LORD BEAVERBROOK is Mr Churchill's super-charger. A year ago he was made Minister of Aircraft Production to "boost" the output of aeroplanes. Now he has been appointed Minister of Supply to do the same for tanks and guns. Sir Andrew Duncan has gone back to the Board of Trade; and Mr Oliver Lyttelton has been chosen with the rank of Minister of State to represent the War Cabinet in the Middle Eastern Command. Mr Lyttelton's appointment is an imaginative stroke. It recognises the importance of Cairo, Jerusalem, Damascus, Baghdad, and Ankara in the conduct of the war. It gives the responsibility of the British Government a personal seal, and a local habitation; and it offers the confident and able Minister of State a task in organising supplies, administration and propaganda in North Africa and the Levant which about vies in importance with the mission of his colleague, Lord Halifax, in Washington. General Haining, with the Cromwellian title of Intendant General, will serve with him as chief Quartermaster; and it is reported that Mr Lyttelton will preside over joint meetings of the Commanders of the various Services.

General Wavell will not be in Cairo to work with Mr Lyttelton. The most successful British general of the war—"the star that rose over the eastern horizon" (as Mr Churchill once put it)—has been sent to India—some say because he is tired after his five-point campaigns, others that he is needed to organise India's defences against Hitler. No layman knows; but the shock caused to public opinion by this change at this crucial hour must be recorded. If General Wavell is not diminished in stature, his transfer to India and the seconding of Mr Lyttelton to the Middle East would appear to be contradictory—though, in fact, they may well be complementary. Mr Menzies has said

that a "fresh mind" was needed in the Middle East; but the replacement of General Wavell at a node of the present conflict, where a German army stands in wait, will remain surprising whatever the reason may be.

It is hardly less surprising, at home, that one of the few marked successes among wartime Ministers should have been moved elsewhere at a critical moment in the development of his department's policy. Mr Lyttelton has brought the concentration of industry to the present stage where the progress that can be achieved by voluntary schemes has almost reached its limit. Now, when questions about the scope and character of compulsion are bound to come up very soon, he has been called away.

In some respects, Lord Beaverbrook's appointment is the most puzzling of all. It is certainly the most significant; and it is unquestionable that, if tanks are urgently needed, the new Minister will produce them, come what may. But it was only in May that Lord Beaverbrook was made Minister of State and the Prime Minister's formal deputy in matters of supply and priority. The move was widely welcomed. At last, it seemed, Mr Churchill had beside him a man of his own calibre of forcefulness, with all the virtues of his vices, a man who, with technical aid, might stand in a position to control the progress and balance of war production and give the force of fact to the plans and schedules of the Cabinet Defence Committee and the Production Executive of Ministers. But this, it seems now, was never the intention. To be Minister of State was a breathing space; and it was apparently to propaganda and not to production that Lord Beaverbrook turned his free hand before being brought back again to the hurly-burly.

It is widely supposed that Lord Beaverbrook has never wished to become an Economic Controller.

Now, his short-lived power to decide disputed priorities has reverted to Mr Churchill's Ministry of Defence and to the Production Executive—although it has not yet been stated whether his deputy chairmanship of the Defence Committee in matters of supply has also become a dead letter. Lord Beaverbrook is the first Minister of Supply to be in the War Cabinet; but it is still hard to avoid the view that a chance has been lost to give production the determined, personal direction that, in the nature of his many duties, Mr Churchill cannot give it. Lord Beaverbrook has presumably been sent to the Ministry of Supply because there is a danger that the output of tanks may be insufficient. There are, of course, many other possible interpretations of this move. It was not until the Germans invaded Russia that Lord Beaverbrook was made Minister of Supply. Mr Churchill has said that the threat of an attempted invasion of these islands has been heightened. The loss of Crete showed, by their absence, the worth of tanks in defence. Nor, even, are the possibilities entirely defensive. The German drive to the east may give chances for counter-offensive strokes in other fields.

