium term issues. On the other hand, the increase of overseas balances in London, which in the Treasury's tables is included with the preceding item to form one total, has probably found its main employment in the discount of Treasury Bills originally issued through the weekly tender. This

largely explains the considerable reduction in the amount of these bills placed through the discount market in the six months to the end of last February.

Bill Rate Prospects

With the gradual return of money from circulation and a further £5,000,000 increase in the Bank's Government securities conditions in the short loan market have this week become exceptionally easy. They would have been plethoric had it not been for the fact that the discount market is being called upon to take up a larger quota of bills than for many weeks past and that, in consequence, it has been a potential seller of substantial lines of bills to the banks. The banks for their part have been good buyers, some of them being prepared to take July maturities, though most of them have restricted their purchases to the June bills. The prevailing ease of money is well reflected in the latest Bank return, which shows bankers' deposits at the comparatively high level of £115,145,000, an increase of £13,693,000 over the previous fortnight. With more bills offering, there is some expectation in discount market circles of raising the rate of discount to a slightly higher figure than has recently obtained. The opportunity for making a change should occur next month, when the market will again be tendering for 92-day maturities as against the 91-day bills which are now the rule. This may therefore be made the occasion for dropping the application price by 1d. to £99 14s. 10d. At this price the return would be 1½d. over 1 per cent as against the return of 1½d. over 1 per cent earned on the present scale. The more generous figure would hardly justify the charge of profiteering.

Easter Circulation Record

The Bank of England note circulation rose to a new record over the Easter holiday week-end. On the Wednesday before the holiday the notes outstanding amounted to £618,718,000, comparing with the previous record of £616,904,000 set up last Christmas. By Wednesday of this week, although some reflux of notes from the week-end peak had begun to make itself felt, the circulation had advanced further to £622,203,000. Although the seasonal variations in the circulation have lost some of their sharpness, they persist with a regard for precedent which is surprising given the disturbance of usual holiday arrangements. The Easter spurt in the circulation brought the total of unissued notes down to £8,038,000 and the reserve ratio to the unprecedentedly low figure of 5.0 per cent. Though there has been some relief from this extremely strained position, it is evident that the situation is now shaping for another upward adjustment in the fiduciary circulation. Despite the effects of the Budget and of the Government policy of price stabilisation, there can be no doubt that the general trend of the note circulation continues upward. In the circumstances a further £50,000,000 increase in the fiduciary issue can hardly be avoided between now and the summer months, when once again seasonal factors will be exerting their influence on the circulation.

Treasury Bill Offer Raised Again

After remaining for two successive weeks at its recently increased level of £70 millions, the total of Treasury bills to be offered at the weekly tender has again been raised by £5 millions. The £75 millions to be tendered for on Friday of this week is £10 millions in excess of next week's maturities. The discount market syndicate will automatically raise the aggregate quota of bills for which it tenders to the higher figure of bills on offer, and though its proportionate allotments may not benefit spectacularly from the increased offering of bills, its allocation of bills, in absolute terms, should increase materially, assuming the weekly issue to remain for some time at or above £75 millions. Especially is this so as the official "outside" tendering for bills should for some time be tempered by the disappearance of India Council funds absorbed by the recent vesting order. At last week's tender the applications showed a drop of about £8 millions, and the market was able to increase its allotment from the previous week's 26 per cent to 30 per cent of the £70 millions quota.

*

This is the time of the year at which the expansion in the floating debt is normally at its steepest. The decision of the authorities to spread that expansion over the Treasury bill as well as the Treasury deposit issue has probably been dictated by the requirements of the banking position. Owing to the outside competition for

Treasury bills, the clearing banks' holding of bills discounted has in recent months fallen to unprecedentedly low proportions. Last month the bill portfolio had fallen to £194,170,000, which compared with £335,740,000 in March, 1940, when the customary seasonal factors depressing the bill issue were as much at work as they were last month. The latest total was admittedly beaten in March, 1939, at the height of the Treasury bill famine which accompanied the substantial losses of gold then being incurred by the Exchange Equalisation Account. But even then the ratio of bills to deposits was considerably higher than it was last month—8.85 per cent against 7.03 per cent. The banks have no doubt found some compensation for this serious drop in their bill holding in their accumulation of six months' Treasury deposits. But the compensation is by no means perfect. The Treasury deposit has not the elasticity of the Treasury bill, and in the assets structure of the banks it must rank decidedly behind the latter in the matter of liquidity. It is, therefore, to suit the convenience of the banking system that the current increase in the floating debt is being effected through Treasury bills as well as Treasury deposits. The discount market is fortunate in benefiting from this decision, since it still provides the main channel through which the bills issued by tender reach the banks. But it is the interest of the banks and not the specific claims of the discount market which were primarily studied and given their due weight before the decision to increase the Treasury bills issue was reached.

INSURANCE NOTES

Refuge Assurance.—Extracts from the life revenue accounts of this large industrial-cum-ordinary office, which has its headquarters in Manchester, are set out in the accompanying table. The figures speak for themselves, and for the most part need no comment. New business has, however, fallen away rather more than in the case of other offices of this class whose accounts have so far been reviewed; concomitantly with this expense ratios are lower, reduced first year costs on new business having more than offset higher expenses resulting from war conditions, these expenses including the supplementing of service pay of employees now with the forces. In common with other offices, the company is meeting in full claims on policies issued before the war which arise by reason of enemy action, even if the war risk is excluded from the policy cover.

The annual valuation was made on a strengthened basis in the ordinary branch, the rate of interest assumed being 3 per cent as previously, but in the case of participating policies 9½ per cent only

of the net premiums has been valued; in the industrial branch the valuation was again made on a 2½ per cent basis. Combined earned surpluses were £1,037,703 (£337,537 in the ordinary branch and £700,166 in the industrial branch) a reduction of £732,171; of this reduction £542,621 relates to the ordinary branch and is doubtless largely attributable to the strengthened valuation. No reversionary bonuses are being granted in the ordinary branch, interim bonuses, however, being continued at a lower rate; the system of bonus allowances in the industrial branch is likewise being maintained on a modified basis. The cost of providing for these bonuses is £175,744 (£75,744 ordinary branch and £100,000 industrial branch); £450,000 is allocated to investment reserve and shareholders receive £112,500, against £120,000.

The chairman (Mr. J. Wilcock Holgate) stated at the meeting that the aggregate value of the company's Stock Exchange securities, based on middle market prices, very materially appreciated during the

year under review and exceeded considerably the figure at which they appear in the balance-sheets, the investment reserve funds, aggregating £4,700,000, remaining intact. In addition to these free reserves there are unappropriated surpluses carried forward amounting to £1,421,331. British Government securities increased during the year by £3,744,997 and now stand at £30,193,321, 40·47 per cent of the total assets; as the chairman rightly pointed out, so high a proportion of this class of investment is not conducive to a high interest yield but does possess some favourable features, one of which is the resulting very satisfactory balance-sheet position.

* * *

Wesleyan and General Assurance.—This society, which operates on a mutual basis, celebrates its centenary this year. The main features of the revenue accounts are revealed in the accompanying table. Liabilities were valued on the same bases as last year, with interest at 3 per cent in both ordinary and industrial departments and after making provision towards meeting excess mortality likely to arise from the war, the earned surpluses disclosed amounted to £287,873 (£119,866 in the ordinary department and £168,007 in the industrial department); this is higher than in 1939, in which year, however, the surplus had to carry the strain of converting the valuation basis in the industrial department from 3½ per cent to 3 per cent. Ordinary department policyholders are being allowed a simple reversionary bonus of £1 per cent, costing £82,344, and £20,000 is being utilised for bonuses to industrial policyholders; a noteworthy feature is that £20,000 of the profits in the industrial department is applied for the benefit of ordinary department policyholders. £50,000 has been transferred to investment reserve and £35,000 to general reserve, but £10,000 has been taken from the latter: reserve to strengthen the valuation basis in the capital redemption department, so that the net addition is £25,000. The staff pension fund receives £65,000 and bonuses to outdoor staff absorb £20,000.

In the balance-sheet mortgages represent nearly one-quarter of the total assets. It is certified that the assets are in the aggregate fully of the value stated, less the investment reserve of £600,000. There is a general reserve of £150,000 and surpluses carried forward unappropriated total £119,778.

Investment

Marking Time

The investor had scarcely time to digest the new Budget provisions before he was plunged into a fresh set of uncertainties by the German advances in the Balkans and Libya. It is far too early as yet to assess either the course, or the importance, of this joint campaign, but its immediate repercussion on the stock market has been twofold—namely, to dry up business and to reverse the trend of quotations for all stocks directly affected. In consequence, such securities as Egyptian Unified, Anglo-Iranian, and through them Burmah Oil, have touched new low levels for the current year to date, while Greek loans are at or near their worst. The rest of the market has varied between easy and weak, with few falls of importance, and virtually no selling. In a general way, those short of stock find it difficult to even up their positions, and, failing any reverse in the field of unexpected dimensions, it is reasonable to assume that there will be a resumption of selective buying as soon as the outlook is a little less uncertain. The foundations for this belief remain the reinvestment demand, so often referred to in recent months, and the fact that the Government attitude towards the crucial question of allowing industry to establish some reserve against post-war reconstruction is slowly becoming more sympathetic. On the former point, there is some evidence that the vesting of dollar stocks, and the repayment, or vesting, of Dominion issues may be even nearer than it seemed a few weeks ago. Despite the recent payout, Indian funds in London are still high, while Canadian sterling balances are accumulating fast, and the New Zealand Prime Minister has just announced a rise of £20,000,000 in the Dominion's London funds since the beginning of the year. In general, the growing "outside" applications for the increased amounts of Treasury Bills at the weekly tender point to the probability of action, early rather than late, to deal with some of this excess. In the case of Canada, vesting seems to be indicated; for other Dominions there are the alternatives of vesting and repayment of maturing loans. The Commonwealth and States of Australia have some £47,500,000 of optional maturities, which fell in last year, in addition to £11,500,000 of 3 per cent stock 1939-41, while New Zealand has over £13,250,000 3½ per cent repayable 1939-45, which could be paid off at any time, unless it were preferred to vest other stocks carrying a higher nominal rate of interest, of which there is a wide choice. Whichever alternative is chosen, the effect will be a growing demand for stock, which can only be satisfied by the tap issues of Government securities, or purchase of the fixed amount in the market. The offset provided by drafts on private and institutional savings is not likely to be large in comparison.

* * *

Municipal Conversion Option

Further particulars as to the pending municipal conversions, now available, suggest that the minimum life of the new stocks will be 24-25 years and that the right to convert will remain open for two months, in the case of those stocks subject to three months' notice of repayment, and for five months, where the notice period is six. This is a most unusual procedure, although not unknown. Presumably, the reasoning is that the longer the right remains, the more holders will convert and, in the particular conditions of the moment, this may well be the case, since reinvestment demand is likely to exert a favourable pressure. It is also permissible to hope that by the end of June, when the shorter period expires, the war outlook will be less uncertain than at present. In the ordinary way, it would be safe to assume that what is in effect a free option on the gilt-edged market for two or five months, would add something to the value of the maturing stocks. As things are, business in most of them has been very restricted for some months past, any stock coming on the market being snapped up by the money houses. Once the terms are officially announced, it is possible that these institutions will be ready buyers at rather over present prices. In this case, their desire to take maturing stock will be based on the expectation of a small premium on the new stock, issued in exchange, and not

on the desire to take cash on maturity, a transaction which would not be likely to win official approval. With little over ten days to go before May 1st, few authorities have so far announced their application for permission to convert, but it is safe to assume that a large sum will, in fact, be dealt with on May 1st.

* * *

Stock Exchange Finance

The appearance of the report of the Stock Exchange, London, for the year to March 25th, provides some indication of the impact of total war, and the control of financial markets, upon this important element in the organisation of the national savings. Total income fell by almost £203,000, or some 43 per cent, and, despite a small saving in costs and a reduction of £43,500 in taxes, the net figure available is a mere £6,163, compared with £150,607. In consequence, the proprietors receive no dividend and the carry forward is increased by a very moderate amount to £198,483. During the current year income is likely to be further reduced, but it is possible that the Trustees and Managers will draw on the carry forward rather than make a further issue of debentures, or a new call on the shares, on which the liability is unlimited. The actual membership of the exchange has declined only slightly, although there was a heavy fall in new entrants, but serving members, and clerks, retain their rights without paying full subscriptions, and this, together with the fall in entrants, is the main reason for the sharp drop in income. Some 1,156 members and 1,041 clerks—that is, house and room clerks, not office employees—have joined the forces, and the result of this, and of retirements, is a reduc-

PRINCES ST., LONDON, S.W.1

tion of some 41.5 per cent on the year in the population of the actual market and settling room, with possibly an even larger drop in ordinary office employees, as well as some replacement of men by women. Although it is possible that there will be no further falling off in business, there is every prospect of a considerable further reduction in the numbers engaged, and some brokers are already beginning to find difficulty in carrying out their task with the expedition and accuracy to which they are accustomed.

Argentine Railway Outlook

A semblance of life has been given to the market in the junior stocks of the British-owned railways of Argentina by the news of a fresh application by the companies to be allowed to increase their fares. This really does little more than call attention to the similar application made last autumn, and although more than one company chairman has expressed hopes that the result would be favourable, there is little real evidence that the concession will be granted in the near future. If it were, it would still be the case that the remedy was lagging far behind the growth of the disease. In the first half of last year there was a deterioration in peso receipts of some 19½ millions, and in the second half of some 17 millions against the previous year, when receipts were already unsatisfactory. Recent figures have shown some improvement on a year ago, due to exports to Spain, but there is no indication that the problem of providing export markets for the Republic is likely to be solved. Until this is done, the outlook for railway stockholders must continue gloomy. Not only will both inward and outward traffic remain small, but there will be a fresh threat to the stability of the peso and of further restrictions on the transfer of such currency balances as the companies are able to accumulate. It is possible that the Willingdon report, whose appearance is expected in the not distant future, may contain suggestions immediately applicable, as it will certainly furnish valuable information on a position which remains obscure in its details, however evident its general nature may be.

Cunard Results

The latest results of the Cunard group, relating to the calendar year 1939, show a substantial improvement in gross earnings, and a further gross rise for 1940 is forecast by the chairman, Sir Percy Bates, in his speech circulated with the report. Thus, total income of *Cunard White Star*, the leading operating company, rose from £6,949,959 to £7,586,883 in a year which included four months of war. Since general expenditure on renewals and repairs was reduced from £6,442,204 to £5,956,374, the company was able to place £1,032,211, against nil, to depreciation of ships and £124,531 to reserve against cash and balances in European countries, while reducing the free surplus only from £461,887 to £421,499. It was, however, necessary to provide £976,280 for depreciation of ships in 1938, which absorbs the whole of these sums and reduces the carry-forward from £223,152 for 1937 to £130,257. The rise in gross profits of *Cunard Steam Ship*, which holds 62 per cent of the *Cunard White Star* capital, from £359,309 to £387,573 leaving a free surplus of £63,443, which is wholly devoted to raising the carry-forward to £277,528, does little toward wiping out arrears on preference capital, which have been accumulating since the end of June, 1931. Sir Percy Bates points out that one further payment of £10,000 discount and commission on 5 per cent Mortgage Debenture stock will finally extinguish this charge and that, during the current five-year period, the company is empowered to repay the issue in whole or in part. *Cunard Steam Ship* lost one Mediterranean vessel, the *Bosnia*, by enemy action, although generally satisfactory results were obtained in this area in 1939. The chairman also informs stockholders that, since the date of the accounts, the remainder of the shares, amounting to 40 per cent of the ordinary capital, has been acquired in *Thos. and Jno. Brocklebank*. Agreement of requisition terms with the Government was complicated by the existence of the Treasury share in control of a number of *Cunard White Star* vessels, and this delay was partially responsible for the late publication of the 1939 accounts. Sir Percy considers that the terms now agreed represent a fair compromise, but it is hardly possible yet to estimate the movement of net earnings in the past year. Insurance receipts on vessels sunk exceed book values, but are

well below replacement cost, while deferred maintenance will have to be provided for, with, possibly, further writing off of assets in Europe. On the whole, the prospects of an immediate reduction in preference dividend arrears does not appear substantial. *Cunard Steam Ship* 5 per cent first cumulative £1 preference stock now stands at 36.

Alliance Trust Report

The full accounts of Alliance Trust for the year to January 31, 1941, show that gross revenue is almost maintained at £648,512 against £668,301. Management and general expenses have been strictly controlled during the year, showing only a moderate rise from £28,369 to £28,959, and, despite an inevitable rise in the tax provision from £151,161 to £200,463, the surplus for ordinary capital is reduced only from £286,327 to £244,174. At this level, it represents a rate of 42.9 against 42.3 per cent, thus providing ample cover for the ordinary dividend, which is maintained at 25 per cent. After transferring £100,000 to contingent fund, as in the three previous years, the carry-forward is £2,072 higher at £61,095. Since the accounts cover the first full-year of wartime conditions, the past year's profits must be regarded as highly satisfactory. They are, of course, largely a reflection of the extent to which industry as a whole has contrived to maintain a stable dividend policy in the early months of the war. There is little prospect that stockholders, either in investment trusts or in industrial concerns, can indefinitely be protected against the impact of rising costs and taxation, but Alliance Trust continues to maintain a substantial margin of cover for the ordinary dividend. The balance-sheet valuation of investments, at or under cost, shows a further reduction from £11,455,860 to £11,398,996. The £100 ordinary stock, at £460, yields £5 12s. per cent.

Union Corporation Group

Geduld ore reserves were more than maintained at 9,000,000 tons with a slight fall in grade to 4.5 dwt., and development on the Black Reef has started. Profits were higher than in 1939, but with increased taxation the dividend is cut from 16s. to 15s. The major development in this mine is completed, and it will become increasingly dependent upon its large holding in *East Geduld*, and to a lesser extent in *Grootvlei*. *East Geduld* had another highly successful year: owing to the increase in the price of gold, 2,600,000 tons of 2.5 dwt. ore, already developed, were brought into the reserves. Moreover, development was expedited, and, in all, the reserves increased by a further 3,700,000 tons to 15,200,000 tons, averaging 5.2 dwt., a fall in grade of 0.5 dwt. Profits increased substantially, but taxation was higher, and dividends were maintained at 14s. *Grootvlei* also had another satisfactory year: a large tonnage of low-grade ore was included in the reserves, which showed an increase of 2,300,000 tons at 7,500,000 tons, averaging 5.2 dwt., a fall in grade of 0.3 dwt. As forecast, development in the Eastern portion of the mine is not so good as in the Western area. The plant is now crushing to its normal capacity of 120,000 tons a month, a figure which will be considerably increased when ore from *Palmietkail*, which has now been absorbed by *Grootvlei*, becomes available. The total dividend is raised from 3s. to 4s. 6d. per share, and should be further increased in the current year. The ore reserves of *Van Dyk* were increased by 500,000 tons to 3,100,000 tons, averaging 5.4 dwt., a fall in grade of 0.2 dwt., but are still not adequate, so that intensive development will be continued until the position becomes satisfactory. This factor, extensive minor faulting, a narrow reef in certain areas, and the cost of additional support to mine workings has raised working costs, but dividends are increased from 3s. to 3s. 6d. Plant is now running to capacity, but the ore reserve position must improve before any expansion may be expected. The intersection of the fault and excessive water has again restricted underground development in *Marievale*. Otherwise development has been satisfactory, and reserves at end-1940 amounted to 2,000,000 tons, averaging 5.7 dwt., an increase of 300,000 tons, but a decline in grade of 0.1 dwt. The plant is now crushing to full capacity of about 50,000 tons a month. A maiden dividend of 8d. has been declared and half-yearly dividends should increase. Development is at present in the centre of this very large property, and it is difficult to forecast results in the Eastern and South-

western sections of the mine. It can, however, be said that *Marievale* is the only property north of *Sub-Nigel*, on the eastern fringe of the Rand basin, which has prospects of a promising career.

Central Mining Results

The *Crown Mines* report shows that available ore reserves fell by 1,024,500 tons to 20,207,000 tons having a grade of 4.8 dwt., a decline of 0.2 dwt. The ore reserve position is so strong that the decline in tonnage should cause no anxiety. Working profit showed a substantial increase, but, with higher taxation, the dividend is reduced from 190 to 185 per cent. Owing to the great depth and poor ventilation in certain areas, refrigerating plants are to be gradually installed. *Crown Mines* is crushing over 4,000,000 tons a year, and is naturally dependent to a large extent on the supply of native labour. *East Rand Proprietary* had another difficult year. Ore reserves fell by 315,900 tons to 10,336,300 tons, averaging 4.9 dwt.—a fall of 0.2 dwt. in grade. Development in the central portion of the mine was restricted owing to ventilation troubles, and disclosures in the eastern and western sections showed no material improvement. Rock pressure trouble was also experienced during the year in the central sector, but these difficulties are being overcome, and the underground position should gradually improve when the new ventilation plans come into operation. In spite of the increased taxation, available profits were almost maintained and the total 3s. 6d. dividend was repeated. *Rose Deep* was again able slightly to increase its ore reserves by 24,400 tons to 2,424,800 tons at 3.9 dwt., a fall in grade of 0.1 dwt. Development was mainly in the Southern Section, which gave erratic and generally disappointing results. Capital expenditure was reduced and dividends total-ling 2s. were paid, as against 1s. 9d. for the previous year. Ore reserves of *Geldenhuis Deep* showed a further decline of 147,200 tons to 837,600 tons, averaging 3.3 dwt., a further fall of 0.2 dwt., and represents about one year's supply. A capital repayment of 2s. 6d. a share was made during the year. Profits are tending to fall, but a dividend of 4s. was paid on the reduced capital. The life of *Geldenhuis Deep* is, of course, very limited.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

SCARCITY of business was the outstanding feature of the stock markets both before and after the Easter holiday. Discouraging news from the Balkan war zone and from Libya contributed to the smallness of turnover, assisted no doubt by holiday influences. A definite setback in most sections on Tuesday did not lead to continued selling pressure, and, in midweek, price changes were extremely narrow, while the gilt-edged market showed signs of rallying. On the whole, the tendency in all sections was for prices to fall moderately. For obvious reasons, the foreign bond and oil markets suffered rather more severe losses.

On Good Friday, hardly enough business was put through to test prices, but a number of stocks continued to lose ground after the general selling of the previous day, so that, before the week-end, 2½ and 4 per cent Consols, 3½ per cent War Loan, and all the Funding issues lost ½ on the midweek quotation, while 3½ per cent Conversion fell ¼. Further losses of ¼ were suffered on Tuesday by such leading investment issues as 2½ and 4 per cent Consols and 3½ per cent Conversion and War Loans, and various Indian stocks were lower on balance. In the foreign bond market, the chief casualties were, understandably, Egyptian and Greek issues, while certain central European bonds, including Austrian 4½ per cent and Czech 3 per cent stock, were lower in sympathy. The chief falls in Egyptian issues took place on Tuesday, when Egyptian Unified slumped 4½ points and Egyptian 3½ per cent loan 5 points. On the same

day, Greek 7 per cent lost 1 point. Far Eastern bonds were dull on news of the conclusion of the Russo-Japanese Neutrality Pact, and, after the week-end, the Japanese 5 per cent issue of 1907 and the 6 per cent issue of 1924 both lost 1½ points. Brazilian funding issues were again out of favour, and the San Paulo Coffee loan lost ground.

There was little support for home or foreign rails over the Easter holiday. Losses were concentrated on the ordinary stocks of the main line railways, but some of the senior issues also came under pressure. Thus, Berwick 4 per cent 1st preference lost 1 point on Tuesday, when Great Western ordinary, LMS ordinary and Southern deferred all eased ¼ point and Southern preferred was ½ point lower. Among foreign rails, there was some demand for Argentine issues on the prospect of an increase in charges, and Bengal and North Western remained in demand. Canadian Pacific preference was marked down in a small way.

There was little business among industrial issues, and the post-budget rises in brewery and tobacco shares rendered them all the more liable to attack. The tobacco leaders lost ground daily, and, in the brewery section, Barclay Perkins, Distillers, Watney Deacy and Ind Coope were all quoted lower. The general weakness extended to electrical equipment issues, among which Associated Electrical Industries, GEC, Crompton Parkinson and W. T. Henleys all suffered, and, in the textile group, Courtaulds, Coats and British Celanese experienced small losses before the weekend. The heavy industrial group remained relatively firm, but

Maypole Dairy Meeting

In his speech at the annual meeting of Maypole Dairy, Sir George Schuster showed that this concern, as well as the Home and Colonial group proper, is finding that the burden of war taxation trenches deeply into earnings. The facts are interesting since last year the company's total profit, after depreciation, at £393,531, was slightly in excess of the £382,610 for 1938-39, the last year of normal peacetime earnings. In the earlier year, the company reserved £35,000 for taxation, and retained a free surplus of £207,610 from which a dividend of 9 per cent was paid to deferred shareholders. Last year, with a total tax reserve for income tax and EPT of £180,000, the surplus was reduced to £86,031, at which level it did not completely cover the reduced 4 per cent deferred dividend. The provision of £35,000 for contributions under the war damage bill to the end of the Maypole financial year is met by a draft on reserve. Sir George Schuster points out that EPT was deducted at a rate of only 90 per cent during 1940-41 and that liabilities under this head will be heavier during the current year. From the profit earning standpoint, the concern has always specialised in dairy produce and jam, all goods which are now either rationed, or, in the case of eggs, in short supply. Consequently, no redress is possible through extension of sales, although the company is doing everything possible to develop new lines. On the general question of war taxation, Sir George reinforced his criticism, made at the Home and Colonial meeting, that the present weight of taxation, and the practice of disallowing for exemption from income tax sums spent on many essential repairs, was responsible for an accumulating liability for renewals and replacements. Some of Sir George's points are met by concessions in the new budget, but there does not appear to be any change in the administration of EPT which overcomes the disability imposed on those concerns which suffered from depression during the base period. Even so the 20 per cent refund will be of material assistance. As to the possible bearing of other concessions nothing definite can be said until the Finance Bill is available. The 2s. deferred ordinary shares, at 1s. 6d., yield £5 6s. 8d. per cent.

among miscellaneous industrials, Boots, Associated Portland Cement, London Brick, Dunlop and Turner and Newall were all quoted lower. Hudson's Bay and Sudan Plantations also suffered small losses on Tuesday.

The commodity share markets reflected to the full the general weakness. Turnover in *kaffirs* was particularly small, but Sub Nigel led the market downward on Friday with a fall of ½, when *Grootvlei*, *Rose Deep* and "Sallies" were also losing ground. After the holiday, the market remained relatively firm, though there was no recovery in business. The rubber market also attracted a minimum of attention, and, in the oil market, geographical proximity to the Middle Eastern war zone gave rise to considerable selling. This was most marked on Tuesday, when both the ordinary and preference issues of Anglo-Iranian slumped, the former losing ½, while Burmah ordinary eased ¾. Shell Transport, after previous firmness, gave way ½, and the Trinidad issues were also lower. Selling in this market was continued in midweek, when Anglo-Iranian and Burmah Oil were mainly offered.

Industry and Trade

Unemployment in March

On March 17th the number of persons on the registers of employment exchanges was 458,000, a decline of 123,000 from February 10th and of 774,000 from August 14, 1939. The total number of registered unemployed last month included 364,000 persons wholly unemployed, 76,000 temporarily stopped and 18,000 normally in casual employment. Moreover, the wholly unemployed group included only 160,000 men. The unemployment problem has now been solved after nineteen months of war, though it should be possible to reduce even further the number of wholly unemployed. At the present moment Great Britain cannot afford the wastage of a single pair of hands. Moreover, employment in unessential and overstaffed occupations must now be reduced to the minimum compatible with the maintenance of the health and efficiency of the civilian population. This principle has been accepted by the Government, and its application is reflected in the revision of the schedule of reserved occupations and in the compulsory registration of men over military age and of women. But it is not enough to provide the machinery for transferring workers to the war effort. It is the speed of the transfer that counts.

* * *

Wages and the Cost of Living

One of the most important features of the Budget was Sir Kingsley Wood's announcement that a further rise in the cost-of-living index was to be prevented as a means of arresting the upward trend in wage rates and in the prices of manufactures. If Sir Kingsley Wood's announcement is the prelude to the introduction of a national price policy, it will mean a big step towards the closer control of the national economy. As the data given in the next Note show, workers' earnings rose, on the average, by nearly 30 per cent between October, 1938, and July 1940; and as the upward trend has continued, the average increase in earnings since October, 1938, must have been well above 30 per cent. The official cost-of-living index for March 1st showed a rise of 27 per cent over the figure for October 1st, 1938, when it stood at the same level as before the outbreak of war on September 1, 1939. It appears, therefore, that the rise in average earnings has exceeded the advance in the official index of the cost of living. The trend of the net return of capital employed in industry, on the other hand, has

(Continued from page 535)

New York

BEFORE markets closed for the Good Friday holiday and on Saturday, Wall Street sentiment was predominantly lethargic and business remained narrow and irregular. An improvement in the domestic labour outlook was largely nullified by the serious turn taken by military developments in the Balkans and in Libya, and, generally, the prevalent uncertainty held down turnover to a low level. This week, again, little business has passed. An incipient rally on Tuesday was cancelled later in the day by a more pessimistic reading of the labour outlook, and dealers were discouraged by the conclusion of the Russo-Japanese Neutrality Pact. Steel issues remained strong against the trend, although there were, in fact, few net falls on the day. The American Iron and Steel Institute estimates steel mill activity at 98.3 per cent of capacity, against 99.3 per cent in the previous week.

Total share dealings: Apr. 9, 580,000; Apr. 10, 360,000; Apr. 12, 290,000; Apr. 12, 290,000; Apr. 14, 460,000; Apr. 15, 450,000.

been downwards since the beginning of the war. The aggregate net profits of the 531 companies whose accounts were published and analysed in *The Economist* between January 1st and April 12th this year, show a decline of 11 per cent from the preceding year. The comparison is not exact, since net profits are struck after taxation, while workers' earnings are, of course, gross and there has been some increase in the taxation that falls on the lowest incomes. But the figures nevertheless serve to show that the trade unions will not be sacrificing their members' interests if they accede to the Government's wish for a stabilisation of wage-rates.

* * *

The Rise in Earnings

The analysis of earnings which appeared in the *Ministry of Labour Gazette* for November and December last year is summarised in the March issue with certain recalculations intended to make the 1938 and 1940 figures more comparable. Returns received from employers did not represent the different industries in the same proportions in October, 1938, and July, 1940. They have now been recalculated on the basis of the numbers actually employed at each date. Figures for Government industrial establishments have been added. As some of the firms which supplied data in July, 1940, did not give separate figures by age and sex, the earnings for men, women, boys and girls at this date are based on less than four-fifths of the total returns, and therefore are also not fully comparable with the figures for the earlier data. Subject to this qualification, the table on the next page shows, for the principal industries, actual average earnings in July, 1940, for men, women and boys, and the increase over the earnings in October, 1938. The earnings of girls under 18 ranged from 18s. 8d. in the paper, etc., group to 36s. 4d. in Government industrial establishments, and they averaged 22s. 4d. in all the groups. Their increases compared with October, 1938, ranged from 8.3 per cent in the food group to 45.6 in the treatment of mines products group, and averaged 20.7 per cent. When the average earnings for the separate industries are weighted according to the numbers employed in October, 1938, to eliminate as far as possible the effects on the general averages of changes in the numbers employed, the increase in earnings is approximately 27 per cent for all workers, 26 per cent for men, 32-33 per cent for boys and 18 per cent for

† Probably an understatement, as the firms in the motor vehicle, aircraft, etc. industries which omitted to supply data classified by age and sex were among those at which earnings were highest.

but the rise in earnings cannot be attributed solely to war conditions, since there was a substantial improvement in employment between October, 1938, and September, 1939.

War Workers' Welfare

Perhaps because of its policy of coaxing rather than compelling people, especially women, into the work where they are most needed, the Ministry of Labour is occupying itself more than ever before with matters of welfare. It publishes messages to employers suggesting that their canteen arrangements should be modified in order to bring the meals more into line with those to which the workers have been accustomed, and suggesting a snack for workers on overtime before they go home; it warns dock authorities that notice may be served on them requiring them to provide canteens and washing facilities, and now it has published a pamphlet on the welfare of women workers, addressed especially to large employers who have no previous experience of employing women, but applicable to all employers of female labour. This pamphlet stresses the importance of appointing a woman personnel officer, and outlines her duties. It also emphasises the necessity of making new entrants feel welcome. The long hours which have frequently been worked since last June are criticised as unproductive, and it is urged that the weekly working time should not exceed 48-56 hours. It is pointed out that if the hours are not so arranged as to allow women workers to do their shopping there is bound to be discontent, bad time-keeping, and even absenteeism. It is recommended that part-time work should be available for married women, and that those with husbands in the Forces should be promised reasonable leave of absence when their husbands are home on leave. Those with young children to be got off to school or day nurseries in the morning should be allowed time for this. All these provisions are admirable. If the time does come when the Government exercises its powers of compulsion the workers will find themselves more comfortably off than they might have been if the community had never been wholly dependent upon their good will.

(Continued on page 538)

COMMODITY AND INDUSTRY NEWS

THE Government has decided to free reserve rubber to replace losses due to enemy action. Spot smoked sheet closed on Wednesday at 14 1/2 d. per lb., compared 14 1/2 d. a week ago and 13 1/2 d. a month ago. On Wednesday the price of tin, standard cash, was £269 15s.-£270 15s. per ton, and the three months' figure was £269 15s.-£270 15s. per ton, the highest the spot price was £267 10s.-£268 per ton, while the three months' quotation stood at £264 15s.-£265. Though raw cotton prices in Liverpool remained fixed at 9-24d. per lb. American middling there was an upward movement in New York early in the week, but this was followed by a setback on Wednesday.

for insurance. By a further order (No. 491) practically all the goods which had previously been uninsurable under the commodity insurance scheme became voluntarily insurable under that scheme, from April 17th. Growing crops, live-stock and certain agricultural products, as well as goods supplied under hire-purchase agreements, remain uninsurable under the commodity insurance scheme and therefore become insurable under the business scheme.

Pacific Copra Marketing Board.—The Governments of Australia, New Zealand, Fiji and the Eastern Pacific High Commission are to set up a Pacific Copra Marketing Board, with headquarters at Sydney. It will administer a scheme to assist British and Free French copra-producing areas in the Pacific, including mandated territories.

Food.—The Ministry of Food has received from the West Indies 500 tons of orange and grapefruit pulp for marmalade making, and orders placed are expected to reach 1,500 tons; the price is £20 per ton for orange pulp and £18 per ton for grapefruit pulp. In order to increase the amount of sausages, galantines and pressed meats, the special allocation of meat for manufacturing purposes to general butchers was doubled from April 14th. Consignments of boned frozen meat are now available for distribution. Maximum importers', wholesale and retail prices for imported canned pilchards and herrings were fixed on April 14th. The prices vary (according to the size of containers and the number of containers in a case), on a first hand sale, from 25s. to 38s. 6d. per case, on sale by wholesale, from 27s. 6d. to 42s. 6d., and by retail from 4d. to 10 1/2 d. per container. The order restricting sales of milk to six-sevenths of the quantity sold in the first week of March came into force on April 13th. An Order made by the Minister of Food which came into force on April 14th, prohibits, except under licence, the use of rice for purposes

other than the manufacture, production or preparation of human food.

COMPANY MEETING

THE BAH LIAS RUBBER ESTATES,
LIMITED

DIVIDEND OF 7½%

The thirtieth annual general meeting of the Bah Lias Rubber Estates, Ltd., was held on the 16th instant in London.

Mr. H. Eric Miller (the chairman), in the course of his speech, said:—The rubber crop accounted for, 5,487,930 lbs., shows an increase over the corresponding figure for the previous year of 46 per cent. The sale price, at the equivalent of 11½d. per pound London landed terms, is about 2d. per pound better than for 1938-39.

With these two favourable factors, the available profit for the year under review would have shown a substantial improvement but for the heavy increase in the burden of taxation.

(Continued from page 537)

The Vegetable Marketing Company

The promise to vegetable growers that they should have a guaranteed market for their carrots and onions has now been implemented. Schedules of prices at which these vegetables will be purchased have been published, and a national marketing company has been formed to deal with them. The Ministry of Food will be represented in the company by Mr Pym, M.P., the chairman will be Mr W. P. Spens, M.P., and the managing director will be Major Edgar Munro, who, as the head of a firm in Covent Garden, can bring to his task a practical knowledge of the technique of vegetable marketing. Potatoes will presumably remain under the control of the Potato Marketing Board. Other vegetables may also be dealt with by the new company, but for the time being, at any rate, it is likely that carrots and onions will be its principal care. When our staple foods come to be counted on the fingers of one hand, carrots will still be one of them, and it is therefore highly important that no matter how lavish the output it should never come to be regarded or treated as a glut. By orderly marketing, and if necessary by properly planned use as fodder, this can and will be prevented.

* * *

Manganese Ore and the War

The extension of the war to the Eastern Mediterranean is likely to affect the international trade in manganese ore. Soviet Russia, the largest manganese producer in the world, contributed 2,900,000 long tons to the world output of 5,800,000 tons reached in the last year preceding the war (1938) and is exporting her ore via the Black Sea. Manganese shipments from Russia have already suffered through the reduction of trade through the Mediterranean. It is quite conceivable that they will cease altogether in the near future, especially if the German threat to Turkey continues to persist. During the last war, too, there was a serious shrinkage of Russian manganese ore exports, although then urgently needed supplies were transported at heavy cost via Siberia and the Pacific to the United States. The British iron and steel industry would not be affected by a possible stoppage of Russian shipments, for British plants have used hardly any Russian manganese ore in recent years. The United States, too, would scarcely be affected by the loss of supplies from Russia. The chief reason is the expansion of the British Empire's output of manganese ore in the past quarter of a century. British India, which started to produce manganese ore almost fifty years ago, is now in a position to supply, if necessary, up to 1,500,000 long tons of metallurgical manganese ore per year. The Gold Coast, where the first deposits were found in 1914 and where production started on a small scale in 1916, can now easily produce as much as 650,000 tons of high-grade ore per annum. Moreover, the years preceding the war have witnessed a systematic development of production in the Postmasburg district

The total provision for taxation for the year under review of some £114,000 is equivalent to 22½ per cent on the issued capital, and the dividend you are to receive of 7½ per cent gross is equivalent to only 4½ per cent net after deducting tax at 8s. 6d. in the £.

I will not repeat what I said last year about the hardship of double taxation which is virtually expropriatory, but when times are more propitious we will do what we can to get the injustice remedied.

Our own estates continue to be upkept at the expected high standard of efficiency.

We are estimating the accountable crop for the financial year 1940-41 at much the same as that for the year 1939-40. The estates continue to be worked economically, and as the price of rubber is being maintained at a reasonably profitable level you can see for yourselves that the company is likely to make further substantial contributions to the revenues of the Netherlands Indies and of our own country.

The report and accounts were unanimously adopted.

of the Cape Province in South Africa, where production reached a peak of 621,200 long tons in 1937, and where at least 750,000 tons could be produced yearly without further development work if a market can be found for such a large tonnage. Additional supplies from the United States and the Sinai Peninsula of Egypt could raise potential supplies of British and Empire companies to something like three million long tons per year, which would more than cover both Great Britain's and the United States' needs. The United States, however, can also obtain not inconsiderable tonnages of manganese ore from Brazil and Cuba, where about 400,000 tons annually are produced with United States capital. Here, however, the greater part of supplies consists of low-grade ore. But as the American iron and steel industry has already prepared itself for the loss of Russian manganese ore, no technical difficulties are likely to arise from the increased use of low-grade material. While some years ago America's imports were still dominated by supplies from Russia, the Russian share of her total imports in 1940 was below 15 per cent. British India, South Africa and the Gold Coast supplied about 55 per cent of the total imports of slightly under 1,300,000 tons, while the bulk of the remainder came from Brazil and Cuba.

Dried Bananas

In the House of Commons it was recently announced that the Colonial Secretary was in consultation with the Minister of Food on the question of importing dried bananas into this country. If the banana ban could be lifted in favour of the dried fruit, it would be of great assistance not only to the Cameroons, which is largely dependent on banana exports and where the Germans long ago introduced the drying process, but also to Jamaica, where the banana surplus, as was pointed out in an article in *The Economist* of March 29th, page 410, is creating grave financial and economic difficulties. Clearly, fresh bananas must give way to other foodstuffs in the shipping queue, because their food value in relation to the shipping space they require is small. But it is claimed that dried bananas take up only 5 per cent of the shipping space needed by bananas on the stem; moreover they need not be shipped in refrigerated vessels. The method of drying is simply to place the fruit in a closed chamber, through which warm air is pumped. Unripe bananas, which have been dried and then beaten into a powder, make an excellent stock food. Ripe bananas, dried, are reported to be a palatable human food. In France, flour made from dried ripe bananas has been mixed with cocoa and used to make a beverage called "Banania," which is said to be both nourishing and pleasant. It is to be hoped that the Ministry of Food will give serious consideration to these claims of the dried banana and, if they are justified, to lift the import ban, for, besides giving much-needed assistance to two distressed Colonies, it would at the same time provide a cheap and nutritious food for the people of this country.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended April 12, 1941, total ordinary revenue was £23,877,000, against ordinary expenditure of £79,633,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £112,531,000 against £54,763,000 for the corresponding period a year ago.

"Old Basis" includes public issues and issues to shareholders. "New Basis" is all new capital in which permission to deal has been granted.

BY TENDER

Bristol Corporation.—Tenders are invited for £500,000 Bristol six months bills. Tenders will be received at Westminster Bank, New Issue Dept., 41 Lothbury, London, E.C.2, on April 22, before 2 p.m. Bills in amounts £1,000 and £5,000 dated April 28, will be payable October 28, 1941.

PRIVATE PLACING

Smethwick Drop Forgings.—This company proposes to increase its capital from £175,000 to £325,000, so that it can enlarge its productive capacity. The new capital is to be £150,000 five and a-half per cent cumulative redeemable preference. To be redeemed by cumulative sinking fund of £3,750 per annum, from

year ending March 31, 1943, by purchase at any price up to 22s. per share (exclusive of accrued dividend), or failing purchases by drawings at 22s. per share. Meeting April 26.

Shorter Comments

Skefko Ball Bearing.—Final dividend 10% per cent., tax free, against 12½ per cent, making 17½ per cent, tax free, as compared with 20 per cent. Net profit £180,696 against £253,396 (after tax).

Swedish Separator.—Aktiebolaget Separator (Stockholm) reports a net profit for 1940 of Kr.3,450,000, against Kr.5,130,000 for 1939. Dividend 4 per cent, against 6 per cent.

of them state this conclusion baldly. Actually, it is as near certain as makes no matter that every one of them would have decided as Mr Churchill did. Their objections now are not to the dispositions which were made, but to the reserves which have followed. If Yugoslavia had been offered no aid and if Greece had been left to perish unhelped, while the German tide flowed on into the Peloponnesus and the Aegean Islands, the protests of these critics would have been no less loud. And they shared with the general public in the gratitude and relief with which the opening of the Red Sea to American ships and cargoes—made possible by the mopping-up of East Africa—was greeted. Their chagrin now is mainly a reflection of the over-high hopes with which they awaited the Balkan and Libyan battles. They knew the facts, but they did not draw the right deductions.

It is, of course, possible to question the system of intelligence which allowed the first German drive into Cyrenaica to be described officially as a "propaganda gesture." It is more than possible to protest at the system of information which wraps up the meagre facts of these overseas operations in a cloud of reassuring statements which are an insult to the common sense and fortitude of the British people. The public do not ask for a running commentary on what is happening in every theatre of war. They know, as Mr Churchill has said, that news of complicated and crucial operations on remote fronts must seep out slowly—even to the Government. There is no need for the official pundits to comment, reassuringly or otherwise, on what even they do not know. But these are matters of detail. It is still not possible to envisage an alternative course of action which would have turned defeat into a victory and routed the Germans.

The uncomfortable fact must be swallowed; there have been setbacks, and there will be more setbacks, not because the higher strategy of the Cabinet and the Services has, on balance, been wrong, but because the forces at their disposal are still too weak. And the reason for this goes back a year to the fall of France and more years still to the ineptitude of the economic preparations made for fighting. There has not been time yet since Norway and Dunkirk to catch up the enemy's long start. The flood of American aid has still to come; and it is a stark fact that it may take years to gather strength enough to stand victorious in the field. Until then it will be "guerrilla warfare," except in the defence of Britain and the Atlantic lifelines; and, despite the grievous course of events, the campaign in Greece has been a guerrilla operation of no small importance. It has shocked and mauled the enemy and eaten into his precious materials. Moreover, there are notable credits to set against the setbacks. It was against odds that General Wavell destroyed Italy's African army; against odds that Admiral Cunningham drove a hostile navy from the open sea; and against odds, tangible and intangible, that the will to fight was kept alive in South-Eastern Europe. A show of force in Iraq has shown its local *fuehrers* that it is not all jam to shout with the Swastika men. In Cairo, with some justification, there is still "calm and confidence."

In Revolutionary France defeated generals were guillotined. In ramshackle Italy, still, soldiers and sailors are made scapegoats. It would be a pity if an attempt were made to follow these brutal precedents in British affairs. Last year a welter of incompetence in almost every department of war management—brought to a head in Norway—very properly led to the fall of a Government and probably to the salvation of the State. But there is no parallel now. Two of the Services have been overhauled at the top—the Army and the Air Force. In the key positions of the Government there are new men of vigour; and in every branch of war strategy, economic as well as military, there is a new awareness and determination. The old faults of reluctance and delay do reappear, it is true; there is still need, now underlined again, in battle, for

more haste and drive in economic mobilisation; there is a paucity of talent over the range of Ministerial offices. Only in Mr. Churchill are the war qualities of ruthlessness and resolve fully shown. But there is no better alternative Government waiting in the wings. Among the known leaders of all the parties there is no statesman to play Churchill to Mr Churchill's Chamberlain; no Labour leader to play Bevin to Mr Bevin's Brown; no virtuoso to play Beaverbrook to Lord Beaverbrook's Kingsley Wood. A new Government is not needed. If there are failures in the field, Mr Churchill's Government has failed with its eyes open, not erred with its eyes shut. Every sign points to the fact that Mr Churchill, as supreme director of strategy, now knows the road that must be travelled—the ways and means by which, with American aid, a lasting deficiency of man power will be made up, on land as well as in the air, by superior equipment. There is every reason for the utmost public criticism—of a constructive kind—in times of crisis. For *The Economist* to deny that would be to repudiate its own record. But the pattern by which reverses in battle are matched by a frontal attack on the Government is not one to be repeated.

This is not to say that changes are not needed, quite independently of the immediate perils. Mr Churchill is not *primus inter pares*. He stands out alone. He directs everything, for no one else in his Cabinet has the broad grasp of grand strategy that total war demands. His colleagues are often able and energetic specialists, but they are not statesmen. Mr Churchill needs help. It is not a new Government that is wanted, but a stronger one. The present Government is the best possible all-party administration. It is not the strongest possible assemblage of the Empire's leaders. In Australia this week there are complaints, from the Labour Opposition, because the AIF was rushed into Greece. They are misplaced and arise from foreboding. The fact that this is Australia's war has already been recognised, and Mr Menzies has remained in London to sit with the War Cabinet. There is an inkling of what is needed in this. What is wanted to direct Imperial strategy and satisfy the Empire's will is not, of course, representatives from each Dominion; that would simply repeat the fault of the present Government, whose main weakness is that its members are chosen, in balanced proportions, to represent each party. The need is for the best men in the Commonwealth—regardless of party or country.—a War Cabinet chosen from the widest field. Mr Menzies might be one. In another of the Dominion Premiers, General Smuts, there is a man of quite unexampled experience who, in the last war, played as vital a part in the day-to-day government of the country as any one but the Prime Minister of that day. That Prime Minister himself is still alive—and kicking. Mr Lloyd George may no longer be capable of sixteen hours' work a day; but he is no older now than Clemenceau was in 1918, and his matchless talent for making other men decide and act is still at his country's service. There are others of strength and vision available at home if the net is cast wider than the party politicians—Lord Trenchard, for example. There is no question that a real War Cabinet could be assembled if Mr Churchill willed it.

Total war requires total government. Mr Churchill was quite right some months ago when, in effect, he claimed that there were not men enough of ability among his all-party colleagues to man a War Cabinet and the war departments as well. But it would be an unproven reproach to the Commonwealth to suggest that there are not leaders enough, outside the political hierarchies, if need be, in the length and breadth of Britain and the Dominions. The lesson of the growing crisis is not that someone has blundered. It is rather that we are strongly menaced and still perilously weak; and that to win through this trial to the years of attack and triumph requires the leadership that only a full sifting of all the brains and character of the Empire can give.

American Survey

To survey in adequate range and detail the procession of public affairs and the development of economic tendencies in the United States presents a journalistic problem at any time. America is not "just another foreign country," and the interest of readers of *The Economist* in American affairs, even of the purely internal kind, goes far deeper than with those of any other country save their own. But in wartime, just when the affairs of the United States and Great Britain are getting daily more "mixed up together," the difficulties of reporting on American events are greatly increased. Cabled news is scanty, other information is shockingly delayed, and space is short.

The Economist has given a great deal of thought to the problem thus posed, but has always come up against an inescapable dilemma. Its one horn is to select for comment only the outstanding events and its other horn is to list in summary form a long catalogue of items without the comment needed, in many cases, to extract their significance. It is not claimed that the following three pages escape from this dilemma, even for a single week. On the contrary, they illustrate it. But it is hoped that by the mere juxtaposition of so many different items, some idea will be conveyed of the breadth and colour of the canvas on which the American democracy is painting current history.

The Fight for Public Opinion

THE isolationists have by no means abandoned the struggle. For a moment, the passage of the Lease-and-Lend Act seemed to decide the issue and the isolationist vote in the Senate fell to a mere handful on the Appropriation Bill. But the trend of the news in recent weeks, with its implication that either American aid to Britain will have to be intensified or else the risk of failure will have to be accepted, has led to a redoubling of their efforts. Senators Wheeler and Nye in public and Colonel Lindbergh in private are preaching America's lack of concern in the outcome of the struggle. To judge from two indications, the degree of success they are having is not large. The first is the progressive decline in the rationality and responsibility of their arguments, which are now hardly distinguishable from the crudest Nazi propaganda. Colonel Lindbergh, for example, declares that Britain is defeated and that the war is virtually over. The other is the steady trend towards belligerency in the opinions recorded by the various "polls"; in the latest, 71 per cent of those voting declare themselves in favour of American convoys if they are proved necessary. Mentally, the qualifying phrase "short of war" has already been dropped. The majority of public opinion is ahead of national policy; Great Britain is already treated by the public virtually as an ally; and prophecies of a declaration of war are rife. Yet the symbols of neutrality remain untouched; "cash and carry" is still on the statute book.

In these circumstances, the disquiet and impatience of the public are emerging in accusations that the President is not providing leadership. This is a situation with which Mr Roosevelt is familiar. It is almost exactly the same as that which ruled in November. Then, as now, the main issue had been decided in principle—then by the election, now by the Lease-and-Lend Act. Then, as now, the President waited for public opinion to catch up with his policy, to overtake it and to accuse him of lagging. Then he

reasserted his leadership in a series of rapid steps forward. The probability is that he will repeat the manoeuvre this time.

If this analysis is correct, a new phase in American policy is impending. To judge either by the necessities of the moment or by the content of the rumours that are current in Washington, the new phase will have a naval bearing. That is, indeed, the only field in which large new departures are possible. The programme of supply is already in train and is designed to occupy the full capacity of American industry. The financial problem has been regulated. American diplomacy is active and unambiguous. The fleet is the only asset already in hand but not already in use.

New Deal v. Business

BOTH from the President and from Mr Willkie, and from many less eminent voices, have come appeals for national unity in the present emergency. There is, indeed, substantial national unity on the objects of American policy. But earlier preconceptions die hard in the discussions of means to the common end. In particular, the old quarrel still rages over the rôle that private industry is to play. The business man claims that he can achieve most if freed from irksome controls; and he is accused of wishing to profit from the emergency to upset the verdict of the people, given in three successive Presidential elections. The New Dealer wishes to safeguard the social gains of the past eight years; and he in turn is told that he is using the nation's peril to further his sectarian ends. Unfortunately, after eight years, the distrust on either side is so deep that controversies such as these are not easily resolved.

An example of the harm that is being done in this way can be taken from the present state of labour relations in American industry. Both Capital and Labour believe that the new conditions in industry present them with an opportunity. The Labour unions have the better case in law. They rely on the New Deal statutes, particularly on the Wagner Act (which establishes the right to collective bargaining), on the Walsh-Healey Act (which imposes "fair labour standards" on Government contractors), and on the Wage-Hour Act (which fixes maximum hours and minimum wages). Indeed, if the unions relied on the law alone and if the law enforced itself, they would be in a strong position; but unfortunately for them the only way in which their theoretical rights can be established in practice is by provoking a dispute. The tactic is more likely to succeed if it is defence work that is interrupted, since the employers and the Government will then be the more anxious to reach a settlement. But strikes in defence industries anger the public, and the unions' case is further prejudiced by their habit of paying as much attention to the feud between their rival organisations, the AFL and the CIO, as to the rights of Labour. The employers thus have the stronger case in public opinion. They can point (with some exaggeration) to the time lost in defence contracts by strikes; they can inveigh against the 40-hour week and the "week-end black-out"; they can agree with the Army and Navy Departments (whose interest is to get production, not to enforce laws which are not their concern) to wink at the more restrictive clauses of the legislation.

The position of the law saying one thing and public opinion saying another is not unfamiliar in recent American history; but it never fails to be very embarrassing to the Administration. In this particular

instance, the President and his chief lieutenants evade the main issue and concentrate on establishing machinery for mediating in the disputes it creates. It is not a very courageous policy, nor is it likely to be very effective. But the President cannot limit the rights of the unions without abandoning one of the major aspects of the New Deal; and he cannot encourage them to assert their rights without risking a serious interference with the programme of production. Add to this dilemma the internecine feud of the rival federations and it is easy to predict that the last has not been heard of American labour troubles.

Labour relations provide only the most striking of the examples of old antagonisms persisting and even being intensified under the pressure of the defence programme. Business men are not precisely encouraged by reports that plans are in preparation for the strengthening of the already stringent anti-trust laws and for their employment, not merely for the negative purpose of preventing monopoly, but also for the positive purpose of forcing Government control on industries under threat of prosecution. Again, it has not escaped the attention of industrialists that the first operation of the new price-control machinery has been directed against Big Business. An order has been issued stabilising steel prices at their level in the first quarter of this year, in spite of the fact that an increase in wages has just been granted. On both these issues there is another side to the argument; the point is that the two sides persist.

It is not for the outsider to pronounce judgment on these domestic controversies. But he can legitimately point out that so long as they persist, so long as there is an unwillingness on both sides to suspend peacetime controversies in wartime, the unity of purpose and the magnitude of achievement of the American nation will both be less than they might be.

The Technique of Rearmament

THE same antagonisms spill over into the more technical aspects of defence production. There is a tendency on the part of the radicals, the reformers, and the labour spokesmen to maintain that American industry is incapable of performing the task of acting as democracy's arsenal without very extensive reorganisation and control by the Government. There is a contrary tendency on the part of industry to understate the adjustments and the disturbances that will be necessary.

The most important case in point is the steel industry. The present "reported capacity" of the American steel industry is about 84 million ingot tons per annum, and present production is virtually up to this figure. The battle has raged over the figures of probable requirements. The critics have assessed that defence needs alone will absorb more than the total capacity. The industry has replied that 80 per cent of the capacity of the industry would be available for civilian needs and would provide more steel than was actually consumed in 1940.

Behind these discrepancies have lain preoccupations with matters deeper than mere statistical veracity. The industry, for its part, has been anxious to avoid the creation of capacity that will stand idle after the emergency is passed—an anxiety in which it has been joined by the CIO union for the steel industry. The objection would be even stronger if the additional capacity were to be Government-financed and therefore Government-controlled. Rather than submit to what it considered an uneconomic expansion, the industry would prefer a restriction of civilian demand. Its critics, on the other hand, belong predominantly to the school that does not wish to sacrifice any butter for guns. They would rather impose an ex-

pansion on the industry, even if it were uneconomic in the long run, than have civilian requirements go short—and it may be supposed that their willingness to do so is increased by the fact that the steel industry has always been attacked for its attitude to both the labour and the anti-trust laws.

This controversy became so acute that the President called for a special report from Mr Gano Dunn, an accepted expert. As might have been expected, his report concludes that the truth lies somewhere between the contentions of the two sides, but rather closer to those of the industry than to those of its critics. The direct requirements of the Army, Navy, and Maritime Commission in 1941 are put at 8,100,000 tons, the export demand (mainly for Canada and Britain) at 13,400,000 tons. Civilian requirements are estimated at 61,000,000 tons, making a total of 77,500,000 tons. The 1942 figures are 4,500,000 tons for direct armaments, 14,500,000 for exports, and 70,000,000 tons for civilian needs, a total of 89,000,000 tons, or virtually the same as the estimated capacity at that time.

There is inevitably, to the European ear, a ring of unreality about these elaborate discussions of the extent to which the civilian demand for the most basic of all war materials can be met. The United States has more steel than the whole of Europe. The British, French and German armies, navies and air forces were equipped, and the peacetime civilian needs of 160 million people were met, out of an annual production of only just over 40 million tons of steel. In the light of these comparisons, the United States ought to have no insuperable difficulty in providing, out of its production of nearly 90 million tons, both for a very rapid rearmament and also for the basic needs of its people. On the other hand, some restriction of civilian purchases will certainly be necessary. Anticipatory buying is already swamping the market, and Mr Dunn's figures show that "civilian requirements" can be maintained in 1942 only if the phrase is taken to include all the indirect munitions requirement. The argument cannot thus be carried on in terms of black and white. It is not a case either of guns and unlimited butter or of guns and no butter, but of guns and some butter.

A similar argument has raged over the rôle that the automobile industry is to play—though, interestingly enough, with the rôles reversed. In this case it is the outside critics who urge a full utilisation of existing facilities rather than expansion of plant, while the insiders answer that fighting aircraft cannot be made in an automobile factory. A great deal of attention was attracted by the so-called Reuther Plan, a proposal by Mr Walter Reuther, leader of a CIO union, that the Detroit factories could turn out 500 planes a day. The experts rejected the plan on the ground that there would be a shortage of machine-tools and of alloy materials, and that armament could not keep pace with such an output. Here again, the hard facts of munitions technique put the truth nearer the assertions of the expert technicians than those of their critics. If mass-production methods could be adapted to the production of aircraft, the British and German industries would surely have moved in that direction under the extreme pressure for output that both have felt.

But the discussions aroused by the Reuther Plan have nevertheless had beneficial results. In the planning of rearmament in a democracy that is still at peace, there is a constant struggle between the alternative principles of improvising with what is at hand and planning wholly new additional facilities. The designer, a professional perfectionist, naturally inclines to the latter alternative, and he is supported by all those who are reluctant to disturb existing civilian business. British rearmament has suffered from this unholy alliance from the outset. But improvisation, if it imposes the maximum disturbance, does the job in the minimum time. It is probably true

that modern fighting aircraft cannot be made in an automobile plant. But the automobile industry can help in a number of ways. It can make components—and every automobile plant in the United States is now doing so. It can lend its skilled toolmakers and patternmakers—the industry is releasing them by abandoning new models and the "tooling up" they would require for the duration. It can train new skilled mechanics—every plant has a training scheme in operation. The extent of the industry's assistance is growing week by week, and the encroachments upon its normal business are already so severe that civil production is to be cut by 20 per cent.

Discussion of the financial implications of a vast rearmament programme is also moving into a new and more realistic phase. As long ago as last December the Board of Governors of the Federal Reserve System presented a programme for making inflation impossible by reducing the present enormous potential volume of bank credit. These proposals seem to be inspired by somewhat naïve quantity-theory illusions; there has been an enormous supply of money in the United States for years without inflation resulting, and no credit stringency will prevent an inflation of prices if the Government and the public between them try to buy more than the community can produce. But at least the Federal Reserve proposals showed how completely the circle had turned from the inflationary plans of eight years ago.

Somewhat more realistic have been the recent proposals of Secretary Morgenthau for increases in taxation. The present estimate of revenue in 1941-42 is a little over \$8 billions; Mr Morgenthau proposes to increase it by \$3½ billions. The proportion shows that the increases in taxation will be sharp. No hint of their nature has been given; but they will almost certainly include increases in direct taxation on the middle incomes. (A married man with no children pays in tax 1.76 per cent of an earned income of £1,000, or 5.28 per cent of an earned income of £2,500; the British figures are 35.11 per cent and 45.05 per cent.) If the Secretary's proposals are adopted, the revenue will amount to two-thirds of the Budget estimate of expenditure, which is about \$17½ billions. But this figure does not include the Lease-and-Lend expenditures, for which Congress has passed an appropriation of \$7 billions. And with a national income that will almost certainly be \$90 billions before the year is out, the revenue total of less than \$12 billions, even after the Secretary's proposed increase, still looks minuscule. Obviously, this is only a first step in war taxation—but the first step is a portent.

Aid to Britain

SHIPS, planes, tanks are the three vital items on the list of supplies to be sent to Britain under the Lease-and-Lend Act, and on each there is progress to report. In merchant ships the objective of American building is a rate of 5,000,000 tons a year. This, with perhaps 1,000,000 tons from British yards, would be enough to offset sinkings at the rate of 125,000 a week and would provide virtually complete security. But the 5,000,000-ton rate is not to be reached for another two years. American shipyards will turn out about 1,000,000 tons of merchant shipping this year. The rate of production will be over 1½ million tons by the end of the year. But there is all too obviously a large deficit to be met in the next two years.

There are three sources from which contributions can be made. The first is the 545,000 tons of Danish, French, German, Italian and other immobilised ships now in American harbours. This is a legal question, which Congress is in process of resolving. The second is the requisitioning of American ships now on ocean service, but not absolutely essential. A beginning was made with this last week, when the Maritime Commission requisitioned four liners, which are expected to be transferred

to Britain. The third source would involve drastic adjustments and cannot be regarded as more than a possibility at the moment. This is the suspension of American inter-coastal trade by sea and the transfer of the ships now engaged in this trade.

Meanwhile, the shipbuilding programme is going ahead with speed and energy. In the last war American shipbuilding rose from almost nothing to well over 3,000,000 tons a year in little more than two years. This time the conditions are more favourable, particularly since a very substantial programme of building for the Maritime Commission's 500-ship plan was already under way. On March 1st of this year the United States already possessed 119 shipbuilding ways and 142 more were under construction.

In the field of tanks the good news arrived this week that the first medium-weight tank of the new British-American design was completed on April 19th and that before long the factory that produced it will be turning out three a day. This company, the American Locomotive Company, and the other firms concerned in the programme, the Baldwin Locomotive Works and the Chrysler Corporation, are all well ahead of the schedule. To overwhelm the German armoured divisions, tanks will be needed in the scores of thousands. To produce 60,000 of them in twenty months will require not three, but 100 a day.

The manufacture of aircraft for Great Britain has been going on in the United States ever since the outbreak of war and the air programme, unlike the tank and ship programmes, is therefore reaching maturity. The gigantic Boeing "Flying Fortresses" are now delivering themselves in England, and breaking the Atlantic record on the way. These planes have four engines of 1,200 h.p. each and they have a range, with a very heavy bombload, of 2,450 miles.

The ultimate target at which the American aircraft industry is aiming is a monthly output of between 3,500 and 4,000 planes a month. The programme is behind schedule and the March output was no more than 1,216 planes of all types, of which 1,074 went to the British and American Governments. But the phase of rapid increase is now beginning and it will not be many months before the British share alone will be approaching 2,000 a month. In this, as in nearly every other respect, the crucial point when productive ascendancy will be decisively gained is within the next six months.

The details of the application of the Lease-and-Lend Act have not yet been made clear to the public in either country. Reference is made on page 560 to the loan of \$25 millions that has been made on the security of a British-owned tobacco company. This was said to be "in line with the policy of the United States Government to require the liquidation of British-owned American investments." It will, however, be a gain if the pledging of assets can take the place of their outright sale.

Some further clarity has also been given to the financial relations between Canada and the United States. Canada is reluctant to obtain munitions for her own use under the terms of the Lease-and-Lend Act; but she will need some assistance in meeting her adverse balance of payments with the United States. It has been announced after discussions between Mr. Roosevelt and Mr. Mackenzie King that American purchases of Canadian raw materials will be increased and that Lease-and-Lend procedure will be applied to Canadian purchases of machinery and components needed to fulfil British contracts. A further possibility was mentioned by Secretary Knox on Wednesday of this week, namely, the sale of Canadian-built ships to the United States and their subsequent transfer to Britain under the Lease-and-Lend Act. The President and the Prime Minister declared their intention of integrating the Canadian and American production programmes as closely as possible. Eventually, American production will swamp that of Canada. But in the meantime there are lessons that the United States can learn from Canada, whose war output is already very much larger than its 1918 peak. There is hardly a weapon of modern warfare that is not being made in quantity in Canada.

Branded Goods in Wartime

THE full implications of the Government's scheme for concentrating industry have yet to be worked out. Two points are generally agreed: first, that concentration is necessary for the efficient use of labour and factory capacity in war conditions; and, secondly, that there is a considerable danger of creating monopolies which it will be hard to dissolve when the war is over. Among the critics there has been some confusion and wasted effort. The 1941 Committee, for instance, in a recent broadsheet speaks as if the deliberate purpose of the Government's scheme was to sponsor monopoly. "The jam which is intended to make the powder palatable (the broadsheet declares) is a fantastic promise about the restoration of small firms after the war." Actually, there is no conspiracy to be smelled out; concentration is one of the ways and means of war; and the proper rôle for men of good will and common sense is surely to propound practical methods of concentration whereby the risk of hard and lasting monopolies may be minimised.

As a matter of fact, the "monopolists" are not all on one side in this matter. In a recent letter to the *Times*, the President of the Institute of Incorporated Practitioners in Advertising, while admitting that some contraction in the range of goods available to consumers might be unavoidable, expressed the hope that the importance of maintaining the existence of established brands and brand names would be fully realised. In many quarters arguments are being brought forward in favour of giving branded goods special consideration in the coming concentration. The arguments merit attention. By the closing of works making well-known branded or proprietary articles, goodwill built up over many years with much expense may be destroyed. Chain and department stores which have come to rely upon the sale of branded and price-marked goods will be embarrassed. Many branded goods are, in fact, superior to the unbranded article; and, especially in such lines as the pharmaceutical trade and sports gear, British brands have a powerful export connection.

But this is wartime. The fundamental question is whether any product can prove a claim to special treatment in a scheme the single aim of which is the efficiency of the war effort. There are many branded goods whose claim to superior qualifications would not bear close scrutiny, and the common qualities of almost all branded goods are not specially desirable in wartime. It is the advantage of branded goods in normal times that they are packed, tinned, or wrapped in clean and convenient containers. Their price is fixed, and their weight and contents are plainly stated. They save time and trouble. But in wartime these are to a large extent luxuries—and wasteful. Paper, cardboard, tins, tubes, jars, bottles, and all kinds of containers—these are precisely the things that ought properly to be economised. This is a problem, not of status or prestige, important though these considerations may be, but of physical supplies. Even if the qualities did generally exist in branded articles to justify the higher prices that must be charged to cover the producers' outlay on materials, publicity and machinery, loose, plain, unbranded, and unheralded products would still seem preferable in a war economy. Nor would this necessarily represent a loss to the consumer. The ILO recently drew attention to a memorandum of the Department of Health for Scotland which observed:—

Unnecessarily high cost (in prescriptions) can also be caused by the use of certain proprietary medicines which, in spite of the quasi-scientific claims made for them, can be replaced by equally pure, effective and much less costly medicaments.

Examples were given:—

Prescribe Paraff. Moll. Flav. at 1d. per ounce and not Vaseline at 2d. per ounce; prescribe Calcium Sodium Lactate Tablets (50) at 1s. 6½d. and not Kalzana Tablets (50) at 8s. 8½d.

Medicines are only one corner of the disputed field. Were it not for the strong points established by costly advertisement, it would not be unreasonable—in wartime—to expect housewives to buy soapflakes and smokers cigarettes and tobacco, all loose. It would be a saving in supplies of metal if expensively packed and publicised tooth pastes were replaced by the simple powder which still forms the principal substance of the elaborate branded cleansers. The question of goodwill is important and powerful. It was this consideration which delayed the unbranding of so vital an article as margarine for many war months. But its only validity, in face of unmistakable war needs, is in sales abroad. The loss of brands in home trade would be a misfortune for branded manufacturers. War economy implies misfortune for civilians; and if the consideration of efficient production—that is, output with the minimum use of labour, plant and materials—really dictates the suspension of separate brands, all that can be claimed by the owners of the brands is some earnest of an opportunity, after the war, to restore them.

Moreover, even in peace time, the chief feature of retail trade is its redundancy. There are too many shops and too many varieties of the same article. On the shopkeepers' side, as a consequence, there are too many traders struggling on the margin; and, on the consumers' side, too much is paid out in the swollen prices required to maintain this inflated apparatus of retailing. If rationalisation was desirable then, it is imperative now; and a reduction in the number of brands will be a vital part of the process.

There is another point, no less important, in the same field of civilian manufacture and retail trade. The President of the Board of Trade was anxious to explain to the House of Commons on March 28th that his plans for concentration would not lead to monopoly. He asserted that trusts were only feasible "where large quantities of homogeneous products are produced"; with consumers' goods, he said, monopolies were "utterly impossible." This is disingenuous. The trade in consumers' goods is overridden with retail trade associations. The main supports of these associations are generally the big firms in the trade, and in many cases their power and influence are enhanced by their relation to cartelised manufacturers whose standardised and branded articles they distribute. Any preference given by the Government to the manufacturers of branded articles—even if the preference only expressed itself negatively in special exemptions from the concentration scheme—would run the risk of strengthening the monopolist tendencies of these bodies. The tendencies are plain enough. The price of a branded article is always a "minimum" price; the retailer who finds it possible to undercut this price by a fraction must expect to be put on "the black list," not only as regards this article, but also for many others. Any fresh preference in favour of the manufacturers and retailers of branded goods would strike hard at the independent retailers who sell unbranded goods and are often no members of a retail trade association. The first object of concentration is to secure efficient and economical wartime production. The second must be to balance fairly the different interests involved. The small independent shopkeeper has admittedly no special claim to weigh against the national interest. But the claims of trade associations and branded manufacturers are not a whit greater.

NOTES OF THE WEEK

Lord Stamp

It would be the crown of many an ambitious man's career to be Chief Economic Adviser to His Majesty's Government, or chairman of the world's largest railway, or President of the British Association, or Director of the Bank of England, or a member of the Dawes and Young Committees, or the country's leading expert on taxation. Josiah Stamp filled all these posts and filled them with distinction, as well as a countless number of positions that were minor only for him, such as the presidency of the Royal Statistical Society or the chairmanship of the trustees of *The Economist*. When asked, "How do you do it?" Stamp would smile as if to suggest that it was easy; and so it seemed to be for him, for his mind and his tongue could both move at twice the ordinary speed, while his body apparently never knew fatigue. It was inevitable that, towards the end of his life, there were evidences of haste in some parts of his immense output. But the average standard was amazingly high, and if a man's intellectual calibre can be judged by a combination of standard and output, then Stamp stands at the head of his generation. All through his many careers ran two constant threads. One was a passionate interest in economic science, particularly in its statistical aspects. At the beginning of his life he is said to have secured promotion in the Inland Revenue by using Pareto's Law to determine the number of tax evaders. And at the end, his annual speeches at the LMS meeting were treatises in practical economics. The other constant thread was a very sincere, practical and personal Christianity. Like many other supremely successful men, Stamp had his detractors; but it was impossible not to feel affection for him. His large, active, friendly personality will live for many years in the memories of a crowd of friends in very many and varied walks of life. It is impossible yet to grasp the dimensions of the loss that the nation has suffered from his tragic and untimely death.

Greece Defeated?

The retreat in Greece has gone on, and the Greek King and Government have moved from Athens to Crete, which now becomes the key to Near Eastern defence. Never after the German attack began had the Allied troops found a line to stand on, even in the mountain passes; and it has been a triumph for brave and brilliant

resistance that the invaders, with their overwhelming superiority in numbers of aircraft and tanks, have never yet been able to catch and break through the Imperial and Greek forces. The Yugoslav collapse rendered the Greeks in Thrace and Macedonia helpless and caused the Allied armies to fall back on a line from Mount Olympus to the eastern edge of the Greek front in Albania. It opened the doors into Albania itself for westward-marching German columns; and, pursued by the defeated Italians with German stiffening, the withdrawal of the Greek victors into the Epirus began. The Allied link to Albania was lost; the hinge on Mount

Olympus was remorselessly battered; the retreat was resumed; and the Germans poured into the plain of Thessaly, to the road and rail junction of Larissa and to the port of Volos. In their path to Athens and the Gulf of Corinth there were now the Othrys mountains. They struck over them, against heroic resistance, to Lamia and beyond. Once again the Germans had struck shrewdly with dominant force against every weak place and joint in their enemy's battlefront. East of the Pindus, the Allied forces had been beaten steadily back; but they were still intact when they came to Thermopylae. West of the Pindus, however, where the Greeks, cut off from the Western armies, had come back to Epirus from Albania, safe withdrawal was not possible. The Germans struck south-west from the Thessalian plain through the Metsovo pass to Janina. On Tuesday the army of the Epirus surrendered; and as pressure on the short Allied line in the hills south of Lamia began, the sad proclamation of King George was announced as he sailed for Crete. The enemy's superiority in bombers and tanks had been decisive at every stage. This time the Imperial forces were excellently equipped and trained. Man for man, tank for tank and plane for plane, they were superior, and proved it by the toll they took. But they were vastly outnumbered; and it will remain a marvel that, with the command of the air also denied them by weight of numbers, this third "contemptible army" avoided being overwhelmed.

Halt in Egypt

For a week the initiative in North Africa has been British. True, the battle has been local since the German thrust died away on the Egyptian borders; but, since the Germans were halted, they have suffered many sharp blows. Last week, a convoy bringing transport and troops was annihilated by naval action. Tripoli has been devastatingly shelled from the sea and repeatedly bombed from the air. Around Sollum and near Bardia, too, naval and air bombardments have inflicted losses, while repeated attacks on the garrison of Tobruk have been heavily flung back and even followed by punishing sorties. The attack has probably not been stopped in its tracks; careless of losses, the enemy offensive may be resumed, by the coast and inland. But no headway has been made for some days, and for all their surprising success in bringing an army by sea to Africa, the Germans are still weak on the water. In the Balkans, their supplies of men and equipment were, for all practical purposes, limitless. In Egypt, they will be confined to what they can ship. There is a great opportunity here for the Navy to ease the strain on the waiting and weakened Army of the Nile, an opportunity for daring—and hazard. The situation is still grave; reinforcements from East Africa take time to transfer with their material; and, in Abyssinia,

both in parleys and in manœuvring, the Duke of Aosta, whose forces in the district of Dessie are still undestroyed, is playing a delaying game. It is probably airpower that will tip the scale; and in the air here the RAF have done outstandingly well. It is true that air-power over the sea enabled the German troops to arrive; but great losses have been inflicted by the personal and technical superiority of the RAF; and, with more tanks and more men on the ground, this advantage may stop the invaders.

* * *

Spain on the Brink?

All the evidence goes to show that Spain will not be allowed to hold her hand much longer. The report that a request has been made for the passage through Spain of German troops suggests that the Spanish decision must shortly be taken. During the last fortnight public opinion has been further prepared for the final step, both by an intensification of the Press campaign against Britain and by belligerent radio comment. The German necessity, at the present stage of the war, to control the straits of Gibraltar is clear. Such a move would be the natural complement to the increasing pressure now being brought to bear on Turkey with a view to eventual control of the eastern Mediterranean. While Spain has every domestic reason—lack of political unity, a shattered economy, disastrous food shortage and an outbreak of typhus—for wishing to avoid implication in the war, she may have very little power to resist. It is true that the acuteness of the food shortage in Spain and the inability of Germany to relieve present economic sufferings lends an unusual importance to the food and capital imports permitted by Great Britain and provides some safeguard against transfer to Germany of the British £2,500,000 loan. Britain can offer to meet a pressing need which cannot be supplied by Germany and, consequently, it is to General Franco's advantage to continue to sit on the fence as long as possible. If Spain is in no form or heart to fight for the Axis, she is, however, even less well placed to resist its demands when Germany decides that the critical step must be taken. With Germany in virtual control of French Morocco, hopes and fears for the future of Spanish Morocco must, of course, play an important part in inducing compliance with Hitler's plans. German troops already stand on the Spanish frontier at the western end of the Pyrenees and infiltration has been taking place for several months. But if a German army does succeed in installing itself in Andalusia in the course of the next few weeks, there is good reason to believe that Gibraltar will prove a hard nut to crack. Moreover, in southern Spain the British are on excellent terms with the local population and officials and it is safe to assume that a German army of occupation would not meet with a wholly Falangist reception.

* * *

Blow for Blow

The topic of reprisals is burning again. Newspapers, even in the same stable, are quarrelling about the wisdom of striking "blow for blow" when British towns are blitzed. The Prime Minister has promised bombed citizens that "they" will be "given it back." On the night after the Luftwaffe's "reprisal" raid on London, Berlin was bombed; and Mussolini has been officially warned that if Athens (as distinct presumably from the port of Piræus) or Cairo is bombed the systematic raiding of Rome will begin. The question is: What does "blow for blow" mean? The simple fact is too readily overlooked, in unofficial comment at any rate, that in war strategy there are no such things as reprisals *per se*. There are shrewd blows, glancing blows and misses. If to bomb Berlin or Rome, after London or Athens has been bombed, will aid in imposing our will upon the enemy, it should be done; and the susceptibility of German and Italian metropolitans to direct assault may, admittedly, be a chink in the Axis. But revenge in itself is not policy. The outcry among bombees in London for Berlin to be bombed is natural; but it needs translation into military values before it is acted upon—as it should be. The geographical fact that, until British bombers can safely fly towards their goal in daylight, Berlin and Rome can never be bombed so long and intensively as London can is incontrovertible—whatever the size of the bombers and the weight of the bombs. Officially, the

Government does not believe in reprisals, and the bombing of Berlin after London was, officially, a coincidence; it was part of the master plan to weaken and dislocate the enemy's war machine, the plan which has wrecked a large part of Kiel. It may, of course, be good policy to frighten Mussolini and his Romans, and the warning was good propaganda—though it is Hitler who will decide whether the risk is to be taken, not the menaced Duce. The story, also from Downing Street, that Italian planes were ready to drop bombs on the Vatican City if British bombers came over Rome, was surprisingly circumstantial. But it was good Goebbels, and can lose nothing of its provocative effectiveness for being true.

* * *

Testing the Fire Fighters

Some particularly heavy air-raids in recent weeks have fully tested the efficiency of the half-voluntary, half-compulsory fire prevention scheme inaugurated in the New Year. The failure of the raiders to start fires on a scale approaching those started in the first raids on provincial cities or in the City of London on December 29th is evidence enough that, whatever the shortcomings of the scheme itself, it has certainly aroused in the public a sense of awareness to incendiary bombs. Whether official fire-watchers or not, most people are alive to the danger of unattended bombs and empty premises, and even places which have not yet been raided are not likely now to be caught entirely unawares. The work of fire-watchers during the raid on London on April 16th, probably the heaviest and most widespread the capital has experienced, has won semi-official commendation, and, indeed, their activities are sadly illustrated by a number of announcements of deaths "while on fire-watching duty." But it is still true that this duty—and danger—is shared by too few people, and that in some areas the local authorities are doing little or nothing to discharge their obligation to make adequate arrangements for fire-watching in residential areas. There is ground for congratulation that no fires in the big London raid became conflagrations, but the fact remains that the fires were very numerous and the strain on the fire-fighting services in London and other bombed cities is still great; it is intensified in some areas by a shortage of water. Moreover, although there is complete willingness on the part of the fire brigades of different local authorities to give mutual help—a willingness which prompted Dublin to help Belfast—it is sometimes defeated by stupid practical difficulties. There are reports of Cornish nozzles not fitting Devon hoses and similar stories, which, although perhaps exaggerated, are typical enough to be substantially true; one urban brigade has been called many times to distant areas and has never yet been able to use its own gear because of differences in size and type. Such practical deficiencies could easily be overcome, since the Regional Commissioners have the power—and the duty—to co-ordinate the civil defence services of all the authorities within their jurisdiction.

* * *

Local Government

The fact is emerging that, under fire, local government has worked by no means well. There has been no lack of zeal and effort, but too often there has been a sad want of competence and foresight. The fault is parochialism—which is forced upon local authorities by the system itself. The parish virtues—those of a close communal spirit and neighbourly loyalty—faded long ago in face of urbanisation; and the ebbing interest in local politics, except as a clash of vested claims, has borne witness to this for more than a generation. In place of the virtues, there are the parish deficiencies, which add up to a narrowness of outlook and a shortage of vision—and cash. The organisation of ARP from the outset, for instance, was shortsightedly done. Meagre salaries brought into the full-time executive posts men who could command no positions of responsibility elsewhere. Job after job was added to the variegated tasks of town clerks. The permanent personnel of the posts and shelters tended to be citizens who had not the qualities to find other work. The elected representatives on local councils, group leaders rather than the locality's best men, have too often failed to see their defence tasks in the round. The actual ordeal has, admittedly, burnt away much dead wood. Gallantry and the talent of individuals for hard work and improvisation have made a

success of unpromising plans; and, in the battle, ARP has stood up better than its local framework. A wise provision set up Civil Defence Regions to cement local effort, and it is still a shortcoming that control is not used boldly. The disparity of local fire-fighting equipment in a scheme which hangs upon mutual aid and inter-local mobility is only one instance. Another is the nightly dispersion from bombed areas in search of quiet and safety. In London County there is a regional authority ready made, to billet the homeless over wide areas and to organise air-raid care; and there are tube shelters. In towns like Southampton it is different. When the wanderers cross the borough boundary into the county, the borough's responsibility, it seems, ceases; there are no powers "outside the area"; and only voluntary aid and private kindness have a care for the nightfarers. Yet the local authorities, singly or in alliance, have all the powers they need to requisition, to billet, to house and to shelter. If it is finance that bars the way, as is the case again and again, then here too there are regional ways and means; no citizen should become a refugee simply because he or she crosses a line on the map. Administratively and financially, the regional future of local government—long discerned by some—has been made very plain by the war.

* * *

New Pressure on Vichy

The stage reached in negotiations between Hitler and the Vichy Government remains obscure, nor is much light shed by reports of Admiral Darlan's increasingly frequent journeys between Vichy and Paris or of terms carried by Otto Abetz from the Fuehrer. There is sound reason to believe that the pressure on Marshal Pétain is being increased, coincident with that being brought to bear on General Franco, to permit, at some date, the passage of German troops through unoccupied France to Spain and thence to Gibraltar. But there is as yet no clear evidence whether the pressure is compounded more largely of threats—to dispose Vichy and reinstate the pro-German *cadre* of Bonnet, Laval and De Brinon—or of bribes—to reduce French payment for the army of occupation and to release French prisoners for farm work. It is possible that Germany now requires control of the French Navy and Naval bases and that their transfer would necessitate a shift in personnel, with or without the grant of concessions. So far, apparently, Marshal Pétain has rigidly maintained his code of honour and his insistence on observance of the armistice terms. His continued control of the French fleet has been his main bargaining counter. The fleet is still under the control of Vichy, and while it remains so it continues to be possible for unoccupied France to exercise a measure of control over its own destiny.

* * *

Lancashire Complains

The Lancashire cotton industry has no wish to be "concentrated." From the beginning of the present discussions, it has clearly preferred the method by which the manufacturing permitted is spread over all the plants; and, since no manufacturer in common sense can prefer a state of chronic underemployment throughout the industry, the demand has been, by implication, for enough work, that is, enough supplies, to keep all the plants going. As it stands, this claim is quite untenable. It is significant, because it illustrates the sort of argument with which the Board of Trade, in its efforts to release the maximum amount of labour and materials from civilian work, will be faced from several sides. It is Gilbertian that, at this stage of the war, plans to maximise the war effort should still be greeted by the old plaint that unemployment will be created by them. In detail, the argument is that, of the 50,000 workers whom it is hoped to release from the manufacturing side of the industry, 20,000 are married women whom it will not be possible to move to war work. It is, of course, very often not feasible for wives and mothers to become migrants, though no effort should be spared to induce the wives with few ties, with no children and with husbands serving or working elsewhere, to play their part in essential employment. There will be every sympathy for Lancashire's local problems, and there is every reason for ingenuity in solving them. But Lancashire is a region of industrially trained women. It is now a hive of war industries crying out for labour. Where the workers cannot move, the work must be taken to

them, to the factories and workshops in their own districts. Far more than 50,000 fresh war workers are wanted in this region alone, and any plans to bring the cotton industry into line with the war economy must envisage the biggest possible release and use of men and women workers in face of all special and local difficulties. It is worth noticing that the weavers, for their part, are complaining about the underemployment which is persisting, while the decision as to which weaving sheds shall be shut down is delayed. No special pleading can alter the fact that the supplies and the labour allotted to the industry must be cut to the absolute minimum. The Government's responsibility is to see to this, and, further, to ensure, by every possible device of imaginative planning, that the labour—and the plant—released are given employment and remuneration in the war effort.

* * *

War Weapons Ballyhoo

Lord Kindersley has given what he calls the complete answer to critics of "War Weapons Weeks ballyhoo." The answer is that small savings during War Weapons Weeks in the three months December to February averaged £3 17s. 3d. per head of the localities where they were held, while the average weekly small savings over the whole country in the same period amounted to only 4s. 8d. per head. It may be that there have been critics foolish enough to allege that the War Weapons Weeks do not bring in the money, and to them Lord Kindersley has indeed given the answer. But he has missed the point of the more responsible criticism. This is that money raked in by these intensive local campaigns serves no useful purpose unless it is the fruit of abstention and economy. Subscriptions by local branches of banks, insurance companies and other large institutions, the proceeds of sale of other assets, money taken out of the safe or the stocking, the anticipation

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

of future income that would be saved in any event—all these contribute to the impressive totals of the War Weapons Weeks. But none of them perform the economic service to the community that the National Savings Campaign is intended to promote—namely, the release for war service of resources of labour or materials that would otherwise have been consumed. If Lord Kindersley wishes to give a really "complete answer" to the critics of War Weapons Weeks, he should adduce evidence to show that, for that week, the local shops do no business, the pubs are empty and the cinemas deserted. The National Savings Campaign has no enemies and its purpose is beyond reproach. It is a pity if those who venture constructive criticism of its methods are to be treated as hostile witnesses who require "a complete answer."

No Hope?

In the Commons on Tuesday Mr. Amery again stated the Government's attitude towards the *impasse* in India. It was far from hopeful. Rightly, the Secretary of State underlined the disregard for their democratic responsibilities shown by the withdrawal of the Congress ministries from seven provinces eighteen months ago. Rightly, he emphasised—perhaps with a certain disingenuous over-stress—the totalitarian implications of the Congress claim to represent the entire Indian people in a single party. Rightly, he pointed to the "terrible dangers" that would be involved in the partition of India by the Moslem plan for a separate Pakistan. Rightly, he claimed that the only true solution for the problems of Indian government must be agreement among the major elements there; and he made it quite plain that, if that agreement could be achieved, the working out of a new constitution for India after the war by representative Indians under the Viceroy's suspended offer would "not be bound in any way"—except, presumably, by Britain's "obligations" to minority interests, a lasting stumbling-block in Nationalist eyes. The Indian Liberals, a handful with no mass following, have put out a plan for an all-Indian executive; Mr. Amery claims, again rightly, that—even apart from the difficulty of altering the character of executive government in wartime, a significant reservation—the plan should be addressed to the main leaders of Indian opinion for agreement and not to the Government of India. The official attitude is consistently right—and completely negative. It may be, of course, true that nothing whatsoever can be done until the Mountain comes to Mahomet—Mr. Gandhi to Mr. Jinnah. If it is true, then the "terrible dangers" Mr. Amery spoke of are very real; the vital war effort of India will be shackled; exacerbations will spread and fester; and the British people should be prepared for the worst. In this country as well as in India, it is believed by men of goodwill—and this belief was voiced by speakers from all parties in the Commons—that something can be done, or at least that something should be attempted. It is hard to be convinced for certain that every quality of leadership has been shown in attempting to secure that minimum measure of agreement that Mr Amery says is essential—but suggests is impossible.

Rejoinder in Iraq

By landing "strong Imperial forces" at Basra to keep the lines of communication open in Iraq, the British Government have taken Sayid Rashid el Gailani—now Prime Minister and leader of an administration which has received the formal approval of the National Assembly—at his word. Since his seizure of power, the new Prime Minister has publicly affirmed his Government's determination to honour its obligations under the Anglo-Iraqi Treaty of Alliance of 1930, a treaty which empowers Great Britain to maintain troops and air fields in Iraq for the protection of transport and communications. On the face of it, there is no ground for disagreement between the two Governments; the procedure is normal and regular. There is little doubt that German influence, which has been actively fostering anti-British sentiment in Iraq, as in Syria and Palestine, will have received a disconcerting blow both through the timely and legalised arrival of British forces in Iraq and from the spontaneous popular enthusiasm with which they were apparently greeted. From the Allied standpoint, the importance of ensuring that Iraq shall afford at least the same facilities to Great Britain as are provided by Egypt is obvious.

Not only is Iraq the custodian of the pipe line and an essential link in the air route to India, but, if it were to pass under Axis control, it could provide, in alliance with a pro-axis Syria, a grave threat to Turkey. There is no reason to expect that the arrival of Imperial troops will bring German activity in Iraq to a halt, but their presence should give pause to potentially pro-German elements.

The Eclipse of Yugoslavia

With the German claim that Yugoslavia formally capitulated at 12 noon on Friday, April 18, the last relic of the post-1918 "security system" is destroyed. The Southern Slavs have succumbed to a powerful union of Prussia and the pro-German elements among the heirs to the Dual Monarchy, and the work of the Paris Peace Conference is undone in yet another respect. This is the significance, in the terms of history, of the Axis victory in Yugoslavia, where, despite the probability of guerilla resistance, military activity virtually came to an end with the surrender of the Second Yugoslav Army Corps at Serajevo on April 16 and the failure from that time to maintain a unified command. It seems likely that Germany will treat Yugoslavia on the Polish rather than on the Western European model. Occupation is not enough. The State is to be dismembered, portions passing to Italy, Hungary, Bulgaria, and the Reich itself, with, perhaps, the restoration of a puppet government under Italian control in Montenegro. Croatia is to form a Quisling state under the leadership of Anton Pavelitch, chief of the murderers of the late King Alexander. For Serbia itself is to be reserved the final tyranny—government by a Reich commissioner as in Central Poland, and it is to be feared that the Yugoslavs will pay dearly for their last minute decision to rally to the cause of freedom. Their future is now linked with that of the countries which fell earlier under German occupation in vital dependence on a British victory. Meanwhile, King Peter and General Simovitch, who managed to reach Athens, and thence Jerusalem, provide the nucleus for continued national resistance in which escaping Serbian troops, the mercantile marine, and Yugoslavs in this country and the United States may still play an important part. In his proclamation to his people on the day of his departure, King Peter provided an assurance of his determination. "I do not mean to abandon the struggle;" and Mr Eden has replied to this assurance with a declaration in the Commons, on behalf of the Government, of its intention "fully to restore the independence of Yugoslavia."

A Shortage of Doctors?

In reply to a request from the British Red Cross, President Roosevelt has appealed for a thousand American doctors to volunteer for work in Great Britain in the RAMC or the Emergency Medical Service. This need to import doctors is at first sight rather surprising. Before the war the British Medical Association was so fearful of a medical surplus that very few of the considerable number of refugee doctors were allowed to practise or take up hospital appointments in this country, although the latter ban was removed a few months ago. Moreover, the scale of war casualties, among both the Services and civilians, has been unexpectedly light, and the state of the nation's health remains surprisingly good. It seems clear, in fact, that it is not so much a question of shortage as of faulty distribution. In theory, the medical services of the nation should be as mobilisable as any other asset, but the corollary—concentration—would be almost impossible to carry out, because the whole value of a doctor's practice is represented by goodwill—which, even in industry, is often proving to be a great stumbling-block. There seems, however, a case for examining whether waste is not caused by the hard dividing line between the five different medical services—those for the Army, Navy and Air Force, the Emergency Medical Service and private practice. Under the present system, doctors have been called up and have frequently found themselves with nothing to do, while their partners or colleagues are struggling to cope with practices heavily swollen by evacuees—although the Central Medical War Committee is, it is true, trying to call up doctors mainly from areas where they can best be spared. Moreover, there may be

an RAF hospital, overcrowded with patients and understaffed, and a military hospital, empty and overstuffed, in the same place, but the one is unable to help the other. What is wanted, in fact, is a single medical service, a Royal Medical Corps, which would alone be responsible for seeing that all the medical requirements of the nation were adequately satisfied.

Party Recriminations in Australia

Australia's anxiety about the fate of the Anzac troops in Greece is, of course, most understandable; but a section of the Australian Labour Party is evidently trying to make political capital out of the struggle in the Near East. Dr. Evatt, one of Labour's representatives on the Advisory War Council, has complained that the Council was not consulted about the transfer of the AIF to Greece, and from different parts of the country calls have come for the reassembly of the Commonwealth Parliament to hear "the facts." Mr. Fadden, the acting Prime Minister, has agreed to the reassembly of Parliament, but a broadcast from Mr. Menzies, who has been constantly in touch with the War Cabinet, has appealed to Australians for no recriminations. There is no evidence that the Australian people as a whole regret the decision which has won for the Anzacs' operations the description "brilliantly conducted." Moreover, the Labour party has only itself to blame that it was not consulted about the transfer. It has consistently refused to join an all-party administration under Mr. Menzies, and, as the Prime Minister pointed out in his message, discussion on a major decision of war strategy, which in London was confined to the War Cabinet, could not have taken place in a Council which has no responsibility. The Australian Government itself was, of course, fully consulted before the decision to move the AIF was carried out. If the leaders of the Australian Labour party wish to be consulted on such matters, they must be willing to accept responsibility. Not strong enough to form an administration themselves—in the House of Representatives the Labour Members, including unofficial Labour, are exactly equal to the members of the Government parties, while in the Senate the Government has a majority of

two—they must surely see that the time has come for them to accept Mr. Menzies' offer of seats in his Cabinet. If, for the sake of a party programme, they still refuse to do this, then the least they can do is to keep quiet while—in Mr. Menzies' words—"the tempest is raging."

Shorter Notes

Now that expenditures all over the world are reaching astronomical figures, the meaning of the word billion is under discussion, and the Prime Minister was asked this week whether uniformity in the use of the word could be obtained on both sides of the Atlantic. The true meaning of billion is, of course, a million million, but in the United States it is used for a thousand million. It is unlikely that confusion would ever arise in practice. It is becoming the custom in England (for example, in *The Economist*) to use billion in the American sense in American statistics, and for the rest to avoid the word. Only in the German inflation did the true billion become a financial reality and in default of a repetition, it may be left to the astronomers.

Last week-end a delegation from Oxford University conferred the honorary degree of DCL on Dr. Salazar, the Portuguese Prime Minister. A timely lesson might have been drawn by General Franco from the Public Orator's address, in which he praised earlier Portuguese statesmen, who "had set before the world a pattern of peaceful culture," and Dr. Salazar himself, who "was to-day pointing out to other nations the only way by which the true and enduring happiness of a State could be achieved."

The approximate number of casualties up to the beginning of April is 29,856 civilians killed and 40,789 injured and detained in hospital; and 37,607 members of the Armed Forces killed or missing and 25,895 wounded. Of the civilians killed, 13,712 were men, 12,112 women, 3,644 children under 16, and 388 unclassified.

THE WORLD OVERSEAS

Holland Fights the New Order

(By a Dutch Correspondent)

April 15th

SINCE last February, tension in Holland has risen. That month was characterised by serious strikes and riots. Between February 9th and 12th there was street fighting in Amsterdam, and when it was announced that a trial would be held in The Hague against the members of a secret sabotage organisation a wave of unrest swept the country. Towards the end of February, riots broke out in Amsterdam, and on February 25th and 26th street fighting occurred as a result, the Germans said, "of the action of paid British agents, mainly Jews." Martial law was declared throughout North Holland, and heavy fines were imposed.

As a result of the serious disturbances, Dutch Nazis were appointed Commissioners of the provinces of Utrecht, Limburg and North Holland, martial law being raised on March 5th. Employers were forbidden to pay wages for hours of labour lost in strikes—apparently they were willing to do so. At the beginning of March, a decree was issued declaring all Dutchmen liable to labour service. This service is now confined to the "occupied territory," but it is generally expected that it will be extended to Germany, where more than 110,000 Dutchmen are already forced to work.

Not only labour but all other Dutch resources are slowly but surely being transferred to Germany. In an

address given on February 8th at Amsterdam Dr Fisch-boeck, Commissioner-General for Economy and Finance, boasted that Dutch imports from and exports to Germany now nearly equalled each other and had reached an amount equal to £5 millions monthly. It should be remembered, however, that Dutch exports to Germany consist largely of food, which substantially benefits the German people, while German exports to Holland mainly consist of military supplies for the German army and raw materials for the Dutch engineering and metal industries.

Various decrees have been issued to facilitate the "scientific looting" practised by the Germans. All gold in private possession has been handed in to the *Nederlandsche Bank*—between July and October, 1940, the amount given up was the equivalent of about £3 millions. It has almost certainly been transferred to Germany, together with £8 millions of gold forming part of the large reserves of the *Nederlandsche Bank*, most of which are safely deposited in the United States. What has happened to the gold forebodes little good for the owners of foreign stocks and shares.

All Dutch investments in Germany will shortly be converted on a 4 per cent basis. That is to say, German industries, etc., are authorised to convert their loans placed in Holland. The *Ruhrverband*, to give an

example, has already declared that it has decided to convert its 6 per cent and 7 per cent loans of 1927 and 1931. Those who were unwilling to accept the new obligations were able to get their money back, but this money would either be paid in so-called *Inlandmarken*, which have only half the official value, or deposited with the *Verrechnungskasse*, the deposits of which are liable to a 70 per cent tax when transferred to Holland.

Nazi Financial Penetration

On April 1st the new president of the *Nederlandsche Bank*, the Dutch Nazi, Rost van Tonningen, announced that the clearing between Germany and Holland had come to an end. All "financial barriers" between the two countries had been raised. Rost van Tonningen did not announce what would happen to the huge debts which Germany had accumulated on the clearing with Holland. The rate of exchange which is now "normal" is, of course, highly advantageous to Germany: 100 Rm. equal Fl. 75.36. The raising of the financial barrier makes it much easier for Germany to buy Dutch industrial shares. Some months ago it was announced that £1,300,000 of shares of the *Algemeene Kunstzijde Unie*, the large Dutch rayon concern, had been bought by a German group. Since then the *Vereinigde Stahlwerke* have bought two millions pounds of shares in the *Koninklijke Nederlandsche Hoogovens*, a Dutch heavy industry situated in Ymuiden. These shares were in the possession of the City of Amsterdam.

In the end this process must give the German *Herrenvolk* complete control of the key-points of Dutch industry and trade. That the Dutch themselves realise this is indicated by the fact that the spectacular rise in quotations on the Amsterdam Stock Exchange during the last months of 1940 has been followed by an equally spectacular drop in the first months of 1941. The average drop in all quotations was 39 per cent between January 1st and March 1st. Oil, sugar, tobacco and tea suffered the heaviest losses, which, apparently, partly originated in the tension in the Far East. There are other factors, however, which determine the black outlook for the general investor. The profit tax will, it is expected, be raised from 30 to 45 per cent. *Het Volk*, the Labour daily, which was taken over by the Dutch Nazis, insists on a limitation of all dividends to 6 per cent. The bond market is decidedly pessimistic.

More Scarcities

The decline in the standard of living continues. Prices are slowly rising, and supplies for the home market are getting more and more scarce. Reconstruction work is still severely hampered by the lack of building materials. Far more trees are cut down than is justified, because there are hardly any imports of timber. It is announced that genuine coffee will no longer be available from the end of April. The rationing of textile products presents every Dutchman with the difficult problem of how to divide a fixed number of points which is clearly insufficient. Between February 1st and September 1st this year he may spend 100 points. A suit is valued at 80 points, a raincoat 65 points, a pair of trousers 28 points and a shirt 24 points. Sheets, blankets, overcoats and women's coats are only available after a special request has been granted. There is an extensive black market for textile points, and hundreds of shops have been closed because of "fraud."

There are no signs of starvation, but the diet is rather monotonous. The standard of health is declining, and many people died in the severe influenza epidemic which swept Holland in the first two months of this year, when some people had not sufficient coal to heat one room, even in the bitter cold.

The position of the Dutch Jews is getting more difficult and desperate. On March 14th a decree was issued,

officially called "decree for the elimination of the Jews from economic life." Jews are forbidden to set up new businesses without authorisation. The Reich Commissioner may appoint "commissioners" to any Jewish firm and has the right to order Jewish businesses to go into liquidation. Nazi burgomasters have forbidden the Jews to visit some popular seaside resorts. In Hilversum they are forbidden to make use of the public baths. Jews have been struck off the lists of blood donors for Gentiles. It is clear that the Germans' intention is to enforce the Nuremberg laws upon the Dutch Jews, who, as private and public information prove, are regarded by the Dutch as the symbol of German tyranny, and for that reason are actively supported by the whole people with the exception of the Nazis. In many a church special prayers are regularly said for the Chosen People.

The struggle against the Dutch Nazis is getting more and more bitter. The Dutch Quisling, Ir. Mussert, has recently paid many visits to Germany, but the Germans do not seem to have made up their mind whether to hand over all nominal power to the NSB now or to defer this to a later date. It must have been an unpleasant surprise to Ir. Mussert that the *Nationaal Front*, or *Firestone Movement*, of Arnold Meyer, a Catholic Fascist, and a bitter enemy of the Dutch Nazis, was granted permission to hold public meetings some time ago. The *Nederlandsche Unie*, however, is still being boycotted by the Germans, and the leading Triumvirate, who are still courageously criticising the Dutch Nazis, is faced with the dilemma of whether to declare in favour of the New Order and to lose most of the *Unie's* 700,000 members, or to declare against the New Order and to risk the disbanding of the movement. As many of the *Unie's* members are Catholic, it is of interest to note that the relations between the Dutch Catholics and the Nazis are worse than ever. In the beginning of February the Dutch bishops issued a Pastoral Letter in which they declared that the sacraments should be withheld from Dutch Nazis.

It is therefore not difficult to guess the mood of the Dutch, now that the first anniversary of the occupation is approaching. They hate the Germans more bitterly than ever. The number of those who listen to the broadcasts from London is so big that the Germans some time ago threatened the Dutch with confiscation of all radio sets. German-sponsored institutions, like the Winter Relief and the Labour Service, are boycotted by all patriots. Ir. Mussert declared some time ago that his movement included 1 per cent of all Dutchmen. It is safe to assume that the other 99 per cent are only waiting for the opportune moment to throw off the German yoke.

The Future of Eire's Economy

[FROM OUR DUBLIN CORRESPONDENT]

April 9th

THE war has succeeded in laying bare the anatomical structure of the Irish economic system. In future there will be no excuse for the delusions that have obscured economic issues in popular political controversies since the Treaty. The facts of the last eighteen months have demonstrated clearly the degree to which the standard of living and the industrial programme depend upon the maintenance of a large flow of imports. The sudden diminution in the supply of wheat, petrol, coal, tea and many industrial raw materials has caused widespread inconvenience, which is capable of being only partially remedied by home production of substitutes. Eire is at present experiencing the reality of self-sufficiency which has been held out as the ideal by many politicians, and it is generally agreed that the advantages of that condition are not unmixed. Doubtless the increased home production induced by the necessities of the war will not completely disappear when peace is restored, but the dependence upon imports of articles for domestic consumption and of raw materials will not have been abolished. At most, the margin will be shifted away from imports and towards domestic production.

The second fundamental fact of the Irish economic system, not perhaps equally appreciated by the general public, is that imports must be paid for by exports, visible or invisible. The very large reserves of sterling

assets owned by the banks and by the public have enabled an excess of imports to continue for twenty years. If, as is of course exceedingly unlikely, the value of these external assets should suddenly suffer a material reduction, the capacity to import would be *pro tanto* diminished. Owing to the extreme difficulties caused by the war and the blockade, Irish capital assets held abroad have temporarily lost some of their capacity to command imports, and, owing to the British exchange regulations, they are not so freely convertible into foreign currencies as in peacetime. The disposition on the part of persons in responsible positions to belittle the value of those external reserves because of their temporary reduction of liquidity is unfortunate, as it tends to mislead the public regarding their real significance. Certainly, if they permanently disappeared, the Irish economic system would need to be fundamentally adjusted.

The truth of the foregoing argument has been corroborated by the distinguished statistician, Dr R. C. Geary, in a paper read before the Statistical Society of Ireland on the probable future population of Eire. Taking a number of alternative assumptions regarding future trends in fertility, mortality and migration, Dr Geary reaches certain conclusions about the size, age and sex distribution of the population during the next hundred years. Analysing the shift in occupations from primary to secondary industry between 1926 and 1936, he concludes that the first part of the programme of industrialisation has been completed, and that the further stages of the programme depend upon the development of the purchasing power of the agricultural section of the population. This, in turn, depends upon increasing agricultural exports, which necessitates the increase of the efficiency of agricultural production. Thus, he argues, the facts that the population will increase slowly, if at all, and that the proportion of young people will tend to decline are no justification for planning to spend less on the educational services in the future. On the contrary, they are clamant reasons for spending more "on teachers and on the teachers of teachers," since the efficiency of the workers in the export trades will determine the capacity of the country to import and the level and variety of the standard of living.

★

The following figures demonstrate the effects of the war on the public finances:—

Year ended	Revenue	Expenditure
March 31st		
1939	£31,883,864	£33,110,247
1940	32,388,747	34,395,023
1941	34,637,659	37,772,081

The deficit for the last financial year was caused by expenditure on the Army, which increased from £2,973,246 to £6,682,231. The revenue showed considerable elasticity in spite of the abnormal conditions. Customs rose by £1,109,000, income tax by £1,357,000 and estate duty by £288,000. The only borrowing that took place, apart from savings certificates, was a ways and means advance of £500,000, but the fact that the balance in the Exchequer on March 31st had sunk to £728,320 suggests that further borrowing may soon be necessary.

Australian Taxation and War Expenditure

[FROM OUR SYDNEY CORRESPONDENT]

March 1st

AUSTRALIA's war expenditure for the six months ended December 31, 1940, was £A64,798,000, of which £A9,852,000 was provided from revenue and the balance from loan moneys. In the revised December estimate, total war expenditure for the financial year July, 1940-June, 1941, was £A186,500,000. In the readjustments consequent on the amendments introduced by Labour during the Budget debate, the proportion of the total to be provided from revenue was reduced from £A65 millions to approximately £A62 millions. Thus, during

the first six months of the financial year, war expenditure was just over one-third of the total for the twelve months; expenditure out of taxation was less than one-sixth of the estimated contribution for the full year, while expenditure from loans was not far short of half the full twelve months' total.

The disproportionate share borne by loan moneys can be explained by special considerations in addition to the usual reason that income tax is paid mainly in the second half of the financial year. Many of the tax increases were imposed, not at the beginning of the financial year, but in December, when the year was already nearly half over. Therefore the greater proportion of indirect taxes, as well as of direct taxes, will be received in the final six months of the period. Further, the acceleration of war expenditure will continue in 1941, and mounting revenue will be available to meet the rising war bill.

It might have been expected that expenditure in anticipation of revenue on the scale of the past few months would be financed by issuing Treasury bills. By using loan funds the Government has avoided the expansion of credit which Treasury bills would involve. The methods of finance adopted, however, have permitted some credit expansion. The Central Bank, as underwriter of Commonwealth loans, takes up any portion of a loan which is not subscribed by the public and the trading banks. It was announced that the Central Bank had taken a small proportion of the last loan of £A25 millions issued in December.

The need to reduce civilian consumption and increase revenue from taxation has focused attention on the different levels of State income tax in various States. The Commonwealth Government's powers of taxation are severely hampered by the fact that it must limit its levy in all States to that level which can be borne by the State with the highest State taxation. The weakness and inequity of such a system is strikingly apparent in time of war, when the Commonwealth is financially responsible for defence expenditure.

The Need for More Coal

SINCE coal is the basic raw material of Great Britain—it is the principal source of heat, light, power and of many indispensable chemicals—an adequate supply of it is essential in time of war. Moreover, in contrast to most other raw materials, coal is a domestic product and is available in abundance below ground. A shortage of coal, which does not have to run the hazards of ocean transport, would therefore seem to be difficult to explain. Yet, while the shortage has not been as acute in the past winter as in 1939-40—partly because the weather has been much less severe—it has been serious enough to cause a good deal of inconvenience, especially to private consumers. If this state of affairs is not to be allowed to continue, steps must be taken now to meet the prospective demand during next winter. The problem to be solved is twofold: first, output must be speeded up to meet current needs and to enable the accumulation of stocks; and, secondly, transport facilities must be provided to move the coal from pithead to centres of consumption in adequate quantities. The two aspects of the coal problem are closely linked, for an expansion in output without a corresponding speed-up in distribution would be of little avail.

In view of the severe reduction in exports consequent upon the extension of Nazi rule on the Continent—the coal-mining industry's principal overseas market—the existence of a production problem seems at first sight surprising. In 1937, when production reached 240 million tons, no less than 56.3 million tons were shipped abroad, inclusive of the 11.7 million tons shipped for the use of steamers engaged in foreign trade. Even in 1938, when demand showed a decline, shipments absorbed 49.6 million tons of the output of 227 millions. While neither production nor export figures are available for 1940, the value of exports (excluding bunkers) fell from £10.6 millions in the last quarter of 1939 to £2.7 millions in October-December, 1940, a reduction of 75 per cent. Indeed, it is doubtful whether the current and prospective volume of shipments exceeds an annual rate of 20 million tons. Home consumption, true, is expanding, and prospective needs are probably in excess of the 1937 level of some 182 million tons. But as the increase in home demand is unlikely to equal the fall in exports, the total demand must be below the industry's pre-war productive capacity, though it is probably still in excess of 200 million tons a year.

Unfortunately, the capacity of the coal-mining industry was allowed to decline after the collapse of France below the limits dictated by prudence. It has lost a substantial part of its labour force—the reduction during the past twelve months has been estimated at about 10 per cent—to the fighting services and other industries. The rate of output per head is reported to have declined since the outbreak of war. Many pits, especially in the export districts, have been closed down for lack of orders or labour or both (though this movement has been stemmed by a scheme, introduced on January 1, 1941, and financed by a levy of 9d. per ton sold, whereby colliery owners receive compensation for loss of trade, provided they maintain their pits in working condition). In general, production has fallen to a level which is inadequate in relation to prospective needs.

The Government has at last realised the danger to the war effort of an inadequate supply of coal, and it is now making a determined effort to reverse the trend of production and to accumulate adequate stocks as an insurance against an emergency and in order to prevent a shortage next winter. It is reported that the authorities are aiming at a weekly output of about 4½ million tons, which corresponds to an annual rate of some 230 million tons. While this would involve an appreciable

increase, given a measure of goodwill there is no reason why the target should not be reached.

The pits that are still in working condition are understood to be adequate for the desired increase in the rate of output. It will be necessary, however, to concentrate production as much as possible on the collieries that are geographically most favourably placed. Moreover, some consumers will have to adapt themselves to the use of coal somewhat different in quality from that to which they have been accustomed. The Government, moreover, must assist the industry in securing an adequate supply of pit props, machinery, stores and other colliery equipment.

Labour probably presents the biggest problem in the effort to speed up production. By applying to coal-mining the Essential Works Order—to which the Mineworkers' Federation has now reluctantly agreed—the exodus of miners from the industry has been arrested, for it forbids employers from dismissing miners and miners from leaving their employment without the consent of the Ministry of Labour. Steps must also be taken to strengthen the industry's labour force by the recruitment of youths—this should be facilitated by the limitation of entry into consumption goods trades—and, if necessary, by the recall of miners who have taken up other occupations, and by the release of a number of those who have joined the fighting services. (The recall of miners from other industries will be made easier by the registration of men over military age which has already begun.) In view of the need for concentrating production upon the collieries that are geographically in the most advantageous position it may also be necessary to redistribute the industry's labour force.

But the manning of the collieries, which is the task of the Ministry of Labour, is not enough. In fact, the success of the production drive depends in a large measure upon the active collaboration of the miners. The greater the output per head, the less will be the industry's drain on the country's man power; and large-scale substitution of female labour is, of course, impracticable. No figures of output per man-shift have been published since the outbreak of war, but it appears that it has tended to decline—through absenteeism, for example. This tendency must be arrested, and it can only be arrested by the goodwill of the miners. The country cannot afford a repetition of the experience of twenty-five years ago, when the output per man-shift fell from 20.3 cwt. in June, 1914, to 14.1 cwt. in the last quarter of 1920. This fall can only in part be ascribed to the reduction in maximum hours below ground by one-eighth, from 8 to 7, on July 16, 1919. Absenteeism must be reduced to the minimum, and, if necessary, hours of work must be increased to the maximum compatible with the maintenance of the health and efficiency of the miners. Provided the miners are alive to the urgent need for more coal and willing to make an effort commensurate to the emergency, the labour problem is not impossible of solution. And since wages in the coal-mining industry are now linked to the Ministry of Labour's cost-of-living index—in a debate in the House of Commons on February 19th Mr David Grenfell, the Secretary for Mines, gave the average increase in wages since the outbreak of war as 25 per cent—miners have little cause for complaint. A minimum weekly wage would give them added security, and, provided they are willing to collaborate in the effort to increase production, its introduction need not bring a reduction in output per head.

The effort of the coal-mining industry to raise production must be accompanied by a corresponding improvement in transport. Indeed, it is well known that

the scarcity of coal in certain districts has been due in a large measure to this cause. The task of speeding the movement of coal to the centres of consumption, however, is only one aspect of the wider problem of transport. Hitherto Great Britain has not made the best use of her transport system, which is capacious as well as flexible. And the problem cannot be solved unless the various facilities are treated as so much interchangeable carrying capacity and are rationed in accordance with a schedule of priorities. There are indications of improvement—by the formation of a War Transport Council, for example. But Great Britain still lacks the Transport Executive that alone can operate the various carrying facilities as efficiently as possible in the national interest. Steps must also be taken to secure a more equitable distribution of coal among consumers. As the Select Committee on National Expenditure pointed out in its eighth report of the 1940-41 session, closer collaboration between coal merchants, by the pooling of orders and stocks, local labour and transport, for example, would facilitate the distribution of fuel. Again, a reduction in

the number of grades of fuel—on April 21st the Mines Department announced that only six grades are to be available in future—should simplify the process of distribution.

Further, if the upward trend of costs and prices is to be arrested, the price of coal, which has risen by 33 per cent between August, 1939, and March, 1941, is one of the most important that must be stabilised, for it enters the cost of production of every industry in the country. Sir Kingsley Wood has already announced the Government's intention to stabilise the cost of living, in the hope that this would relieve the pressure for higher wages. If the Government really means to introduce a national wages policy, coal-mining would be among the first industries to benefit, for wages form some two-thirds of its cost of production.

In sum, it is well within the industry's capacity to supply the country's need for coal. But the task of increasing production and of shifting the larger output from pithead to centres of consumption must be tackled boldly and without delay.

Profits and Producers

RECENT articles in *The Economist* quarterly series on industrial profits have suggested that the measure of control over company earnings has now become fully effective. Reported trading profits, generally speaking, have risen during the past twelve months—which is not surprising. But a high level of output has also coincided with a falling tendency in both equity earnings and dividends. These trends continue to be evident in the company reports published during the first quarter of this year. No evidence is available of the trend of profits of the legion of small businesses. But at least the large public concerns, whose contribution to war production is far greater, now have to be content with a diminishing reward.

During the March quarter, the reports of 439 industrial companies were received. The trading profits of these concerns (so far as they could be ascertained from the reports) amounted to £98,954,489, against £94,300,714 in the previous accounting year, which, on the average, would have fallen, very roughly, to mid-December, 1939. The gross return to industry has increased by 5 per cent, on this evidence, but, in truth, the growth in trading profits was certainly higher, for allowance must be made for increased taxation already deducted from the profits of certain companies. As in earlier reviews of industrial profits, however, the latest figures show a clear distinction between higher trading returns and increased net earnings.

The following table summarises the profits experience of companies whose reports appeared during the past quarter. It includes also an estimate of adjusted net profits before taxation, from which the accurate measurement of equity earnings and dividends in Table II is derived:—

TABLE I.—PROFITS OF FIRST QUARTER COMPANIES—1941

	Previous Financial Year	Latest Financial Year	Adjusted Net Figures before Taxation
Total Profits*	£94,300,714	£98,954,489	—
Depreciation	6,208,118	—	—
Debit interest	38,618,707	37,137,497	—
Other charges†	—	—	—
Net Profit	£55,682,007	£56,628,042	£70,936,000
Preference dividends	—	9,776,374	12,592,000
Ordinary dividends	—	34,386,485	51,859,000
Added to free reserves	—	6,465,183	6,485,000

* After depreciation where not separately stated. † Incl. taxation.

It will be seen that the increased total profits are accompanied by a fall in net profits from £55,682,007 to £50,628,042, equivalent to a setback of approximately 9 per cent. The adjusted equivalent net profits figure before deducting normal income tax (but after EPT) is slightly below £71 millions. Some measure of the increased inroads in net distributable profits, which are now made by normal income tax, is shown by the relation between reported net profits and adjusted net profits, before tax, for the groups of companies reporting in each of the past five quarters. In the first quarter of 1940, published net profits were raised by 25 per cent

on conversion to a "before tax" basis. The percentage varied between 21 per cent and 29 per cent for the other three quarters of 1940. For the first quarter of 1941, however, the tax proportion is no less than 40 per cent. Such calculations tell us little about the movement of profits, but they clearly show how the Exchequer now holds that perfect security, unknown to the ordinary investor—a prior charge-cum-equity. EPT is the prior charge; standard income tax is the equity component. In combination, they are absorbing wartime increases in profits plus an appreciable slice of standard profits.

This conclusion is reinforced by the latest figures of *The Economist's* profits index, which was described and calculated up to the end of 1940 in the issue of March 1st. Compared with a figure of 114.2 for the fourth quarter of 1940 (July, 1935-June, 1936 = 100), the index has declined further to 112.3 for the first quarter of 1941. Compared with the high pre-war levels of the index (it reached 131.7 in the second quarter of 1938), which reflect the EPT standards of the majority of the companies included in the index, the present level is indicative of the measure of control upon industrial earnings. An Investment Note on page 281, of the issue of March 1st, made it clear that the index is not statistically perfect (though, unfortunately, it gratuitously complicated its intricacies by a nonsense-making misprint). But, in conjunction with other evidence, it throws considerable light on the steady reduction of distributable profits in wartime.

TABLE II.—DISTRIBUTION OF PROFITS AND RETURN ON CAPITAL

	Proportion of Adjusted Net Profits (%)			Rates of Payment (Gross)			
	Prof. Div.	Ord. Div.	To free Reserves	Deb.	Prof.	Earned Ord.	Paid Ord.
1941							
1st Quarter	17.5	71.6	10.9	4.2	5.5	15.1	13.1
2nd Quarter	20.3	65.0	14.7	4.8	6.2	12.3	10.0
3rd Quarter	20.4	65.0	14.7	4.9	6.9	12.2	9.6
4th Quarter	23.6	61.4	15.0	4.8	5.8	12.1	9.8
Whole Year	21.6	65.1	13.4	4.6	6.1	13.2	10.9
1940							
1st Quarter	17.7	73.1	9.2	4.0	4.7	11.4	9.6

In a second table, these consequences are measured in terms of the distribution of profits between different classes of capital and their ratio of return. A marked feature of the latest quarter's figures is the sharp fall in the proportion of profits set aside to free reserves. During the greater part of 1940, this proportion kept fairly steady about 15 per cent. In the latest quarter, it has fallen to 9.2 per cent, while the proportion of profits paid out in ordinary dividends has jumped to 73.1 per cent. In order to pay their ordinary dividends, in short, companies are following a less conservative policy regarding free reserves, and, in future, they may be expected to reduce their conservatism still further, counting instead upon the return of part of their EPT payments

for capital reconstruction purposes after the war. Ordinary dividends and earnings nevertheless continue to show a perceptible decline. In the latest quarter, ordinary earnings (calculated on adjusted figures, before any deduction for income tax) were 11.4 per cent, compared with 15.1 per cent for the similar, but not entirely comparable, batch of first quarter companies which reported a year earlier. The average dividend rate

showed a comparable fall from 13.1 per cent to 9.6 per cent.

There are, doubtless, individual exceptions to this general trend, though study of the profits of twenty-five industrial groups on page 576 will not reveal any outstanding case in which net profits have increased. But the global figures show how effectively—and how quickly—the Exchequer has obtained the whip hand.

Finance and Banking

Bigger Bill Tender

The market made its tender for £75,000,000 of Treasury bills last Friday and succeeded in holding its allotment at 30 per cent of the quota applied for. Total applications rose by almost exactly £5,000,000, accounted for by the larger syndicate quota, which continues to cover whatever may be the figure of Treasury bills on offer. With more bills to take up, the market has been a good seller to the banks this week. The banks for their part have in certain cases been engaged in their monthly making-up, and at no time has there been a surfeit of credit in the market. The amount available has, however, always been adequate. One of the factors in the credit position is the exceptional sluggishness in the return of notes from Easter holiday circulation. The latest Bank return shows a further small net increase of the circulation, raising it by £247,000 to the new high record of £622,450,000. The unissued notes in reserve have been correspondingly reduced, while the reserve ratio remains at the exceptionally low level of 5 per cent.

* * *

Free Sterling in New York

The free sterling rate in New York has during the past ten days shown the first signs of fluctuations since the autumn of 1940. It was towards the end of August, 1940, that the rate ended the steep recovery which set in after the tightening of the exchange regulations in July, 1940. These measures promised the ultimate abolition of the free sterling market in the United States, and the "free" rate then settled down at around 4.03½, which showed a slight premium on the official middle rate. Last week the rate suddenly weakened to 4.00½, but has since made as rapid a recovery to around 4.02. Movements of this magnitude and in so small a market as that for free sterling in New York would in normal times have aroused no particular interest. But their coincidence with the receipt of unfavourable war news has inevitably imparted to them an apparent significance which the facts do not warrant. The persistence of a premium of free over official sterling was itself a thoroughly artificial phenomenon. It was largely a relic of the existence in July, 1940, of a considerable bear position in sterling against dollars. As the new exchange arrangements between this country and the United States precluded the creation of free sterling, except on the conscious initiative of the British authorities, the bears were caught, and their attempts to cover in so rigidly limited a market naturally caused the rate to bound as it did.

*

It should, however, be realised that the supply of free sterling has not been rigidly restricted to the U.S. holdings existing in July, 1940, when the registered account machinery came into operation. In the first place, the British authorities have no doubt been prepared to furnish sterling in the free market to balance the situation brought about by the existence of a substantial speculative bear position in sterling. Had it not been for such official intervention in the market, we

may rest assured that the free sterling rate would have been forced to a higher premium on the official rate than was in fact reached. In the second place, the British authorities have, in the course of their grants of permits for transfers of certain capital sums abroad, been prepared to create additional supplies of free sterling. It has been found, for example, that refugees, who after passing through this country have migrated to the United States, have in certain cases been allowed to convert their sterling holdings into dollars, provided they did so through the free market. At the recently prevailing rates this has involved no hardship whatsoever to the persons concerned. But it follows that any appreciable application of this policy must make for a somewhat more elastic free market than has obtained for the past seven months. All things considered, it is not the recent minor fluctuations in the free sterling rate that must be regarded as abnormal; rather is it the complete rigidity of the rate at a slight premium over the official rate, which has endured so long.

* * *

London Credits and Non-Sterling Trade

The continuous search for possible flaws in the control of sterling exchange has, this week, led to additional instructions to London banks regarding credits granted by them to finance trade between Argentina and Brazil, on the one hand, and the United States, on the other. Though the application of exchange control in this country has destroyed most of the business by which trade, which never touched this country, was nevertheless financed through a London bank, some relic of these once important operations remains. Bank of England authorisation for such operations has in most cases been readily forthcoming, even though it meant that, for a time at least, the London bank in question would be out of dollars—having to disburse dollars under the terms of the credit before being reimbursed by the foreign importer. On certain occasions in the recent past such arrangements have encountered difficulties from the Argentine and Brazilian exchange controls. It has been found that the importers in those countries have been unable to obtain U.S. dollars from their respective authorities wherewith to reimburse the credit givers in London and have been compelled to repay them in sterling through the Special Account machinery. In order to avoid such unfortunate accidents, London banks have now been instructed to desist from all such credit operations unless they can provide evidence of exchange permits from the Argentine or Brazilian authorities guaranteeing that the U.S. dollars will duly be forthcoming when the goods covered by the credit have arrived at their destination. It is, incidentally, reassuring to have this reminder that London still retains this foothold, however small, in this particular type of business. Its value will be better appreciated after the war, when international banking will be called upon to play its part in setting the wheels of world trade in motion again.

Exchange Account's Gold Operations

A clearer picture of the gold operations of the Exchange Equalisation Account emerges from the Treasury's "Analysis of the Sources of War Finance" when read in conjunction with the data on United Kingdom gold and dollar operations recently published in the United States. The juxtaposition of the two sets of data is unfortunately marred by the fact that the Treasury White Paper brings the figures up to February 28, 1941, while the official figures published in the United States only go up to the end of 1940. The Exchange Equalisation Account held on the outbreak of the war gold to

the amount of £509,500,000. Up to February it had, according to the White Paper, sold £388,000,000 of this reserve, leaving a balance of £121,500,000. Not all of this is immediately available. At the end of 1940 about £5,000,000 had to be reserved against forward exchange contracts, while another £7,500,000 was dispersed in different parts of the world. The task of centralising the unavailable gold has, however, been proceeding fast, as may be seen from last week's Washington news that \$132,000,000 of gold had reached the United States from South Africa. The balance of gold left in the E.E.A. at the end of February represented between three and four months' supply at the rate at which the reserves were being drained in the preceding six months. Allowing for this rate of exhaustion, the sales of pre-war E.E.A. gold at the end of 1940 must have amounted to about £320,000,000, which at that time would have left a balance of £189,500,000, some £176,000,000 of this being available. The data published in the United States, however, put an even more urgent complexion on the position. They show sales of gold from the pre-war stocks of the E.E.A. up to the end of 1940 at £436,000,000, leaving a balance of £73,000,000, of which only £60,000,000 was at the time available. The discrepancy suggests that the figures published in the United States regarded as actually expended items which would not be so treated under the strict cash accountability of the British Budget.

* * *

Chinese Exchange Weakness

The Chinese dollar has lost further ground in the foreign exchange market this week, receding to a middle rate of 3½d. The fall has been equal in terms of U.S. dollars, for it should be noted that the sterling-U.S. dollar cross rate in Shanghai has remained around 3.90 despite recent political developments that might have militated against sterling in that market. The weakness of the Chungking Government's currency is in part a reflection of the disquiet aroused in Chinese circles by the Russo-Japanese Pact. It must also be attributed to the intensification of the struggle in China and to the fact that the currency war, as conducted by the terrorists under Japanese control, has now compelled the Chungking banks to close their Shanghai offices. This development must deprive the Chinese dollar of part of the machinery of control which has hitherto been used in its support. On the other hand, it was announced by the Secretary of the U.S. Treasury this week that an agreement is about to be signed allocating a further \$50 millions from the United States Stabilisation Fund for stabilising Chinese currency. With this reinforcement of the exchange reserves backing the Chinese currency, uncontrolled depreciation in the near future need not be expected. As for the mechanism of control, it may be assumed that American and British banks in Shanghai will readily take over such official activities as were pre-

viously centred in the Chinese Government banks which are no longer functioning.

* * *

New Zealand Sterling Funds

The rate of growth of New Zealand's sterling funds since the outbreak of the war has been as great as that of any other member of the sterling area. Mr. Fraser, the New Zealand Prime Minister, speaking last week at the annual conference of the Dominion Labour Party, said that the London funds had risen by nearly £NZ20,000,000 since the beginning of 1939. At that time they stood at about £NZ7,500,000. By normal standards the present reserve of London funds of the Dominion would appear to provide a reassuring margin of safety. Under present conditions, however, there can be no question of allowing this improvement in the reserve position to lead to any relaxation of the scheme of exchange control which the Dominion had applied well before sterling itself became a controlled currency. The need for cohesion in the operation of the control of exchanges throughout the sterling area remains a paramount consideration. In any case, the need for vigilant conservation of New Zealand's exchange reserves is likely to become more apparent in the coming months. The improvement in the position has been the product of two sets of influences: the rigid import restrictions put into operation when exchange control was introduced in the Dominion, and the rise in export income due to higher prices and larger shipments of foodstuffs and raw materials to Britain. But the consequent improvement in the sterling reserve position was achieved during a period when shipping difficulties were far less serious than they are to-day. The Dominion's export income is likely to be cut seriously this year, and though restriction of imports will operate with even greater rigour than before, the need for a reserve such as New Zealand has been able to accumulate is likely to become increasingly evident as the war proceeds.

* * *

Bristol Bill Tender

Tenders were opened this week for an issue of £500,000 Bristol Corporation bills, dated April 28th, and having six months' currency. The results of the issue revealed the abundance of credit available for short-term investment and the consequent pressure on the discount rate. The applications amounted to £3,000,000, and the £500,000 were allotted at an average rate of £1 0s. 5.32d. per cent, or only 2½d. per cent higher than the latest rate at which three months' Treasury bills were allotted. The successful tenders were those put in at £99 9s. 9d., at which applicants received 29.4 per cent of the amount tendered for.

Investment

Business at Minimum

The underlying factor in the stock market continues to be the struggle between the news from the various fronts, military and diplomatic, which has been predominantly adverse, and the growing volume of reinvestment demand, mostly prospective. Recovery in the Funds on Monday, and a tendency for it to spread through other fixed interest stocks, and even to equities on the following day, shows that the effects of developments in the field are likely to be at least as transitory as was anticipated. It is symptomatic that sellers are holding back as much as buyers and that, in consequence, turnover has fallen to an almost negligible figure. Price movements, in fact, represent the reaction of the jobber to fears of selling, which has not materialised. It would be optimistic to suppose that the worst of the war news has been received, but it is probable that the market, and the investor, will become accustomed to reverses. Meanwhile, the purely financial pressure continues to accumulate. The end of the month brings the LCC repayment, to which has to be added disbursements under the latest vesting order, due to start on June 6th. This, and, in a moderate degree, the Commonwealth offer and the municipal conversions will call

for readjustments of investment positions during the coming five months, while it is certain that further operations will not be long delayed. Doubtless, such demand as arises from these changes, and in the aggregate it must be considerable, will be felt chiefly in the gilt-edged market at first. There appears, however, to be no factor threatening to arrest the familiar process of adjustment to falling interest rates. Indeed, the Budget concessions, which have still to find their reflection in prices, should encourage a moderate and independent appreciation in equities. Against this has to be set the certainty that net distributable profits will decline with the rise in income tax, but it is not impossible that this will be offset by a rather more liberal distribution policy. This tendency is already in existence and, while its wisdom may be questioned, it is a factor to be considered. Doubtless owing to the extreme uncertainty of post-war developments and the present severe demands on private individuals, the choice between income in the immediate future and the building up of substantial reserves is swinging in favour of the former. If this change in preference persists, it will evidently offer considerable opportunities to those institutions and individuals who find it possible to sacrifice immediate to future satisfaction.

FAMOUS SINCE 1795

OTARD'S
COGNAC BRANDY

U.S. Stock Vesting

Last week-end brought yet another vesting order, covering more than 160 U.S. securities. Of these, rather under a quarter are gold bonds, including a number of the Erie, Missouri-Pacific and Southern railways, two issues of Belgium and three of Cuba. The remainder are preferred and common stocks, the latter category being rather more numerous. Although the number of individual securities involved is large, the total amount of dollars represented is probably considerably less than in recent call-ups. This is not surprising, for, with this order, substantially over 500 securities have now been taken over by the Treasury, and the number of popular stocks remaining, even before this call, was not great. Limitations of space forbid reproduction of the full list, as has been done on previous occasions, but rather over a score of the better known equities are given below, together with the prices to be paid for

Title of Security	Price per Sh.	Title of Security	Price per Sh.
Aluminum Co. of U.S.	32 8 11	Lorillard (P.) Company \$10	4 3 4
American Loco.	2 14 9	National Biscuit \$10.....	4 2 1
American Power and Light	0 5 8	National Power and Light	1 11 1
Babcock and Wilcox.....	6 6 10	Phelps Dodge \$25	6 10 7
Baltimore and Ohio \$100..	0 16 10	Shell Union Oil \$15.....	3 0 11
Briggs Manufacturing.....	4 13 11	Southern Railway	2 19 8
Cities Service \$10.....	1 2 5	Standard Brands.....	1 9 3

† Ex Apr. Div. ‡ Cum May or June div.

them. As on the last occasion, payment for the securities will be made six weeks after receipt or, in this case, on June 3, whichever is later. The usual arrangements are made for payment, on request, in the Government tap issues, and, as in previous cases, holders should consult their banker or broker as to facilities for lodging securities. If, as seems virtually certain, the amount involved is relatively small, the effect upon the stock market must be correspondingly slight. At the present juncture, even the most modest increase in the volume of business will be very welcome, since the uncertainties of the military situation have prevented the revival in turnover, which promised to follow the opening of the Budget. The operation, and others which may well follow it, should serve to prepare the way for a good response to the municipal conversions, acceptances of which should be flowing in throughout May and June, and, in smaller volume, over the following quarter.

Commonwealth Loan Extension

A first instalment, announced at the end of last week, of the numerous Dominion conversion operations, which would seem to be impending, takes the form of an offer to extend for three years the Commonwealth 3 per cent stock and bonds falling due October 1st next. The amount outstanding is some £13,470,000, and the offer is to renew at the old nominal rate of interest, but with a cash payment of 10s. per cent, which makes the issue price 99½ and the yield, with profit on redemption, some £3 8s. 6d. per cent. The terms are not unattractive, and are likely to be acceptable both to institutions and to a fair proportion of private holders. The Commonwealth will, however, pay off any holders who do not accept conversion and, as was to be expected, no offer for cash is to be made. Australia has certainly a much larger accumulation of sterling balances than will be required to meet this payment, and it still leaves the field open for conversion of some of the large mass of optional maturities, mentioned on page 533 of last week's issue. Since this loan is being paid off at its final date, and since the nominal rate of interest is below that ruling on loans of the Dominion, the operation provides little evidence as to the means by which any further excess of sterling balances will be cancelled. The market, however, reads the offer as a preliminary to other operations.

BAT—Courtaulds Contrast

The shareholders, and indeed the board, of Courtaulds Ltd. can hardly fail to regard with envy their more fortunate fellows of the British American Tobacco

Company. The latter concern has a subsidiary in the U.S.A., the Brown and Williamson Tobacco Corporation, on which the British Government wished to raise dollars. Instead of an outright sale, the Corporation has been granted a loan of \$40 millions by the Reconstruction Finance Corporation, of which \$25 millions will be lent to the parent company, which thus raises dollars without losing control. The reason for the difference in treatment is only too clear. BAT buy American tobacco through this American subsidiary. It would be of no advantage to the U.S.A. to take it over. Indeed, if they did, it would tend to encourage the substitution of Empire, and in due course, Eastern tobacco for American. The new step is a further proof of the goodwill of the American administration, but it makes no contribution to the solution of the problem which faces most British concerns with direct interests in the U.S.A. Most of these are manufacturing concerns, as is the Viscose Corporation, or are engaged in competition with American interests, as are the British insurance companies and Lloyds syndicates. It is certainly to the interest of this country and, perhaps, in the long run, to that of America, that these assets should be pledged for repayment as soon after the war as may be. It is, however, evidently to the interest of American business interests that they should obtain possession of these undertakings outright. If this country wishes to retain power to repurchase, there must be some compensating advantage to the U.S. Government or nation, and it is to be hoped that the British authorities are bearing this possibility in mind. It is, however, necessary to face the fact that if the arguments in favour of the persistence of British interests in the U.S.A. are to triumph, it will involve the abandonment of all those ideas, conveniently summed up by the expression "economic nationalism."

Company Notes

Paint and Varnish Results

Both *Pinchin Johnson* and *Indestructible Paint* show reductions in dividends and profits for the calendar year 1940. *Pinchin Johnson*, with total earnings of £338,347 against £363,866, reduced the ordinary payment from 10 to 8½ per cent. The amount earned for ordinary capital fell from £265,509 to £170,147, although, grossed up at the higher rate of tax, the earned rate improved from 16.3 to 16.7 per cent. *Indestructible Paint* cut the total ordinary dividend from 25 to 20 per cent, and the preliminary statement shows a reduction in net profits from £56,925 to £40,045.

	Years ended December 31		
	1938	1939	1940
	£	£	£

* Including loss of subsidiary of £9,782 in 1938, £4,069 in 1939, and £4,000 in 1940.

† Including £16,792 recovered from income tax.

The statement of the chairman, Mr. E. Robson, which is circulated with the *Pinchin Johnson* accounts, throws considerable light on balance-sheet movements. The rise in stock from £641,152 to the new record level of £867,394 is due, in part, to the necessity of maintaining higher stock reserves both at home and abroad to meet shipping difficulties, and in part to the rise in the price level. The increased holdings are responsible for a reduction in cash from £295,818 to £203,298. Contingencies reserve stands at £65,103 against £25,514, and the chairman states that the fund will be further increased until it can provide cover for all interests in enemy

occupied territory. It is satisfactory, however, that the company's assets in free territories are in themselves adequate to provide an offset for possible loss through enemy occupation. General reserve, as before, stands at £674,150, and the normal increases in debtors and creditors indicate that the company's business has continued to expand in the past year. Since both *Pinchin Johnson* and *Indestructible Paint* are now largely employed on Government contracts and export business, margins are likely to be small, but there is some reason to hope that revenue will be fairly well maintained in 1941. The 10s. ordinary shares of *Pinchin Johnson*, at 17s. ex dividend, offer a yield of £5 per cent. *Indestructible Paint* £1 ordinary shares, at £3 18s. 9d., yield £5 4s. per cent.

Canadian Pacific Costs

The full accounts of the Canadian Pacific Railway Company for last year serve to stress the fact that, even then, the war was producing important changes in the economic life of the Dominion. With a wheat crop even larger than that of 1939, and exports seriously curtailed, only 30 per cent of the crop of the Prairie Provinces had been moved at the end of the year, compared with 60 per cent for the preceding period. In consequence, earnings on grain dropped by 13.1 per cent, but, despite this, total earnings rose by almost the same percentage. There was no material change in the level of freight rates, except for twelve new agreed charges, and freight revenue per ton-mile was, at 0.84 cents, the lowest since 1918, while, thanks in part to military traffic at low rates, passenger revenue per passenger-mile fell to 1.97 cents, the lowest since 1916. The rise in gross earnings thus represents an even more marked expansion in work done, which was due to a variety of causes, including lack of shipping on the Pacific, increased demand for Canadian pulp and paper, and a general expansion in the demands of this country. Broadly speaking, there was an impressive increase in business from the East and from British Columbia, and a smaller falling off in that from the Prairie Provinces. This increase in traffic went

hand in hand with appreciable economies in operating charges, the expense ratio declining to 74.61 per cent, the lowest yet achieved with the exception of 1936. This fall was again due to economies in transportation expenses to a new low of 33.97 per cent of gross earnings. Both train loads and speed were improved, while there was a saving of rather over 2 per cent in freight train fuel consumption per gross ton-mile. There is every reason to suppose that the current year will see a further expansion in industrial freight, while the large amount of un-ion in industrial freight, a useful reserve against, carried grain will constitute a useful reserve against, either a bad crop, or the reopening of markets. The fall in expense ratio has been effected despite heavy charges for renewal of equipment, which serve to maintain full efficiency. In addition, there have been important deliveries of new rolling stock during the year, which should place the company in a strong position to meet any increased demands made upon it. Gross traffic, to date, show a rise of over 25 per cent, but the net amount available for dividends will depend as much on special appropriations as on the course of earnings.

Godfrey Phillips Report

The full accounts of Godfrey Phillips for 1940, disclosing profits, after tax, of £254,898 against £281,758, and a reduction in the rate earned for ordinary capital from 21.4 to 17.8 per cent, add little to the information contained in the preliminary statement. An ample margin of cover is still preserved for the ordinary dividend, maintained at 10 per cent, and the reduction in carry forward from £76,165 to £71,107 is very moderate. The £50,000, against £82,585, allocated to development and contingencies reserve brings the total reserve to £1,325,000. The gravest problem which the company has to face is undoubtedly the difficulty of obtaining leaf stock, and the balance-sheet total has, in fact, declined by £231,000 to £932,157, despite the fact that a substantial part of the physical stock carries two further rises in duty. On this point the chairman, Mr. A. I.

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

SIXTIETH ANNUAL REPORT OF THE DIRECTORS OF THE CANADIAN PACIFIC RAILWAY COMPANY YEAR ENDED DECEMBER 31, 1940

To the Shareholders:—

The accounts of the Company for the year ended December 31, 1940, show the following results:—

INCOME ACCOUNT

Gross Earnings	\$	170,964,897.01
Working Expenses (including taxes)	\$	135,325,458.93
Net Earnings	\$	35,639,438.08
Other Income	\$	10,692,163.30
	\$	46,331,601.38
Fixed Charges	\$	25,380,715.44
Interest on bonds of Minneapolis, St. Paul & Sault Ste. Marie Railway Company, guaranteed as to interest by your Company	\$	805,830.00
	\$	26,186,545.44
Net Income	\$	20,145,055.94
Dividends on Preference Stock:		
2 per cent. paid October 1, 1940	\$	564,069.10
2 per cent. payable February 1, 1941	\$	564,069.10
	\$	5,042,781.70
Balance transferred to Profit and Loss Account	\$	15,102,274.24

PROFIT AND LOSS ACCOUNT

Profit and Loss Balance, December 31, 1939	\$	141,353,502.86
Balance of Income Account for the year ended December 31, 1940	\$	15,102,274.24
	\$	156,455,777.10

DEDUCT:		
Amount credited investment reserve owing to impairment in investment in Minneapolis, St. Paul & Sault Ste. Marie Railway Company	\$	10,000,000.00
Loss on lines abandoned and on property retired and not replaced	\$	1,539,475.25
Miscellaneous—Net Debit	\$	871,006.39
	\$	12,410,481.64

Profit and Loss Balance, December 31, 1940, as per Balance Sheet 144,045,295.46

Net Income for the year amounted to \$20,145,055, being \$10,362,907 greater than in 1939.

RAILWAY EARNINGS AND EXPENSES

The comparative results of railway operations were as follows:—

	1940	1939	Increase or Decrease
Gross Earnings	\$ 170,964,897	\$ 151,280,609	\$ 19,684,188
Working Expenses (including taxes)	\$ 135,325,459	\$ 122,756,880	\$ 12,568,579
Net Earnings	\$ 35,639,438	\$ 28,523,819	\$ 7,115,619
Expense ratios:			
Including taxes	79.15%	81.15%	2.00
Excluding taxes	74.61%	78.26%	3.65

GROSS EARNINGS increased by \$19,684,188, or 13 per cent. Each month contributed to this increase with the exception of September, during which there was a substantial reduction owing to the absence of the usual heavy movement of grain.

FREIGHT EARNINGS increased by \$15,493,585, or 12.9 per cent., and were greater than those of any year since 1929.

Earnings from grain and grain products showed a decrease of \$4,171,034, or 13.1 per cent. The total handling of all grains during the year amounted to 166 million bushels, as compared with 203 million bushels in 1939, an average of 155 million bushels for the years 1930-1939 (during which grain production was generally sub-normal) and an average of 254 million bushels for the years 1925-1929. Delayed movement of the 1939 crop resulted in increases in grain earnings during the early months of the year, but these were more than offset by reductions in the autumn months.

The Prairie Provinces wheat crop of 525 million bushels in 1940 was second only to the 1928 crop of 545 million bushels, the largest in the history of these Provinces. However, with much of the normal export market closed as a result of the war, the terminal elevators were over-taxed, and it became necessary to hold a large part of the wheat on farms or in country elevators. At the end of the year it was estimated that only 30 per cent. of the crop had been moved, as compared with about 60 per cent. in 1939 and 70 per cent. in 1938.

Apart from grain, freight earnings increased 22.2 per cent., gains being shown in every important class of commodity except fruits and vegetables and anthracite coal. There were particularly heavy movements of manufactured goods, construction materials, petroleum products, bituminous coal, coke, and miscellaneous freight. Owing to lack of ocean tonnage on the Pacific large consignments of lumber and timber moved from British Columbia to eastern ports for shipment overseas, and special rates were provided for this movement. The inability of producers of pulp and paper in enemy-controlled parts of Europe to reach American markets was an important factor leading to increased movement of these commodities from Canada. There was a substantial gain in shipments of dressed meats and packing house products to the United Kingdom. Ores and concentrates and refinery and smelter products moved in increased volume. Owing to wartime conditions, there was a notable

change in the geographical distribution of originating tonnage. Losses in the Prairie Provinces were more than counterbalanced by impressive increases in the East and in British Columbia.

PASSENGER EARNINGS increased by \$2,784,687, or 17.8 per cent., as a result both of military movements and of increased business activity. Among the adverse features were the virtual disappearance of ordinary passenger traffic in connection with the Atlantic steamships and a considerable reduction in travel through Pacific Coast ports. Unfortunately, during the summer widespread publicity was given to false reports of difficulties encountered by United States citizens entering and leaving Canada. These tended to interfere with tourist traffic in the early part of the season, but later their effect was largely overcome by intensive publicity in which your Company participated.

OTHER EARNINGS increased by \$1,405,925, or 0.2 per cent., notwithstanding a decrease of \$2,236,232 in steamship traffic commissions, which were discontinued on February 1, as explained at the last annual meeting. Under this heading the largest increase was in express earnings, but sleeping car, dining car, news service and other passenger train revenues also showed considerable gains. There was also a substantial improvement in switching and storage revenues and other miscellaneous items.

WORKING EXPENSES increased by \$12,568,579, or 10.2 per cent. Excluding taxes, the increase was \$9,163,205, or 46.55 per cent. of the increase in gross earnings. The ratio of working expenses (excluding taxes) to gross earnings of 74.61 per cent. was the lowest ratio of any year since 1917, with the exception of 1926, when it was 74.41 per cent.

MAINTENANCE OF WAY AND STRUCTURES EXPENSES increased by \$2,119,456, or 10.9 per cent. During the year 1,473,986 treated and 1,609,582 untreated ties were placed in track. New rail laid totalled 229 single track miles. Rock ballast was applied to 108 single track miles between Winnipeg and Fort William, completing the rock ballasting of the main line between these points.

MAINTENANCE OF EQUIPMENT EXPENSES increased by \$4,955,668, or 17.2 per cent. Effective January 1, depreciation for rolling stock was provided on the basis of use. This involved charges to maintenance to the amount of \$10,317,760, as compared with charges for retirements in 1939 of \$7,411,151. The difference of \$2,906,609 reflects the increase in the use of rolling stock as well as the change in the method of accounting. Expenditure on locomotive repairs amounted to \$8,864,494 and included the shopping of 572 engines for heavy repairs. The boilers of 15 passenger locomotives were completely renewed, and new tenders were provided for 19 freight locomotives. Expenditure on freight train car repairs amounted to \$6,480,285 and included main shop overhauling of 11,738 freight cars. Passenger train car repairs amounted to \$5,034,367 and included the overhauling of 1,167 passenger cars. At the close of the year 89.5 per cent. of locomotives and 96.0 per cent. of freight cars were in serviceable condition, as against 85.6 per cent. and 96.5 per cent., respectively, at the end of 1939.

TRANSPORTATION EXPENSES increased by \$3,344,182, or 6.1 per cent. They amounted to 33.97 per cent. of gross earnings as compared with 36.18 per cent. in 1939. This was the best ratio yet attained. The improvement in transportation performance is further indicated by the following comparisons:—

	1940	1939
Freight train fuel consumption—pounds per 1,000 gross ton miles	97	1,171
Freight train load—tons	1,747	1,732
Freight train speed—miles per hour	17.5	29.573
Gross ton miles per freight train hour	30,653	

OTHER WORKING EXPENSES increased by a net amount of \$2,149,273. As a result of the changed method of accounting for the cost of soliciting ocean steamship traffic, to which reference has previously been made, traffic expenses incurred on account of the ocean steamships have been charged directly against their earnings and are no longer included in railway working expenses. In 1940, expenses so charged amounted to \$1,611,692. The expenses of the Immigration and Colonization Department, amounting to \$231,837, were included in traffic expenses instead of being charged to Land Surplus as in previous years. While some of the work of this department is still directly related to the sale of lands, the greater part of its activities now has in view the long term traffic benefits brought about by increased settlement and the development of the resources of the country. During the year the salaries of the senior officers and the fees of the Directors were restored to the basic rates of 1930. Taxes were higher by \$3,405,873, bringing railway tax accruals for the year up to \$7,765,865, an increase of 78.1 per cent.

OTHER INCOME

Other income totalled \$10,692,163, an increase of \$3,927,312, or 58.1 per cent.

Dividend income increased by \$77,822. There was an increase of \$420,625 in dividends received from The Consolidated Mining and Smelting Company of Canada, Limited, which were at the rate of \$2.25 per share as compared with \$2.00 in 1939, but this was partially offset by a decrease in other dividends.

Net income from interest, exchange, separately operated properties and miscellaneous sources increased by \$87,527. Interest received on deferred payments under land contracts, which heretofore has been credited to Land Surplus, was included for the first time under this caption.

The operation of ocean and coastal steamships resulted in a net profit of \$3,075,910, as compared with a net loss in 1939 of \$1,274. As reported at the last annual meeting, commencing with their first voyage from the United Kingdom after February 1, 1940, your Company's Atlantic fleet were requisitioned by the Ministry of Shipping to be operated for the account of the British Government. Some details of hire for requisitioned vessels remained unsettled at the end of the year, and the items affected have been estimated for inclusion in the year's results. As your fleet was intensively used throughout the year, the withdrawal of vessels from service for normal overhaul was necessarily restricted, but adequate provision for maintenance has been made in the accounts. Depreciation was accrued on all ships at the same rate (5 per cent.)

GENERAL BALANCE SHEET, DECEMBER 31, 1940

ASSETS	\$	\$

AUDITORS' CERTIFICATE:

We have examined the Books and Records of the Canadian Pacific Railway Company for the year ending December 31, 1940, and having compared the above Balance Sheet and related schedules therewith, we certify that in our opinion it is properly drawn up so as to show the true financial position of the Company at that date, and that the Income and Profit and Loss Accounts correctly set forth the result of the year's operations.

Montreal, March 7, 1941.

PRICE, WATERHOUSE & CO.,

(Continued from page 561)

Phillips, in the course of his speech circulated with the report, makes it clear that leaf tobacco in bond has in fact been considerably reduced after a year in which consumption has continued and replacement has been impeded. The difficulty, of course, arises from the virtual suspension of imports from the U.S.A., which formerly supplied some 70 per cent of normal annual British consumption. Mr Phillips, however, expressed the opinion that the curtailment of leaf stock would not lead to any immediate shortage of supplies for manufacturing purposes. He also provided the welcome information that, despite inevitable separation from export markets, the volume of exports was approximately maintained in 1940, thanks to an increase in trade with those markets which have remained free. Apart from such anxieties as exist about leaf supplies, the company is likely to be faced with labour shortage, and possible rises in wages. There is, however, every indication that demand will be maintained, and in the absence of serious loss by enemy action earnings should not suffer appreciably. The £1 ordinary stock, at 26s. 6d., offers a yield of £7 15s. 4d. per cent.

J. and P. Coats' Profits

The fall in J. and P. Coats' total profits, struck after tax, other than tax on dividends, and depreciation, from £2,187,797 to £1,884,852, for the calendar year 1940, is not considerable in view of last year's steep rise in tax liability. The figures which are supplied in the preliminary statement indicate that published profits are still above the level earned in 1936 and 1938, and it is possible that the trend of gross revenue, before tax or

as adopted by the British Ministry of Shipping in its chartering arrangements. Four of your Company's ocean vessels, having a gross tonnage of 78,666, were sunk by enemy action during 1940, and at the end of the year your fleet was reduced to 246,072 gross tons. The operation of coastal steamships resulted in increased earnings, and no damage of an important nature was sustained by vessels in this service during the year.

There was an improvement of \$614,779 in net earnings of hotel, communication and miscellaneous properties, of which amount hotel operations accounted for \$228,406 and communications \$217,686.

DIVIDENDS

Dividends aggregating \$5,042,782, representing 4 per cent. on the non-cumulative Preference Stock, were declared from the net income of the year. Your Directors decided that no action should be taken with respect to a dividend for the year 1940 on the Ordinary Capital Stock.

Bryant and May Accounts

Profits for the year to March 31, 1941, struck after all expenses except depreciation, are reduced from £636,602 to £523,912, a decline which, as the directors state, is fully accounted for by increased taxation. After allocating £80,000, against £50,000, for depreciation and meeting debenture and preference service, the surplus for ordinary and partnership shares and for the employees' proportion is rather over £90,000 lower at £406,712. The tax-free ordinary dividend, for the first time in the past decade, is cut from 25 to 22½ per cent, absorbing £297,000 against £330,000, and the allocation to reserve fund is halved at £50,000. With the partnership dividend, maintained at 10 per cent on a slightly increased capital, there is, however, a reduction in the carry-forward from £135,657 to £124,999. It is probable that the suspension of large-scale import of matches last year, together with an actual increase in home production, benefited Bryant and May and the holding company, British Match, at the expense of

foreign competitors. Such reduction as took place in home consumption has not, of course, affected the demand for Bryant and May's products, and future profits will clearly be determined solely by the available supply of match wood and the pressure of costs and taxation. The balance sheet shows a rise in stocks from £254,108 to £292,073 and a decline in advances for timber purchases from £61,999 to £49,737. After the draft on general reserve for payment to British Match of the bonus dividend of £200,000, agreed at last year's annual meeting, the balance-sheet total is reduced from £850,000 to £750,000. Creditors and debtors show normal increases, and cash holdings are moderately higher at £899,710 against £862,217. The £1 14 per cent cumulative preference shares, at 52s. 6d., ex dividend, yield £5 6s. 8d. per cent.

West Rand Consolidated

The full accounts of West Rand Consolidated for 1940 show record earnings and output. Total profits, after deduction of operating expenses, increased from

£1,448,030 to £1,954,413, while gross revenue from gold production passed the £4,000,000 level for the first time at £4,303,404. The sum due in Union income tax rose steeply from £581,376 to £1,033,586, and capital expenditure, charged against profits, increased by more than £100,000 to £198,405. The dividends are maintained at 25 per cent on ordinary shares and £7 1s. 8d. per share on deferred shares, involving a reduction in the carry-forward from £114,380 to £90,827. The report indicates that last year's progress is largely to be attributed to the improvement in the native labour position, which made possible use of the south reduction plant at capacity, and further progress with development operations, which had to be checked in 1939. Consequently, there is an improvement in ore reserves, despite the record activity of the mine, from 10,447,000 to 10,800,000 tons, with an average value of 4.3 dwts. against 4.4 dwts. Tonnage milled increased from 2,520,000 tons to the new record of 2,781,000 tons. There appears to be no immediate prospect of a further increase in production, and the slight fall in grade of ore milled suggests that, in the absence of fresh economies, revenue before tax is not likely to improve further. The 10s. ordinary shares, at 31s. 3d., offer a yield of £8 2s. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

No revival of business took place before the weekend, and, on Monday, while sentiment improved slightly and there was an increased demand for undated Funds, turnover remained at a very low level. A moderate rally the next day, occasioned mainly by the prospect of investment demand arising from holders of the newly requisitioned dollar stocks gave way in midweek to a small volume of selling on news of the capitulation of two Greek armies, a movement followed by a fractional recovery. The main price movements of the week have been concentrated on the gilt-edged market, business in all other sections remaining at a minimum.

Small losses in the gilt-edged market before the weekend were generally corrected in the first two days of the week. The improvement was concentrated on undated investment stocks. Thus, 3½ per cent War Loan gained ½ on Monday, followed by ½ the next day, when 2½ and 4 per cent Consols, 4 per cent Funding and Local Loans all improved the same amount. Tuesday's gains were, however, largely reversed in midweek. The foreign bond market was characterised by the recovery of Brazilian issues. European bonds generally shared in the setback caused by the critical nature of the war news from Greece. French rails lost ground before the weekend, and Greek, Spanish and Belgian issues were also subject to occasional selling.

Home rail issues remained quietly firm, with few price changes. Great Western ordinary enjoyed a steady improvement of ½ point on Friday and Tuesday, but reacted ½ point on Wednesday. LMS ordinary was also in demand and a few of the senior issues improved. Among foreign rails, Argentine issues gave way on small but persistent selling. Bengal and North Western continued to improve and Canadian Pacific ordinary was also in demand.

The industrial market remained dull throughout. Before the weekend, there was some weakness in the aircraft and motor section, and Morris, Hawker, Austin and Bristol Aircraft all lost 3d. On Monday, Hudson's Bay and Sudan Plantations were quoted lower and, the next day, heavy industrials suffered a long list of small losses, which included

Babcock and Wilcox, John Brown, Colvilles and Dorman Long. Among miscellaneous industrials, Pinchin Johnson lost a few pence and Dunlop, ICI and London Brick were sold. In midweek, the tobacco leaders were unchanged on balance, following a momentary setback.

The war news was the dominant influence in the mining and commodity share markets. Turnover in kuffirs remained small, but a number of moderate gains were realised early in the week. Thus, Springs and Consolidated Goldfields gained ½ on Monday, and the next day Grootvlei and West Wit Areas improved ½. The tone, in general, remained firm despite lack of business. In the rubber market, a number of companies, including United Sui Betong, Malayalam, Rubber Trust and Bukit Rajah suffered losses before the weekend. In the oil market, remarkable firmness was displayed by Anglo-Iranian issues, the ordinary shares improving daily. Trinidad issues were also firm and Leaseholds continued to improve in midweek. Canadian and Mexican Eagles were both sold in a small way.

New York

TRADING on Wall Street remained extremely sluggish during the past week, with turnover low and price movements narrow. Sentiment was depressed by anxiety regarding the Balkan situation, and by pessimism with regard to the impact of further taxation at home. Before the weekend, steel issues were offered, but during the present week there has been little perceptible change in the majority of quotations. On Tuesday, there were signs that dealers had already discounted the possible capitulation of various Greek forces. In midweek, despite fears of surtax in-

crease, demand increased toward the close, and steel issues improved.

The Iron Age estimates steel mill activity at 96 per cent of capacity, against 98.5 per cent in the previous week.

Industry and Trade

Improving Factory Attendance

The war has enormously increased the waste of labour arising from excessive turnover, absenteeism and unpunctuality, just at the time when economy of labour is of the utmost importance. Turnover appears to be something like three times what it was before the war, which means, in the case of factories employing women, the equivalent of a complete change of staff during the year. The chief cause of this is the shortage of labour, and something has been done to meet it in the engineering industries by Government restrictions on movement and advertising, but such negative measures can have only a limited degree of success. As by far the majority of people changing jobs have been in them for less than a year, the organisation of suitable training schemes, which will make beginners more competent, and therefore more contented, is probably the best antidote. Selection tests which would ensure the new entrant being given the job best fitted to him would also be a help. Absenteeism, especially among women, particularly married women, is a cause of grave concern, even in the best-conducted factories. The commonest cause is "home circumstances"—shopping difficulties, husbands home on leave, complications with the children, or air-raid damage. Shopping is a real difficulty, for it is no longer possible to do the domestic catering at any regular predetermined time, nor even always to do it in one expedition. The butcher may be sold out before the fishmonger's stock has come in, while most of the unrationed foods, a few of which must be found, even though they are not individually indispensable, require careful reconnaissance work at a variety of times.

It is suggested in an article by Mrs W. Raphael in the April issue of *Occupational Psychology* that factories could do something to help in the matter by allowing their canteens to stock essential foods, including rationed articles, which women could buy in the lunch hour. Sickiness is quoted in this article as the second most important cause of absenteeism, though there is no evidence that the sickness rate has increased since the war. Third in importance comes lateness. Employees of both sexes, finding that they are going to be very late, perhaps because of dislocation to transport, are apt to decide that it is not worth while to go at all. Excessive hours, which though now forbidden for women, are still being worked in some cases by men, lead to the need for an occasional day off in order to recuperate. All these causes also contribute to unpunctuality, which is further encouraged, among the least conscientious minority, by the consciousness of a labour shortage. Many of the causes of absenteeism and unpunctuality call for sympathy rather than repression, and where attendance cannot be improved the ideal solution is to adjust the factory organisation in such a way that the individual's bad attendance does less to hinder production. Best of all, where the labour can be obtained and the machinery is not too complex, is a system of understudies, nor-

mally employed on jobs that can be postponed, but trained to replace absentees. Failing this, there is nothing for it but an appeal to the employees, and these, according to the evidence Mrs Raphael has found, invariably elicit a response. Such devices as slogan competitions, output competitions between shifts, punctuality and attendance drives, have all been found to produce good results. A regular practice of interviewing all late comers and absentees also tends noticeably to a reduction of carelessness in these matters, which, if allowed to pass without comment, tends to become habitual. It is, however, rightly observed that appreciation must also be shown to the very many who have maintained punctual and regular attendance in the face of severe difficulties, discomfort and danger.

The Volume of Food Sales

The value of food sales in Great Britain, as reported by the Bank of England on the basis of a representative sample of shops, has shown an almost uninterrupted upward trend since the outbreak of war. But in view of the rise in prices, the value of food sales does not reflect changes in the volume of turnover. In order to obtain a rough measure of the trend in the volume of food sales, the Bank of England's value figures have been adjusted for changes in the food component of the Ministry of Labour's index of the cost of

INDICES OF THE VOLUME OF FOOD SALES (1935 = 100)

	1932	1938	1939	1940	1941
January	88 1/2	101	103 1/2	95	94
February	88 1/2	106	110	97	96
March	80	108	113 1/2	105 1/2	
April	88 1/2	116	123	106 1/2

November	104 1/2	129	117	107	
December					
Total	92	108 1/2	111 1/2	99	

living. The resulting indices, tabulated in the accompanying table, suggest that the upward trend in the volume of food sales was arrested soon after the outbreak of the war. Indeed, from November, 1939, the indices are consistently lower than those for the corresponding months a year earlier. For 1940 as a whole the index of the volume of retail food sales shows a reduction of 11 per cent, from the figure for 1939. But the index for 1940 is still 7 1/2 per cent above that for the depression year 1932. True, Great Britain's population in 1940 was greater than in 1932, but the increase must have been largely offset by the growth of the armed forces, who have their own catering arrangements.

RESULT OF TENDER

Bristol Corporation Bills.—Tenders for £500,000 bills were opened on April 22nd. Amount applied for, £3,000,000. Tenders at £99 9s. 9d. received an allotment of 29.4 per cent. Average rate of accepted tenders was £1 0s. 5.32d. per cent per annum.

Shorter Comments

Shell Union Oil Corporation.—Gross earnings three months to March 31st, 1941, \$62,990,600 (\$67,006,300). Net income, \$3,621,800 (\$5,314,100). Net income struck after, \$1,046,300 or \$96,500 extra for tax. Costs and expenses, \$47,044,700, a decrease of \$2,076,000. Charges for depreciation were \$449,300 smaller at \$10,569,900.

Chrysler Corporation.—Net sales 1940, \$744,561,238 (\$549,806,327). Cost, \$633,606,186 (\$459,655,341). Net profit, \$37,802,279 (\$36,879,828). Dividends paid, \$5.50, against \$5. Forward \$115,669,127 (\$107,960,682).

Transvaal Working Profit, March.—Total estimated working profit of Witwatersrand gold mines for March, £3,897,732, against £3,670,312 for February.

Shipping Losses

The public must be prepared for worse news of the Battle of the Atlantic before Mr. Churchill's confidence in a decisive victory is justified by results. The losses since the renewal of the offensive early in February have been serious. The rate of attrition must be more than halved before the tide can be said to be turning. But, as the accompanying table shows, the sinkings so far announced—the figures for March are only provisional—are still below the level reached in the worst

periods of last summer and autumn. It remains to be seen whether stronger British escorts, combined with the bombing of the submarine bases and shipyards along the European coast, can neutralise at this stage the intensified efforts which the Germans are making; but it would be no matter for surprise if the record of the current month—which will probably not be revealed for another fortnight or three weeks—shows an increase in losses.

* * *

An Invaluable War Service

A piece of spontaneous war work whose value can hardly be overestimated is being done by the British Standards Institution, which, a few months before the war, offered its services to the Government as a complete unit. The offer was accepted with alacrity, and upon the outbreak of war the Institution revised its procedure and set up a large number of small executive committees to deal with the various sections of its work. The Government departments are finding this machinery invaluable in the preparation of specifications, as the Institution has not only the experience but the "contacts" necessary for the most efficient execution of this work. As it is invited to send a representative to appropriate meetings of the Materials Committee of the Production Executive, it is able to bring about a considerable measure of co-ordination in the preparation and issue of specifications. It is estimated that the first issue of specifications for tins and cans saved 40,000 tons of steel in the first year, and the adoption of a specification for bolts and nuts with smaller heads is expected to save many thousands of tons a year. The work of rationalising alloy and special steels is also said to be well under way. It is not only in the field of metal work,

where the possibilities of waste by the absence of standardisation are the most spectacular, that the British Standards Institution is rendering service. It is also being used by the Ministry of Works and Buildings; by the Ministry of Home Security in connection with A.R.P. work; and it is even providing the definitions which are necessary for the administration of the purchase tax. All this is an admirable contribution to the war effort, and it is particularly satisfactory that it is not being accompanied by any relaxation in the collaboration of the Institution with the Dominions and the Argentine. This collaboration is of the utmost value to our export trade.

* * *

The Ministry of Labour Sets an Example

The functions of government have undergone so great expansion and extension in consequence of the war that the organisation of the respective departments is transformed out of all recognition. The Ministry of Labour has been the first to recognise that this development calls for steps to familiarise the public with the various new departments, and has issued a handbook explaining its own organisation. The functions of the Labour Supply Board, the Labour Supply Departments, the Engineering Branch, the Training Department, the International Labour Branch (specially devoted to the employment and welfare of friendly aliens), the Factory and Welfare Advisory Board, the Seamen's Welfare Board, the Factory and Welfare Departments, the National Service Department, the Military Recruiting Department, the Industrial Relations Department, the Trade Boards Department, the Statistics Branch, the International Labour Organisation Department, the Unemployment Insurance Department, and the Juvenile Department are all explained, and the local organisation of the Ministry is set out in a similar way. There are other ministries which might follow this example with great benefit to the public. Much valuable time could be saved by business men on important work if the Ministry of Supply, for example, were to publish a similar description of its organisation. It is one of the differences between dictatorship and democracy that in a democracy the Government departments are the servants of the public, and the more the public knows of the nature and whereabouts of the available services the better for the cause for which we are fighting.

* * *

Training Canal Boatmen

About two months ago Mr Frank Pick was appointed by the Minister of Transport to investigate and report upon the use of inland waterways. While his report has not yet been completed, it is understood that he has already been able to make certain suggestions to the Minister, one of which has been embodied in an offer of grants to canal carriers for the training of boatmen. A canal boat, as distinct from a barge, is a small vessel for the navigation of non-tidal waterways, and it is the object of the Ministry of Transport to bring back into service as many of these as possible. The chief difficulty is the shortage of competent boatmen, and to encourage carrier companies to train a supply the Ministry of Transport is offering a grant of £10 for each man trained, to help to meet the additional costs arising from slower working and possible damage. The grant will be paid upon the completion of training provided the Minister is satisfied that, as a result of training more men, the company has made a net addition to the number of boats in service. The carriers must also undertake to employ each man for a year after training. Assuming that £10 is a sum adequate to remove any serious financial objections on the part of carriers to joining the scheme, the chief difficulty is likely to be a shortage of suitable recruits. Among men over military age, this form of war work is likely to make a strong appeal to a very limited number, and its best chance of success is therefore likely to be found in skilfully directed publicity.

COMPANY MEETINGS

ROYAL EXCHANGE ASSURANCE

221st ANNUAL REPORT

STATEMENT BY THE RT. HON. LORD BICESTER, GOVERNOR OF THE ROYAL EXCHANGE ASSURANCE, ON THE OCCASION OF THE PUBLICATION OF THE ANNUAL REPORT AND ACCOUNTS OF THE CORPORATION FOR THE YEAR ENDED DECEMBER 31, 1940

Having regard to war conditions I am departing from my usual custom of giving a review of the work of the Corporation in the form of an address at our annual general court, which will be held on Wednesday, the 30th instant. In order that stockholders may be as fully acquainted as possible with the current affairs of the Corporation I am now enclosing a statement on the year's work to enable you to receive it with a copy of the annual report and accounts of the Corporation for the year ending December 31, 1940.

Two changes in the court of directors have taken place. Lord Catto has had to relinquish his seat on our court upon his appointment as Financial Adviser to His Majesty's Treasury, and Mr A. B. Leather, chairman of our associated company, The State, has been appointed a director.

In the United States Mr R. A. Lovett, a member of our American Advisory Board, had to resign upon being appointed a Special Assistant to the United States Secretary of War, and his place has been filled by Mr E. Roland Harriman.

There have been no important changes in our executive staff.

LIFE DEPARTMENT

In our life department the premium income of £1,377,000 was only £11,000 less than in 1939.

The net new sums assured under policies issued in 1940 were nearly £2,250,000, being 75 per cent. of the corresponding figure for 1939. The difficulty of forecasting the future of interest and mortality rates is recognized, and therefore a large addition of new business is not without its difficulties. It seems probable that the main cost of the war to life assurance companies may not lie in casualties to civilians caused by enemy action, but will arise from investment and taxation problems, none of which will cease with the cessation of hostilities.

The gross rate of interest earned during the year 1940 was £4 9s. 9d. per cent., or 2s. 6d. per cent. less than the corresponding figure for 1939.

The Corporation's determination to support the Government's war loans to the fullest possible extent will naturally result in a growing proportion of Government securities to other investments in the portfolio of the life fund, and as the duration of the war, and its after effects, are both unpredictable, it would be idle to attempt to forecast the level to which the net yield upon our investments may eventually fall.

QUINQUENNIAL BONUS DECISION

The year 1940 was a quinquennium year, and you will see that an amount of £85,658 is shown in the accounts as the Proprietors' share of the valuation surplus.

Among other changes in valuation standards it was considered advisable to reduce the rate of interest assumed in the calculation from 3 per cent. to 2½ per cent. per annum, an action which is amply justified, unfortunately, by the course of interest rates over the quinquennium.

In view of the uncertain outlook, and of the downward course of net interest yields, the directors felt that it would be prudent to limit the amount of bonus declared to a rate of £1 per cent. per annum of the sum assured for each full year's premium due and paid in the quinquennium ending December 31, 1940, and at the same time to continue that rate of bonus for policies becoming claims during the present quinquennium in respect of premiums paid since December 31, 1940.

Nevertheless, in order to avoid any hardships to policies becoming claims during the current quinquennium the directors considered that it would be proper to pay, in respect of such policies, a special interim bonus of 10s. per cent. per annum of the sum assured for every premium due, and paid, in the quin-

quennium ending on December 31, 1940, but they reserve the right to withdraw this interim bonus scheme at any time should circumstances appear to make it expedient.

A profit of £65,000 is shown as the result of the working of our annuity business over the period 1935-1940.

Last year I mentioned the connection between the demand by the general public for annuities and the decline in interest rates and subsequent earning power of investments, and I emphasized that this often entailed the investment of such purchase monies at a time when securities stood at high prices, giving correspondingly unattractive yields. To help the future interest earnings and to provide for a small estimated shortage in valuation your directors have this year made a transfer of £100,000 from the general profit and loss account to the annuity account, which has been applied in writing down the book value of the investments.

Our trustee and executor business has been carried on satisfactorily.

FIRE DEPARTMENT RESULTS

The results of our fire department have for the first time for many years proved disappointing. It would undoubtedly have been too sanguine to have expected this year's experience to have been good, in the light of the published estimate of losses in Great Britain, which during 1940 were £12,600,000, against £9,000,000 in 1939, an increase of approximately £3,600,000, or 40 per cent.

Many factors have combined to contribute to this unfavourable result. The growing intensity of the war effort, expansion of operative staffs, more continuous use of industrial plant, and the effects of the black-out have all tended towards an accumulation of risk, which would be less in times of peace. Added to this there are the higher values of property and goods destroyed.