Even so, the implication of the appointment is still that the rate of output of tanks is too low. The need to write up production programmes and factory performances with great suddenness after the fall of France last year arose from the total unexpectedness of that fall, as well as from the half measures of the administration which Mr Churchill's National Government replaced. But the German attack on Russia was not unexpected; at least, it came as no surprise to Mr Churchill himself. The defeats in Greece and Crete were surely discounted somewhat beforehand. It cannot very well be pleaded in 1941, as it was in 1940, that the output programme has been thrown out of step by unexpected developments in the field. It almost appears that progress by "fits and starts" is regarded, not simply as an emergency method due to uncontrollable circumstances, but as a normal principle of production policy. In this conception, Lord Beaverbrook becomes whipper-in, chivvying the laggard departments one by one as they fall behind; or, to change the metaphor, he is the stout-hearted stroke who is called upon to "give her ten" at intervals all over the course whenever his boat begins to falter in the rear.

Lord Beaverbrook brings to tanks all the showmanship and enthusiasm that raised aircraft output so strikingly in the critical weeks of last summer. Already, Tank Funds with their quite misleading implication that subscriptions will conjure up additional materials, plant and labour for tank-making are doing for Lord Kindersley and Sir Kingsley Wood the same excellent work that has been done by the Spitfire Funds. It is not Lord Beaverbrook's ability to raise tank output in the short run that is in question, but rather the chronic propensity of war production to fall into arrears which makes these spectacular interventions necessary. What has come to be regarded as the Beaverbrook method is not a plan. Wars are not won by short sprints. They are won by setting a steady, even pace over the entire course. "More haste, less speed," applies in production as it does elsewhere; and it is speed, not haste, that is wanted. For a time after Dunkirk, even the attempt to maintain a balance in war output was abandoned; the men and the machines already at work on aircraft were worked to breaking point; and against the considerable and vital immediate advantages that were gained must be set the legacy of disorder that was left. In this very real sense, it can be said, with some plausibility that the price which has had to be paid for Lord Beaverbrook's first intervention—which in the circumstances probably saved the country—is the need for another intervention by him now.

In Mr Churchill's thirteen months of office, there have been immense strides forward in the economic war effort. There have been important changes in Ministerial personnel, and in the organisation and working of the Cabinet and its committees. There have been the innovations of the limitation of supplies, the concentration of industry, and intelligent rationing. In the secrets of the

Government, there may exist a production plan which relates strategy to resources and resources to strategy at every point. If there is, then the gap which menaces the structure of the war effort is the absence of a method of execution and control to ensure that the plan is proceeding to time and in balance. To the outside eye, the old policy of dealing with bottlenecks as they arise still lingers. The fantastic shortage of coal in a maritime country which in peace time produced coal for itself and for the western fringe of Europe is only the *reductio ad absurdum* of a wider policy which has lacked cohesion and foresight. It ranks with the remarkable situation in building last autumn when the plans of public departments were nearly twice the building trade's capacity—which had never been measured. In agriculture, as well as in coal-mining and construction, the greatest lack is of labour; and it is still regarded as needless to mobilise or to train for war work the main body of men and women whose present employment could be spared in the nation's peril. "Sufficient unto the day" is still heard. It remains a political axiom that, except for occupations where death in battle is the wage, the use of compulsory powers which Ministers have been given over persons and property would be dishonourable and damaging. It is still the essence of British freedom to rely, even in the eleventh hour, on appeals and exhortations in place of the marching orders that a puzzled people look for.

Experience teaches. Piece by piece, a war economy is being hammered out. But the experience has been one of costly deficiencies and cruel setbacks. The failure of Allied and friendly countries last year cannot be laid at Britain's door, and there was leeway to make up then which left small room for broad and long-sighted planning. Even now, there are curbs on the nation's effort that cannot be struck off by argument; manpower is scarce; the supply of seaborne materials is limited. It may even be that the vital thrusts of production cannot go forward abreast—aircraft, tanks and guns—because resources and ships are restricted. But these are not arguments for plans that are piecemeal and partial. Nor are they arguments for delays until the hour for frenzied activity strikes in face of a rising danger—or for an organisation of economic life which, after twenty-three months of war, still leaves a large part of the nation's strength and willingness unused.

Lay planners and amateur strategists are rightly regarded as pests and nuisances. What they do not know they take for granted. Yet, it is perhaps not presumptuous for watchful and anxious freemen to judge their rulers by the results they see. It is perhaps not unnatural for them to wonder whether the economic direction of the war is still not too scattered, too amorphous and too personal; or to ask whether the outlines of an economic master-plan have yet taken shape on the Prime Minister's table—as plain as the battle schemes that fill his brave vision, and distinct from the competing memoranda that flow from a tribe of experts and a score of departmental heads. There must be regret that the chance of setting a single sovereign over the execution and control of such a plan has been surrendered. There must be concern when, at a week-end of deepening emergency, two commanders, one on the home front and the other in the field, are moved to fresh pastures.

This is not the first time that key pieces have been shuffled at a crisis in the struggle. It may be necessary. It may yield benefits; and not a single one of the new appointments, in itself, merits less than a welcome. But the doubt must linger whether "all change" and "at the double," sounded at irregular intervals, are the proper slogans for conducting total war. The kangaroo symbolises the skill and courage of Anzac soldiers. It might also be used as a symbol for the syncopated progress of the economic war effort which seems inevitably to go forward by occasional great leaps and bounds instead of moving steadily onward. The might that has been forged since Dunkirk, in the air, at sea and on land, will not be underestimated, either by critics or by the enemy. But the target is the full capacity of this nation and its friends, and the mark is not yet in sight.

Neutral and Dependent

IN this twenty-third month of war, Sweden still enjoys the immunity which was the declared policy of all the smaller Powers of Europe on the outbreak of war. All four Scandinavian countries declared their absolute neutrality on September 1st, 1939. Now, three have been swept into the vortex of war, Norway and Denmark occupied, Finland first attacked by Russia and later serving as a base for the German attack upon Russia. Yet, in the surrounding turmoil, the Swedes go about their business and they might almost be living in another planet.

There has been no obvious interference with their way of life. The best measuring rod of the freedom of a community is its Press; and here, within the geographical frontiers of German Europe, such newspapers as the *Handelstidningen*, the *Dagens Nyheter* and *Nordens Frihet* continue to report the war objectively or even, as is the case with the *Handelstidningen* with a strong pro-British bias. Representations have been made to the Swedish Government by Germany to ensure the exclusion of all but German news; but these efforts have only led to loud protests in the Swedish Press and a more trenchant expression of Anglophilism.

Nor has there been any interference with the processes of democratic government. The four-year term of the Riksdag was reached in September, 1940, and the Prime Minister, Hr Hanson, was strongly advised to avoid the uncertainties of a possible change of government in such a time of crisis. His answer—to hold the elections in the accustomed manner—proved to be not only a vindication of the country's internal independence but also a sound stroke of party politics. The Social Democrats increased their votes by 200,000 and their seats by 19, and the election amply proved the strong measure of popular support for the Government's policy of cautious neutrality.

Sweden owes this fortunate immunity in the first place to geography. Lying beyond the Baltic, the country is out of the main arena of the European conflict. Not that this trans-Baltic position would have been enough in itself to protect the Swedes, but the Norwegians to the west and the Finns to the east have proved to be a remarkable protective glacis. Sweden was not a convenient base for any attack, whereas Finland was from the first a potential, and later an actual, stepping stone for a German attack on Russia, while Norway was an invaluable base, not only for a possible invasion of Britain, but also for the submarines and aircraft engaged in the Atlantic.