The results in the foreign field were satisfactory, but our business in America has been unprofitable.

In addition to the assistance which, in common with insurance companies generally, we are rendering to the Government as their agents in connection with War Risk Commodity insurance, we are helping in other ways, and the work arising out of the recent passing of the War Damage Act will make still further demands upon us. The task is not made easier having regard to depleted staffs, but I have no doubt that they will cheerfully make every effort to meet this essential war work.

MARINE BUSINESS

Our marine department has, owing to a state of war, encountered many special and difficult problems. At the outbreak the Government set up a War Risks Insurance Office, since when most of the import and export cargoes of the country have been insured with that office. In addition the Government made arrangements to insure the hulls of British vessels against war perils.

We have, however, participated to a small extent in what business against war risks remained with the market, and this is principally the hulls of some foreign vessels and cargoes passing between neutral countries or between our Dominions and Colonies.

The risks at sea must inevitably lead to an increase in casualties falling under marine policies which in practice are attributable to working under war conditions, but this situation has been met in a wonderful spirit of co-operation by the market as a whole.

The Joint Hull Committee is working effectively, while the Advisory War Rating Committee has contributed invaluable

To Speed Up The War Effort

H.M. Stationery Office ask all owners of typewriters to offer any which can be spared for work of urgent National importance. Machines should be in good working order and not over 20 years old.

THE DIRECTOR OF SUPPLIES (S3E),
H.M. Stationery Office, Princes Street, S.W.1.
State name of maker, model and whether you wish to sell or loan.

help in the smooth working of the cargo section of the business, and in addition the very necessary increase in marine cargo rates has been arranged by the creation of a surcharge agreement.

While the results of our marine department are not unsatisfactory, we have not made any transfer to our general profit and loss account this year.

ACCIDENT DEPARTMENT'S SATISFACTORY YEAR

Our accident department has had a satisfactory year.

The income of £1,078,000 represents a reduction which was fully anticipated under war conditions, but the profit figure of £160,000, including net interest, was more than we deemed it prudent to expect.

Constantly changing conditions, particularly abroad, make any detailed review of the account of little value, but there is one feature concerning reserves for outstanding liabilities to which attention should be drawn.

Full provision on the usual basis has been made to meet unsettled claims, both from home and overseas, but owing to the method of accounting which we have adopted in dealing with business from enemy and occupied countries, the item of "Payments under policies" has been increased, while the figure for "Total estimated liability in respect of outstanding claims" has been correspondingly reduced.

The accident account is in a very healthy condition, and these results are particularly satisfactory, occurring as they do in a year when we have been less fortunate in our fire business, a position which emphasises the great value that attaches to the composite and widespread nature of the corporation's insurance operations.

RESULT OF YEAR'S WORKING

In the general profit and loss account the conditions created by the war are reflected in the decrease in the receipts from interest, dividends, etc. We have not escaped defaults on some of our investments, and we have received no dividends from certain foreign subsidiaries.

The result shown on the account is a reduction in the balance of £111,000, of which £100,000 is the transfer to the annuity account investments and £11,000 the balance on the various revenue items brought into the account.

If they had thought it advisable to do so your directors might have brought into this account larger dividends from certain of our associated companies, as well as some of the increased accumulated profit in our own marine account. In the present circumstances, however, it was preferred to allow this slight reduction in the balance of the general profit and loss account.

The corporation has already paid a dividend of 11 per cent. (less income tax) in November last, and the directors are recommending at the annual general court on April 30th the payment of a further dividend of 19 per cent. (less income tax), making 30 per cent. on the capital stock of the corporation for 1940.

With regard to the results of our associated and subsidiary companies, the Car and General and the Motor Union have had an extremely good year. Some of our other companies have been adversely affected by the unsatisfactory results of the home fire business, which I have already mentioned, but in the aggregate the result of the year's trading is not unsatisfactory.

TRIBUTE TO STAFF

Before concluding these remarks I should like to pay a tribute to our staff for all they have accomplished in the past year.

From those attached to the head office and our branches and district offices in this country, 322 have joined the armed forces of the Crown. Many members of our overseas organisation are also serving the Empire. We wish them all good luck and a safe return.

I regret to tell you that two members of our staff have been killed on active service, and four civilian members as the result of enemy action in this country. We honour their memory and extend our deepest sympathy to those who mourn their loss.

It has been a difficult year—difficult because of the exceptionally heavy increase in the home fire losses experienced throughout the country, and difficult because of the conditions under which our business has had to be carried on. Some of our officials and staff have remained at our head office. The remainder are located in the country, and this distribution of our organisation has added enormously to the difficulties with which they have had to contend in carrying on the corporation's affairs; but it has been done efficiently and cheerfully, and we owe a very warm debt of gratitude to our managers, the heads of our departments, to our branch managers, our staffs, and in fact to the whole of our organisation throughout the country. Nothing could have exceeded their loyalty in their service to the corporation.

THE LONDON ASSURANCE

A CREDITABLE ACHIEVEMENT

The annual general court of the London Assurance will be held at the head office, London, on the 30th instant. The following is a summary of the statement issued on the publication of the accounts by the governor, Mr R. Olaf Hambro:—

Nineteen-hundred-and-forty was the closing year of the quinquennium period 1935-1940. The life assurance fund on December 31, 1940, was at the substantial figure of £10,968,393. They would be making the customary valuation as at the end of the current quinquennium in 1945, but they hoped conditions would have asserted themselves long before that date, enabling them to deal with the matter of bonus and in a way which would be satisfactory to their policyholders. On policies maturing by death or otherwise during the current year an intermediate reversionary bonus would be paid of £1 per cent. per annum, calculated on the sum assured and existing bonuses for each with profits premium due and paid since December, 1935, and under the old series of policies a cash bonus of 35 per cent. of the ordinary whole term with profits premiums due and paid since December 31, 1935, would be paid.

The valuation figures disclosed an exceedingly strong position of security to their life policyholders and in the better times which were surely ahead of them, their participation in the profits would exhibit as they had in the past, the tangible effects of the sound management of that section of their operations. At the end of each year the question of intermediate bonus would be examined and policyholders advised of their decision.

The profit and loss account disclosed that interests, dividends and rents received, less income-tax, amounting to £209,732, were slightly in excess of the amount required for dividends both to ordinary and preference shareholders. That was a satisfactory feature. Taking the various transfers from the revenue accounts, including the final figure in the life department in respect of the 1930-35 valuation period, the comparative figures turned out to be that in 1939 the total of those transfers amounted to £379,000, and in 1940 the total was all but the same at £376,000, which was a creditable achievement.

JAMES W. COOK AND COMPANY, LIMITED

DISTRIBUTION MAINTAINED

The forty-fourth annual general meeting of James W. Cook and Company, Limited, was held on the 23rd instant at the offices of the company, 130-138 Minories, London, E.C.

Mr W. J. Clarke (chairman and managing director) presided.

The secretary (Mr J. Cunningham) having read the notice convening the meeting and the auditors' report,

The chairman moved: That the statement of accounts, balance-sheet and report of the directors for the year ended December 31, 1940, be and the same are hereby received and adopted; that a final dividend on the ordinary shares of the company at the rate of 7½ per cent. per annum, less income tax, making with the interim dividend already paid 10 per cent. for the year, together with a bonus of 2½ per cent., less income tax, be now sanctioned and declared; that the sum of £7,500 be transferred to reserve for deferred repairs; that the sum of £7,500 be transferred to taxation reserve; and that the balance of £46,047 9s. 9d. be carried forward to the credit of the year 1941.

Mr R. Massey seconded the resolution, and it was carried unanimously.

On the proposition of Mr E. G. Devitt, seconded by Mr E. N. Foster, the auditors (Messrs. Lescher, Stephens and Co.) were reappointed.

On the proposition of Mr E. N. Foster, seconded by Mr P. A. Smith, a hearty vote of thanks was accorded to the chairman, directors and staff, and after a brief acknowledgment by the chairman, the proceedings terminated.

LANGEN (JAVA) RUBBER ESTATES COMPANY, LIMITED

"A VERY GOOD YEAR'S WORK"

The thirty-first ordinary general meeting of the Langen (Java) Rubber Estates Company, Limited, was held, on the 24th instant, in London, Mr H. Eric Miller (the chairman) presiding.

The following is a summary of the chairman's address circulated with the report and accounts: The crop accounted for in 1938-39 was 725,366 lbs., which compared with 1,351,389 lbs. in 1939-40, a figure 179,190 lbs. greater than the exports permitted to them under the regulations, rendered possible by the purchase of licences at a figure which left them a small profit. The increase in the export quota to 100 per cent. international, equivalent to 90 per cent. internal in the Netherlands Indies, had not required any alteration in the conservative tapping system in force on Langen.

As overheads were spread over a larger crop, estate cost of production showed a satisfactory decline per lb., but that was more than neutralised by the heavy increase in the amount which their Java company had had to provide for Netherlands Indies company tax and war profits tax. The average net sale price of the crop accounted for was two and one-third pence per lb. higher. The profit in the London company's accounts, after making provision for a substantially larger amount for national defence contribution, had to be trimmed still further by a transfer to taxation reserve of £1,500 towards their tax liability in this country, and the stockholders, who had 4 per cent. less tax the year before, were to receive a dividend of 5 per cent., less income tax, as their return for what might fairly be described as a very good year's work.

The general condition of the estate, buildings and machinery was good. Agriculturally all was well with Langen, and the demand by the U.S.A. for additional reserve stocks of rubber had maintained the rate of export at a high level, while at the same time assuring producers of a fair price for their exportable crop. He was afraid there was no prospect of obtaining relief from the heavy burden of taxation.

The report was unanimously adopted.

BATANG CONSOLIDATED RUBBER ESTATES, LIMITED

The twenty-first ordinary general meeting of this company was held on the 22nd instant, in London.

Mr E. F. Slade, J.P. (the chairman) said that their standard assessment for 1940 was 1,105,800 lbs., and had only reached that figure after an appeal. That was 184,700 lbs. more than in the previous year, which had shown an increase of 81,100 lbs. over 1938. He was sure it would be agreed that the figures spoke well of the productive capacity of the property and showed that every care had been given to its cultivation.

Their export allowance at 82½ per cent. was 912,285 lbs., while the estate had actually produced 941,000 lbs. On December 31st their unlicensed stock was 105,421 lbs. For the actual rubber exported an average gross price of 11.71d. per lb. landed London equivalent had been realised as against 9.95d. for the previous year. As a result of the increase in output and the higher price, their net profit was £17,303, compared with £5,103 in the previous year. Fortunately the year's profits were not affected by the E.P.T., but they had made provision to the extent of £1,000 to cover National Defence Contribution.

Their forward sales for 1941 were 212,800 lbs. at a price equivalent to 11.72d. per lb. landed London for delivery during the first half of the year.

The board recommended a dividend of 15 per cent., and he felt sure that shareholders would consider that to be fair and wise. After the placing of £9,000 to taxation reserve the carry-forward was £6,181. The liquid position was sound, and they might look forward to the future with confidence. The manager and his staff had met all difficulties with fortitude and success.

The report was unanimously adopted.

SUN LIFE ASSURANCE SOCIETY

ASSURANCE FUNDS EXCEED £48,000,000

The general meeting of the Sun Life Assurance Society was held on the 22nd instant in London.

The Hon. Sir William Henry Goschen, K.B.E., the chairman, in the course of his speech, said:—The accounts now submitted will enable you to judge how the society has fared during a complete year of war. The new business secured was rather more than 13,500 policies for sums assured of £7,125,000, which is about half of that for 1939. This is a considerable fall, but the society's new business is still one of the largest totals secured within Great Britain by any assurance office.

The gross rate of interest in the life assurance account was £4 8s. 6d. per cent., compared with £4 11s. 11d. per cent. in the previous year; this fall was in part due to the low rate of interest which the society has received from its investment of nearly two million pounds in the new war loan issues, a sum well in excess of the total increase in the society's funds for the year. Nevertheless, the society has been proud to make this contribution to the financial side of the war effort.

You will also be interested to know that the society has inaugurated an assurance scheme which enables the public to purchase War Bonds and Savings Bonds by instalments. The society has already on its books a large number of policyholders who have taken advantage of the scheme, and it is expected that many more members of the public will avail themselves of the opportunity thus afforded.

Our claims by death at £1,519,000 are only some £77,000 greater than those of 1939, even though they include a full year's claims due to the war amounting to about £200,000.

VALUATION OF ASSETS

Turning now to the assurance fund balance-sheet, the assurance funds have increased by £1,847,000 to just over £48,000,000. The items on the liability side are self-descriptive and call for no remarks. With regard to the assets, we have made a careful investigation of our mortgages and loans, and we have valued our Stock Exchange securities at market prices. The result shows that the value of our assets is in the aggregate in excess of that stated in the balance-sheet.

In the present period of special anxiety to property owners, we are comparatively fortunate in that for several years past we have made no new investments by way of purchases or mortgages of blocks of flats or large properties generally.

When referring to our Assets in 1938 and 1939, I stated that their aggregate value exceeded the values at which they appeared in the balance-sheet by a considerable margin, and in 1940 I said that this margin had sufficed to cover the depreciation of the previous three years without drawing upon revenue. It is a matter for satisfaction that this statement still holds good as at December 31, 1940. For many years we have confined our new investments to the British Empire and have avoided foreign investments of all kinds. An analysis of our securities shows that only 3½ per cent. of our total assets is represented by investments outside the British Empire, and of these about two-thirds consist of Argentine Government and U.S.A. securities.

Before concluding my remarks I should like to refer to the staff. It will interest you to know that the call to the Services has taken nearly 40 per cent. of our male staff, and I can testify to the willing support and efficiency with which those who are left behind have carried on.

RETIREMENT OF MR RIETCHEL

In facing the difficult problems occasioned by the war we have had the advantage of the courageous leadership, as general manager, of Mr Rietchel, but now the moment has arrived when he has decided to relinquish his position, and I take this opportunity of offering him our gratitude for the unremitting zeal which he has devoted to the affairs of the society.

I have still to welcome his successor, Mr Edwards, a man well tried in the services of the society, and one who will, I feel sure at this time of his succeeding to its highest office, receive the full support of the staff.

The report was adopted.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION, LIMITED

EXCEPTIONALLY GOOD FIGURES

The fifty-fifth annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, will be held on the 30th instant at Perth.

The following is a summary of the statement issued with the report and accounts by the chairman, Sir Francis Norie-Miller, Bt., J.P.

The year through which they had passed had required constant thought and attention by the board and executive, and it was a matter of congratulation that they were able to submit such satisfactory results. The premium income was less by 7.24 per cent. At the beginning of the year he would not have allowed himself to forecast such a satisfactory figure, especially as they had had no business from Denmark, Holland, Norway, France, Belgium or Belgian Congo, where their total income was formerly £372,000.

DEPARTMENTAL FIGURES

The new business in the life department was very much reduced, as not only were nearly all their inspectors with the Forces, but the men who would have insured their lives were also absent. He anticipated, however, that their organisation would regain their accustomed figures immediately they rejoiced in a victorious peace. The premium income of the fire department showed an increase of £13,000, which was extremely satisfactory, but what was more satisfactory was the fact that they had the very substantial sum of £142,377 to transfer to profit and loss account. The casualty department showed a very substantial fall of about £900,000, due largely to the reduction in motor-car premiums. The claims ratio had decreased by 2.20 per cent. and had enabled them to carry £522,528 to profit and loss account. The marine department showed an improvement over previous years, and he thought that they had now got that department on a satisfactory basis that would result in good profits in the future. The total income was £408,110, but of that £174,000 consisted of risks which had now almost entirely expired, and they had the sum of £303,839 to carry forward against an income of £234,000.

On reading the profit and loss account, he was sure shareholders would share the great satisfaction that the board and executive felt on being able to put before them such exceptionally good figures. During the whole year they were in a state of war, with the difficulties and dangers attached to it, and yet they were able to lay before shareholders most satisfactory figures and to pay the same dividend as formerly, while their special reserves for liabilities were very full in every respect.

STRONG RESERVE POSITION

They had in addition a general reserve fund of £2,000,000. Their carry-forward, after paying the dividend, would amount to £888,758. That they looked upon as an equalisation of dividend account, and it would thus pay four years' dividend of the amount they were now paying. Moreover, their reserve for depreciation of investments and adjustment of exchange was largely in excess of their requirements. Notwithstanding all the difficulties, it was a source of extreme satisfaction to the board to report that the expense ratio was 39.34 per cent. as compared with 38.32 per cent. in the previous year, only 1 per cent. more, notwithstanding the fact that they had paid the staff who were fighting, to make up their salaries to what they were previously. The profit was 7.72 per cent., a record which he hoped, with the same careful underwriting and watching of expense, would continue. For the first four months of the current year's working their figures were equally satisfactory.

Their report and statement of accounts evidenced the wonderful soundness of the foundations of their business. They had overcome great difficulties and would continue to do so. They would also continue to progress because in the members of executive, the branch managers, the heads of departments, and, in fact, every official of the company, they had as loyal a body of men as it was possible to obtain, and they were deeply indebted to them all for the work which they had done, especially during the past year. They reported with deep sorrow that during the year Lord Farrar passed away.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

IMPROVED FARMING CONDITIONS

SIR HARRY GOSCHEN'S SPEECH

The twelfth ordinary general meeting of the Agricultural Mortgage Corporation, Limited, was held, on the 23rd instant, at Stone House, Bishopsgate, London, E.C., Sir Harry Goschen, Bt., K.B.E. (the chairman), presiding.

The following is a summary of the chairman's address, which was taken as read:—

During the past year they had completed further long-term advances of £315,315, bringing the total of loans granted up to £13,614,225, secured on first mortgage of 922,283 acres of agricultural land, together with the necessary farmhouses and buildings, valued in all at £21,347,729. In addition loans of a further £167,410 had been approved by the directors. The total of loans granted under the Improvement of Land Acts had increased to £128,183.

Improved farming conditions were reflected in a considerable reduction in the arrears of interest and capital repayments, and it was satisfactory to note that 92 per cent. of the amount which fell due was actually paid within seven days of the close of the financial year.

"FARMERS WILL NOT FAIL"

The most notable feature of the past year had been the great expansion of arable farming. The campaign for increased food production placed a heavy burden on War Agricultural Executives, but the first two million additional arable acres had been secured and, with few exceptions, all the newly ploughed fields carried a crop for the harvest of 1940.

The first wartime harvest was gathered in good condition, except in the North, where the weather was not altogether kind. Considerably more wheat was grown and the yield was satisfactory. Oats and barley were grown on the larger part of the extra land cropped and an additional one million tons of grain was produced. Root crops and potatoes generally did well in spite of the dry summer. The sugar beet crop was a good one, and records both for tonnage and sugar content were reported in many districts. The 1941 beet contracts gave an additional rise in the price to growers. The 1940 potato crop was the heaviest ever lifted, and a still further increase in production was arranged for 1941. Purchase of the crop was now guaranteed, and this should give growers full confidence.

Prices of live stock had fluctuated considerably during the period under review, but, generally speaking, values had been on a higher level than for some time past.

KEENER DEMAND FOR HOLDINGS

The improved outlook in farming had been reflected in a keener demand for all types of holdings in good condition, and the corporation had made satisfactory sales of a number of properties which had been on its hands for some time.

Their total of cash and free investments was now in excess of £2,397,000, and it seemed unlikely that under present conditions they would have the opportunity to place more than a small proportion of this amount in new loans to farmers. The profit and loss account again indicated a contraction in revenue, due partly to the reduction in the total of loans outstanding and, in some measure, to the gradually increasing proportion of loans running at the lower rates of interest. They had, however, had to ask the Minister of Agriculture for a grant of only £10,000 under the provisions of the Agricultural Development Act, 1939, to enable them to meet the deficiency on the year.

After bringing in that £10,000, making provision for all bad and doubtful debts and for contributions under the War Damage Act, 1941, in addition to setting aside a sum sufficient to cover all interest payments due from borrowers up to December 31, 1940, and not paid by the end of the company's financial year, the amount available on profit and loss account was £9,165. Of that amount £2,664 had been transferred to special reserve and £8,333 written off discount on issue of debenture stock, leaving a balance of £3,168, which the directors proposed to carry forward.

The report was adopted.

ARMY AND NAVY STORES, LIMITED

PROFIT WELL MAINTAINED

The annual general meeting of this company was held on the 23rd instant, in London.

Brig.-General Sir Frederick Gascoigne, K.C.V.O., C.M.G., D.S.O. (chairman and managing director), in the course of his address, said:—In regard to the past year you will have observed that we are in a position to recommend the payment of a dividend of 7½ per cent. (or 9d. per share). It is hardly necessary for me to say that there has been a considerable drop in the volume of sales. You have all been enjoined not to spend your money on anything you can possibly do without, but to lend it to the Government; and our experience is that you have obeyed at any rate the first of these injunctions. I hope you have obeyed the other one as well. Rationing, too, has of course reduced our turnover. Winning the war and retail trade prosperity do not go hand in hand. Of the two alternatives we know which we all want, and that quickly.

While I am on the subject of turnover I would like to direct your attention to the balance from trading account. This amounts to £508,641, or a drop on last year of £61,572, which is, of course, accounted for almost entirely by the falling off in sales. To this reduction must be added a fall of £2,633 in miscellaneous revenue and £9,556 in less interest from our investment account. To enable you to get a quick and accurate idea of what has been achieved to offset this reduction, the net result, or profit, viz., £84,739, is only £20,166 down on last year.

LIMITATION OF SUPPLIES ACT

Many of our problems have been the outcome of the Limitation of Supplies Act. The Government, in their undoubted wisdom, decided that only a certain percentage of some of the more or less unessential goods be manufactured, so that the people employed on and the materials employed in the manufacture of those goods could be diverted to the war effort. Such goods

(Continued from page 566)

a reduction in producers' stocks, which amounted to only 142,800 short tons at the end of last year, against 316,500 tons immediately before the outbreak of war. In recent months the speeding up of production has raised America's copper requirements still further and at present it seems likely that this year's consumption may be as high as 1,500,000 short tons. In the first quarter of this year domestic deliveries in America reached 366,900 short tons, against 219,000 tons in the corresponding period of 1940, and as her production of refined copper was only 282,300 short tons, stocks in the hands of the country's producers declined to 89,900 tons at the end of March. As America's production from domestic ore is nearing its peak, she is increasingly forced to supplement supplies from foreign sources. Her imports of foreign refined copper advanced from 16,300 short tons in 1939 to 67,500 tons in 1940. Her refinery production from foreign ore increased from 304,600 short tons to 368,000 tons, while her total exports of copper declined from 396,400 to 382,500 short tons. Since the beginning of this year imports of both foreign metal and ore have much increased, while exports to foreign countries have seriously declined following the introduction of a licensing system in February. The bulk of the import comes from Chile, where the United States Metal Reserve Company has so far bought 235,000 tons of refined copper, a tonnage which will be further increased in the immediate future, so that America will probably absorb the whole of the Latin American copper surplus before the end of the summer. The British Government has agreed to acquire the whole of the copper surplus of the Belgian Congo, and as it had already taken a lien on the British Empire's output, comparatively little surplus copper is at present available on the international market. The tonnages available to Great Britain and the United States after the completion of the planned purchases will be more than adequate for all essential purposes. Meanwhile the approaching solution of the copper surplus problem has not led to any change in prices. In this country the price remains at £62 per ton, delivered, while in the United States the 12 cents per lb. level established last September, remains in force.

are, in consequence, in short supply, and it has not always been possible to meet our customers' demands for them. Some have had to go short, or possibly without altogether, but so far as possible we have looked after our old customers first, bearing in mind their probable requirements and making provision for them.

Stock in trade stands at £653,847. I told you last year that we were doing everything possible to accumulate as much stock in everyday demand as we could. The result is that our general stock still stands high, which—in these days when the Limitation of Supplies Act restricts our replenishment of stocks—is a satisfactory position. We would have had no difficulty in selling a large proportion of these goods very rapidly if we did not put some restrictions on the amounts we are prepared to supply to individual purchasers, and thus safeguard—so far as possible in these cases also—the interests of our old and faithful customers—not indeed always to the extent they ask, for that is not possible, but so far as is practicable while the stocks last.

Cash in hand and at bank at £89,097 is £18,498 up, while investments at £423,563 are down by £226,307. With regard to the allocation of the profits, which amount to £196,584 after adding £111,844 brought forward, after the payment of the dividend of 7½ per cent., it is proposed to carry forward £103,084.

ASSISTANCE FROM INDIAN BRANCHES

I am glad to be able to report that, like this island of ours, we have received great assistance during the past year from our connections overseas, to wit our Indian branches. It is true they have had great opportunities for trade out there, and they have taken full advantage of it. They have been able to obtain from one part of the Empire or another, or from America, most of the supplies they require.

Government contracts have been received, and no doubt difficulties of travel have caused many people to stay out there who would otherwise have come home, and this has tended to increase trade. India has made a fine contribution during the year under review and helped to conserve our position.

The report was unanimously adopted.

Fall in U.S. Oil Exports

Exports of petroleum and petroleum products from the United States—the world's principal producer—fell from 180,009,000 barrels in 1939 to 116,268,000 barrels last year, a decline of 85 per cent. Though oil is one of the sinews of war, the demand for the American product was limited last year by the lightning character of hostilities, the operation of the British blockade and the imposition of severe restrictions upon European consumers. With three exceptions, the principal customers all took less than in 1939, nothing at all being sent to France or Italy in the second half-year:—

U.S. OIL EXPORTS				
Thousand Barrels				
	1939	1940	1939	1940
Canada	32,861	34,172	Cuba	2,121
Japan	27,805	22,747	Australia	1,540
United Kingdom	18,640	11,540	Brazil	2,364
France	18,312	6,775	China	1,160
Dutch West Indies	10,463	2,959	U.S.S.R.	884
Italy	7,355	2,129		
			Total*	180,009
				116,268

* Including other countries.

The marked increase in exports to Canada, mostly of crude oil, is attributable to increased industrial activity in the Dominion, while sales of refined products to Australia rose for a similar reason. Shipments to Japan included 527,450 barrels of aviation spirit and 2,624,340 barrels of ordinary petrol (against 547,340 and only 650,380 barrels, respectively, in 1939), besides large quantities of crude and heavy oils. The reduction in the total reflects larger purchases elsewhere—notably the Dutch East Indies and Mexico. Britain bought less oil in the United States, mainly to conserve dollars for other uses, while the heavy drop in consignments of material for further treatment in the Dutch West Indian refineries followed the loss by that colony of many of its European outlets. In view of the fears expressed in some quarters that the blockade of Germany is being circumvented by shipments via Vladivostok, it is satisfactory to note that only small quantities of American oil (mostly petrol—a product in which Germany is relatively well placed) were sent last year to the U.S.S.R. The total was equivalent to less than 150,000 tons.

COMMODITY AND INDUSTRY NEWS

THE highlights of the week have been the rise of tin and rubber prices and the subsequent recession in rubber. Prices of iron and steel in the United States are to be controlled at the level of January-March, 1941. The Control of Paper (No. 32) Order, which came into operation on April 21st, imposes further restrictions on the use of paper for posters, circulars, loose inserts in publications, labels, greeting-cards, crackers and programmes. Maximum prices have been fixed for packeted and processed nut kernels. It will be possible to purchase four weeks' cheese ration at a time, within four-weekly periods from the date of rationing. Eggs are not to be reduced further in price as was previously promised, and the maximum price of category A will remain at 27s. 6d. per 120 wholesale, and 3s. per dozen retail.

Rubber and Tin Prices.—Rubberspot prices rose to the high level of 14½d. per lb. on the 16th and were maintained at that level for three days. The rise was probably due to the political news, and especially to the news of the Russo-Japanese pact. Fear of official control however, may be the reason for the recession which took place on the 21st and 22nd, when the price was 14¼d. per lb. On Wednesday the price was 14½d. Tin was in sympathy with rubber, and since the 16th the price of standard cash has been about £271. On Monday and Tuesday the price was £271-£271 10s. per ton, with the forward quotation £267-£267 5s. per ton. Wednesday's price was £270 15s.—£271 standard cash, the same price as it was a week earlier; the three months forward quotation was £266 15s.—£267, compared with £268—£268 5s. It is announced that no export licences are to be granted in May.

Cotton Trade and Prices.—The Cotton Controller announced that the prices of raw cotton will remain at the level of the March 31st closing prices until July 31st. The price of American middling is 9.24d. per lb. The Controller stated that he would endeavour to give at least one month's notice of any change in price. Trading conditions on the market during the past week have shown very little change, and the difficulties of arranging transactions have been pronounced. Some special orders have been put through to meet Government requirements, but ordinary business has been at a very low ebb. Exporters are expecting to receive their quotas under the selective export policy very shortly, but no trade expansion can take place until more is known about which weaving firms are to cease production. Some stock lots in fine fabrics and fancies have been sold for Java, the Argentine and South Africa. Operations in yarns have been confined to odd lots. Order lists of spinners and manufacturers are distinctly lighter than at the beginning of the month.

Fewer Grades of Coal.—Methods of ordering coal and other household fuels have been simplified in order to facilitate their distribution. In future household fuel will be supplied only in the following classes:—ordinary coal: best selected coal, house coal, kitchen coal; other fuel: domestic boiler fuel (including coke), anthracite stove fuel, low temperature fuel. The prices charged will be those relating to the actual grade of coal delivered. The effect of this decision of the Mines Department will be to assist merchants to secure a rapid clearance and turn-round of wagons, and the maximum economy in labour and cartage. Coal producers will apply the same principle

to orders received from the merchants. These arrangements came into operation as far as practicable this week.

Homeward Look

ATHENS, like Rome, is now in Nazi hands, but the glory of Greece shines in the islands and overseas, in the Aegean and in England, in North America and in the British Commonwealth; it shines wherever men are free. That was Mr. Churchill's message to the world on Sunday—the power of freedom: the fortitude of British men and women under fire, their exertions and their "most high and splendid" morale; the instinct for honour that called the slender Imperial forces to the aid of Greece; and the strength, spiritual and material, that can give the free peoples victory over the usurping regiments. The world felt better for these words of unshaken faith.

Mr Churchill blinked no facts. Above all he is a strategist. He knows that wars are not won by retreats, but he sees the whole. This is a defensive war until the decisive strength of the United States and the British Empire is fully grown, and it has two aims: to kill Germans and to hold the fort; to weaken their war economy by blockade and bombing and guerrilla forays and to defend this island. Wars are not lost by retreats which prick the swollen strength of the enemy and feed the flame of resistance. The retreat in Greece was more sudden than had been hoped. Against their heavy losses, the Germans can set their swift advance towards new targets, Iraq, Suez and Gibraltar—the bastions of the British fort and the outward-opening doors of blockaded, oil-hungry German Europe.

But every one of these bastions could fall, and the outpost of Singapore, too, without victory being achieved. There is still no safety from "the avenging justice" in Spain, Morocco, Turkey or Russia, on the Black Sea or the Caspian. Hitler has an appointment with destiny on English beaches; he "must conquer this island or cut the ocean lifeline" to win. The war-

ships and soldiers are waiting for his coming; the airfields are crowded; the guns are manned; war courts have been set up to give law in the battle areas. The defence is many months stronger than it was when the enemy failed in the first Battle of Britain; and in the Atlantic the American Navy has now taken a hand.

This is the true perspective, but the vista must not be regarded with a false good cheer. Defeats are not successes. The road to victory will be long in any event, and every loss in Africa, Asia and the Far East will drag it out and multiply the force needed to reach the final goal. The democracies have still to find a line to stand on, outside this island. Is such a line in sight in the Mediterranean? At least four-fifths of the Imperial forces have escaped safely from Greece, though without their heavy equipment; but the Germans have a three-point plan already in train for the next stage of the Battle of the Mediterranean. The tide of invasion is already washing from island to island round encircled Turkey towards Syria and Haifa; the Axis forces are on the move again in Egypt, where Sollum is now theirs; and though Madrid and Vichy have still to make their surrender, Spain and North-West Africa are awaiting their turn in the German tragedy.

The outlook is sombre, as the German soldiers and pilots stand poised in France, Italy, Sicily, the Peloponnese, Macedonia, Thrace and the islands to make their leap to the opposite shores and control of the middle sea. But there are reasons for believing, with Mr Churchill, that "we will give a good account of ourselves." At sea, there is the dominant British Navy, and Gibraltar, under Lord Gort, may be another and greater Tobruk—or Acre—in the wider battlefield. On land, there are Allied bases in West Africa from

which to strike at the Germans as they come across the north-western deserts; in Egypt, with his men and material powerfully reinforced, General Wavell can calmly await the German attack, which can only be fed by precarious sea-borne supplies; and in Palestine and Iraq defences are ready. Wherever the RAF matches the enemy in numbers, even remotely, it wins. The enemy would not attack if he did not see promise in his chances. Hitler never gambles. But there is a sea-line from Gibraltar to Suez, and a land-line from the Senegal and the Niger to the Nile and on to the Euphrates.

Hitler may break in; at places he will. At many points the line is thin. The strong points are scattered, and as yet there is no great reservoir of men, materials and aircraft to support the Allied forces. He may strike through Turkey to the Persian Gulf. He might even strike at Russia. It is true that there is no reason in the known relations, political and economic, between Germany and Russia why Hitler should turn on his cynical associate, but there may be one in grand strategy. Whatever the course of events now, the final act will be fought out in the West, and so long as Stalin broods, safe and inscrutable, on his frontiers, there is danger for Hitler in the East.

Time is against this possibility. When we say that the war will be long, we mean that it will be long if we win it. For Hitler to win, it must be short. He must clear the Mediterranean and strike down or strangle Britain before American aid tips the scales. No theory of this war in space, read from maps, is sufficient. Time is the key and the crux. The free peoples will beyond doubt be strong enough to triumph in the future, but only if they can make themselves strong enough to hold out now. The economic resources of North America and the British Empire are overwhelming, but only a tithe of them is yet in the field.

Mr Churchill spoke of America's power to produce. The United States has more wealth, more technical resources, more steel than the rest of the world put together. Only the goods of war are scarce. Mr Churchill cannot have forgotten the poster which the German invaders found on the walls of Paris, depicting the economic might of the French and British Empires and concluding that the Allies must win. He spoke of 200 million inhabitants in the United Kingdom, the United States, and the British Dominions, against 70 million Germans; but he did not speak, except as troublesome slaves, of the many millions of European captives working for the Nazi war effort or of the many millions of his 200 million freemen working for no war effort at all.

The Prime Minister was speaking to the free world which has given the people of this country its admiration. He could do no less than bow his acknowledgments, and voice the resolution of the men and women he leads. To us alone he might have been sterner; it must be said that he should have been. Many have been cruelly bombed. Many have worked at full strength through long months for the war. Many have suffered uncontrollable and uncompensated war losses. But very many more have neither suffered nor laboured yet. Mr Churchill rightly spoke of the sacrifices that have been made and the endurance that has been shown; no less, it was his plain duty to speak of the abstention and work that are still needed if defeat is to be warded off. Where we are not already besieged, we must besiege ourselves. In their standard of life and comfort, measured by the quantities of food and clothing sold, the people of this country have gone on until lately better off than in the depression a decade ago; whereas Paris in 1870 would be a better measure than London in 1932 of the sacrifices required to make possible the gigantic effort needed to win through—and win.

The conception of a defensive war is sound; it can be no other. The conception of a waiting war is as false and as perilous as it was before Dunkirk. In the battlefield, maybe, the democracies must wait and hang on. In the factories, they must sacrifice

everything to war output or be defeated; there cannot be a moment's waiting. The true test of their chances in the long battle is not the balance of strategic and tactical possibilities in the next few weeks or months; it is the speed and scale of their mobilisation of manpower and resources. That was the lesson of Norway and Dunkirk. It is the lesson of Greece, and will be the lesson of every setback that may follow. The gallantry of outnumbered soldiers with inadequate support in the air makes epic telling; but it is the tragic reflection, none the less, of the inability of great and rich nations to set aside everything else for the defence of their freedom; and the lesson will be read in North America and the Dominions as well as in Britain. Men are losing their lives and peoples their independence, because other men and women, in the warring countries as well as in fallen France, had not surrendered a sufficient part of their standard of living and way of livelihood earlier. That is brutal, oversimplified, but fact.

Nor is it their fault. In general, the community has done every task that has been asked of it. Enough has not been asked and required; it cannot be done by individual gestures; it must be planned and commanded. To this, there are two official answers, in addition to the justifiable plea that leeway was left a year ago which it has been hard to make up. One is that the process of mobilisation cannot be done on the instant by agreement; the other is that mobilisation is now at speed—figures of output are cited, of aircraft and tanks on both sides of the Atlantic. The first answer is a denial of the "high and splendid" courage and endurance that Mr Churchill praised; cliques and cliques may oppose the rigorous march of war economy, but they should be matterless. If the people cannot or will not produce, under statesmanship, dramatically more, they will not win; if, by comparison with a year ago, they are doing well, they must, and can, still do outstandingly better. The comparison, for Americans as well as for the British peoples, is not last year's production, or even last week's or last month's—it should be no boast that every month's output of aircraft is a new high record. The comparison is with the deployed power of the enemy; and the measure of the task is his success in battle.

The second answer is no more clinching. The elements of war economy have indeed been learned in the last twelve months. The limitation of supplies; the concentration of industry; the mobilisation of men and women for war work; the broader planning of the latest Budget—these spell understanding; but they still do not add up to achievement. They have not been pressed home with ruthlessness and logic. Supplies are limited, but few are cut off all together; and it is even proposed now to use ships to import tobacco. In the concentration of industry, there is haggling, compromise and delay; time limits have now been fixed; but, as a note on page 584 points out, the schemes—which are undoubtedly coming forward—are not the radical plans needed for effective and war-winning mobilisation. In the mobilisation of labour there is reluctance; it is being openly said, without any official denial, that most women and older men who register and are "in work" will not be disturbed. Even allowing for the fact that the coming year's war supplies, because of a bigger output and fewer initial expenses, will cost less, the new Budget, by comparison with Germany's war expenditure, is too small. The road is the right one; but the pace is not hot enough.

Mr Churchill might have said all this, and he needs men beside him to translate it into action. The British nation is indeed "stirred and moved as it never has been before," because the country is in danger. It can and will be saved. "Westward, look," the Prime Minister declared; and North American aid can turn the conflict. But only if the efforts and sacrifices required of the British people themselves are as big as they are ready and waiting to make.

The Humbug of Finance

IT is perhaps not always realised what a revolution in thought on the principles of war economics has been brought about in this country in the twenty months of the war. Things are now done by almost universal consent that would not have been considered possible, outside a theorist's dream, in September, 1939. If so much has been done already, in a period fully half of which was spent in playing at war, how much farther is totalitarian economics likely to go? There is obviously a long period of the grimmest struggle ahead of the country; what new financial expedients will it call forth? No foolhardy attempt will be made here to answer these very large questions. But the time has perhaps come to reconsider the fundamental principles of war finance and to attempt to discover in which direction they point for the way we have still to travel.

In war economics, money can be said to have two main functions, one negative, the other positive. Both are of secondary importance to the real physical problems of mobilising men and materials, which are the true substance of war economics. The negative function of money is to avoid impeding the solution of these physical problems; as has been remarked before in *The Economist*, the task of finance in war is to see that nothing is decided on financial grounds. In the waging of war, then, finance plays a non-combatant rôle, clearing the path for the soldier and keeping out of the way. Its second and more positive contribution is concerned not with waging the war but with distributing its effects. Anything as wasteful and destructive as war necessarily results in loss. The physical losses—death and mutilation—must necessarily be left to lie where they fall; the economic losses, however, are transferable, and every State makes some attempt to distribute them fairly. The disabled are not left to starve; the dependants of fighting men are cared for; and requisitioned property is paid for. These are the minima of compensation which even the most primitive State now tries to observe. In the more complex social organism of Great Britain, an attempt is made to go far beyond these minima in the direction of the ideal of "equality of sacrifice." "Equality" is a question-begging word. Perhaps the nearest approach to what is meant by it is that the economic burden of war should be distributed in such a way as to reduce to a minimum its social displacements. Whole classes of persons—shopkeepers, for instance—should not suddenly and arbitrarily lose their accustomed place in the scheme of things as a result of differential impoverishment; and within classes, individuals should not be singled out to suffer more than their fellows—shopkeepers in London, for example, more than shopkeepers in Oxford. Or if there are to be such displacements, they should follow some deliberate and conscious scheme and not be left to be brought about by the hazards of war. But whatever the precise meaning of "equality of sacrifice," the way to obtain it is by monetary means, by creating some sort of financial pool and by determining who is to pay into the pool and who to draw out of it.

Judged by these standards, the wartime financial system is obviously far from perfect. Let us briefly consider how far the two main requirements are being met. Are decisions of economic mobilisation being made on strictly real, physical, non-financial grounds alone? Clearly not. There are still too many cases of policies that would be desirable for their physical results being held up for reasons that are fundamentally financial. What, for example, are the difficulties that are impeding the concentration of retail trade and the consequent release of the biggest single reservoir of man-power in the country? There is no anxiety that concentration would make it impossible for goods to

be quickly or adequately distributed from wholesaler to consumer. How purely financial are the difficulties can be seen by reflecting how quickly they would disappear if it were found practicable to guarantee to every shopkeeper now in business his pre-war, or even his present, income. For finance to hold up necessary action is bad enough; but the case is worse when it leads to the positively wrong thing being done. Early in the war it was argued that the motor industry must be allowed to continue manufacturing for the home market because it was only by securing a large volume of production that it could afford to compete in the export market. Events have dealt faithfully with that contention, but there are others hardly less mischievous. How much of the fumbling and hesitation in agricultural policy is due to the fact that the avoidance of loss to the farmers has been considered as an object of policy, instead of the avoidance of starvation for the community? In how many control schemes have needless complications been introduced in order to provide a "livelihood" for middlemen who suddenly had no useful function to fulfil? The argument is not that the motor manufacturer, the farmer, the middle man ought to have been ruined. Indeed, it is exactly the contrary; the incomes of these sections of the community should have been considered as a problem entirely separate from the use of steel, the import of feeding-stuffs and the distribution of controlled commodities.

In its second aspect, that of attaining equality of sacrifice, financial policy has been even further from success. Indeed, even the effort that has been made to reach equality has varied according to the origin of the loss to be provided against. Thus when the "sacrifice" takes the very deliberate and visible form of money to be handed over to the State, a considerable effort has been made to choose equitable taxes and to avoid the indiscriminate inequity of inflation. Where the loss arises from German high explosive, the effort has been much less consistent and successful. Losses suffered by shipowners and the owners of commodity stocks are covered. Until very recently the loss suffered by the owners of bombed buildings was left to lie where Hitler dropped it. The first draft of the War Damage Bill contained a number of specific inequities; and even after their removal, the Act suffers from what might well be regarded as the fundamental defect that the "sacrifice" represented by these losses is left to be borne, in the first place, not by the whole community, but by the class of property-owners, who are no more responsible than their fellow-citizens for the fact that the country is at war. There is a third form of "sacrifice" in which even less effort at equalisation has been made. These are the losses that emerge neither from the Budget nor from German high explosive, but from the indirect effects of the war. It is in this class that the seaside landladies, the travel agencies, the shopkeepers in evacuation areas and their fellows in misfortune fall. They are no more responsible for the war than other classes of the public, but they have suffered much more from it. The State has recognised their sufferings; but all that it has done—recognised their sufferings; but all that it has done—in the Courts (Emergency Provisions) Act and in the new Liabilities (War-Time Adjustment) Bill—is to pass some part of them on to those who are unlucky enough to be the creditors of unlucky debtors.

In peacetime, real activities and monetary transactions march together. The income that is derived from a particular activity is the incentive that calls it into existence. It would be wrong to say that monetary incomes should never be interfered with, but interference with them has real results that must be taken into account. But in war the connection between real activities and monetary transactions is very largely broken. More and more of the activities of the com-

munity are undertaken without regard to the money incomes that will result, and previous paragraphs have illustrated the unfortunate consequences that follow from a survival of the money criteria of peacetime into the changed conditions of wartime. From the theoretical standpoint, there are two solutions of the dilemma. One would be to abolish money altogether in wartime; to provide every citizen with his board and lodging and assign him his duties. The other would be to keep the monetary circulation in existence but deprive it of its controlling function. Since the first solution is impossible, the second is, in effect, the only one worth considering.

The ideal financial policy for totalitarian war would therefore be to guarantee an income to every citizen, unconnected with the work he does; to call on him to do any work that is required; and completely to control what he could consume. This has been called an ideal, and it is certainly impracticable in the actual world, for a variety of reasons ranging from administrative imperfections to psychological obstacles. But if the ideal could be attained, it would have superlative advantages. The individual would not then have to suffer, in addition to the inescapable sacrifices of war, the additional bitter burden of being discriminated against by accident. It would be possible to mobilise resources, to concentrate industries, to expand some forms of activity and close down others—all without thought for the individual misfortunes that these actions at present entail. And when the war was over,

the pre-war distribution of activities and consumption could be re-created. Not only would the mobilisation of resources be facilitated; three universal wishes could be met at once: "Put us all in khaki till it's over," "We're all in the same boat," "We'll start again where we left off."

The statement of the ideal does at least serve as a pointer to practical policy. It suggests that, wherever it is possible, the state should deliberately try (as the Nazi State has tried) to maintain incomes in their pre-war relationship to each other. There are, of course, the two great provisos—that the spending of income is controlled, and that nothing is allowed to interfere with the mobilisation of resources for the war. But where those two provisos can be met and the practical difficulties can be surmounted, the bias should be towards, not against, the payment of compensation for loss either of income or of capital. To do so will, of course, "cost money." But if present consumption is controlled there is little risk of inflation during the war arising out of compensation for loss of income, while compensation for loss of capital would not normally be payable until resources become available after the war. In any case, if loss has emerged, a fair distribution of the burden will lessen rather than increase its weight. The State cannot, in wartime, evade responsibility for what happens to the community, nor can the community dissociate itself from the individuals who compose it. In a very real sense, we are all members one of another.

The Russian Front

THE problem of Russian foreign policy since the outbreak of war has been how to keep out of it. It is possible to interpret this policy of "non-involvement" in terms of a dialectical determination to see the capitalist world fight itself to extinction and, as sole survivor, to inherit the earth, but the determining factors are probably simpler. All along Russia's western frontier stands the German army. The only obstacle which has so far held the German tank is the English Channel. Russia enjoys no such immunity. Even the Urals are far away. At almost any cost, the Russians must avoid giving battle. This fundamental pre-occupation has not changed, but the fortunes of war in the West account for the vicissitudes of the policy expressing it.

In the first phase of the war, Russia fell into a false security. The Nazi-Soviet Pact, which turned the Germans west once Poland was overrun, appeared to guarantee Russia a period of tranquillity during which the Germans would try vainly to break through the Maginot Line, and the armies of the European Great Powers would exhaust themselves in indecisive combat. The Soviets went about enlarging the zone of their security—Russian-Poland, the Baltic States, Finland, Bessarabia—and profited by their immunity to recover the Czarist patrimony.

This phase closed with the collapse of France and the failure of Goering's air squadrons over Britain. It was the worst possible outcome from the Russian standpoint. The German army was once more unemployed, and the toughness of Britain's defence and the extreme hazard of invasion suggested that the Nazis would find it hard to fight to a decision in the West. Soon after, the collapse of the Italians in the Balkans and Libya created something uncomfortably like a war on two fronts. The Russians know that it is a cardinal principle of German strategy to avoid a dual commitment. The West was obstinately undefeated and gaining strength with America's intervention. The Germans might well argue that, after all, the Eastern front would be easier to liquidate. There is reason to suppose that the Soviet Government did so interpret the intentions of the German General Staff. The old

halcyon days of blockade and Maginot Line and the little peoples of Eastern Europe falling like nine-pins were over. After September, 1940, the Russians were in a very much worse situation than that of the early summer of 1939.

Three themes run through recent manifestations of Russian foreign policy. The fact that they are to some extent contradictory helps to explain the apparent inconsistencies in the Kremlin's conduct of affairs. The aim, "non-involvement," is perfectly consistent. The methods are not—no new phenomenon in Russian diplomacy. One theme is the avoidance of any action that might provoke the Germans to action. Only on one occasion since the rapid German advance into the Balkans and on to the Black Sea and the Dardanelles began, have the Russians done anything to impede Germany's invasion of their sphere of influence. Their compliance went so far that M. Molotov visited Berlin last November, after the dismemberment of Roumania, and a new trade agreement was signed in the new year when Nazi infiltration into Bulgaria had already begun.

The one action to which Germany could hardly avoid giving an unfriendly interpretation belongs to the second theme, that of encouraging other nations by their resistance to make Germany's advance eastwards as difficult as possible. On the morning of Germany's invasion of Yugoslavia and a week after the sensational change of regime, Russia signed with Yugoslavia a Five Year Pact of friendship, which was of no military significance, but was undoubtedly intended to encourage the Slav peoples in their resistance. To this category of encouraging others to fight also belongs much that has been said in recent weeks by official and semi-official Russian spokesmen, for example, the censure of Hungary's and Bulgaria's subservience to Germany or the guarantee to the Turks that in a defensive war they would have nothing to fear from Russia.

Both these policies—conciliation towards Germany, encouragement to Germany's potential victims—are clearly designed to keep Russia out of war, not to strengthen Russia's position should war become inevitable. The third trend in recent Russian diplomacy

appears to accept the likelihood of war and to take what steps are possible to strengthen the country's military and strategic position; clearly this involves contradiction with the policy of doing nothing to provoke Germany, since Germany is the enemy against whom provision must be made. Into this category falls the Pact with Japan. The pledge of neutrality given by Japan to a belligerent Russia can mean only one thing—that if Germany forces a war, Japan will not harass the Russians in the Far East. To the extent, therefore, that confidence can be placed in the consistency of Japanese diplomacy, Stalin has exorcised the spectre raised by the signing last September of the Tripartite Pact. To this category also belongs the latest move in diplomacy—the ban placed on the passage of war supplies through the Soviet Union. The ban was imposed after Germany and Japan had reached an agreement to exchange German aircraft parts for Japanese naval units and it may therefore be interpreted as Russia's move to avoid contributing to a strengthening of its two potential enemies.

It may be asked why, if the Russians are seeking to consolidate their position, they have not made some attempt to reach an understanding with those Powers which have already openly ranged themselves against their potential enemy—Britain and the United States. The reason is, of course, that the Western Powers are already doing all they can to defeat Hitler. A hand-shake from Moscow would not make them fight any harder, but it would involve Russia in war. An alliance or a *rapprochement*, or even a covert understanding, with Germany's enemy in the West would undoubtedly lead the Nazis to do what the Russians still hope they will not do, turn to the Eastern front before finishing with the West.

It is impossible to estimate how real the German threat to Russia may be. Only the German General Staff possess the data for such a calculation. There have been signs that aggressive action is intended. German divisions are undoubtedly massed along the Russian frontier; the Soviets are clearly perturbed by the recent arrival of German reinforcements in the recent arrival of German reinforcements in the Russo-Finland; and it does not appear that the Russo-German Pact put an end to the Nazis' encouragement of Ukrainian irredentism. Yet these activities may only be a phase in the war of nerves. The determining factor is whether the German generals believe it possible to crush Russian resistance and to establish German control of at least Russia-in-Europe in one short campaign. No country has so far withstood the

impact of the Panzer divisions. There was little in the Finnish war to suggest that the Red Army would give a better account of itself than the armies of France. On the other hand, the Napoleonic precedent is not encouraging. It is, of course, possible that the Germans could count, in the event of war, upon a large Fifth Column in Russia. The purges of 1936 and 1937 were drastic enough, but it is not certain on which side the purgers themselves may ultimately be found. Here again only the German secret service is in a position to calculate the probabilities.

It is often assumed without discussion that British diplomacy should endeavour at all cost to secure a *rapprochement* with Russia. Hitler fears above all, so the argument runs, a war on two fronts. It is therefore in the interests of Britain that Russia's support should be enlisted and battlefronts established in the East as in the West. This argument obviously accepts a Napoleonic outcome to a German attack on Russia. Is it so certain? If the Russians were overwhelmed in a quick campaign, and the Germans had the opportunity to integrate the grain and oil and coal and industry of Russia into their war economy, the Allied fortunes of war would have taken a decided turn for the worse. It is not self-evident that the entry of Russia into the war would serve British interests. A Russia, master in its own house and immobilising many units of the German army and air force, may well be the best that Britain can hope for in the East. Only if Germany's Blitz tactics failed and the German armies were bogged on the Russian plains would Russian participation serve the Allied purpose, and there is no guarantee that this would be the outcome.

The situation appears, therefore, to demand that British diplomacy in Russia should be comparatively passive. Russia will reject any overtures which increase the risk of war, and if they led to rapid and victorious German intervention, the Allied cause would suffer. In the one guise in which a war in the East would serve Britain—that of a long drawn-out and indecisive conflict—it is Russia and not Britain that would be in need of assistance and the overtures could be safely left to the Kremlin. Nothing in the East can deter the Allies from continuing the struggle in the West, and Russia from continuing the struggle in the East. Only if need have no fear that the war would be called off if the Nazis were to attack "the citadel of Bolshevism." In the event of a German attack, this assurance should be conveyed to the Russian Government. Beyond this, Russo-British diplomatic relations should be regarded as the problem not of London but of Moscow.

NOTES OF THE WEEK

Finis in Greece

The campaign in Greece is virtually at an end, although there are reports of three Greek and British divisions still resisting in the Peloponnese. For a full report the British people must wait until the operation is complete, but according to a preliminary estimate, 48,000 of the 60,000 Imperial troops have been safely evacuated in incredibly disadvantageous circumstances—the Germans had rendered the Piræus unusable—and miracles of improvisation and co-ordinated action must have been performed to make possible an evacuation with apparently few of the favourable conditions of Dunkirk. Athens was occupied on April 27th, and the Nazis have discovered a quisling in General Kollakoglu, who is already repeating the stale formulas of loyal collaboration, work and peace and ringing the changes on the "cowardly flight" of the British Army and the Greek King. However, his subservience has not prevented the dismemberment of Greece. The appetite of the Bulgarians is disgustingly insatiable. Not content with Yugoslav Macedonia, they now occupy Greek Thrace, Western Macedonia, Florina and Castoria. Bulgaria has little to learn even from Italy on the function of the jackal. The fighting in Greece is yet another illustration of the lesson already driven home on the battlefields of Europe. Modern war is won in the factories. Man for man, Allied forces were as

courageous and disciplined as any troops the Germans could put in the field. But they never met the enemy man to man. They met him man to machine and went down in the unequal contest. It is likely that the Greek campaign as a whole must now be seen as the first phase in a larger strategy with Suez as its next objective. One thrust of a two-pronged attack lies through Libya and Egypt, the other through Turkey, Syria and Palestine. The capture of the Greek islands of Lemnos and The capture of the Greek islands of the Dardanelles, which command the entrance to the Dardanelles, and the German reinforcements of the Italian garrisons in the Dodecanese are contributing to the encirclement of Turkey, which began with the occupation of Constanza, Varna and the Turco-Bulgarian frontier. The Germans are in a position to exercise extreme military pressure on the Turks, and there is little in their recent diplomacy to suggest that the pressure will be resisted if exercised à l'outrance.

Forward to Suez?

The new advance into Egypt has clearly been designed to synchronise with the close of the campaign in Greece. The Germans claim that when they have taken Crete they will use the island as an advance and naval base for attacks on Alexandria. Yet the lesson of Malta

and Rhodes and Castelorizo is that islands are not such easy prey, even when adequate sea power can support landing parties. The potential threat from Crete is, however, less serious than the situation which may develop in the Western desert. After a week's lull, broken only by yet another abortive attack on Tobruk, the Axis forces are again in motion and have advanced five or six miles across the Egyptian frontier to take Sollum. Here their advance has come to a halt again. The three columns are composed of Italian forces, and it is possible that they are being used as a shield for heavier German units. Their attack is delayed until a sufficient head of machines and aircraft and stores can be collected to make another drive comparable in speed to the one which brought the Germans from Benghazi to Bardia in a few days. This is no easy task. All supplies must come the long route from Tripolitania and must survive the harassing attacks of the British air force. Much has been done by troop-carrying planes, but these aircraft are excellent targets and the work of reinforcement is correspondingly costly. The loss of a whole convoy in the Mediterranean still appears to be having a hampering effect, and behind another lightning advance lies the danger of advance units cut off and of a British foray from Tobruk strong enough to disorganise the Germans' attenuated lines of supply. There is no reason to suppose that when the attack comes it will not be devastatingly heavy, yet the difficulties facing the Germans should not be underestimated. The fall of Dessie and the ending of Italian resistance in Abyssinia will free aircraft immediately, and troops and machines in a short time, for use on the vital northern front. Air squadrons certainly and possibly equipment are being brought back from Greece, and with the close of the Balkan campaign General Wavell is free to concentrate entirely upon the defence of Suez. Whatever the next weeks may bring, the fortnight's delay imposed on the German forces in Libya has already contributed to their ultimate defeat.

Convoys and Patrols

The unpleasant news from the Eastern Mediterranean has had the effect in America of calling forth impressive reaffirmations of the policy of aid to the democracies, both in general and in particular. On the wide issue of policy, Mr Cordell Hull, Colonel Knox and the President himself have all re-emphasised the point that every German advance is an additional reason for rapid American action to ensure his ultimate defeat. The isolationist propaganda is becoming ever more shrill and irresponsible—but there is no reason to doubt that the great majority of the American people are behind Mr Roosevelt. There are indications that he judges the time ripe for another of his very effective radio addresses and, in all probability, for a further step forward in policy. Whether this will take the form of naval convoys remains to be seen. The system of "neutrality patrols" has already, it appears, been extended to cover the greater part of the Atlantic Ocean and to occupy the whole of the Atlantic Fleet, and the President has made it clear that it will be further extended into the "combat zone" itself if need be. He has also asked for 2 million tons of existing American ships to be made available immediately for shipping supplies to the democracies. These ships, in their turn, will need protecting. The "neutrality patrol" can be of great assistance to the British Navy, without itself taking any offensive action. But convoys or patrols whose duty was more than observation would be still better.

Domestically, the incidence of labour troubles continues to excite the widest attention. This subject is dealt with in some detail in messages from our New York and Washington correspondents on page 586. The strike in the coal industry, after lasting long enough to have a perceptible effect on the output of munitions, has now been settled, at least provisionally, by Presidential mediation. This strike had a number of features of particular interest. In the first place, it was called by the United Mine Workers, of which Mr John L. Lewis is president. Mr Lewis's opposition to the President in last autumn's election, his close association with the CIO, and his membership of the isolationist America First Committee inevitably inject an element of politics into the dispute. Secondly, the strike raised once again the very difficult and delicate matter of the

"wage differential" which, in coal mining as in other industries, exists between the North and the South. The President's mediation persuaded the owners of the Southern mines to agree to the same wage increase as had already been conceded in the North—namely, \$1 a day. But they have not agreed to remove the differential in their favour of 40 cents a day. The question is to be argued while the men go back to work, but it may yet cause a renewal of the strike.

The Battle of Britain

Neither the four-hour bombardment of Dover on Tuesday nor the setting-up of war emergency courts has so far turned out to herald the invasion—as some of the "embattled" population of this island, almost expectantly, half believed. But the second Battle of Britain is on, a fact which critics of the weakness of General Wavell's forces, by comparison with the call-up since the war began, should remember. The front line is in the Atlantic, where non-belligerent America is now taking a stronger hand. The back areas are Plymouth and Portsmouth, where the defences against sea-raiding—and military invasion—are nourished. German bombing, which like the attacks of the RAF, has become heavier, has lately shifted somewhat from commercial to naval targets, from arriving freighters and their cargoes to their fighting protectors. Merseyside and, for the first time intensively, the North-East have, it is true, had recent visits; but for the time being Plymouth has taken over the distressful fame of Bristol. It is tempting to suppose that the latest raids are simply retaliation for the havoc done in naval Kiel; and it can hardly be doubted that the occasional smiting of London has been largely retaliatory malice. But, for the second time, the first chords of a crescendo of direct assault are being played. What is happening at sea is not known; but on land there have been more disturbing accounts of delay and muddle. Plymouth has stood its great ordeal well and with outstanding courage; but, unfortunately, like so many of its predecessors, the town entered the front rank of bombed areas unprepared for many of the consequences of violent attack—in spite of the experience of the earlier sufferers. It is not panic which sends citizens from the worst-hit areas into safer surrounding districts; but, as in the case of Southampton, it is sheer incompetence that does little or nothing for them when they wander. And it is yet another prime example of the constipated attitude of local—and central—authorities in these matters that Plymouth was not declared a evacuation area, and the children moved, long ago.

New Men

There is support in many places for the suggestion that the Cabinet should be strengthened by the inclusion of men who, though they may not be party leaders, may prove in service to be statesmen. The suggestion is being linked to the revived demand for a small War Cabinet of Ministers with no departmental responsibilities—quite logically, for the Prime Minister's refusal of this demand some months ago (a refusal which he has unreservedly repeated this week) was based, in effect, on the contention that there were not enough able men available to man such a Cabinet and supply heads for the War Departments as well. Unfortunately, there is some misunderstanding. A number of critics are calling for an Imperial War Council in which each Dominion would be "represented" by its Premier. In the event, this might prove the best body to conduct the war, but only by accident. It is because it is "representative" of the parties, in the sense that it is made up by a nice balance of the various parties' leading members, that the present Government is scarce of the broad talents which Mr Churchill needs by his side to lighten his responsibilities. One man cannot wage a war—not even Mr Churchill; and the critics, who have the utmost trust in the Prime Minister himself, remember that, in Mr Lloyd George's War Cabinet in the last war, there were several statesmen who could take their leader's place in the decision of high policy. It is not a question of representing the Imperial Governments but of enlisting the Empire's statesmen from the widest possible field of choice—of substituting an orchestra for a one-man band. This is not, of course, to ask Mr Churchill to ignore the politicians. That would be nonsensical. But there are men in the British parties with more ability and

character than their leaders, for leadership is too often the reward of long service or skilful bargaining. There are such men outside the parties; and the same may be true elsewhere. In peace and war alike, vigilance and criticism by Parliament are indispensable; but, while party has been, and will be, the life-blood of democratic politics among the freedoms and choices of peacetime, it can be a stumbling-block during war, when there can only be one political aim—to win. Renewed crisis has not weakened Mr Churchill's position. His Government still holds the confidence of Parliament and the nation; and it includes many able men. It will be given a decisive vote of confidence in the debate on Greece next week. But, in the grand strategy of the battlefield and the workshop, it needs fresh leaders to share the Prime Minister's burden.

Politics and Unity

Axis claims that relations between Britain and Australia have been strained to breaking point by the defeat in Greece are ridiculous. They spring from the usual totalitarian misinterpretation of free speech; criticism to them means disruption. The Australian people are solidly and resolutely in the war. All that has, in fact, happened is that they have been shocked by the swiftness of the reverse and the peril of their troops; they have resented the apparent disinclination of the authorities to disclose bad news; and now they are given a daily bulletin, necessarily with no details, by their Army Minister. It is foolish, however, to pretend that all is entirely well; there has been a row in Australia. But, at bottom, the trouble there has nothing to do with the present crisis, which is only an occasion to reveal the difficulties that arise when politicians cling to party lines in days of national danger. Politically, Australian government is hobbled by faction, as much, perhaps, as in Canada, where the parties still bicker and clash, not so much perhaps as in this country before Mr. Churchill, but in a similar way. Labour will not join a National Government, though it holds half the seats in the Australian Parliament. Its leaders are members of the Advisory War Council, but will accept no executive responsibilities—except in a purely Labour government. Yet they claim, or appear to claim, equal rights in the decision of war policy in strategic crises. It is not possible for an Englishman to apportion blame, if any blame is deserved, between the Australian parties; it may be that the parties in power have not done everything possible to bring in Labour. But, speaking from a country which was compelled by fire and peril to set aside its own party manoeuvring, it is possible to assert that, if it is true, as both the acting Prime Minister and the Leader of the Labour Party have said, that Australians are solidly united behind Mr. Churchill, and that every class is prepared to "give all" for the common war effort—and it is beyond all questioning true—then the best proof, and the best means to mobilise Australia's entire resources, would be to set up a National Government, and so advance the day when the Empire's leadership and statesmanship are equal to the resources, the willingness and the determination of the Imperial peoples. It is now for Australian civilians—as it is for all British civilians—to match in wisdom and exertion the immortal gallantry of Australian soldiers.

More News

There has lately been criticism throughout the Empire of the way in which information about the war is given out. But one fact should not go unnoticed; no critic has alleged that official news is false. This trust alone merits greater generosity; and last week the Prime Minister promised Parliament to press for as much news as possible from the combatant areas. Information often cannot be given about the crucial stages of remote campaigns: details may not be known; revealed, they may aid the enemy. On Sunday, Mr Churchill was blamed by nobody for not giving the "facts" about what was then going on in Greece and Egypt—though the spectacle of an Australian Minister reporting about the evacuation from Greece on successive days, while silence reigned in London, struck many people as odd. Often there is no news; but the fact is that no news, in wartime and from experience, is taken as bad news; and it is no help to the

Allied war effort for American—and Dominion—journalists to struggle in vain for news from the authorities, sometimes merely for the release of known news, in order to combat German accounts of grave events, or for friendly wireless stations to be compelled to use more of Goebbels's news to fill the gaps left by British reticence. It is part of the strategy of war itself that silence should be avoided whenever possible. But it should not be replaced by reassuring statements and encouraging comments. Mr. Churchill never errs in this way; but Departments do. The macabre memory of the French military spokesman making the best of meagre and days' old news while the Germans plunged towards Paris last summer is still too fresh for this procedure to be acceptable. Britain and the Commonwealth—and the United States—have no right to news that, for safety reasons, cannot be published; but they have every right to all news that can be published, even about the Battle of the Atlantic, and to have it plain and unvarnished.

The "Ration" of Milk

The domestic consumption of milk has been cut by a seventh, and there have already been protests. The need to curtail milk sales, in order to increase the output of cheese and in order to lay up stores of processed milk against the time later in the year when liquid supplies will dwindle, is not denied. It is the incidence of the cut as it is at present arranged that is criticised. It has been left to retailers to ration their customers, and the easiest way for them to do so, apart from haphazard discrimination, is to reduce everyone's purchases by a day's supply, regardless of the quantity, large or small, which is already being bought per head, and regardless of visitors and troops on leave. This is obviously inequitable. Lord Woolton himself has expressed his disapproval of the "milkless day." But in whatever way the cut is carried out, it means that people who used to buy large quantities of milk still have ample, while those who only bought their minimum needs go definitely short. The Ministry of Food does not believe that a specific rationing scheme would "necessarily" (whatever this may mean) improve the situation, and an "official" has gone on record as saying that consumers could well go without 50 per cent of their supplies. It is, of course, true that, in comparison with other consumers, some could. That is the point. The prime importance of milk as a food is already recognised in the Government's agricultural policy and in the provision of cheap milk for children and mothers—which is cushioning the harshness of the present position. Whether or not a rationing scheme is feasible or desirable, the fixing of some minimum quantity per head—not per family, irrespective of its size, which is the Ministry's fatuous concession—is clearly wanted.

Exports & Imports

While the war has increased the already vital need for exports and imports, it has, at the same time, necessitated the introduction of numerous regulations and restrictions which add considerably to the trader's difficulties.

The Westminster Bank maintains specialized departments where its customers may obtain expert advice and assistance in dealing with such problems as arise, and it strongly advises those who are exporting or importing to consult it as soon as their intentions are known. Information is also available regarding Documentary Credits—so necessary to the financing of war-time trade.

Further particulars may be obtained from the Manager of any branch or from

War Zone Courts

The establishment of war zone courts in England and Wales recalls the struggle which took place last summer between Commons and Government over their Enabling Act—the second Emergency Powers (Defence) Act of 1940. Members of Parliament insisted that, at least in cases in which the death sentence was imposed, there should be a right of appeal, and that this right should be granted in the Act itself, instead of being left to chance in the regulations to be made under it. This demand was conceded; and, in fact, the regulations also included the right of appeal for cases in which a sentence of seven or more years' penal servitude has been passed, and for any other case which the president of the court thinks should be reviewed. Moreover, the appeal tribunal, which will consist of three judges, can review the conviction as well as the sentence in these cases. With these exceptions, no appeal can be made from the decision of a war zone court, which consists of a High Court judge as president and two advisory members appointed from a panel of justices of the peace. There will be no jury, but both prosecutor and defendant can be represented by counsel, and the ordinary rules of evidence will be maintained. Although the purpose of the new courts is to expedite criminal justice in a time of emergency, it is probable that they will only be used for serious cases. Thus they can direct that a person should be tried by the ordinary courts if, having regard to the nature of the offence and the military situation, they think it advisable. On the other hand, they have to consider any representations which may be made to the contrary by an officer of His Majesty's forces, and any representations he may make as to the gravity of the offence in the light of the military situation. Thus, although the courts are not, and do not resemble, courts martial, military considerations will be taken fully into account. The establishment of the courts is not, of course, a declaration that the military situation, which presumably can include the situation caused by air-raids as well as invasion, is retarding unduly the ordinary process of justice; or that invasion is at hand. It is a precautionary measure, and these courts cannot function in any area until that area has been declared a war zone by the Minister of Home Security.

Spain In Waiting

Suez may determine the fate of Gibraltar; for there are signs that in spite of the very great pressure Germany is bringing to bear upon General Franco, he is playing a waiting game. Ever since the beginning of the war, Hitler's diplomatic successes have varied in inverse proportion to Britain's defeats. The Balkan campaign has had a profoundly depressing effect, but the collapse of resistance in Greece is obviously not decisive for the fortunes of the Mediterranean war as a whole, and it is in the outcome of this struggle that Spain is passionately interested. In Spain the German press and whisper campaigns continue. After reaching a frenzy of exaggeration with rumours of General Franco's supersession by Señor Suñer, they have concentrated in the last week more on Britain's failures than on Spain's domestic politics. It is difficult to assess the balance of power inside Spain. The Caudillo is sincere in his desire to avoid war. He is reported to have rejected all possibility of military collaboration, at least until the harvests are in. Otherwise Spain faces starvation. This delay also allows time for the Suez campaign to develop before Spain is committed to any drastic step. The Army is divided. Many generals support the Caudillo in his desire for an independent course, others have listened to Germany's fantastic schemes for the restoration of an Hispanic Empire. The Falange is openly for intervention, and it is with its connivance that the Nazis have been able to build up a Gestapo network in Spain, to prepare food and petrol reserves, and to supply at least the ground staffs at a number of key aerodromes. Behind Caudillo, Army and Falange are the forgotten men, the people. That their passionate desire is for peace need not be doubted, but their opinion will not be asked. They serve the cause of non-intervention only in so far as the risk of their passive or active resistance interferes with the calculations of the German General Staff. There are, however, more ways of invading a country than by crossing the frontier with a roll of drums. What would be the

popular reaction to an airborne invasion designed to occupy only vital military objectives with the acquiescence of the Spanish Army? Probably nil. The issue will be decided in Spain by the success of British resistance. The appointment of Lord Gort as Governor and Commander-in-Chief at Gibraltar has the right air of determination, and in Dr Salazar Britain possesses a friend whose influence is all on the side of Iberian neutrality. But Suez remains the key.

* * *

The Line of Least Resistance

The technical difficulties of industrial "concentration" are very considerable. The products of single industries may be extremely diversified; machinery is very often not easily turned over to other uses; the factory space "released" may not be the space wanted by the Supply Departments. Nevertheless, the need to release labour and factory capacity for war work is so urgent that these are simply obstacles to be overcome. In the latest bulletin of the Institute of Statistics, Mr G. D. N. Worswick suggests that, in the hosiery industry, the pooling of plant is being stopped far short of the possible degree, in order to preserve the large number of brands and designs; and this, of course, is the compromise most favoured by manufacturers. Unfortunately, the line of least resistance is almost always wrong in total war. It should be as plain in these industrial discussions, as it is on the Mediterranean battlefields and on the Atlantic, that this is the life-or-death stage of the war; and when it is a question of releasing resources for war production, the most radical solution is generally the right one. In this case, and indeed in the case of most industries, the radical—and right—solution is the production of pooled or standard products in each class of production (in each line of hosiery, for instance), the suspension of trade marks and the merging of the resources of all firms, large or small, in the common pool. The important point is physical concentration—the production of the allotted ration of output with the minimum use of resources, space and man-hours. As Mr Worswick points out, to "encourage individual firms to initiate the desired changes," though in keeping with "traditional British economic policy," does not do the job. Concentration schemes are hammered out; but financial considerations are confused with the physical task in hand. Overhead charges, it is true, should be pooled, including the cost of maintaining closed factories; there should be compensation for hardship—if only to speed the war effort; and in every financial arrangement there should be safeguards for the smaller and weaker units. But these are separate problems from the real one, in which there is only one interest, the nation's safety and strength. Physically, there are no separate interests of firms and undertakings, only a single problem in each industry, or more precisely in each homogeneous line of manufacture, the problem of producing a fixed quantity of civilian goods with the least possible withholding of resources from the military effort.

Food Distribution

In the Commons on Wednesday there were strong protests about the maldistribution of food supplies, and in particular about the excessive supplies secured by multiple stores. In his opening speech, Major Lloyd George had said that mistakes were unavoidable and would be rectified. It is sternness and planned command that the Ministry of Food most lacks in its vast labours—both in rationing and in the control of supplies and distribution. There are the food parasites, for instance. The offence of people who steal from bombed premises is plain and heavily punishable; but there are bigger fry in this criminal game. They do not steal and they would call themselves traders or business men; but they are looters, taking advantage of wartime conditions, none the less. The Chairman of one Food Price Investigation Committee claims that speculation is rampant. Goods change owners many times like stocks and shares without leaving the warehouse. Canned soup, sold by the manufacturer at 6s. 6d. a dozen, passes through the possession of seven successive middlemen and is retailed at 14s. 6d. a dozen; canned marmalade, imported at 8½d.

a tin, is retailed at 3s. 6d. The Chairman, Sir Douglas McCraith, suggests that the middlemen should be cut out by law, and that producers or importers should sell only to wholesalers, and wholesalers only to retailers; that only licensed traders should be allowed to trade in food-stuffs; that maximum percentages of profit should be fixed; and that offenders should be put out of business and fined or imprisoned. This would be common sense and simple justice. It is the full control which, for some reason, the authorities have hitherto been reluctant to impose; it has been obvious, ever since the war started and the speculators got busy, that some such step was necessary. Only the punishments seem lenient, for the penalty for the cruder forms of looting can be death.

* * *

Ships for Smokers

In *Tobacco*, the trade journal, there is some interesting—and disturbing—news. Growers and exporters in the United States "hope" that shipments of American tobacco to this country may start at once; and they are talking of shipments in the coming summer at the rate of 10 million lb. a month. On the face of it, it seems a shocking thing that any use of shipping space for tobacco should even be contemplated, by anyone, at this stage. Tobacco is, of course, important for that convenience which, nowadays, is lightly called "morale"; and lately there have been local "shortages" of cigarettes—very often, however, only in the sense that the popular brands have been temporarily missing. But there is no real deprivation. It is true that, since the second half of last year, supplies of retailers have been reduced by one-tenth, but the difficulty in the way of reducing the pre-war rate of consumption is that in the first year of the war demand rose by a fifth or more; and the belated attempt to cut it down results in these "shortages." Thus the proposal is to employ invaluable shipping space to bring in tobacco in order to maintain a higher rate of consumption than in peacetime—at a time when ships are desperately needed for munitions and food. The task of cutting down consumption has, admittedly, been made harder by the long period early in the war when the tobacco companies—from time to time parroting the statement that they had "two years' supplies" (at the pre-war rate of consumption) in this country—complacently watched consumption mounting without doing anything about it; and the business of distributing supplies in accordance with the movement of population has been bungled badly—mainly, it would seem, from reluctance to cut down supplies really drastically in areas which have lost population. But the correct wartime policy for tobacco is still plain. At the most, consumption should not be above the pre-war level; brands should be pooled and cigarettes sold loose, to save materials and labour; advertising, which in the present situation is irrelevant, wasteful and actually harmful, should be cut down; supplies should be properly distributed; and there should be no imports. If the tobacco companies cannot carry this policy out, the Government should. This is a test case.

* * *

The Waste of Petrol

Since there are very few uses for tankers other than the carriage of oil, and as Great Britain and the United States now control the bulk of the world's tanker capacity, it has been widely assumed that oil was one of the imported commodities in which Great Britain was least likely to run short. This belief has certainly been encouraged by the Government, which is not only enabling the owners of all licensed cars to obtain a small basic quantity of petrol, but also permits many of them, through the liberal operations of the system of supplementary allowances, to exceed their basic ration. As a result, many thousands of tons of petrol are still being used by private consumers who, in the present emergency, could do without it altogether. If ever there was an example of waste it is the present method of allocating petrol and oil. Even if stocks in the country are being maintained, the Battle of the Atlantic is bound to take its toll of tankers, and the greater the number of tankers that can be held in reserve, the longer

their supply will last and the longer will it be possible to maintain the import of oil for essential needs. The time has clearly come when the lenient petrol rationing scheme at present in force must go, and when the test of any allocation must be the use to which it is put rather than the mere possession of a car. This would exclude all private motoring except for essential purposes. It is unfortunately necessary once again to point out that so long as the administration of the system of petrol distribution is in the hands of a Board which represents only the oil companies, it is difficult to feel confident that the public interest is given its full weight.

The Monthoire Policy

Save for the fanatics of the Laval school, who still believe that France can secure Italy's New Order rôle of "most favoured nation," it is not the outcome of the war in the Near East but economic necessities at home which will determine France's policy *vis-à-vis* Germany. The Nazis probably realise that, however complaisant Admiral Darlan or De Brinon may be, so long as Marshal Pétain remains at the head of affairs, open collaboration is either political or naval—is out of the question. It is, moreover, questionable whether political collaboration is what the Nazis chiefly want from France. Over the economic aspects of the Monthoire policy, Marshal Pétain has no scruples; indeed, the idea of Franco-German collaboration for securing mutual benefits and prosperity has long been preached in the wealthy industrial circles in which Marshal Pétain has his connections, with the economic life of France, and M. Lucien Romier, one of the Marshal's economic advisers, has been for years an advocate of Franco-German collaboration. Any hesitations bred of the fact that Germany is waging war to the death on France's former ally can be swept aside by the reminder that France's economic rehabilitation is possible only through German co-operation. The makings of a bargain are there. Germany is desperately short of skilled industrial and agricultural workers. France has millions unemployed. Germany needs plant out of the range of British bombers. France has the equipment but lacks the raw materials which only Germany can provide. With the active collaboration of many great French industrialists economic collaboration is already well under way. Whether Germany can extort more than this remains to be seen. The Nazis possess potent bargaining counters in the prisoners of war, the watertight zoning of France, and the undermining of the franc. These factors may be brought into play when the campaign for Gibraltar and North Africa opens. For the time being, economic collaboration is the order of the day, and apart from demanding that America shall not feed Hitler's French workers there is little that Britain can do to alter the position. Her best hope is the passive resistance of the French people, but they, too, long for work and bread.

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

in numbers was rendering them all over-capitalised. Now, some have to struggle with the costs of evacuation, while the registration of the under twenties will make those who go on to a University leave school at an earlier age in order to get through as much as possible of their University course before they are called up. Many schools, however, though they may find it difficult or impossible to make ends meet, are nevertheless richly endowed; their trouble is that in most cases the terms of the endowment prevent them from using the money where it may be most needed. By the new Bill, therefore, power is given for an Order-in-Council to be made enabling the governing body to apply the income or capital of any endowment for purposes other than those for which it was originally intended. The consent of the appropriate authority must be obtained to every proposal by a governing body to divert endowment funds; and the provision giving power to divert capital as well as income was inserted at the suggestion of the standing joint committee of governors and headmasters. It can therefore hardly be said, as was suggested when the Bill was introduced in the House of Lords, that power to alienate capital has been given indiscriminately by the Government without the consent of governing bodies—though it is quite true that the latter are still not fully and permanently represented on the joint committee. The Bill will help governors and headmasters alike in a peculiarly difficult period. But it cannot be regarded as a permanent solution to financial difficulties, and it may well be that public schools, too, will find their best salvation in concentration.

Shorter Notes

During the two hours' period of summer time, which begins on Sunday, May 4th, the black-out period will be shortened. In Scotland, Northumberland, Durham and Cumberland, with their longer twilight, it will begin an

hour after sunset and end an hour before sunrise instead of the present half hour in each case. In the rest of England the period will be shortened by a quarter of an hour at each end. The chief drawback to the longer daylight period will be the added incentive to spend, but it will also cause confusion in the country where single summer-time will govern the working day for agriculture, but not for anything else such as schools. Thus, on each farm there will be one time for the children and another for the cows.

*

In spite of the lesson of December 29th the City of London has not been able to make adequate arrangements for fire prevention throughout its jurisdiction. The chief reason is, of course, the very small residential population, which means that there is no pool of fire watchers from whom the City can form additional fire parties for firms unable, by reason of their small staffs, to make adequate arrangements under the Fire Prevention (Business Premises) Order. A new Order has, therefore, been made under which, with certain exempted classes, all men aged 18-60, whose usual place of work is in the City, may be required to register and to be enrolled for fire prevention duties in the City.

*

Another shocking total for road accidents is shown in the March return. The number killed was 834, compared with 496 in March last year. The number of deaths during hours of darkness was 369 and in daylight 465, compared with 235 and 261 respectively in March, 1940.

*

Parliament approved this week the draft regulations putting the Determination of Needs Act into effect. They will come into force, both for unemployment assistance and for supplementary pensions, in the first week of June.

THE WORLD OVERSEAS

Strikes in the United States

The Labour Riddle

[FROM OUR NEW YORK CORRESPONDENT]

ANY way one looks at it—and there is a wide choice of ways in which it may be regarded—the news of the month for March was the outbreak of strikes. Strikes were fairly frequent during the autumn, but after the turn of the year they began to fill an increasing space in the Press and to occupy an increasing share of the public attention. It is frequently, however, almost impossible to discover, even by the closest reading of the most voluminous reported strike, exactly what issues are involved. The bituminous coal strike, which began on April 1st and is the largest now in progress, is different—here the United Mine Workers presented specific demands, of which the most important were for a guarantee of 200 working days a year and the elimination of the north-south wage differentiation. Sometimes one side presents its case in the form of a paid advertisement in the Press—as did the bus companies in the recent New York strike—but such statements are immediately denounced as *ex parte* (which they naturally are) and mendacious (which they may or may not be).

To make matters more perplexing, it is now alleged that the space given to strike news in the Press is out of all proportion to the actual significance of the strikes themselves; that it represents an organised campaign of

labour baiting, deliberately designed to prejudice the public by assimilating strikes to sabotage of the defence programme, with the intent of securing repressive or oppressive legislation. Others state a different opinion in analogous terms—that these strikes are deliberate sabotage of the defence programme, and are to be regarded as parts of a political pattern.

The familiar aphorism of Sir Roger de Coverley that much might be said on both sides hardly applies. There are more than two sides. It is an irregular polyhedron; and your correspondent is incapable of enumerating all these sides, let alone measuring them.

First of all, the American labour movement has for several years been engaged in organising the labour element of an economy that formerly was mostly unorganised. In this process, what are called “organisational strikes” are likely to be frequent. Secondly, this programme of organisation was divided between two rival and mutually antagonistic groups (omitting the numerous “company unions”), the AFL and the CIO. This rivalry may take the form of a strike, analogous to but distinct from the “organisational” strike. Thirdly, the continuous process of changing techniques, notably in the building industry, creates conditions in which the new technique might rationally be allocated to either of two unions—for example, the use of steel windows instead of wooden windows raises the question of whether the installation of a window is carpentry or metal work. An allocation to either union provokes a protest and often a strike from the other union. This is the so-called jurisdictional strike.

Public Impatience

All these types are frequent, and none basically involves what is assumed to be the usual cause of strikes—wages, hours, or working conditions—although these questions may also be involved. Further, strikes are generally more propitiously timed when industry is active and labour scarce, regardless of the causes of the activity and scarcity. But when the activity is caused by a programme of intense national concern, as in the present instance, these interruptions, however they may be regarded by their participants, are regarded by the public in a special light. The public rarely understands the specific issues of a strike, and usually does not much care. Under current circumstances it feels that it is, for once, an interested party, and its primary concern is not the right or wrong of either side, but the interrupted process of production. Hence, the definite shift of public attitude from indifference to irritation, then to indignation, and, finally, on to something resembling exasperation.

In a play produced some years ago in New York, one of the characters (a politician proposing an unsavoury suggestion to his colleagues who demur in apprehension of public opinion) remarks sagely, “The great natural resources of apathy among the American people have barely been scratched.” But while apathy may be rated an American virtue, dispassionate objectivity, in periods of rising temperature in the emotional atmosphere, never has been. Hence, the present readiness to fling (and to believe) extreme statements—on the one side, that the publication of strike news is labour-baiting, and *a priori* evidence of treasonable relations with a foreign power; and, on the other side, that every strike is sabotage, and *a priori* evidence of treasonable relations with a foreign power. It is not merely to the jealous that “trifles light as air are . . . strong as proofs of Holy Writ.”

Strikes and American Defence

[FROM OUR WASHINGTON CORRESPONDENT]

April 5th

In the course of the last six weeks the strike situation has become the major domestic issue. A compilation made by the Labour Division of the Office of Production Management, at the request of the Chairman of the House Naval Affairs Committee, covering strikes in defence industries during the period September, 1939, to March 27, 1941, lists forty-three strikes directly affecting defence industry, and thirty further disputes regarded as secondary. (Twenty-three of the former and twelve of the latter began in February or March.) Since this compilation was published, a long-awaited stoppage has closed the River Rouge plant of Henry Ford, and the soft-coal contract has expired (on April 1st) with negotiations still pending for the renewal of the labour arrangements.

Examination of the causes of the strikes indicates that, contrary to general opinion, the main contention in the defence strikes is not wages. According to the OPM analysis, wages are an issue in seventeen of the forty-three main strikes. Five of the strikes have been “jurisdictional” disputes, either between the CIO and the AFL or between craft unions within the AFL. In nineteen cases, union recognition or union relations are the main unsolved problem.

In other words, labour, during the past weeks, has been attempting to do what industry did last summer—bargain for the basic arrangements under which the defence programme shall go forward. Last midsummer, business men were shying from Government orders. They foresaw endless wrangling over contracts bound round with the red tape of the General Accounting Office. They foresaw changes of specifications after work was under way. They foresaw idle plant on their hands when the show was over, with continuing taxes on their expanded capitalisation. It took about three months to work out the terms on which industry has inaugurated the expansions of this past winter, terms providing for rapid amortisation of new capital investment, or for the

sale of such properties to the Government at the end of a given period, or for the original construction of premises for defence work by the Government with private operation.