Geography alone, however, would not have kept Sweden immune. It has been reinforced by political and military factors, of which the most important was the uneasy balance of power between Germany and Russia. So long as neither aggressor wished to provoke the other, Sweden remained a species of no-man's land in which neither side was inclined to interfere for fear of inciting the other to intervention in reply. Another factor was the actual course of the two wars—in Finland and Norway. Both Finnish and Norwegian resistance collapsed before the question really arose of using Sweden as a base. Had the Finns called in the Western Powers and continued fighting, France and Britain might have attempted to force Sweden to grant them passage, and the Germans would then undoubtedly have stepped in. Had Norwegian and Allied resistance developed on a really formidable scale round Trondheim and Narvik, the Nazis would have used Southern Sweden and the port and railway of Lulea. At the height of the fighting in Norway, it seemed certain that a German invasion of Sweden was imminent—just as, during the Battle of France, so long as French resistance was maintained in the east, it seemed that the Germans would invade Switzerland.

Finally, the policy of the Swedish Government, and the attitude of the Swedish people, have contributed more

than a little to the preservation of neutrality. Had there arisen within political circles in Sweden a determined race of quislings, the Germans might have profited by it to bring in a puppet government; but the Swedes have remained entirely united behind a policy of "neutrality and independence." The impressive ceremony of May Day, 1940, when all the political parties of the entire nation joined in a solemn affirmation of Sweden's freedom was a symbol of the unity which exists. Again, if the Swedes had been as undefended as the Danes, it is possible that the German invasion of Norway would have swept over them as it did over Denmark. But the Swedes had not left it in doubt that they would fight if they were invaded. They have increased their expenditure on national defence, arrested spies, organised civilian defence and mobilised in each great crisis. So far the adding of Sweden to the list of belligerents has been at no time a necessity for the Germans, but the country's preparedness may have spared it a casual invasion.

The Government's policy does not only owe its success to stubbornness and resolution. Sweden's neutrality has also been bought—at a price, and a price which her neighbours have had in part to pay. The Swedish Government's refusal to allow the transit of troops to Finland in the winter of 1939-1940 kept the Swedes clear of the struggle, but the Finns lost Viipuri and had to abandon their frontiers. The fact that Sweden made no attempt to assist Norway in April, 1940, purchased her immunity, but once Norwegian resistance had collapsed, the Germans were in control of the whole long undefended land frontier of Sweden, and in a position to back any demands by the threat of immediately effective military action. It is no coincidence that, within a few weeks of the occupation of Norway, Sweden committed the first breach of neutrality by permitting unarmed German soldiers and German material of all sorts to pass to Norway over the railways of southern Sweden. Almost exactly a year later, at the beginning of the onslaught on Russia, a further and graver breach was committed, when Sweden permitted Germany to send fully equipped divisions from Norway to Finland across Swedish territory. It is in one sense true that Sweden has kept her neutrality at the cost of abandoning it.

Less sensational, perhaps, but more far-reaching, are the concessions the Swedes have been obliged to make in the economic sphere. The Germans have not directly intervened in Sweden's economy. They have merely secured complete indirect control of it by way of Sweden's export trade. In 1938, Great Britain supplied 12.2 per cent of Sweden's imports and took 23.2 per cent of Sweden's exports. To-day, it is estimated that Germany's share in Sweden's total foreign trade is 75 per cent, while the other 25 per cent is accounted for by the share of German-occupied Europe and of Russia. More important than the actual volume of trade are the categories which go to make it up. Sweden used to rely very largely upon Britain for the coal and coke essential to her iron and steel industry. Now this industry must turn to the Germans, who guaranteed to send the equivalent of two-thirds of Sweden's pre-war coal supplies. Actually in 1940 only 80 per cent of these were delivered. Since there is no alternative source of supply, the Germans could put a stop to Sweden's entire industrial development, and, although there is no evidence that the Nazis have any such intention, the lever is there, and it could be used if the Swedes were to seek to oppose the far-reaching modifications in their economy which enforced membership of the German *Lebensraum* entails.