At the time that the industrial bargain was made, the country was far less awake than it is at present to the need for speed in re-armament; and the right of business to bargain is a generally recognised right. Labour is making its bid now under highly contrasting circumstances. The right of labour to collective bargaining has less than a decade of legal recognition behind it. Certain major corporations like Bethlehem Steel and companies like Ford are still testing in the courts the necessity of compliance under the laws by which these rights were established. Picket lines at big plants are likely to lead to disorder. Disorder is front-page news. And the country wants deliveries now.

“There Ought to be a Law”

Action in this situation is taking a variety of forms. Speeches, Bills and resolutions in the State legislatures currently in session and in Congress indicate that a growing number of citizens believe that “there ought to be a law.” For example, a Bill currently before the Oklahoma legislature (already passed by the State Senate) would make it a felony punishable by three years’ imprisonment and a \$10,000 fine to solicit defence project workers for union membership. In the Federal House of Representatives, the Judiciary Committee has before it a collection of comparable proposals. The harshest of these would make advocacy of, or participation in, a defence strike a treasonable offence, punishable by twenty-five years’ imprisonment, or, if the strike resulted in fatalities, by death. Another proposes amendment of the Selective Service Act to include registration up to sixty-five years and to empower the President to draft men for defence labour. A third provides for a compulsory “cooling-off period” before a strike could be called.

Testimony that the legislators are echoing feeling in the country comes from the Gallup poll. The number of persons favouring unions even “in principle” is dropping slightly; more than half of those currently dissatisfied with progress under the defence programme cite strikes as the major cause of delay; and a just tabulated vote on whether labour union leaders are helping the programme as much as they should showed eighteen persons voting “yes” to sixty-eight voting “no.” The recent decision of the AFL building trades to ban jurisdictional strikes among themselves on defence projects is evidence that labour is seeing the handwriting on the wall. Clearly, legislative action taken in the current public mood may undo many recent gains.

The Administration's View

So far, administration policy is opposed to legislation as a means of halting strikes. The Government's current answer is the executive order of March 19th, creating an eleven-man National Defence Mediation Board, with four representatives of employers, four of labour and three of the public, under the chairmanship of Mr Clarence A. Dykstra, President of the University of Wisconsin and Director of Selective Service. The President has specifically asked that legislative action be deferred until this Board is given a trial as a means of settling disputes certified to it by the Secretary of Labour. A number of cases have already been certified to the Board. Most important so far is that the Allis plant at Milwaukee. On March 26th Colonel Knox and Mr Knudsen of OPM demanded resumption of work at this plant, where a strike was in its tenth week, “vitally affecting the delivery of navy orders.” The union (CIO) criticised their action as an attempt to force its hand, and work came to a stop again on April 2nd, after clashes with the police. The case was certified on April 3rd.

With this case and the Ford case assuming large proportions, prophecies of a “crack-down” are busily circulating in Washington. The two cases, both concerning CIO unions, would make a pair. Those present when the President addressed the White House correspondents—or listening over the radio—remember the burst of applause when he said: “It [the determination of America] must not be obstructed by unnecessary strikes of workers,” and they remember how he firmly continued, “or by short-sighted management” across the applause. That sentence may have been the beginning of a formula.

Nazi Trade in the Far East

(From Our Shanghai Correspondent)

March 20th

GERMAN exports to China, forwarded via Siberia, have this year maintained an average value of £250,000 per month. Some £175,000 worth of these exports are being placed in the Shanghai market and the remainder in Japanese-occupied parts of North China. German aniline and other coal-tar dyes, as well as sulphur black, play the leading part in these exports, and account monthly for about £100,000 in Shanghai and about £35,000 in North China. Germany supplies 80 per cent of Shanghai's imports of dyes. Over £50,000 worth of German machinery, supplied monthly to semi-official Japanese "development" firms in China, rank second. Other German exports to China include chiefly medicines and drugs, chemicals and some hardware.

Proceeds from these exports fully serve for the purchase of Chinese supplies for Germany. Chinese Customs reports this year include dried egg products, bristles, pig intestines and horsehair among exports to the Reich. In Japanese-occupied China, the Misui Bussan Company works on behalf of the German purchases by discouraging egg shipments to Shanghai's Anglo-Saxon exporters, while promoting the manufacture, in hundreds of small native plants, of dried egg products for Germany. As a result, since the beginning of this year, exports of Chinese egg products to Germany considerably exceed Shanghai's shipments of eggs to London.

These exports to Germany all follow the route via Dairen, Manchuli and Siberia, and the same route takes additional exports to Germany which the Chinese Customs list as shipments to Japan's Kwantung Leased Territory. These latter exports are considerable, and make Kwantung Leased Territory rank third among the countries of destination for Shanghai exports. They mainly include black tea, buffalo hides and leather, vegetable oils and fats, as well as some raw cotton, and will soon include some high-class mineral oil products as well as wolfram and rubber.

No value figures and but few other details are known about German trans-Siberian trade with Japan and Manchuria. Several heavy industry plants in Manchuria have in recent months reported the arrival of important items of German machinery, ordered before the European war and long overdue. Power plants in Japan proper also secured new German equipment. Japan is known to hand over to Germany some tropical produce and metals imported by herself, while Manchuria forwards bean oil to Germany as well as other vegetable oils and fats. Problems of foreign exchange do not enter into this trade; out of pre-war commercial transactions between Germany and Japan the latter is heavily indebted to Germany, which has large commercial credits "frozen" in Japanese State banks to draw upon. On the other hand, although a special Italo-Japanese committee has been formed to promote trans-Siberian trade between Japan and Italy, there is no indication that such trade has assumed any significance.

Russia's Price

The Germans have set up a special organisation to handle German trade with the Far East via Siberia. At the German end, this organisation makes use of the apparatus of the Hamburg-America Line, while the Far Eastern end is looked after by a group of German, Chinese and Japanese firms. At several points in Russia proper, as well as in Siberia, this organisation maintains representatives and transportation experts. Berlin and Moscow are reported to have arranged for German-Far Eastern traffic through Siberia to the extent of 2,000 tons of goods per day, but the actual volume of this traffic is far below that. Russia is unable, or unwilling, to mobilise a sufficient number of freight cars. Delays are enormous; carloads are known to have arrived in German-occupied territory as late as from three to six months after dispatch from Manchuli or Vladivostok. Damage to trans-Siberian freight transport to and from Germany is very considerable.

Russian charges for trans-Siberian transit traffic are extremely high, and since the closure of the Suez Canal

have been multiplied. The Russians not only sharply raised, last autumn, their valuation of the Russian currency against the Reichsmark, but early this year they also doubled and trebled the basic freight rates for most commodities of importance in Germany's trans-Siberian trade. For Germany, of course, it is the Far Eastern supplies that now count and not the cost of transportation, however high; nevertheless, this cost constitutes a serious burden for Germany, since Russia insists on transit freight charges being paid on a U.S. dollar basis.

Canada's New Wheat Policy

[FROM OUR OTTAWA CORRESPONDENT]

March 21st

THE King Ministry on March 12th made an announcement of its wheat policy for 1941. Mr Gardiner, the Minister of Agriculture, and Mr Mackinnon, the Minister of Trade and Commerce, revealed the decision to follow the example of the United States in an attempt to curtail the production of wheat by giving bonuses to the western farmers for not growing it. The basic features of the Government's new plan are that, in the next crop year, it will limit the amount of wheat of which delivery will be accepted by the Wheat Board to 230 million bushels, on a quota basis, with the present guaranteed minimum price of 70 cents per bushel (No. 1 Northern at Fort William) continued for another year. It will also give a bonus, at the rate of \$4 per acre, on all land taken out of wheat production and cultivated in summer fallow, and at the rate of \$2 per acre for land withdrawn from wheat growing and sown with oats, barley, rye, grass or clover; if land, which earns this lower bonus, is still under the same crops in 1942, an additional \$2 per acre will be paid. The system of paying for farm storage of grain will be contributed next year, but only on grain that comes under the farmers' new quota.

Estimates and Reactions

The Government's calculation is that the bonus should be an attractive inducement to the farmers to grow less wheat, because on the average small farm in the West \$5 per acre is counted a fair profit on a wheat crop after costs of labour and seed have been allowed for; it also estimates that the acreage allocated to wheat this year will be cut to 65 per cent of the acreage of 1940. If farmers grow wheat in excess of their quota, they themselves will have to assume the risk of finding a market for it. July 1st has been fixed as the "deadline" date on which farmers must be able to prove that their land is "black" in order to be able to collect the bonus for summer fallowing. There will be no change in the processing tax of 15 cents per bushel for wheat made domestically into flour, which the grain growers wanted to be increased. Moreover, the new scheme will not be applicable to Eastern Canada, where farmers will be allowed to market as much wheat as they like to grow at the price prevailing this year. The Minister of Agriculture estimated that, if the 35 per cent reduction were achieved and nine million acres withdrawn from wheat into summer fallow, the bonus payments would total \$36 millions, but that, if 6,000,000 acres were summer fallowed and 3,000,000 acres given over to coarse grains and grass, the payments would be only \$30 millions.

The new scheme has not been received with much enthusiasm in Western Canada, and evidently does not satisfy the leaders of the wheat pools of Manitoba, Saskatchewan and Alberta. On the day following the announcement they issued a joint statement, urging the Government to reconsider its 1941-42 wheat policy "to bring it more in line with the needs of Canadian agricul-

May 3, 1941

THE ECONOMIST

589

ture"; they criticised it on the ground that the basic guaranteed price of 70 cents which is being retained is too low to provide an adequate return to the producers, and that the projected reduction of wheat acreage is far too drastic an adjustment. The plan is also meeting with objections in Eastern Canada, particularly in Ontario, on the ground that the Government is giving bonuses to the western farmers for turning from wheat growing to raising products which will compete with those of eastern farmers. There already exists a serious disparity in the cost of livestock feed between the east and west; mill feeds in the east to-day cost \$26 per ton, but in the west the best wheat is available for feed at \$17 per ton; as a result the production of pigs in Saskatchewan has been doubled during the past year. Now, the western farmers are to be given a bonus of \$2 per acre for growing barley, a favourite feed for pigs, and it is estimated that western farmers, who switch a quarter section of land (160 acres) from wheat to barley, will be given the cash equivalent of twenty-three pigs by the Federal Government. As a result the western farmers will be able to undersell their eastern brethren in pigs. Mr Gardiner admitted on February 27th that there was already a serious over-production of pork products, with two million pounds of pork going into cold storage each week, and fears are expressed that the present glut may be greatly exaggerated. It is also feared that the bonus on coarse grains will encourage the western farmers to turn to products like cattle, poultry, butter and condensed milk, which are the mainstays of the revenues of the eastern agriculturists. Ontario, as the richest province, will have to provide a substantial part of the funds for this new Federal subsidy to the west; it is therefore forecast that many representatives of rural constituencies in Ontario will oppose the scheme on the ground that it is unfair to make it contribute to a subsidy, the ultimate effect of which may be harmful to its own farmers.

The most powerful argument for the scheme, however, is the virtual impossibility of finding storage for another wheat crop like that of 1940. Official estimates indicate that, at the end of the current crop year on July 31st, the carry-over of Canadian wheat will amount to about 575 million bushels; according to figures given to Parliament by the Minister of Trade and Commerce, this amount of wheat will occupy almost all the storage space available. The Government has made arrangements with elevator companies for the construction of temporary storage capacity at the head of the Great Lakes to hold an additional fifty million bushels of wheat, which will bring Canada's total storage capacity for wheat up to 571 million bushels. To this can be added storage capacity available in the United States for thirty-six million bushels, and an allowance of fifteen million bushels for grain in transit by rail or water, making a total of 622 million bushels. But, according to the Minister, from this figure there should be deducted an allowance of forty million bushels for working space and for accommodation for coarse grains, so that there would only be left capacity for 582 million bushels.

New Blows Against Czechoslovakia

[BY A CZECH CORRESPONDENT]

April 20th

EVENTS in the Protectorate when Yugoslavia revolted are typical of the spirit of the Czechs. When Cvetkovic and Cincar Markovic yielded to the Axis demands, the Nazis ordered the streets of Prague to be decorated with flags. Only a few flags, however, were to be seen, and these only on official buildings. But as soon as the people learned that Yugoslavia had found its soul, the town was a sea of flags. The rejoicing all over the country was so great that several people in Brno were arrested for "unreasonable demonstrations." Moreover, the heaviest blow so far against Czech nationalism was struck by the banning of the "Sokol" organisation. The Sokol was the biggest organisation in the Slavonic countries; although a gymnasts' organisation, it was not only concerned in physical training, but also in moral and intellectual education. In the U.S.A. it is the only link between Americans of Polish, Yugoslav, Ukrainian,

Czechoslovak and Bulgarian extraction. The membership in the Protectorate included adults, adolescents and children of both sexes, and amounted to 6½ per cent of the population. Every little village had its "Sokolovna" (Sokol home), and the Germans seized 1,000 buildings (with drill rooms, libraries and club-rooms), 200 swimming pools, 183 skating rinks, two big hotels and a large publishing house. When the Habsburgs tried to suppress this movement during the last war it was the first signal for Czech rebellion.

Agents Provocateurs

The Gestapo are choosing reliable Nazis to pretend to be Czechs and mix with Czech society. When they succeed in making acquaintances they are to pose as organisers of the liberation movement and to recruit members for it. Then the prospective members are arrested. The following incident shows how the Gestapo organises a frame-up. A week after the issue of telephone directories printed in German the telephone boxes in Prague were damaged by unknown persons; the telephone wires were cut, receivers broken and the directories mutilated. The damage was so great that there was a danger that the public telephones would be out of action. A few days later, two students of the German university were caught damaging a box. After this had been reported to the Gestapo, this activity immediately stopped. Even if Germans should be tried by a Czech court they can still hope for Nazi justice to liberate them. The Reich Protector, Herr von Neurath, has issued a decree to Czech courts reserving to himself the right to change and cancel verdicts which have already been put into execution, and the German authorities make extensive use of this privilege.

The Czechoslovakian spas and holiday resorts are overcrowded with German children, who have been arriving daily during the last two months in large numbers. Hotels and private houses are commandeered for them in the simplest manner. A fortnight ago, the owners of country houses in beautiful Jevany, near Prague, were ordered to the police station, where they were informed that their houses were requisitioned. The children, among whom are Himmler's offspring, walk about in the Czech towns clad in Hitler Youth uniforms, which causes great annoyance.

Shorter Notice

"An Outline of War-time Financial Control in the United Kingdom." By W. F. Crick. Macmillan. 59 pages. 6d.

The only circumstance that will prevent this pamphlet from becoming the definitive description of the machinery of financial control that has grown up in this country since the outbreak of war is that events are still moving; and that single defect can be—and, it is to be hoped, will be—removed by successive editions. The titles of the three main chapters sufficiently describe the scope of the pamphlet: "The Control of Capital and Credit"; "The Control of Purchasing Power Abroad"; "Frustrating the Enemy." Mr. Crick has all the virtues; he is comprehensive, objective, lucid and accurate; he is to be congratulated on performing a most valuable service of exposition.

More Typewriters wanted

To Speed Up The War Effort

H.M. Stationery Office ask all owners of typewriters to offer any which can be spared for work of urgent National importance. Machines should be in good working order and not over 20 years old.

German Europe

German Coal.—Germany's coal industry and coal trade, traditionally organised by powerful syndicates, recently formed a new organisation called the Reich Coal Co-operative (*Reichskohlenvereinigung*). At the same time, the office of the Coal Commissar was dissolved. The task of the new organisation goes far beyond that of the dismissed Commissar, who was appointed in spring 1939 with the object of increasing output. The new Coal Commissar, who has been appointed leader of the new organisation, is the director-general of the Hermann Goering Works, the State-owned concern which is the biggest coal producer in Germany. At the same time, a new Special Commissar for coal transport has been appointed. The stated objects of the new organisation are greater output, a higher standard of living of the miners, the equalisation of interests between different syndicates, the planning of transport and collaboration in the expansion of synthetic industries based on coal.

Actually, the new organisation is hailed as a success for private industry, created by the initiative of private employers. But State control will remain as effective as before. The reasons for the reorganisation are manifold. The distribution of household coal according to a point system similar to that for clothing was cumbersome. It has been abolished. The former Coal Commissar dictatorially increased wages, which in turn affected the earnings of the industry, especially when working at full capacity. In short, the industry, hampered by a shortage of labour, could not use the favourable situation of an almost unlimited demand for coal to its full advantage. The new organisation comes as an interesting compromise between powerful cartels, compulsory economic federations, and control organisations working through the Ministry of Economic Affairs and State-owned concerns. Generally speaking, some restrictions on private initiative have undoubtedly been removed and other industries are expecting similar reorganisations.

Germany's war economy depends entirely on coal. Directly or indirectly the manufacture of synthetic products consumes enormous quantities of coal, and the necessary increase in the capacity demands time and a large capital expenditure. Before the collapse of France Germany seemed to have solved her coal difficulties by the occupation of Poland, with an output of 38 million tons. But the conquest of Western Europe, as well as the extended industrial programme, created new difficulties. In 1938, Germany and the countries under German control produced 324 million tons of coal and 208 million tons of lignite equivalent to another 50 million tons of coal. Germany's and Poland's net exports of coal in that year amounted to 37 million tons, whereas the net imports of all the continental countries during the same year may be put at 57 million tons. Compared with peace-time demands, therefore, the continent is thus short of some 20 million tons of coal. Actually, in 1940, coal output was very small in the Saar territory, in Belgium and in France. During 1939, Germany may have reached the record of 1938 and there has probably been an increase in 1940. Nevertheless, coal and coke rationing for household consumption could not be avoided.

Company reports covering 1939-40 indicate that there has been no actual shortage of coal for industry. But without adequate exports of coal to neutral and occupied or controlled countries, Germany cannot make full use of their industries. In the Ruhr, no rapid increase in coal output is possible, because of unfavourable working conditions, but in German and Polish Silesia working conditions are favourable for a new record output. This area produced 55 million tons of coal in 1938, and it is planned to reach an annual output of 100 million tons. But several years will be needed for this programme. The incorporation of Polish concerns into German companies has been completed and mechanisation is being speeded up. The coal mines in Northern France, which produced on an average 30 million tons a year, may soon reach the pre-war output. In Belgium and Holland, the mines are working normally and the greater part of the mines in the Saar territory will have been restarted by now. But shortage of labour, especially of skilled miners, is still the greatest obstacle to increasing output. During the winter 1940-41, miners were released from the army in great numbers; new machinery was installed; and increased wages were paid, intended to attract more

workers. At the same time, a comprehensive scheme of training young workers to be skilled miners was introduced.

With a strict system of rationing household coal, German Europe may be able to supply the industrial requirements of continental Europe; and the generation of electric power from water may relieve the situation. But there remains the problem of transport. With the exception of the Baltic, all the sea routes are closed, and the bulk of the coal has to be transported over land or on inland waterways. There are no waterways for the transport of coal to Italy and France.

★

Electricity.—The manufacture of synthetic rubber, aluminium, other light metals and most substitute products requires enormous amounts of electric current, and ever since 1938-39 electricity companies have been strained to the utmost of their capacities. The largest producer of electricity, the *Rheinisch-Westfälische Elektrizität Werke AG*, reports a further increase in 1939-40 in the supply of electric current. This concern operates 250 power stations which are connected by a grid system, which includes in addition some 400 small stations. During 1940, new power stations began operation and the concern concluded agreements with Bavarian and Austrian companies for the construction of new water power stations in the Tyrolian Alps. The gross income of the concern increased from Rm. 111.7 millions in 1938-39 to Rm. 122.1 millions in 1939-40. The total supply of current increased from the 8,200 million kwh in 1938-39, which was then roughly one-eighth of the total supply of electric current in the Old Reich. Two years ago the output was 6,200 million kwh, and it was only 3,000 million kwh in 1931-32.

The occupation of Norway and other European countries has led to plans for a European grid system based on the cheap water power in Scandinavia, on the one hand, and in the Alpine countries on the other. In February, 1941, a German-Norwegian body for the expansion of electricity generation in Norway was founded; and an increase of 10,000 million kwh is planned, of which the greater part will be transported by cable to the Continent. It will, however, take many years until the export of current can begin.

★

Savings.—The additional purchasing power of the great masses of the population has been absorbed to a large extent by the savings banks. But the actual increase in deposits held by the special savings banks can only be estimated. The latest official figures relating to June, 1939, shows total savings for the Old Reich amounting to Rm. 18,860 millions. The *Frankfurter Zeitung* estimates total savings deposits for Greater Germany at the end of 1939 at Rm. 21 to 22,000 millions, and at the end of 1940 at Rm. 27,000 to 28,000 millions. That is an increase of 30 per cent. during 1940. The greater part of the additional purchasing power has been absorbed by the banks. The most recent development in bringing back money and capital into the Treasury is a decree compelling all companies to reduce prices as soon as profits exceed "normal" proportions—which are measured by a 6 per cent dividend. If a company discovers that the reduction in prices should have been made earlier, the excessive profit gained over that period must be at once handed over to the Regional Treasury Departments.

★

Artificial Textile Fibre.—The output of staple fibre in 1940 is estimated by American sources at 300,000 metric tons, against 200,000 tons in 1939 and 162,000 tons in 1938. The output of rayon is reported to have reached 100,000 tons in 1940, against 67,000 tons in 1938. The 1940 output of staple fibre and rayon would thus be 39.6 per cent of the total supply of textile fibres in 1938. During 1940, imports of flax increased considerably from Belgium, Holland and the Soviet Union.

THE BUSINESS WORLD

The Battle of the Yuan

THE currency battle in China, the fight between the yuan of the National Government and the various currencies of the invader and his puppet authorities yields nothing in fierceness or importance to the other aspects of the struggle in that country. Two agreements signed on Saturday of last week between the Chinese Government and the Treasuries of the United States and Great Britain respectively should ensure that, for a time at least, that battle will be waged by the Chinese with greater equality of resources than they can at present command in the military field. The two monetary agreements place at the disposal of the newly constituted Chinese Stabilisation Board credits amounting to £5,000,000 and \$50,000,000. These are being provided directly by the British and United States Treasuries and will be used, in the words of the official statements issued in Washington, where the agreements were signed, "in order to check undue fluctuations in the exchange value of the Chinese yuan."

The external help to Chinese currency began with the establishment of the Chinese Exchange Stabilisation Fund in March, 1939. The British contribution to the initial resources of that fund amounted to £5,000,000 and was made by two British banks operating in the Far East, the Hong Kong and Shanghai Bank and the Chartered Bank, whose interests in this operation were fully safeguarded by a British Treasury guarantee. Last December it was announced that the British Government had agreed in principle to extend the sterling credits to the Chinese Government by a further £10,000,000. Of this total, £5,000,000 was made available for financing Chinese purchases within the sterling area. This was a merchandise credit, and its proceeds were never placed at the disposal of the Chinese Stabilisation Fund. The balance of £5,000,000 was promised in the form of a Stabilisation Fund credit as soon as the necessary technical details for operating it had been worked out. It is this £5,000,000 which has now been credited, not to the Exchange Stabilisation Fund, but to the Stabilisation Board which is to take its place.

The establishment of the Stabilisation Board is a token of the concerted approach now being made by the Chinese, American and British authorities to the problem of monetary stability in China. The Stabilisation Fund was established to operate the fund fed by exchange contributions from Chinese and British sources. The Management Committee operating it consisted of three representatives of the Chinese Government, Mr. C. Rogers, of the Bank of England, and the managers of the two British banks which provided the initial contribution to the fund. Though the Committee must at all times have worked in close collaboration with the authorities operating the substantial United States dollar credits placed from time to time at the disposal of the Chinese Government, it remained essentially a Sino-British organisation. The Stabilisation Board, on the contrary, will crystallise the Tripartite agreement emerging out of the parallel monetary agreements signed at the end of last week. It will have three Chinese representatives, one nominee of the United States Treasury, and one member appointed on the recommendation of the British Treasury. Mr Rogers will hold this last position. The Board will co-ordinate the highly complicated task of Chinese exchange control with an effectiveness and unity of objective which was not possible under the former arrangements. It should, however, be realised that the exchange resources of the fund cannot be pooled and used as one homogeneous *masse de manœuvre*. Even in a free market such as Shanghai,

sterling remains a controlled currency and, unless the sterling that is being placed at the disposal of the Chinese Stabilisation Fund is given the attributes of ready convertibility into gold or United States dollars at the official rate, it will not mix readily with the United States dollars which will form the other part of the Fund's resources. Thus the dollar and sterling sides of the Fund will be operated separately—but under the control of one and the same authority.

The difficulties that must be faced in attempting the task of exchange stabilisation in China are formidable. In the first place, the efforts of those who are endeavouring to give the yuan some semblance of stability must be seriously hampered by the fundamental fact that far from the whole of the proceeds of Chinese export trade now reach the agents of the Government. The Treaty ports are in Japanese hands, but the leaks through their control, though they have been, and still are, considerable, are gradually being stopped. In the second place, the difficulties which the yuan is encountering in its

struggle for survival are increased by the fact that not only the enemy, but his fifth column are within the gates. Wherever the Japanese army pushes in, the military yen follows it. In the territories under Japanese control and governed by puppet authorities, local currencies have sprung up. The most important of these is that issued by the Central Reserve Bank which was established in Nanking last January and has since opened a Shanghai office. The difficulties of propping up a basically weak currency (as the yuan is, because of the Japanese control of the main outlets for Chinese exports) are increased many times when competing currencies are circulating side by side with it in its domestic market. The Japanese and their puppet Governments can to some extent force their currency into circulation, and in exchange obtain notes or credits expressed in terms of National Government yuans. If they offer these yuans on the open market, and if the Stabilisation Board, in performing its function of "checking undue fluctuations in the exchange value of the yuan," sells sterling and United States dollars against them, the exchange resources provided to support the yuan will, to this extent, merely have found their way into the coffers of the enemy.

Can this be avoided? In theory, it could be, provided an effective scheme of exchange control could be devised in China. If, for example, China could be brought within the scope of the British Special Account agreements as regards transactions with the sterling area, and if a similar technique could be applied to China's transactions with the dollar area, all would be well. But effective exchange control, which is difficult enough to operate under the most favourable conditions provided by the United Kingdom with its sea frontiers, would create a nightmare of difficulties in a country such as China, where it would have to be operated without the help of a highly developed banking system and where it would have its every move countered by the invader and his agents. In other words, the fact must be accepted that Shanghai, the centre on which the operations of the Chinese exchange control will have to be largely focused, will remain a free market. And this means a risk that some of the funds may be diverted to channels which

neither Great Britain nor the United States wishes to feed.

That risk cannot be altogether averted, however cautious and cunning the operations of the Stabilisation Board may be. It must be accepted in the cause of upholding Chinese confidence in the yuan. Under existing conditions the best way of averting this danger of diverting sterling and dollars into unwanted hands is so to underpin local confidence in the National Government's yuan that the efforts of the Japanese and their puppet Governments to oust it from circulation and to obtain considerable holdings of it meet with as little success as possible. It should be pointed out that hitherto the measure of success met by the new currencies in supplanting the yuan has been surprisingly small. The military yen enjoys a forced circulation which does little more than outlast the initial transaction in which it was thrust on an unfortunate and unwilling Chinese merchant or peasant. The circulation of the Central Reserve Bank remains very modest. Its notes, which began by circulating at par with the yuan, now command an exchange premium over the National Government's currency, but this is an artificial corollary of the attempts which have been made to link its exchange value to that of the Japanese yen. Provided the exchange value of the yuan can be held at about 3½d. this premium need cause no concern. In fact it will tend to favour the yuan as the basis of such export transactions as can still be financed in the free market.

The resistance of the yuan to the heavy odds against which it has had to contend has been unexpectedly tenacious and successful. Its exchange value, since the establishment of the Stabilisation Fund, has admittedly fallen in terms of sterling from 9d. to 3½d. But its hold on the loyalty and confidence of the Chinese population—even in the occupied parts of China—has not been shaken by this. The exchange stability of the yuan must, however, be held at around the present level if that confidence is not to be ultimately undermined. If Great Britain and the United States can purchase this stability and all it implies for continued Chinese resistance to Japan, at the cost of the new credits, they will have made an excellent bargain.

Electrical Equipment Shares

THE conclusions reached in an article on Electric Power Companies, in *The Economist* of April 19, form a natural point of departure for a consideration of the prospects of the equipment companies. Most of the leading companies in this section experienced great expansion between the two wars, but, although they are well past the troubles of adolescence, they are still far short of old age; the secular trend of the industry is still upwards and, in favourable circumstances, should remain so for a substantial period. A full measure of success for the industry depends on the possibility of further reductions in the real cost of electric power, both in this country and in numerous overseas markets, and upon the discovery of fresh uses for electricity. In considering the outlook, it is necessary to distinguish between the supply of heavy equipment for the manufacture, distribution and conversion of current, and the growing collection of lighter products for the home, the office and the factory, with the necessary accompaniment of detail distribution. While, however, this distinction must be kept in mind, most of the firms concerned do not restrict themselves to one side of the industry.

In the field of heavy equipment, an era of great expansion was well advanced at the outbreak of the war. Late as was this country in the field, the plans for the first section of a national grid had been carried out and a high percentage of factories was employing electricity for a variety of purposes. It is reasonable to assume that the erection of many new war factories has brought a further increase in this proportion, but saturation point has certainly not yet been reached, even in the field of heavy equipment. Further, the replacement of existing plant, and of the distribution network, must continue to be an important item. In the years prior to the war, the Empire and numerous foreign countries were taking a considerable and growing share in the total output. With the U.S.A. increasingly occupied with war work, it is difficult to see what alternative source of supply exists,

and, while this country will continue such exports as it may, the amount derived from here is not likely to be large. Granted that many potential customers will do their utmost to produce at home, it is scarcely probable that they will be able to manufacture the more elaborate

items of equipment, and there is reason to suppose that there will be large arrears to be made good once exports are freed.

Great as has been the expansion of output on the heavy side over the past two decades, it has been propor-

tionately greater in lighter products, which include, of course, a large and growing collection of domestic appliances. Here, overseas markets may be better placed to meet their own demand, but the demand will grow only slowly if heavy equipment is not obtainable to increase the distribution of power. At home, if it be conceded that, when war and essential reconstruction are finished, an increasing section of the community will be in a position to afford those labour-saving devices and luxuries for which electricity seems peculiarly adapted, there still seem very large fields for expansion. This takes no account of the virtual certainty of new uses. The one probable exception to this rule is the cable section, which will continue to be affected by wireless communication and, in some degree, by the replacement of waterborne by air mail.

With good prospects of further expansion, the leading companies have already established a reputation for conservative finance. The table on the previous page shows the movements of profits, before tax and depreciation where possible, and of dividends for eight companies, which afford a representative cross-section of the industry. It will be seen that while distributions have, on the whole, been steadily increased, profits have been the subject to the effects of trade depression, despite the marked expansion over the period. Profits are expressed in percentages of the average for the decade to facilitate comparison between one company and another, but they give only a rough approximation, because there is, in most cases, no means of assessing the treatment of important items by subsidiaries. Where gross figures are available, those for the past two years suggest that the impact of armament demand is considerable. After making due allowance for factors affecting English Electric in the early part of the period, and now happily removed, the picture presented is broadly similar for most of the companies, despite wide divergences in their scope. General Electric, possibly, casts the widest net, producing virtually all kinds of equipment as well as owning a supply company, a feature which it shares with Johnson and Phillips. The latter company and English Electric place the accent on heavy goods, while Associated Electric, with its subsidiaries, covers a very wide field. British Insulated specialises in cables and industrial equipment, with substantial interests in automatic telephones and copper refining. Callender's has kept mainly to its original business of cable and wire making, and had an almost world-wide system of branches and agencies, a fact which, perhaps, explains the recent setback. Crompton Parkinson represents mainly the lighter side, and Ever Ready a highly specialised section of it. All can and have adjusted type of output to changing conditions of demand.

The table below attempts to give a picture of the position of each company at the date of the latest balance sheet. The percentage of fixed to total assets appears low for the type of business and probably conceals hidden reserves. It is, however, affected by the very high level

of liquid assets, and, in particular, of stock-in-trade. The wide divergences in this item between companies are largely due to differences in date, for there has been a marked expansion during 1940 among all concerns working for Government account. No anxiety need be felt about this sudden rise, provided that it represents work under contract, but it seems that there has been some deterioration in the percentage of total liquid assets to near liabilities, given in the fifth column. For all companies, the general level of prices after the war will be the test of the adequacy of reserves, but, with the exception of English Electric, which was at one time the victim of indifferent finance, all the companies have ploughed back large sums over the past decade and some of them more moderate amounts over a lengthy period. With the exception mentioned, free reserves, including

carry-forward, range between 45 and 31.3 per cent of net assets. Differences of gearing are not great, except that for Associated and Johnson and Phillips the ratio of ordinary to total share and loan capital is very high. But, even in these cases, the cover of reserves is eminently satisfactory.

The average yield on electrical manufacturing shares was, according to *The Actuaries' Investment Index*, 5.68 against 6.42, for all industrial equities, at the end of March, and will not have altered greatly since then. The figures of the table show that the return obtainable on the leading companies places them in the category of gilt-edged equities. It is impossible to feel any confidence as to post-war price levels, or to guess what the official attitude will be towards those who take the risk of holding ordinary shares. These uncertainties, however, affect all equities, and, if the course of events is only reasonably favourable, the electrical equipment industry appears to offer opportunities for sound investment, if it does not promise a repetition of the almost spectacular rise in dividends and capital values which characterised the decade prior to 1940.

Finance and Banking

Fiduciary Circulation Raised

The expected adjustment of the fiduciary circulation to the long-term expansion in the demand for currency was made this week. The fiduciary total has been raised by £50 millions to £680 millions. As the active circulation rose by a further £899,000 over the week, the reserve of unissued notes increased by £49,101,000 to £56,892,000. At this level it should prove adequate to face any further increase in the demand for currency for some months. The Bank return's reaction to this increase in the fiduciary circulation follows the normal precedents. The £50 millions of Government securities backing the increase in the fiduciary circulation have been transferred from the Banking to the Issue Departments. As the additional notes which have now gone to swell the reserve in the Banking Department are withdrawn into circulation, the Bank will rebuild its depleted holding of Government securities, thus neutralising the otherwise contracting effect of the expanding circulation on the volume of bank cash. This process has already begun, for the Bank return shows a reduction of only £22,865,000 in Government securities. The process of rebuilding this item is thus proceeding much faster than the increase in the

circulation warranted. Consequently the volume of bank cash has expanded over the week, and bankers' deposits are up by £19,232,000 to the exceptionally high level of £131,754,000. This figure explains the considerable easing in the credit position which was apparent towards the middle of the week. With public deposits at only £13,648,000 on the eve of the May dividend distributions, it is probable that some further recourse to Ways and Means borrowing from the Bank was required in the second half of this week.

* * *

Treasury Deposits Top £500,000,000

The feature of the monthly floating debt return, showing the position on April 25th last, is the jump of £73,000,000 in Treasury deposits which has carried this item to £502,500,000. Otherwise there was surprisingly little change in the floating debt over a period in which it normally expands rapidly. The total of Treasury bills increased by nearly £24,000,000 between March 31st and April 25th, but a comparison of the "tap" and "tender" components of this total must cover the pre-

ceding two returns, as March 31st did not fall on a Saturday. Between February 21st and April 25th the issue of tap bills was almost stationary—moving from £1,369,430,000 to £1,370,380,000. This is a clear indication of the diminished rate at which the Exchange Equalisation Account lost gold and dollars during this period. The tender issue, on the other hand, has risen by £20,000,000 over this period. The usual monthly table summarising the returns of the financial year to date is given below:—

(£'000)			
Total ordinary expenditure ..	310,408	Total ordinary revenue	92,375
New sinking funds	326	Loans raised:—	
Loans repaid:—		3% Def. Loan 1934-38	45,721

Britain's Payments to Canada

The speech made this week by Mr. Isley, Canada's Minister of Finance, when introducing the budget for 1941-42, provided further interesting information on the balance of payments between Canada on the one hand and Great Britain and the United States on the other. The deficit which Great Britain was called upon to meet in its payments with Canada over the year to March 31st last amounted, according to Mr. Isley, to \$795,000,000. Of this, \$250,000,000 was met by shipments of gold, \$337,000,000 by repatriation of Canadian securities previously held in England, and the balance of \$208,000,000 by the accumulation of sterling balances in London. It is interesting to compare these figures with the data showing the transactions of the sterling area with Canada for the first sixteen months of war and the corresponding estimates for 1941 which were recently published in the United States. These showed a deficit of \$555,000,000 for the sixteen months to the end of 1940, of which \$330,000,000 had been met by repatriation of Canadian securities and increase in Canadian sterling assets. The British Treasury, which provided these figures, estimated that the corresponding deficit for 1941 would amount to \$880,000,000. It is evident from Mr. Isley's speech that the greater part of this will have to be financed by Canada by accumulations of sterling assets. He pointed out that British purchases in Canada during the new financial year would total \$1,500,000,000 and added that no gold had been transferred from London to Canada since last December, and that the dollars required for British purchases in Canada were being provided in full by the Canadian authorities. The counterpart of this considerable help will either have to be accounted in special inter-Treasury transactions or will lead to an enormous growth in Canadian sterling funds seeking investments in the open market. The choice of method made by the two Governments concerned will be a matter of considerable importance to the London money market. As for Canada's deficit in its payments with the United States, this amounted to \$478,000,000 in the year to March 31st last. This figure will no doubt grow considerably in the current year, but the problem of financing it has probably lost some of its urgency as a result of the new arrangements with the United States for the exchange of war materials.

The Thaler Returns to Abyssinia

With the departure of the Italians from Abyssinia, the silver Maria Theresa thaler is returning to general circulation in that country. Large quantities of this traditional currency had gone to earth following the Italian invasion and the forced introduction of lire notes into circulation. The invader had decreed a rate of exchange of 4.50 lire to the thaler, and as the inhabitants instinctively felt that this ratio grossly overvalued the new notes, Gresham's Law rapidly came into play and

the bad currency drove out the good. Meanwhile, however, the supply of thalers has been fed by considerable minting of these coins, not only in the Italian mint, which obtained the original dies from Vienna, but in Britain, France and Belgium. The demand for this currency did not only come from hoarders in Abyssinia, but from contiguous territories in Africa and from Arabia and Aden as well. The thalers minted in this country were responsible for part of the coinage demand for silver which made itself felt in the London market on many occasions during the course of last year. These supplies of new coins have already made their way into the country in the course of the Patriot operations. Fresh supplies are now being brought into the country by more direct and open channels. They have been given a sterling rate of 1s. 10½d.—dictated largely by their silver parity, and are being exchanged for lire notes at the rate of 45 lire to the thaler.

War Damage Insurance

Information concerning the *modus operandi* of Part II of the War Damage Act, relating to the insurance of goods, has been issued by the Board of Trade. The business scheme, which is voluntary for manufacturers and traders with plant, machinery and equipment worth £1,000 or less, and compulsory above that figure, came into operation on April 17th; the private chattels scheme, which is voluntary irrespective of the value of the chattels, takes effect from May 1st. In both cases thirty "days of grace" are allowed within which application for insurance must be made, and the cover will apply retrospectively from the date of outbreak of war, subject to deduction from the claim of the premium which would have been paid if the insurance had been in force. The schemes will be worked through the fire insurance companies and Lloyds, acting as agents of the Board of Trade. There will be no free insurance under the business scheme, but householders who fail to effect insurance under the chattels scheme will be covered up to £200 if single or £300 if married, with an extra £25 for each child under sixteen. The rate of premium for the business scheme will be 30s. per cent., covering the period to September 30, 1941; the insurance must be effected for "full value," that is to say, for replacement value less depreciation, and any manufacturer who insures for less, apart from committing an offence, will under the terms of an "average" clause receive only a *pro rata* proportion of the loss. For cover under the chattels scheme, over and above the free insurance, the rates will be £1 per cent up to £2,000, 30s. per cent for the next £1,000 and £2 per cent for a further £7,000, the maximum sum for which protection can be secured being £10,000; these rates are for a period of one year from the date the insurance is effected. Under this scheme insurance will be on a "first loss" basis, and there will be a limit to the amount which can be recovered in respect of valuables of £100 or 20 per cent of the sum insured, whichever is the greater, as well as a limit on any single article (excluding motor cars) of £50 or 5 per cent of the sum insured, whichever is the greater; where no insurance is effected the limit in respect of any one article is £25. In general, payment under both schemes will be deferred until after the war, interest accruing at 2½ per cent, but earlier payment may be made under the business scheme if the total amount of the claim does not exceed £100; or the Board of Trade are satisfied that the replacement or repair of the goods is expedient in the public interest, and, under the private chattels scheme, if the total amount of the claim does not exceed £25; or the Board of Trade are satisfied that the payment in whole or in part should be made to avoid undue hardship. This brief outline does not embrace the insurance for farmers, for whom special arrangements have been made, and it should be mentioned that in the case of very small businesses, with equipment not exceeding £100 in value, this is insurable under the chattels scheme.

These schemes of insurance very largely meet the public needs, and have clearly been designed to satisfy conditions of easy workability; they have been thoroughly debated in Parliament, and it would be out of place to offer criticism at this stage. None the less, there are certain anomalies to which reference might be

made. The Government have been much impressed with the difficulties of obtaining accurate figures of the value of goods to be insured, so much so as to have considered them an insuperable obstacle to the application of compulsion to small businesses and to households irrespective of size. These same difficulties, however, are encountered when considering the question of whether the insurance should be for "full value" or on a "first loss" basis, since in order to apply an "average" clause it is equally necessary to arrive at accurate assessments of the value of goods. There is thus evidence of inconsistency in making the insurance of goods worth £1,000 or less voluntary under the business scheme, at the same time requiring the insurance to be for full value; if it is possible to ascertain the value in order to apply average there should also be no barrier to insistence on insurance being compulsory, at least at a much lower figure than £1,000. The disadvantage in not so doing is, of course, that there will inevitably be a preponderance of applications from the more hazardous areas. Concerning the premiums for the chattels scheme, which, strictly speaking, is not a "first loss" but an "excess" arrangement, there is the curious feature that the rate increases with additions to the sum insured, although the risk obviously diminishes; this will deter many people from insuring for full value, deeming the premiums asked

excessive in relation to the relatively small risk of total loss. In regard to the provisions for immediate payment where the total amount of the claim does not exceed £100 under the business scheme or £25 under the chattels scheme, it would seem more equitable to pay all claims up to these limits, otherwise the person who suffers lightly recovers all his loss whereas the person suffering heavily recovers nothing. Notwithstanding that the insurance provided under the War Damage Act is in the nature of a social service, presumably some attempt will be made to balance income and outgo. In this connection there is provision in the Act for the annual compilation of figures of receipts and payments in such form as the Treasury may direct, the figures to be laid before Parliament. It is highly desirable, if these statistics are to possess any value as a basis for future premiums, that the various sections shall be carefully segregated; in the business scheme, for example, the figures for the voluntary insurance should be kept separate from those for the compulsory insurance, and similarly in the chattels scheme the accounts for the voluntary section, as well as being kept distinct from the free section, should be subdivided into the various groups for which different rates apply. Some kind of a classification by districts would also be invaluable when the results of the insurance come up for debate.

Investment

Prospects of Recovery

Another week of apathy on the part of investors has left the general level of prices much where it was. Daily fluctuations have, in general, been moderate and, in the Funds, compensatory for some time past. The indices of *The Financial News* show movements on the month which leave fixed interest stocks a shade higher and equities some 1.35 per cent lower. The general appearance of the curve for the latter suggests that the next major move should be upward. It may, however, be deferred for some time. The public, as citizens, appear to be prepared for a good deal more news of the sort which the past fortnight has brought, and there is reason to suppose that, as investors, they have discounted further reverses. The effect of reinvestment must, from now on, make itself increasingly felt, and there is not likely to be any pressure to realise at these

trial concentration puts a term to the period of doubt as to the methods to be adopted. News in either of these fields will give the investor a less uncertain basis for calculating values. The circumstances continue to suggest some rise in the Funds with a narrowing of yield margins throughout the list.

Recession in Savings

Figures of savings for April, so far as available, make a disappointing showing. Those given in the table below, taken in the main from the monthly Exchequer returns, show that, after the spurt of February and March, there has been a definite setback in small savings. Still, with the exception of March, the April average is the best since November, and the actual fluctuation is not abnormally large. This cannot be said of receipts from 2½ per cent National War Bonds and 3 per cent Savings Bonds, which are down by some 32 per cent on the month, to a level well below the average for the old 2½ per cent War Bonds alone for the second half of 1940. No doubt the fall owes a good deal to the fact that conversion of Deposit Receipts has fallen off, but, if the total contains nothing on this account, an annual rate of less than £700 millions is not a matter for complacency. It would probably be a mistake to suppose

that the fall in either section could properly be attributed to the increases in taxation announced at the beginning of the month. It is possible that the prospect of having less to spend later—coupled with some remaining doubts as to the maintenance of the existing price level—has tended to stimulate expenditure in the past month. It is, however, at least equally probable that any stimulus to spending, which has arisen, comes from the knowledge that, shortly, there will be far less to purchase. In either case, the factor should not be long lived. A force which may have had some importance in reducing actual applications, but not in diminishing

prices, except in case of necessity. Somewhat tardily, the Government is taking steps designed to reduce distress selling. With equity prices, in general, less than 5 per cent above the level of early September, when, in the public eye, the result of the Battle of Britain was not a foregone conclusion, the mere absence of news worse than is expected may well suffice to permit a recovery. The near future can hardly fail to bring more news of the Chancellor's EPT concessions, while the fixing of dates for the presentation of schemes of indus-

savings, is a desire for exceptional liquidity at a time of acute uncertainty. Also, over the extensive field where the increase in income tax is immediately effective, this would, of itself, account for some decline in saving, which ought again to be only temporary. Over a very wide portion of the field of small savings, the increase does not become operative for six or eight months, and a great effort is necessary at once if the result is to be even moderately satisfactory from the standpoint of the Exchequer.

Corporation Repayments

On Tuesday, nineteen of the twenty-three corporations listed on page 383 of *The Economist* of March 22nd, gave formal notice of repayment of loans maturing, in eighteen cases, on August 1st, and in that of Stoke-on-Trent three months later. A twentieth, Birkenhead, had already given notice to pay off half the amount outstanding, and will redeem the remainder out of its resources later this year or next. The other nineteen are, in fact, all making offers of conversion of the whole or part of the maturing stocks, it being understood that, in most instances, there will be some funds available for repayment out of the resources of the borrower. The Treasury has, in any case, undertaken to find any money required for such repayments, and the division of this sum between the borrower and the Exchequer is not a matter of the first importance to investors. The twenty operations cover a gross amount of stock of some £24,250,000, leaving three loans to be dealt with, namely £3,000,000 of Birmingham, £3,500,000 of Liverpool and £2,000,000 of Sheffield, all carrying 5½ per cent, the first two repayable October 1st and the last on six months' notice. The new stocks offered carry 3½ per cent repayable 1960-70 in every case, which the market still finds attractive. As already stated, the lists will remain open for conversion until a month before the maturity of the old stock, unless previously closed, because conversions have absorbed the whole of the new stock offered. Details are not yet available as to the amount of the latter in all cases, but the table below gives the figures for fourteen issues. It will be seen that, in all, ten corporations are providing £3,750,000 towards the liquidation of some £15 millions of debt. Business in the maturing loans will cease on July 1st—three months later for Stoke—and dealings in the new stock will presumably commence only on that day.

Stock Exchange Reform

With a month still to go before the date at which they come into force, the new regulations of the London Stock Exchange, for the ordering of relations between itself and the two outside bodies, the Associated Stock Exchanges and the Provincial Brokers Stock Exchange, are still some way from securing the general agreement for which it is hoped. London has confirmed the changes, after minor modifications, and they have been accepted by all but one of the leading provincial exchanges. But some of the latter and the PBSE, which consists of individual brokers attached to no exchange, are holding out in the hope of obtaining better terms. While it is diffi-

cult to follow the reasoning of the smaller provincial exchanges, it is easy to sympathise with many of the individual brokers who perform a useful service in the small towns by disseminating information and acting as collecting agencies for business. They must, however, be prepared to face the fact that they, still less than the provincial exchanges, cannot exist by themselves; that they have not the responsibilities imposed by the expense of maintaining an exchange, and that the requirements for membership have, in the not distant past, been very elastic. The new regulations do not appear to damage them directly. They merely treat them less well than members of the Associated Stock Exchanges. There appears to be no means of immediate escape from the disabilities under which this group of brokers labours, but a further tightening up of conditions of membership, and an agreed limitation of spheres of influence between them and the Associated might lead to an early improvement in their status, to the benefit of all concerned and particularly of an important section of their own membership.

Company Notes

William Beardmore Profits

In 1940, the second year since the capital reconstruction, William Beardmore profits after depreciation and tax, except Schedule A income tax, declined from £513,674 to £375,094. After meeting normal expenses and prior charges, the surplus for ordinary capital dropped from £431,100 to £298,635, at which level, however, it represented a rate of 60.2 against 71.7 per cent and continued to provide a generous margin for the ordinary dividend of 10 per cent, paid for the second year in succession. After allocating £200,000 to war contingencies against £300,000 to general reserve, the carry-forward is raised from £166,147 to £215,145. There is no doubt that the company's plant has continued to run at capacity during 1940. Work in progress, less instalments received, is up from £1,312,646 to £1,942,625, including, as the auditors point out, certain Government contracts valued at estimated prices. Stocks have risen from £549,613 to £717,724. The high pitch of activity maintained last year, together with the acquisition of £91,800 of Government securities, has sharply reduced cash resources from £110,212 to £2,862. Moreover, a bank overdraft of £63,888 has been incurred, and, despite a fall in debtors of some £48,000, sundry creditors have risen by nearly £400,000 to £1,432,816. Total reserves, less £160,000 for preference dividend reserves, stand at £866,629, including depreciation of £366,629 against fixed assets of £1,698,815. It is clear that William Beardmore will be fully employed during the current year and that, as the directors pointed out in the previous report, little opportunity will be available for carrying out repairs. In the circumstances, it is especially to be regretted that stockholders are given no opportunity of knowing whether depreciation is adequate. The company's shortage of working capital is inevitable, and will, in all probability, be an entirely temporary condition. Net profits fell in 1940, mainly owing to EPT, and will tend to decline still further as taxation and costs rise, but there is every probability that the ordinary dividend can be maintained. The £1 ordinary stock, at 19s. 1½d. ex dividend, yields £10 9s. per cent.

* * *

William Whiteley Scheme

William Whiteley, the Bayswater store, have severed their connection with the Selfridge interests, and the holders of the 25 per cent ordinary capital have accepted a composition in respect of what remained of the latter company's guarantee of their dividend. The directors of Whiteleys now propose a scheme of capital adjustment, under which all special rights would be abandoned and the £450,000 of 25 per cent ordinary capital would rank *pari passu* with £22,500 of "A" deferred and £27,500 of "B" deferred shares. Of these, the bulk of the former are said to be in the hands of ordinary shareholders, while the latter have been taken over by those now in control. While the Selfridge guarantee of 25 per cent to holders of the ordinary was due to expire next year, their right to receive that sum,

out of 37/40ths of the available profits, did not, and what the directors are, in fact, suggesting is that holders of these shares should abandon the whole of their cumulative rights and receive in compensation a participation in profits in excess of 25 per cent, from which they are at present debarred. Over 10 per cent was earned on the ordinary capital during the quinquennium 1934-38, whereas nothing was paid on the deferred, so that the former would seem to be entitled to some preferential or cumulative right. Past performance suggests that profits of 25 per cent are highly improbable and that compensation by this means is likely to be long in materialising. In putting forward their scheme, the directors state that it will benefit holders of the ordinary capital more than the granting of any reasonable cumulative rights, but what is reasonable must be determined, in part at least, by existing rights. Although the amount of dilution threatened is slight, the principle of concessions without real compensation is faulty. If the new management feel, as they very well may, that the reward promised by their holding of "B" deferred capital is too small, they would be justified in demanding a percentage on any increase in net profits above those of the period 1934-38.

West African Anxieties

The recently issued reports of *Gold Coast Selection Trust* and of two of the mines in which it has a substantial interest, *Marlu Gold Mining Areas* and *Amalgamated Banket Areas*, provide much information as to the influence of war conditions on West African profits. The three companies have adjusted their financial year to September 30 so that the periods covered by the latest accounts are 18 months for *Gold Coast Selection* and *Amalgamated Banket* and 14 months for *Marlu*. In all cases, the profits position is somewhat disappointing. *Marlu*, with total income at £886,011, only slightly above the £880,531 earned in the 12 months to July 31, 1939, is liable for an increase in tax liability and directors' additional remuneration from £100,000 to £342,000. The total dividend of 10 per cent less tax against 25 per cent tax free is not completely covered by equity earnings at 9.0 per cent. *Amalgamated Banket*, not yet in full production, was forced to borrow £360,266 for further development from *Gold Coast Selection*. Despite an increase in gross receipts from £248,254 for 12 months to £387,386 for 18 months, a steep rise in mine expenses from £170,092 to £282,860 is responsible for a deficit for ordinary capital of £20,132, against a surplus of £21,076. The failure to pay a final ordinary dividend is mainly responsible for the drop in total earnings of *Gold Coast Selection* from £374,183 in a year to £266,754 in 18 months. The ordinary shares of the trust receive 10, against 15, per cent tax free. It is satisfactory that the chairman, Mr H. G. Latilla, is able to state that quoted investments—mainly in five leading West African mines—with a nominal value of £1,345,382 stood at a market valuation in London on April 22, 1941, of £2,125,000. West African gold mining has a number of important difficulties to contend with in the immediate future. Since most of the mines are very newly developed, much plant has still to be acquired at inflated wartime costs and to be transported at exaggerated freight and insurance rates. The mines are exceedingly ill placed from the standpoint of EPT. Moreover, there is always the latent possibility that hostilities

may develop in the vicinity, which might mean loss of dividends for some years. The 5s. ordinary shares of *Gold Coast Selection*, at 8s. 9d., offer a yield of £5 17s. 7d. per cent tax free. *Marlu* 5s. shares, at 4s. 6d., yield £11 15s. 3d. per cent.

Rubber Company Results

The results of four typical rubber companies, whose profits are analysed in the following table, indicate that net earnings during 1940 have, in general, shown a considerable improvement on those of the previous year, to which, owing to shipping problems, palm oil output made little contribution. Of the four selected companies, those operating in Malaya, *Highlands* and *Lowlands* and its offshoot *Ayer Kuning (F.M.S.)*, have shown less spectacular improvement during the past year, partly because they were already in a more profitable trading position. The two Sumatra companies, *Sungei Buaya* and *Ampat (Sumatra)*, show a remarkable increase in equity earnings, and both these companies have raised the payments on ordinary capital.

Company (years ending December 31)	Total Profits	Earned for Ordinary		Dividend	Present	
		Amount	Rate		Price	Yield
<i>Highlands</i> :						
1938	74,823	22,126	9.0	5	21/3*	9 8 2
1939	82,726	22,544	11.7	10		
1940	111,558	27,942	18.0	10		
<i>Ayer Kuning (F.M.S.)</i> :						
1938	38,444	8,596	8.5	6	23/0*	8 8 4
1939	43,539	9,872	11.3	10		
1940	58,424	12,082	17.3	10		
<i>Sungei Buaya</i> :

1940	50,769	17,756	16.7	6 1/2		

* Ex dividend.

The improved results are, of course, largely due to the rise in the average release permitted by the International Rubber Regulation Scheme from 47 1/2 to 72 1/2 per cent in the case of the Sumatra companies, whose year runs to September 30th, while the others enjoyed a release of 82 1/2 per cent of standard production. The rise in output was, in general, sufficient completely to absorb the year's increase in costs and the average selling price of rubber was approximately 1d. per lb. above the 1939 level. All companies have liberally increased allocations to estate reserves: *Highlands* from £3,000 to £10,000 and *Ampat (Sumatra)* from £3,000 to £8,000. Higher taxation has been a heavy charge on increased profits and, although none of the companies discloses the total payable in various forms of taxation, *Highlands* is raising the allocation to tax reserve from £13,000 to £20,000, while *Ampat* is transferring £6,000 against nil for the same purpose. It is, of course, becoming increasingly difficult for companies in the East to carry on direct trade with the United Kingdom, but the determination of the United States to continue the creation of a substantial reserve stock should go far to compensate for the loss of European markets during the current year. At present prices, which have suffered in the general setback of recent weeks, yields are high, ranging between £8 and £17 per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

MARKETS remained generally firm during the present week, although business was on a small scale. Buying was concentrated in the gilt-edged market, but the industrial section was also more cheerful than of late. Commodity share markets turned dull on fears of an extension of the combat area. Despite the encouragement derived from the Prime Minister's week-end speech, and the considerable volume of money awaiting investment, business and military uncertainties prevented dealers from entering into large commitments.

The gilt-edged market, which closed last week quietly steady, enjoyed a modest rally on Tuesday, and a number of gains were followed up in midweek. Demand was assisted by the repayment of LCC 5 per cent stock, 1940-60. The market was led, on Tuesday, by 3 1/2 per cent Conversion, which gained 1/8. Four per cent Consols and 3 1/2 per cent Consols 1/8. Later in the week, demand continued to be centred on undated investment stocks. The foreign bond market moved somewhat irregularly. After some weakness on Monday, Greek issues enjoyed moderate support, despite the German invasion, on hopes that the next coupon presentations will be honoured. Egyptian Unified were

firm, gaining 1/4 point on Tuesday. Chinese bonds attracted some attention, and Japanese issues were sold in a small way, the 4 per cent issue of 1899 and the 5 per cent issue of 1924 losing 1/4 on Tuesday. Elsewhere in the market there was little business.

Home rail issues remained firm, although few quotations were altered during the week and business was exceptionally small. Among the ordinary stocks, Great Western fell 1/4 on Monday, while LMS gained the same amount the next day. Before the week-end, some selling of London Transport "C" stock and of the senior issues was

(Continued on page 599)

Industry and Trade

Progress of Concentration

Necessary though it is to eke out resources of labour and factories, the concentration of the production of consumption goods is beset with difficulties. On the whole, however, it appears that progress is being made with the task. It is understood that schemes have been submitted to the Board of Trade by firms which employ about 25 per cent of the labour force in industries covered by the Limitation of Supplies (Miscellaneous) Order. In order to speed up concentration, Mr. Oliver Lyttelton, President of the Board of Trade, has now fixed definite time limits for the submission of voluntary schemes. For the industries covered by the Limitation of Supplies (Miscellaneous) Order these dates are as follows:—

May 17th	May 24th	May 31st
Toilet preparations	Toys	Fountain pens
Gloves (except wool-linen knitted)	Lighters	Pottery
Photo goods	Umbrellas	Cutlery
Sports goods	Plastics	Jewellery
Musical instruments	Combs	Linoleum
	Carpets	Leather goods
	Lace	Corsets
	Hosiery (incl. woollen knitted gloves)	Braces

(Continued from page 598)

evident. In the foreign rail market, Argentine issues were generally offered. Canadian Pacific was in steady demand, the preference issue gaining 1/4 on Tuesday, followed by 2 points in mid-week.

The industrial market displayed considerable buoyancy, although turnover was not large. The demand for heavy industrials continued to be good, and many leading issues, including Baldwins, Bolsover, Guest Keen, Sheepbridge, and Stewarts and Lloyds improved by a few pence. Among miscellaneous industrials, Murex attracted attention, and among breweries, which generally remained steady, Distillers showed improvement. Motors and aircraft were moderately favoured, in particular Raleigh Cycle Holdings and Rolls Royce. There was little business in the textile or tobacco sections. Electrical supply preference issues were in demand, but jobbers continued to be short of stock. Cable and Wireless preference rose 1 1/2 on Monday, followed by a further 1/4 point the next day.

In the commodity share markets, the main features were a steady selling of tin and rubber shares in an attempt to discount the possible spread of the war to Malaya. Among tin shares, such market leaders as Mawchi, Tronoh and Malayan Tin Developments suffered. Among rubber issues, Pataling and Glenshiel lost 1s. 3d. on Monday, although the latter recovered 7 1/2d. the next day. Tandjong and Kepong also suffered. At the beginning of the week, kaffirs were firm, but turnover slight. Later, a number of issues, including City Deep, Durban Deep, E. Daggas, Springs and Western Reefs showed some improvement. *West African* issues turned dull on the results of *Gold Coast Selection* and the associated companies, and, among copper shares, Rhokana was sold on the reduction of the interim. Oil shares withstood the threat constituted by deterioration of the military situation in the Middle East with considerable firmness. Before the week-end, both the ordinary and preference issues of Anglo-Iranian improved, and Attock, Burmah and Trinidad Petroleum Developments all gained ground. This week's support for Anglo-Iranian ordinary continued, although the preference issues, as well as the Shell Transport preference stocks, reacted moderately.

The list does not include cotton and wool textiles, footwear and paper, for example; for these industries concentration is being carried out with the assistance of the raw material controllers concerned. In the case of the cotton industry, for example, May 15th has been fixed as the limiting date for the submission of voluntary schemes in the spinning section and May 27th in the weaving branch, while the textile finishing trades have been given time until June 10th. Firms that fail to formulate schemes by these dates will presumably have to accept arrangements made for them by the Government.

Control of Factories

The appointment of Sir Cecil Weir as Controller-General of Factory and Storage Premises has now been supplemented by the appointment of Sir Thomas Barlow as Deputy Controller-General and Factory Controller and of Mr Philip Warter as Storage Controller. There are also to be ten regional controllers, of whom nine have already been appointed, and to whom a very wide

New York

AGAIN this week, taxation and labour fears combined with anxiety regarding the course of the war to maintain business at a very low level on Wall Street. After a slack close before the weekend, volume improved somewhat on Monday, and sentiment was encouraged by the tone of Mr. Churchill's overnight broadcast. Price movements, however, continued to be irregular, and no definite trend developed. There was intermittent support for steel and chemical issues, and General Motors, General Electric, International Nickel and U.S. Steel all enjoyed fractional gains at the beginning of the week. On Wednesday, markets were dull and many leading issues were subject to selling pressure.

The *Iron Age* estimates steel mill activity at 94 per cent of capacity, against 96 per cent last week, to which it had declined from 98.5 per cent.

discretion is to be delegated. A register of factory and storage premises is being compiled, and the factory section is expected to be ready in about a month. It will contain all the particulars necessary to show which premises can most readily be made available for other purposes, and the particular purposes for which they are most suited. After a date to be announced shortly, all requisitioning of premises by Government departments will be subject to the consent of the Control, so that it can be regulated. The Control, in allocating premises, will bear in mind the importance of securing the rapid resumption of production and the importance of wide dispersal of storage premises. There is to be close collaboration with the Ministry of Labour, since it is of the utmost importance that departments requiring premises should be given them in districts where there is a supply of labour suitable for their purpose. The Control will not provide premises for private persons, but will issue permits to private persons engaged on production for Government departments, if their application is supported by the department on whose behalf they are working. An Order is to be issued to prevent unauthorised transfers by private firms to other premises, and meanwhile the Control appeals to them to stay where they are, and warns them that by moving otherwise than under permit from the Control they run the risk of finding their new premises requisitioned at any moment. This machinery seems well designed to secure the best use of available accommodation, if only its working can be kept free from red tape. If, on the other hand, the familiar delays occur at every stage of the process involved in applying for and obtaining new premises, it has formidable possibilities of wasteful obstruction.

* * *

First Aid for Bombed Houses

In recognition of the urgent desire felt by every bombed-out person, however luxurious his temporary accommodation, to return to his own home, the Government has established an effective priority for repairs to damaged houses and an effective system for carrying it out. The responsibility for all such repairs rests with the local authorities, and the responsible Government department is therefore the Ministry of Health, which works in collaboration with the Ministry of Works and Buildings. The latter Ministry directly employs emergency building squads, comprising some five thousand men who were taken out of the Army at the time of the first Coventry raid. Somewhat more than half of these are in London, the rest are in the provinces, where they are moved from town to town as the need arises. In London there are fifteen depôts, equipped with tools and materials, and the men are organised in squads about a hundred strong. When any local authority is overwhelmed by the amount of repairs to be done, it approaches the Ministry of Health, which appeals to the Ministry of Works and Buildings for the help of these squads. Their work is strictly confined to first-aid repairs; decorations and other work not strictly necessary to render the building habitable are not permitted, for the great object is to rehouse people as quickly as possible and to prevent further damage by the weather. Already the time lag has been very greatly reduced.

*

Invaluable as this squad system is, it cannot tackle more than a small proportion of the work to be done. The bulk is done by the local authorities through ordinary building contractors. The Ministry of Works and Buildings has an Emergency Repairs Department whose job it is to organise the employment of contractors for this purpose. With the consent of the contractor and of the person to whom he is for the time being under contract, the whole unit is switched off when necessary on to first-aid repairs for bombed houses. The difficulty here is the contractors' fear of reprisals from their more powerful customers, but the Government has appealed to the public to be reasonable in this matter, and will if necessary take steps to protect contractors against disgruntled customers. Public opinion would be so overwhelmingly against any individual or company which sought to put its private improvements before the needs of the homeless that such protection should not be difficult. Already the building contractors' organisations in Greater London have made a willing response to

the Government's appeal to hold themselves ready to give assistance, and an appeal has now been made to the contractors outside the organisation to do likewise. A similar system is being adopted for the provinces, where the problem is much less acute and complicated.

* * *

Distribution of Consumption Goods

Among the many inevitable difficulties arising out of the limitation of supplies are two which are capable of adjustment, and these are at last receiving a measure of attention. Evacuation has so completely altered the relative needs for goods in different districts that adherence to a pre-war basis for quotas leads to acute shortage in reception areas and relative abundance in evacuation districts. This is particularly marked in the case of children's clothing, since the majority of evacuees are children, but there is also a general shortage of children's clothing which threatens to become acute, because, although there was far less scope for economy in children's wear than in that of adults, the same quotas were applied to both. There is less scope for wartime economy, both because more economy is exercised in children's than in adults' clothes in peace time, and because the growth of children sets a much more rigid limit to the length of time they can wear their clothes. Already big stores which normally carry heavy stocks are completely sold out of certain sizes of even the most essential garments, and the small shops are in even worse case. The President of the National Children's Wear Association, at a recent meeting called to discuss this situation, said that the state of available stocks was far worse than was generally realised and that unless the Board of Trade and the Ministry of Supply took action the situation next winter would be critical. He suggested that 2½ per cent of the adult quota should be transferred to children, and, failing that, that all clothing for children up to the age of fourteen should be decontrolled. So far the only action taken by the Board of Trade in this matter has been an appeal to manufacturers not to concentrate on adult lines. To meet the local shortages of goods other than foodstuffs caused by evacuation, the Board of Trade has issued to Trade Associations confidential suggestions based on population movements, as a guide to wholesalers in scaling up or down their supplies to particular areas. These gentle admonitions might have sufficed to tide the country over a short war. Most people are now accepting the fact that the war is likely to last long enough to require much more drastic measures, and the sooner these are adopted the better. To parents who are unable to find mackintoshes, school trousers or winter gloves for their children, it is infuriating to see in shop windows costly nightdresses embodying hours upon hours of labour, and to read in the daily papers articles showing how, by the exercise of great ingenuity and the purchase of a good deal more material, a really patriotic young woman may achieve the egregious sacrifice of wearing part of a dress or suit for a second season.

* * *

Shipowners Close Their Ranks

The Chamber of Shipping and the Liverpool Steam Ship Owners' Association have decided to arrange for closer collaboration in order to ensure "unity of action and policy on questions of major importance to the industry as a whole." A General Council of British shipping, representative of both organisations and of all sections of the industry—liner, tramp, coasting and tanker—is to be set up forthwith. Its functions are to include the co-ordination of the views of the different sections of the industry. In addition, it is proposed to set up a Liner Committee representative of the interests of the two organisations. So far as tramp vessels are concerned, the industry already has the requisite organisation in the Standing Committee of the deep-sea tramp section of the Chamber of Shipping. Mr. D. Maurice Hill, the general manager of the Chamber of Shipping, and Mr. Martin Hill, a joint secretary of the Liverpool Steam Ship Owners' Association, have been appointed to act as joint secretaries of the new General Council and Liner Committee. In view of their criticism of certain aspects of the Government's shipping policy, the closing of the shipowners' ranks is not surprising.

Animal Rationing

The Ministry of Agriculture has made various changes in the rationing regulations for the May-July period. Farmers must register in advance with not more than four distributors, and must deposit their coupons within fifteen days of issue. Supplies are so limited that the summer ration scale must be fixed with the greatest economy, but because of the backwardness of the grazing season, dairy cows will be given an allowance of ¼ cwt. of concentrates in May, with an additional ½ cwt. in Scotland and certain northern English counties. The value of the ration unit, which had been temporarily reduced in April, is to be restored to 1 cwt. Home-grown grain stocks on farms are not taken into account in fixing the summer rations. No coupons will be given in exchange for grain sold after the end of April, but farmers who have given undertakings to sell grain must fulfil them. Dairy cows may, on application, receive allowances for May based on their production in March. These range from 28 lb. for a cow averaging 1½ to 2 gallons per day to 56 lb. for a cow averaging over 2½ gallons. Special food for calves under six months is available at the rate of 42 lb. per calf per month, in order to economise milk. Rations are also provided for young pedigree bulls; stall-fed cattle which are not yet marketable; goats with a yield of over six pints a day; kids being reared for milk, pedigree ram lambs; pigs; poultry and horses used for agricultural purposes where there is insufficient food on the farm. These rations are in all cases designed only to supplement the food which farmers have constantly been exhorted to grow for themselves, or in the case of poultry and pigs, to supplement kitchen scraps and swill. It must be clear by now to every farmer that only by aiming at the highest possible degree of self-sufficiency will he be able to carry any substantial proportion of his stock through next winter.

* * *

Diamond Trade Difficulties

For the first time in the history of the international diamond industry steps have been taken in London to finance uncompleted export transactions of cut and polished diamonds. Hambros Bank has agreed to advance between 60 and 70 per cent of the value of finished diamonds exported from this country under Board of Trade licence to North American destinations. The remaining 30 to 40 per cent are paid to the exporter after the final sale of the stones. These facilities will greatly help the recently enlarged British diamond cutting and polishing industry, which naturally has not so far been able to accumulate the necessary reserves to finance its

transactions over a longer period. The credit scheme will assist British exporters in securing good prices in the United States, where in the past, sales at the first opportunity have often been necessary. British exporters should have no difficulties in obtaining favourable prices for their finished stones in North America as the supply of cut and polished diamonds has been seriously curtailed through the German occupation of Belgium and Holland, which normally are responsible for over 90 per cent of the world's cutting and polishing transactions. The extension of the cutting and polishing facilities in the past twelve months in Great Britain, the United States, South Africa and Palestine has not been very impressive, for supplies of skilled diamond workers outside the German sphere of influence are very restricted and the training of these workers requires many years.

*

Meanwhile the restricted cutting and polishing facilities are keeping down sales of raw diamonds. At the London "sights" in the first four months of this year only about one-third of the pre-war turnover has been achieved, although recently sales of industrial diamonds, prices of which were reduced by 20 per cent in April, have been fairly large. As normally industrial stones cover two-thirds of the quantity but only one-fifth to one-quarter of the value of total diamond sales, the comparatively large sales of industrial stones cannot counterbalance the declining sales of luxury diamonds. Consequently the position of the diamond mining industry for the remainder of this war will continue to be strained, and it is not surprising that all mines in the Kimberley district of South Africa have been closed down, while production in the other diamond fields of the world has been substantially curtailed. It is true, in addition to the London sales, some parcels of diamonds have been shipped directly to the United States from South Africa in recent months, but endeavours to transfer the chief selling centre of the industry from London to the Cape or the United States have so far failed. Even Brazil, after withholding its shipments to Great Britain during the greater part of last year, returned to the London market early this year. Whether the position will be changed in future remains to be seen. At any rate the bulk of the Diamond Corporation's stock of diamonds, which forms the chief basis of current sales, is kept in London. Moreover, the difficulties of the international diamond industry are in no way connected with the fact that London finds itself in the front line of the war, so that little could be gained, while a well-running selling organisation would be lost by any transfer of the diamond syndicate from London to another centre.

COMMODITY AND INDUSTRY NEWS

TIN prices have been easier, following lower prices in the United States, and the Ministry of Supply's lowered cash selling price. Standard cash closed at £269 5s.—£269 10s. per ton on Wednesday, compared with £270 15s.—£271 a week earlier. The three months quotation was £266 15s.—£267 per ton, compared with £266 15s.—£267. The latest dates for submitting voluntary arrangements for the concentration of industry have been announced by the President of the Board of Trade for some industries.

Rubber Controller.—The Ministry of Supply has announced the appointment of Sir Walrod Sinclair as Rubber Controller. It is understood that the appointment will not affect the position of the rubber market, at any rate for the time being. It is hoped that a fuller statement on the Control will shortly be made. Rubber prices were considerably weaker, a fact probably due in some measure to the announcement of the appointment. Wednesday's closing price for spot was 14½d. per lb., compared with 14½d. a week earlier.

Cotton Trade and Concentration.—Throughout the past week the business done in yarn and piece goods has been decidedly small. The concentration of production plan is now taking a more definite shape. In the spinning section

the latest date for submitting voluntary schemes is May 15th and in the weaving section May 25th. The Cotton Board hopes that firms in different districts will arrange by mutual agreement which plants should be stopped. The Cotton Controller has released 30,000 bales of American barter cotton, of which 24,000 bales will be allocated in Liverpool and 6,000 bales in Manchester. Exporters have received their quotas, but owing to uncertainty as to weaving production fresh business has not been easy to arrange. Cloth inquiry for several foreign outlets has been fairly substantial, but only isolated orders have been booked.

Orkney and Shetland Wool Controlled.—The Control of Wool (No. 16) Order, which came into force on April 26th, has the effect of bringing under control raw wool produced in the Orkney Islands, the Shetland Islands, and the Outer Hebrides in so far as it is not retained for manufacture in those islands. No raw wool produced in these islands may be moved out of them except under a licence granted, or a direction issued, by the Minister of Supply; nor may the first delivery be taken on the mainland except under similar authority. After the first delivery of the raw wool on the mainland it will become subject to the same licensing procedure as applies to other raw wool in the United Kingdom.

Flower Bulbs for Export.—The sale of tulip, hyacinth and Dutch and Spanish iris bulbs is prohibited in the home market, by a Board of Trade Order, and it is hoped that they will be exported to the United States and Canada. It is thought that the whole supply of these bulbs can find a market across the Atlantic, as much larger quantities were originally bought from the Netherlands than can be supplied from this country. There is a Bulb Export Group, and growers who have no experience of export can be assisted.

Textile Designs Exhibition.—The Colour, Design and Style Centre of the Cotton Board opened an exhibition on April 29th at the Manchester Art Gallery. The main object of the exhibition is to show that there is a pool of talent in the country which can be drawn upon to bring fresh ideas to designing for fabrics. The Board invited a number of artists to contribute to the exhibition, and among them there are many who have had no previous experience of textile designing. Many well-known names are included in the list of exhibitors, and their designs and names should do much to assist the export of cottons.

Food.—The distribution of summer oranges will be undertaken by the South African Co-operative Citrus Exchange

DIVIDEND OF 25 PER CENT MAINTAINED

MR JAMES PRAIN'S SPEECH

The annual ordinary general meeting of the Alliance Trust Company, Limited, was held on Friday, the 25th ultimo, in the company's registered office, Meadow House, 64, Reform Street, Dundee.

The chair was taken by Mr James Prain, and after formal evidence of the proper calling of the meeting had been submitted, the secretary, Mr Alan L. Brown, read the auditors' report to the shareholders.

The chairman, in moving the adoption of the annual report, said: It is now my duty to submit for your approval the directors' report and accounts for the past year.

SATISFACTORY RESULTS

The gross revenue from the investments amounts to £649,000, as compared with £668,000 a year ago, a result which I trust you will consider satisfactory in the circumstances. We propose, with your approval, to repeat last year's distribution on the ordinary stock of 25 per cent., which is the highest rate of dividend paid by the company, and is now paid for the fourth year in succession, and in doing so we have not neglected the reserves, for which again ample provision is made.

On this occasion we do not submit a valuation of the investments, a decision which was made after careful consideration. We are of the opinion that in the majority of securities free markets do not exist, and quotations, therefore, are apt to be misleading. In addition, national calls to service have left us with an ever-dwindling staff, whom it is necessary to employ on work of more importance. In the whole circumstances, valuations will be dispensed with until more normal times arrive.

U.S.A. INVESTMENTS

The past year has been one of considerable activity as a result of the continuing process of liquidation of our investments in the United States. It will be of interest to you to know that so far we have had taken from us under the Vesting Orders securities valued at approximately \$4,000,000. In addition, we have realised from sales, interest, dividends and collections from the mortgage business, a further \$5,000,000, which has been handed over to the Treasury. I have no reason to think that the experience of other investment companies differs greatly from our own, except in amount, and I must conclude that the steady flow of dollars from such realisations during the past year has reached substantial proportions and has been of very considerable national importance during a time when purchases of war material in the United States could be effected only on a cash basis.

THE MORTGAGE BUSINESS

I might mention that the mortgage business has contributed its share to this flow of dollars to the Treasury. As you are aware, the liquidation of this part of the company's business has been our settled policy for a number of years, from the time it became evident that the profitable rates of interest of fifty years ago were no longer obtainable, while, in addition, rising taxation and the difficulties and uncertainties in collecting sums due to us were diminishing our margin of profit. It is not surprising, perhaps, that this side of the business is generally regarded as moribund and now an expensive legacy from the early days of the company's existence. Nevertheless, there are assets here of value which well repay the care and attention of management. We have been fortunate in this respect in having efficient and loyal agents who have spared no pains to collect the principal of our loans and to dispose of the company's holding of real estate on advantageous terms.

SALE OF PROPERTIES IN SOUTHERN STATES

During the past year negotiations were concluded for the sale of some of our few remaining large properties and plantations in the Southern States, with the result that the amount collected is the highest figure reached for the last five years. The sales included one of more than usual interest—a tract of land of some 47,000 acres in New Mexico, which was taken over in the eighties of last century from the Dundee Land Company, and has remained an unremunerative investment on the company's books. The United States Government were interested in acquiring this property for the purpose of an Indian reservation, and paid us a satisfactory price.

I might mention that in this and other sales we retain an interest in the mineral rights, which may eventually prove to be of some value in the oil-bearing parts of the country. The sums realised from real estate are invested and become revenue-bearing, thus replacing less remunerative assets. This helps in some small degree to mitigate the loss of revenue resulting from the liquidation of our American stocks and shares, which yielded on the average a higher return than we can expect to obtain in this country without some sacrifice of security. This liquidation we must expect will be continued. The passing of the Lease and Lend Bill, while removing the urgent necessity to obtain dollars, has not relieved this country of the obligation to pay to the limit of our capacity for our purchases in the United States. I assume, therefore, that very shortly there will be little or nothing left to us of our American investments, apart from our mortgage business, which now represents only 5½ per cent. of our total funds.

THE OUTLOOK

For this and other reasons the outlook is more than usually uncertain. There can be no doubt that Government expenditure in this country has increased very largely the purchasing power of the community, while adequate measures to prevent or postpone that power being exercised have not been taken. Trading concerns in general have been able, therefore, to meet the demands arising from the increased spending capacity of the public, and dividends on the whole have been maintained. That is a situation which in my view is bound to change for the worse as the limitation of supplies becomes more effective. This and other problems, such as the heavy burden of war insurance, the pooling of industries and the promiscuous attentions of the enemy, combine to make the scene somewhat unattractive to the investor. We must be prepared, I think, to experience leaner times.

TRIBUTE TO STAFF

Before moving the adoption of the directors' report and accounts, I must express my appreciation of the services rendered by those members of our staff who are still with us on whom additional duties have necessarily fallen. To those members who are with the Forces you will wish me to convey your good wishes. To the excellent work of our agents in America I have already made reference.

The report and accounts were unanimously adopted and the formal business transacted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8, Boulevard Street, E.C.4.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

QUINQUENNIAL VALUATION—BOARD'S BONUS POLICY

The annual meeting of the Clerical, Medical and General Life Assurance Society was held on Wednesday, the 30th ultimo, at Hamilton House, Victoria Embankment, E.C.4. Sir Francis E. J. Smith was in the chair. After referring to changes in the directorate, to the results of the past year and to the support given by the society to the new issues of British Government securities, the chairman dealt with the quinquennial valuation made as at December 31st last, and said:—

THE QUINQUENNIAL INVESTIGATION

As the result of this investigation the directors have decided to distribute £800,800 to proprietors and participating policyholders, to make provision for possible additional war mortality and for future intermediate bonuses, and to carry forward, as a reserve against the contingencies of the future, in support of the book values of the assets an unappropriated surplus of £960,529 in the life assurance fund and of £64,459 in the capital redemption fund, making a total of £1,024,988.

The customary detailed examination of the assets by the directors showed that the mortgages, loans and property investments have stood up well, so far, to the strains of war conditions. Actually, at the end of 1940, there was only one case of interest in arrear on a mortgage or loan, whilst war damage to properties represented less than 1 per cent. of book values. Apart from the revaluation of Stock Exchange securities, on the basis of middle market prices less accrued interest, no general revision of book values was made, and, after taking into account the unappropriated carry-forward of £1,024,988 already mentioned, the auditors and other persons signing the balance-sheet certified that the assets were, in the aggregate, fully of the value stated therein. The life assurance fund rose, during 1940, by £12,478, and amounted at the end of the year to £15,909,580.

The whole of the liabilities of the life assurance fund were valued upon the society's customary interest basis of 2½ per cent., combined with the A 1924-29 Table for Assurances, and the a (m) and a (f) Tables for Annuity contracts. The net liabilities so calculated amounted to £14,070,298.

THE SURPLUS DISCLOSED

The net surplus disclosed at December 31, 1940, thus amounted to £15,909,580 less £14,070,298, i.e., to £1,839,282. If intermediate bonuses paid during the quinquennium to proprietors (£25,000) and to policyholders (£122,042) be added, the gross surplus of the quinquennium is seen to be £1,986,329. Of this gross surplus the directors have decided to reserve £125,000 for possible additional war mortality and £100,000 for future intermediate bonuses, to carry forward unappropriated the sum of £960,529—making a total reserved or carried forward of £1,185,529—and to distribute the balance of £800,800 as the divisible surplus of the quinquennium.

THE METHOD OF BONUS DISTRIBUTION

From the aspect of the incidence of surplus earned, the past quinquennium may properly be regarded as consisting of two distinct parts—the three "peace" years of 1936, 1937 and 1938, in which substantial profits were earned, and the remaining two years, 1939 and 1940, of impending or actual war, in which the profit-earning powers of the society were adversely affected.

The directors consider that the method of bonus distribution now to be adopted, in order to give effect to this feature, should take the form of a combination of a declared bonus in respect of the first three years and an intermediate bonus in respect of the two final years.

They have accordingly decided to declare a bonus in respect of the three years 1936-1938 inclusive, to postpone any bonus distribution in respect of the two years 1939 and 1940 until the outlook becomes clearer, and in the meantime, in recognition of accrued, equally with accruing, bonus rights, to calculate intermediate bonuses with effect from January 1, 1939, the date up to which the distribution of profits is now being made.

In respect of the declared portion of the bonus, the participating policyholders are entitled to receive nine-tenths of the divisible surplus of £800,800, i.e., £720,720, of which £122,042 has already been paid by way of intermediate bonuses, so that the balance remaining to be allotted, as bonuses in respect of the three years 1936, 1937 and 1938, is £598,678. It is hoped that three years hence, as at December 31, 1943, it may prove possible to make a further distribution of profits, in respect of the five years 1939-43 inclusive, but upon this point no pledge can, of course, now be given.

INTERMEDIATE BONUSES

Until otherwise determined by the directors, intermediate bonus will be payable upon participating policies which terminate by death, maturity or surrender, on or after January 1, 1941, upon the percentage scales previously in force, in respect of each annual premium due and paid on or after January 1, 1939.

The directors would like to make it clear that their decisions in regard to the allocation of the available surplus have necessarily been reached on broad lines, and that the form of the present "war-time" bonus distribution is no more intended to foreshadow the precise scales of subsequent bonuses than the amount carried forward unappropriated is intended to indicate the probable effects upon the society's assets of the unmeasurable risks of the future. The foregoing decisions represent, in fact, an attempt to hold the balance, as fairly as possible at the present stage, between equity as regards the past and prudence as regards the future; between the claims of participating policyholders to a prompt recognition of their bonus rights in respect of the profitable pre-war period, and the necessity of conserving financial strength for the ultimate protection of their contracts.

It is hoped that these decisions will commend themselves to the general body of the society's policyholders, whose best interests, as a whole, they are designed to protect.

In conclusion, the chairman paid a tribute to the staff, pointing out that 60 per cent. of their pre-war staff was on service with His Majesty's Forces, and that the heavy volume of exacting work had been carried out by those who remained in a manner which called for the highest praise.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY, LIMITED

A SATISFACTORY REPORT

The eightieth annual general meeting of this Society was held on the 29th ultimo, in London.

Mr. J. K. Wiseman, joint managing director, who presided, in the course of his speech, said:—The combined premium income of all branches for the year amounted to £7,451,659, an increase of £84,248 over the previous year. The total income for the year amounted to £9,292,803, an increase of £118,912. The total claims paid, including annuities and surrenders, amounted to £4,183,691, bringing the total of claims paid by the society since its foundation to £57,827,000. The total assets amount to £48,678,894, an increase of £2,661,069.

The premium income in the ordinary life branch for the year (including consideration for annuities granted) amounted to £1,898,299.

As regards war risk on new policies, we have continued our special scheme under which a benefit of 50 per cent. of the full sum assured is allowed on with-profit policies issued at the ordinary rate of premium should death occur in consequence of war or hostilities while the life assured is a civilian. Air of war or hostilities is therefore provided without an additional premium being charged, service as a civilian in any form of this scheme to include part-time service by civilians in the Home Guard. Full cover instead of 50 per cent. may be secured on payment of a small extra premium. In the case of men serving in the mercantile marine the war risk benefit on with-profit policies issued at the ordinary rate of premium is 25 per cent. of the full sum assured.

In the industrial life branch the premium income for the year amounted to £5,442,599.

During the past five years the total claims and surrenders amounted to £12,152,323. The amount added to the funds, that

is, the increase of the life assurance fund during the period and the amounts added to additional reserves, being money put aside as a provision for future payments to policyholders, was £9,136,566. These two items give a total of £21,288,889, which is arrived at after taking account of interest on investments. This total, being the actual amount paid to policyholders, plus the amount added to reserves as provision for future payments to policyholders, together make up a sum equal to 82.8 per cent. of the premiums received during the period.

As regards war risks on new policies, we have adopted a scheme similar to that mentioned for the ordinary branch.

The balance-sheet shows that the assets total £48,678,894, an increase of £2,661,069 over the previous year.

The report and accounts were unanimously adopted.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

THE HON. A. O. CRICHTON'S SPEECH

The one hundred and thirty-first annual general meeting of the North British and Mercantile Insurance Company, Limited, will be held at Edinburgh on Thursday, the 8th instant.

The following is a summary of the statement issued to the shareholders by the Hon. Arthur O. Crichton (the deputy chairman):—

The National Savings Campaign had continued to receive whole-hearted support from the staff. So far as the "North British" group of companies was concerned, all moneys becoming available here had been placed at the disposal of the Government by subscription to the new Government loans. With taxation still further increased and the yield on new Government loans restricted, the net return on their investments as a whole continued to shrink. As to the stability of their funds, there was a substantial increase in the market value of their investments at the end of the year compared with the previous year, which provided a valuable safeguard for future contingencies.

The strain of war on their life funds had not been unduly heavy up to the present, and the total claims sustained during the year under life policies had proved within the number expected in a normal peace-time year. They hoped that satisfactory experience would continue, and if it did they would be fully justified, as they had been justified so far, in having given policyholders that full and unrestricted protection which was almost a tradition of the "North British." The new business completed during the year had naturally been much smaller than in the pre-war years, but in comparing the figures with those for 1939 it had to be remembered that comparison was made with a "bumper" year. They were satisfied that the business they had written was of a good class and was mainly of a provident nature.

In the fire department premium income had increased by nearly 4 per cent., but the loss ratio at 48.31 per cent. showed an increase of very nearly 6 per cent. on last year. The resultant profit, after providing 40 per cent. for unexpired risks, amounted to £95,571, or 2.80 per cent. of the premium income. This was the smallest figure of profit recorded for many years past, but they had the satisfaction of knowing that their business had been well maintained in spite of the temporary loss of so many sources of income on the continent of Europe.

Their casualty insurance business was conducted through the medium of their subsidiary, the Railway Passengers Assurance Company, whose results were once more of a highly satisfactory character notwithstanding the anticipated unavoidable shrinkage in premium income.

With interest on investments the underwriting profit was £248,720, practically the same as in the previous year.

The premium income of the "Ocean Marine" Company, their marine department, amounted to £634,689 for 1940, showing a considerable rise over that for the previous year. The business of the Fine Art and General Insurance Company during the past year could, in the circumstances, be considered as satisfactory.

The directors again recommended a dividend of 6s. 3d. per share, less income tax. This dividend, together with the preference dividend, would absorb £393,323, while the combined total of net interest amounted to £447,169.

INTERNATIONAL NICKEL COMPANY OF CANADA, LIMITED

NICKEL AND COPPER SALES INCREASED

The annual general meeting of this company was held on the 30th ultimo at Toronto.

Mr Robert C. Stanley (chairman and president) said that the most important duty of the management during the period under review, the first full year of operations under war-time conditions, was to provide an adequate supply of nickel, copper and platinum metals to meet all demands for the war programmes of His Majesty's Governments in Canada and Great Britain. Furthermore, the defence programme of the United States Government, in conjunction with its policy of aid to Britain, was adding heavily to the toll on the company's output of nickel. To meet the situation they had not only continued their programme of balancing smelter and refinery capacity with mine output, but had augmented and accelerated this programme by making plant extensions wherever possible and utilising all available facilities. In addition, they were treating and refining the entire bessemer matte output of Falconbridge Nickel Mines, Limited. Due to these efforts, nickel output was increased in 1940, and was being further expanded this year.

COPPER PRODUCTION

Copper production, resulting from increased nickel output and from the treatment of Falconbridge bessemer matte, exceeded the capacity of the copper refinery, and they had found it necessary to make outside arrangements for the refining of a portion of their copper. The contract with His Majesty's Ministry of Supply for the delivery of about 80 per cent. of their output of electrolytic copper expired on September 1st last, and had been renewed for another year.

In 1940 the company's sales of nickel in all forms were in excess of the sales in 1939, as also were the sales of copper. Sales of platinum metals, however, were lower because of restricted markets.

The net profit for 1940, after all charges, inclusive of substantial emergency reserves, was \$35,544,772, equivalent to \$2.80 per share on the common stock after provision for preferred dividends of \$1,933,899. The common shareholders were paid \$2.00 per share, and the remaining 30 cents per share transferred to earned surplus.

It was of interest to note that, notwithstanding a large increase in the volume of metal sales, the net earnings per share of common stock were 9 cents lower than in 1939, due mainly to the heavy increase in taxes.

The tax provision of \$21,130,703 in 1940 was equivalent to \$1.45 per share on the common stock, and compared with the provision of \$11,322,121, or 78 cents per share, on the common stock in 1939. This meant that each share of common stock contributed \$1.45 to Government treasuries for war and defence programme expenditures and for general purposes. All shareholders would agree that heavy taxation was a vital necessity in this grave emergency. The war and defence programmes must be shared in by all and must be paid for in cash. Thus it was gratifying that the tax contribution of this Canadian enterprise was a substantial contribution to the war effort.

DIVIDEND UNCHANGED

For the third successive year dividend disbursements remained unchanged. Four quarterly dividends had been paid on the common stock, and four quarterly dividends on the preferred stock, amounting to \$29,156,338 and \$1,933,899 respectively, a total of \$31,090,237.

In closing he wished to emphasise that the policy of this company during the period of the war was to produce sufficient nickel to meet the war-time requirements of Canada, Great Britain and of the United States; to supply the needs of industry to the fullest degree that national requirements would permit; to maintain all of the plants and equipment in the best working condition; to foster a spirit of co-operation between employees and management throughout the various branches of the organisation; to expand research and development efforts concerning uses for the company's metals; and to conserve the financial resources to the fullest extent that the present world situation permitted.

PINCHIN, JOHNSON AND COMPANY LIMITED

THE CHAIRMAN'S STATEMENT

The annual general meeting of Pinchin, Johnson and Company, Limited, was held on the 30th ultimo at Tigbourne Court, Witley, Surrey.

Mr C. J. Heywood (the chairman) presided.

The chairman's statement emphasised the following points:— Shareholders will appreciate that during the war the company is faced with very greatly increased expenditures in order to maintain its business.

It is neither politic nor practical to attempt to pass on to the consumer these added burdens, as it must be understood that export trade is necessarily of a strictly competitive nature, whilst the home business has almost entirely changed in character in the last eighteen months.

Temporarily, the domestic business of the company in this country has declined considerably, but the company is confident that its completed plans for distribution and service after the cessation of hostilities will meet with the entire approval of its valued and extensive clientele.

Curtailement of essential services affected production in the last quarter of the year, and the company is now planning to provide duplicate facilities where this is practicable.

STOCK POSITION

The necessarily high ratio of imports of raw materials for the paint trade from overseas, and its effect on shipping space, needs, in the opinion of your directors, a greater constriction of available usage into such channels as are really essential for the war effort—i.e., industry and export.

Reference to the balance sheet will show that the stock-in-

trade is the highest inventory figure yet shown in any of the company's accounts to date. This is caused by:—

1. The necessity of carrying unusually heavy stocks of raw material in reserve, stored in as many places as is practicable, to keep the production effort continuous.

2. Abnormal increase in the cost of vitally essential materials.

3. Placing increased stocks overseas to safeguard local requirements of the company's overseas customers.

This large tie-up of cash resources necessarily affects the cash position. Sundry debtors show a considerable increase, which indicates a higher volume of trade and outstandings.

STRONG RESERVES

The reserve for contingencies is being built up to a figure which will take care of the complete—but unlikely—total loss of the company's assets in enemy occupied areas.

On the other hand, the real value of the company's subsidiaries in free territories, if maintained, would be more than sufficient to take care of the loss; thus, in two ways, are the possible losses of these assets more than safeguarded.

TRIBUTES TO STAFF

The directors wish to pay tribute to the exemplary courage and fortitude of many of the factory staff and operatives who have distinguished themselves in their devotion to the company's interest and the preservation of the company's properties.

The company's home and overseas employees have, individually, subscribed to and presented to the country a fighter aircraft which is known as the "P.J." Spitfire.

National War Savings groups have been inaugurated throughout the company's organisation, and the response per head by the staff has received high commendation from the authorities.

(Continued from page 601)

acting in conjunction with the Ministry of Food. The present method of allocation through Port Panel committees to wholesalers will continue. Three shiploads of oranges have recently arrived and it is hoped that more will follow. A new Cheese (Maximum Prices) Order will come into force on May 5th, the date of the beginning of cheese rationing. The Order will govern the price of all cheese made from cows' milk, except blue-vein, soft, curd and cream cheese, and processed cheese. The maximum retail price for all cheese covered by the Order will be 1s. 1d. per lb. This represents no change in the maximum price of the main varieties, but a reduction of 1d. per lb. in the maximum price of Wensleydale, Stilton and Caerphilly, which will also be subject to rationing. An Order came into force on April 28th amending the price of some sizes of canned salmon. The wholesale price of Grade I Talls and Grade I Flats has been increased from 62s. 6d. to 66s. per case, and the retail price from 1s. 7½d. to 1s. 8½d. per container. For Grade III ½'s the wholesale price of 26s. 6d. per case and retail of 4d. per container, have been prescribed. Eggs from the United States are to be included in Category IV, the same as those produced in the Dominions. These prices are 22s. 6d. per 120 or 2s. 6d. a dozen, and 20s. per 120, or 2s. 3d. a dozen. Families taking one pint of milk per day or less, will not have their supplies cut.

Assistance to Exporters.—Transport and Progressing Officers have now been appointed to most Area Boards by the Board of Trade. In each of the Civil Defence Areas there is a Board of Trade representative on the Area Board, one of whose main duties is to assist exporters to overcome difficulties encountered in the course of their business. Transport has offered particular difficulty and the new appointments are designed to assist the Board of Trade representative.

His Majesty's Government

It is exactly a year ago this week since the great two-day debate in the House of Commons that brought Mr Chamberlain down. And again the Government has been facing its critics in a two-day debate. But if there is this formal similarity between May 1940, and May 1941, the fundamental position is utterly different. The country has found unity behind Mr Churchill such as it never quite attained at any time in the last war. There is no other possible leader in sight. Indeed, that is too grudging a testimony. Mr Churchill is not a *pis aller*; he is a great leader of men. He has touched and uplifted the hearts of men wherever in the world they are free—and here, in this island, where the shield of freedom is being borne, he has earned the title his great ancestor carried, that of Captain-General of England.

Yet there is disquiet and anxiety in the country. Why? Partly no doubt the reason is to be found in the natural reaction that bad news produces when it follows hard on the heels of good. The successes of March were far too sanguinely interpreted, and those who were most hopeful then are the most gloomy now. One of the most serious charges brought against the Government in this week's debate was that over-optimism was officially encouraged. The charge is well founded. The Prime Minister himself must be acquitted; he rarely misjudges the country's wish, which is to be told the worst that is true. But he is seemingly the only person in the whole Governmental machine who has grasped this simple fact. It is not so much the paucity of hard fact to which there is objection—the man in the street knows that there are many things he cannot be told—it is the consistently over-optimistic tone of the "spokesmen's" commentaries, of the inspired interpretations, of the Parliamentary speeches of minor Ministers and their Parliamentary Private Secretaries that causes alarm and

despondency. The Prime Minister would do well to impose his own standards on the whole machine.

When this factitious reaction from over-optimism is discounted, a great deal of the exaggerated gloom of the last few weeks goes with it. The situation to-day is not greatly different from what was anticipated six months ago. It was expected that there would be heavier night bombing, that there would be a sustained campaign against shipping in the Western Approaches, that there would be a drive against Egypt. In none of these respects are things going worse than was to be expected last November. The only real surprise in the debit ledger has been the defeat in Cyrenaica—but then the preceding conquest of that province was an equally surprising item on the credit side of the account.

This does not, of course, mean that the position is good or that it is strategically favourable. Britain is still on the defensive, fighting desperately against very heavy odds. There are still the familiar and heart-breaking shortages of men, of guns, of aircraft, of tanks, of ships. The Greek campaign did not reveal these shortages for the first time—or in greater measure than was known to exist—indeed, the only continuing deficiency that can fairly be deduced from the Greek campaign is the shortage of ships. If the first crime, in a situation of extreme peril, is complacency, the second is lack of a sense of proportion. Had Mr Churchill predicted six months ago that the nation would stand in the second week of May exactly where it stands to-day, it would have been accounted a hopeful prophecy.

Not all the disquiet, however, by any manner of means, is to be disposed of in this way. There are real causes for anxiety and sound reasons for criticism. One of a general nature was emphasised in *The Economist* last week. The great transformation of American policy and action is one of the chief gains

of the past six months. But there is a real danger lest, in contemplation of the magnitude of America's resources, the British people should relax their own efforts. For another twelve months, it cannot be too often repeated, the future of the world—and our own safety—lies almost entirely in British hands. It is perhaps the one mistake that Mr Churchill has made in the handling of the people in recent months that he has not emphasised this fact. What is needed this summer is not any relaxation of effort, but another tremendous burst of energy such as was put forth with such zeal and devotion last year.

This is, of course, the Government's business. The people will respond to leadership. They will once again "Go to it," but only if they are told where to go and what to do. And the Government must go to it too. Many of the old defects remain, and if the public's support of Mr Churchill is enthusiastic, it has a very different opinion of many of his colleagues. There is still too much timidity of decision. It is true that a step that has been taken in the past week, the amalgamation of the Ministries of Shipping and Transport, promises drastic action to meet one of the most serious deficiencies. Mr Leathers is not known to the public; but his first declarations show that he grasps the point at issue. He has made it clear that he believes in regarding the entire transport system of the country as a unit; and if he can show that the new arrangement is not a mere administrative regrouping but the beginning of a real transport policy, he will be a great reinforcement to the Government. A certain scepticism is only natural, for there have been too many cases in which some basic principle of war economics has been accepted, under heavy pressure, and then left in the air without

practical application. The most flagrant example, of course, is Mr Bevin, whose course of action over the conscription of labour (of which the latest episode is discussed on page 616) is not very far removed from deception of the people. It is the spectacle of Mr Bevin talking hot and acting cold which, more perhaps than any other single factor, accounts for the undercurrent of uneasiness in the country.

It is for these reasons that the suggestion of a small War Cabinet of Ministers without departmental duties is put forward with such persistence by so many of the Prime Minister's most devoted supporters. It may be that it is also used as a stalking horse by those whose real game is to embarrass Mr Churchill—and if so he is politically wise to reject their suggestions. He must be the sole judge of that. But it shows a misconception both of the idea and of the motives of most of its proponents, to say, as Mr Churchill did on Wednesday, that it is an attempt to surround him with a group of "No" men. That is not at all the proposal; it is rather that the Prime Minister should have a War Cabinet of men who (as Mr Lloyd George said of his lieutenants in the last war) are "eyes and ears—and a good deal of toe." They should not be "No" men so much as "Go" men. Lord Beaverbrook is apparently to fill that rôle in a sphere wider than Aircraft Production; it is fantastic to suppose that there are no others in the country.

There was an undoubted touch of acrimony about this week's debate. The more is the pity, for it does not represent the mood of the country and it will undoubtedly militate against the Prime Minister's accepting suggestions for the strengthening of his Government that are very widely, most earnestly and quite sincerely offered to him.

Fighting in Iraq

FIGHTING broke out in Iraq on May 2nd, and after a week's campaign the British Army is advancing into the country. It is too early to forecast the shape of the struggle, but on the British side the time factor is the key to success or failure. The Iraqi army, thanks to Great Britain's interest and assistance, is an efficient and well-mechanised force. Nevertheless, there can be little doubt that vigorous British action and the despatch of reinforcements can restore the situation provided the necessary measures are taken in time.

The extent to which the situation was allowed to deteriorate before action was taken is enough to throw doubt on the efficacy of British diplomacy, which cannot escape the suspicion of having been weak, vacillating and ill-informed. It was not as though there were any excuse for being caught unawares. Ever since the Sidky Bekr *coup d'état* in 1936, and more especially since Rashid Ali el Gailani succeeded General Nuri-es-Said as Prime Minister in March, 1940, the attitude of the Iraqi Government has been very unsatisfactory. To give the most obvious example of their obstructive policy, they refused to break off relations with Italy a year ago, and the Italian Legation has ever since been a centre of Axis intrigue. The brief supersession of Rashid Ali by General Taha-el-Hashimi in March and April this year only increased the tension, and on the proroguing of Parliament the ex-Prime Minister, backed by the Army, staged a *coup d'état*, deposed the Regent, Emir Abdul Ilah, and, after appointing the Sherif Sharif to succeed him, set up a new "constitutional" Government. The British authorities then exercised their treaty rights (which permit them to use Iraq's communications, airports and waterways in time of war) by despatching reinforcements to Basra. At first the Rashid Government made a show of compliance, but when further troops arrived transit was refused, and, on Britain's insistence, the Iraqi Army launched an attack on the British air station at Habbaniyah.

The connection of the Iraqi incident with the general strategy of the war is obvious enough. Whether the clearing of the Mediterranean is the next main objective of the German General Staff or an elaborate feint to draw British forces and attention away from the invasion front, the crux of the Eastern Mediterranean sector is the defence of Suez. In the south, the land attack has advanced as far as Sollum, in the north to the Peloponnese, to the islands of Greece and to Rhodes. Now that a new front has opened to the east, the aim of Hitler's generals must be to effect a junction with the Iraqi forces before their offensive is crushed. It seems certain that the despatch of British troops to Basra upset the timing of the Iraqi *coup*. Rashid Ali had to act before the British were strongly reinforced, and he was therefore compelled to begin the fight before the Germans had fully liquidated the Greek campaign or cleaned out the fortress of Tobruk.

The Germans probably do not think of transferring massive land forces from Greece to Iraq. Air strength is the decisive factor. Hence it is unlikely that the Germans need at the moment either to threaten or cajole the Turks into permitting the transit of troops. Such a step might come later when prolonged isolation and inactivity had reduced Turkey to the impotent status of a Near Eastern Sweden. The Germans are almost certainly more interested in Syria, where there are landing fields, facilities for re-fuelling, a demoralised administration, public ferment and some sympathy for the Rashid Ali regime. Given Syrian co-operation, the Germans may well hope to turn Iraq into a hostile base for the encirclement of Suez and the total isolation of Turkey.

Behind these immediate strategic considerations lies Germany's interest in the oil supplies of the Near East. It is true that it would take months to restore production in Iraq and transport would remain a

serious problem. Yet it is in fact the need for oil that makes control of the Mediterranean and its hinterland a valuable prize.

As usual in a Nazi campaign, intervention, if it comes, will be only the crowning phase of a long process of diplomatic and psychological preparation. The Germans have experience of Middle Eastern politics from the last war, where their agents—Wassmuss, Schünemann, von Hentig, Seiler—bid with Lawrence and Dunsterville and Sykes for the support of the Arab peoples, and it is significant that both Seiler and von Hentig have been until very recently in Iraq, Iran and Syria. In the last war, the Germans were fatally handicapped by the fact that they were allied to the Turks, against whose dominion the Arabs were seeking to revolt. In this war, the disadvantage has shifted somewhat to the Allied side, for although Iran and Saudi Arabia have obtained complete independence and Egypt and Iraq almost complete independence, France and Britain are the Mandatory Powers in Syria and Palestine and their treaties with Egypt and Iraq impose certain obligations. Against this may be set the obvious readiness of Great Britain to concede ultimate independence and Germany's black record with the subject peoples of Europe. Nevertheless, the French and British are the imperialists on the spot, and this fact has given the Axis propagandists their opportunity.

It is difficult to assess the strength and significance of Arab nationalism. It usually takes the form of the demand for some sort of Arab confederation, but there is no agreement on its constitution and leadership. Moderate pan-Arabism has much in common with enlightened public opinion among the Allies, since its supporters recognise that only with Allied help could the Arab States achieve cohesion and protection against the predatory Great Powers. To this school of thought belonged Dr Shahbender, the murdered Syrian leader. It has supporters among the more responsible officials throughout the Middle East, and some quiet preparatory work—the discussion of a Customs Union, of frontier delimitation and so forth—has been accomplished. To a full understanding among these people, the undefined but not unfriendly attitude of Ibn Saud, and, to a much greater extent, the unsolved problem of Palestine are serious obstacles.

It is not with the moderates that the Axis propagandists have established contact. Extremist pan-Arabism is negative, and all the fiercer on that account. It has solved none of the problems of an Arab confederation—whether Iraq, Saudi Arabia or Egypt should lead, whether race or religion should be the test, the fixing of frontiers, the economics of co-operation—and it derives its force from its clamour against Britain and France. Whatever else is built afterwards, it is claimed, British and French rule must first be torn down. The chief centre of the movement is in Iraq, but it is strong in Syria and, naturally, in Palestine. The Mufti of Jerusalem has played a part in inciting opinion and he has found a ready audience, particularly in army circles in Baghdad. It is with these groups that German agents have been in touch. An alleged Iraqi gives the quivering broadcasts from Berlin. Syrian and Iraqi notabilities are often to be seen in Germany. How far co-operation has gone it is still impossible to say. Reports speak of the arrival in recent months of Axis war material. The consignments are not likely to have been heavy and the evasions with which the

Nazis countered the news of Rashid Ali's first appeals for help suggest that plans were not at that time fully concerted. But Axis influence is all too apparent in the shape and timing of the final *coup*.

Nevertheless, it should not be thought that pan-Arabism is the decisive factor, even though it has created an entry point for Axis propaganda. British administration, even in Palestine, has in no sense been as hopeless and onerous as the Ottoman rule against which the Arabs rose in arms in the last war. The Arabs know that Britain is a satisfied Power, that her diplomacy is conciliatory and that there exists a genuine desire to find a solution compatible with Arab independence. The decisive factor is not political aspiration but power. The real force behind Axis propaganda is not that the Arabs believe they will achieve independence in the New Order but that they fear an Axis victory. Until the French collapsed there was quiet in Syria. While General Wavell was advancing on Benghazi there was quiet in the Middle East. To-day, in spite of General Dentz's efforts, French authority has degenerated so far that much of it has passed to the Syrians, and they are swayed this way and that by the fortunes of battle. In the Middle East generally, the rapid advance of Hitler's armies across Libya and the lightning campaign in the Balkans are the Nazis' best arguments when bargaining with a Rashid Ali or a Prince Aslin. It is the old weary argument.

"The British are decent. If they win they will treat us well in any case. But if the Nazis are to win, we must buy their favours now."

It follows that only in one way can the situation in Iraq be restored—by vigorous action. Surveying the Near East just over a year ago *The Economist* wrote:—

We owe the advantages of our Near Eastern position to the fact that we are powerful and satisfied. If we cease to be powerful, the question whether or not we are satisfied will become entirely academic. The Near Eastern States will be reckoning how best they can come to terms with our conquerors. . . . One thing is certain. We cannot fall back on a favourable Near Eastern situation. We can only create it.

Events have only borne out this analysis. The only argument which can impress Iraqis, Syrians, Palestinians, and even Egyptians to-day is clear proof of Britain's ability to maintain her position and strike back. It follows that the Turkish and Egyptian offer of mediation cannot even come under consideration until the Iraqi army has abandoned all resistance and that the conditions of a settlement must include the return of the Regent, the restoration of Constitutional government and the eclipse of the Rashid Ali regime.

Great Britain has her sympathisers in all the Arab lands, but they will only be rallied to a cause which looks like holding its own. The extent to which British forces can be deployed in the new front is beyond the competence of civilian observers to determine. Against the obvious danger of allowing Iraq to fall must be set the fact that it is essentially a diversion and the immediate defence of Suez must continue to absorb the major part of Britain's African resources. Nevertheless, if it is humanly possible, courageous military action must make good the damage done by faulty diplomacy. The Middle East is the last area in the world where Great Britain can afford the luxury of appearing less strong and determined than she is.

Canadian Ally

THE Canadian scene can be easily misread. Once more, Mr Mackenzie King, the Federal Premier, is being sharply criticised, and there is sufficient acrimony in the politics of the Dominion to give the appearance of a house deeply divided. Axis propagandists are not slow to point out another weak place in the Imperial war front; but actually they are wrong, for (as Mr Graham Spry shows in a notable vignette of the Dominion published recently*) Hitler has united Canada. Canada is, of course, divided by geography, race and religion. The centres of population in the Atlantic provinces are 700 miles from central Canada; central Ontario is 900 miles from the prairies; and the prairies are 400 miles from the Pacific coast. It is a nation of fewer than twelve million people scattered over a vast sub-continent cut up by rocks and mountains and water. "Quebec, northern New Brunswick and north-eastern Ontario are largely French and Catholic. Ontario, British Columbia and Nova Scotia are predominantly Anglo-Saxon and Protestant. The three prairie provinces are less than half Anglo-Saxon, and there are significant groups of Germans, Scandinavians and Slavs." Four-fifths of the people are less than 200 miles from the American border; nearly a quarter of them were born outside Canada; and Canadians may have loyalties to Washington, Paris or Rome as well as to London and Ottawa. But, though there is no uniformity in Canada—the choice between Vichy, where the Dominion is represented, and General de Gaulle has caused sharp controversy in French Canada—there is unity in the war effort; and it is the first merit of Mr Spry's book that he makes this distinction plain.

For a week after Britain was at war with Germany, Canada was neutral. Then, when the neighbouring United States, with the same strategic and geographical interests at stake, unanimously preferred neutrality, Canada unanimously chose war. Later the decision was twice endorsed at the polls, once in Quebec and once in the entire Dominion. In contrast to Eire, Canada came freely into the fight; and in contrast to South Africa, there is no anti-war Opposition there.

Yet criticism and quarrels persist. "Each race, each group, each section, each religious faith felt the threat of a resurgent Germany"; but the sections remain. The Dominion is a federation. Its people are "federal-minded"; and "to the divisive influences of geography, race and religion" is added "the disintegrating force of provincial sovereignty." In peacetime, the Federal Government lacks the powers to tackle national problems on a national scale; and this weakness in the spheres of social, financial and economic policy is more than ever a hindrance in wartime. A battle is going on even now between the farming provinces and the Government; and it is illustrative of the background of Canadian war politics that the recommendations of the Royal Commission on Dominion-Provincial relations, set up four years ago to look into the distribution of powers and revenues between the central and provincial governments, have lately been blocked at a bitter conference by the opposition of three of the ten provinces. The main reason is that it was proposed by the Commission that the provinces should cease to be the collectors of income tax, corporation tax and succession duty. These taxes were to be collected by the Dominion Government, which would take over unemployment relief and provincial debt, making grants from central funds where needed. Now the Budget for 1941-42, introduced last week, has raised this controversy again.

The Dominion requires \$300 millions more tax revenue this year; and it is proposed that the provinces should vacate the field of income and corpora-

tion tax for the duration of the war. Two other taxes formerly provincial, the succession duty and the tax on petrol, appear in the Budget. Power follows finance. The same struggle has gone on for generations in the federation of the United States, as nation-wide duties have arisen to be centrally done; and it is hard to see how the Dominion Government can fight and finance this war without focusing the powers and revenues needed. The present proposal is a compromise. It begs the question whether, in a modern State, positive and efficient government is possible, even in peacetime, in face of federal checks. With much argument, the compromise will be accepted, but the debate will still go on.

Actually, this Budget is itself proof enough that Canada's war effort is not being stemmed by dissension. The first estimate of war expenditure in 1940-41 was \$500 millions. After Dunkirk, it was raised to \$700 millions. In the event, it was \$1,800 millions, something like a quarter of Canada's national income, which is rising rapidly; and in 1941-42 war expenditure is to be \$1,450 millions. Total expenditure will be \$1,918 millions—over \$160 (or £35) per head of the population, man, woman and child. The corresponding figure in Great Britain is £94 per head. Canada still has much slack to take in. But there is no doubt about the scale of the effort. Canada is high among the industrial nations—sixth or seventh. The Dominion is the third largest exporter in the world, and the largest exporter of wheat and non-ferrous metals. The national income of Canada is equal to Italy's and a quarter of that of Germany and Austria together. Total production in the Dominion is said to be 70 per cent higher than in 1918, though the population is only 25 per cent larger; and actual output for the war—almost every weapon is being made in Canada—is very much greater than it was in 1918, when the Dominion war effort was at its peak. The flow of food, raw materials and manufactures makes Canada granary, mine and arsenal alike to the Commonwealth. On land, the Canadians have not shared the ordeal of the Anzacs, but the Canadian Corps is the pivot of Britain's defence. In the Atlantic, the Canadian Navy has a central rôle. In the air, Canadian pilots and squadrons have been in the fight since it started, while the Empire Air Training Scheme in Canada is a main pool for RAF personnel.

Why, then, is Mr Mackenzie King so sharply assailed? Partly, it is the normal, healthy process of Parliamentary surveillance and criticism, which the Nazi can never understand. Partly, it is the consequence of provincial fears and grievances. But partly, too, it has been the Government's fault. The war is not opposed by the Canadian critics. The scale and direction of the war effort are not fundamentally questioned. It is the conduct and management of Canada's effort that have been arraigned, and last February the attack became "a grave political storm." It was then claimed that aircraft production in Canada was in "an impossible position"; that the planes made were primarily training machines; that the official comparison between the output of light fuselages in Canada and the output of complete planes in the United States, some of them four-engined bombers, was misleading; and that the Empire Training Scheme was badly behind schedule. Criticisms were made of shipbuilding, the supply of military equipment and tank production; and, while it was made clear in the discussions that the opposition had gone much too far, it was plain at the end that there were serious hold-ups and bottle-necks in war production. In the production of shells, bombs, vehicles, clothing, equipment, chemicals, and explosives there have been marked successes; in the

production of tanks, guns and aircraft, and in the supply of machine tools, there have been several failures and disappointments.

As in Britain, the shortcomings of war government in Canada have been mainly economic; and because of the sectional character of Canadian life and politics, it is not possible to set up a National Government drawn from all parties and groups, and, most important of all, from all talents. There is a weakness in personnel which was not lessened by the Liberal triumph at last year's general election. Nevertheless, what faults there are—and the successes much outnumber the failures—are not merely political in origin. The Munitions and Supply Department in Canada is directed in the main by business men, not politicians. The root of the trouble is simply the difficulty in a democracy and a federation of changing over from peace to war economy, a difficulty which is aggravated in the case of Canada by technical causes.

Canada is in no sense self-sufficient. What the Dominion buys from the United States is normally paid for by the proceeds in gold and dollars of sales to the United Kingdom; and Canadian industry is interlocked with American, a connection which has caused great difficulties in working out designs for tanks and aircraft to be built in Canada and which implies, in most items of manufacture, that Canada must depend on the United States for many of the parts to be assembled. Since the war started, purchases from America have gone up, swollen by raw materials, components and machinery for war production, and the deficit in this trade is growing. On the other hand, although sales to the United Kingdom have also mounted, the United Kingdom is short of gold and dollars to pay with; and the problem of paying the United States has therefore become serious. Every month, twice as much in value is bought by Canada from the United States as Canada sells to the United States.

In trade with the United Kingdom last year, there was an export surplus of \$787 millions, of which between two-fifths and a half was covered by the repatriation of Canadian securities, a third by the transfer of gold from the United Kingdom, and a fifth simply by the accumulation of sterling balances in London on Canadian account. This year, when Canada is to supply \$1,500 millions' worth of munitions, materials, and agricultural produce to the United Kingdom, the British deficit may be \$1,150 millions; there are limits to the quantities of gold and Canadian securities that can be thrown in; and there is the

prospect of a "substantial war debt" due from Britain to Canada.

The position is, therefore, that Britain cannot pay Canada, and Canada finds it correspondingly difficult to pay the United States for essential war supplies. But these are precisely the considerations of finance which President Roosevelt has laid down must not hobble full aid to the democracies; his remedy is to pay for goods with goods or the promise of goods; and Canada is bound to the United States, not only by the joint American-Canadian Defence Board, but also by the joint committee which has just been set up to work out priorities for war materials. The Lease and Lend Bill can be used to ease the strain; under it, Britain can count goods and materials sent to be worked up in Canada. Last month's Hyde Park Agreement between the President and Mr Mackenzie King will ease the strain further by facilitating the delivery from Canada of munitions, strategic materials, aluminium and ships in return for American supplies. The new Budget tackles the problem on the other side, by making it easier for Britain to pay Canada in goods. There is to be a discount of 25 per cent in the duties on imports of woollens, boots and shoes from the United Kingdom and 50 per cent on all other imports except spirits, tobacco, sugar, and silks. The dollar problem will remain difficult; and debts may pile up on two sides of the triangle United States—Canada—United Kingdom. But it is a gain that, though faced with onerous expenditure, heavy enough to require a sharp increase in income tax, new taxes on successions and petrol and new levies on cinemas, amusements, betting, and on travel by rail, road and air, the Canadians have been realistic enough to make these reductions in duty.

Canada is "Britain's first ally"; and the Dominion is part and parcel of North America as well. Without North America, the war would be lost; and the statesmen of Canada, like those of the United States, have a historic task. By and large, they have shown the way to their neighbours. It is an answer to Axis propagandists that Canada went to war when the United States did not and set the pace in North American mobilisation. But it is not a complete answer to the friendly critics. There is a saying that "Canada is a difficult country to govern." Mr Spry points out that there are two kinds of Canadian politician: those who represent provincial and sectional interests, and those who are "nation-minded." To-day, there is need that the latter, on both sides of the political fence, should prevail, if the united will of the Dominion is not to be hindered by lack of leaders.

NOTES OF THE WEEK

Spanning the Atlantic

In the Battle of the Atlantic, Mr Churchill reported on Wednesday, "we are maintaining great progress, though with heavy losses"; and, with assistance from the United States, "we can probably maintain our minimum essential traffic during 1941." The United States is to assemble two million tons of merchant shipping for "all-out aid to the democracies." Negotiations are going on with other American republics. Newly-built ships will be recruited for the pool; shipping routes will be readjusted and vessels drawn from inter-coastal, coastal and Great Lakes employment; under a Bill now before Congress, foreign ships in American ports will be requisitioned and impressed. This is strikingly good news for the future, for the scale and scope of the island and Imperial war effort will be decided by the available tonnage of ships. Shipping space is the bottleneck through which overseas supplies must pass, and the establishment of this pool, to be supplemented from the gathering output of American shipyards, goes to ensure its being sufficiently wide. But, though there is strength in numbers, there is not necessarily safety, while the Battle of the Atlantic hangs in the balance. "Our test is the number of tons of imports brought into these islands in any given quarter in

any given year." It is arrivals in British ports that matter most just now—protection rather than tonnage; and the American decision on convoys has not yet been made. The President, in a speech whose terms were perhaps more general than many had expected—and hoped—has said that America is ready to fight for democracy. More specifically, Mr Willkie has offered his support for conveying American arms to Britain. A host of politicians, naval men and newspapers have also spoken for convoys; and, most significant of all, Mr Stimson, the Secretary of War, in a challenging broadcast to the nation, has called for the use of the American fleet to reinforce the British navy—to save America from the deadly peril that would follow if the Battle of the Atlantic were lost. The signs are that Mr Roosevelt is waiting for rising opinion to push him into the decision, which will risk probable war; and he is waiting in half-way house. There are patrols—reaching from the Atlantic coast to Greenland and far out into the ocean, to watch for raiders and to warn their victims—but no convoys; this week commanding officers from most Latin American navies have come for talks in Washington. The news of America's help in spotting caused "indescribable relief" in high quarters in Britain, but it is not protection.

* "Canada." By Graham Spry. Oxford Pamphlets on World Affairs. No. 47. Oxford University Press. 32 pages. 3d.

American Ships

The aid that the United States can give, in warships and merchant vessels, can be decisive. The Washington Treaty of 1922 gave the United States the right to build a navy equal in size to Great Britain's, and American naval shipbuilding capacity is already large. According to the *American Journal of Commerce* of February 14th, no less than 433 naval vessels were then under construction, 185 of them in private shipyards; they were made up as follows:—

	No.		No.
Battleships	17	Submarine tenders.....	7
Seaplane tenders.....	32	Repair vessels.....	4
Aircraft carriers	12	Mine-layers.....	3
Cruisers	54	Destroyer tenders	3
Destroyers	204	Submarine reserve vessels	5
Submarines	81		
Minesweepers	11	Total	433

The volume of merchant ship construction, however, has fallen rapidly from the heights reached in 1919. Twenty-five years ago, America's output of merchant ships, excluding Lake vessels, rose from 157,000 gross tons in 1915 to 3,580,000 gross tons in 1919. According to the *Journal of Commerce*, the volume of merchant ships delivered in 1939 was only 241,000 gross tons; in 1940 the deliveries aggregated 445,000 gross tons, and in 1941 they are expected to reach 860,000 gross tons. Various alterations in the programme announced since last February may bring this year's total to one million gross tons; but, with America's vast resources in materials and industrial skill, it should be possible for the United States to exceed even the 1919 output within a not too protracted time.

Changes at the Kremlin

The news that Stalin has formally assumed the functions he has long exercised—those of the supreme direction of affairs—is the most significant report that has come out of Russia for some time. In effect, of course, Stalin has been in supreme control since 1924, but he has preferred to exercise his total power through a variety of puppets, and has never sought any other title than that of Secretary-General of the Communist Party and member of the Supreme Council. Now it is announced that he is to succeed M. Molotov as Prime Minister (or Chairman of the Council of People's Commissars), while Molotov will retain the Foreign Office and act as Stalin's assistant. There is inevitably the widest speculation about the meaning of Stalin's emergence into the limelight, and the clam-like quality of Russian diplomacy allows for the most divergent interpretations. It is possible that as the process of purging continues—now fast and furious, now slow moving and unostentatious—the number of men on whom Stalin can rely at all has gradually dwindled. It is not an uncommon phenomenon at the court of an absolute ruler where the desire to gather all the reins of government into one hand is reinforced by the supposed unreliability of all alternative drivers. Molotov has had a relatively long lease of life, but there have recently been signs of *malaise*. In February this year, during a purge in which some officials were dismissed “for not having fulfilled their obligations,” the name of Molotov's wife was removed from the list of reserved members of the Central Committee. The process of demotion by stages is customary in Russia, and it may be that Molotov has embarked on his downward journey to oblivion or worse. If this interpretation is correct, the change of office is a matter of domestic politics—the discrediting of Molotov, and Stalin's inability to find anyone else. Yet it is hardly likely, at this time of crisis, to be a matter of domestic politics. A far more probable interpretation relates Stalin's decision to the growing tension with Germany. If a crisis is imminent, Stalin may well prefer to be openly and completely identified with the policy he pursues, since he alone commands the fanatical loyalty and blind confidence of the Russian masses. There remains the major problem of Hitler's plans and Stalin's reactions. The German dictator has the choice of three conquerors of old, westwards with Julius Caesar, to Moscow with Napoleon, to Syria, Persia and India with Alexander. There is no evidence—beyond a persistent war of nerves the length of the Russo-German frontier—to suggest that he has already made the choice of Napoleon. Still less is it possible to forecast Stalin's

reactions. There is that in his career to suggest a preference for the way of compromise, delay and double-dealing. He intrigued rather than fought his way to power. If this trait is dominant, the Prime Minister of Russia may yet play the part set for the former Prime Minister of Yugoslavia and the present Dictator of Italy. On the other hand, it is from Stalin that has come the ever-growing emphasis on Great Russian nationalism. The “military vanguard of world revolution” may yet be set in motion by a reaction as simple and direct as an old-fashioned patriotism.

Telling the Reichstag

Hitler has pronounced the epitaph on the Greek campaign in a speech which was remarkable as much for its omissions as for what it said. In his assessment of the losses suffered by Germany and the numbers of troops engaged, he seems to have allowed his fancy free play. Claims and counterclaims are, however, of rather academic interest. It is for hints on the next move in Germany's strategy that Hitler's speech will be most closely examined, and in these it is singularly barren. The warm thanks to Hungary and Bulgaria for their “loyalty” suggests that both countries are to receive more compensation at Yugoslavia's expense. Italy's great role in “weakening” the Greek Army is also to receive recompense. It is interesting to speculate where. The historic Italian claim is, of course, Dalmatia, yet it appears to be unallotted, so far. Possibly the claims of Hungary and of puppet Croatia are not yet sorted out. However, Italy has recouped herself by taking Slovenia, and nothing could better illustrate her dependence upon the Reich. There are important German minorities in Slovenia, but so completely are Italian interests subordinate to German, that it is a matter of indifference to the Nazis whether or not the local *Gauleiter* chooses to call himself *podestà*. In the widest sphere of war strategy, Hitler had nothing to say. He called for more arms so that the German Army could maintain its lead, and the German soldier be better equipped “this year and next year.” He made no promise of immediate victory, no promise of annihilation for Britain. On the contrary, his references to the further phases of the war were definitely defensive. The Democracies cannot starve or crush Germany into submission. “The German people will never again experience a year like 1918. Force of arms will never make us yield, let alone break us.” The tone, surely, is peculiar. To the outside world the problem is still not of Germany being broken, but of Germany breaking Britain. Is it that, with the definite turn of American opinion, Hitler has abandoned all hope of total victory and is working for a stalemate? That he has always envisaged such an outcome is obvious from the consistency with which he has put forward compromise peace terms. Alternatively, it should be remembered, that never was there more talk of a long war and of *Sitzkrieg* than in the weeks before Norway. Hitler's silence may be a preface not to a western stalemate, but to the new offensive.

* * *

Business as Usual

The interviews of the 800,000 or so women born in 1919 and 1920, who have registered for war work, began this week. Actually, though nothing final can be said until some estimate can be made of the numbers actually called up, it appears that only a small fraction will be interviewed; first, those who are unemployed or unoccupied, which includes women doing only household duties (but not domestic servants), and those doing unpaid or part-time work; and, secondly, the women who “when registering, stated that they were available for transfer to war work and volunteered for such work.” The great majority, it is said, that is, all those who are officially described as being engaged in the “normal” industrial or commercial work of the country, will not be called upon; they are all doing “useful” work, it seems. This is not industrial mobilisation. “Ossification” would be a better word, for the general belief that everyone who works in wartime is doing war work is going to be deliberately confirmed. The parade of a national registration was hardly needed simply to rope in the unemployed. Women can now stay quite happily, with official approval, in work which

provides no contribution to the war effort at all; they are seemingly not even to be labelled as “available,” or told to expect a summons when the number of vacancies grows. This astonishing situation will also be true of the men over military age who have registered, for they, apparently, are to be interviewed on the same principle—that of “do not disturb.” The fact is that the National Work Register seems likely to be a historic sham—even though the biggest bottleneck in the war economy, by contrast to the enemy, is labour. It is true that the limitation of supplies and the concentration of industry will increasingly displace workers. But there is no guarantee under the present arrangements that many of these will not drift into non-essential work and stay there; and, in any case, if the war is not to be lost, the need for fresh war workers in the coming months and years has no limit. The vast pool of non-essential labour in distribution, domestic service and office work is apparently to be left stagnant, and, blessed with the Government's diploma of “usefulness,” the millions who are contributing nothing to the war effort can go on losing the war with a clear conscience.

* * *

Cautious Progress

It has now been announced, after widespread public pressure, that petrol allowances will be cut in June. The authorities are still unwilling to lay down the harsh principle that no petrol should be used for pleasure, and the cut is to be made in the supplementary allowances given for business purposes. It is, of course, true that there has been notorious waste and diversion of the extra petrol allowed in bulk to contractors and other business undertakings. It is well known that far too many supplementary allowances are granted to individuals. Saving could be effected by pruning these allowances, and the chief sources of supply for the “black markets” could thereby be closed. The danger of any flat-rate reduction would be that many men and firms who at present genuinely need every drop of their allowances for business purposes would be penalised together with the leeches. The basic ration for all car users is, apparently, to remain. Some waste of resources, even in total war, may admittedly be permissible for the sake of what is loosely called “morale”—which in the long years of this war may be of decisive importance. But there are two provisos: the military effort, which includes the shipping position, must not be weakened; and no chance to shorten the war must be missed by the over-tolerance for civilian conveniences. It may be the Government's view that every owner of a licensed car is entitled to the limited use of his car afforded by the basic ration; or, perhaps, that most car-owners could claim a small number of more or less essential uses for their cars which the ration will normally cover. But it is remarkable that the only cuts contemplated are in the allotments which are ostensibly granted after a careful scrutiny of essential needs.

*

Decisions on petrol rationing rest, of course, with the Government; administration of the scheme and—presumably—responsibility for advising the Government remain with the Petroleum Board, a body which represents only the oil companies. The Petroleum Board is an example of the obnoxious practice that has been all but universally followed in this war of appointing Controllers from the trades they control. Indeed, it may be considered the extreme example since, though it has public functions, it is self-appointed. Readers of *The Economist* are familiar with the very grave objections to this system of organisation; with the very best will in the world it necessarily increases the difficulties of distinguishing between private and public, peacetime and wartime, interests. But (since misunderstanding appears to have been aroused by a reference last week) it is perhaps necessary to state explicitly that the objections do not rest on any suspicion of lack of patriotism or public spirit in the members of the Petroleum Board or any other controlling body.

* * *

The Western Desert

The German advance still halts at Sollum, and during the past week the initiative has to a great extent

passed to the British forces. A heavy German-Italian attack on Tobruk, launched on April 30th, was brought to a standstill after piercing the outer defences. Thereafter the British garrison counter-attacked, and after a fierce fight, during which the enemy lost at least eleven tanks, the besiegers were driven off, the gap closed, and the defences restored. On the night of May 3-4 the British continued their offensive action and broke up the preparations which the enemy was making for a renewal of the attack. It is probable that the presence of this unreduced fortress on the flank of the German advance is still having an inhibiting effect on the Axis troops. By sorties and counter-attacks, the British garrison has already made 3,000 prisoners, and the threat offered by their activities is exactly the kind which the Germans with their long lines of communication can least afford. Round Sollum, the front is obviously in a state of flux, and it has been possible for British mechanized columns on at least one occasion temporarily to cut the Bardia-Tobruk road. And all the time the RAF is complementing these harrying tactics by sustained attacks on airfields, ports, columns and ammunition are being moved up, and the attack when it comes will make furious and unexpected use of all the resources at the disposal of the Axis in Africa. It is by no means certain that the attack will be confined—as it has been hitherto—to the coastal plain. The five oases of the Western Desert—Siwa, Baharia, Farafra, Kharga, and Dakhla—are potential stepping stones from the Libyan frontier to the Nile Valley. Siwa is only 75 miles from the Libyan post of Jarabub, and is linked by motor road with Mersa Matruh. Good desert tracks run between Siwa and the four oases farther south, and of these Kharga is connected by rail with the main Cairo-Khartoum line. Hitler has shown a preference for unorthodox routes which expose unprotected flanks and leave the main armies intact but surrounded. A drive to the Nile above Cairo would cut land communication with Abyssinia at a time when the northward movement of men should

become accelerated and would place a strain on the Sudanese forces which they may well be unprepared to take. These possibilities are, of course, familiar in Cairo, and General Wavell can be relied upon to have made appropriate preparations.

* * *

The Food Question

Last week's food debate in the House of Commons deserves more attention than it has yet received. A good deal of publicity has been given to certain rackets which were "revealed"; but despite a general preference among the speakers for avoiding the major issues and pursuing minor anomalies at length, the occasion once more drew attention to the one outstanding weakness of existing food policy. The trouble is that the essential problem, the increasingly feverish scramble for unrationed foodstuffs, has not been tackled at the root. So long as the problem is approached by a combination of partial price control and the timid extension of rationing, competition for those commodities whose sale is unrestricted must grow; and the solution is a drastic extension of group rationing or the imposition of an upper limit to personal food expenditure. As many speakers pointed out, and as Major Lloyd George recognised, the fish situation cries to heaven and is a grave reproach to the Ministry. The position with regard to canned fruit and vegetables is far from satisfactory; consumption is unnecessarily high and prices are rising. On the question of the provision of extra rations for men and women on heavy work, there appears to be a good case for following the precedent created by the provision of extra cheese for agricultural workers and miners. But it is perhaps not generally realised that the unwillingness of the Ministry to extend this principle is due to the knowledge that it would involve definite cuts in the rations of the ordinary citizen.

* * *

Defence of the Union

It is still the case of the Opposition in South Africa that this is "England's war"; and, as South African troops fight farther and farther from the Union's frontiers, protests grow. When the war started, it was understood that the troops recruited would serve in the defence of South Africa—somewhere south of the Zambesi. It was later argued, very reasonably, that the defence outposts of the Union in the struggle against Italy and Germany might be north of the Equator. South African soldiers and airmen moved to Nairobi and beyond. They took a notable part in the destruction of Italy's East African Empire, and now they are to move to North Africa, to the Mediterranean itself. This is common sense. The defence of the British Commonwealth and Empire, of the whole and of the separate parts, is indivisible. Anzacs defend Australia and New Zealand in the Near East. Indians defend India in Irak. Canadians defend North America in Britain and over Germany. The South African forces themselves have no complaint; but the Opposition grumbles. They ask whether it is the intention that the Union should become a Colonial Empire; they ask what South Africa owes to Abyssinia; they ask whether Haile Selassie will refund to the Union the expenses of the Abyssinian campaign. But, except in the failure to see that the African campaigns, however distant, are in South Africa's defence, they are not consistent: some protest at fighting for British interests and British "imperialism"; Dr. Malan, on the other hand, speaking for South African racialism, and referring to "the policy of extending South Africa's frontiers up to who knows where," asks, "Are we going to make a white man's country of South Africa and keep it so, or are we going to make a colossal native compound with a white patch at one end of it?" The war and recruitment continue. While the Opposition is mostly convinced that "the war has already been lost"—which is the real basis of their attitude—the great bulk of the South African people take pride in the achievements of their troops; and wherever they fight in Africa, or even in Asia (for which, if it became necessary, he would seek authority from Parliament), General Smuts will have general backing.

The War of Nerves

From Paris to Dakar there are the stir and uneasiness which usually precede some major political crisis. There are renewed rumours of German reinforcements to the already large German Armistice Commission in Morocco. General Weygand is said to have protested in vain against the flood of visas granted to German agents by Vichy, and many observers find it ominous that the *Jean Bart* is believed to be lying in Casablanca with a full war complement of men and armaments. Further north, there are persistent rumours of Spanish reinforcements in Tangier and Spanish Morocco. In Spain, Independence Day brought truculent warnings to the "pluto-democracies" that Spain "is master of her own destiny," which reads strangely beside circumstantial reports of the extent to which Biscaya and Galicia have passed under German control. Finally, in France, Admiral Darlan's negotiations with Paris have borne fruit in the shape of an agreement with Germany. According to its main provisions, the Nazis are to permit the transport of foodstuffs, coal, iron and other goods across the frontier between Occupied and Unoccupied France, and to reduce the cost of occupation by one quarter (from 400 million to 300 million francs daily). The French *quid pro quo* is given no publicity, and although there is a new under-current of hints that Vichy-France should take vigorous action to restore the Free French Colonies to their "allegiance," it is unlikely that the Germans are yet in a position to exact political or military concessions without risking a break with Vichy. Marshal Pétain's prestige and the twilight status of "neutral" France are far too valuable for the Nazis to risk such a breach. The Germans know that both Marshal Pétain and the Caudillo would oppose any definite scheme of military co-operation, but their countries are being submitted to the full blast of a war of nerves at high pressure in the hopes that, with a sweep of victories from the Eastern Mediterranean, they may be stamped by their more impressionable Ministers—a Suñer or a Darlan—into action which their better judgment rejects.

* * *

Iraq's Oil

The importance of Iraq's oil lies more in Hitler's desire to have access to it than in any indispensability to the Allied cause. From Hitler's point of view, the Iraqi production—normally about 4 million tons of crude a year—is the most accessible large field after Roumania. The Caucasian field is perhaps geographically more accessible, but he may judge the political and military obstacles to be too severe. If Hitler can hold Iraq and the Eastern Mediterranean, and if he can either capture the double pipe-line (to Haifa in Palestine and to Tripoli in Syria) intact or repair it, he will be well on the way to a considerable increase in his petroleum supplies. These are, of course, large ifs, and there would also be the problem of transporting the oil—refined from Haifa, where there is a large refinery, crude from Tripoli—to Germany. All in all, there is little prospect of any Iraqi oil for Germany in 1941, even if everything goes like clockwork in the Middle East. But that is undoubtedly Hitler's game. From the British point of view, the Iraqi oil is no more than a convenient supplement to other supplies. In 1938, less than 5 per cent of the petroleum supplies of the United Kingdom came from Iraq. It may be that in wartime the Mediterranean Fleet is making more use of the supplies conveniently to hand at Haifa. But there are other supplies not far away. The Persian Gulf fields—Iran, Bahrein, and Saudi Arabia—produce and refine nearly 12 million tons a year, and Egypt's oil production is rapidly approaching the million ton mark. If Hitler has Alexandrine ambitions he may dream of occupying these oil fields too. But even he can hardly dream of having such naval control of the Persian Gulf, the Indian Ocean, the Red Sea, the Suez Canal, and the Mediterranean, and enough tankers in those waters to be able to use a drop of the oil they produce. On a relative calculation, therefore, the enormous balance of advantage in the oil politics of the Middle East lies with sea power. The important thing to do in the immediate future is to prevent Hitler from getting the Iraqi oil, even if that involves denying it to ourselves. The main British supply is, in any case, at the other end of the world. In 1938, 48.3 per cent of

the United Kingdom's oil came from the Caribbean and South America and a further 18 per cent. from the United States, and it is safe to assume that the proportion taken from the west rather than the east has risen since the war began.

* * *

By Any Other Name

"Co-prosperity" hath a wondrous fair sound. As a description of the material bliss due to be introduced into eastern Asia by the signature of two economic agreements between Japan and Indo-China, it may prove overrated, at least as far as the latter State is concerned. The purpose of the two agreements is to provide for the economic domination of Indo-China and its exploitation by Japan. The model that Germany has given to the world, as the fruit of Dr Funk's experimentation in the Balkans, is more or less closely followed. Thus, French Indo-China is to admit Japanese capital for the development of agriculture, and mining and hydraulic concessions. Increase in mutual trade is to provide a market for rice, maize, coal, and minerals from Indo-China in Japan, in return for which Japan will despatch textiles and manufactured goods. The crux of the matter, the rate of exchange at which these goods will pass, is not yet apparent. It is to be suspected that the rate of exchange between the agricultural products of Indo-China and the finished goods from Japan will be strongly in favour of the new masters of eastern Asia. So far as the treaties are concerned, it appears that customs barriers in Indo-China are to be scaled down more substantially than those in Japan, but it would be rash to conclude from this that the terms of trade are to be in favour of Indo-China. The solution is probably to be found in the provision in the second of the two treaties, which admits Japanese commercial firms to Indo-China. Any apparent concession to the inhabitants of Indo-China will no doubt be appropriated by Japanese-controlled enterprise. It will be interesting to see what manufactured articles the Japanese will, in fact, export. What is the Far Eastern equivalent of aspirin?

Debating Public Schools

It was perhaps inevitable that the second reading debate on the Public and Other Schools (War Conditions) Bill should produce the usual attacks on the public schools, in spite of Mr Ramsbotham's valiant attempt to parry them by emphasising in his opening speech that the Bill had nothing to do with the "public school problem." One or two members got round this by asserting that, if the House did not pass the Bill, the public schools would have to close down—which would help the war effort. Others were more sensibly concerned lest the power to alienate endowment funds would mean that scholarships for poor boys would be reduced in order to maintain masters' salaries. Actually, the Bill itself is a perfectly innocuous measure. It does not ask for a penny of public funds to be voted, and the Board of Education and the Lord President of the Council can refuse to permit an alienation of funds which would prejudice the interests of the beneficiaries of the endowment. But the bad temper and testiness produced by such an unimportant measure show once again what an impossible position has been caused by the peculiar benefits which a public school education confers. How very real these benefits have become in this century is illustrated by the undignified attempts of schools outside the pale to get themselves admitted. The Public Schools Acts of 1868 and 1873 only allow the distinction to seven schools, which with the 24 or so administered by bodies incorporated by Royal Charter will have to make their applications to alienate funds to the Lord President of the Council. But Paton's List of Schools includes 183 so-called public schools, and it may well be that in the course of time the description will apply to every grammar school and other secondary school in the country. Not that this will redress the balance against secondary schoolboys unless they can at the same time acquire the public school manner and accent. Not very long ago, however, the headmaster of a Lincolnshire grammar school actually announced that he was going to teach his pupils the "southern accent," in order to help them to get jobs. It is this state of

affairs which "is perpetuating snobbery"—the words of one of the Labour speakers in last week's debate—not the Bill which was then under discussion.

* * *

Family Allowances

It is to be hoped that little time will be lost in debating the motion proposing the introduction of a State-paid scheme of allowances for dependent children which has been tabled by Wing-Commander Wright, Miss Eleanor Rathbone and Dr. Edith Summerskill. This motion is now supported by some 120 members of all parties; and, in these days, there is little need to argue the case for the provision of family allowances through all its stages. It is sufficient to point out that allowances are, in fact, enjoyed by all citizens with families who are subject to income tax, and also by unemployed persons in receipt of insurance or transitional benefit. With the recent extension of income tax to cover the aristocracy of labour, the only section of the community which is virtually without any State provision for its children is the mass of working class families. The provision of family allowances for this section of the population would remove an anomaly rather than introduce an innovation. The social benefit would be out of all proportion to its scope, for it is precisely among the lower working class incomes that the rearing of a family presses most injuriously on the standard of living. The fear of trade unionists that the "wage level" would be depressed by the provision of allowances is no more justified than the assumption that the wage level—in the abstract—will adequately support an average family capable of maintaining the population. It would be an advantage if the sponsors of the motion would extend its scope to include the provision of certain allowances in kind. The National Milk Scheme is already a form of family allowance, and the principle could be extended indefinitely.

Concentration in Whitehall

Now that the common-sense step of merging Transport and Shipping in a single Ministry has been taken, it is tempting—simply as a somewhat speculative exercise in political theory and with no very serious intent—to scan the Departments for other places where "telescoping" might be possible. The amalgamation of Food and Agriculture in a single Ministry of Food Supply would be a useful step towards the making of a single and consistent food policy; and it has always seemed logical, in theory, though not probably, a really practical proposition, that the Ministry of Supply should cover, not only industrial capacity and materials, but labour as well, with three departments, Munitions, Materials and Manpower. With these three Ministries—Wartime Communications, Food Supply and War Supplies, each with its component but co-ordinated departments—the framework of war economy might be much more evident and apt than it is at present; there would, of course, be the Treasury; and a Ministry (or Board) of Trade, with departments of external and internal commerce, while more miscellaneous than its colleagues, would round off a very formidable economic quintet. The picture may be fanciful, but it is attractive.

South America's Airways

(By a Correspondent)

May 1st

FOR the maintenance of close and friendly relations with the South American republics there is to-day hardly any need more urgent than that of air communications. The lines under German or Italian control comprise more than 20,000 miles of scheduled routes. In South America, Pan-American Airways fly over 15,000 miles; their affiliated companies include another 11,000; and their Caribbean services must give them some 40,000 miles of flying lines in Latin America. Certain other small independent companies maintain local services, and in Central America, the Taca, owned by a British subject, covers the area with a close network of freight and passenger services. The Dutch K.L.M. service, connecting Surinam with Curaçao and the coasts of Venezuela and Colombia, has been suspended by the Germans, and Air-France, which provided a transatlantic service via Dakar, collapsed with the fall of France. These facts, therefore, have to be faced: the predominance among European lines of Axis interests, the great trunk services of Pan-American Airways, and the absence of British enterprise on any substantial scale. Indeed, the successful British company in Central America owes its results not to the support of interests in England, but to the initiative of its owner and manager.

The subject has two distinct aspects, transatlantic services and internal development. An airmail letter from London to Buenos Aires usually goes first to Lisbon, thence in the Pan-American clipper to New York, and thence down the coast. Theoretically, this should only take a little over a week. But the pressure on the mail space, difficulties of exact connections and, sometimes, bad weather usually mean that two to three weeks elapse before arrival—without allowing for censorship. During the past winter, surface mail from Buenos Aires has even reached this country before the corresponding airmail. When Air-France was running, it was possible to get a letter to Buenos Aires in under a week.

The Axis powers are not thus embarrassed. In December, 1939, the Linee Aeree Transcontinentali Italiane (Lati), a heavily subsidised offshoot of the Ala Littoria company, inaugurated the Rome-Rio service. The principal ornament of Lati is its managing director, Bruno Mussolini. As Lufthansa's transatlantic services were suspended at the outbreak of war, Lati alone now flies the South Atlantic. The service is maintained by trimotored Savoia Marchetti S 83 T convertible bombers. The Rio-Rome route takes three days and goes via the Cape Verde Islands, Rio de Oro and Seville. These planes are of inestimable value for propaganda material, and, it is safe to assume, a good deal else besides.

German Penetration

Internal air communications present an equally disquieting picture. Of the German lines the Condor syndicate is the most aggressive. It flies the Brazilian flag but is controlled by the Deutsche Lufthansa, and that it is the spearhead of German aerial penetration in South America can hardly be doubted. It maintains its own aero-photo-grammetric section. Its passenger fares are well below those of Pan-American Airways, and revenue is not its primary consideration; some of its lines into the Brazilian interior are definitely uneconomic but provide useful transport for government officials. "Test flights" have recently carried Condor planes so far out to sea that the Argentine Government showed concern. No non-scheduled flight beyond the range of vision from an Argentine airport can now be made without an army observer on board.

Lufthansa's operations are closely connected with Condor's. The Rio-Natal service, an essential transatlantic link, was opened in 1930; the Graf Zeppelin made its first landing at Rio in that year; and in 1934 the Lufthansa-Condor combination established a weekly airmail link between Europe and South America, which operated up to the war. Since then Lufthansa's internal services have been mostly taken over by Condor, and the transatlantic service has been left to Lati.

There are other German companies in South America, but they are all connected in devious ways with the Lufthansa-Condor combine. Such activity has not passed unnoticed. Lufthansa in Peru had its licence cancelled early this year; Sedta, a small company in Ecuador, is under close surveillance. Scadta, in Colombia, is different. It was founded in 1919-20, and in 1931 Pan-American Airways acquired control. But the personnel remained largely German, and, finally, after various adjustments, the company became merged with Avianca, a Colombian concern. In 1940, the German technical staff and most of the executives were discharged.

The Pan-American Airways service is sufficiently well known; the Lisbon-New York flight is a vital line for Anglo-American communications. In Latin America there are extensive routes in the Caribbean, and two main trunk lines down the east and west coasts. Buenos Aires is now within four days of New York, and directly linked with Santiago and La Paz. The service is regular and efficient, but expensive. Pan-American Airways have unquestionably made a real contribution to inter-American relations, and the mere mechanical business of organising inter-American conferences is now much facilitated.

A Remarkable Enterprise

Taca (Transportes Aereos Centro-Americanos) operates in the five little republics of Central America and in Western Panama. It is owned and managed by Lowell Yerex, a New Zealander, and, in spite of limited coverage, is the most remarkable adventure in aviation in Latin America. Yerex turned up in Central America in 1931, the pilot of a single aircraft, without any influential backing and without any company behind him. Last year, Taca carried 11,000 tons of freight, 3½ million pounds of mail, 65,000 passengers, and large quantities of baggage. One-hundred-and-fifteen airports belong to the company.

Taca has conclusively demonstrated three important factors for the future of aviation in Latin America. First, the aeroplane is a freight carrier; until recently the whole chicle trade of Guatemala was carried by Taca, and the gold mines of Nicaragua import their machinery and export their gold by the same means. Secondly, by careful planning it is possible to bring air travel within popular reach; most of Taca's passengers are farmers. Thirdly, aerial communications do not mean trunk lines only. Whole regions can be intensively developed by air, especially when land routes are difficult, and not only does the region itself benefit, but the trunk lines find much-needed feeders.

It is lamentable that such experiments—there are one or two other small British ventures—have been so few. Latin America, although clearly offering vast opportunities, has failed to strike the British imagination, and the initiative has gone to competitors. An exploratory commission from London visited Buenos Aires a few years ago, but the war has prevented action. We are thus almost entirely dependent upon Pan-American Airways, first, for the transatlantic service, and, secondly, for continental air transport. That "Pan-Am." have this service so well organised is all to their

credit, but the experience, for example, of Taca, shows that there is an encouraging future for British enterprise; if Britain herself finds her hands tied, it may be hoped that Canada, which is rapidly forging new commercial links with Latin America, will seize the opportunities.

Improvement in Eire's Supplies

[FROM OUR DUBLIN CORRESPONDENT]

April 29th

THE position with regard to supplies has improved. The petrol ration has been increased and private motorists will be able to take to the road again. The existing stocks of flour will enable the country to tide over the harvest, after which the mixture of other cereals with wheat may be necessary. Efforts are being made to import wheat, but the difficulties are great, and there is the special danger of cargoes being sunk. No reliance, therefore, can be placed on imports, and the food programme is based on the need for Eire to be completely self-supporting—which is luckily possible. The Minister for Supplies, in announcing the improvement in the situation, expressly disclaimed the allegation that the shortage of supplies was the result of any external pressure. "The difficulties," he stated, "are an inevitable outcome of the war and will end only when the war ends." The Minister also stated that "it is a dangerous fallacy that all the country's present difficulties could be avoided by some manipulation of the currency or by some wider utilisation of bank credits," and proceeded to point out that "the false idea that financial difficulties are impeding effective action might not merely cause mischief, but would, if it persisted, prevent the concentration of effort on the realities of the situation."

The Engineers' Association has published two very valuable reports dealing, respectively, with the present fuel situation and with the fuels and materials available for emergency transport. In the former report, it is stated that the normal annual fuel consumption in Eire consists of 2,500,000 tons of coal, 3,500,000 tons of turf, 40,000,000 gallons of petrol, 10,000,000 gallons of gas and oil fuels, 4,500,000 gallons of crude petroleum and 18,000,000 gallons of paraffin oil. Of the coal, 60 per cent is used for domestic and 40 per cent for industrial purposes. In order to maintain industries and rail transport, at least 500,000 tons of coal must be imported. The substitution of home produced fuel for coal would involve the solution of four problems: first, the winning of 3,000,000 additional tons of turf; secondly, its transport; thirdly, the conversion of industrial furnaces for native fuels, and, finally, the conversion of domestic stoves and ranges. The winning of the additional turf would employ 300,000 men for a hundred days a year. The transport of the turf would necessitate the control of the railways and canals on an emergency basis.

The report on emergency transport states that the number of mechanically propelled road vehicles is as follows: private 50,000, goods 10,000, public passenger 5,000, steam 100, electric battery 70, motor cycles 3,000, miscellaneous, including agricultural tractors, 2,000. Upwards of 90 per cent of these vehicles depend upon petrol or oil. The problem of substituting alternative power is a threefold one, of material, of equipment and of fuels. Considerable difficulties exist under each of these heads. From the point of view of materials, the most hopeful possibility is the conversion for use of town gas, but the supply of this gas depends upon the continued import of coal, which is by no means certain. The conclusion is reached that only one-tenth of the private and commercial vehicles in the country could be commissioned to use substitute fuels on the basis of available resources.

Higher Cost of Living

The announcement by the British Chancellor of the Exchequer of his intention to prevent the cost of living from rising more than 25 to 30 per cent above pre-war level is of interest to people in Eire owing to the close connection between the currencies of the two countries. In the Report of the Banking Commission attention was

drawn to the necessity of keeping up the internal value of the Irish pound if the parity with sterling was to be maintained. The following figures, which are taken from the *Irish Trade Journal*, show that, in spite of considerable differences in the increases in the various groups composing the index, the cost of living index numbers have increased by practically the same amount since the beginning of the war.

PERCENTAGE INCREASES.

	United Kingdom 1st Sept., 1939, to 1st Feb., 1941	Ireland mid-Aug., 1939, to mid-Feb., 1941
Food.....	24	24
Clothing	65	36
Fuel and light.....	24	46
Total (including rent and sundries)	27	26

In view of the large sums which the British Government proposes to devote to the subsidising of essential commodities and of the difficulties of the supply situation in Eire, there is a possibility that the cost of living in Eire will rise more than in Great Britain. Such a divergence between the index numbers would point to the overvaluation of the Irish currency.

Arbitration in Australian Labour Disputes

[FROM OUR SYDNEY CORRESPONDENT]

March 31st

THE rapid expansion of industrial production since the outbreak of war has caused serious maladjustments in Australia's labour conditions. The shortage of skilled workmen inevitably brought pressure to bear on the existing skilled labour force, with the result that there was a great deal of overtime worked. Plans for training additional skilled workers have been put into effect, but they have not yet restored equilibrium and long hours of overtime continue in munition industries. In this atmosphere of strain it was only to be expected that labour disturbances would occur.

The Commonwealth arbitration system of wage fixation had certain weaknesses, the most outstanding being that Court procedure was cumbersome and the hearings of applications for wage adjustments were frequently long delayed. This weakness, sufficiently annoying at any time, was intolerable under the rapidly changing conditions of war. One of the first actions of the Advisory War Council, on its establishment towards the end of last year, was to survey the arbitration system and recommend ways by which it could be improved. Regulations were issued, based on the Council's recommendations, which amounted to a complete overhaul of the then existing machinery with the object of fitting it to consider and settle grievances promptly whether these were local or Commonwealth-wide in their application.

The most important alterations may be briefly summarised thus:—

Three more Conciliation Commissioners have been appointed, making four in all. These Commissioners are closely linked to the Arbitration Court and are under the jurisdiction of the Court's judges. Their duty is to investigate any disputes immediately and on the spot, forming their own committees of employers and employees and working in close contact with trade union officials. In matters of local import, the judge may empower the Commissioner to arbitrate without referring the matter to Court.

SETTLE ALL QUESTIONS as to
PROTECTION FOR YOUR FAMILY,
PROVISION FOR YOUR OWN FUTURE, AND
SAVING FOR THE COUNTRY

by means of a policy with

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE

— FOUNDED 1835 —

48 GRACECHURCH STREET, LONDON, E.C.3.

Important reforms of Court procedure have been agreed upon to speed up the machinery. The limits imposed upon the Court, restricting its authority in those disputes which concerned only one individual State, have been removed for the duration of the war.

Further important powers have been added by giving the Court authority to act on its own initiative, and authorising the Minister for Labour and National Service to direct the Court to carry out an investigation into any matter which has either led to, or in his opinion is likely to lead to, a strike or stoppage.

Special emphasis has been placed on the necessity for the Court to make the maximum use of employers' and employees' authorised representatives in order to cut down formal evidence and so expedite decisions.

The Court is now empowered to make a flexible common rule for an industry, or part of an industry, or a group of industries, according to its own discretion. If, however, there is a likelihood of the Commonwealth ruling impinging on the findings of a State Tribunal, the two authorities are to adjust the matter between themselves.

Finally, it is now provided that any organisation or employer, knowing of any matter which may lead to a cessation of work, is expected to inform the necessary authority so that the Court can take action.

The decline in industrial disputes during the past weeks may, it is true, be partly attributable to increasing war tension and to the active participation of Australian troops; nevertheless, the improved arbitration system has undoubtedly played an important part.

An interesting public announcement was recently made by one of the Commonwealth Arbitration Court judges which stresses the importance of conciliation by the Court. Of eleven important cases for the renewal of awards settled through him since the outbreak of war, four were settled by agreement; three substantially by agreement; one partly by agreement; and only in three cases was no agreement reached without Court action.

The Distribution of American Trade

[FROM OUR NEW YORK CORRESPONDENT]

March 22nd.

THE foreign trade of the United States in 1940 showed a large increase over that of recent years.

MERCHANDISE TRADE (\$000,000)

	Exports (incl. Re-exports)	Imports for Consumption	Export Surplus
1937	3,349	3,010	265
1938	3,094	1,950	1,134
1939	3,177	2,276	859
1940	4,021	2,540	1,396

In the table, the balance is the excess of general exports over general imports, not the "imports for consumption (retained imports)."

EXPORTS BY GRAND DIVISIONS (\$000,000) (including re-exports)

	1937	1938	1939	1940
Africa	152	118	115	161
Asia and Oceania	679	610	640	715
Europe	1,360	1,326	1,284	1,645
North America	840	740	806	1,070
South America	318	300	360	435

GENERAL IMPORTS BY GRAND DIVISIONS (\$000,000)

	1937	1938	1939	1940
Africa	92	55	77	131
Asia and Oceania	1,036	586	723	985
Europe	843	567	620	390
North America	690	490	581	694
South America	422	263	318	395

These figures show an excess of exports to each of the "grand divisions" in 1940, except Asia and Oceania. In each of the past four years, the trade has shown an excess of exports to Africa, Europe and North America. The trade with Asia and Oceania showed an excess of imports in 1937, 1939 and 1940—only the recession year

of 1938 reversed this balance. The trade with South America showed an excess of imports in 1937 and a rather small excess of exports in the three subsequent years.

Since June, so far as our trade is concerned, for Europe, read the United Kingdom. In the last half of 1940, monthly exports to the United Kingdom ran about double the average of the first half. For the imports, the average held roughly through the year (about \$13 millions a month); slightly above 1939, well above 1938, but below 1937. For the year the total imports from the United Kingdom were \$155 millions, or under half of the total imports from Europe, hence the figures for the year 1940 are far from representative of the current movement.

Comparing 1940 with 1915, our exports averaged rather higher—\$335 millions a month, against \$296 millions; but our imports are much higher, averaging \$219 millions, against \$148 millions. However, our exports to Europe in 1940 averaged \$137 millions, compared with \$214 millions in 1915; and our imports from Europe \$32 millions, compared with \$45 millions in 1915. Not all of this shift is attributable to war influences. A generation ago, foreign trade meant, to the U.S.A., trade with Europe; now it is much more generally distributed. While it is obvious that the present distributions are dominated by the war, one would certainly hesitate to suppose that either present or previous distributions would hold in the future.

The Tempo of Defence

The increase in expenditure for national defence, noticeable from the beginning of the current fiscal year, has accelerated rapidly since the end of the calendar year 1940.

The following table shows the movement:

EXPENDITURES ON NATIONAL DEFENCE (\$000,000)

	For Month	Accumulated		For Month	Accumulated
July, 1939	109	109	July, 1940	177	177
Aug.	114	223	Aug.	199	376
Sept.	108	331	Sept.	219	595
Oct.	115	446	Oct.	284	879
Nov.	118	564	Nov.	365	1,244
Dec.	125	689	Dec.	460	1,704
Jan., 1940	132	821	Jan., 1941	561	2,265
Feb.	129	950	Feb.	576	2,841

Shorter Notice

"The Ukraine." A History. By W. E. D. Allen. (London) Cambridge University Press. 404 pages. 21s.

This history of the Ukrainian people, which is as much a history of Russia and Poland, is a timely addition to the history of Eastern Europe. A postscript, entitled "Ukraine and Europe, 1939-40," deals with the partition of Poland between Germany and Russia and the occupation of Western Ukraine by Soviet Russia. This was a severe blow to the Ukrainian nationalist movement, which itself appeared as a result of the general nationalist developments in Europe during the 19th century. Before 1914-18, the Ukrainian nationalist movement was largely dependent on German and Austrian assistance; and the mass of the Ukrainian people, peasants and industrial workers, showed little interest in national independence. In 1918, Germany failed to create an independent state, and the Soviet Ukraine became part of the Union of Soviet Republics. In 1938, Soviet Ukraine produced 55 per cent of the total Russian output of pig iron; but Ukrainian industry is not an independent whole. The Soviet Government systematically binds southern industry to other parts of the Soviet Union; and a similar policy is pursued in agriculture. To-day Soviet Ukraine is not the granary of Russia. It is the most important part of Russia's industry, and is rapidly developing into the most highly industrialised part of the Union. But it still remains for many the enticing transit country from Central Europe to Asia.

German Europe

Oil.—The Germans have taken a big step in the direction of a European war economy by founding a Continental Oil Holding Company, the *Kontinentale Oil AG*, Berlin. The company is a joint undertaking of eight large German combines, including the leading oil companies, the *Deutsche Erdoel AG*, the *I.G. Farben*, *Wintershall AG* (potash and oil), the *Reichswerke H. Goering*, and the leading producers of synthetic oil. More than half of the aggregate capital of the founders is State owned, and all the companies are large integrated combines manufacturing oil, coal, potash, metals, iron and steel, and chemicals. The company will start with a capital of Rm. 80 millions; Rm. 50 millions will be provided by the founding companies, and Rm. 30 millions will be offered to the public by four of the Big Five banks, led by the *Deutsche Bank*. The purchase of foreign oil interests on a large scale is to be expected.

The importance the Germans attach to this new company may be seen by the fact that the Minister for Economic Affairs, Dr. Funk, is the director; and the head of the "Wehrwirtschaft and Armament Department" of the High Command of the Fighting Forces, General Thomas, is a member of the board of directors.

At the end of April, hardly four weeks after the company was founded, the first results were reported from Roumania. The new company undertook the supply of drilling and other material to the Roumanian oil industry. The Roumanian oil companies are to be nationalised and all the foreign-owned companies are to be acquired by the Roumanian State. In 1941, 165 wells are to be drilled, as well as 50 test wells; and it is hoped to achieve an increase in output of 300,000 tons. A short time ago one of the founder companies, the *Wintershall AG*, acquired a controlling interest in the Hungarian oil industry with an annual output of some 300,000 tons.

The supply of oil for military as well as industrial activities is one of the most important problems in Germany. So far, the high estimates of an annual wartime consumption of 20 million tons have been very sharply disproved. But it is a fact that the total consumption of oil on the Continent in 1938 was estimated at between 24 and 27 million tons, the higher figure including storage for military purposes. In 1940, the total output of natural and synthetic oil on the Continent may perhaps have reached half the lower figure, that is, 12 million tons.

The largest single source is the Roumanian oil industry. Its output, according to the *Petroleum Press Service*, fell from 8,704,000 tons in 1936 to 5,815,000 in 1940. In 1939, and particularly in 1940, drilling fell off rapidly. In January and February, 1941, the daily output was still very low; and, without a substantial increase, total output in 1941 will not exceed 5 million tons. One of the main purposes of the activities of the *Kontinentale Oil* in Roumania is the centralisation of the different operating companies and the supply of drilling and operating material formerly imported from the United States. Special efforts will be needed for the manufacture of drilling material, because German companies were already employed to full capacity. The recent course of Roumania's oil exports has been as follows, in 1,000 tons (according to *Petroleum Press*).

	1939	1940	Jan.-June, 1940	July-Aug., 1940
Total exports	4,178	3,493	1,797	1,696
United Kingdom	629	488	481	7
Germany*	1,285	1,430	375	1,555
Italy†	634	343	156	187
France	238	87	87	0
Switzerland	114	92	21	71
Hungary	165	35	31	4
Jugoslavia	150	174	79	95
Bulgaria	94	95	45	50
Turkey	30	148	99	49
Greece	75	187	74	113

* Czechoslovakia included. † Albania included.

In 1940 exports to Germany increased 11.2 per cent to 41 per cent of the total exports. The changes are easily explained by the German occupation of the Balkans, which began last autumn. Shipments through the most important Balkan ports and loading places developed as follows:—

	1938	1939	1940	Jan.-June, 1940	July-Aug., 1940
Constantza....	3,349	2,738	1,433	1,240	193
Giurgiu	936	1,204	1,246	320	926
Ploesti	175	180	606	190	416
Orsova	0	0.4	142	18	124

The Black Sea port of Constantza, handling in normal years two-thirds of total oil exports, was thus reduced to third place in the second half of 1940. Giurgiu and Orsova, the Danube ports, and Ploesti, the production centre where shipment by rail starts, increased their shipments correspondingly. The figures reveal the German effort to reorganise transport by rail and by river. At present, two new pipe lines from Ploesti to Giurgiu and to a place near Orsova, as well as new tank cars, are under construction. It can hardly be doubted that the Germans will be able to ship a great part of the oil output by rail and inland waterways to their consumption and refinery centres.

If the increase in the production of natural and synthetic oil in Germany proper is taken into account, and the small production of annexed Poland and Alsace is added, Germany should be able to increase total oil output in Europe, including Albania and Italy, to well above 12 million tons. But Germany will only be able to supply industries in occupied countries, if those industries are to be used for Germany's war industry, by cutting down civilian consumption to the barest minimum. Unless there is land fighting on the scale of 1940, acute shortage in Central Europe is hardly likely. Certain lubricants and other specific oil products which are not produced on the Continent can be supplied by Soviet Russia.

Outside Germany, the occupied countries are frantically trying to find some source of oil. There are reports of oil prospecting in France. Sweden is developing a shale oil industry similar to those in the former Baltic States. Hungary was able to increase its home output to the point of self-sufficiency, and at the same time all these countries are changing cars over to wood gas generators and the use of liquified gas.

★

Industry in the South-East.—Roumania's industry has been chosen for direct co-operation. Even before the activities of *Kontinentale Oil* began, a characteristic move by the *Reichswerke H. Goering* secured what was called "a co-operation agreement" with the *Malaxa* combine, which controls the leading Roumanian iron and steel plants. The combine includes a modern rolling mill and will probably work for German orders; and raw materials will be supplied by Germany. The Germans claim that the South-Eastern countries developed heavy industries for strategic reasons without any proper raw material bases and without sufficient markets. A "rationalised" South-Eastern Europe under Germany's direction would develop mainly industries subsidiary to agriculture, together with the intensified production of high quality foodstuffs, such as dairy produce, meat, vegetables and fruit. Natural resources like bauxite and non-ferrous metals, however, would be developed on the spot, and there might be possibilities for developing textile industries based on artificial fibres. Heavy industries vital for war industry will "co-operate" with German combines; and this "co-operation" will be effected by purchase, by cartels or by inclusion in a German concern. Industries subsidiary to agriculture, such as meat and fruit packing, machine industries and other civilian industries will be developed "normally" and as far as possible with home supplied raw materials; but specialised industrial products will be monopolised by Germany.

THE BUSINESS WORLD

Investment and the Lyttelton Plan

UNDOUBTEDLY, the Stock Exchange was over-complacent at the outset about the probable effect on its own wares of the Lyttelton scheme for wartime concentration of reduced output in the consumption trades. It was assumed, almost as a matter of course, that the larger companies had little to fear—and perhaps something to gain—from closer organisation whose avowed objective was to limit weak production and weak selling. Only fish of a certain size normally find their way to the Stock Exchange pool, and the market, for reasons partly economic and partly historical, has a relatively smaller stake in the total capital of the consumption trades, with a few exceptions, than in the big staple "heavy" industries, which have for decades been seeking the investor's capital.

Closer consideration of the problem, however, has sensibly modified first impressions. The consumption trades, as a whole, made great headway in this country during the 1920's and 1930's, and the Stock Exchange played quite an important part in supplying the new capital they required. The "shilling" deferred share, whose vogue in new company promotions in the last twenty years has been viewed with such mixed feelings, was a device mainly suited to the flotation of smaller concerns subject to the speculative risks of trades catering for the tastes of a somewhat fickle clientele. In some "Lytteltoned" industries, like cotton and wool textiles, the Stock Exchange has always had a considerable interest. But even the most superficial comparison of a present-day Official List with that of, say, December 31, 1918, will show that the investor's stake has increased considerably, in the meantime, in trades like musical instruments, rayon, hosiery, bricks, household requisites, carpets, sanitary ware.

Further experience gained from preliminary discussions among traders, and from inquiries at the Board of Trade, has suggested that the benefits of "concentration," even to the larger units, will be less automatic than had been at first assumed. It is clear that the authorities, though their primary aim is to release men, factories, and sites for the war effort, conceive themselves, so far as conditions allow, as guardians of the small man's interest. This may have an important bearing on the way concentration is likely to work out in practice. There is only one recognised qualification for a "nucleus" firm—that its works shall be running full time. This condition may be satisfied, broadly, in one of three ways. First, a concern may have reached capacity on a combination of home, export and Service orders. That may be the position with a few lucky small or medium-sized firms turning out more or less specialised products, whose entire plant may be needed to cope with a few good Service contracts. It is hardly likely, however, to be the condition in which the majority of the larger concerns find themselves. In their case, the gap left by severe limitation in the civilian home market, and reduced export trade, will need a great deal of filling. Secondly, a company may, by shutting down some of its factories or parts of factories, bring about full production in the others. This is likely to be the characteristic method adopted by the larger units, and it has already secured official recognition, e.g., in the case of Courtaulds. The third method involves co-operation between a number of separate firms, with a pooling of quotas, machinery or labour, or agreement by one unit (in this case a "nucleus" in the true sense) to turn out the quotas of the others at cost. This is the method the Board of Trade particularly favours, because it secures immediate concentration with the least possible extinction of goodwill, trade marks, and established connections, which may become national assets again after the war.

For the majority of firms, by number, the third method, or some variation of it, is likely to be the most widely adopted—particularly if, as seems not improbable, the bulk of actual "telescoping" is eventually done under the direct instructions of the authorities, in default of voluntary local agreement within the stringent time limits the Board of Trade has, rightly, laid down. If local preferences, however, still carry weight, geographical and labour factors being equal, it may be questioned whether the smaller firms will be particularly anxious to go under the wing of the big combines rather than join with firms of their own class; for they will naturally regard the former, in possession of their trade secrets and customers' lists, as the more formidable post-war competitors. Naturally, to the extent that the large concerns do in fact take over the production of the smaller on a "cost" basis, their own profits will be increased, since the considerable reduction in overheads under full-time running will be shared between their own output and that of the "taken over" firms. But if, in fact, the authorities favour arrangements among the smaller firms inter se, then the combines will have to rely for economies in expenditure on their own internal arrangements, and will actually be denied the opportunities, which might have come their way under a *laissez faire* régime, of absorbing distressed competitors on bargain—or at least favourable—terms at a later stage.

All this has obvious relevance for Stock Exchange investors, since most of the leading market issues, at least, in the trades affected, are those of the bigger units. Given the necessity for reduced production any-

† Free of tax. (a) Apart from preference arrears. (b) On "A" shares. (c) Subject to EPT. (d) 5 per cent. cum prof. £1. (e) No quotation.

how, under Limitation of Supplies or Raw Materials Control Orders, the Lyttelton plan is a bull rather than a bear point for investors, so far as it goes. For one thing, it will prevent the "queering" of the trade by the existence of numerous weak concerns struggling to keep in being, at the margin, on a woefully inadequate level of permissible output. And it will enable the bigger concerns themselves to make more drastic cost-saving adjustments than would probably have been effected in equal time, if the customary barriers to the shutting down of entire factories and the turning adrift of their labour force had been present. But the economies thus achieved are highly unlikely to compensate, in terms of profit-earning power, for the severe cuts in total production which the national interest dictates, unless the large concerns do succeed in bringing the smaller firms right into their factories on a wider scale than, for reasons already suggested, seems likely.

All British companies, under EPT, have a fixed ceiling but no firm floor for wartime dividends. It must be concluded, on the whole, that the effect of the Lyttelton plan will be to raise the "floor" slightly above the reduced level which official raw material and sales restrictions would have established in any event—but not much more.

It is fortunate, therefore, for investors that the "Lyttelton" trades (with some melancholy exceptions) usually enjoyed a satisfactory degree of prosperity before the war. Their leading concerns, consequently (again with some exceptions), are still in good financial

trim, and can hope to survive a lean period by reducing or passing dividends if necessary, but without catastrophic deterioration of their financial structure. The table on page 624, which gives a brief selection of companies—usually of the larger type—from industries which would appear to be affected by the Lyttelton plan, shows clearly that the earnings position was, in most cases, still eminently satisfactory in the earlier war months. The figures also suggest where some of the "exceptions" are likely to be found—notably in the textile trades.

Many of the figures, admittedly, relate to financial periods which closed some months back, when official restrictions on output and sales were much less clear than now. It would be surprising if future reports made as good a showing. But no sane investor would dream of buying the shares of companies in predominantly civilian industries, during wartime, on their immediate prospects. The Lyttelton scheme, in itself, may tend to enhance the present status of the debenture and preference securities of low-gear and conservatively financed companies in these industries, which may fare better under the scheme than if events had been left to take their course. But the equity stocks of those companies must be classed, in the technical phrase, as a "lock-up" for eventual post-war recovery. In that sense, a selective buying policy might have something to commend it, if share prices were to fall disproportionately on the future publication of reports showing a decline in profits.

Non-Ferrous Metals in War

THE last war was a turning point in the history of non-ferrous metals. It marked the beginning of an era of rapid expansion in production and consumption, the one being facilitated by progress in mining technique and by the opening up of new deposits, and the other by the growth of industry and the downward trend in prices, especially in the past decade. These tendencies are reflected in the following table, which shows the growth of world production and the course of prices for the five leading non-ferrous metals:

World Production (1909-13=100)					
	Aluminium	Copper	Lead	Spelter	Tin
1914-18	195	136	102	101	106
1919-23	229	97	83	77	99
1929	569	201	151	163	162
1937	989	240	146	183	170

Prices in London (1909-13=100)					
	(a)	(b)	(c)	(d)	(e)
1914-18	180	157	170	214	117
1919-23	116	123	156	126	103
1929	109	120	153	104	114
1937	91	87	153	94	136

(a) New York.

In an attempt to assess the supply position during this war and the effect of the conflict on post-war developments it may be useful to distinguish three groups of producers and consumers: Nazi-dominated Europe; Russia and Japan; and Great Britain and the United States. The search for synthetic products which has revolutionised the position of other commodities has not been of much influence on metals. There are no synthetic metals, and the extent of the substitution of plastics for metals has been very small. The three groups of countries are therefore thrown back upon their own resources for the duration of the war.

With the exception of aluminium and, to a lesser extent, spelter, Nazi Europe is deficient in non-ferrous metals. Under the lead of Germany, Europe's output of aluminium rose from an average of 25,000 metric tons in 1909-13 to 240,300 tons in 1937, when it was responsible for 49 per cent of world production. But Europe's mine production of copper only rose from 103,000 metric tons to 149,600 tons, while its proportion of world production fell from 10 per cent to 6 per cent. Europe's mine production of spelter increased from 488,000 metric tons to 445,200, but, as in the case of copper, its share of world output fell from 41 per cent to just under 25 per cent. Its output of lead showed an absolute decline during this

period, from 332,000 tons to 248,600 tons, while its proportion of world output fell from 28 per cent to 15 per cent. So far as tin is concerned, Continental Europe was and remains entirely dependent on other continents for supplies.

Russia, on the other hand, has large deposits of all base metals, but hitherto her resources have been exploited at a very slow pace. The speed of exploitation may be increased with the help of German technical assistance. But metal industries cannot be expanded at short notice, while Russia is not likely to favour the installation of German technicians in key positions. On a long-term view, Russia's non-ferrous metal industries have enormous possibilities; but in the near future the rate of growth may be expected to remain slow. Japan is deficient in metals, and while China has substantial resources, years would be needed by Japan to make herself independent of other sources of supply.

Since, with the exception of aluminium, the greater part of the expansion in production since the last war has taken place in countries outside the influence of Germany, Russia and Japan, the position of Great Britain and the United States is considerably stronger than twenty-five years ago. The world's annual capacity to produce copper has increased from 1,000,000 metric tons to over 2,500,000 tons, that of zinc from 1,000,000 tons to 1,750,000 tons, that of lead from 1,250,000 tons to 1,800,000 tons, and that of tin from 150,000 tons to about 250,000 tons. The world's aluminium producing capacity has risen from about 70,000 tons to 700,000 tons, and although hitherto the expansion has been most marked in Germany, the United States and, to a lesser extent, Canada, are now expanding their plant at a rapid rate to meet the growing needs of the aircraft industry.

The British Empire's copper production has been increased enormously by the development of the Northern Rhodesian and Canadian deposits. Similarly, the Canadian, Australian, Newfoundland and Burmese lead and zinc industries and the Malayan and Nigerian tin mines have been appreciably enlarged since 1914. Among other countries, Chile and the Belgian Congo have developed their copper deposits, Mexico its lead and spelter mines and the Dutch East Indies and Siam their tin resources. Indeed, the growth of productive capacity has been such that prices have fallen and production has had to be regulated to prevent the flooding of the markets. And since 520,000 metric tons of copper, 390,000 tons of lead, 175,000 tons of zinc and 58,000 tons of tin were imported by the continent of Europe in the twelve months preceding the war, the quantities now available to Great Britain and the United States are sufficient to prevent them suffering from any shortage of non-ferrous ores.

In the circumstances, it has not been surprising that hitherto the war has not touched off a boom in non-ferrous metals on the world market. The present prices of copper, tin, lead and aluminium in the United States are actually slightly below the average for the year 1937, only zinc has risen, by 0.75 cents to 7.25 cents per lb. In the United Kingdom the official maximum quotations for copper, lead, spelter and aluminium, as well as the market price for tin, are slightly higher than the average of 1937, but the differences are largely counterbalanced by the fact that the delivery basis has been changed from ex warehouse to free consumers' premises.

The British Government has, in the main, confined its metal purchases to the Empire in order to economise foreign exchange. The contracts placed with Empire producers are based on pre-war prices, subject to adjustment for rises in production costs caused by the war. While these agreements allowed the British overseas production to be raised to its potential maximum, they tended to depress production elsewhere, as the United Kingdom had regularly imported large quantities of non-Empire metals before the war.

More recently, however, a major change in the international metal position has taken place. Great Britain has agreed to buy the whole copper surplus of the Belgian Congo, while the United States has so far contracted for about one-half of Chile's normal copper production, and is about to place further orders, which will cover additional quantities of Chilean copper and the great bulk of the lead and zinc surplus of Latin America, including Mexico. In addition, the United States Government has placed a contract for the accumulation of a large strategical tin reserve of 75,000 long tons—the figure will probably be further raised by a new agreement next summer. Like Great Britain, the United States is paying approximately pre-war prices for the metals bought abroad, so that a metal boom on 1918 lines may be avoided. As United States war production comes into full swing, that country, together with Great Britain, may eventually absorb the great bulk of the extra-European metal-producing capacity. But, except in the case of aluminium, further expansions in the capacity to produce the leading non-ferrous metals in the countries accessible to Great Britain and the United States seem unnecessary.

The position is somewhat different as regards metal refining and the production of aluminium. In metal refining the extra-European position has been greatly affected by the blockade of the Continent, which has cut off many overseas producers of base metals from their normal refining bases in Belgium, Germany, Holland and Norway. Before this war, the tonnage of base metals refined on the mainland of Europe was about 40 per cent larger than the tonnage mined in

Europe, and in lead and zinc, in particular, Belgium played an important role as a refiner of American, Asiatic and even Australian ore. As a result, additional refining facilities are required outside Europe. The United States has refining capacity more than large enough to handle its domestic ores, but a number of new copper, lead and zinc smelters and one tin refinery are being built to deal with imported ores. There was a similar development in the last war, but the business was lost to America after the war owing to the lower European costs of refining and the presence in Europe of a market for metal refined from imported ore. A similar development may be expected after this war. The position would be different if new refineries were erected in the mining territories, but so far, at least, hardly any development in this direction has taken place, nor are there signs that they will take place in the near future.

In the case of aluminium the production facilities now being added in Europe, the United States, Canada and even Australia will prove of greater importance from the long term point of view, and it appears certain that the aluminium industry will be the only one of the major metal industries whose basic position will be fundamentally altered by this war. Before this war ends, international aluminium output may have passed the limit of 1,000,000 metric tons a year, which compares with 490,600 tons in 1937 and 282,100 tons in 1929, themselves the two outstanding boom years between the two wars. Whether this enormous tonnage can be absorbed without difficulty in peace conditions remains to be seen, but the far-sighted scientific research into civilian uses of aluminium, which has been continued everywhere despite the war, and the reasonable price policy pursued by the leading aluminium producers since the outbreak of the war (in the United States the Aluminum Company reduced its price from 20 cents to 19 cents per lb. last year in spite of the pressure of demand) at least indicate that the industry is aware of its problems.

Since the expansion in the production of base metals in the past two decades has been concentrated on the countries accessible to the English-speaking nations, their supply position is considerably stronger than during the last war, though their capacity to produce aluminium—so important in the manufacture of aircraft—and to refine other metal ores may have to be expanded. Continental Europe's supplies, on the other hand, are not much bigger than twenty-five years ago, except in the case of aluminium, while Japan's resources are inadequate. The voracity of the war industries is likely to lead to a further increase in the world's productive capacity, but there is no reason why the increased supply should not be absorbed after the war, when one of the main objects must be the increase in the standard of living of the people.

Finance and Banking

Treasury Bill Allotments

Even allowing for the larger quota of Treasury Bills for which it now applies, the discount market on Friday of last week obtained its most disappointing allotment for three months past. The tender was the first one at which the normal currency of the bills on offer returned to 92 days. The market understandably endeavoured to lower the price of application to £99 14s. 10d., or 1d. lower than the price at which it had been tendering for the 91-day bills. To have kept the effective price at 11d. would have reduced the profit on turnover to a mere 5s. 7d. per cent. The total applications for bills were, however, exceptionally heavy, and as most of the outside applicants—both official and unofficial—appear to have put in their tenders at £99 14s. 11d., the syndicate had to be content with an allotment of 11 per cent only. This disappointment may, however, be the price which the market had to pay for establishing the rate at the slightly more attractive level. If, as is probable, the unofficial outsiders obtained more bills than they expected, the way should now be clear for the syndicate both to maintain its price of application at £99 14s. 10d. for the 92-day bill and to obtain more reasonable allotments. The short money position has been comfortable this week, and the market itself has found it difficult to satisfy the banks' appetite for bills. Outside sources have, however, proved good sellers. The Bank return covering the week to last Wednesday shows an excep-

tional variety of changes. The circulation, contrary to all seasonal trends, continues to increase, and at £625,972,000 is £2,623,000 up on the week creating a new high record. The facilities granted to the India Council in connection with the recent vesting order are being rapidly repaid and other securities fell by £13,553,000 over the week. With Government repayment of ways and means advances, Government securities are £6,830,000 down. Fortunately there was ample room for contraction in the credit basis from last week's inflated level of bank cash, though bankers' deposits at £113,556,000 are still at a fairly comfortable level.

Mexican Misgivings

Purchases by Mexico of British exports do not in normal times amount to a very large proportion of the total; but, owing to strategic barriers to some former markets and exchange shortages in others, exporters welcome gladly any expansion of demand through the remaining channels, and it has become obvious from the current spate of status inquiries on Mexican firms that commercial developments are to be expected. It is not wished to cast doubts on the desirability of trade expansion, but the matter may be considered from the angle of present needs. Exports to Mexico are paid for in "free sterling"; they are not subject to settlement

through registered or special account and thus escape the directive influences operated under Regulation 5B with other markets. The proceeds of exports to Mexico therefore represent funds with which the holder can play as he chooses; there is no need for them to be used in settlement for British imports from the same country. They can be offset against cheap Japanese textiles dumped in South Africa, or the importer can obtain access to the sterling by purchasing it either in the New York free market or in other places, such as certain Central American countries. In London banking circles, the numerous inquiries from Mexico are attributed to the possibilities associated with present methods of payment. The discount on free sterling is possibly not wide enough to provide the only reason, and it is suspected that if free balances were to be subjected to more rigorous inquiries than at present, their legitimacy might be disproved. It is contended that if a Special Account were set up promptly for the settlement of reciprocal indebtedness, it would serve to close a further gap in the country's economic defences. In the absence of the trade statistics formerly published, it is difficult to judge the extent of this free sterling loophole and the extent of Mexico's exports to the sterling area. But so long as British exports escape the net of exchange control, it is not certain that they contribute their maximum yield to the sterling area, and if recognition of the exchange position is tardy, there is also the risk that such recognition might be accomplished only by freezing an adverse transfer-hazard.

Hambros Bank

The report and accounts of Hambros Bank for the year to March 31st last epitomise the difficulties which the war has placed in the way of merchant banks and, in particular, of those which have endeavoured to cling to their traditional business of financing foreign trade. The set-back in this type of activity is reflected in the balance-sheet in a reduction of acceptances from £3,667,534 to £707,855. Its impact on the profit and loss account is equally marked, the net profit, after allowing for directors' remuneration, being down from £194,528 to £80,458. Mr. Olaf Hambro, in some notes on the report, which have been circulated in lieu of a chairman's speech, states that over 90 per cent of the bank's acceptances were international credits granted to customers in the Scandinavian countries against shipments of merchandise between them, the United Kingdom, and abroad. When the enemy occupied Denmark and Norway, Sweden and Finland were in effect cut off from trade with this country, and as a result practically all the acceptances outstanding on behalf of clients in those countries gradually ran off and were repaid. Some of the Norwegian and Danish commitments have been liquidated during the year, and as for the remainder, it should be noted that the deposits held with the bank on Danish and Norwegian account exceed in the aggregate the engagements of clients in those two countries. Wherever such assets and liabilities are in

the name of the same customer—and that holds true in many cases—the bank will ultimately be able to compensate the two. The experience of the war has, in the opinion of Mr. Hambro, demonstrated the soundness of the principles on which London acceptance credits have been based. Except in the case of German credits which, at the request of the Government, were made subject to the Standstill Agreement, the war has not prevented the bulk of the credits opened on European account from being repaid by the credit takers.

U.S. Balance of Payments

The official estimates of the United States' balance of payments for 1940 have been published. The data will be found in the following table, together with comparative figures for 1939:—

	In million \$.					
	1939			1940		
	Creds.	Debits	Net	Creds.	Debits	Net
<i>Trade and Service</i>						
Merchandise	3,177	2,318	+ 859	4,021	2,682	+ 1,339

Merchandise exports last year rose above \$4,000 millions for the first time since 1939, and the export surplus, at almost \$1,400 millions, was the largest since 1921. These figures are, however, dwarfed by the total of gold imports, which amounted to \$4,750 millions. Even allowing for the increase of \$645 millions in gold under earmark, the net gold inflow was larger than the gross merchandise exports. A feature of the estimates is the large "residual" item of \$1,432 millions in favour of the U.S.A. This is largely accounted for by capital inflow other than that shown specifically as such in the tabulation. Among possible examples of such unrecorded capital transactions the following may be mentioned: funds bought by foreigners but held in domestic names; funds previously held for foreign account withdrawn in the form of currency and thus not included in retransfers of such funds abroad; and refugee funds shifted from foreign to domestic addresses with the arrival of the owners in the United States.

INSURANCE NOTES

The quinquennial valuation was made on December 31st, 1940, the bases employed being the same as those used five years previously, with interest at 2½ per cent., both for life assurances and annuities. After devoting £324,858 to writing down Stock Exchange securities to market values, there is a disposable surplus of £748,352, but the directors have wisely decided to postpone any declaration of bonus; interim bonuses will continue to be paid, subject to review at the end of each year, at about one-half the pre-war scale.

Premiums and profits in the other departments are set out in the table below:—

	Premiums	Rise or Fall	Profits	Rise or Fall
Fire	£ 2,207,951	+ £ 6,765	£ 81,984	- £ 66,073
Accident	1,332,383	- 126,559	223,306	+ 63,428
Marine	1,259,066	+ 261,400	50,000	...
Capital Redemption	11,010	- 6,248	...	...
Total	4,810,410	+ 135,364	355,290	- 2,645

The London Assurance.—Shareholders of the London Assurance may well be content with the results of operations during the first full year of the war, for the report and accounts just published make pleasurable reading. The life department is the chief sufferer from war conditions, but even here the corporation has fared better than the general run of offices, as the following figures show:—

New business—net sums assured		Rise or Fall.	
Net premiums	£868,081	+ £665,377	(31.7%)
Net interest	£358,333	- £19,538	(5.5%)
Rate earned	£3/6/9%	- £/4/11%	
Claims by death	£291,738	- £524	
maturity	£245,043	- £174,190	
Surrenders	£79,199	- £11,143	
Commission & expenses	£115,338	- £5,594	
Commission & expenses ratio to prem.	13.3%	- 0.7%	

The reduction in death claims is especially remarkable, bearing in mind that the 1940 figures include £32,306 on account of war claims.

Considering the defection of business consequent upon cessation of operations in enemy and enemy-occupied territory, the maintenance of the fire premium income is highly satisfactory. Fire profits are lower, the chairman (Mr. R. Olaf Hambro) explaining that the experience at home has been the worst for many years; it is known also that the business has run less favourably in the United States. In the accident account (which does not include a United States portfolio) the twin features of lower premiums and higher profit doubtless alike spring from the common root of conditions in home motor insurance. The big jump in marine premiums is readily accounted for by increased hull values and cargo surcharges; the profit released of £50,000 is purely nominal, the fund remaining very strong at 126 per cent. of the premium income.

In the profit and loss account there are credit transfers, including net interest of £209,732, aggregating £587,641. Provision for taxation, expenses not otherwise

(Continued on page 628)

Investment

The Turning Tide

Although it would, perhaps, be optimistic to describe the news of the past week as good, it has been sufficiently favourable to allow the forces making for higher prices to make a visible impression. There has been some measure of recovery, tentative and sporadic. It is true, in the two sections which bore the brunt of last month's decline, the Funds and industrial equities. So far, this movement has not been accompanied by any appreciable revival in the volume of business from the very low levels to which the Greek reverse reduced turnover, which strongly suggests that, as yet, the public is taking little part. This is the usual sequence of events, and, if all goes well, the buying ought to spread, despite a tendency in some quarters to maintain existing standards out of capital. If this happens, the effect on a market, still short of stock in almost every section, is likely to be substantial. For the investor, the lesson of the Greek campaign is presumably that the end of the war, and the resumption of freer trading conditions, is rather further off than he may have hoped. There is, however, no evidence at the moment that this has affected his ideas as to what are desirable investments. In so far as equities are rising, the improvement is still rather in those which may be expected to do well out of post-war reconstruction, than in those which will maintain profits during the period of hostilities, but may suffer later. The preference is the more remarkable in that the latter give the relatively high yields, whose attraction in the fixed interest field is outweighing the disadvantage of possible loss of capital.

* * *

April Recession

The extreme paucity of business during the period of the Greek adventure made it more difficult than usual to keep track of its effects on prices, and it is still, perhaps, rather early to assess the effects of the April campaign on markets. The appearance of *The Actuaries' Investment Index* does, however, give an opportunity to put movements in perspective up to April 29. Despite the pressure of money, which everyone knew to be imminent, the

Funds lost their March rally, but were still above end-December levels, while in every other major section of fixed interest stocks not only did the closing of margins continue, but prices actually rose, with a consequent fall in yields. The only exception of note was a slight recession in miscellaneous industrial preferences. In industrial equities, there was also a tendency for the closing of yield margins to offset the effects of some reduction in distributions. The result was, that, while price indices fell back to below the November level in many cases, the yield indices were better than the December figure for all the main sections. The principal

exceptions were more severe reverses in coal, gas and oil shares, and improvements in investment trust, aircraft and electric light and power companies. The setback was very slight in insurance, electrical equipment and stores and catering. The best performance of any major group was that of the distributive industry, where, thanks largely to shipping, a fall in distributions was accompanied by virtual stability of prices.

INSURANCE NOTES—continued.

charged and pensions, etc., absorb £298,918 and £4,800 is taken for the capitalization of part of the profits of an associated company. Dividends cost £207,463, which is less than the interest earnings, and the balance carried forward is higher by £76,461 at £934,553. The balance sheet position is exceedingly strong. As already mentioned, Stock Exchange securities in the life fund have been written down to market values; in the general fund book values show a surplus over market values of £258,607. There is a general reserve of £3,000,000.

Co-operative Insurance Society, Ltd.—This important organisation, which is closely associated with the co-operative movement, transacts life assurance in three sections—ordinary, collective and industrial—extracts being exhibited in the accompanying table. The society has been handicapped during the past year by the same difficulties as have beset other insurance offices, the chairman (Mr. A. Judd) referring especially to the introduction of substitute labour unaccustomed to the intricacies of the business of insurance; the accounts, however, make a good showing. In the ordinary life section, the virtual closing of the house purchase scheme has been an important factor contributing to the reduced new business. Under present circumstances the society has decided to defer the annual valuations, but will continue to pay interim bonuses without alteration; in the collective section there is a surplus of £12,720 available

for distribution among those retail co-operative societies which contributed to this fund.

The premiums and profits in the non-life sections are set out below. Profits are the actual earnings, excluding interest, and do not correspond with the transfers to profit and loss account.

Demand for "Assented" Stock

The Consol market had acquired maturing corporation loans in advance of the announcement of the full terms, and, having accepted conversion in respect of their holdings, are now offering them at figures ranging from 3½ to 5 points above the price of issue, namely 99½. Since the loans have a minimum life of over fifteen years, the premium does not impair their trustee status, and the sharp rise in quotations shows that the particular combination of terms offered is exceptionally popular. As will be seen from the table below, the running yield on these 3½ per cent stocks is appreciably above that obtainable on 3 and 2½ per cent securities of equal standing, while the return to redemption, whether before or after deduction of tax, is considerably lower. This marks an intensification of a tendency which is by no means new. For months past, investors have been prepared to

"Assented" Stock	Interest 1/s/41	Offered Price	Flat Yield	Net Return to redemption

† September 1. There is a further 16s. 8d. on November 1. ‡ Less tax at 10s.

face an ultimate loss of capital to secure a higher current income, but this factor has been strengthened by the raising of income tax to 10s. in the pound. The widening of this margin suggests that those who do not need to live on capital would do well to avoid the purchase of redeemable stocks at a premium, and that the Treasury might well attract savings of some individuals more easily, and save the taxpayers' money in the long run, by offering a medium to long stock at a premium, with a suitable adjustment in the nominal interest rate. The minimum price for "assented" stocks has been fixed at 98, which seems even more out of touch with existing prices than are most of the other official minima.

INSURANCE NOTES—continued.

society increased during the year by nearly three millions and now stand at £5,092,000.

The **Sun Life Assurance Society**, notwithstanding the severe fall in new business, still remains one of the largest producers in the country; considering that the call to the services has taken nearly 40 per cent. of the male staff, the reduction is not so remarkable as might appear at first sight. Premium income is but little affected. The lower interest earnings on the Society's funds are partly due to an increase in holdings of Government securities of £1,828,000, from £11,609,000 to £13,437,000. The rise in claims by death is more than accounted for by war claims amounting to about £200,000. Commission and expenses are lower, but the reason lies in the reduced new business. The balance-sheet position is strong. The Chairman (Sir William Goschen, K.B.E.) stated at the meeting that the Society has made a careful examination of mortgages and loans and has valued Stock Exchange securities at market prices, the result indicating that the value of the assets in the aggregate exceeds that stated in the balance-sheet; the bulk of the mortgages, totalling £5,883,000, are on well-distributed residential property and for several years past no new investments by way of purchase of mortgage have been made in blocks of flats or large properties generally. During the year the life assurance fund increased by £1,701,000 to £43,290,000.

The accounts of the **Scottish Provident Institution** likewise show a sub-

Company Notes

Marks and Spencer Profits

Shareholders in Marks and Spencer are to be congratulated upon a further increase in profits, after interest and fees, for the year to March 31. The increase is modest, less than 1 per cent, to £2,881,925, of which taxation, including tax on dividends, absorbs some £1,815,000, so that, after a small reduction in depreciation, the ordinary dividend is down from 38.8 to 35 per cent, the earned percentage having fallen much more sharply. The 1939-40 dividend was to have been 42½, but was cut, to the figure given, in accordance with the dictates of the Dividend Limitation Bill. The table below gives profits and their allocation for the past three years:

	Years to March 31.		
	1939	1940	1941
	£	£	£
Profit†	2,213,003	2,860,157	2,881,925

Reserves 435,225
Carry forward 98,569 325,089 346,530

† After interest and fees. ‡ On capital increased by 10% scrip bonus.

A considerable portion of the company's accounting year was covered by some limitation of supplies, and, at the outbreak of war, a considerable portion of the total turnover was in textiles, which have been most adversely affected in various ways. The management has, however, succeeded in adjusting the business to the changing needs of the public, and is understood to be doing a substantial business in foodstuffs, while the geographical spread prevents population movements from affecting profits greatly. These factors, coupled with the rise in prices which had until recently enabled retail trade to maintain its cash turnover, explain the figures, but it is doubtful whether even so successful a company as this can repeat the performance in the current period. The "A" ordinary shares of 5s., at 30s. 6d. ex dividend, give a return of some £5 14s. 9d. per cent.

stantial drop in new business; the Chairman (Mr. A. W. M. Beveridge) explained that this is due partly to withdrawal from the issue of temporary and other low-rated assurances and partly to a reduction in the number of inspectors. The net interest rate, although lower, is still well in excess of the valuation rate of £2 15s. per cent. Included in death claims is an amount of £82,667, representing claims resulting from enemy action. Of the total assets £8,300,000—approximately 32 per cent.—represents British Government securities. To meet depreciation in investments the investment reserve has been increased by £750,000 to £1,350,000 through a transfer

from the revenue account, thus enabling the directors to certify that, taking the investment reserve into account, the assets are fully of the value stated in the balance-sheet. At the last quinquennial investigation (December 31st, 1938) there were undistributed balances aggregating £478,000 and, with the addition of the surpluses earned during the past two years, it may be safely assumed that there is a margin in the assurance funds more than sufficient to provide the above transfer of £750,000. The directors have considered it prudent to suspend payment of intermediate bonuses after December 31st, 1940.

* In addition there was expenditure of £8,117 on air raid precautions.

Canadian Pacific Railway March, 1941, Earnings.—Gross earnings of Canadian Pacific Railway for March, 1941, were \$16,619,976 and expenses \$13,373,901. Not earnings were \$3,246,075, an increase of \$1,744,514 over March, 1940. Gross earnings increased by \$5,142,420.

Industry and Trade

Rubber Under Control

The London rubber market has temporarily lost most of the attributes which made it the world's centre for dealings in rubber. Owing to the war it had found it difficult to fulfil its former functions. The blockade of the Continent involved the loss of an important market; shipping difficulties impeded the free movement of rubber; heavy purchases by the American Government at virtually fixed prices tended to limit price movements. Now, the Battle of the Atlantic has forced the Government to take over the control of imports into Great Britain, to husband available supplies, and to distribute them in the national interest. And the control over imports and distribution will probably involve regulated prices, based on production costs, with allowances for transport and other charges. All this has been inevitable. But steps have been taken to prevent the complete disintegration of the market. The Government is prepared to make use of its organisation for the purchase of rubber and service to consumers, and the market will be able to continue its international business.

Rubber Supplies

So far as is known the appointment of a rubber controller to the Ministry of Supply does not immediately affect the International Rubber Regulation Committee's function of controlling exports from producing countries. It is now necessary not only to regulate total exports but also their destination, a task which is facilitated by the fact that the British and Free Dutch Governments, which are represented on the Committee, together control some 90 per cent of the world's rubber-producing capacity. (French Indo-China and Thailand are the only important other producing countries.) And if the Committee can fulfil these functions there is no reason why it should not continue to exist. In view of the importance of the United States as a consumer of rubber, close collaboration with that country is desirable, and, indeed, has already been established. So far as actual supplies are concerned, these are ample. The 250,000 to 300,000 tons formerly consumed each year by Continental Europe are now available to the democracies. Moreover, the export quotas of the producing countries adhering to the international agreement are now 100 per cent of the basic tonnages calculated by reference to productive capacity. The heavy supplies now forthcoming are diverted chiefly towards the United States, whose imports rose from 486,000 tons in 1939 to 811,000 tons in 1940, and showed a further increase during the first quarter of this year. As a result, the United States has been able to accumulate a substantial reserve against the contingency of a temporary interruption of trade with Far Eastern producing countries.

Retail Trade

In March, the average daily value of retail sales, as measured by the Bank of England on the basis of returns from a large number of shops, was 2.1 per cent smaller than in the corresponding month last year. As the following table shows, the extent of the fall was the same in foods as in other merchandise:—

	Percentage Changes from Preceding Year	
	Food and Perishables	Other Merchandise
1940 August	+ 5.4	+ 21.0
September	+ 11.5	+ 6.7
October	+ 5.2	+ 20.9
November	+ 0.3	+ 1.3
December	+ 0.8	+ 6.7
1941 January	+ 5.8	+ 8.8
February	+ 3.5	+ 1.8
March	+ 2.1	+ 2.1

An analysis of the geographical distribution of sales shows that, except in Central and Suburban London, they remained above the level of March, 1940. Sales in Central and West End London showed a fall of 17.9 per cent, and those in Suburban London one of 12.9 per cent. The value of stocks (at cost) at the end of March was 15.4 per cent higher than a year earlier in the case of food and perishable articles and 10.7 per cent higher in other merchandise. Total stocks in Central and West End London were only 0.9 per cent higher than a year earlier, but in other districts they were appreciably bigger, the increase ranging from 8.2 per cent in the Midlands and South Wales to 22.1 per cent in North-east England. But as the rise in retail prices during the past twelve months has exceeded the increase in the value of stocks, the quantity of the goods held by shops must now be appreciably smaller. It is understood that proposals for concentration in the retail trade are to be announced shortly. The need for adjusting the size of the trade to war conditions is unquestionable. But the task bristles with difficulties, not the least of them being the solution of the problem of the landlords of the shops that are to be closed.

Textiles of the Future

Few industries have had a more spectacular growth during this century than the rayon industry, which has created for itself an immense market quite apart from its encroachments upon the field of some of the older textile fibres. The shortage of natural textile fibres brought about by the war opens up further possibilities for rayon and for other synthetic textiles which have recently been introduced in the United States. Rayon itself has been so greatly improved that its fabrics are now able to compete with woollen and worsted fabrics, and it even appears to be developing a field for itself in the carpet and blanket industries. The United States army is experimenting with its use for service clothing, and it is said that the manufacture of rayon in that country is only limited by the available plant. Unfortunately, new plant construction is hampered by the fact that the cost is high, the plant has no alternative uses, and the rapid march of the industry renders it particularly liable to sudden and complete obsolescence. Side by side with this best-known synthetic textile are arising several others whose possibilities are as yet scarcely estimated. Nylon, whose ultimate raw materials are air, coal and water, is remarkable in particular for its elasticity; it is said to have a recovery of 100 per cent when released from a stretch of 4 per cent, compared with a recovery of 50 per cent for silk and acetate rayon, and 30 per cent for viscose rayon. It is stronger than silk when dry, less absorbent than wool, rayon and silk, is not easily burnt or mildewed and does not attract moths. Its principal future seems to lie in the stocking trade, but it is also believed to have merit as a parachute fabric and possibilities in some of the luxury fields now held by rayon and silk. Vinyon, produced from derivatives of coal or natural gas, salt, water and air, is water repellent and has a high resistance to acids and alkalis at ordinary temperatures. It makes an excellent electrical insulator. Fibreglas, made from fine-drawn molten glass, is resilient, flexible and has a very great tensile strength. Several other synthetic fibres, on which work has not yet proceeded so far, seem to hold out a promise of varied individual merits which should assure each of a considerable field of usefulness. It seems likely that the manufacture of many of them will be developed rapidly in the United States, where the increased demand for textiles arising from the defence programme has coincided with a greatly diminished supply of imported raw materials. Other countries, notably Japan, will probably develop their production of synthetic textiles with increasing rapidity, and something like a revolution in the textile industries may be found to have taken place by the time the post-war reconstruction problems present themselves for solution.

American Export Policy

The extent to which the flow of exports from the United States is now canalised by the Administration is not generally realised on this side of the Atlantic. Under the Export Licence Control Act the President has power to curtail or prohibit the exportation of any article in which a threatened shortage would be dangerous from the standpoint of national defence. The list of commodities thus controlled has lengthened considerably in recent months and the licensing system has, in fact, become a valuable instrument of Government policy. If the export of a particular commodity is not prohibited altogether but is made subject to licence, applications must pass through the State Department; and it is credibly reported that applications for shipment to some destinations are subject to almost interminable delay, whereas a licence for the dispatch of the same article to another country may be dealt with immediately. The petroleum trade offers an example of the way in which the provisions of the Act are being used to bring pressure to bear upon Japan. Last July, the export of aviation spirit, tetra-ethyl lead and certain associated products from the United States was prohibited except to countries of the western hemisphere. Japan surmounted the obstacle to some extent by purchasing petrol of a quality slightly below the specification laid down in the order. And because she was short of tankers and also of bulk storage accommodation she bought much of this petrol in steel drums, shipped it in cargo vessels and probably stored it in the original containers. Early this year, however, the President decided that the export of steel drums should in future be controlled by licence in order (so it was said) to conserve steel for national defence. On the other hand, the Administration may grant a general licence for the export of certain goods to a particular destination. Such general licences have been issued to the British Purchasing Commission and the British Iron and Steel Corporation for the supply of iron and steel to British possessions, while a similar order for the unlimited supply of various petroleum and other products to the United Kingdom was issued early in March. Thus the American Government is unobtrusively assisting Great Britain in her effort to withhold vital supplies from the Axis Powers.

Zinc

Zinc has become scarce in the United States, in spite of the large and growing domestic output. Between 1939 and 1940 production rose by 33 per cent to 674,100 short tons; of this total 588,600 tons were derived from domestic ore and 85,500 tons from imported ore. During the same period domestic consumption rose by 9 per cent to 662,900 tons. Simultaneously, exports of the metal, chiefly to the British Empire, rose from less than 5,000 tons to more than 80,000 tons. As imports of zinc in the last year were negligible, the deficiency in production had to be met by withdrawals from stocks. Between the end of 1939 and the end of 1940 producers' stocks fell from 66,000 tons to 12,900 tons, and consumers' stocks from about 110,000 tons to 78,000 tons. While production rose to an annual rate of 711,600 tons during the first quarter of the current year, this was inadequate to meet the growing demand. As domestic consumption has increased and is now at the annual rate of more than 750,000 tons, while exports to the British Empire have been at the rate of 50,000 tons per annum, producers' stocks at the end of March totalled only 7,000 tons and consumers' stocks some 60,000 tons. But as several new zinc smelters will come into operation within the next few weeks, the supply position should soon show a gradual improvement. Large quantities of zinc ore are now arriving from Mexico, Canada, Newfoundland, Australia and South America. If, pending the increase in domestic smelting capacity, the munition industries are given preferential allocation, there is no reason why the armaments programme should be held up by the temporary squeeze in zinc. Steps have already been taken by the Office of Production Management to assist munition manufacturers by the formation of a defence pool to which producers are required to contribute a proportion of their output. In April this contribution was 3,300 short tons; it was raised to 12,000 tons in May, while further increases are expected until the supply position becomes easier. Great Britain is adequately supplied with zinc, though part of the Empire's ore production has to be smelted in the United States. Among the Axis Powers, Germany appears to have no difficulties in meeting her requirements—

Belgium has the largest smelting capacity next to the United States—but Japan is apparently beginning to feel the effect of the export restrictions imposed by the United States.

Europe's Pre-war Trade

The absence of the necessary statistics for their Annual Review of World Trade has led the Economic Intelligence Service of the League of Nations to substitute this year a most interesting analysis of the trend of European trade before the war. At the beginning of the century Europe was transacting about two-thirds of the world's international trade. The last war accelerated a reduction which had already begun, and by 1925 Europe's share was reduced to half, a proportion which has not substantially changed since. In 1938 Europe was responsible for 56 per cent of the world's imports and 46 per cent of its exports. The distribution of European trade altered gradually during the thirties, mainly owing to political measures directed towards increasing self-sufficiency. One result of these measures was to increase the trade between European countries and their dependencies. In 1935, only 25 per cent of the imports of European countries were derived from areas outside her and outside Europe the territories connected with her by political ties, and only 17 per cent of its exports went to such regions. The trade of Europe as a whole with the British Dominions, India and European overseas territories was only slightly smaller than that with the rest of the world, and was still growing at the outbreak of war. More than half was conducted by the United Kingdom. The highly industrialised States of Europe were responsible for the bulk of Europe's external trade; in 1935, eighteen agricultural countries accounted for only 17 per cent of the aggregate imports and 19 per cent of the aggregate exports. They did not even provide a very large proportion—less than a quarter—of their industrial neighbours' net imports of foodstuffs and they were themselves net importers of raw materials. Far more trade was done between the industrialised States themselves: in 1935, industrial Europe derived 34 per cent of its imports from industrial Europe, 51 per cent from other continents and only 15 per cent from the rest of Europe. The United Kingdom, almost two-thirds of whose trade was conducted outside Europe, exerts such a marked influence on the figures that it is useful to consider some of them separately:—

	TRADE OF UNITED KINGDOM AND CONTINENTAL EUROPE in 1935	
	Net imports (—) or exports (+) in millions of dollars	U.K. and Continental Europe
Six important animal foodstuffs, including live cattle	— 580	+ 226
Twenty-two important vegetable foodstuffs	— 542	— 545
All other foodstuffs	— 276	— 3
Tobacco	— 81	— 47
Six oilseeds and oilseed cake and meal	— 73	— 274
The chief fertilisers	— 2	— 37
Six raw textiles	— 316	— 686
Rubber	— 35	— 56
Wood and wood-pulp	— 218	+ 58
Coal and coke (excluding bunkers)	+ 155	— 200
Crude petroleum, petrol, gas and fuel oils	— 130	— 183
Copper, lead, tin and zinc, unwrought	— 54	— 111
Iron, manganese and tin ore, and bauxite	— 52	— 46
All other raw materials and semi-manufactured goods	— 120	— 353
Total foodstuffs, raw materials and semi-manufactured goods	— 2,333	— 2,257

It will be seen that, whereas continental Europe is a net exporter of animal foodstuffs, British imports of these are more than twice as great as the continental exports. Britain imports, largely from other continents, practically as much of the important vegetable foodstuffs as the whole continent of Europe. Even though the inclusion of British figures gives an exaggerated impression of the proportion of Europe's trade with the rest of the world, it is none the less the fact that almost every country which possessed overseas territory was tending, in the years immediately before the war, to direct an increasing proportion of its trade to them.

COMPANY MEETINGS

THE MERCANTILE BANK OF INDIA, LIMITED

PROFITS WELL MAINTAINED

SIR CHARLES INNES'S STATEMENT

The annual general meeting of The Mercantile Bank of India, Limited, will be held on the 20th instant.

The following statement by the chairman, Sir Charles A. Innes, K.C.S.I., C.I.E., has been circulated with the report of directors and balance-sheet for the year ended December 31, 1940:—

Instead of making a speech at the annual meeting, I have decided this year to circulate the following statement with the bank accounts. In view of the difficulty of travelling, I believe that this course will be the most convenient one for shareholders.

THE LATE LORD ABERTAY

The bank suffered a severe loss when Lord Abertay died suddenly last December. As Sir Charles Barrie, he joined the board in 1930, and his wide knowledge of men and affairs was always of great service to the bank. In him we have lost not only a wise colleague but also a valued friend.

Lord Catto, too, has left us. When he was appointed financial adviser to H.M. Treasury, he found it necessary to give up—only temporarily, we hope—all his varied interests in the City. Our pleasure at his appointment to so high an office is inevitably tempered by regret that a man of such distinction and ability is no longer a member of the board.

To fill one of these vacancies we have been fortunate enough to secure the help of Sir John Hay. Sir John is the managing director of Guthrie and Co., Limited, a firm whose name is a household word in Malaya, and he is also a member of the International Rubber Regulation Committee. He adds greatly to the strength of the board, and I am sure that you will cordially approve our choice.

POSITION EXCEPTIONALLY LIQUID

I do not think that I need say much about the accounts. The balance-sheet is just what you would expect from an exchange bank at a time when international trade has been disorganised by war conditions. The chief point to notice is that our position is exceptionally liquid. We have deliberately maintained it so. It is an obvious precaution in times like the present, but naturally it affects the earning power of the bank. For the rest, deposits and investments are both larger, but advances have declined owing to poor trading conditions. Bills have increased, but the increase is due mainly to the fact that they are longer on the water. In spite of all difficulties, however, and among these difficulties I must include a sharp rise in taxation not only in this country, but also in most other countries where we do business, our profits have been well maintained. We have been able to pay our usual dividend and to make our usual allocations. These results, I think, are satisfactory, and we can again congratulate Mr. Crichton.

Questions of staff have been one of our chief preoccupations during the year. A large proportion—two-thirds, in fact—of the men in the London office have been called up, and are now serving with His Majesty's Forces. I am sure that you will approve of my sending them on your behalf a message of good wishes. Fortunately, casualties among them have so far been light, but there have been some, and our sympathies go out to the relatives. We have replaced the men who have been called up, mainly by women. They are doing very well, but the demand is beginning to exceed the supply. In India, Malaya and Ceylon the position is even more difficult. Many of our European staff have been called up either for continuous military service or for lengthy periods of training. It is now impossible to send out new recruits to fill vacancies, and a heavy burden of work and responsibility falls on the remaining officers, most of whom have to spend what little leisure is left to them in some form of military training. Still they carry on cheerfully and with unabated vigour. A special word of praise

is due to the London office staff. It is no easy matter to get to the bank during or after a heavy air raid on London. Travelling is always difficult, and sometimes dangerous. Yet without exception, women as well as men, they have all turned up with unfailing regularity and cheerfulness, and I take this opportunity of offering them our thanks.

TRADE CONDITIONS

It would not be appropriate in present circumstances to attempt any detailed survey of trade conditions in the countries where we have branches. Defence regulations, import and export control, and exchange restrictions have thrown comparative statistics, even if the material for making them were available, completely out of gear. My remarks under this head, therefore, will be brief. Before the war, trade with Germany and with the other countries on the Continent of Europe now occupied or dominated by Germany, accounted for about one-sixth of India's total overseas trade. This trade has now been cut off, and trade with other countries has been gravely hampered by lack of freight and also by import and export control. I referred last year to the prosperity then enjoyed by the jute trade. Mills were working to full capacity for 60 hours a week and exports from India of manufactured goods were at a high level when the course of the war in Northern Europe and the collapse of France in particular caused a falling-off in demand, which also was adversely affected by the scarcity of freight space. Mills faced the situation by cutting down production to the equivalent of 34 hours weekly and thereby have been able to keep stocks at reasonable levels. These developments, however, increased the difficulties of marketing an exceptionally large jute crop for which Government was anxious to secure an adequate return to the cultivators. It was ultimately agreed that mills should continue buying jute in quantities and at prices that would ensure orderly marketing, while they at same time fixed prices for their manufactures that would encourage buyers to operate. As a result values of jute, both raw and manufactured, have been well maintained, and if Government's efforts to control sowings of next season's crop are successful the immediate future of the jute trade will depend largely on the amount of space available for overseas shipments. The area under groundnuts has also been reduced, and the agriculturist is, I am afraid, not too prosperous.

COTTON MILLS ACTIVELY ENGAGED

The cotton mills, however, are actively engaged. There is a large internal demand for cloth and military orders are substantial. Industries too which contribute to the war effort, notably the iron and steel industry, are very busy and are expanding rapidly. There is no doubt that as the result of the Roger Mission and the Eastern Group Conference, the war will give a big impetus to the growth of industries in India. It is all to the good that India should, so to speak, be getting down to the war, and taking the long view, the more balanced economy which will result from these developments will be greatly to the benefit of the country. But the developments raise problems for exporters in this country, and the same remark is true of the expansion—greatly stimulated by the war—of India's market for cotton goods in British East Africa, Ceylon and Malaya. A higher rate of release combined with favourable prices has made the rubber and tin industries prosperous, at any rate for the time being, and this prosperity has been reflected in Malaya. The Ministry of Food is practically the only buyer of Malaya's other staple products such as vegetable oil products, sago and pineapples, and shortage of freight has interfered with the shipment even of these purchases. But rubber and tin are by so much the predominant factors in the prosperity of Malaya that despite other adverse

influences, the total trade of the country increased in 1940 by nearly 600 million dollars compared with that of 1939. Ceylon too had a good year owing to the prosperity of the rubber industry and to stable conditions in the tea industry.

POSITION IN CHINA

The war in China has dragged on through another year with little in the shape of success to the Japanese armed forces. Each month, however, has seen Japan obtain by political manoeuvres a tighter economic grip on the country. During the year control of all major commodities forwarded to Shanghai from the interior has been enforced. A system whereby permits have to be obtained before goods are purchased up-country and moved to Shanghai for export has resulted in more and more business going to Japanese firms who have no difficulty in obtaining permits to the exclusion of European firms. Silk and eggs have been particularly affected, but the restrictions are applied from time to time to most major commodities. Another threat to British trade in China is the recent opening of a new Central Reserve Bank of China under the control of the Nanking Government. In spite of everything, however, Shanghai itself enjoyed a fair measure of prosperity during the year. Local industries all did well, and many new industries were started and are flourishing. It is doubtful, however, whether the roots of this prosperity go very deep for the period was one of considerable inflation. In addition, the horizon is gravely overcast in the Far East, and I cannot speak too highly of the courage and ability with which Mr Huxter, the manager of our Shanghai branch, conducted the affairs of the bank during a period of continuous difficulty and anxiety.

I referred last year to the work of our enemy debt department, presided over by Mr Kennedy, our inspector of branches. It has succeeded in liquidating all but a small proportion of German outstandings, but the collapse of France brought a fresh access of work to the Department. The problems that have arisen are much the same as those I mentioned last year, and I need not go into any detail. The point I wish to make is that though we are hopeful that a good portion of the sums still due to us will prove ultimately recoverable, we have thought it wise to make full provision for all outstandings.

THE OUTLOOK

I can say little about the future. The fate of this bank is bound up with the outcome of the tremendous issues which are being fought out in this gigantic war, and like every one else in this country, I have no fears as to the final result. As regards immediate prospects, you will of course recognise that since we are an exchange bank, our prosperity depends mainly on the prosperity of international trade, and international trade for the reasons which I have already briefly indicated is at a low ebb. We have also to bear in mind the effect of the Excess Profits Tax combined with the high rate of income tax. Our profits are now limited to those we made in our standard year, and moreover these profits are subject to our income tax at more than double the rate then obtaining. We have no complaint, of course. It is the same for all public companies, but I will permit myself just one observation about the effect of the Excess Profits Tax at its present level. A bank's policy is to keep its dividend stable. When it has a good year it does not "dissipate"—the word is not mine, it is the word used by the Chancellor of the Exchequer—the extra profit in increasing its dividends. It puts it away to reserve, and the strength and stability of British banks is largely the result of this policy. The great disadvantage of the 100 per cent. Excess Profits Tax, from a banker's point of view, is that it makes this policy impossible, and that it prevents us from taking advantage of a good year to strengthen our reserves. If the tax is kept on too long it will be a serious thing for British banking.

I have already paid a brief tribute to our staff. I need only say now that we continue to have good reason for placing confidence in the skill and ability of our chief manager, Mr Crichton. We owe indeed a debt of gratitude to him for the way in which he has steered the bank through all the dangers and difficulties of the past few years. Mr Paton and Mr Cruden are able lieutenants, and have rendered him valuable assistance, and our branch managers and all our staff at home and abroad have laid us, as usual, under a great obligation.

UNION BANK OF SCOTLAND, LIMITED

RESULTS ENTIRELY SATISFACTORY

STRONG LIQUID POSITION

The annual meeting of shareholders of The Union Bank of Scotland, Limited, was held on the 7th instant.

Colonel Hugh B. Spens, D.S.O., D.L., presided in the unavoidable absence of the chairman of the bank, Sir A. Steven Bilsland, Bt., and read the latter's speech, in the course of which it was stated that the balance-sheet showed that deposits stood at £36,638,000 an increase of £637,000 compared with last year. This figure represented the highest point their deposits had reached at the date of the annual balance. In view of the very large increase in Government borrowing for the purpose of meeting war expenditure, a general expansion of bank deposits—in degrees which varied according to the nature of the business carried on by each individual bank—was inevitable. Government expenditure was also bound to have a considerable effect upon the amount of their note circulation, and this at £3,172,000 showed an increase of £239,000.

LIQUID RESOURCES

On the assets side, cash and money at call amounted to £9,597,000, an increase of £523,000. Bills under discount at £1,494,000, which included £1,325,000 Treasury Bills, showed a reduction of £987,000. An entry which appeared in the balance-sheet for the first time was that relating to their holding of £1,500,000 Treasury deposit receipts. Although not negotiable like Treasury Bills these receipts could be discounted at the Bank of England if necessity arose. They therefore formed an addition to the liquid resources. All these assets, together with British Government securities standing in the books at £16,461,000, amounted to £29,053,000, and consequently they were in the strong position of having 73 per cent. of their liabilities to the public in respect of deposits and notes in circulation available in the form of cash or easily realisable securities.

During the past few years they had been glad to be able to report a steady increase in the amount of loans and advances. This year, however, the total of £9,369,000 showed a decrease of £1,164,000. Although they were financing to a considerable extent many of their customers who were actively engaged in important Government work either as contractors or subcontractors, this was more than offset by a substantial reduction in general banking advances due to restriction of the stocks normally held by traders and to the fact that the Government was itself financing the purchase of raw materials and other commodities to an appreciable extent. The reduction in advances and the increase in deposits was more than covered by the increase in British Government securities amounting to £1,351,000, representing their support of Government issues during the year, together with the increase on balance in the amount lent to the Treasury on deposits and bills.

PROFIT AND ALLOCATIONS

The profit for the year amounted to £298,000, a reduction of approximately £4,700 compared with last year. Taking into account the continued rise in practically all items of their costs and in taxation, he thought they would agree that the results were entirely satisfactory.

For a number of years past allocations had been made regularly to contingencies account, but on this occasion it had been decided to place a sum of £50,000 to their published reserve. The bank's premises, which stood in the books at the very conservative figure of £404,000, had been maintained in first-class condition, but, as the present building restrictions had the effect of reducing additional capital expenditure to a minimum, it had not been considered necessary at this time to make any special allocation out of profits. As usual, they were being asked to approve of a sum of £25,000 being set aside to account of their liability in respect of pensions and other allowances. After making these allocations and providing for the proposed dividend of 18 per cent., they had a balance of £142,000 to carry forward, an increase of £7,000. As usual, full provision had been made for any bad or doubtful debts, and a valuation of their investments at April 2nd showed a considerable aggregate surplus over the total amount at debit.

The report was unanimously adopted, and a dividend at the rate of 18 per cent. per annum declared.

NATIONAL BANK OF EGYPT

EFFECTS OF WAR CONDITIONS

ACTIVE TRADE AND LARGER EXPORTS

ALY SHAMSY PASHA'S STATEMENT

The forty-first ordinary general meeting of the National Bank of Egypt was held on March 26th at the head office of the bank, Cairo.

Aly Shamsy Pasha (the president) was in the chair.

DIRECTORS' REPORT AND ACCOUNTS

The gross profit for the year, after providing for depreciation on the Bank's buildings and furniture, for rebate of discount and for doubtful debts, amounts to £945,130 13s. 2d. After deducting from this sum £20,205 for directors' fees and £513,041 18s. 11d. for current expenses, there remains £411,883 14s. 3d. In conformity with Article 49 of the bank's statutes, a dividend of 4 per cent. is payable on the share capital, £120,000, and after this distribution there remains £291,883 14s. 3d. Adding to this the balance brought forward from last year of £223,736 15s. 11d., the amount available is £515,620 10s. 2d. From this amount the directors recommend the payment of an additional dividend of 10 per cent. on the share capital, which will absorb £300,000, and to carry forward the balance of £215,620 10s. 2d. The total dividend for the year will thus be at the rate of 14 per cent., equivalent to £1 8s. per share. An interim dividend of 8s. having been paid on September 2, 1940, there remains to be distributed the balance of £1 per share, which will be paid subject to taxation under Laws No. 14 of 1939 and No. 26 of 1940.

BALANCE SHEET, 31st DECEMBER, 1940

	L.E.	MM.	£ST.	s.	d.
LIABILITIES					
Share Capital					
300,000 fully paid Shares of £10 each	2,925,000	000	3,000,000	0	0

PRESIDENT'S SPEECH

The year through which we have passed since our last annual meeting has been one of continuous anxiety and difficult business condition.

This country had enjoyed comparative immunity from the effects of the war in the early stages of the struggle, but with the overthrow of friendly countries in Europe and the declaration of war by Italy, the situation changed completely and even our territory could no longer be regarded as secure from invasion. It is not surprising that in such conditions foreign trade suffered a setback and great apprehension was felt regarding the disposal of the cotton crop which had been sown under happier conditions.

The Government at once realised that the country's whole economic structure was faced with a grave misfortune and that a large number of agriculturists would be impoverished unless special measures were taken; their successful endeavours which resulted in the sale of the 1940-41 crop to the British Government merit the warmest approbation of the whole country and not least of the business community to which we belong. I think it would be ungracious were we not also to acknowledge our deep sense of gratitude to the British Government for their prompt and friendly action which saved the country from dire distress.

There is considerable evidence to show that the increased note circulation is largely due to causes unconnected with the rise in prices of certain goods. The clearing house figures also afford evidence that there has been no significant degree of an inflationary rise in prices.

HIGH FINANCIAL REPUTATION MAINTAINED

Despite the many adverse factors, Egypt has been able to maintain her high reputation for the soundness of her financial administration. The Budget for the coming year has been balanced without recourse to the reserve fund, a notable achievement at a time when most countries have had to face heavy deficits. It has been achieved not by increasing the burden of taxation to any great extent, but by reducing expenditure.

The circumstances to which I have referred earlier have had their effect on our balance-sheet. The figures reveal a large increase in our resources, and our monthly published statements will have shown you that the inflow of funds occurred in the latter months of the year and will have left you in no doubt regarding the benefit accruing from the happy arrangement for the disposal of the cotton crop.

The gross profits for the year 1940 were £945,130, representing an increase of £46,542 over the previous year. After deducting general expenses amounting to £533,246, there remains a net profit of £411,884, which, with a small draft of £8,116 on the carry-forward, your board proposes should be distributed by way of dividend at the same rate as a year ago—namely, 14 per cent.

CALEDONIAN INSURANCE COMPANY

RESULTS OF A DIFFICULT YEAR

The one hundredth and thirty-sixth annual general meeting of this company was held, on the 8th instant, in Edinburgh.

The chairman, Mr. Maurice Crichton, C.A., in moving the adoption of the report, said: Speaking generally, I should like to assure the shareholders that we are steadily surmounting our difficulties and have made full provision for our liabilities.

The net new life assurances granted during 1940 amounted to £627,450, the premiums thereon being £27,173, including £3,963 by single payments. The net new sums assured compare with £1,454,772 for the previous year, the reduction being due to the effects of the war and to the careful attitude maintained by the company.

The death claims for the year 1940 were £285,467 compared with £267,739 in the previous year, the increase being directly attributable to the war. Surrenders amounted to £87,582 against £57,278 in 1939, the increase being apparently due to financial stress. The total net premium income for 1940 was £591,838 compared with £610,603 in 1939.

The expenses for the year 1940, excluding those applicable to annuities, showed a ratio to the net premium income of 15 per cent. compared with 16.5 per cent. in 1939.

The average rate of interest on the combined Life Assurance and Annuity Fund (excluding reversions purchased) was £3 9s. 9d. per cent. after deduction of income tax, against £3 12s. 8d. per cent. for the previous year, the reduction being mainly accounted for by the increase in the rate of income tax.

The valuation of our Stock Exchange securities as at December 31st last showed that, in the aggregate, the market value at that time was less, by about 3½ per cent., than the figure appearing in the balance-sheet.

With regard to the question of the statutory valuation of the life fund, you will have seen from the annual report that it has been decided to make the next investigation as at December 31, 1941, in respect of the five years ending on that date. In the meantime, you will notice that the directors have decided to allot an interim bonus of £1 per cent. per annum under policies becoming claims by death or maturity in 1941 in respect of each year's premium due and paid in the years 1937 to 1940 inclusive.

FIRE, ACCIDENT AND MARINE DEPARTMENTS

The premium income for the year 1940 was £732,755 against £684,680 in 1939, and the profit was £14,665 compared with £45,989. The total fire fund at December 31, 1940, amounted to 108 per cent. of the premium income for the year.

You will observe this year that there is a special item, namely, "War Contingency Reserve," under which the sum of £3,600 has been set aside. This, I may explain, is in connection with contingent liabilities in respect of our business abroad, which are at present unascertainable on account of the war.

The combined account shows that the total premium income for 1940 was £510,930 against £568,358 for 1939. The profit was £16,520 compared with £23,767 for the previous year. The total accident fund at December 31, 1940, amounted to 89 per cent. of the premium income for the year.

As in the case of the fire department, you will notice that we have provided for a war contingency reserve, and that the amount set aside is £46,000.

The premium income for 1940 was £255,794 against £121,847 for 1939. The first year's claims in 1940 were £52,610, being 20.6 per cent. of the premium income.

The marine fund at December 31st last amounted to £306,071. On account of the uncertain conditions it has been decided to make no transfer on this occasion to profit and loss account.

PROFIT AND LOSS ACCOUNT

The balance at credit of profit and loss account at December 31, 1940, including the sum brought forward from the previous year, amounted to £193,400. Provision in the profit and loss account for British income tax covers all known liability to account for British income tax over the sum of £193,400 tax at the new rate of 10s. per £. Out of the sum of £193,400 the directors recommend that £20,000 be carried to the staff pension fund as at January 1, 1941, and that a dividend be declared at the rate of 15s. per share, subject to deduction of income tax, to be paid by equal half-yearly instalments on May 15th and November 11th next.

G. BEATON AND SON, LIMITED

INCREASED PROFIT

MR S. C. GOODWIN'S SPEECH

The annual general meeting of G. Beaton and Son, Limited, was held, on the 7th instant, in London, Mr S. C. Goodwin (chairman of the company) presiding.

The Chairman said: Ladies and Gentlemen,—It is not my intention, nor will it be expected of me, to enlarge upon the activities of your company during the past year; consequently, my remarks will deal with the salient features of the accounts and balance sheet.

You will observe that the profit for the year, using round figures, amounts to £56,519, an increase on 1939 of £9,199, and that after charging directors' fees and providing for taxation, the net profit comes out at £14,019.

TAXATION CHARGES

The charge for taxation includes an adjustment, due to the imposition of a higher standard of tax in the supplementary Budget of 1940, and the estimated liability, based on the existing scales of taxation, which arises on the accounts under review. It may appear to members that this charge is unduly high in relation to the profits. This is, of course, due mainly to excess profits tax, but is accentuated by the fact that the figure of profits upon which taxes are levied invariably differs, often materially, from that upon which a board of directors could prudently base its dividend recommendation. This difference in viewpoint in relation to profits results in the creation of definite hardships to companies which have effected developments in certain channels which cannot be regarded as other than temporary, inasmuch as only a modicum of the cost is immediately allowable by the revenue authorities in calculating the liability to excess profits and ordinary taxation, the balance being left to be dealt with in due course. In consequence, this balance must, for the time being, be financed out of profits left to the company as its "standard," with the result that the amount remaining available for distribution to shareholders is seriously depleted.

I feel strongly that I should be failing in my duty to shareholders if I did not refer to this position and the difficulties arising from the incidence of excess profits tax, which in many cases leaves a company with a too small portion of the profit earned, insufficient financial resources, and the inability to reserve adequately against post-war exigencies.

BALANCE SHEET ITEMS

Turning to the balance sheet, I would direct your attention to the fact that reserves, other than the amount earmarked against debtors, total £51,725, or upwards of 50 per cent. of the company's capital, and that the surplus of assets over liabilities is £169,754, a figure which has not materially changed from last year.

A significant point indicated by the balance sheet is that creditors on trade accounts and in respect of accrued expenses are higher by some £37,000, stocks and work in progress are up by over £50,000 and debtors by roughly £15,000. It is not considered necessary to increase the reserve against book debts which was built up against contingencies arising in the course of our normal business of motor accessories manufacturers. The fixed assets do not show any decided fluctuation compared with 1939, but there is a drop of roughly £16,000 in cash.

Under the heading of trade investments an increase of £7,500 will be noted. Of this amount £4,700 represents additional loans to another company which, along with moneys previously advanced, will in due course be satisfied by the issue of shares, and £2,800 is on joint venture account. I may add that the company referred to, and the joint venture in which we hold a 50 per cent. interest, are earning profits on a scale considered by the board to be satisfactory.

I know it would be your desire that I should express the thanks of this meeting to the company's officials, staff and workpeople for their services during the year.

The report and accounts were unanimously adopted and the usual formal business transacted.

At a subsequent extraordinary general meeting a resolution was passed approving an alteration to the articles of association fixing the fees of the directors at £1,000 per annum.

SAN FRANCISCO MINES OF MEXICO, LIMITED

The twenty-eighth ordinary general meeting of San Francisco Mines of Mexico, Limited, was held, on the 7th instant, at Winchester House, Old Broad Street, E.C., Mr C. T. Pott presiding.

The chairman, in the course of his remarks, said: The operating profit for the year amounted to £22,232, as compared with £4,515 during the previous period. After charging reserve for depreciation of machinery, etc., Mexican income tax and the usual London overheads, and crediting interest and a reserve of £4,108 no longer required, this profit is changed to a net loss of £15,845.

While the operating results for the year show some slight improvement, it is nevertheless disappointing. The smaller tonnage milled, poor labour efficiency, the low market prices for metals, and the small demand for lead all contributed to this unsatisfactory result.

For a portion of the year lead was practically unmarketable, but we were able to dispose of our zinc concentrates in the United States. Fortunately the lead position has now improved, and we have been able to sell at remunerative prices the heavy stocks of lead which we held at the end of the year.

The tonnage milled was 437,920 tons, being a reduction of about 8 per cent. on the previous year, which is due partly to the suspension of milling of carbonate ores and partly to the labour shortage.

We shall shortly be entering upon negotiations for a new collective labour contract. While we have always aimed to treat labour on generous lines, both as regards wages and social benefits, there are many conditions in the present collective contract which are most onerous. As I have mentioned on other occasions, these unduly burdensome labour conditions coupled with the enormous taxation, which is mainly charged on revenue and which the company has to bear during a period of unfavourable base metal prices, results in there being nothing left for those who have to bear the weight of financing and running the business. However, I am glad to say that there has been some amelioration so far as certain existing taxes are concerned, and we can only hope that the Mexican Government will see the wisdom of granting more sympathetic treatment to mining companies operating in Mexico.

Due partly to the shortage of labour and partly to the necessity of increasing our broken ore reserves, development operations during the year were further restricted, the total accomplished being 2,433 metres, which was 30 per cent. less than for the previous year. As we all know, development is vital for the maintenance of ore supplies for the mill, so that this falling off gives cause for some anxiety. Fortunately the results of the development were encouraging. The work to the south on the tenth level of the important Brown vein, on the Footwall vein below the seventh level and on the tenth level of the Bronces vein is most promising, and in general this applies to development on other veins in the San Francisco Mine. The work on the Cobriza vein is exposing ore north of any ore previously developed at the San Francisco Mine, and we are hopeful that the area north of the North Shaft, hitherto considered barren, may ultimately yield an important ore supply.

At the Clarines Mine, the Clarines vein, which is at present the main source of ore production from this mine, development for a while exceeded expectations, but more recently the vein has pinched and is of low grade. On the Pilares vein developments continue to be good.

There is no doubt that the mine continues to open up well, and under reasonable operating conditions a long and profitable existence would be ensured. But we are beset with many difficulties. The waging of war handicaps the marketing of our production. The uncertain and unsatisfactory labour supply necessitates operating the mill at much under capacity, and it is impossible to prognosticate the demand and prices for the metals we produce and the trend of taxation. As to conditions now ruling, it suffices if I mention that during the first quarter of the current fiscal year we made a small operating profit of about \$12,000, which does not include excess realisations in respect of end-year metal stocks since sold.

The report and accounts were unanimously adopted.

SPILLERS LIMITED

FLOUR MILLERS' NEGOTIATIONS WITH MINISTRY

STATEMENT BY SIR MALCOLM ROBERTSON

The fifty-fourth annual general meeting of Spiller, Limited, was held, on the 9th instant, at the Aldwych Room, Waldorf Hotel, London, W.C. The following is an extract from the statement which was submitted to the meeting by the chairman of the company, the Rt. Hon. Sir Malcolm A. Robertson, P.C., G.C.M.G., K.B.E., M.P., and which had been previously circulated to stockholders:—

It is a matter of regret to your directors that for the second successive year they are unable to present to you the accounts of the company. Last year I explained to you the circumstances which made impossible the compilation of accounts for the financial year ended January 31, 1940. The same applies to the year ended January 31, 1941.

SOME AGREEMENTS REACHED

During the past year almost continuous negotiations have been taking place between the Ministry of Food and the various industries in which your company is interested with a view to arriving at some basis for determining the earnings of these industries under control conditions. Considerable progress has been made, and in certain instances agreement has been reached; but on the flour-milling side negotiations have not yet arrived at a stage where a scheme can be submitted for the consideration of the industry. It is hoped that this stage will shortly be reached, but even if this is so, and if the scheme is one acceptable to the industry, the accounting problems to which it will give rise will be such as to delay the ascertainment of the company's position for a very considerable time thereafter.

In the present circumstances, I must defer further comment until such time as a scheme has been evolved and its effect upon the company considered. I shall also be compelled to propose once again that this meeting be adjourned *sine die* for the future reception of accounts.

BOARD'S DIVIDEND DECISION

The absence of information concerning the actual earnings of the company is a source of great anxiety to your board, and, you will appreciate, presented a serious problem in regard to the recommendation of dividends for the past year. After full consideration your directors came to the conclusion that in view of the strong liquid position of the company, the reserves built up over a long period of years, and the volume of business conducted in the past year upon which some reasonable profit ought to be forthcoming under such scheme of remuneration as may ultimately be formulated, they would be justified in recommending the declaration of dividends at the same rates as have applied for a number of years past. A resolution to this effect will be laid before you at a later stage of this meeting.

Although in view of the considerations mentioned the Board felt itself able to recommend the maintaining of the dividend rates for the past years, I think it wise to state that this should not be taken as an indication that under prevailing conditions it will be possible to continue distributions at the same level. I have already intimated that we are as yet unable to forecast the effect upon the company of such agreement as may be reached with regard to the flour-milling side of the business.

Apart from this, there is the possible reaction upon the results of our other activities arising from the curtailment of supplies of raw material, and finally, there is the general effect of war conditions as a whole and particularly damage from enemy action. In the latter connection it is right to inform you that damage has occurred to certain of your company's properties, and we are, of course, unable to assess what the future may hold in store in this respect.

THE WAR DAMAGE ACT

In connection with this latter subject, I might refer to the provisions of the War Damage Act. While it is true that this provides a substantial measure of indemnity against the

MITCHELL COTTS AND COMPANY, LIMITED

STATEMENT BY MR ALEXANDER HAMILTON

The following is the statement of the chairman, Mr Alexander Hamilton, which has been circulated with the report and accounts:—

The profit and loss account shows trading profits of £139,343, from which are deducted directors' fees £500, and provision for taxation £60,000, leaving a balance of £78,843.

The preference dividend absorbed £5,363, which left £73,480 available for reserve and ordinary dividends. The directors propose to transfer to general reserve £20,000 and to staff provident fund £5,000, making a total of £23,000.

It will be remembered that we declared and paid an interim dividend of 4 per cent. (less tax) in July last, and a final dividend was declared at the annual general meeting held last December, and has since been paid. This was 9 per cent. (less tax) and made a total for the year of 13 per cent., as against 12 per cent. for the previous year. These dividends together absorb £42,897, leaving £5,583 of the year's profit to be added to the balance carried forward, which will now stand at £43,607.

The increased provision for taxation will cause shareholders no surprise, being brought about by the increase in profits and the higher rates now in force.

As regards the excess profits tax, progress has been made with the negotiations with the Inland Revenue, and although no final figure has yet been agreed, the indications are that our "standard profits" will be satisfactory. It is estimated that the present charge for taxation in the accounts under review is adequate to cover the company's liabilities under this heading.

In view of the unavoidable delay between the close of the accounts and their presentation, it may be helpful if I state that during the current year we have fully maintained our position, and have every reason to expect that the accounts for the year to June, 1941, will not be less satisfactory than those now before the shareholders.

F. FRANCIS AND SONS, LIMITED

INCREASED PROFIT AND DIVIDEND

The fortieth ordinary general meeting of F. Francis and Sons, Limited, was held on the 8th instant in London.

Mr John Ismay (chairman of the company), who presided, said: I record with the deepest regret the loss to our company by the death of our joint managing director, Mr J. H. E. Francis, who was the son of the original founder of the business and had been associated with it for over 50 years. He became a director when F. Francis and Sons, Limited, was formed in 1900. He was not only a keen business man, but had a kindly nature and was highly esteemed by all who knew him. We will miss him deeply. You will be glad to see that his brother, Mr S. W. Francis, remains as managing director.

I do not think there is anything special to draw your attention to in the balance sheet. The bulk of our extra profit has been taken up by the additional provision for taxation. We have slightly increased our provision for depreciation, but have not put anything to general reserve, as this is not considered necessary, our assets being conservatively valued, adequate depreciation having been written off our wasting assets over many years.

Whilst we propose a final dividend of 10 per cent. against 8½ per cent. for the previous year, this actually only involves a payment of £10,000 against £10,600 previously, and we have increased the carry-forward to over £20,000.

The consolidated statement shows that, in spite of the heavy provision for taxation included in the current liabilities and provisions, our margin of liquid assets over liabilities has risen from £93,676 last year to £110,477 this year, that is, an increase of £16,800. Your board view the future with confidence.

The report and accounts were unanimously adopted. The final dividend of 10 p.c. (making 14 p.c. for the year) was approved; the retiring director, Mr F. Skade, was re-elected; and the auditors, Messrs Jas. Williamson and Co., having been reappointed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

loss of or damage to physical assets, there is no cover against consequential loss. Again, the War Damage Act calls for the payment of substantial premiums, and those relating to fixed assets are specifically described as being of a capital nature and accordingly do not constitute an admissible deduction from profit for the purposes of assessment to taxation. In effect, this represents a material additional tax upon owners of property and of itself will bring about an appreciable reduction in profit available for distribution.

It is fully accepted that great sacrifices must be made by the whole community for the purpose of financing the expenditure necessitated by the war; but the preservation of essential industry on a basis which will enable it to live and to compete in the post-war period is surely a matter which cannot be ignored. In these circumstances I express the hope that something may yet be done to spread more equitably the burden of war damage, as the effect of adding still further to the existing level of direct taxation in the case of an industry subject to rigid control may well be serious.

PRODUCTION OF ESSENTIAL FOODSTUFFS

As regards the general conduct of the company's business, I am happy to be able to tell you that every effort has been made, and will continue, to utilise to the fullest extent possible our facilities for the production of essential foodstuffs. Your directors are also continuing so far as is within their power, and consistent with current conditions, to preserve the basis of the company's trade and to conduct operations in the best interests of the stockholders.

The report was adopted unanimously.

WILLIAM BEARDMORE AND COMPANY, LIMITED

DIVIDEND OF 10 PER CENT

The ordinary general meeting of William Beardmore and Company, Limited, was held, on the 5th instant, in the offices of the company, at 207, Shettleston Road, Glasgow.

In the unavoidable absence of Sir James Lithgow, Bt., M.C., D.L., chairman of the company, Mr. Alexander Williamson, B.Sc., M.Inst.C.E., managing director, presided.

The secretary, Mr D. M. Cameron, C.A., read the notice convening the meeting, and the auditors' report was read by Mr R. H. Ballantine, C.A.

The chairman, after referring to the circular which had been issued to ordinary stockholders informing them that the directors had considered it advisable at the present time, in the interests of national security, to dispense with his usual address, moved: "That the report of the directors and the accounts for the year ended December 31, 1940, be, and they are hereby, adopted."

Mr J. B. Talbot-Crosbie seconded the resolution, and it was carried unanimously.

The placing of the sum of £200,000 to war contingencies reserve was confirmed.

The final dividend on the ordinary stock of 7 per cent., less tax, making 10 per cent. for the year to December 31, 1940, was authorised; the retiring directors, Mr Wilson Harvey and Mr Frank Hodges, were re-elected; the auditors, Messrs J. Wyllie Guild and Ballantine, were reappointed; and, after a vote of thanks had been accorded to the chairman, the proceedings terminated.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes. In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, 8 Bouverie Street, E.C.4.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended May 3, 1941, total ordinary revenue was £30,933,000, against ordinary expenditure of £86,487,000, and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £274,033,000 against £167,012,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS

The agreement between the Ministry of Supply and the Rubber Trade Association, whereby the Rubber Controller is to become the sole importer of rubber into this country, is discussed more fully on page 632. The market was in a state of uncertainty while discussions were proceeding, and little business was done—on Monday no prices were quoted. On Wednesday, spot closed at 14d. per lb., compared with 14½d. a week before. While prices in general in this country have shown little or no change, in America, Moody's daily index of staple commodity prices (December 31, 1931=100) rose from 185.8 on April 29th to 190.3 on May 6th.

Quicksilver Prices and Supplies.—The Control of Mercury (No. 6) Order which came into force on May 3rd, amends an earlier Order by fixing maximum prices for mercury metal. Prices of mercury salts which were fixed by the earlier Order remain unchanged. The price of metal ruling on May 2nd was £48.£50 per 76 lb., and the Order prescribes maximum prices for quantities of over one bottle but less than eleven bottles, of £48 15s. per standard bottle of 76 lbs., and for larger quantities, £48, ex sellers premises in both cases. Higher prices are prescribed for lots of under one bottle and for redistilled grades. The Ministry is prepared to sell quicksilver (commercially pure virgin mercury) to buyers approved by them, in quantities of not less than eleven standard bottles; the Ministry's selling price will be £47 15s. per bottle until further notice. Applications for smaller quantities and quantities not in standard bottles of 76 lbs., and for redistilled mercury, should be made in the normal way to dealers.

Tin Statistics.—World visible tin stocks during April showed a further fall, according to Messrs. A. Strauss & Co. Ltd.'s Monthly Bulletin. Stocks on April 30th were 38,788 tons compared with 39,971 on March 31st. Deliveries in the United States were nearly 14,000 tons, compared with the high figure of 16,000 tons for March. These two high

delivery figures may offset the decrease in visible tin stocks by an increase in "invisible" stocks if, as is probable, substantial amounts have been acquired by the Metals Reserve Company in America. Stocks in this country fell by 825 tons during April, to 2,183 tons. Prices have varied but little during the week. On Wednesday standard cash was £270 5s.-£270 10s. per ton compared with £269 5s.-£269 10s. a week earlier. The three months forward price was £267 5s.-£267 10s. per ton compared with £266 15s.-£267.

Rise in Rayon Prices.—On June 1st rayon yarn prices are to be raised, the rise varying from no change to 4d. a lb. Deniers will be unchanged at 75d. per lb.; viscose yarns will rise from 53d. to 56d., and acetates and Bembergs will rise 4d. to 55d. per lb. A meeting is to be held to decide whether the rise should be extended to knitted goods.

Coffee Stocks Return.—A return of raw coffee stocks is required by the Ministry of Food from persons who held more than one ton net of raw coffee beans on April 30th. Returns must be made on a special form by May 17th, specifying net weight, country of origin and stating whether the coffee is in bond, or duty paid. Stocks of coffee in the country on the outbreak of war were in the neighbourhood of 214,000 cwt. The price has risen considerably since August 30th, 1939, when Costa Rica, medium to good, was 62s.-84s. per cwt.; on May 6th last it was 150s.-165s. A maximum retail price of 2s. 8d. per lb. was fixed by the Minister of Food on March 31st of this year, and retailers were also obliged to stock coffee at 1s. 8d. per lb.

Revision of Poultry Prices.—Prices of all poultry are to be uniform after June 16th, but different categories are to be brought into the uniform price level at different dates. The maximum prices on sales by producers to wholesalers will be 1s. 6d. per lb., on sale by wholesale, 1s. 7d. per lb., and by retail

1s. 10d. per lb. These are the prices which originally applied only to boiling fowls. From May 5th they applied to roasting chickens, geese, and poultry imported from Eire. The special price for poussins (by retail 3s. 6d. each) will be withdrawn on June 1st, and on June 16th domestic ducks will come into the uniform price scale.

Soft Fruit Prices.—The Soft Fruits (Maximum Prices) Order has been made by the Minister of Food, under which maximum prices of gooseberries, strawberries, raspberries, loganberries, blackcurrants, redcurrants and whitecurrants grown in this country are controlled. The prices for the fruit are laid down, but the dates on which they become operative will be announced later. The Order prohibits the picking of gooseberries before a date to be announced, except for "Leveller" and "Early Sulphur" varieties. Fruit preservers using more than one ton of fruit per year must in future be licensed by the Minister of Food.

★
Maximum prices for canned vegetables have been fixed, on first-hand sales and sales by wholesale and retail, by the Canned Vegetables (Maximum Prices) Order, which came into force on May 5th.

COMPANY MEETINGS

CURRENT STATISTICS

The Post-War Boom

IN the short time that he has been in office, Captain Oliver Lyttelton has already shown that he is not afraid of ideas just because they are new or big. In the concentration of industry he is tackling a necessary job of appalling difficulty and complexity. An announcement made this week (and discussed in a Note on page 665) shows that, if he is not yet ready to begin on the still more difficult and complex task of concentrating retail trade, he is not running away from the problem. And in a speech delivered a week ago, Captain Lyttelton showed that his mind is not wholly occupied by wartime problems. It would be wrong to give the impression that Captain Lyttelton's speech was entirely devoted to post-war problems. On the contrary, he essayed a defence of the Government's existing economic policy, though he was not very successful in the uphill task of proving that it is "coherent, comprehensive and comprehensible." But the passages of the speech which have rightly attracted the greatest volume of attention were those in which, for the first time, he sketched the first vague outlines of an economic policy for the years immediately after the fighting comes to an end. Captain Lyttelton revealed that he had set up in the Board of Trade a special section under Sir Charles Innes, charged with studying the problems "of the first two or three years," and he made it clear that, in his opinion, the solution would have to be found in a continuance for that period of many of the wartime controls.

The War Office is proverbially prepared to win the last war; Captain Lyttelton's remarks give some assurance that the Board of Trade is not preparing to win the last peace, which would be a mistake almost as catastrophic. Actually, there are many misconceptions about Armistice economics, as exemplified by the ex-

perience of twenty-five years ago. There would, for example, be fairly general assent to the proposition that post-war unemployment had its origin in the demobilisation of men from the armies and the munition factories; the general belief is that peacetime industry was never able to absorb the millions set free by the end of the war. It is, of course, true that the chronic unemployment of the twenties (and even of the thirties) was a by-product of the war; if there had been no war, there would have been very much less unemployment. But the causation is indirect; and in the popular memory there is some foreshortening of events. It is certainly not true that mass unemployment arose out of demobilisation. The demobilisation crisis was met and mastered in the spring of 1919. An out-of-work donation was provided for men and women demobilised from the services and from munition industry, and for two months, March and April, the numbers drawing the donation just exceeded the million mark. But for two months only; by October, when the civilian donation ceased, the numbers had fallen to less than half a million. The unemployment percentage was 6.6 per cent. in December 1919 and in the middle of 1920 it fell to very low figures. It was not until the early months of 1921 that really severe unemployment—as the term came to be understood in the following years—put in its appearance; and by that time demobilisation had long been complete.

This history is worth remembering, for, if it can be taken as any sort of precedent, it shows that the immediately post-war problem is not that of finding work for the soldiers and the munition workers. Last time, the process of re-transfer very largely solved itself—indeed, there was a labour shortage in the first two years after the Armistice. The problem is rather one of seeing that

To the fulfilment of the German plan there are apparently only two major obstacles—Marshal Pétain and General Franco. On their strength of will and integrity the Franco-Spanish front depends. By their tenacious resistance until now—Hitler's campaign was already at pressure in October, 1940—they have proved their deep distaste for a policy of co-operation, Marshal Pétain because it offends his honourable scruples over the strict letter of the armistice, General Franco because his people are beset by famine and plague, and a further war would crown their misery. Yet the external and internal pressure on these two men is overpowering. Within, the whisperers, the intriguers, the quislings, the ambitious, the venal are gathered together into one great cabal against the policy of resistance. Economic necessity and military force reinforce the internal disintegration. It is hard to imagine how two men, one aged, the other alone, can resist Germany's "bloodless offensive" much longer.

There are signs that one at least of them has failed. Complete agreement has been announced from Vichy on the policy of collaboration with Germany, negotiated by the French quislings, Darlan and De Brinon. The economic benefits to Vichy have already been published. The *quid pro quo* remains secret—for obvious reasons—but it probably covers such matters as political and military

concessions in Syria and the North African Colonies, and it may even include provision for the "joint use" of the French Fleet. If this is so, it can be truly said that never have so few men brought so great a country so low. But if the will to resistance in Vichy is exhausted there are signs that General Franco is continuing his determined stand. The recent "purge" has removed Falangist enthusiasts from key positions in the Home Office and the Army and their place has been taken by army men after Franco's own heart.

The balance remains desperately precarious, and it is difficult to see how, at the present juncture, any British action can influence the choice that lies before the leaders of France and Spain. What can be done by propaganda and economic assistance is already being done. American diplomacy is active, especially at Vichy, and the probability that the United States will intervene is far more impressive than any credit or "cultural exchange." Fundamentally, Vichy France and Spain, like every other smaller Power in this battle of the Titans, are waiting to see which side will win. Even the most steadfast leader would prefer to come to terms, if a Nazi victory were certain. It follows that the only effective British propaganda lies in successful warfare. The fate of France and Spain will be decided on battlefields as distant as Suez and Baghdad.

Recruits for Industry

THERE is one marked difference between the last war and this. The recruiting campaigns of 1914-18 were for the Army. This time they must be for Industry. It is impossible to match the enemy in numbers on the battlefield, and in the factory, too, there is a wide gap. Men can only be called up as equipment is made available; and in German Europe the enemy can impress six or seven times more workers—of varying quality and willingness—for his war effort. Only in British and American factories, taken together and mobilised for war, can that effort be surpassed. The main immediate problem is to draft every available man and woman into war production.

This is not simply a question of Compulsion *v.* Volunteering. It is a question of Recruitment. Compulsion may in the end be required to staff the war factories fully, and especially to bring in the millions of women who will be needed. But the present policy is to use voluntary means, and a chief doubt is whether this method is being used to the best effect. Broadly, so long as the voluntary principle is retained, the aim is to create the conditions in which the required numbers of men and women will choose war work, to entice the unemployed and unoccupied into war factories, and to persuade those in work to transfer from their civilian and non-essential jobs. The opportunities for civilian employment have been deliberately cut down by the limitation of supplies to civilian industries and by the concentration of their reduced output in a few nucleus factories working full time. By the autumn, some hundreds of thousands of civilian workers will have been set free.

In itself, however, this process of "slimming" cannot solve the problem. There are large sectors of employment in distribution and the clerical and service trades which it is extremely difficult to cut down by conscious plan; and it is precisely from these occupations that the main body of general labour for the war factories must eventually come. They are occupations which to a considerable extent can be spared in wartime; and a programme which only seeks recruits among the unemployed, the unoccupied and the workers displaced by restrictive measures will not staff war industry on the scale required. It is, of course, true that the curtailment of civilian manufacture and the limitation of civilian supplies must lead to some falling-off in distributive, clerical and service activities; but this falling-off tends to take the form of underemployment rather than actual displacement; and it remains imperative to attract men and women still in work.

At the moment, even the unoccupied and the displaced may not go into war employment. They are available, it is true, and at the employment exchanges they will be encouraged to take up war jobs. But there is no certainty that they will choose them. In both remuneration and working conditions, jobs in civilian employment may seem more attractive. Many workers prefer to look for work themselves from advertisements or by interviews rather than at the exchanges. The fact is that, so long as there is no compulsion, the "choice" of employment must be much more heavily weighted in favour of war work than it is at present. The present approach may be described as "recruitment by registration." Certain grades of skilled labour were registered some time ago; women aged 20 and 21, and certain age-groups of men over military age have been registered recently; men with experience in coalmining are to register shortly; and there are registers of clerical, technical, scientific and professional qualifications. These lists of the resources available are indispensable; but, by themselves, they fill forms rather than jobs. The important thing is to bring men and women into touch with actual vacancies in essential employment and then to make sure that they take them. Labour registered is not labour recruited, any more than labour released is.

In theory, the call has gone out to all volunteers, in work or out of it. In practice, would-be war workers have been advised not to give up their civilian jobs hastily; and the young women and older men who have registered are not to be interviewed for war work unless they voluntarily choose it. But in wartime the staffing of essential war activities must be given priority, and by this test, the present recruiting campaign for industry has two defects: it lacks urgency; and it is not efficient. There may, of course, be shortcomings in the physical expansion of war industry which currently limit the intake of new workers. But unless the entire labour force of this country is harnessed to the war effort, success can hardly be hoped for.

By compulsion the required recruits could be enlisted. It has been claimed that, from the beginning of the war to the end of last year, workers moved into the German war industries at a rate six times faster than in this country. But there is no virtue in compulsion, and there are many drawbacks. The voluntary method could do better than it has done yet—although it cannot be disguised that a measure of compulsion would probably be needed to achieve the mass recruitment of women, who are waiting to be told where to go and what to do.

Actually, the distinction between effective recruitment by compulsory means and effective recruitment by voluntary means is not very sharp. In the one case men and women are conscripted; in the other they are presented with a set of conditions in which it is practically impossible for them to choose anything but war work; and the point is that these conditions are far from existing yet.

In the first stage of the war, the problem was to put the unemployed to work and to make the best possible use of skilled labour. The Ministry of Labour, as the employment bureau for the supply departments, set up a Munitions Labour Department and a Labour Supply Board, served locally by labour supply committees and exchange managers. The employment exchange was the centre: it was the focus of the unemployed; and by the Undertakings (Restriction on Engagement) Order of June last year, munition firms were not allowed to engage or seek to engage any worker except through the exchanges, the object being to prevent poaching or counterbidding between firms for rare craftsmen. Advertising vacancies in munition work was forbidden.

Now the position has changed. It is no longer simply a question of the workless and the skilled artisans; it is the mass of the workers that it is sought to enlist now, men and women in work, who may often have little knowledge of the exchanges and who have no special skills. The general demand for munitions labour has been well publicised, but under existing arrangements many of these workers will never know of the actual jobs available and their conditions. It is very doubtful whether the prohibition on advertising, which was intended to protect skilled labour, is appropriate in these conditions; these are not craftsmen; and, in any case, it is now possible, by means of the Essential Work

Order, to prevent skilled men from being stolen and moving away. As it is, firms on war work are the only ones who cannot advertise, and most workers who are not in touch with the exchanges, where the details of war jobs are exclusively kept, will tend to take up the civilian employment they do see advertised. At present they simply do not know what actual jobs are open or how suitable they may be. They may be "released"; they may even be registered; they are certainly exhorted. But they remain ignorant.

A remedy for this is, obviously, better propaganda: not simply the general appeals already put out by the Ministry nationally, but also local appeals by local employers for local labour. In addition to the exchanges, often remote and dingy, recruiting centres are needed—with drums and bands and speeches—set in busy shops, in cinemas and eating places. Even in Germany compulsion is supplemented and labour guided by local advertisement. Advertisement would not solve the problem. It would hardly be possible, for instance, for firms and propagandists to call specifically on, say, shop-assistants, domestic servants and typists to transfer to this or that particular war job, so long as the impression remains which the Government has given, in connection with the registration of women, that in general those kinds of workers should "stay put." Nor would it be easy for the industrial equivalent of the recruiting sergeant to lay stress on the attractiveness of the employment offered, so long as wages and welfare conditions may well be unsatisfactory. The solution is simple: to tell people what they're wanted for; and to make the essential jobs worth taking. But, first of all, it must be made much clearer than it is that the Government really does want a vast number of recruits.

Union Now With America?

MR. CLARENCE STREIT, if not the only begetter of the Federal Union movement, is certainly its most persistent and persuasive advocate. His original proposal for "Union Now" between the democracies of America, Britain, France and the small anti-Nazi States of Europe is necessarily in cold storage at least for the duration of the war. But in a new book, which has recently been published in America and of which the English edition is shortly to appear, he adapts the basic idea to the exigencies of wartime, and by doing so gives it a new urgency. The proposal is for "Union Now With Britain," as a means first of winning the war and thereafter of ensuring the peace. The nations of the British Commonwealth and the United States would enter into an immediate Federal Union. Each of them would surrender to a joint authority certain defined powers, including all those bearing upon war and peace. This joint authority, however—and this is the essential element of Mr. Streit's proposals—would not be a delegacy of the Governments; it would be elected by the peoples. It would have a legislature of two houses, one elected on a population basis—that is, containing a majority of Americans—the other composed of representatives in equal numbers of the independent States entering into the compact—that is, with a British majority. There would also be a joint executive, elected by some means other than by vote of the legislature, and a Supreme Court appointed to act as guardian of the federal Constitution. In brief, the proposal is that Britain and America should form a federation with a constitution of the American type. The resemblance, it is true, would not be absolute; the federation would have more restricted powers than the present American Union possesses, and there would be greater variety (for example, as between republicanism and monarchy) among the member States. But the two basic ideas of the Philadelphia Constitution would be faithfully reproduced: both the Federal and the State Governments would equally draw

their powers from the people, neither therefore being able to displace the other from its appointed sphere; and within the Federal Government itself there would be a similar division of powers between legislature, executive and judiciary.

Union of the American and British democracies—reunion, it could more aptly be called—is a very high and noble ideal. Indeed, it is not merely an ideal, it is the ideal; and it is not merely the ideal, it is the attainable objective for practical politics—the great political aim of this century. All through the decade of the thirties, civilisation was retreating before its enemies and crashing to an apparently inevitable end. In that dreadful summer of 1940, the ordeal of this generation reached its stark culmination. We have been forced back to barbarism to defend civilisation; we have had to risk all to ensure security; we have had to plan wickedness in order to win righteousness. But out of this pain and degradation has been born the great redeeming hope of new comradeship and unity between the two halves of the great Atlantic Commonwealth. It has taken the horrors of these past twelve months to conquer pride at one side of the ocean and prejudice at the other. And nothing less than permanent, real and active friendship between the two peoples will be enough to compensate for the sufferings that have been endured and those that are still to come.

British-American unity is, indeed, a necessity, both for the defence of civilisation and for its further progress. When faced with the ultimate perils, the two peoples recognise and proclaim (what they have always known in their hearts) that their aims in the world are at one, that their strengths are interdependent, that their antipathies and revulsions are the same. Now that both peoples have seen the dangers, to which one was blind while the other was indifferent, now that both have recognised that the perils can only be surmounted together, surely it is inconceivable that they should be allowed to drift apart once the immediate urgency has passed? If that is to

happen, then the war will have been fought in vain. The best that could then be hoped would be that America will be able to rescue Britain in the next war; the worst, and most probable, would be that she will not be in time. If Atlantic unity alone can win the war, Atlantic disunity can easily lose the peace.

Fear is reinforced by hope. Democracy, as developed in the English-speaking countries, has its grievous faults. But at least it is the only system of government now visible to the eyes of humanity that strives after decency, freedom and toleration, that believes in the dignity of the individual, that has intimations of immortality. We can rightly claim that the future of human progress is wrapped up in its survival—not because it is the only possible form of perfection, but because only through its survival can the negation of progress be averted. Britain and America share equally in this achievement. Each has contributed part of its peculiar quality. As Mrs Alice Duer Miller puts it in her very moving poem "The White Cliffs"

And were they not English, our forefathers, never more
English than when they shook the dust of her sod
From their feet forever, angrily seeking a shore
Where in his own way a man might worship his God.
Never more English than when they dared to be
Rebels against her—that stern intractable sense
Of that which no man can stomach and still be free,
Writing: "When in the course of human events . . ."
Writing it out so that all the world could see
Whence came the powers of all just governments.
The tree of Liberty grew and changed and spread,
But the seed was English.

This is the dream which the two nations, if they are not to betray their destiny, must now unite to further—the great dream of a Free Peace, a peace not of the sword but of consent.

"Reunion Now" thus covers the greatest political mission that any peoples have ever been given. There can be no question that the Declaration of Independence was of direct benefit to the American people. It can be argued that it has been of advantage to the British people in the past century and a half. But for the civilised world, it was a disaster the price of which has already been two world wars. The task now is to repair it, to replace the unilateral Declaration of Independence with a mutual Declaration of Interdependence. Nor can reunion be dismissed as an idle dream. Union was offered to France in all solemnity in the dreadful days of last June, and if complete Anglo-French Union, with its no smaller difficulties and its far smaller rewards, was a practical proposition, some degree at least of Anglo-American unity cannot be impossible. Nothing prevents it save men's ideas, and they are changing fast.

In any such movement towards reunion, both countries will have to make sacrifices. And the British sacrifice must be to recognise that we are the weaker, and the less numerous partner. This does not mean that Britain's day as a Great Power is over or that her strength and spirit are on the decline—the events of 1940 mock the very idea. Because of her exposed position, the initiative may well rest with her for decades to come. But the ultimate decision must rest with the ultimate power, and that, increasingly, lies over the oceans. If the British people have not lost their political wisdom, they will neither blink this fact nor cavil at it.

The Aim and the Method.

The case for "Reunion Now" has been stated at this length, partly because of its supreme and urgent importance, but partly also to prevent any misunderstanding when the point is made that Mr Streit's proposal is utterly impracticable, and that the degree of support it has won is more a cause for alarm than for gratification. Unfortunately, it will be difficult to set out the compelling reasons for this view without running some risk of giving offence in America. These reasons add up to the fact that a written constitution, a federal constitution, a constitution that enshrines the division of powers, would run flatly counter to all British experience and habits

of thought, and might well leave this island in a more dangerous and exposed position than ever, as the outward limb of a paralysed body, the prow of a rudderless ship. Americans, who are ready to debunk everything else, never criticise their Constitution, and the British view will be hard for them to understand. But the point must be made, and made clearly, lest irreparable misunderstanding follow.

The fundamental principle of the American Constitution is that of checks and balances. It springs from a double distrust of government—first, of all government as tending to encroach on the rights of the individual; and secondly, of the federal government as tending to encroach on the rights of the States. Accordingly, a system was erected which puts the maximum of negative powers in the hands of minorities. The American Constitution was deliberately designed (it is hardly an exaggeration to say) to make it difficult for anybody to do anything. There is a premium on opposition (a clearer example could hardly be wanted than that which is under our eyes), and there are twenty chances of saying No to every one of saying Yes. Moreover, the system makes true leadership difficult. In Great Britain, when the Government decides on its policy, more than half the members of Parliament are pledged to expound and defend it in their speeches, in their writings, in all their contacts with the electorate. Popular consent is needed in Britain as in America, but here the dice are loaded in the Government's favour, there in the Opposition's.

It is not for an Englishman to express an opinion on the suitability of the American constitutional system for America's domestic needs. But when it is proposed to project the same system on to the international plane, and to apply it, not to a union of contiguous States with many more interests in common than at issue, but to two nations of very different structures and geographical positions—albeit with a common tradition and a common purpose—then the Englishman can legitimately raise his protest. The objection is not to the placing of limitations on the power of the Government—still less of a joint British-American Government; there can, and should, be such limitations—indeed, that is the difference between democracy and totalitarianism. There is also no insuperable objection to putting the limitations on paper—though the English tradition would rather trust in "that stern intractable sense of that which no man can stomach and still be free." But when the proper province of the state has been marked off, Government must be free to act within it with decision, promptness, courage, consistency and forethought. How else can a successful diplomacy be pursued against the crafty schemers of less scrupulous Chancelleries? How else can forethought be employed to accumulate sufficient power behind the forces of decency, and sufficient decision be summoned up to use it at the right moment?

The Negative Principle.

The task of democratic Government is difficult enough in any case. Mr Churchill, speaking in the House of Commons this month, asked if it was realised

how strong the negative principle is in the constitution and work of the British war-making machine. The difficulty is not to have more brakes put on the wheel. The difficulty is to get more impetus and force behind it. At one moment we are asked to emulate the Germans in their audacity and vigour and the next moment the Prime Minister is being assisted by being surrounded by a number of "No" men to resist him at every point and prevent him from making anything in the nature of a speedy, rapid, and, above all, positive constructive decision.

If that is the present state of affairs under the British Constitution, which is both centralised and unitary—at a time, moreover, when the legislative powers of the Government are unlimited—can it really be proposed that the great issues of State should be put in the hands of an authority which would be infinitely more inhibited by the negative principle? It is no answer to say that

British Governments do not always show foresight or courage. There is always the risk of Baldwinism—but the point is that a British Government is not prevented from showing foresight or courage; within living memory there have been several Governments that showed both qualities. But the past eight years have given an almost perfect example of the prohibitions that the American system of the division of powers imposes. Mr. Roosevelt has been a "stronger" President than any of his predecessors in modern times; there is no doubt that he has seen the crisis of civilisation coming a long way off, or that he would have the courage to act decisively if it rested with him alone. But, for all that, America has met the crisis less prepared, materially and spiritually, than Baldwinian England; and she has not yet fully made up her mind to act. Let it be repeated that this is not said in criticism or in reproach, but merely by way of supporting evidence for the belief that, whatever may be true of America, Britain in her exposed position cannot afford to accept any more checks and balances to a democratic Government's powers of decisive action.

If the dilemma were posed of union on Mr Streit's terms or no union at all, then the choice would indeed be a hard one. But there is no real reason to believe that this is the choice. A generation ago exactly the same false dilemma was posed among the British nations themselves. In the last war, the air was thick with plans of Imperial Federation and there were many who could see in this the only alternative to a steady drifting apart of the nations that had been drawn together in the comradeship of war. But it was not so. Paper schemes of federation were decisively and unanimously rejected. Indeed, it was not until the last tenuous bonds of obligation were deliberately snapped that the idea of Commonwealth reached its fulfilment—and we are seeing to-day that the unity is all the more real for being less formal. Britain can claim that her Commonwealth of Nations is the only union of fully free and wholly sovereign States that has ever worked in a crisis—and its constitution is a denial of all mutual obligations between the members, save only understanding and loyalty.

It is for these reasons that the order of ideas represented by Mr. Streit's book is to be deplored. It is not that the object is unacceptable—quite the contrary: there is nothing in public affairs more worth working and fighting for than the closest possible unity of the British and American States and peoples. It is not that, in the face of the need for unity, there would be any clinging to narrow national sovereignties for their own sake. It is because the method that Mr. Streit proposes would defeat his

own object. His Federal Congress would merely add the certainty of constant bickering on small issues to the difficulties of securing common action on large. It would add the political manoeuvres of one house against another, and of both against the executive, to the difficult enough task of mutual understanding. Rather than ensuring that both nations should act together, it would ensure for most of the time that neither could act at all.

What, then, is the road to unity, if this is a blind alley? It lies not through the grandiose planning of an Anglo-American Federation, but in the much more gradual and difficult creation of an Atlantic Commonwealth. Constitution-building, after all, is a delusion and a distraction. It concentrates thought on the machinery of politics, while all the time hard and continuous thought is needed on the policies themselves. This meeting of minds is not easy to secure, nor even the creation of conditions in which it is possible. One line of action, however, will certainly be beneficial—the fostering of the greatest possible interchange of personal contacts. There should be, after the war, a scheme of financial assistance, provided by the two Governments, for any citizen of one nation who will visit the other, not as a tripper but as a serious student—the assistance might well take the form of very cheap ocean passages. There should be a doubling and redoubling of institutions such as the Rhodes Scholarships and the Commonwealth Fund Fellowships. As between the Governments, too, there should be an effort to build up a continuous traffic of men and ideas. The Ambassadorship in Washington should never again be held by any but a member of the Cabinet; and the precedent that is growing up in wartime, whereby nearly every British Government Department has one of its senior officials continuously in Washington (with an only slightly smaller concentration of American talent in London), should be faithfully followed in peacetime. By this means there would, in time, be no front-rank politician or leading Civil Servant in either country who had not had first-hand contact with the problems of the other. It is by means such as these, widely practised and steadily continued, that mutual trust and understanding can be built up. The method is less spectacular, but more likely to be productive.

What is required of the two nations is a full recognition of their fundamental unity of purpose, the establishment and maintenance of continuous mutual contact, the creation of confidence through knowledge and frankness, the instinctive assimilation of loyalties. These are difficult aims; but if they are achieved, formal constitutions will not be needed; and if they are not achieved, no paper document, however venerable, will bring agreement out of dissent.

NOTES OF THE WEEK

The First Arrival

We are grateful to Rudolf Hess. In a war in which the chief characteristic of the enemy has been iron efficiency and ruthless planning, Hess has provided the first genuinely romantic episode. The Fuehrer's deputy taking off alone in a plane, the parachute descent in the fields of Scotland, in a kindly ploughman, the final visit of confirmation by a Foreign Office official flown by special plane to Glasgow—all this has the genuine movement and excitement of the best thrillers—a *Thirty-Nine Steps* or a *Greenmantle*. Why did Hess undertake this astonishing journey? We have been fed so long upon "internal collapse," "dissent between the German leaders," "crippling rivalries," and the rest, that now when an incident occurs which seems to bear out the old hopeful prophecies, we feel chary of casting Hess for the rôle of rat, or of believing that the Nazi ship is sinking. Nevertheless, we can agree with the Prime Minister that the journey of Hess is evidence of a "maggot in the apple." We can be less certain of the reason for the inner disintegration. Both British and German sources are now agreed that Hess came on a peace mission. His intention was to establish contact with circles already known to him in this country and to attempt some

sort of *rapprochement*. The burning question is, of course, what kind of *rapprochement*? The Germans, seizing wildly on the only story which gives their propaganda an outlet, claim that Hess, a great but misguided patriot, flew to Britain to persuade the people to spare themselves the horrors awaiting them by driving "the Jewish murderer, Churchill" from office and coming to terms with Hitler. The British reports tally with this only in so far as they suggest that Hess wished to reach some understanding with Britain. The nature of the understanding is, naturally, quite different and remains uncertain. Some sources hint that Hess wishes to end the war in order to spare the Germans the horrors of aerial bombardment, others that the stars to which Hess—and Hitler—are addicted, prophesy disaster for the Nazi regime; again others that Hess's name, while second in the list of succession, is first on the list of liquidation, and Britain is the only country where he can hope with impunity to become the Trotsky of the German Revolution. None of these reports carry as much conviction as the interpretation of Hess's flight which links his action with the current negotiations between Germany and Russia. Germany's Left Wing, it is said, has carried the day. A far-reaching agreement of co-operation may be announced in the near future, and Hess, belonging

to the Old Guard, stands to the abandonment of anti-Bolshevism as Trotsky and Kameneff stood to the abandonment of Bolshevism. In his extremity, he has turned to Britain to plead for a "Western front," including "moderate" Germans against the new Janus-headed National Bolshevism of Moscow and Berlin. If this interpretation is correct, Hess may have come either as a genuine patriot or a Nazi stooge. That patriotism should suggest an alliance with West rather than East is plausible, even in a Nazi. But a subtle Nazi move might consist in sending Hess to Britain as a veiled threat to Russia and as a factor for disintegration between the supposed "peace lovers" and "Churchillites" in this country. The possibility of a vast Nazi "plant" must, therefore, be borne in mind. However, it need not deter the British Government from making the fullest use of Hess for propaganda to the Germans. However skilfully Goebbels may plug the "peace mission" line, nothing can reverse the first damaging denouncement of the Fuehrer's Deputy as a madman, subject to increasing delusions. British propaganda has an opportunity such as it has never enjoyed before. It must not be lost.

Minister for Production

Mr. Churchill has now indicated what Lord Beaverbrook's new work is to be. The Defence Committee of the Cabinet, of which the Prime Minister is chairman, has two tasks, the supervision of war supplies and the direction of operations; and the new Minister of State is to be deputy-chairman in regard to supply, while Mr. Attlee is deputy-chairman in regard to operations. Hitherto Mr. Churchill normally presided over both sections of the Committee, and it is not yet clear whether Lord Beaverbrook will have any more actual authority in supply matters than Mr. Attlee has in operations. But, at least as Mr. Churchill's delegate, Lord Beaverbrook's job will be to see that tanks, munitions, aircraft and all kinds of war material are forthcoming, and he will be authorised to say the deciding word on their respective urgency. In effect, he will be in day-to-day charge of war production, and it will be interesting to see how his relations develop with the Production Executive, the committee of Ministers in charge of economic departments, which was set up in January under the chairmanship of Mr. Bevin. In a recent report of the Commons' Select Committee on National Expenditure, it was commented that the changes of last January had worked as a great improvement, but that, as late as March, there were still priority difficulties; and it will be a specially congenial task for Lord Beaverbrook to enforce upon the departments these decisions about what is to be produced and in what order. By temperament, he is not likely to be patient with the failure of the departments concerned—described by the Select Committee as "too strongly buffered from outside contacts"—to respond to information and criticism; and his rôle as "referee" (Mr. Churchill's phrase) will certainly not be a passive one. It is still possible to doubt whether Lord Beaverbrook has the broad and articulated conception of economic strategy that its best direction requires. But this may not be needed. Primarily, the Minister of State will be the War Cabinet's executor in supply matters; and the strongest possible guarantee of his capacity to compel departments to work to order—and in order—is the difficulty he himself found, as a departmental head, in fitting in with less forceful people.

Bombs and Bombing

The latest German raids have underlined the lessons of recent air developments. The attack, both German and British, has increased in striking power, though distance still operates against the RAF and will continue to do so. The raids of the last week on London and Mannheim rank among the heaviest of the war so far. The defence, too, has rapidly advanced, and here the British forces, operating over a compact and more defensible area and employing a quicker ingenuity in the solution of technical problems, have a clear lead. It would be premature to say that the night raider is in sight of being beaten, though the German losses in moonlight—133 in the first eleven nights of May and thirty-three on the night of the latest raid on London—represent something not too far off a deterrent rate of loss. On dark nights, the bombers cannot find their targets so well as in moonlight; but the night-fighters still cannot find the raiders in numbers without the moon to help them.

By next winter heavy bombing at night is likely to be unprofitable. But, in any case, it is hard to believe that night bombing, by either side, can have any crucial influence on the war during the next few months. Nights will be too short, and although British raids on places such as Kiel, Brest, Hamburg and, possibly, Mannheim, like the heavy German raids on crowded ports in Britain, do appreciably influence the day-to-day conduct of the war, it is still very doubtful whether night bombing can be at all decisive. The effects of bombing on actual war activities can be repaired with notable rapidity, and can only be cumulative if the raids are more or less continuous. The effects on civilian life are more serious, but these also can be mended, and there is no sign that the will to carry on has been weakened—which is the only way in which a spiteful and destructive raid like last week's on London could acquire any military value. The opinion has been strengthened that, in the air, command of the sky in daylight and over battlefields and combat zones is likely to be the only decisive factor.

The Monthly Toll

The first announcement of shipping losses on a monthly basis is shown in the accompanying table, together with previous figures on the same basis. British, Allied and neutral ships sunk in April amounted not far short of half-a-million tons gross. High losses were expected; the April total includes 189,500 tons sunk in the Greek campaign; and it is possible that the general total may still have to be raised as further ships are posted overdue and later news comes in. Indeed, it would be difficult to understand why this statement was made only ten days after the end of the month, were it not for the fact that some authoritative statement was needed to counter a number of misunderstandings which had arisen in the course of the American talk about convoys. The American people now have something like a vested interest in British losses. But experience has shown how greatly ten-day old figures may have to be altered. Publication of the figures for the last week of March was delayed by the usual ten days; but the total for the whole month has now been given as 489,229 tons compared with the previous announcement of 394,417 tons for 28 days; and if the April total were to be revised by only half as much as the March figures were raised, the combined total for these two months will reach the disturbing

MONTHLY SHIPPING LOSSES (In gross tons)			
	British	Allied and Neutral	British, Allied and Neutral
Average Sept. 1939-April, 1940	83,900	71,000	154,900
May, 1940	75,200	173,500	248,700
June	269,800	264,100	533,900
July	290,300	115,600	405,900
August	282,400	105,100	387,500
September	307,400	128,100	435,500
October	299,400	124,200	423,600
November	299,800	69,000	368,800
December	230,300	82,900	313,200
January, 1941	205,500	100,500	306,000
February	264,500	69,500	334,000
March	326,600	162,600	489,200
April	293,100	195,000	488,100
Average May 1940-April 1941	262,000	132,500	394,500

height of over a million tons. Apart from the special circumstances of this first monthly announcement, which came at a time when all sorts of statements were being bandied about concerning the gravity, real or alleged, of the Atlantic position, it is clear that a time-lag of two or three weeks would be less misleading and would satisfy one of the declared purposes of changing from a weekly to a monthly basis. Pending revisions, the April figures do give some appreciable encouragement. The considerable proportion of the April losses due to the Greek campaign suggests that in the Battle of the Atlantic the enemy has not been able to keep up the grievous toll in March. Of course, this was to be expected when the main weight of the battle and a considerable proportion of shipping activity were for the time transferred to the Mediterranean; and in any case, by themselves, these figures of losses may give a very distorted picture, in the absence of information about the ratio of sinkings to safe arrivals and to the amount of damage caused to ships and cargoes. This, of course, is one of the reasons given by the "secrecy school" for suppressing the figures altogether. Actually, the enemy cannot be markedly aided by these announcements, and in

the present circumstances of the war, the need for the public, American as well as British, to be given all possible information is inescapable.

Quiet in Africa

It has been a quiet week in Africa, partly because of the sandstorms raging round Tobruk and Sollum. The military position is unchanged, but the number of prisoners seized in sorties and patrols is increasing steadily. The real fighting has been on the sea, where the Germans launched an unsuccessful attack on a British convoy and the Navy kept up a continuous strafing of the aerodromes at Benghazi and Derna and harassing reinforcements and supplies as they come up. To an astonishing extent, the air initiative rests with the RAF. The Axis air fleets do not seem to be making much attempt to destroy British positions by preliminary air attack. Possibly the limitations which transport and supply place on air activity have led the Germans to shepherd their resources against the day of the next lightning attack. In their strategy the bomber is above all designed to act as heavy artillery support to advancing columns, and to this may be due the onesidedness of the aerial activity above Libya, but it is difficult to see how the Germans hope to be successful in a desert attack undertaken at the height of the summer heat. In Abyssinia, the weary pursuit of the remnants of the Italian army continues. The next strong point is Amba Alagi. It is uncertain how much further the Duke of Aosta's forces can withdraw without becoming demoralised or surrounded. Their immediate aim is of course to keep pockets of resistance intact until the rains put an end to all campaigning, and they may still entertain some distant hope that, by the autumn, Germany will so have altered the balance of power in Europe that they will be reinforced and relieved. Even if the hope is vain, their continued resistance serves the purpose of diverting supplies from other fronts. Meanwhile, the Emperor Haile Selassie has re-entered his capital in triumph on the fifth anniversary of the entry of the Italian troops. It is only right that the first King to be dispossessed by the Axis should be the first King to be restored and his return is a happy omen, however remote the likelihood of restoration may seem in Europe. It cannot seem much more remote than Haile Selassie's in May, 1936. The Abyssinian empire remains at war with the Axis Powers and Haile Selassie has offered the Allies an army of seasoned fighters for us on any front.

"Stabilisation" in Iraq

The revolt in Iraq drags on. Although the British forces are in complete control at Habbaniyah and Basra and have recaptured the important desert post of Rutba, there has been no news from Baghdad, save for the false, or at least premature, report that Rashid Ali has fled. The situation is described as "stabilised," but how can a situation be stabilised while the rebels still control the capital and—even more important perhaps—the Mosul oilfields? How can a situation be stabilised when the lawful Regent is still out of the country under the protection of the Emir of Transjordan? How can a situation be stabilised while there are still at large some 20,000 Iraqi troops who have given no evidence that—whatever the opinion of the British authorities—they think "the revolt is petering out"? It is a confused and confusing situation, and the amateur strategist must be excused some bewilderment when he remembers the unanimity of military opinion on the importance of the time factor. Two weeks have passed since Rashid Ali's first appeal to Berlin, and although it is now almost certain that his coup misfired and interfered with the timing of the German plan for the Middle East, the apparent dilatoriness of Britain's counter-measures seems to be bringing the timing back to its original schedule. Von Papen is on his way to Ankara and Rashid Ali's Defence Minister, Sayid Naji Shawkat, has arrived in Turkey, ostensibly to confer with the Turks, probably to receive his marching orders from Hitler's envoy. In the meantime, the negotiations between Germany and the Vichy government are ended, and it is all too likely that "collaboration" in the Colonies, particularly in Syria, is to be the price paid for economic concessions. On the outcome of these concessions, then, the Iraqi campaign may well depend. The Germans have almost certainly demanded the use of airfields and the co-operation their use entails. If Vichy suggests there is nothing in General Dentz's history

to suggest that he will take an independent line, and the British may be faced with the predicament of letting Syria go by default or of invading it at the risk of hostilities not only with Germans but with the French. The surest way of avoiding this predicament is swift action to end the Iraqi revolt.

Stalin at Work

Those who have been speculating on the meaning of Stalin's assumption of the Premiership have had a number of pointers during the week, none of good omen. Within five weeks of the Russian signature of a Pact of Friendship with King Peter's Government, Yugoslavia, together with Norway and Belgium, have been formally deprived of Russian recognition and the Kremlin has withdrawn its diplomatic representation on the grounds that these Powers have lost their sovereignty. The move has been variously interpreted, some maintaining that Stalin was primarily concerned to coerce the British Government into a recognition of the Russian conquest of the Baltic States, others that, on the well-known principle of lightening the sleigh when wolves are in pursuit, Stalin is throwing overboard a number of embarrassments which might at some time be used by the Nazis to pick a quarrel. This interpretation is borne out by Russia's sudden and otherwise inexplicable recognition of Iraq, a country whose independence the Russians have hitherto refused to admit. Here desire to conciliate the Nazis may even be going as far as active co-operation. One of the most encouraging features in Rashid Ali's revolt has been the disapproval and reticence of the neighbouring States. To this atmosphere of ostentatious non-co-operation, Soviet Russia's recognition is a striking exception and, by their geographical position, the Russians are in a position to exercise some pressure upon Iran and, if acting in concert with Germany, very considerable pressure upon the Turks. The Russians have attempted to explain the incident away by saying that the request for recognition came from the Iraqi side and that it was a repetition, without any limiting condition, of an offer made during 1940, to which had been coupled the proviso that Russia should at the same time recognise the independence of the Arab States. The invitation very probably came from Rashid Ali. No one is more anxious for foreign recognition than the ruler of an upstart regime. The serious point is that Russia should choose a time when a Government of very doubtful legality is occupied, with Nazi backing, in a struggle against Britain, to accord it official recognition.

Civil Defence

The country's 1,400 fire services are to be transferred from local to State control. The responsible authority will be the Home Secretary (in Scotland, the Secretary for Scotland), and since the purpose of the change is to organise fire-fighting in larger units to facilitate co-ordination and mobility, the regional framework provided by the areas of the twelve defence commissioners will be used. Once again, the right step has been taken, far too late. The only way in which reforms in civil defence can be secured is by lengthy campaigns of criticism during which the faults complained of remain to plague bombed districts. In his last broadcast, Mr. Churchill paid tribute to the work done by local authorities in the bombing, but actually this praise needs qualification. In improvisation under fire and in the devotion and endurance of individual officials, there have been a host of local triumphs; but in planning, preparedness and adaptability there have been grave shortcomings. At the outset, it was inevitable that air raid precautions

should be entrusted to the local authorities as agents; ARP is local and intimately associated with local services, and will remain so. But to entrust them also with policy and organisation has, in places, been very nearly disastrous, and nowhere more so than in firefighting. No system of local control is more variegated and anachronistic than the fire services, many of which, though jealously independent, are still no more than offshoots of the police station or the parish pump. Now, under the charge of Mr William Mabane, Parliamentary Secretary to the Ministry of Home Security, there is to be the chance to alter this; and the question whether all ARP should not be put under similar control and direction is inescapable. A private motion has been tabled in the Commons to set up a Ministry of Civil Defence, to concentrate authority for all the activities, firefighting, the warden service, shelters, evacuation and first-aid, which are now scattered among three or four Ministries—and left to the local authorities. It is not really the local authorities that are ultimately to blame for the slow, slipshod state of many of these activities; they are just not competent. What has been lacking is foresighted and vigorous direction from above and close and efficient co-operation over wide areas; and a Ministry of Civil Defence, possibly with only a small central bureau at the Home Office, but with a dozen or so well-staffed and energetic departments in the defence regions, might shore up the defence of the realm at a score of weak and vulnerable points.

A Pool of Merchant Seamen

An Essential Work Order has been applied to the merchant navy which, in effect, prevents the men already in it from leaving it and empowers national service officers to bring back members who have already left it. A Merchant Navy Reserve Pool is to be established consisting of persons qualified to be officers or ratings of the merchant navy, but for the time being not so employed. All persons who were so employed within four weeks before May 26th, the date upon which the order comes into force, automatically become members, as do also persons in the reserve whose employment ceases unless they are immediately re-engaged by the same employer. The Reserve is under the management of the Shipping Federation, and members must accept any employment or undergo any training which may be notified to them by the Federation with the approval of the "appropriate society" (one of a specified list of trade and professional unions), or by a National Service officer. Conditions of service are to be determined by the National Maritime Board, or, in the case of radio officers, by the Federation and the Radio Officers' Union. Employment may not be terminated on either side without the consent of the appropriate society, and, except for serious misconduct, with the written permission of a National Service officer. Local Appeal Boards are provided for the hearing of appeals against dismissal for serious misconduct or of grievances in respect of the National Service officer's exercise of his right to grant or refuse permission. Members of the Pool may not be engaged without the permission of the Federation and the appropriate society, and persons engaged in shipping services or in the provision of wireless transmitting apparatus, and radio officers for ships may only engage employees from the Pool. Members of the Pool may not engage themselves otherwise than as officers or ratings of the merchant navy, through the medium of the Federation. This moderate and well-safeguarded measure of compulsion is intended to secure that workers are always available to meet the requirements of shipping, and to make provision for reliefs, training and refresher courses. It is a pity that its scope could not have been widened to include men who have been out of the service for longer than four weeks.

Speculation in Foodstuffs

The exchange of statements between the Ministry of Food and the Food Price Investigation Committee of the North Midland Region is perhaps a trifle unedifying for the general public. Food speculation in war time is a serious crime, as the Ministry of Food would be the first to admit. Thus, it is somewhat difficult to understand the purpose of the statement, issued by the Parliamentary Secretary to the Ministry, to the effect that Lord Woolton considers undesirable disclosures made by the Committee regarding two cases of speculation; and that the undesirability is increased by the fact that the Ministry was contemplating judicial proceedings and that the Ministry was itself the original source of the information. The

defence of the Price Committee is to deny the fact—to submit that in one case at least there was no question of judicial proceedings being taken and that in neither case was the Ministry the original source of the information. On the question of fact, it is probable that deadlock can only be avoided by some face-saving formula regarding misunderstanding or misinterpretation. But the incident raises a more important question of principle. Suppose that the Ministry is correct in claiming that it deserves sole credit for detecting the speculation and will shortly prosecute, is there any reason in the public interest why the facts should not be published by the Price Committee? Is there any reason why the Ministry should claim a monopoly in the matter or seek to copyright its knowledge? The aim of both bodies is to eliminate food speculation, and publicity is a valuable instrument to that end. The quarrel smacks of official pettiness and should give place to an attempt to provide effective protection for the consuming public against the sharp practices that are admitted by both parties to be going on.

Essential Work

The Essential Work Order is to be applied to coal-mining and, not improbably, to building. These are bold steps. In future, in these two industries, no worker will be able to leave or be dismissed without official sanction; and, in return, every worker will be guaranteed a minimum weekly wage. It so happens that neither in mining nor in building can work be relied upon to be continuous, which means the likely risk of paying the guaranteed wage for no work. But the Essential Work Order is necessary. Miners have been drifting away from the pits ever since last year's loss of markets in Europe, and not even the current urgent demand for a 10-15 per cent higher output has stopped them. In building the trouble is poaching from one site to another. In both ways the Essential Work Order will help, and all that is needed now are purposive and effective means to bring back old workers. Appeals have had some results, but not very many. All old miners will be asked to register, which will be useful information, though it will not bring them back to the pits.

Concentration in the Press

On Tuesday, in the Commons, on the adjournment, the question was raised whether, in the national interest, the plant and labour of newspapers and periodicals should not be concentrated, and the Government's answer, in brief, was that, after careful consideration, it had been decided that such a step was neither necessary nor desirable. The suggestion that the Press should voluntarily seek ways and means of "telescoping" is a good one; but, unless it is proposed to restrict the number of newspaper readers, to cut down the number of newspapers would save little or no paper; and it would be hard to shut down any section of the Press without at any rate risking the appearance of curtailing the free expression of opinion. Supplies are already severely limited, and Captain Waterhouse argued that further release of labour, materials, factory space and plant by concentration would not be of any appreciable magnitude. Probably he somewhat overstated the case for leaving the Press alone, for which every trade can easily find reasons. If the Press can contribute further it must be prepared to do so. There are organs which are not primarily expressions of opinion at all, but rather ancillary to activities which in wartime have ceased to be significant; and in a number of cases, among women's journals, for instance, some merging for the duration of the war would be conceivable. But the amount of resources that would be released would be small. In September, 1939, 11,100 tons of paper were used weekly by newspapers and periodicals; now the figure is 3,200 tons, a reduction of 75 per cent. It is true that much less labour has been released—perhaps a quarter or a third—largely because there can be no *pro rata* reduction in the labour force, since practically the same number of people are required to print or publish a newspaper however much it may be cut down. On the labour side, of course, skilled printing operatives can be invaluable for training in war work, and the absurdity of the present position is that when these workmen are de-reserved they are swallowed up by the Forces.

Motors and Motives

There is considerable perturbation in the motor trade. The trade has been hard hit by the wartime decline in

motoring, but sympathy should not be indiscriminating, and some of the views that are at present being expressed in the trade are odd, to say the least. It is argued in one motoring journal, for instance, that since the basic petrol ration only adds up to 2½ million gallons a week, 30,000 tons or three tankers a month, any saving that could be made by cutting out joy-riding and waste would be negligible. The case for abolishing the basic ration, which is that no one then could use any petrol at all without a permit granted after ascertainment of need, is not met at all; and the possibility that, in the war context, almost every motorist's basic ration may be "waste" is just not seen. It is true, of course, that it is the job of trade representatives to speak *ex parte*—which must, incidentally, be very troublesome in a corporate State where sectarianism is made a constitutional virtue. It is understandable, for instance, when another motoring journal complains that co-operative societies are buying petrol filling stations. But for the journal to attack this development, on the ground that it might menace "price protection" after the war, because the societies might intend "working on a smaller profit ratio," is none the less pernicious. The motor trade will not help itself to regain its feet after the war by restrictive practices; nor will any other trade.

Permits for Cars

Anxious discussion is going on about the price of used cars. In March, 1939, one-year-old 8, 10 or 12 h.p. cars were sold at about 25 per cent below their original price; now one-year-old small cars are priced at 22½ per cent above their original cost. Two-year-old small cars in 1939 were sold at over 50 per cent below their original price; now two-year-old cars command their new price. The cause is, of course, the shortage of cars, since necessarily, and very rightly, no new ones are being made, but the trouble is that people who must have cars for business purposes are heavily mulcted. There is a wide opinion that Government control does not go far enough. Present prices do, admittedly, reflect the state of supply and demand, but the solution would be to restrict demand; sales could be forbidden except to buyers with permits to buy for essential purposes. And from permits to buy cars to permits to use them is only a short step. It is not perhaps probable that those who oppose any cut in the petrol ration would favour the deliberate restriction of rationing in this way; but it is absurd to maintain at one and the same time the right of every man to be a motorist and the right of every motorist to reasonable car prices. This is wartime, and there are many reasons, economic, strategic, industrial and defence, why the further physical curtailment of civilian motoring might be desirable.

Parents' Remittances

Discussion around the desirability of remitting to America and Canada sums for the support of evacuated children has now reached the "parliamentary question" stage. The matter has been raised by Mrs. J. R. Rathbone in a question to the Chancellor of the Exchequer. The proposal takes two forms: that existing exchange restrictions should be lifted in order to permit the despatch by parents of regular sums to America for the support of their own children; and for permission to create a fund in this country to be invested in Government savings for the duration, and to be given at the conclusion of hostilities either to an American charity or the New World hosts of British children. It is implicitly recognised that the contributions would in neither case compensate the American and Canadian families which have received British children, and there is good reason to believe that the sum involved would be correspondingly small—in the nature of a token thank-offering. None the less, relaxation of the present exchange restrictions, by however little, would diminish the capacity of this country to wage war. Such gold and exchange as Great Britain can muster for despatch to America must, at present, be used for the purchase of goods not within the scope of the Lease-Lend Act, and the generous impulse must be curbed for the general good. As regards the second proposal, that a fund should be created for post-war transfer and blocked for the duration, the position is rather different. The proposal is fully in tune with the requirements of war-time financial policy, requiring, as it does, extra economy in consumption. Indeed, those parents who have been relieved of the ability to provide for their children during the war have had spend-

ing power fortuitously liberated. It cannot be certain, however, that the shortage of dollars will be overcome, even after the war, and it is on this ground that the Chancellor of the Exchequer rejected the suggestion. But there is nothing to prevent parents from accumulating their own funds and hoping that it will be possible eventually to transfer them.

Diplomacy under Fire

Mr. Eden's decision to call on Sir Malcolm Robertson to prepare a report on the Diplomatic Service, will be welcomed by many critics who, arguing from the manifest weakness of British diplomacy in recent years and its apparent lack of information—illustrated by such incidents as the Rashid Ali *coup*—put the blame upon the methods of recruitment for the Foreign Office and demand that an infusion of new blood be made to weaken the aristocratic complexion of a corps which has to live and work in a world from which the traditions of aristocracy have fled. Although there is some truth in the charge of inadequacy, the actual practice of British diplomacy has probably not been as ineffectual as some critics suggest. Effective diplomacy abroad demands resolute policy at home and, ultimately, the sanction of sufficient material force. Since the last war British diplomats in the field have had behind them neither firm policy nor the promise of force to back up decisions already taken. If they are criticised on the grounds of weakness and vacillation, the charge should also be laid at the door of the Governments they have had to serve. There are, however, other scores upon which criticism is perfectly valid. If the diplomats have not been served by their Governments, neither do they appear to have served their Governments adequately in the vital sphere of information. A sound foreign policy must be based on valid premises—the political conditions in foreign countries, the economic and social significance of different groups, the influence or lack of it of the leaders—and the first duty of a diplomatist is to see that his Government is fully and exactly informed. The qualities especially needed are sound judgment, a lively interest and the power to generalise from individual instances, and these qualities on the whole depend upon education and tradition. It follows that the critics who blame the present methods of recruitment on the grounds that it is confined to candidates who have enjoyed the advantages of public school and university education are missing the real point of the problem. Diplomacy by its very nature demands such training. The present methods of recruitment surely fail because they do not ensure that the most intelligent members of the educated classes are recruited for the Diplomatic Service and to the criticism of faulty recruitment must be added criticism of a routine and a training after admission to the Foreign Office which appears to stultify whatever qualities of energy and initiative the candidate possessed on entry. In a world in which the direct business of diplomacy is and will be ever increasingly conducted by the Governments themselves, information is the vital function of the diplomatist, and he will fail if his education and tradition and diplomatic training, instead of giving him mental energy and a universal curiosity, have narrowed his mental interests to the social life of a diplomatic clique.

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

THE WORLD OVERSEAS

The Atlantic Islands

(By a Correspondent)

WITH the development of a major Atlantic front, the strategic outposts of the African continent are taking on military significance. Portuguese Madeira, the Spanish Canary Isles, sixty miles from the coast and halfway between Spain and Dakar, the Portuguese islands of Cape Verde, 350 miles west of Dakar: all these lie athwart the stream of British traffic from South Africa, Australasia and the Far East; and, in enemy hands, they could threaten Britain's commercial routes to South America. The third group of islands, the Portuguese Azores, have potentially even greater strategic importance, since they are a natural stepping-stone between the two continents, 1,000 miles out from Portugal and another 2,000 miles on to Bermuda. At Horta the American Clipper breaks its trans-Atlantic journey.

The islands are not important except by virtue of their geographical position. The Canaries are fertile, and their exports of fruit and vegetables and wine reached £5 millions in the year before the war. In return, manufactured goods, coal, iron and cement are imported. From the Cape Verde islands go coffee, oilseeds, salt and oranges in return for coal and fuel oil. The Azores import coal, timber, iron and machinery, and export butter and cheese and hides and straw hats; but none of the islands is economically of great importance, save, perhaps, for the luxury fruits, wines and vegetables of Madeira and the Canaries.

It is as pawns of war that they have achieved importance. There are good harbours in all the islands, except Madeira, where Funchal is only an open roadstead. Horta, in the Azores, has a magnificent bay with deep water and a firm sandy base for anchorage. Only a south-east wind affects the harbour and, incidentally, the Clipper anchorage. In the Canaries, Las Palmas is the third greatest port of Spain, and heads the list for tonnage cleared. It is an excellent harbour of refuge of 156 acres, 50 to 60 feet deep, protected by a 2,025-yard breakwater. At Santa Cruz, there are oil and coal bunkers and 7,300 square metres of quay space, and at St. Vincent, in the Cape Verde islands, the Porto Grande is spacious and safe, with three coaling depôts, two oil depôts and facilities for Diesel oil. The coaling station serves practically all ships going to South America. All the islands could supply seaplane bases, although the low clouds which hang over the Canaries through the summer are treacherous, and the Horta base is somewhat dependent on the direction of the wind. However, the possession of the islands would give clear strategic advantages and would, for example, facilitate the work of Axis commerce raiders.

"Preventive Protection"

Their advantages have long been recognised, and it is significant that at every crisis in Western Europe the question of their possession comes up. During the Spanish Civil War there were constant Axis accusations that Britain intended to seize the islands, and equally persistent rumours in Britain that Germany had established fuelling and submarine bases in the Canaries. Since the outbreak of war, these accusations have continued from time to time, and in recent weeks there has been such a spate of claims and counterclaims that, on May 9th, Dr. Salazar announced that the Portuguese Government had received no request or suggestion from any of the belligerents that they should "preventively occupy" the Portuguese islands and that Portuguese reinforcements had already been sent to strengthen the garrisons on the islands. His statement may very well have been provoked by one of the latest contributors to the campaign of occupation, Senator Pepper, who urged the United States to "get tough" and occupy the Azores among other strategic vantage points.

If any belligerent were determined to seize the Portu-

guese islands, it is doubtful whether Portugal disposes of sufficient force to resist them. The peacetime strength of the Portuguese army is only 2,551 officers and 26,424 men, and the navy is small—with only seven escort vessels, six destroyers, one torpedo boat, seven gunboats and three submarines. In the critical sphere of air power the Portuguese have no independent air force, and their naval flying service has only twenty-four machines.

South America's Industrialisation

[BY A CORRESPONDENT]

WARTIME difficulties in obtaining manufactured goods from Europe are leading to two main developments in South America. First, there is an increase in inter-American trading (particularly with the U.S.A.); secondly, a powerful stimulus has been given to national manufacturing industries—such as was given by the war of 1914-18—which is bound to lead to further permanent changes in South America's principal imports.

Argentina is primarily a farming country, and the lack of iron and coal militates against the development of manufacturing industries. Even so, a recently published official census of industrial activities in 1938 already showed considerable expansion over the previous census in 1935, the total annual value of production having risen to 2,417 million pesos (say £142 millions sterling) from 1,804 millions (£106 millions). A further official report, covering the electric light and power industry during 1939, showed a marked growth since 1935, total sales of electric current having risen to 248 million pesos (£14,600,000) from 193 millions (£11,300,000).

The Promise of Brazil

Industrialisation is most promising in Brazil, and already many lines of Brazilian manufactures are becoming increasingly competitive in other Latin-American markets. Brazil has already captured a large part of the cheap end of the cotton goods market in Argentina, even from Japanese competitors. Although undue optimism—particularly in view of the lack of skilled labour—may attach to Brazilian expectations that the new steel plant at Volta Redonda may make Brazil independent of imports of iron and steel within two years or so, the fact remains that the country is rich in iron ore and coal, and the site of the new plant is conveniently situated in this respect, while the output of iron and steel has already grown steadily for some years. Of the new company's authorised capital of 500,000 contos (say £6,250,000 sterling), the preference shares total 250,000 contos and are stated to have been fully subscribed by Federal Savings Banks and Pensions Institutions in Brazil, while the ordinary shares will be taken up by the Federal Government for re-issue later to the public.

Activity in Chile

The output of Chile's manufacturing industries remains very high, the average general index for 1940 showing a rise of 11 per cent over the 1939 figure, while the average index of sales of industrial products was 7 per cent higher; and there is practically no unemployment. Peru's industries had also already advanced to the extent of providing most articles of everyday use, while, as in the case of Brazil, Peru is negotiating with the U.S.A. with a view to the participation of the Export-Import Bank of Washington in

a scheme to develop the Peruvian iron and steel industry, which would require some \$20 millions. Large deposits of iron ore exist at Marcona, 250 miles south of Lima, and at Chimbote, in the north of Peru. Active steps are also being taken for the installation of a cement plant to supply the needs of Southern Peru, as well as for the establishment of a rayon industry whereby the cost of rayon goods would be reduced by about 40 per cent compared with the imported article.

Industrial development in Colombia continues to make steady progress, and expansion in this direction appears to be most marked in the Department of Antioquia. The combined capital and reserves of twenty-four of the principal industrial concerns in Medellin showed an increase during 1940 from 41,163,000 pesos to 45,171,000 pesos (say £6,400,000 sterling), with a corresponding increase in the balance-sheet valuation of their assets. The increased productive activity of the textile industry was outstanding, and textiles hitherto have been Britain's chief export to Colombia.

Italy at War

[BY A CORRESPONDENT]

GERMAN and Italian representatives have just negotiated production programmes for the current year on the basis of the trade agreement of February. There is no doubt that Germany's vastly increased share in Italy's foreign trade is making itself felt. Without German coal and steel supplies, blockaded Italy's heavy industry and railways would be at a standstill.

In agriculture, Italy is able to feed her population with cereals (with rationing), but the further reduction of the fat ration from 28 ounces per month to 14 ounces shows that Italy, too, has a "fat gap" like Germany; before the war Italy used to import roughly one quarter of her total fat consumption. The favourable sugar beet crop in 1940 made it possible to increase the monthly sugar ration from 17½ ounces to 21 ounces. Vegetable and fruit exports, on the other hand, amounted in peace-time to one quarter of her total exports; and under the new trade agreement the entire exportable surplus of fruit and vegetables will be supplied to Germany. In future, Italian fruit and vegetable growers will adjust their cultivation plans in such a way that bulk exports to Germany may start when home-grown vegetables in Germany are short. Germany will, moreover, supply the necessary plant and machinery for the preservation and drying of vegetables and fruit, which are to be exported during winter-time.

In Search of Autarky

Italy, though lacking resources of coal, iron and oil, nevertheless embarked on a programme of industrial autarky after the experience of economic sanctions in 1936. The Council for Autarky worked out the programmes, and the IRI (the Institute for Industrial Development) used State subsidies to finance a number of industries, such as electricity, steel, coal, light metals, artificial textile fibres, cellulose, synthetic rubber, engineering, and especially motor-cars and aircraft.

The output of electricity in Italy in 1940 is estimated at 17,000 million kwh against only 6,000 million kwh in 1936. Nearly 50 per cent of the railways have been electrified during the last seven years, thus reducing the import of coal. There has been hardly any increase in steel output, which amounted to 2.5 million tons in 1940 against 2.3 million tons in 1938. The Council for Autarky planned a final steel capacity of some 8 to 9 million tons, to be produced mainly from iron deposits in Albania. The total output of crude oil in Albania in 1940 is estimated at some 250,000 tons, or roughly 10 per cent. of the total supplies in 1938. Extensive resources of bauxite favoured the production of aluminium, which increased from 13,800 tons in 1935 to an estimated output of roughly 40,000 tons in 1940. The development of the production of cellulose from home-grown reed and beech wood has been equally vigorous. The manufacture of staple fibre and rayon is a leading industry in Italy, and American sources estimate that Germany and Italy accounted for roughly one-half of the world output of staple fibre.

Italian domestic supplies of non-ferrous metals are insufficient for modern war industry, but there are ample supplies of mercury, pyrites, lead and zinc. Small quan-

ties of nickel, tin and antimony, too, are mined. At present, an effort is made to increase the output of silk, and hopes are expressed that total supplies will reach 4,000 tons to be used for war purposes in Germany and Italy.

Active Industry

A number of company reports covering the year 1940 show that industrial activity increased considerably during the year. Public orders were sufficient for good employment; average profits increased; dividends were around 7 to 9 per cent; and complaints about increasing costs of production were numerous. The decree limiting dividends to 7 per cent, after the German model, caused a temporary slump in share prices.

During February and March, a new series of Treasury Bonds was issued yielding lira 18,900 millions. A year ago only lira 13,600 millions were subscribed. The disclosed Budget deficit at the end of the financial year 1940-1 amounted to lira 28,400 millions.

The system of rationing civilian consumption is not functioning as well as in Germany. A general tightening-up has been noted. In textile materials, the manufacture of a standard cloth has been decreed, and the admixture of staple fibre is fixed at 30 per cent for men's cloth and at 40 per cent for women's cloth. Stocks for the army as well as for export purposes were requisitioned; and the manufacture of standard shoes was further developed. Successive reductions in the petrol ration show that difficulties in the supply of petrol are increasing. A petrol monopoly is in preparation.

"New Order" in Poland

[FROM A POLISH CORRESPONDENT]

May 5th.

POLAND is an outstanding example of Hitler's "New Order." While the other occupied territories are still treated by the Nazis as under war occupation, Poland has been given a "permanent" administration and a new system of government corresponding with the Nazi plans for the "reconstruction" of Europe. The first step after the Polish campaign was to incorporate the regained "German" territories into the possessions of the Reich. As such were acclaimed all the territories along the former German-Polish frontier which the Nazis thought worth while taking over. The boundaries of the Polish territories fully incorporated into the Reich go far beyond any claim the Nazis ever made against Poland. They include, not only Danzig and parts of Upper Silesia, but also the whole of Pomorze, Poznan, parts of the Central Polish Voyevodships, including the city of Lodz. The border line between the incorporated territories and the "General Government" has neither historic nor ethnographic justification; most of the incorporated territories never belonged to Germany and the population is purely Polish, with the usual Jewish minority.

Indeed, the Germans have made it clear that their decision was guided mainly by economic reasons; this incorporation would give to Germany the greatest advantages during the period of occupation. The exploitation of the well-developed agricultural regions of the Pomorze and Poznan Voyevodships, the denuding of the cultivated forests of western Poland, the confiscating and taking over of the famous Polish textile industries of Lodz, Tomaszow and Bielsko, and also of the rich mines and the heavy industries of Upper Silesia:—all these could be achieved more easily by including these districts as part of the Reich.

BANK OF MONTREAL

(Incorporated in Canada in 1817 with Limited Liability)
Financial Agents of the Government of the Dominion of Canada in London
CAPITAL \$36,000,000
RESERVE \$39,000,000
TOTAL ASSETS IN EXCESS OF \$95,000,000
Head Office: MONTREAL
H. R. Drummond, Esq., President
Major-General The Hon. S. C. Mewburn, C.M.G., W. A. Bog, Esq., Vice-Presidents
Jackson Dods, O.B.E., G. W. Spinney, General Managers
LONDON COMMITTEE: The Most Honourable The Marquess of Willington, P.C., G.C.S.I., G.C.M.G., G.C.I.E., G.B.E. (Chairman), F. R. S. Balfour, Esq., Sir Hardman Lever, Bart., K.C.B., Sir Frederick Williams-Taylor.
London Offices: 47 Threadneedle Street, E.C.2 Edward Pope, Manager
9 Waterloo Place, Pall Mall, S.W.1 J. H. Pangman, Manager
The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

The act of incorporation automatically changed the political status of the inhabitants. With the exception of the small number of the *Volksdeutsche*, they became foreigners and could be forced at any time to leave the country where they were born and their ancestors lived for centuries. A mass deportation of the population started. The first victims were the Jews, to whom the anti-Semitic Nuremberg laws were applied. By these means the Nazis acquired a considerable proportion of urban and industrial property which belonged to Jews.

This policy of deportation was later applied to the Polish population. The Nazis started a Press and radio campaign about the superiority of the German race and the "natural" right of the Germans to treat the Poles as of a lower race. This propaganda was followed by a mass deportation of Poles to the General Government and by a mass migration of German colonists from the Reich and from the Baltic States and Soviet Russia to the newly incorporated territories of their "Fatherland." Over a million people were moved from one place to another in a period of six months. Every care was taken to give to the German colonists facilities for travel and assistance in settling; Poles and Jews were deprived of the means of existence and transported in terrible conditions.

Simultaneously with the mass deportation, economic "adjustments" were carried out. A special department under the supervision of Goering's bureau for the Four-Year Plan was opened in Berlin. This department was later reorganised and incorporated in the planning organisation for the Four-Year Plan; branches were opened in Poznan, Katowice, Lodz, Gdynia, Ciechanow, Suwalki, and now they are dealing with all former Polish State property, Jewish property and the property of Poles who are absent. This department also has the right to take over all property which they find fit for German economic requirements. These "trustees" have now acquired nearly all the industrial and agricultural property and commercial businesses of the incorporated territories.

The policy is to fit the resources of Polish Silesia and the well-developed industrial areas of Western Poland into the German war economy. Concentration of production is being fully applied, and the Goering combine has taken over all the mines, furnaces and other heavy industries based upon the rich natural resources of these territories. The fact that Upper Silesia is almost 900 miles from English air bases has induced the German authorities to make the most of it. The raw materials and heavy industries of Upper Silesia and the textile industries of Upper Silesia and the textile industries of Lodz, Bielsk, Tomaszow, etc., which used to supply all Poland, are now being fully used for the German war economy. The territories outside the "incorporated" districts are deprived of any access to these resources, and if any industrial establishments were left in the General Government, they could not carry on production.

Deportation of the population was later followed up by conscription of agricultural and industrial workers for forced labour in Germany. According to figures given by official German sources, nearly three-quarters of a million Polish workers are doing forced labour in Germany, which does not include the number of several hundred thousand war prisoners also forced to do agricultural and general labour. The recruiting of forced labour battalions was easier than it might have been, because of the great poverty of the deportees and the unemployment amongst the Poles in the incorporated districts and in the General Government. Hunger is a first-class weapon in the hand of the enemy.

The Hyde Park Pact

[FROM OUR OTTAWA CORRESPONDENT]

April 29th

THE most important event of the past month has been the agreement reached at Hyde Park on April 21st between President Roosevelt and Premier Mackenzie King. It represents an effort to co-ordinate the economies of the United States and Canada for the most effective production of war materials for the purpose of aid to Britain and the defence of North America. The United States will purchase from Canada certain kinds of munitions, materials like aluminium and ships, thereby probably enlarging her purchases in the Dominion by between 200 and 300 million dollars per annum; and this increment will enable Canada

to purchase, in larger quantities, equipment and materials which she can only obtain in the United States. Mr King declared that the new economic arrangements would go a long way towards solving the acute problem which had faced Canada about American dollar exchange; but he also stated that there was little prospect of relaxing the present regulations for the conservation of foreign exchange. He gave warning that, while the agreement would increase the effectiveness of Canada's war effort and her assistance to Britain, the Canadian people must not expect that it would reduce their burdens.

Messages from London suggesting that the British Government desired a conference with all the Dominion Premiers at an early date have been responsible for an agitation, supported by influential papers like the *Toronto Globe and Mail* and the *Montreal Gazette*, that Mr. King should take the lead in urging such a conference and express his willingness to proceed to London immediately. On the opening day after the recess, Mr Hanson, the leader of the Conservative Opposition, raised the question, and argued that such a course was eminently desirable. He maintained that, if it was necessary for Mr King to have a personal conference with Mr Roosevelt, it was equally vital that he should confer face to face with Mr Churchill. Mr King contended, in reply, that his proper place was in Canada, where, when grave decisions had to be taken, he could without delay consult his Cabinet, and he stated positively that no invitation to an Imperial Conference had been issued.

Anniversary in the Low Countries

[BY A CORRESPONDENT]

May 10th

THE German invasion of the Low Countries on May 10th, 1940, marked the start of the third vital phase of the present war—the phase which closed with the collapse of France in the middle of June. By the end of May, 1940, resistance in both Holland and Belgium had come to an end; and both countries have now suffered under enemy occupation for more than eleven months. In this time, there is little doubt that the Germans have made great progress both in economic exploitation and in political control of the two countries. Both the Netherlands and Belgium are infinitely poorer than they were a year ago. Rationing is strict, designed to permit the German army of occupation to live well off the country and at the same time to provide a surplus for despatch to the Reich.

Industrial production has been drastically transformed to complement and assist the German programme of war output. Manipulation on the bourses of Amsterdam and Brussels has achieved some measure of German financial control in leading Dutch and Belgian businesses.

It would be foolish to pretend that the occupation of the Low Countries has not been inestimably useful to Germany. But there is no means of estimating how much damage to Nazi plans has been caused by passive resistance and sabotage. There is considerable evidence of the widespread lack of co-operation and dislike with which the Germans are greeted.

The fact that Germany has not succeeded in crushing the will to resist in either of these countries during the past year has markedly detracted from their power to exploit the Low Countries to the full. It is also a remarkable tribute to the national qualities of these two peoples. There is little doubt that the exodus of the two Governments to Great Britain, from where they have maintained a fighting policy and continued to throw imperial forces into the struggle against Germany, has had an important influence on the survival of resistance inside the countries.

The efforts of the lawfully constituted Governments of Holland and Belgium in this country to provide a nucleus for national resistance have provided a guarantee that the sufferings of the submerged populations will not be in vain. For this reason, the determination of the Greek Government to escape and to resist has infinite value, and the failure of the French Government to establish itself in North Africa and fight on remains the most poignant tragedy of the war.

German Europe

FRANCO-GERMAN COLLABORATION.—The terms of the recent Franco-German Agreement do not reveal the extent of industrial collaboration, which has developed on a larger scale since January, 1941. The foundations of this collaboration were laid by changed economic organisation, characterised by corporative institutions and compulsory marketing bodies in agriculture and "organisation committees" in industry, trade and finance. The distribution and allocation of industrial raw materials is also organised after the German model by the *Office Centrale de Repartition des Produits Industriels*, and the former French cartels in the heavy industries, the *Comptoir de Vente*, have been transformed by the German domination in the International Steel Cartel.

Finance, capital, prices and consumption are controlled and rationed in the same way as in Germany. The Bourse is restricted by an anti-speculation law, and dividends are limited to the highest in the three years before 1940. The *Direction des Prix*, a department of the Treasury, has enforced a price stop after the German model; but prices are still rising, a movement which is officially recognised by price advances in certain industries. Iron and steel prices, for example, have been increased by 35 per cent on the average, and maximum prices have been laid down for all agricultural products.

In occupied France, the sole authority is the German "armament inspectorate" of the "Wehrwirtschaft and Armament Department" of the German High Command. After carrying off raw materials and scarce machine tools to Germany, they set in motion the programme of collaboration with French industry. The agricultural programme is reported to have increased the acreage under winter wheat by 20 per cent and winter rye and barley by 11 per cent. Experiments in the cultivation of soya beans have begun with a view to closing the "fat gap," which is the recurring problem in nearly all the countries under German occupation.

Germany's war economy benefits directly from this industrial collaboration. Twenty French textile companies are actively collaborating in building up a cellulose industry for the manufacture of artificial textile fibres. The aluminium industry has worked out an expansion programme and the necessary electricity will be made available by rationing electric current. The latest instance of industrial collaboration is the Franco-German-Italian automobile agreement. The German Press reported that German industrial orders at the beginning of March had already reached Rm. 1,500 millions, i.e., £125 millions at the rate of Rm. 12 to the £. Unemployment in France is said to have fallen to 500,000 in March, 1941, compared with 1,059,000 in October, 1940. The transfer of workers to Germany was not very successful; the total number of French workers employed in Germany in March amounted to 36,000, mostly metal and building workers.

PROFITS AND DIVIDENDS.—A short time ago the Price Commissar empowered the price control boards to investigate profits in relation to costs of production and prices, with the purpose of ascertaining war profits. Firms and companies which had unjustified war profits were then compelled to reduce prices at once. All war profits earned up to the date of investigation are to be paid to the Treasury. This decree was followed up by a statement made by the Minister for Economic Affairs, Dr Funk, in which a general "dividend stop," similar to the price and wages stop, was foreshadowed. A slump in share prices was the result, and it was several weeks before the boom quota-tions of the beginning of March were reached again. The supplementary decree and Dr Funk's statement show that war profiteering has gone on in spite of all restrictions. The Government, having tightened up the price regulations at the end of last year, is now feeling its way towards a general restriction of dividends at about 6 per cent. The solution will probably be found by the introduction of a war profits tax.

The policy of building up disproportionately large hidden reserves after full employment was reached; the expansion of business since the war began; and the need for reducing interest rates—all these have combined to bring about a steady rise in share prices, which has

reduced the yield on share capital almost to the level of the earnings on fixed-interest bearing securities. The State dominates the capital issue market, and has prevented the use of share issues for the financing of capital expenditure. A considerable number of joint-stock companies are thus under-capitalised, which is reflected in unusually high dividends.

The big German banks, whose annual reports are now available, reflect this development and have already increased their capital or sought permission for increases.

	Rm. Millions.		Share Capital.	
	1939.	1940.	1939.	1940-41
Deutsche Bank ...	4,184	5,315	130	160
Dresdner Bank ...	3,206	4,118	150	200
Commerzbank ...	1,746	2,305	80	100
Reichskredit Gesellschaft ...	668	857	40	40
Berliner Handelsgesellschaft ...	339	400	28	28
Bank der Deutschen Arbeit ...	918	1,795	25	25

The average increase in total assets was 30 per cent; the increase in turnover ranged from 6.6 per cent to 28 per cent. Total holdings of Treasury bills increased by 94.2 per cent; holdings of Treasury bonds increased by Rm. 1,000 millions. Successive reductions in interest rates and the fall in advances led to a relative reduction in earnings. Actual earnings were only slightly higher than in 1939, and the banks easily refuted the accusation of being among the war profiteers.

The leading banks have been instrumental in expanding Germany's economic influence beyond Austria and Czechoslovakia into the occupied and dependent European countries. In Poland, Alsace-Lorraine and Luxembourg German banks have established branches. In Norway, Denmark, Holland, Belgium, and especially in the South-Eastern countries, they are working through subsidiaries. By the incorporation of the leading Viennese banks, German banks have acquired the leading position in South-Eastern Europe. Financial penetration in Holland is particularly advanced, favoured by the former close connections between the two countries.

★

STEEL.—The report for 1939-40 of the leading German steel concern, the *Vereinigte Stahlwerke A.G.*, covers twelve full months of war. There was an increase in the output of German iron ore. Coal mining remained at the level of the previous year, but coke output was higher. The output of iron and steel and rolling material was slightly smaller, which is explained by the loss of export markets. The cost of production tended to increase, but the rise was compensated by higher export prices to neutral countries. War conditions made it impossible to replace and renew plant and machinery, although there was greater wear and tear caused by longer working hours. During the first quarter of the new business year, which began on October 1, 1940, production increased; but coal output remained unchanged. Shortage of labour was overcome by rationalisation and extended training. The report of the *Krupp A.G.* shows the same features. The use of German low-grade iron ore increased cost of production, and there was a marked increase in the manufacture of locomotives. The report of the *Mannesmann Röhren Werke-Duesseldorf* report that a considerable number of blast-furnaces had been converted for the permanent use of German low-grade iron ore.

★

SCANDINAVIAN TRADE.—Scandinavian imports and exports have moved as follows:—

	Percentage Fall in value of Imports 1940 compared with 1939.	Percentage Fall in value of Exports 1940 compared with 1939.
Denmark ...	21	4
Norway (10 months) ...	24	21
Sweden ...	20	29
Finland ...	32	61

Danish exports will probably fall considerably during 1941 after the heavy slaughter of livestock in 1940. Finland suffered exceptionally from the war with Russia.

THE BUSINESS WORLD

German War Organisation

THE task in the Third Reich at war is to blend central control with local initiative, centralisation with individual enterprise. Germany's economy is directed by a General Council, set up under Field Marshal Goering at the end of 1939, which is perhaps the nearest approach there is to an Economic General Staff. Its permanent members are the heads of the "Four-Year Plan Bureaux," the "Wehrwirtschaft and Armament Department" of the High Command and the departmental chiefs of the Ministries of Agriculture, Economic Affairs, Labour, Transport, Armament and Munitions and the Interior; the Price Commissar; and one representative of the Nazi Party. This Council has no executive organs of its own. Its job is to co-ordinate economic administration, which is carried on by Commissars, Ministries and the Army economic departments.

The ordinary Ministries are dependent on the directions of the "Four-Year Plan Bureaux" and the "Wehrwirtschaft and Armament Department" of the High Command and on the co-operation of the so-called self-governing organisations in industry. The Reich Cereal Boards and the Marketing Organisations of the Ministry for Agriculture regulate agricultural production, distribution and prices. The Reich Central Boards of the Ministry for Economic Affairs control foreign trade and allocate materials to plants and factories. The Labour Ministry, working through the Trustees of Labour, controls the supply of labour. The "Four-Year Plan Bureaux" drafts plans for the expansion of productive capacity in key and substitute industries; the Ministry of Transport is responsible for railways, motor transport and shipping; and the Ministry for Armament and Munitions represents the centralisation of the armament factories proper.

The "Wehrwirtschaft and Armament Department" of the High Command may be considered the brains trust and planning centre for the entire war economy. It is the moving factor in the whole war economy, and was first established under its shorter name of "Wehrwirtschaft Department" before the inception of the Four-Year Plan. It deals with the supply and allocation of labour; development and location of productive capacity; the supply and allocation of materials; and transport facilities. This department drew up the plans for actual wartime production and trained the Army economic leaders who are to-day to be found in France, Belgium, Holland, Jugoslavia and Greece.

Production and consumption are thus planned by the "Wehrwirtschaft and Armament Department" and the "Four-Year Plan Bureaux." The execution of the plans and the day-to-day control of the economy rests with the ordinary Ministries and the special commissars. Self-governing economic organisations tend to become State organisations like the Ministries; and there is a rigid centralisation which is a constant threat to the private initiative of employers as well as workers.

All the pre-Hitler federations in agriculture, industry, trade, finance and transport and the cartels have been changed into these compulsory self-governing economic organisations. There is the Agricultural Estate, the Industry, Commerce, Finance and Public Utility Groups and the Guild Association of independent artisans. There is the Economic Chamber, with District Economic Chambers, which co-operate with the German Labour Front, the organisation for workers. These organisations, together with the Chambers of Industry and Commerce, are mainly advisory bodies. They are responsible for statistics of capacity and production; they actually impose levies, such as the export levy, contributions for co-operative assistance and levies for the financial maintenance of "slimmed" or closed-down civilian factories and shops.

These bodies are used for co-operative projects. For instance, group financing of industrial expansion is frequently done by them; machinery and factories are pooled by the Industry Group; the whole organisation has been used to form co-operative groups for export, transport and for special building and production programmes; and information is shared about inventions, standardisation and rationalisation. The special commissars usually work through these self-governing bodies; and some of the traditionally strong cartels provide the means for attempts to recover some measure of independence. Recently, the *Reichskohlenvereinigung*, or Coal Co-operative, was formed, actually replacing the Coal Commissar and leaving the reorganisation of the coal-mining industry and the coal trade to the self-governing organisations under the supervision of the Ministry of Economic Affairs.

The foundation of the war economy is the District Economic Boards, the regional organisations of the Ministry for Economic Affairs. They are parallel to the District Defence Committees—the regional organisations of the Council of Ministers for Defence, which for the duration of the war is the highest political authority. The District Economic Boards bring together the regional representatives of the Army command, of the armament inspectorate, of the Ministry of Armament and Munitions, of the Chambers of Industry and Commerce and of the self-governing bodies; and their territorial boundaries are the same as those of the District Army Command (*Wehrkreise*). These Boards do provide a considerable measure of flexibility. Here the priority of orders, centrally laid down, and the allocation of materials are adjusted to local conditions; and local labour and transport problems are solved. The fundamental principle of the whole system is the allocation of material and labour by quotas according to the priority of orders. But the current demands of the High Command, special requirements for the preparation of campaigns, the sudden expansion of activities in conquered countries or the transfer of factories may require constant changes and a high degree of flexibility. The centralisation of orders in big factories at one time may be followed by the spreading of orders over small shops during other periods.

War orders, of course, are bulk orders, exceeding the capacity of single factories. The Ministry of Economic Affairs therefore instituted, before the war, central and local Order Equalisation Boards, which developed "order bourses," where orders are sub-contracted to small firms. Samples of the articles required or their specifications are exhibited at these "bourses" just as samples are exhibited at commodity markets. The owners of small firms or the representatives of the organisations of independent artisans bid for sub-contracts, which they themselves in turn distribute to their members—tailors, shoemakers, garage mechanics, precision-instrument makers, cutlers, opticians and so on.

There is no doubt that private industry is under constant pressure from expanding State influence; and cartels, syndicates and private concerns struggle with changing fortunes against the influence of price-fixing and the restrictions on profits. Every time war necessity demands more centralisation, private companies are challenged and every time some compensation to the strongest among them is necessary, usually by allowing some measure of independence. Private industry has compensatory opportunities in the annexed and occupied territories, which in itself provide a measure of flexibility. In fact, the organisation is not yet complete. It is changing with expansion into fresh European countries, and more conquests or military reverses will create new problems. Up to now, the system has worked well; but it has grown haphazardly and

reveals an inherent contradiction between centralisation and private initiative.

The system is not really new. It is the logical development of the highly centralised organisation whose foundations were laid in the eighties of the last century. The State control exercised by the Ministries can be traced back to the exchange control instituted in 1931 in a back room of the Reichsbank. The destruction of the trade unions and the subsequent compulsory organisation of the workers in the Labour Front led the employers not only to accept in compulsory cartels, but also compulsory membership in the centralised federations. The change was more radical in agriculture. The Agricultural Estate is hardly comparable with the former peasant and farmer associations. The compulsory marketing organisations put an end to the co-operative selling organisations and the credit and produce co-operatives were deprived of their political independence. This a process that is being repeated in occupied countries. This agricultural organisation was fully developed for war purposes long before the war began, and control of production, the requisitioning of crops, compulsory storage and some degree of rationing were practised before 1939.

The foundations of the totalitarian economic organisation were completed in 1935, when conscription was introduced. It was the final aim of building up an air force and army superior to any combination on the Continent that resulted in the "Four-Year Plan Bureaux," whereas the scientific approach to the problems of modern warfare in relation to modern economy led to the "Wehrwirtschaft" organisation. Private industry, having lost its organised influence on actual economic policy, was reluctant to risk the heavy capital outlay for the expansion of industries (particularly of substitute industries) for war purposes. The State-owned "H. Goering Works," the motor-car factories in Fallersleben, the Gustloff works owned by party and semi-party organisations were a challenge to private industry; and now they have outgrown the largest private concerns.

Finance and Banking

More Bills for the Market

The market syndicate seems to have admitted defeat in its attempts to establish a return of 1d. per cent. on the 92-day bills for which it will be tendering for the next few months. The mere 11 per cent. allotment with which it had to be satisfied was regarded as a sufficient deterrent for a repetition of the attempt. On Friday of last week, therefore, the syndicate raised its application price for the Treasury bills to £99 14s. 11d., a figure at which the return on turning over bills to the banks at 1 per cent. is 0.5d. per cent. The reward for this cut in the rate was an allotment of 40 per cent.—the best the syndicate have obtained for many weeks past. The market has thus been a better seller of bills this week. The banks in their turn have been good buyers, and the position in the short loan market has been one of exceptional ease. It should however, be noted that, though some $\frac{1}{2}$ per cent money has been available, the market cannot count on an ample and persistent supply of such accommodation. When such cheap money is offered, it is for the most part "bad money" available for the night only. Most of the "outside" money now employed in the market can claim comparison in its permanence with clearing bank money and readily commands 1 per cent. It has, however, the advantage from the borrowers' point of view of being secured by bonds and not by bills which are exacted as the required security for 1 per cent clearing bank money. The Bank return is chiefly notable for its revelation of a further increase of £3,450,000 in the circulation, bringing the total to the new high record of £629,422,000. Despite this and a further repayment of India Council borrowing reflected in a reduction of £7,139,000 in other securities, the volume of bank cash increased further during the week, bankers' balances being up from £113,556,000 to £115,519,000. This follows an increase of £12,825,000 in the Bank's holding of Government securities.

Telegraphic versus Mail Transfers

The war has revolutionised foreign exchange business in ways other than those connected with the application of exchange control. The dangers of mails being lost through

From 1935 onwards the massive orders of the High Command made themselves felt as a planning influence. Soon the Army inspectors made their appearance in public, and the self-governing economic organisations were reduced to statistical and advisory bodies. The absorption of the unemployed, the recurrent shortages of foodstuffs and raw materials, and the unrestricted borrowing for armament purposes reacted on finance, prices and wages, and created problems which could not be combated with the existing organisations. Control at that stage affected only the "material" side of the economy; but now the Price Commissar was appointed and the price-stop of 1936 was his first decree, to be followed shortly before the war by elaborate directions for the calculation of prices.

With the approach of full employment, the competition for labour increased; the powers of the Trustees of Labour had to be expanded; and workers were forbidden to leave their working places without permission. The flight from the land and the general shortage of labour led to the conscription of labour in 1938. The existing system of organisation was no longer capable of coping with the ordinary and extraordinary demands of the "Wehrwirtschaft," which experienced its first tests by the march into Austria and the Sudetenland. Remembering the experiences of the so-called "Flying Divisions" of the Great War, that is to say squads of great mobility for special purposes, Dr Todt developed his Mobile Labour Organisation for the building of fortifications; and bottle-necks were combated by special commissars with over-riding powers. The number of special commissars rapidly increased until now the main industries are controlled by them. During the first months of the war centralisation was carried almost to snapping-point. Since then, co-ordination at the top as well as in the regional organisations has enabled a remarkable measure of flexibility and decentralisation to be achieved without impairing centralised control. The progress of the war will show whether this success can be maintained.

enemy action have given a considerable stimulus to the telegraphic transfer as the method of effecting foreign exchange operations. Ever since the first days of the international telegraph and telephone this has been the method of settling international payments of any size. The rates quoted in the foreign exchange market have for years been those for "telegraphic transfers," and where rates for foreign bills at sight or three months' currency were still quoted, they were, apart from a few isolated transactions, a relic of a past age. In the settlement of small payments, however, the mail transfer and payments by drafts or cheques sent by mail remained, until the outbreak of the war, the generally accepted form of settlement. The interruption of much of the pre-war air services and the delays and dangers of transmitting payments by mail have already led to a more general use of the telegraphic transfer. The drawbacks of making foreign payments by mailing cheques or warrants have been particularly apparent, for the loss of such instruments leads to endless delays, in exacting letters of indemnification from the payees before duplicates are issued. Mail transfers, i.e., bank instructions to effect payments overseas, do not suffer from some of these disadvantages, but are still subject to delay and possible loss. They do not therefore provide the ideal substitute for the actual mailing of documents.

DANIEL WILLARD, *President*

Record Dunlop Profit

A preliminary statement by the Dunlop Rubber Company shows profit, before tax and preference dividends, of £3,001,853, which compares with £2,853,133 for the year 1939, and is almost double that of the preceding period. Tax provisions total £2,391,880, against £1,527,474, and the earnings percentage is drastically reduced. The following table shows the profits trend for three years:—

	YEARS TO DECEMBER 31ST.		
	1938	1939	1940
Profit † ...	£ 1,500,893	£ 2,853,133	£ 3,001,855
Current Taxes ...	386,109	1,027,474	1,741,880
Tax Reserve ...	—	500,000	650,000
Preference dividends	276,562	225,000	192,187
Ordinary shares			
Earned ...	838,222	1,100,659	417,788
Paid ...	552,063	624,977	416,651
Earned% ...	13.7	21.1	10.0
Paid% ...	9	12	10
Reserves ...	274,168	448,228	—
Carry forward ...	603,420	630,874	632,011

† After-all fixed charges.

While the company must have suffered from the further closing of the Continent, and in particular through the loss of the French subsidiary, it has enjoyed increasingly important Government contracts in a number of sections. It remains doubtful what fate will overtake the American interest. The price of the 20s. stock units, which had risen to 35s. in anticipation of the dividend, relapsed to 34s., which is within a little of the previous best of the current year. The yield at this figure is some £6 1s. 3d. per cent.

* * *

No Unilever Dividend

The decision to pay no dividend this year on the ordinary stock of *Lever and Unilever, Ltd.*, must come as a serious disappointment to stockholders. It must be remembered, however, that the decision is not irrevocable, nor is it dictated by the trading results of the British company. The directors state that the decision is due solely to the absence of information regarding the 1940 trading position of the Dutch company, *Lever and Unilever N.V.*, to which the British company is linked by a dividend equalisation agreement. While a contingent liability continues to exist in regard to the preference and ordinary dividends of *N.V.*, there can be no doubt of the wisdom of conserving the earned surplus. It should be a considerable consolation to stockholders that profits of *Limited* in 1940, after taxation and an additional provision for tax liabilities in the current year, have declined only from £6,742,053 to £6,600,000. After meeting prior charges, the sum earned for ordinary capital is down only from £2,404,276, representing a rate of 22.3 per cent, to £2,250,000, at which level it would appear to provide even more ample cover for a repetition of the normal 10 per cent. dividend. The immediate future of ordinary dividends is largely dependent on the course of hostilities, but the decision to suspend payment in the present instance is in itself a guarantee of the confidence of the directors that normal relations with *N.V.* will be resumed within a reasonable period. The £1 ordinary stock of *Limited* now stands at 21s.

* * *

De Beers Investments

Despite the absence of a dividend on deferred capital, shareholders in De Beers have considerable grounds for satisfaction with the 1940 accounts. Revenue on diamond account rose from £1,065,362 to £1,534,262 and total income from £1,837,455 to £2,138,106. Tax liability was more than doubled at £150,000 against £55,000, but other charges against profits have been strictly controlled and mining expenditure is sharply reduced from £755,218 to £451,587. Thus, after meeting the claims of the 40 per cent cumulative preference capital, £303,131, against £11,245 is available for deferred shares, the whole sum being devoted to increasing the carry forward from £773,597 to £1,253,131. The decision to pay no dividend on deferred shares was dictated partly by the necessity of preserving cash holdings and partly by the expenditure of £586,000 on the purchase of a portion of the surrendered diamond sales quota of Diamond Corporation. The company profited

from the active market in diamonds which persisted until the German invasion of the Low Countries in May, 1940, and, later in the year, from an increase in the demand for industrial diamonds. The balance sheet shows a number of significant changes. Cash holdings have jumped from £727,796 to £1,267,898 and Government and municipal securities from £15,000 to £171,850. Loans at call stand at £260,000 against nil. These rises, which are financed in part by the retention of profits and in part by reductions in debtors, both inside and outside the group, leave the total of current assets some £400,000 high on the year at £2,004,867. After an adjustment of investments, including a sale of African Explosives preference and a purchase of Consolidated Diamond debentures, quoted holdings are up from £1,158,335 to £1,480,328. On the liabilities side the debt of £1,000,000 on the purchase of Diamond Corporation shares is liquidated and other liabilities are up by about half that figure. The demand for diamonds, both for hoarding and for industrial uses, should be well maintained this year, but De Beers must continue to be hampered by the dislocation of the highly specialised cutting section of the industry since the German occupation of Holland. The 50s. deferred shares now stand at 110s.

* * *

Babcock and Wilcox Dividend Maintained

With the payment of a final ordinary dividend of 6 per cent, plus a 1 per cent cash bonus, Babcock and Wilcox maintain the total distribution on ordinary capital, for the calendar year 1940, at the 11 per cent paid in 1939. Profits, struck after war losses, but before taxation which absorbed £275,000 in the previous year, are shown by the preliminary statement as reduced from the record earnings of £756,663 to £717,347. It is clear that the sum available for ordinary capital must be considerably below the £616,645 earned in 1939 before provision for debts written off and possible fall in merchandise values. In the absence of the report detailed analysis is impossible, but there is reason to expect that the ordinary dividend, which in the previous year was approximately covered after the above allocations, will not have been fully earned. Some setback to profits on account of rising costs was to be expected after the steady progress, which has continued since 1933, even in the absence of the necessity of writing off substantial sums against the temporary loss of interests in enemy-occupied countries—a necessity which must have proved more onerous last year than in 1939, in view of the important French interest. The company has, of course, been working at high pressure during the year, and it is probable that allocations to depreciation and repairs have also required a more substantial amount than in previous years. The £1 ordinary shares, at 40s. 3d. ex dividend, offer a yield of £5 9s. 3d. per cent.

* * *

British Electric Traction

A further rise in the gross revenue of British Electric Traction, for the year to March 31, 1941, brings total receipts, according to the preliminary statement, to £748,552 against £745,874. Despite an inevitable decline in net earnings, the resilience of total profits in face of operating difficulties and enemy bombardment is highly satisfactory. After deduction of all charges except preference and preferred ordinary dividends, net revenue amounts to £531,824 against £548,748, and the total 45 per cent, paid on deferred stock in the previous year, is repeated. The total sum required in taxation is not revealed by the preliminary statement, but EPT provision is increased from £50,000 to £70,000. The maintenance of the ordinary dividend at 45 per cent involves a reduction in the allocation to undistributed profits fund from £29,789 to £12,864, thus bringing the total of the fund to £1,945,588, or two and a half times the deferred capital. The company has no doubt profited from the increased business which has accrued to the operating companies through the greater public use of bus transport. The outlook for these concerns is less certain, however, owing to demands for higher wages, which have already been granted by the corresponding Scottish institution. This and the effects of EPT at the full rate will have to be offset by considerable real economies if the profit is to be maintained. Even so, it is quite possible that dividends will be maintained. The deferred stock stands at 770 per cent, giving a yield of some £5 19s. 2d. per cent, which indicates faith in the continued prosperity of the group.

Industry and Trade

Committee on Retail Trade

On May 13th Mr Oliver Lyttelton announced in Parliament that he had decided to appoint a committee "to examine the present problems of the retail trade in goods other than food, having regard both to the immediate needs of the conduct of the war and to the position after the war, and to report." Mr Craig Henderson, K.C., is to be the chairman of the committee, which will include two independent members, two representatives of Labour, and five or six members with experience of the various branches of retail trade. In view of the complexity of the problems involved in bringing the distributive trade into line with war conditions, the Government's decision to have an investigation made before carrying out the slimming process is no doubt justified. But the wisdom of the decision to leave food distribution outside the scope of the committee, taken at the request of the Minister of Food, seems questionable, especially as there are many shops that sell food as well as other merchandise. Indeed, it would seem that, for the purpose of concentration, the distributive trade should be regarded as one whole rather than two watertight compartments. Mr Lyttelton was careful to point out

that the appointment of a committee does not mean that the problem of concentration will be shelved, and he expressed the hope that interim reports on some of the most urgent problems would be issued as soon as the committee has had time for preliminary discussion.

Control of Storage Facilities

In order to ensure the utilisation of factories and storage capacity in the national interest and to facilitate the speedy substitution of alternative premises for those that may be damaged or destroyed in air-raids, the Board of Trade has created a "clearing house" for factories and storage space. The compilation of a register of factories is already in hand, and on May 12th the Board of Trade made an Order requiring owners of premises with a floor area of 3,000 square feet and more that have at any time since January 1st, 1938, been used for the purpose of storing goods to give details of them to the Board of Trade. The Order has been made necessary by the growing volume of munitions, equipment and materials that has to be

THE STOCK EXCHANGES

London

Note: all dealings are for cash
DESPITE the week-end Blitz on London, markets remained firm in all sections. At the beginning of the week turnover was slight, but the improved levels of the previous week were generally held. Sentiment was encouraged by the successes of night fighters and by the arrival of Rudolf Hess in Scotland. Business in home rails was relatively well maintained and some leading industrials attracted buyers.

The gilt-edged market enjoyed little business, and on Monday the quotations of the previous week were hardly tested. Before the week-end, 2½ per cent Consols were up ¼ on the mid-week price, a rise which was also realised by 3½ per cent War Loan and Local Loans, while 5 per cent Conversion rose by ½. After a firm but quiet start to the week, prices in mid-week were somewhat easier, 3½ per cent War Loan losing ½.

The foreign bond market remained featureless except for spasmodic buying of Mexican issues on Monday. Other price changes failed to indicate a definite trend, although various Japanese issues, including the 4 per cent loans of 1899 and 1910 and the 6 per cent loan of 1924, were higher on balance. The German Young loan lost fractionally. A gain of 2 points for Turkish 3½ per cent on Thursday of last week was not followed up.

Turnover was relatively good in the home rail market. Steady buying, concentrated on the senior issues, raised "Berwick" 4 per cent 1st preference ½ point both immediately before and after the week-end. Southern 4 per cent debentures and LMS 4 per cent. Guaranteed were also in demand. Ordinary stocks, on Monday, held the gains of the previous Friday, when Great Western ordinary and Southern preferred put on ½. Later in the week, ordinary issues remained steady.

The industrial market remained steady, though business was on a small scale. In the heavy industrial section, Babcock and Wilcox was supported on the maintenance of the dividend, while John Brown and Stewarts and Lloyds deferred were also a good market. Electrical equipment shares attracted buyers, and, in the mis-

cellaneous group, Dunlop rose in anticipation of the preliminary statement. Murex was also in demand. Leading textiles, including Coats, Courtaulds and British Celanese, reacted on Monday after the rise of the previous week, the demand for Coats being influenced by the appearance of the accounts and reports of possible requisitioning of the company's United States assets. The tobacco section displayed considerable strength, but, in the stores group, Marks and Spencer, Woolworths and Harrods all reacted.

After a firm close to last week, mining markets opened somewhat subdued on Monday. Later in the week, the demand for *Kaffirs* revived with renewed support from the Cape, but nowhere was demand on a large scale. At the beginning of the week, Sub Nigel and West Wit Areas lost ½ and E. Daggas ¾. In midweek, demand revived and Johnnies, Grootvlei and "Sallies" were all quoted higher. Tin shares started the week firmly with gains of ½ for Tronoh and S. Malayan. In the rubber share market, turnover was reduced to a minimum and few price changes were recorded. The oil market, after last week's rally in Mexican Eagles, made a disappointing showing on Monday, the ordinary issues of Anglo-Iranian, Burmah Oil and Shell Transport all suffering small losses, though some recovery was realised in mid-week.

New York

DOMESTIC influences have been powerful on Wall Street this week. Before the week-end, taxation fears were temporarily disregarded and many issues rose by a point in an active market, which closed firm. Steel, copper, rail and aircraft issues attracted buyers, the latter remaining firm this week. On Monday the advance was halted by renewed fears of labour difficulties, and, later, price movements became once more narrow and irregular. With a favourable technical position, however, the undertone remained firm. In mid-week, business turned dull and idle.

The Iron Age estimates steel mill activity at 99.5 per cent of capacity, against 97.5 per cent in the previous week.

stored and by the need for removing stocks from the ports and for dispersing them as much as possible. So far, however, no steps have been taken to compile a register of offices in the principal towns. Yet a "clearing house" for offices would considerably assist firms whose premises have been rendered unfit by enemy action to find alternative accommodation, as well as firms that require additional floor space, to secure them as rapidly as possible and at a reasonable price.

Scrap

Under the pressure of criticism, Mr Herbert Morrison, then Minister of Supply, decided ten months ago to call for a full survey of the quantity and location of iron and steel scrap in derelict factories, pitheads, railway lines and other disused structures which could be drawn upon, in case of need, for the purpose of supplementing deficiencies in the supply of materials secured from the usual sources of supply. When Mr Morrison decided on this investigation at the end of last July, the iron and steel industry had already been cut off from most of its important Continental sources of iron ore and scrap, and it needed little imagination to foresee that increased shipping losses would limit the intake of scrap from the United States and that, in any case, it was preferable to use the limited shipping space for the import of semi-finished and finished materials. Yet the survey of scrap supplies appears to have proceeded in the most leisurely fashion. Towards the end of last March it was announced that supplies in some twenty counties remained to be scheduled. It is therefore scarcely surprising to read in the trade press that there is a scarcity of scrap, that supplies are not released in quantities sufficient to meet the full requirements of steel producers. True, allowance must be made for labour and transport difficulties. But this country cannot risk a fall in steel production at a time when the munition factories must be fed largely by domestic supplies; and if the present methods of scrap collection are inadequate, other means must be found to ensure an increase in supplies and the maintenance of steel production at the highest possible level.

America's Growing Munition Capacity

Industrial mobilisation in the United States is scarcely further advanced than it was in this country in the summer of 1939. She is still engaged mainly in the preparatory process of constructing the factories and the shipyards that are to pour forth the munitions and the ships. Her output of ships and aircraft is already substantial; so was Great Britain's two years ago. But the construction of munition-making plant in the United States is now proceeding rapidly, by means of direct Army and Navy contracts, by the Reconstruction Finance Corporation and the Defence Plant Corporation, and by private enterprise through the issue of certificates of necessity granting special tax privileges which enable manufacturers to amortise their plant within a few years. According to the National Industrial Conference Board's *Economic Record* the value of the contracts placed by these agencies between June 13, 1940, and February 25, 1941, is \$2,053 millions, exclusive of those placed by private industry without certificates of necessity, and by this country. In 1939 the expenditure on plant by the manufacturing and mining industries totalled only \$775 millions. The \$2,053 millions were allocated as follows:—

	\$ Millions		\$ Millions
Aircraft and parts ...	633	Tanks & machine tools	74
Shipbuilding ...	153	Miscellaneous (a) ...	457
Arms, ammunition, explosives	736	Total ...	2,053
(a) Mainly metal-producing and processing plant.			

(a) Mainly metal-producing and processing plant.

Hitherto plant expansion appears to have been concentrated mainly on the aircraft industry. The value of the contracts placed for enlarging America's aircraft industry during the 8½ months is more than four times the expenditure on new shipbuilding facilities and more than eight times that on plant designed for the manufacture of tanks and machine tools. The additional aircraft manufacturing facilities are being constructed chiefly in the States of Ohio, Michigan, California and New York; shipbuilding facilities are enlarged mainly in New Jersey, California, Pennsylvania, Virginia and Massachusetts. The new

machine tool-making plant will be concentrated on Ohio, Connecticut and Illinois, and that for the manufacture of tanks on Michigan. It is understood that the greater part of the new plant will be completed this summer.

Tin Under Discussion

On Thursday the International Tin Committee met in London to discuss, it is understood, the terms of the new five-year control scheme, which is to come into force on January 1, 1942, on the expiry of the existing agreement. (The export quota for the remainder of the year had previously been fixed at 130 per cent of the basic tonnages.) While the outcome of the discussions was not known before *The Economist* was printed, rumour had it that Bolivia was unwilling to agree to the changes in the standard tonnages demanded by the majority of the member countries, and that Thailand might withdraw from the regulation scheme at the behest of Japan, who was anxious to secure the former's output for the Axis. By recommending the continuation of the scheme last March—the prescribed nine months before its expiry—the International Tin Committee has complied with the terms of the current agreement. But as the details of the new scheme need not be settled for some months, the existence of difficulties does not mean that the regulation of supplies will cease at the end of this year. In any case they appear to have been exaggerated. Bolivia has agreed to sell one-half of her output to the United States at a fixed price, but the other half has to be sold on the free market. And as costs of production in Bolivia are higher than in the other chief producing countries, she would hardly benefit from a return to free competition. Moreover, since tin is an important source of Bolivia's revenue, her Government cannot be interested in wrecking the scheme. Thailand has no tin smelters, but ships her output of tin concentrates to the Straits Settlements for treatment. Japan's small tin-refining capacity is fully employed in treating domestic ore. She could not smelt Thailand's ore in the absence of new smelters and these could not be constructed at short notice even if Japan could secure the requisite machinery. And as transshipments of Thai ore through Siberia to Germany could be intercepted by British warships, it is improbable, in present conditions, that the Government of Thailand will accede to Japan's demands.

Lead Supplies

Lead has always been one of the chief munition metals, but since the last war its importance in the armament industry has increased as a result of the mechanisation of warfare. Lead is used in the manufacture of electric batteries for aeroplanes, tanks, other military vehicles and warships. Moreover, the much increased firing power of machine guns has substantially increased the demand for lead for the production of bullets. Among the chief industrial countries directly or indirectly involved in this war, Germany finds it most difficult to cover her lead requirements. Germany and Austria together can produce some 100,000 metric tons of lead per annum. Another 10,000 tons per annum may be obtained from Poland, while Yugoslavia may be able to supply 80,000 metric tons, provided that the Trepca mine has been kept intact. Spain, normally a not insignificant lead producer, has hardly any exportable surplus at present as the whole of the Spanish output is required at home. Russia is not self-sufficient in lead. Compared with Germany's estimated minimum requirements of over 300,000 metric tons per annum, the supplies to which she has access thus appear seriously inadequate, even if allowance is made for the tonnage recovered from scrap. Great Britain, on the other hand, while producing only about 40,000 metric tons of lead per annum from domestic sources, has access to ample supplies abroad. The British Empire produces about 600,000 metric tons per annum, the great bulk of which is refined near the mines. The Empire's production is more than adequate for its needs; indeed, it exports large quantities to the United States to make up deficiencies in that country's supplies. Last year the United States produced 458,000 metric tons of lead from domestic ore, compared with 420,967 tons in 1939. Consumption, on the other hand, exceeded 625,000 tons, against less than 450,000 tons in 1939. This deficiency

COMPANY MEETINGS

EQUITY AND LAW LIFE ASSURANCE SOCIETY

REVIEW OF OPERATIONS FOR 1940

FACTORS AFFECTING RESULTS

SIR GEOFFREY ELLIS'S ADDRESS

RESULTS OF PAST YEAR

I come now to the working of the Society for the year 1940, and I shall not detain you long in this connection.

New business figures show a sharp decrease compared with those of previous years. Decreases have been the common experience of Life Offices and I do not propose to comment on the figures, except to say that our new business for the current year is being well maintained compared with that of 1940, and that in both years the business has been of a very good type. Our various schemes in connection with the Government Loans have proved, and are proving, very popular, and provide, moreover, an excellent means of extending the Society's connections.

The effect of the war on mortality is, of course, of vital importance to Life Assurance offices. During the year under review deaths have been slightly more than those expected according to the mortality tables, both in respect of lives assured and annuitants. We suffered a certain number of claims in respect of members of the fighting forces, but against this may be set the heavier mortality experienced by annuitants. On balance the result was only slightly less favourable to the Society than that expected according to the mortality tables used.

RATES OF INTEREST

The rates of interest shown in the report are derived directly from the revenue accounts for the year; they are thus calculated on the mean funds during 1940 without taking into account the reduction in the funds due to the revaluation of securities and the transfer to reserve, which you will observe took place as at December 31st.

If the rates of interest are calculated in relation to the funds at the end of the year—that is after the above items have been carried through the accounts—the gross rate would amount to £5 2s. per cent.; similarly the net rate would amount to £4 5s. per cent., after making proper adjustment for certain refunds of income-tax occurring during the year. These rates give an indication of the rates of interest now being earned on the written-down funds.

You will notice that the report this year is in a rather different form from that used on the occasions of previous valuations. We have incorporated the results of the triennial valuation in the annual report instead of issuing a separate report as hitherto; and we propose to adopt this procedure in future.

THE TRIENNIAL VALUATION

Before referring to the detailed results of the triennial valuation, I should first explain that Life Assurance offices when making an actuarial valuation do so on a basis considerably more stringent than that required merely to set up the reserves necessary to cover their liabilities. This procedure is followed in order that additional reserves may be retained to produce surpluses in future years for distribution then in the form of bonuses and dividends. Such procedure also has the great merit that these additional reserves provide an invaluable margin upon which a Life Office may draw, if need be, in times of stress such as the present.

The valuation basis employed by the Society as at December 31, 1937, involved the retention of such additional reserves as I have referred to above, but as at December 31, 1940, these reserves have to a substantial extent been released in order that depreciation might be written off the Stock Exchange securities and reserves provided against other investments as indicated in the accounts.

After giving effect both to the release of additional reserves and to the appropriations to which I have referred, there remains the surplus shown in the report. I may perhaps mention that the normal profits of the triennium before dealing with the invest-

The annual general meeting of Equity and Law Life Assurance Society was held on the 15th instant at the Society's offices, 20, Lincoln's Inn Fields, London, W.C.

Sir Geoffrey Ellis, Bt., M.P., presided.

The actuary and secretary (Mr. A. T. Haynes, F.I.A., F.F.A.) read the notice convening the meeting and the report of the auditors, the minutes of the last meeting being taken as read.

The chairman said:

Gentlemen,—I rise to move "That the report and accounts for the year ending December 31, 1940, be received and adopted and entered on the minutes." These have been in your hands for some days, and I assume that I may take them as read.

What I propose to say to you to-day falls conveniently into three sections—first, the changes which have taken place in the board of directors since the last annual general meeting, secondly the results for the year 1940, and thirdly the results of the triennial valuation made as at December 31, 1940.

RECONSTRUCTION OF SOCIETY'S BOARD

At the last annual general meeting my predecessor in this chair, Sir Dennis Herbert, indicated that your directors had under consideration a reconstruction of the Society's board. During the year a meeting of shareholders was called to modify the Articles of Association in such a manner as to permit one-third of the directors at any time to be persons not connected with the Law; you will remember that before this alteration such connection was a necessary qualification for all directors. Opportunity was also taken of this meeting to reduce the minimum number of directors from twelve to nine, and you will observe that in the process of reconstruction the numbers of the board have in fact been reduced below the old minimum.

The various resignations are set out in the report before you and I do not propose to refer to them in detail; I wish, however, on behalf of all the directors to place on record our appreciation to the gentlemen concerned for the action they have taken, and to the gentlemen concerned for the action they have taken, and taken solely with a view to facilitating the reconstruction of the board. Their old colleagues take this opportunity, too, of expressing their keen personal regret at the ending of associations with the Society extending over very many years.

In pursuing the plan of reconstruction your directors appointed Mr T. F. Tallents and Mr A. H. Reid to vacancies on the board, and since the issue of the report they have appointed also Mr W. M. Kirkpatrick. These three gentlemen bring to our board that element of wide business experience which we felt to be so desirable. We are confident that our new colleagues will be of great assistance to us in the conduct of our affairs.

Your directors have also resolved that their collective fees as from January 1, 1941, should suffer a reduction in roughly the same proportion as their numbers. A resolution fixing the fees at £8,600 p.a. gross—a reduction of £2,262 p.a.—will be brought before you later during the meeting.

I have to report with regret the death of Dr Lewis, the Society's principal medical officer. Dr Lewis served the Society for over twenty-five years and his sage counsel was greatly appreciated. The directors have appointed Dr A. E. Gow, the senior physician at one of London's leading hospitals, as principal medical officer and they are confident that in him they have an admirable adviser.

As at March 31st this year Mr Lewty, the actuary to the Society, retired after 40 years' service, and to succeed him the directors have appointed Mr Haynes, our chief cashier, who joined our service on the same day as Mr Lewty, also retired at March 31st. I should like to take advantage of this occasion to express our thanks to these two gentlemen for their long and faithful service to the Society.

ment situation were on a satisfactory level having regard to the conditions ruling. The modification in the valuation basis to which reference is made in the report will, however, inevitably reduce the future profits of the Society very considerably. Future bonus prospects must depend upon many factors at present indeterminate, but it is not possible to give any optimistic forecast under the conditions in which we now live and are likely to live for some time to come. I need hardly say that at future valuations it will be your directors' primary concern to increase the stringency of the valuation basis.

THE INVESTMENTS

Turning to the balance-sheet, the Society's Stock Exchange investments have been written down to their mid-market prices as at December 31, 1940, and the depreciation in the investments held by our subsidiary Equity and Law Investment Trust has been dealt with by writing down the value of the shares from £210,000 to £10,000 and by placing a reserve of £500,000 against the shares and the deposit made by the Society.

In passing, I would draw your attention to the fact that the Society now holds over £4,000,000 of British Government Securities, an increase of over £1,500,000 during 1940. Of this increase well over half went into new Government loans, and I think that your directors may claim that the Society has given the fullest possible support to the Government in their policy of financing the war. Our investment policy during the war has resulted in a strengthening of our position without the sacrifice of recovery prospects to more than a very minor extent. The balance of loss on securities realised was very small.

MORTGAGE AND INVESTMENT RESERVE

As at December 31st last it was necessary for your directors to consider what reserves—if any—required to be placed against our investments in mortgages, loans and property: I do not need to tell you what difficulties must attend such considerations under present conditions. Your directors, after considering a report from their general manager, felt that a reserve of £500,000 would be proper and sufficient. The mortgage and investment reserve has accordingly been maintained at this figure.

Reversions and life interests and loans thereon were revalued and examined as at December 31st and call for no comment.

SUBSIDIARY COMPANIES

As regards our subsidiary companies, you will remember that there has been for some time a large hidden reserve in the figure at which the capital stock of the Law Reversionary Interest Society has appeared in our balance-sheet. We have now taken credit for that hidden reserve. You will see that this item is now valued at £900,000—a figure fully justified by a careful examination of the position—as compared with £497,506 last year.

The accounts of the Freehold Building and Land Development Company for the period from May 3, 1938, to December 31, 1939, have been published since our last annual general meeting, and showed the reserve of £100,000 created last year to be necessary. As Sir Dennis Herbert said a year ago, the effects of war have been very unfavourable to this business. Nevertheless the future is by no means unhelpful. I may say that the board of this subsidiary company has undergone certain changes. The new board includes two nominees of the Society and has the full confidence of your directors.

The remaining subsidiaries call for no comment—Reserves Securities Trust Ltd. is a public company, carrying on the ordinary business of an investment trust and your Society is well represented on the board.

LIABILITY IN NATURE OF GUARANTEES

Before I leave the balance-sheet I wish to refer to the somewhat unusual docket which appears, and which has now appeared for some years, on the liabilities side, namely, the reference to liabilities in the nature of guarantees.

The guarantees given in respect of Unit Trusts refer to certain Unit Trusts managed by Trust of Insurance Shares Ltd. and—with two exceptions—are all mentioned in the publications of that company. The two exceptions are covenants which in certain circumstances might require us to make well covered loans in respect of uncalled liabilities on certain bank shares; these cannot be of major importance. The guarantee given in respect of a

wholly owned subsidiary refers to a sum of £19,520 deposited by outside interests with Equity and Law Investment Trust Ltd.

These comprise all our guarantees, with the trifling exception of a small life annuity. Your directors do not consider it in any way probable that those guarantees will become onerous.

I do not propose to prophesy about the world situation. The effects of the war on the business of the Society are shown by the report and accounts before you—these effects were accentuated by the fact that they followed closely upon a period of rapid expansion. Our aim now must be to conserve the strength of the Society, both in our treatment of the present and in our policy for the future. To that aim we shall steadfastly hold.

BOARD'S BONUS POLICY

You will observe that no bonus is declared in respect of the triennium ending December 31, 1940, nor is it proposed to pay any interim bonus at present. The probable suspension of bonuses was indicated in the chairman's speech last year, and the results of the valuation, to which I have already referred, left your directors no alternative consistent with sound finance. It is naturally with great regret that the Society's hitherto unbroken record of bonus distribution, ranging over its whole history of nearly 100 years, is thus interrupted.

QUESTION OF DIVIDEND

You will further observe that the dividend recommended for the current year is a very modest one, and that it is amply covered by the interest earned by the proprietors' fund. In this connection I would remind you that hitherto it has been our practice, on the occasion of a triennial valuation, to declare a dividend for the whole of the ensuing three years. The dividend up to and including the half-yearly instalment paid in January this year was thus declared at the annual general meeting in 1938 and was based on the results of the triennial valuation made as at December 31, 1937. We now hold the view that the rate of dividend should be considered annually; this has been done on the present occasion and will be our practice for the future.

It will also be noticed that the rate of dividend recommended has been expressed as a gross amount, subject to deduction of income-tax, not as a net amount, free of income-tax, as hitherto.

SAVINGS BOND SCHEME

I have already mentioned the schemes which we have introduced in connection with Government Loans and I should like to refer especially to our Savings Bond Scheme under which a considerable number of policies has already been effected. This scheme provides a means whereby Savings Bonds may be purchased by instalments extending over a period of fourteen years but ceasing in the event of the earlier death of the purchaser. As in the case of the 3 per cent. War Loan Scheme in March, 1940, the Society took the lead in offering this type of policy to the public.

Our National War Bond and Defence Bond Schemes remain in force and serve a rather different purpose—they combine the advantages of a high yielding annuity with the satisfaction of the entire investment being placed in new Government Loans.

In connection with War Weapons Weeks in many towns and cities throughout the country we have made arrangements whereby policies effected under these various schemes are credited to the local total. Many people who had not the money available for immediate investment have been glad to adopt this means of supporting their own War Weapons Week.

TRIBUTE TO STAFF

I report with deep regret the deaths of two more members of our staff serving with H.M. forces—S. R. Young and R. S. Tucker—I hope that the honour and respect in which such men are held may be a comfort to all those who mourn their loss. Seventy per cent. of our clerical staff are now serving with H.M. forces. The burden placed upon those who remain is very heavy, since beside the great increase of work to be done there are the duties of the Home Guard and Civil Defence with which we are all familiar. Our annual general meeting this year is some weeks later than usual owing to the very small actuarial staff available for the work of the triennial valuation. You will realise therefore that it is in no formal spirit that I close these remarks by expressing your directors' very sincere thanks to all members of the staff—both permanent and temporary—for a very good year's work.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

RESULTS OF A DIFFICULT YEAR

SIR THOMAS B. WHITSON'S ADDRESS

QUESTION OF WAR RISK COVER

Sir Thomas B. Whitson, LL.D., chairman, presided at the one hundred and sixteenth annual general meeting of the shareholders of the Scottish Union and National Insurance Company held at Edinburgh on the 14th instant.

In moving the adoption of the report and accounts for the year 1940, he stated: Although it has been the practice of past chairmen to refer briefly to the prevailing conditions at home and overseas, as they affect the business of insurance, I do not propose to take this course to-day. But let me say this, we are all determined upon winning the war whatever it may cost. In this respect we, with other members of the insurance world, will continue to carry our share of whatever the Government may ask in respect of the National War Effort.

LIFE DEPARTMENT

In the matter of getting new business, the past year has been a difficult one in the Life department. During the period an ever-increasing number of the young men of the country, to whom we normally look for a large share of our new business, have been called to the colours and in most cases have postponed, for the time being at any rate, the question of life assurance. For the same reason we have lost the services of a large number of officials and agents who would normally have been getting business for us. In addition higher taxation, increased cost of living, and the call for savings to be invested in Government issues, are factors which have had a detrimental effect on our figures. As a consequence premium income at £795,874 shows a decrease of £38,108.

Claims by death show an increase compared with the exceptionally light experience of the past two years. The sums assured and bonuses paid under this heading amount to £451,643, being an increase of £57,233 compared with 1939. This increase is very largely accounted for by claims which have become payable in respect of deaths caused directly by enemy action arising under policies issued before the war and which contained no restriction with regard to war risks. Despite these war claims, the total claims paid are well within our estimation. Claims by maturity—£486,355, although about £18,000 less than last year, are considerably higher than normal owing to the large proportion of twenty-year endowment assurance business written in 1920. Surrenders, on the other hand, show a welcome decrease, and at £66,399 are less by £44,672 than a year ago. It is our policy to discourage the surrender of contracts which have been effected with the company. When this course is contemplated by our policyholders, we are frequently able to assist them to keep the benefit of their assurance by allowing premiums to stand over as a debt against their policies, or by other means.

Consideration for annuities is down by £17,733, whilst the net annuity payments show a decrease of £12,673. The reduction in commission reflects the falling off of new business. The expense ratio, including commission at 12.6 per cent., is a decrease of approximately 3 per cent. on the previous year.

GROSS RATE OF INTEREST

Although the life funds have decreased slightly during the course of the year from £12,088,851 to £12,070,323—a decrease of about £18,500—the gross net interest income has been more than maintained at £536,840 against £536,716. The gross rate of interest earned was £4 10s. 2d. per cent.

You will know that, broadly speaking, our life department pays income-tax on its interest income less expenses and not on the profits earned. If the full burden of continued increases in the rate of tax which have taken place in the past few years had to be borne by the offices, the profit-earning capacity of the business would be seriously affected. It is therefore gratifying that the Government has recognised this fact by limiting the rate of tax to 7s. 6d. in the £ on the taxable income reserved for life policyholders.

Last year my predecessor pointed out that at the time when he was speaking, none of the contracts issued since the outbreak of war had included war risk cover. This policy was decided upon as, at that time, we had no means of assessing the magnitude of the risks involved. During the course of the past year we have been able to consider the results of enemy action against our civilian population. With these before us, your directors came to the conclusion that we could safely include war risks on civilian lives in the United Kingdom and Northern Ireland on the payment of a special premium. Consequently, we are now prepared to do this when requested, but at the same time we shall keep the position under constant review.

As mentioned to you a year ago, many offices have decided to reduce or stop payment of intermediate bonuses under present conditions. This company, however, having given a definite undertaking to its policyholders to pay intermediate bonuses under claims arising before December 31st, 1942 (the next valuation date) at 38s. per cent. on each year's premium due and paid subsequent to December 31, 1937, will continue to honour this undertaking.

The sinking fund and capital redemption account has increased slightly from £234,692 to £238,687.

FIRE DEPARTMENT

Judged by the experience of recent years, the results for 1940 are disappointing, but when account is taken of the circumstances which have been operating against us throughout the year, the loss ratio may not be considered as unsatisfactory.

Premium income with an increase of £88,112, passed the million mark at a figure of £1,049,244. This advance was mainly due to America but the home field also contributed.

Our fire claims are somewhat higher than in recent years and in this country a number of factors arising out of the war had a considerable effect on the experience. Black-out conditions, intense industrial activity, emergency storage of goods and the rising costs necessary to replace property destroyed, all tended to increase the loss ratio. In addition the very severe weather conditions both at home and in America during the early part of the year, gave rise to an abnormal number of claims.

In common with other offices the operation on behalf of the Government of the war risks scheme in respect of commodities and fire-prevention arrangements have imposed upon us a good deal of extra work. The Government is making very strenuous efforts to reduce fire waste and the measures which they are instituting should ultimately bear fruit. In the meantime, however, there are so many factors associated with the war tending to increase fire losses that any immediate reduction in loss ratio can hardly be anticipated.

On the Continent our commitments have been relatively small so that it is not anticipated that our aggregate income will suffer to any great extent.

ACCIDENT DEPARTMENT

In the accident department the improvement indicated a year ago has happily been maintained. Each account has shown a profit.

The employers' liability account shows an increase in premiums and in spite of the recent legislation increasing compensation to workers, we are able to show a distinct improvement in the claims ratio and to produce a profit.

Special reference is made to the miscellaneous account in which is included, inter alia, the motor business. The results in this account, whilst showing a profit, are marred to some extent by our overseas motor experience. Steps have already been taken to put this in proper order and it is to be hoped that the beneficial effect of this action will soon be felt. Most other sections in the

miscellaneous account have shown increases in premiums and small profits.

MARINE

In the marine department we have, in spite of continuing difficulties of underwriting, been able to transfer a profit of £30,000 to the profit and loss account.

There have been many changes in the conduct of the marine business and the loss of the services of many of our valued Continental agents, as a result of enemy occupation of a number of Continental countries, has deprived us of a substantial section of business. In addition certain balances which were held in those countries are not at present available to us. Provision, however, for this has been made in our account.

In America business continues to expand and to yield most satisfactory results.

PROFIT AND LOSS ACCOUNT

The profit and loss account shows an experience common to all companies of reduced interest yield. The course which the Government have taken by maintaining interest rates at a low level and by increasing taxation in the National cause, is a matter in which we are all ready and willing to share.

Under present conditions it has been considered prudent to pay our dividend at a reduced rate of 4s. 6d. per "A" share and 16s. 10½d. per "B" share.

BALANCE-SHEET

An examination of the balance-sheet shows that the total assets of the company at £17,890,316 have increased during the year by £367,368.

During the year your directors have consistently given of the company's available surplus to assist the National war effort.

UNITED MOLASSES COMPANY, LIMITED

TRADING UNDER WAR CONDITIONS

The annual meeting of The United Molasses Company, Limited, will be held on the 30th instant.

The following is a summary of the statement by the chairman (Mr. F. K. Kielberg) circulated with the report and accounts.

In the United Kingdom the company had throughout the year acted as agents for the Ministry of Supply, under the direction of the controller of molasses and industrial alcohol. The distribution of the country's requirements of molasses had, under that arrangement, worked smoothly and without a single breakdown. Although by far the greater part of the company's activities had been taken up with work arising out of the agency agreement, the commission received by the company from the Ministry had amounted to less than 15 per cent. of the company's combined profits.

The agreement, however, permitted the company and its foreign subsidiaries to buy and sell molasses abroad for their own account and several of the subsidiary and associated companies, particularly in America, had had a successful year. In other markets trade had been, and continued to be greatly handicapped by the difficulty experienced in obtaining tonnage.

The company's business with the Continent of Europe had, of course, come to a complete standstill, and since last spring no news whatsoever had been received from any of the European subsidiary companies. The future values of the Continental assets and investments must, of necessity, be considered problematical and the directors had decided to write off those assets and investments in full. The written down book value amounted to £166,200, although the actual value was considerably in excess of that figure. The board had also considered it prudent to write off, or to make provision for, all fixed assets situated in danger zones in other parts of the world, and all fixed assets included in the balance-sheet at December 31, 1940, were situated within the Empire or within the United States of America.

He felt certain that stockholders would wish to associate themselves in an expression of gratitude to the company's masters, officers, engineers and crews.

THE EMPLOYERS' LIABILITY ASSURANCE CORPORATION, LIMITED

SATISFACTORY RESULTS

The sixtieth ordinary general meeting of the Employers' Liability Assurance Corporation, Limited, was held on the 14th instant in London, Sir Courtauld Thomson, K.B.E., C.B., the chairman, presiding.

The chairman's address, which had been circulated, stated: A summary of the main features of our operations in 1940 show that our fire and accident premiums were well maintained and amounted to £6,268,000. The total amount taken to credit of the profit and loss account in respect of 1940 is £547,000. This amount includes the underwriting profit of £234,000, which was higher than in 1939 and above the average of recent years, and also includes gross interest income received of £313,000. After providing for British taxation totalling £307,000 and for other charges, and after declaring dividends at the same rates as a year ago, we have added £70,000 to the amount carried forward, which has now reached the sum of £539,000. This mobile reserve is additional to our general reserve of £2,500,000, and the two together form a substantial reserve fund of over £3,000,000.

VALUE OF INVESTMENTS

The market values of our investments at December 31, 1940, if taken at current exchange rates, show a considerable appreciation over book values.

The "Clerical, Medical and General" declared a modified bonus, while carrying forward a large reserve. The "Merchants Marine" showed an underwriting profit on the 1939 marine account and increased premiums in 1940.

The special effects of the war on our business in 1940 were fortunately not serious. The only countries where we have temporarily lost our business on account of enemy occupation are France, Belgium and Holland, but our interests there were relatively small.

The premiums in our fire account increased in 1940 by over 5 per cent., but there has been a smaller underwriting profit than usual. This was to be expected from the larger figures of all home fire losses which have been published in the Press each month.

The decrease in our home accident business due to the war, to which I referred a year ago, was continued in 1940, particularly in the motor branch, where, however, we made an underwriting profit. In workmen's compensation business we have not yet received the full benefit of increased premiums due to greater business activity in war industries, while last year our results suffered from the increased benefits recently brought into force. War conditions also affected other classes of business.

RESULTS IN UNITED STATES

In the United States, workmen's compensation business produced for us, with careful underwriting, a modest profit. It is estimated that there are now 2,500,000 more people in employment, and the payrolls are 20 per cent. higher than a year ago. We may therefore expect larger premiums in this class, though any increase in volume will be offset in some degree by continued reductions in rates. Motor business also yielded us a profit, but lower rates here made discrimination in the selection of risks more necessary than ever. Miscellaneous classes were again favourable. Taking the results of our United States branch business as a whole, both our premiums and the number of policies we wrote were higher, and good underwriting results were once again obtained. These satisfactory features are particularly creditable in a difficult year.

In Canada, where we operate on a large scale, we made a profit, though our results were not as good as they were in 1939. In South Africa and Australia, where we also transact considerable business, our results were profitable, and better than those of the preceding year.

The market value of our investments in stocks and shares at December 31, 1940, as stated in the balance-sheet, is £1,430,000 in excess of their book value if taken at current rates of exchange—that is, \$4.03 to the £ for United States dollars and \$4.45 for Canadian dollars. When allowance is made for revaluing on the same basis our other assets and all our currency liabilities, we have a considerable net appreciation in our assets.

The report was unanimously adopted.

JOHNSON AND PHILLIPS, LIMITED

INCREASED ACTIVITIES

The thirty-sixth annual general meeting of Johnson and Phillips, Limited, was held, on 15th instant, in London.

Mr. G. Leslie Wates, J.P. (the chairman), said that the trading profit at £491,301 to a very large extent resulted from that careful purchase of additional plant during many years past, which he had previously referred to. The reserve for taxation was necessarily an estimate as it was not possible to deal with it exactly. The estimate was, however, on conservative lines and had included for income-tax at the current rate of 10s. in the £ in respect of the profits earned during the year under review, although such income-tax will not become payable until January 1, 1942.

In the trading profit there was included only dividends of a token amount from the subsidiary companies. An additional £30,000 has been transferred to the special reserve for contin-

(Continued from page 666)

between domestic supplies and requirements, however, was fully made up by increased imports of lead ore and metal from foreign sources, chiefly Mexico and territories in the British Empire. United States lead exports, which had been considerable in 1939, fell to an insignificant level in 1940. There has been little change in the supply position of the United States during the first quarter of this year. New supplies are adequate, while stocks in the hands of producers, which totalled 46,000 tons at the end of March, have hardly changed since July last, and those held by consumers have even increased.

* * *

Firmer Oil Markets

After a long period of comparatively stable prices, the oil markets overseas have recently begun to show a firmer tendency; and while the connection between world market prices and British retail prices is now somewhat remote, it is not unlikely that consumers in this country will be affected in the not too distant future. The Gulf export price, which reflects world market movements, has risen from 3.50-3.75 cents a gallon for a representative grade at the end of last year to 5.00-5.25 cents. The rise has so far been considerably less marked in the case of other petroleum products, but lubricants, distillate fuels and bunker fuel oils have all made headway during the past two

months. So far as petrol is concerned, the movement is to some extent attributable to seasonal factors—for the industry is now on the threshold of the main consuming season; but other, and more important, causes have been at work. In the first place, the over-production of crude oil, which was especially marked last year in Texas and Illinois, has been largely eliminated, with the result that posted prices were advanced last month in several districts for the first time for two and a half years. Secondly, refinery operations have been kept within the limits of market demand, so that it has been possible to reduce petrol stocks from the abnormal levels reached last year. Concurrently with these improvements on the supply side, the domestic demand for the chief oil products has registered an advance which has in some instances been very striking. This has rescued the markets from the adverse effects of the fall in exports which occurred last year in consequence of the loss of European markets. Owing to the remarkable growth of motor traffic—new registrations were up by 27 per cent last year—the consumption of petrol in the United States is now estimated to be running 10 per cent above the 1940 level. Similarly, the rapid expansion of general business activity is making its effects felt on the demand for industrial fuels and lubricants. As the American re-armament programme gathers momentum the consumption of oil products is likely to expand further. Though export business remains at a low level, the upward trend of prices at the Gulf seems likely to continue. This means that oil products will be dearer throughout the world.

The recommendation as to dividend was that 15 per cent. should be paid for the year, being the same dividend as was paid last year.

The figures of the balance-sheet reflect the greater activities of the company in the substantial increases in stock-in-trade and work-in-progress. The item "Sundry Creditors" at £300,089 compares with a corresponding figure of approximately £250,000 last year but this apparent increase is to be considered in relation to the increase of stock-in-trade and work-in-progress from £437,000 last year to £626,000 this year. Although the bank loan is up by £50,000, the cash in hand is up by over £40,000, so that the general liquid position of the company can be considered extremely satisfactory. In view of the large figure which now has to be reserved for taxation, this has, for the first time, been shown as a separate item in the balance-sheet, in which it appears at £341,059.

COMMODITY AND INDUSTRY NEWS

BUSINESS was resumed on Tuesday after the Rubber Trades Association's announcement on Monday. Though little business was done, prices were firm. Smoked sheet spot closed on Wednesday at 14½d. per lb., compared with 14d. per lb. a week earlier. Tin showed very little change during the week. Wednesday's closing price for standard cash was £270-£270 5s., compared with £270 5s.-£270 10s. per ton a week earlier. The three months' figure was £267 15s.-£268, compared with £267 5s.-£267 10s. Some of the difficulties which faced the International Tin Committee at its meeting on Thursday are discussed on page 666.

Cotton.—The members of the Liverpool Cotton Association have approved the proposals of the directors for the allocation of the Government grant of money. Instructions have been received that stocks of cotton and cotton arriving in Liverpool must be moved to warehouse accommodation outside the city. Little progress has been made with private agreements for the closing down of mills and sheds. Cloth inquiry for export has been on a rather larger scale

and fair orders have been booked in essential goods for the Home Services. Some spinners of yarn have received more permits to sell from the Controller.

Rubber.—On May 12th a notice was issued to the Rubber Trade Association. The text ran: "The passing of tenders, declarations, and documents, delivery orders and warrants, will be suspended until to-day week, May 19th. Except by mutual agreement between parties, payments will be suspended for the same period. The market will remain open for business within the terms of the preliminary notice issued by the Rubber Controller." No business, however, was transacted during that day, but there was a resumption on Tuesday. The price had been fairly steady at 14½d. per lb., smoked sheet spot.

Assistance to Exporters.—The export trade is to be assisted to the extent that the Board of Trade is prepared to grant licences to firms belonging to export groups to anticipate one-half of their quota for Class 3 goods in the next restriction period. Licences may also be granted to permit the substitution of

woven textiles goods for knitted goods. Applications will first have to be approved by the export group concerned.

More Children's Clothing.—An amending Order to the Limitation of Supplies Order will raise the quota of children's clothing to one and a half times the present value. Suppliers who have already exhausted their quotas may apply to the Board of Trade for licences to enable them to supply up to one-twelfth the quantity (or value) of children's wear they have disposed of in the present restriction period. *The Economist* pointed out in the issue of May 3rd on page 600 that the shortage of children's clothes was acute, particularly in reception areas.

Silk Stockings.—Last December sales of silk stockings by manufacturers to wholesalers were prohibited. The British Silk Stockings Corporation Ltd. has been set up to assist manufacturers and wholesalers to export these stocks of silk stockings. The Corporation, which is a non-profit-making concern, has eight members, three nominated by the Board of Trade, four by manufacturers of silk

(Continued on page 674)

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended May 10, 1941, total ordinary revenue was £13,850,000, against ordinary expenditure of £70,281,000, and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £330,613,000 against £192,952,000 for the corresponding period a year ago.

Forward Rates

Forward rates for one month have remained unchanged as follows:—United States ½ cent pm-par. Canada ½ cent pm-par. Switzerland. 3 cents pm-par. Sweden. 3 ore pm-par. Dutch East Indies. 1½ cents pm-par.

MONEY RATES, LONDON

The following rates remained unchanged between May 9th and 15th:—Bank rate, 2% (changed from 3% October 26th, 1939). Discount rates: Bank Bills, 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1½%. Day-to-day money, 1-1½%. Short loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

Shorter Comments

Celanese Corporation of America.—Profits for the first quarter of 1941 amount to \$1,587,755 net, against \$2,419,414 for corresponding period of 1940. Volume of sales was at record level, but taxation is much increased and costs were slightly higher, without any compensating rise in prices. After provision of dividends on preferred stocks, the surplus is equivalent to 84 cents per share of common stock, against \$1.36 a year before.

Australian Mutual Provident Society.—New business, 1940, £16,927,863

stockings and one by the Wholesale Textile Association. The Government has nominated Sir Cecil Weir as chairman. Agreements will be made between the Corporation and manufacturers and wholesalers, and the Corporation will guarantee a fair return on sales. The manufacturers are to undertake to dispose of their stocks only on conditions approved by the Corporation, and to make every endeavour to sell them abroad. It is expected that the Corporation will recommend that licences under the Limitation of Supplies Orders should be issued permitting the release for the home market of stockings which cannot be disposed of abroad. It is estimated that about 3,000,000 pairs of stockings—a very small proportion of the normal demand—will thus be released for home use, and they will be put on the market in small quantities. Prices will continue to be subject to the Prices of Goods Act and control will be exercised over retail prices.

Rayon Goods.—As a result of increases in the prices of rayon yarns announced last week, rayon goods are to rise in price. Prices of stockings, underwear, dresses and textiles will rise on May 31st. It is expected that the effect on underwear

The Economist

THE statutory period of silence having elapsed, it is now permissible to reveal that the editorial and publishing offices of *The Economist* were entirely destroyed in a recent air-raid. What made the disaster worse was that the printing works in which the paper had been produced since it was forced to migrate by the Great Fire of London on December 29, 1940, were also completely destroyed in the same night. *The Economist* thus found itself without a home, without a printer, and without any preparations for the next week's issue (with the sole exception of one short galley proof carried away by mistake in a compositor's pocket the previous week). Within three days, however, offices had been taken (by a very remarkable coincidence, on the exact spot where *The Economist* started 98 years ago), an entire week's issue had been prepared and the copy handed to new printers. The paper was published promptly, and the staff of *The Economist* like to believe that it took a very sharp-eyed reader to detect that anything was amiss. *The Economist* is probably not the first journal in the country to lose both its editorial offices and its printing facilities in one night, though we believe we were the first in London. It is a privilege to have been given the opportunity of continuing the tradition of journalism: "the paper must come out."

Time has hardly yet permitted an estimate of the losses. But they are very considerable and some of them are quite irreparable. The very earliest volumes of *The Economist* have been in safe keeping since the beginning of the war; but a set of bound volumes running for at least ninety years, and several shorter sets, as well as the complete stock of single back numbers, were completely destroyed. The library of books can be very largely replaced, but the unique collection of statistical sources,

trade returns, pamphlets, periodicals, blue books, reference material and the product of past researches has gone for ever. To a journal such as *The Economist*, this is a very severe blow; much of the material that is needed for the purposes of the paper is not available anywhere else in London; and even if it were, to have it on the spot is essential for work that has to be produced to time-table. Fortunately, no journal has a more faithful body of readers; and their indulgence can be confidently invoked for any shortcomings that may be apparent while the necessarily gradual process of rebuilding the library and records is going on.

Owing to enemy action on the night of May 10th, the Editorial and Publishing Offices of *The Economist* have been moved to

BRETENHAM HOUSE,
LANCASTER PLACE,
LONDON, W.C.2.

Telephone (Temporary): Temple Bar 0082.

Will correspondents and others who are awaiting replies to letters that may have been lost, please communicate with the above address.

The kindness of readers of *The Economist* is also solicited for more direct assistance in the process of reconstruction. Our chief needs (other than for books that can be purchased) are as follows:—

Bound volumes of "The Economist."—One complete set, or as nearly complete as possible, will be required; also three or four sets of recent years.

Back numbers.—Loose back numbers of the last five years will be required.

Reference and statistical material.—Reference books, trade and other returns, collections of financial, commercial and industrial statistics. Those published, and still obtainable, in Great Britain are, of course, easily replaceable, but out-of-print and foreign material will be very welcome.

Government publications.—Here, again, recent British issues are obtainable, but out-of-print volumes, particularly statistical abstracts and trade returns, and overseas Government publications, will be very useful.

Men of Vichy

IT may well be, when the history of these troubled days comes to be written, that the emergence of the Vichy Government as the ally of Germany will be seen as an almost undiluted advantage to the cause of Britain—and of France. The final step of military collaboration was inherent in the position adopted at Montheore, for in total war the fine distinction between economic and military collaboration is hard to draw and impossible to maintain, even when the will to resistance is far more marked than it has been among the men of Vichy. Surely, therefore, it is better that this policy of "collaboration" should appear openly for what it is rather than that it should continue to masquerade in a twilight zone of false neutrality.

Almost from the first, Vichy-France was a leakage in the British blockade and anything up to 60 per cent of the cargoes arriving at Marseilles went on to Germany. More recently, there has been evidence of French supplies, particularly of oil, reaching the Axis forces in Libya—a good example of the confusion between economic and military assistance. The despatch of oil across the frontier is perhaps an economic act. It is also as military as the despatch of refuelling lorries to the battlefield.

Since the beginning of the year, collaboration in industry has gone daily further. Through their control of raw materials, the German officials in Paris are in a position to control industry throughout France, and all the evidence suggests that they have found willing collaborators among the great industrialists. The recent negotiations, in the course of which, presumably, the aerodromes in Syria were given up, largely turned on the transit of materials across the frontier between occupied and unoccupied France, the reduction of the cost of occupation, and the release of French prisoners for work at home—economic concessions, for all of which a military concession was made in return. Now that by gentle gradations Vichy has passed across the No-man's land of para-military co-operation and entered the enemy lines, there is clearly no sphere in which Great Britain can rely upon its continued "neutrality," Marshal Pétain's broadcast statement that in collaboration with Germany "France would preserve her continental and colonial status," opens the door to joint action in North Africa and to co-operation—already threatened by Admiral Darlan—between the French and German navies.

The period of deception is over. Vichy is at last clearly and unequivocally the enemy of Britain. But it is an enmity the British people find hard to understand. The last period of hostility—under Napoleon—was after all with a France battling for European leadership, not cringing as now for a safe job in the racket of Nazi Europe. And since the Vichy regime is a manifestation of an unknown France—a France which we may devoutly

Periodicals.—Recent back numbers of periodicals, circulars, etc., containing statistical and other records, would be valuable.

If any readers have any of the above and would be willing to dispose of them, they would be rendering a real service to *The Economist* by writing to the new address (which is given on previous page with precise details of what is available. Readers are asked not to send anything without previous correspondence.

From those friends of *The Economist* who had heard of the disaster, many kind expressions of sympathy have been received. So far as they bear on our material loss, we are grateful for these. But by far the most precious possessions of *The Economist* are the good-will of its readers and the very proud tradition it has inherited from James Wilson and Walter Bagehot. Neither of these possessions has been, or can be, touched by Hitler's bombs.

hope only lives in the minds of a very few Frenchmen—the policy pursued by the British Government during the last eleven months can to some extent be understood even if not condoned.

Is it not possible that the Government's errors of weakness and complacency towards Vichy, and of somewhat hesitant support for the Free French, sprang from an inability to believe that any French leader could see in the German invader anything but a hated enemy, or that the policy of Vichy could in the long run mean anything more than "to bleed awhile, then rise and fight again"? Yet there are two conceptions of French security and French interests; one is the normal and honourable interpretation which unites the fate of France with the free civilisation of the West and the immediate salvation of France with the liberation of the country from the invading Boches. This is the conception of French honour and French interest which is bringing week by week a stream of volunteers to join General De Gaulle.

The other interpretation—it is perhaps naturally the interpretation of old, discouraged, fearful and miserly men—accepts the view that Europe must be unified by Germany, that France's hope lies in conciliating the old enemy and in fitting her economy into the needs of the Reich. In return the men of property, the bureaucrats, the colonial officials will enjoy the security which business men enjoy when they have made their contribution to the local racket. Only, in their case the contribution is the substance of France. They have been encouraged in this passive acquiescence by years of skilful Nazi propaganda in which the "dangers" of liberal democracy to property were linked with the "menace" to France of the world leadership of a liberal and bellicose Britain. The struggle for France's freedom against Germany was twisted into Britain's attempt to fight a war with the manpower of France and to keep the Continent weak by perpetuating—at the cost of war—the enmity between those two "natural allies," France and Germany. The tale sounds fantastic. It is; but it is also believed—in Vichy.

Since the collapse of France, the Germans have been in a particularly favourable position to play upon these feelings of resentment against "Britain, the warmonger." Oran and Dakar, the blockade, air bombardment, war dislocation—all these could be laid at the door of the British people and their obstinate determination to carry on the war against a unified Europe, which was only waiting for the end of Britain's insane onslaught to organise prosperity under German leadership. The men of Vichy had accepted "the logic of events" and had surrendered in the belief that Britain's surrender would follow. The continuance of the war and, above all, the allegiance of certain colonies to General De Gaulle, were a reproach and a challenge which the Vichy regime was not prepared

to face. Against this background, the persistently carping and hostile tone of the Vichy radio and Press, the readiness for economic collaboration with Germany, the extension of collaboration to the colonial sphere are understandable. The difficulty for Britain is to grasp the background.

British policy has been based in the first place on respect for an old ally with whom Britain has shared the fortunes of two wars against a common enemy. It is probable that policy has also been influenced by the underlying idea that Frenchmen can really only be thought of as sharing the De Gaulliste conception of French honour and interest. It was assumed on the British side that where resistance was still possible, as in North Africa, the leaders would veer to resistance once the shock of collapse had passed, and that, even in occupied France, the terms of the armistice would set rigid limits to collaboration. That generals such as Weygand should prefer surrender seemed inconceivable, that leaders such as Darlan should positively desire to subject France to Germany even more so. British policy, in short, appeared to cling to the belief that Vichy was De Gaulliste at heart, and that everything should be done to hasten the hour of resurrection.

The Laval tragi-comedy did not modify this belief. Whatever the real facts of the case, it can be seen now that the change of leadership has not fundamentally affected Vichy's policy. Laval's dismissal seemed at the time to be an assertion of independence by Marshal Pétain against the Nazis. Subsequent events make it look like little more than an internal struggle for power.

The British tendency to misread the men of Vichy was reinforced by the policy of Washington. The Americans, with memories of Lafayette and the Great War intermingled, are even further removed than the British from the notion of a puppet France. The State Department, by its despatch of Admiral Leahy and by its assistance in the initiation of negotiations with French leaders in North Africa, was basing its policy on the belief that there were men at Vichy who could be rallied to love liberty and honour better than enslaved security. But there were no such men, and as a result the policies of Britain and America alike have given an impression of weakness and uncertainty.

There are, however, welcome signs that the episode of hesitation is at an end. From America has come President Roosevelt's message to the people of France which, ignoring the Vichy Government, appealed for national resistance to a policy of collaboration with Germany. The speech was followed by action—the placing of guards upon all French ships in American harbours. Further steps are likely to include the freezing of French assets and joint action with the other American republics to ensure that the French colonies in the Western Hemi-

sphere are not used by the Axis; there was even a hint in the President's remarks that America's interest extended as far as Dakar. To the statement made later by M. Henry-Haye, the Vichy Ambassador in Washington, that France would "defend" her dependencies against the United States, the general American comment is that France is ready to fight anyone—except her enemies.

Now, with the flagrant readiness of Vichy to accept its satellite rôle and the change of policy at Washington, it is surely possible for British policy to throw off any inhibitions with regard to Vichy-France. Only one deterrent remains—the fear that an open clash might alienate the people of France. But the people of France are less sophisticated than their self-appointed leaders. For them the German, in occupation of two-thirds of their dear country, is a more evident enemy than the British who fight to defeat the German. Every report from France gives fresh evidence that, whatever the failures of their Government, the people of France are neither old nor discouraged nor fearful nor corrupt. On the contrary, a *mise-au-point* between Britain and Vichy, far from harming Britain, might well have a fatally damaging effect upon Vichy's prestige. If there is any excuse for Vichy, it is that it is sparing a section of the French people the horrors of war. If by joining Germany Vichy ensures that these horrors are again unleashed, the average Frenchman may well ask on what mandate the men of Vichy abstained from war for just long enough to bring their country in on the wrong side.

The British Government, in adopting a more positive policy *vis-à-vis* Vichy, has two obvious and immediate duties. On the one hand, more active and definite support should be given to General de Gaulle. It is welcome news that, under a new agreement, the arrangements already made to secure the economic life of the Cameroons will be extended to French Equatorial Africa. The British Government are to buy up practically the whole output of the colony and to give the Free French authorities sufficient credits to cover the import of essential goods from the sterling area.

The other immediate task is to take the necessary precautions—if this has not already been done—against the day of active French participation in the war. There is ominous talk in Vichy of the necessity of "reconquering" the Free French colonies. It does not follow that the British Government must take a bellicose initiative, merely that, as Mr Churchill has promised, Britain will fight the Nazis wherever they show themselves, even if they appear convincingly disguised as men of Vichy. General Dentz has been pleased to call British attacks upon German-occupied aerodromes in Syria acts of "unprovoked aggression." This is the kind of aggression that must continue at all costs.

Local Government on Trial

THE Fire Services (Emergency Provisions) Bill has been treated as a matter of urgency by the Government; and all the fire brigades in the country are to be run on a regional basis under national control. It is not inconceivable that this may serve as a useful precedent for a much wider reform of local government. The fire services require drastic change because control over them is widely scattered among a crowd of local authorities which differ widely in size, competence and resources. Co-operation is difficult, and there are no common standards of equipment, personnel and operational training. Faced with warfare by fire, too many of them have been proved slow, cumbrous and inefficient.

These failings are not peculiar to fire-fighting. Air raids have brought other local services under questioning. In London, the intensive attacks of last autumn made it necessary to appoint special regional commissioners to be responsible for public utilities, shelters and homeless peo-

ple; and, wherever there has been bombing, local arrangements for the distribution of food, for emergency evacuation and for transports have been found more or less insufficient. It is, of course, possible to argue that these are purely wartime difficulties. Local government, it is argued, has been faulty because it was only organised for the tasks of peace. An analogy is drawn between civil defence and the active fighting services, and it is claimed that, just as there are commands in military organisation, so must there be regions for all the aspects of ARP. There is considerable force in these contentions, but they only go part of the way. The need for regions or commands in ARP is unquestionable; but these local shortcomings, to which the special urgencies of air-raid conditions have given a unique significance, are also part and parcel of the normal peacetime system.

It was no arbitrary choice which gave the agency for protecting public services and welfare in raids to the local

authorities. It could scarcely have been otherwise, because public services and public welfare are the care of local authorities in ordinary times; any other arrangement would have involved a readjustment of their old as well as their new functions. In the case of fire-fighting, a wholesale readjustment of this sort has now become inescapable, and the obvious question is whether the same kind of change will not sooner or later be needed over a much wider field. In war-time, inefficiency stands out in relief; but, even in peace-time, local incompetence and delay were frequent and characteristic. There were wide and inequitable discrepancies between the work of one authority and another, in public health, education and the other services.

It is generally agreed that for the fire services, and indeed for most branches of civil defence, regional organisation under active central direction is the remedy. Under the burden of ARP, local government—the self-contained administration of the smaller units of district and borough—has widely collapsed; and it would be foolish and mealy-mouthed to deny this. But this collapse under fire is symptomatic of a deeper disease. At the best of times, local government tends to be lame at many points. Neither in its structure nor in its system of financing was it ever designed, even after its remodelling in the nineteenth century, to shape the welfare of the nation in a positive way; and changes in communications, in the technique of industry and the public services, in the responsibilities of government and in the distribution of the population have not made it more apt. Many of the units of local government are too small; they lack the resources of finance and personnel to carry out their duties; and, again and again, the boundaries between them have no more than a formal, administrative meaning. The point is that some measure of regionalism is required for local administration at large, no less than it is demanded for ARP.

This is not a question of destroying local liberties, but of securing governmental efficiency. Very largely, local autonomy is a myth already. Local authorities do what they are empowered to do by statute and what they are instructed to do by departmental order. Only in "permissive" matters, in matters left to their option by Parliament and in local matters such as scavenging or the establishment of public libraries, nursery schools and swimming baths, have they any really free choice; and in most matters of national importance, such as education, public health and highways, they are, up to a point, merely agents, responsible for maintaining minimum standards centrally laid down. The trouble is that too many are inefficient agents, too incompetent or too poor to do their job.

As a result, there are these sharp differences between district and district in the discharge of vital duties; and it is impossible for the central authorities to set their standards high. If in each of the great urban clusters there was a regional authority to set a common standard; if everywhere town meets country there was a common administration to apply a policy of positive development; and if every local body were designed to possess the resources needed to do its essential work—the whole level of English government could be lifted, without detriment to any of the traditional liberties of Englishmen.

It would be impossible in a single article to describe the kind of regional authority that would solve these problems. Clearly, there is something like a prototype in the London County Council as it might be strengthened by the need to cure London's ills. Clearly, too, there is the chance of experiment and actual progress in the existence of the war-time defence regions and their commissioners. These regional administrations were set up as "shadows" to reproduce the departments of central government in an extreme emergency like invasion; they may prove more important for darning and unifying local government. The present gap between the central and local authorities is too wide. Apart from the governments of some great cities; apart from many of the more efficient counties, who already do a regional work in

supervising and directing the urban and rural authorities below them; and apart from a few well-balanced and middle-sized towns whose resources do match their duties—apart from these exceptions (which in a sense are examples) the need is plain for a new type of regional authority and for a new allocation of administrative tasks between national, local and regional. The description of these authorities, the definition of their tasks and, above all, perhaps, the working out of some new system of "provincial" finance and taxation, to replace the present vexatious and hampering system of local rating, all need articles to themselves. It must be sufficient here, in anticipation of this fuller treatment, to state in general the case for regionalism. It is, quite simply, that local agents of government are needed with the power and resources to govern.

It is not a political question, but an administrative one, a question of finding ways and means to carry out tasks approved by Parliament. Power to act is a *sine qua non* of all government, whether it is free or dictated, and the problem in this instance is simply to discover the right size of administrative unit to act in. The question of political responsibility does, of course, arise, but ultimately it belongs to Parliament. It is true that, where there is local choice and local taxation, there must be a corresponding measure of local representation and local responsibility; there is no reason why the present elected local councils should not remain and no more reason why they should not be supplemented by regional councils, directly or indirectly elected. There would be advisory councils in the regions, representative not only of the constituent local authorities but of the central departments as well. But the point is that whether the regional officers received their authority from above or below or both, they would need power to do their job. All government, local, regional or central, must be popular, it is true; that is, responsive to popular control; but it must no less be effective and efficient.

There can be too many checks and balances in government. Local representation at one end of the chain and central supervision at the other can both become fetters; and local government at the moment is something of a sad example. Small emergency committees of councillors are in charge in most local areas for the duration of the war—not the best and most competent councillors, but representatives of the various parties. Moreover, the will to act is lacking, as well as the resources; there is constant reference to higher authority at every point in the chain, and a persistent reluctance on the part of central officials either to free local hands or to compel local action. These dangers lurk in every large and scattered unit of organisation; they are as evident in the Civil Service itself, in the Services and in big business, as they are in local government. The processes of "passing the buck" and delaying action are congenital diseases of administration, and they are only more apparent in war-time because the exigencies of the hour are plainer.

The danger in democracy is that, because of checks and balances, nobody will be encouraged or even allowed to act; just as the danger in bureaucracy is that nobody will be in a position to act because of the maze of "proper channels" to be threaded. Yet, in Parliamentary England, there is a unique chance to escape these dangers. There are no written safeguards to the constitution, and Parliament can devise and empower the best means of government at will. Local government there must be, because all government must finally be applied at a local point; and it must be fed by local talent and infused by local spirit and patriotism. But it must be accomplished and effective government—which is the true case for regional authorities with ample reserves of finance and personnel to draw upon, and with assured authority. So long as the powers of government are defined and given by the people's representatives, and so long as the exercise of these powers can be scrutinised, criticised and, if need be, withdrawn by the people, power to act can safely be awarded to all governors at every point without detriment either to civil liberties or to the dignity of higher authority.

The Economic War

SECRET sessions of the House of Commons are usually a signal that there is general anxiety about some aspect of the Government's policy. To this rule the recent debate on the conduct of Britain's economic war—the blockade—was no exception. Few topics of the war have aroused so much discussion on both sides of the Atlantic; and there are few questions which are submitted to such varying interpretation. For many, the blockade is still the decisive front. The argument can still be heard that the German economic system and with it, German morale, are strained to cracking point. A few more turns of the screw and the great, overblown Reich will fall to pieces as it did—so the argument runs—in 1918. The vast expansion of Hitler's conquests, however, and the possibility growing to a likelihood that he will soon control the raw material resources of Russia, have created a new type of criticism—that the blockade is inevitably ineffective and that the use of the Navy to carry it through is a waste of Britain's inadequate naval resources.

The truth about the blockade probably lies in between these two extreme views. It is quite false to suggest that the German economy is likely from one day to the next to crack under the strain of shortage and dislocation. The plunder of Europe has undoubtedly eased the economic position of the Reich. There is no problem now of insufficient supplies of iron ore and bauxite, to give only two essential metals. The labour shortage, which is in part created by the blockade, since the production of synthetic materials requires more man-power than the import of the materials themselves, has been mitigated by the reserves of foreign labour upon which the Reich can draw. The problem of transport, too, must not be entered only in the debit column. Complete control of the European system of communications has created for the German executives a more flexible system of alternative routes and the rigid restriction of passenger traffic sets free motor-power and rolling stock for military purposes.

In this context, it may be said that the conquest of the Balkans and the opening of the Straits and of Greek waters to German seaborne traffic from the Black Sea States—particularly Roumania and South Russia—have obviously had a mitigating effect upon transport problems. The railways to the Russian frontier and the Danube were notorious bottlenecks. These can now to some extent be avoided. Of all the commodities affected by this change, oil is incomparably the most important. A general estimate puts the amount of oil Germany can secure from Roumania and Russia during 1941 at 4 to 5 million tons. To this must be added the supplies in Poland and Albania and Europe's synthetic output, giving a total of some 12 million tons. Even though this falls short of the minimum wartime needs of German Europe—the usual estimate is some 18 million tons—the Nazis may hope by pressure to increase Russia's deliveries—and Mosul now lies on the fringe of the fighting.

Nevertheless all is not well in German Europe. From every kind of source come reports of this or that stringency and the total effect is of an economy which, though functioning strongly, is submitted to a steadily increasing strain, the shortage of materials increasing the need for labour for substitutes, the migrations of labour reacting on the transport system, the inadequacy of the transport system increasing intense local shortages of vital supplies. One curious consequence of the general dislocation is the fact that German Europe is often short of supplies which are in fact produced in abundance. So great is the demand made by synthetic production upon coal and timber that the fuel situation in the whole empire is an ugly problem waiting for the autumn and the snows.

The shortages are illustrated by the increasing restrictions on all kinds of civilian consumption, even the most essential. The oil gap, discussed above, is made good in

part by synthetic output. Even so, the Germans, as Josef Winschuh admits, are living on their reserves. Buna production cannot cover more than one-third of Germany's wartime needs or rubber; as a consequence since last February bicycle tyres have only been supplied to tradesmen—a blow, perhaps, to *Kraft durch Freude*. The systematic calling in of the nickel coinage in Italy and France and the anxious notices in the German technical press are evidence of a shortage of ferro-alloys. The need to substitute aluminium for copper has led to congestion and delay at the aluminium reduction plants. The canning industry in occupied territory—particularly in Norway—is barely able to continue production, so short is tin and tinfoil, and even in Germany housewives have been advised against keeping food for long in tin-substitute packings. The possibility of building up family food reserves—a factor, surely, in morale—is seriously affected by this shortage.

The most serious civilian shortages are, however, textiles and leather. The German cloth hunger is well illustrated by the speed with which textiles disappear in occupied territory. In Roumania, clothiers are closing down for lack of supplies and complaints have appeared in the Hungarian Press that textiles have entirely disappeared from the shops in Budapest. The list could be multiplied to cover most of the necessities and conveniences of civilian life, and the news that on July 1st further cuts will be made in the German rationing system is evidence that the plunder period of relative plenty is now at an end. The rationing as it stands to-day is meagre enough.*

Substitutes and synthetics are swallowing up man-power. Germany's search for further labour is incessant. Over one and a-half million foreign workers, apart from prisoners of war, have already been absorbed. The retraining centres for armament work are now almost entirely given over to foreign operatives, and the practice of making a ration card dependent upon willingness to work is being more widely adopted. The position is very delicate, for the extraordinary widespread reports of consistent sabotage—arson (mainly from Poland), carelessness, ca'canny, machine wrecking, de-railing—suggest that there is a point beyond which foreign labour power cannot profitably be used. It might be called a "supervision maximum." If one German is needed to supervise every two Czech workers, the absorption of Czech workers must be limited by the available number of Germans and the whole reason for employing Czechs is the limited supply of Germans.

Finally, in transport, the blockade, by destroying the seaborne traffic of Europe, has created an almost insuperable problem which all the juggling in the world with alternative internal rail, road and canal communications cannot solve. The fuel shortage is another obstacle to efficient transport, and the strain on the transport system has even put a check on the movement of western industry to safer quarters in the Eastern Reich.

This then is the awkward and uncomfortable position of the German economy. The friction and dislocation largely spring from the blockade—to which must be added the complementary bombing by the RAF of synthetic production plants, armament factories and communications. As Mr R. W. B. Clarke wrote in his Oxford pamphlet† some time ago, the blockade does not crack the German economy but it makes it "brittle." This is still true to-day.

* German rations for adults (per week): Bread, 5 lbs.; meat, 2½ lbs.; sugar, 8 ozs.; fats, 9½ ozs.; coffee substitute, 3½ ozs.; cheese, 2 ozs. Milk, honey, cocoa and eggs are also rationed and there is a general ration of 5½ ozs. to cover various forms of *Nährmittel* (semolina, rice, etc.). These quantities, of course, are inclusive totals; they cannot generally be compared with British figures, which exclude food eaten in restaurants, etc.

† *The Blockade*, by R. W. B. Clarke. Clarendon Press, 3d.

It follows that there can be no question of abandoning the blockade because it is "no longer efficient," or because it makes "too great a strain upon Britain's naval resources." It will not bring victory of itself, but victory will be impossible without it and it can be surmised that at the conclusion of the secret debate on May 15th, the Minister of Economic Warfare was urged to intensify to the utmost extent Britain's pressure upon German Europe.

There are still two principal leakages, through Marseilles and through Vladivostok. The problem of Great Britain's policy *vis à vis* Vichy-France, so urgent a few weeks ago, is likely to settle itself now that the Darlan regime has committed itself to a flagrant policy of economic collaboration with the Germans. Nor does it seem that the fear expressed at the time of Admiral Darlan's threat of convoys—that under pressure from the United States the British Government would weakly accept a modification of the blockade—has been justified. Such leakages as have continued of goods from North Africa, and, more treacherously, of oil and supplies from Tunisia to the Axis forces in Libya—have probably been due not to weakness in policy on the part of the British Government but to the physical inability of the Navy to be everywhere all the time. This difficulty will, for the time being, continue.

The leakage through Vladivostok is not susceptible to direct British action. The goods which have reached the port for transport across Russia were largely of Japanese, United States and South American origin, and the only completely effective blockade would be one that

stopped these supplies at their source. The Japanese exports depend to some extent upon the volume of supplies coming to Japan from the American Continent, and one of the most encouraging aspects of the blockade is that the United States Government has progressively—by means of its system of export licences—reduced the volume of war materials leaving the country. The flow is probably unimportant by now. The problem of South America remains, but the leadership and influence of the United States are likely to be effective in reducing the despatch of hides, grain, copper, tin, platinum and other supplies across the Pacific. There remains, too, a possibility of action in withholding the bunkering facilities of the Pacific (largely under British and American control) to all ships outside the new United States pool of merchantmen.

Like so many other problems of the war, the question of the blockade has moved from the purely British sphere to that of Anglo-American collaboration. The immediate naval blockade depends upon the available resources of the Navy. American co-operation would reinforce Britain's naval strength sufficiently to transform the situation at Gibraltar and in the Mediterranean. The most effective long-term blockade is a blockade imposed at the source, and the American Continent is the major source of all extra-European supplies. If America and Britain agree, economic warfare will be effective. One of the most encouraging features of recent weeks is the evidence that Washington, after months of some uncertainty, has made up its mind to assist Britain in carrying through the policy of blockade.

NOTES OF THE WEEK

Offensive Against Crete

Early on May 20th the Germans launched an airborne attack upon Crete, seat of the free Greek Government. For some days before, concentrations of aircraft in Southern Greece and the Greek islands had been observed. About 3,000 parachute troops appear to have been dropped on the first day and most of them were successfully mopped up. What has happened thereafter is, at the moment of writing, not clear. The task of the parachute troops was presumably to capture one or more airfields, so that the somewhat cumbersome troop-carrying planes could make a relatively secure landing with reinforcements. The RAF is handicapped in Crete by the lack of fighter aerodromes and it may be that a certain number of airborne troops have been landed. Fierce fighting is going on. It is tempting to wonder whether the attack on Crete by airborne troops is a small-scale rehearsal for a larger invasion in other seas. The situation is not a real parallel. Neither side can muster the force that would be available on both sides of the English Channel, and the defences of Crete are very rudimentary compared with those of England. Nevertheless, there is this element in common—that the Germans must rely almost entirely upon landings and reinforcements from the air and can make little use of the sea. If the attack on Crete is held, the likelihood of an invasion of England may well become distinctly less. However, this preliminary attack is not necessarily the main thrust at Suez. In a real offensive the Germans would surely wish to stage a joint attack from Iraq, Libya and Crete, and while they are held at Sollum, the Rashid Ali revolt is far from having reached a stage at which Iraq could be used as a German base for a land offensive. The attack on Crete may therefore be a feint or an attempt to gauge the strength of the defences. An interesting indication of what Britain may expect in the event of invasion is the report that the German troops landed in New Zealand battledress. If this report is true, they should, according to the laws of war, be shot as spies.

Iraq: The Fighting Spreads

On May 15th, after a week during which reports—one may trust that they were not officially inspired—were circulated to the effect that the situation in Iraq was "stabilised," the British GHQ Cairo announced that in

reply to Rashid Ali's appeal to the Axis Powers, a certain number of German aircraft had been flown to Iraq, using Syrian aerodromes as refuelling stations *en route*. The news can hardly be said to have come as a surprise, since the whole trend of Vichy policy in recent months has been towards making any concessions the Germans might care to demand and the *dénouement* of a Syria used as a German air base for attacks on the Allies was already inherent in the situation last July when the French Army in Syria decided to remain under the orders of Vichy. Since that time the morale of both the French and the Syrians has steadily declined. A section of the Syrian population has become a prey to Nazi agitators urging Syrian "independence" against the imperialist tyranny of France and Britain, while the French military authorities, though crushing the frequent movements of De Gaulle's in the colony, have sunk to a level of anti-British malice that even Vichy has been obliged to denounce. General Dentz, explaining away the presence of German aircraft with consummate hypocrisy by describing them as aircraft in distress which had been sent out of the country with all speed in order to preserve Syria's neutrality, has threatened reprisals for Britain's "unprovoked aggression" in bombing German aircraft lying on Syrian bases. Vichy has modified his threat and declared that the bombing was not an act of aggression. General Dentz's ignominy is not, however, confined to words. There is evidence that French munitions and aircraft have been despatched to Rashid Ali. To all this connivance and treachery, there is only one answer, vigorous action. German aircraft have not yet arrived in sufficient quantities to turn the scales in Iraq, although they are already raiding British positions. Nor are all the French of the same kidney as General Dentz. Weakness or hesitation on Britain's part at this juncture will ensure that both Iraq and Syria slip into German control. It is therefore a welcome sign of decision that offending Syrian aerodromes are being heavily bombed. It is the only language that makes sense.

The War Cabinet

Last week in the Commons Mr Churchill turned down a suggestion by Mr Mander that the War Cabinet should be reconstituted to include "representa-

tives" of all three major political parties. It is, of course, unquestionable that the Liberal leader, Sir Archibald Sinclair, who was in the questioner's mind, would be an acquisition in the inner circle; but there can still be no doubt that the Prime Minister's refusal of the general proposition was wise. Ideally, a War Cabinet would be representative, not of the party hierarchies, but of the nation's will and skill; and it is already a weakness that the present body retains traces in its membership of the party bargain which ushered it into the world. The most powerful plea in the argument of the critics who are calling for a New Model Cabinet, freed from departmental connections and drawn from the talent of the entire British Commonwealth, is the claim that, if the widest possible field of choice is drawn upon for statesmen, the nation's leadership will be correspondingly uplifted; and any attempt to represent parties or even States or national groups, regardless of statesmanship, is bound to be weakening. Mr Churchill is undoubtedly right when he claims that the co-operation of all parties has been helpful in finding Ministers; and it is common-sense for the Government to consult closely with the party leaders. But the function of an executive body is to be efficient rather than representative. In one other detail, however, the Prime Minister's reply was somewhat strange. The inclusion of all the three Service Ministers in the Cabinet, he said, would be in contradiction of the principle of a small body of non-departmental Ministers—a principle which, as it happens, Mr Churchill, in both speech and practice, has repudiated several times. Actually, the present War Cabinet, with Lord Beaverbrook, Sir John Anderson and Mr Attlee without departments, as well as Mr Churchill himself, and Lord Halifax in America, is nearer to the Cabinet that the critics want than the Prime Minister's utterances suggest. The trouble is that Mr Churchill is short of men, and he does his best, at the departments and in the Cabinet, with what he has. It is only a pity that he can entertain no proposals to broaden his choice.

The Proof of the Pudding

Discussions about war production are still too much concerned with administrative machinery, and there is some danger that this week's secret debate in the Commons on war supplies may have found many of the critics barking up trees which are already dead wood. In the Production Executive of the War Cabinet, in which the new Minister of Aircraft Production has replaced his predecessor, there now exists a Ministerial body which is capable of marrying the supply departments' requirements with the nation's known resources in the sort of output programme which strategic needs require. Lord Beaverbrook, as the Prime Minister's deputy in the supply sub-committee of the Defence Committee of the Cabinet, should be in a position to insist that a satisfactory programme is made and obeyed and that the needs of strategy, in the industrial field, are steadily satisfied. There is not universal agreement that Lord Beaverbrook is quite the best choice for this mission; but if the arrangement is taken as it stands, the only doubtful point about it is whether the Minister of State, if, in fact, he is to preside in this way over production and priorities, should not also preside over the Production Council in place of a Minister with departmental ties. If there is still a short-fall in production—and there is an appreciable amount of evidence, including the present reluctance or inability to take on fresh labour in bulk, to suggest that this so—it is not for lack of suitable executive machinery. The trouble is not that production is not well enough "organised," but rather that it is not well enough carried out. There is a gap somewhere in the translation of requirements and programmes into the finished goods of war; and the fault here is probably not so much one of direction as one of control.

There is still not sufficient assurance that the war goods planned will be delivered. In some directions, there is probably too much control. Manufacturers, it is said, are seriously hampered by the need to refer constantly to civil servants in London; they cannot get on with their job. In other directions, almost certainly, there is too little control. The Government has powers to enforce decisions on firms and individuals and to impress labour and other resources; and it is too frequently unwilling to use these powers to

remove obstacles or widen bottlenecks. It is often charged by industrialists and engineers that the civil servants have not yet learned how to check the actual progress of output in the factories, in order to keep it at speed and in balance; they speak of an over-reliance on paper forms and an inability to maintain an informed running control over what is actually going on without holding output up. The charges may well be overstated, but these are the niggers in the woodpile—rather than the more empyrean considerations of Cabinet organisation. In fact, these shortcomings seem to be chronic in war government: the failure to provide authoritative ways of getting things done; and the absence of that sense of urgency which makes it plain that, unless they are done, disaster may befall.

No Room

Of the women who have registered for war work—429,820 born in 1920 and a preliminary total, excluding late registrations, of 281,961 born in 1921—about 125,000, or approximately one in six, are to be interviewed for recruitment. While the proportion is perhaps not so small as was at one time feared, the total is very far from large when it is compared with the needs of the war industries and the services for women recruits. It may, of course, be argued that this is the crop of only two age groups, but there is no indication that any further registrations are planned for an early date; and, meanwhile, the real damage has been done. It has been laid down, almost as a rule, that women in full-time paid employment of any kind will not be expected to move into war work. From this, and from the application of the same principle to the men over military age who have registered, it is clear that the intention is to staff the expanding war effort with the unemployed and unoccupied. No transfer of personnel from civilian to war work, it seems, is to be attempted, except in so far as the deliberate curtailment of civilian industries, which only affects a limited section of non-essential employment, releases labour. It is, of course, sound policy to find recruits by setting them free in this way, and this was one of the earliest suggestions made by *The Economist* for the mobilisation of labour. But "telescoping" cannot be sufficiently general, comprehensive and quick-acting to produce all the workers that ought to be wanted. In this week's secret debate in the Commons on war production the Government no doubt quoted figures of its achievements and compared them with the past. Those critics who are troubled about the rate of output and the tempo of planning could not have done better than to cite the considerable evidence which now exists that fresh workers are not wanted in any great numbers for the near future. At any rate, the impetus to volunteer is being given a sharp setback by the impression that men and women in work are not wanted. There is still no room for them.

The Fighting in Egypt

The week's fighting on the Egyptian frontier has been on the whole very favourable. The garrison at Tobruk has been reinforced and the outer defences have been further consolidated. At Sollum, a sudden drive by British mechanised forces led to the capture of Sollum and the difficult Halfaya pass. The attack was pressed home as far as Fort Capuzzo, but here the Germans counter-attacked and the British units were compelled to withdraw. Sollum is still in British hands, and some 500 German prisoners have been taken at a cost of only 100 British captives. A slight advantage remains with Germany's forces, and the whole manoeuvre is obviously more satisfactory when it is taken in conjunction with Germany's past boasts and present policy. The drive for Suez may well have begun with the attack on Crete, and it would obviously have been strategically more satisfactory to the Germans if they had already advanced, say, to the railhead at Mersa Matruh. As it is, their advance forces have received a definite check, and, while Tobruk holds out, the menace to their lines of communication continues. Air activity has, as usual, been largely confined to British attacks upon Libyan aerodromes and harbours and upon transport and supplies. More material is obviously being brought up under difficulty, and plans for a new offensive are no doubt dependent upon the news from Crete. Nevertheless, the recapture of Sollum is reassuring evidence of

the quality of Britain's frontier force. It can only be hoped that the flight of the Egyptian General Aziz Ali el Masri in an attempt to reach a country under Axis control—Beirut is believed to have been his destination—is not a sign of widespread Fifth Column difficulties in the rear. After a forced landing, the General is still at large. It will be interesting to discover on his recapture what type of documents he considered to be most useful to the Germans.

Waiting for the President

There is an air of great expectancy in the United States as the broadcast speech that the President is to make this Saturday is awaited. Mr Roosevelt himself has built up the tension. He has encouraged the members of his Cabinet to make speeches which, if they were repeated with his authority, would carry the official policy of the United States Government far further than it has yet gone. He has let it be known that something is brewing, without saying what—except for the significant frequency of his references to the Freedom of the Seas, the traditional American policy from which the Neutrality Act so ostentatiously departed. He has waited until there are almost frantic accusations against him of delay and indecision and dilatoriness. There is every reason to believe that he will now once more reassert his leadership, which has taken the American people a very long way since last November, without ever once seeming to push them. A few weeks ago the debate ranged over somewhat narrowly naval policies: to convoy or not. But latterly (and this is perhaps the President's intention in waiting) the range of ideas has broadened out, and Vichy's new subservience to the Nazis has, more than any other factor, brought discussion back to the grand strategic plane. The next step in American policy now seems likely to be something far wider than the change of patrols to convoys. Psychological preparation for such a move, as well as the physical necessities of an ever more dangerous world, lies behind the announcement of the creation of a new Office of Civilian Defence, to be in charge of Mr La Guardia, the Mayor of New York, who is also Chairman of the United States-Canadian Joint Defence Board and (like many of Mr Roosevelt's emergency appointments) a titular Republican. The lengths to which it will be found necessary, in a country like the United States, to carry ARP measures will have to be found by experiment, and the announcement that the new organisation is to be run on lines similar to those built up in this country under the Ministry of Home Security is more of a compliment than an exact description. But nothing is more likely to "bring the war home" to the American people, both literally and metaphorically, than talk of shelters, gas masks and fire fighting.

* * *

Organisation of the Ministry of Food

An interesting reorganisation of his Ministry has been announced by Lord Woolton this week. It may be recalled that the Ministry of Food, like the other great trading department, the Raw Materials Department of the Ministry of Supply, was organised at the onset of the war on the principle of recruiting controllers for the various commodities from the trades concerned. The chief reason for so doing was, of course, to take advantage of the detailed knowledge and experience of the men selected. But the defects of such a system are no less apparent and have been frequently emphasised and re-emphasised in these columns. Indeed, it was obviously impossible to leave these Controllers—who could be described as ex-partial rather than impartial—without any oversight. In the Ministry of Supply there is a complete dual structure, with a section of the Ministry, staffed by temporary and permanent civil servants, corresponding to each semi-autonomous Control. In the Ministry of Food, the Controllers were from the start much more "in the Ministry," but there tended nevertheless to be the same duality of structure, with all its obvious disadvantages. Lord Woolton has now decided to abolish the distinction between trade staff and civil servants. Each commodity division is to have a single responsible director who, in most cases if not in all, is drawn from the trade. This meets one of the chief requirements of successful administration, that responsibility should be clearly defined and firmly planted on one pair of shoulders. Unfortunately, it slips even more deeply into the original mistake of allowing trades to conscript them-

selves, which, with all the knowledge and experience and goodwill in the world, can hardly be an efficient system. The proper plan is that followed in the last war, to concentrate responsibility and to recruit business men for business jobs—but from trades other than those they are to control. If Lord Woolton would take his new directors and shuffle them round, he would improve his organisation.

* * *

The New Fire Services

Six months too late, the Government has introduced a Bill centralising the regular and auxiliary fire services and then decentralising their administration on a regional basis. The matter is now so urgent that the Bill was passed through all its stages in both Houses of Parliament this week; it is simply an enabling measure, empowering the Home Secretary to make regulations for directing the fire services of the country, and detailed criticism must wait until the regulations have been made and—what is more important—acted upon. It was, therefore, quite unnecessary for Mr Morrison to put himself on the defensive from the beginning of his speech and give an elaborate explanation of why the previous system was maintained. Nor was it necessary for him to praise the members of the fire services. Everyone has recognised the difficulties with which they have been faced and appreciated the courage against them but against the organisation within which they have been working, against a system that could call upon the fire brigades of towns hundreds of miles away to fight in another town, but which could not call upon the local brigades of neighbouring boroughs because these authorities would have to pay their firemen, enrolled for part-time duties, the full-time wage. The regulations under the new Act will provide that the local authorities will henceforward pay 75 per cent of the peacetime cost of the fire brigade services. The remaining 25 per cent, about £750,000, and the total cost of the AFS, which amounts to about £1,250,000 and is at present shared between central and local authorities, will be borne by the State. Moreover, the present number of separate fire brigades—about 1,400—will be reduced by grouping them into 40-50 large fire brigades, each under the direct control of an area or sub-regional officer, who will act on the authority of the Regional Commissioner and will be able to call for assistance upon the mobile regional reserves. Taken in conjunction with the new National Service Act, by which men can be conscribed for ARP duties in any part of the country, the new measure shows that bit by bit something like a national system of civil defence is being evolved.

* * *

Amba Alagi

The surrender of the Duke of Aosta at Amba Alagi marks the end of organised resistance in Abyssinia. To the south, the history of the Italian occupation repeats itself, for guerilla bands are carrying on intermittent warfare as did the Abyssinians after the Italian occupation. Heavy rain is holding up British mopping-up operations, but with the surrender of the main army these isolated groups are of no military significance. The main Imperial forces in Abyssinia can now presumably be transferred to the Libyan or Iraqi fronts, where they are urgently needed, and it is perhaps fitting to pay a tribute to the Duke of Aosta for the bravery and determination with which, given every excuse for demoralisation and surrender, he rallied his troops to forty days' resistance after the surrender of Addis Ababa and thus prevented the despatch of British reinforcements to the north. In the otherwise unbroken record of military incapacity shown by Italy's military leaders in the field, the conduct of the Duke of Aosta is a notable exception, and it suggests that whatever is of permanent value in the political and military organisation of Italy comes not from upstart movements such as Fascism, but from older traditions of responsibility and loyalty connected with the monarchy—traditions which the present monarch has weakly and lamentably betrayed.

Balkan "New Order,"

The "new order" in the Balkans is beginning to take shape. In Roumania, Bulgaria and Greece, quisling governments co-operate with the Germans in using their territory as a military base, with this difference, that Bulgaria, having

chosen the path of dishonour, has received its reward in the shape of Macedonia and Thrace, ceded at the expense of the defeated Serbs and Greeks. Serbia will no doubt be constituted as a German "protectorate" as soon as "order" is restored, but it appears that fighting still continues in the mountains and an ugly reign of terror is being visited on the unhappy people by the Gestapo. There has been talk of an independent Montenegro, presumably under Italian control (the Queen of Italy is a Montenegrin princess), and in the north Slovenia has been ceded to Italy and Croatia has become an autonomous kingdom under Victor Emmanuel's nephew, the Duke of Spoleto. In this way, the problem of Italy's claim on Dalmatia is solved. Croatia keeps Dalmatia and Italy takes Croatia. The general line of division is clear. Germany will control all the important lines of communication and all the valuable supplies of mineral wealth. In addition, the Nazis have access to the Black Sea and to the Mediterranean and they control the Aegean, into which Italy once so hopefully thrust the outpost of the Dodecanese. With the German flag flying over Athens and German air bases established in Sicily and Libya, the hopes of Mare Nostrum must shrink again to the compass of the Adriatic. Here at least the coasts are under Italian control and some of the richest agricultural land in the Balkans added to the Italian economy. But is even the Duce's hold on the Adriatic anything but the shadow of the substantial authority exercised by Germany? The Nazis will demand some return for their "generosity" in ceding Slovenia with its German minorities and Croatia with its historical link with the Habsburg Empire—from which Hitler has claimed inheritance. The only conceivable return is Trieste, once a German port, now, no doubt, to be one again. There are already reports of Germany's intention to transform it into a "free port." The Triestini will know exactly what that means.