The great Swedish market for timber and cellulose and paper in Britain is closed. At the same time, the old imports of cotton and wool from Britain and the Empire

are cut off. Consequently, with German patents and German technical advice, the Swedes are turning their timber into textile fibres; output is to be trebled, and the Swedes hope to replace about 50 per cent of their former textile imports. These excursions into *ersatz* increase Sweden's dependence upon coal and coke and hence upon Germany. It is not certain whether the Germans are using this dependence to force the Swedes into large-scale armament manufacturing for the *Reichswehr*. It is significant that, while industrial activity has declined by 9.7 per cent in Sweden as a whole, the index of the engineering industry has risen. This rise can be explained by Sweden's own expanded defence programme; Finland has been buying armaments; and Russia, too, has been making big orders for machine tools and railway material. Nevertheless, there is something very reminiscent of the processes at work in France and the Low Countries in reports that the Swedish aircraft factories are to increase their capacity by 50 per cent and that capital expansion is to occur in the tank and shipbuilding industries. In short, Sweden, neutral, independent and intact, is nevertheless steadily and inevitably taking on the economic shape of German Europe—industrial expansion in armaments and various substitutes, declining export trade and reliance upon Germany for all vital raw materials. With these symptoms go the accompanying phenomena of a rise in the cost of living, a fall in the real value of wages, rigid control and requisitioning of coal stocks and of ferro-alloys, control of

exports, food rationing and the rest. And behind this economic façade lies the inescapable fact of Sweden's total dependence upon the Third Reich.

The Swedes themselves are conscious of this limiting factor upon their freedom. The various permissions given for the passage of German troops called forth serious warnings from the Press that this so-called neutrality might force Sweden into the war on Germany's side. The steady fire of criticism levelled at the principles and practices of the *Lebensraum* is evidence that the Swedes accept it only under duress. They are not in two minds about their fate, should a German victory be the outcome of the struggle, and they know their independence depends ultimately upon Britain's resistance and the destruction of German hegemony. It follows that they accept their present policy of modified neutrality with distrust and misgiving, even though they regard it as inevitable at this stage in the war.

Nevertheless, Sweden's present dependence is the result of self imposed isolation in the past—when Poland was overrun, when Finland was attacked, when Norway fell. The Swedes stand alone to-day because they let others stand alone yesterday; and now they find themselves in the humiliating position of looking for their deliverance to a victory which, in assisting the Nazis, they are themselves helping actively to frustrate. There can be no neutrality to-day in Hitler's world. There was none for Hungary or Vichy France; there would be none for an isolationist America; there is none for Sweden.

Building in War

NO serious attempt was made during the first year of the war to adapt the building and allied industries to war conditions. With a few exceptions, such as steel and timber, the production and allocation of building materials remained uncontrolled. Builders and contractors continued to operate without an adequate measure of supervision. The industry's labour force was allowed to shrink without proper regard to future needs. Government Departments competed with each other and with private interests for the declining total of the industry's human and material resources. The turnover of labour was abnormally high; and resources were widely wasted. Then there came an awakening. The sudden increase in the demands upon the building industries last summer, arising from the necessity of speeding up production, of strengthening Great Britain's defences against invasion and of repairing the damage done by German bombers, revealed the danger of inadequate control and the urgent need for putting building on a war basis. Last October, the task of mobilising the industries concerned and of ensuring the employment of their resources to the best advantage was entrusted to a new Ministry of Works and Buildings, with Lord Reith as Minister.

The new Ministry had first to assume control or supervision over the industries manufacturing building materials, over the plant and machinery available for constructional purposes, over builders and contractors, and, jointly with the Ministry of Labour and National Service, over the labour force of the building and civil engineering industries. No time was lost in bringing the building materials industries not already within the scope of the Ministry of Supply under effective control. These materials were grouped into classes under directors. These directorates, while self-contained, are grouped under a Controller of Building Materials whose most urgent duty is to take all the steps necessary for the prevention of a shortage of materials in pressing contracts. The Ministry's general task is to ensure an adequate output of these materials within the limits of capacity; but it has also encouraged decentralisation of production as an insurance against the dislocation of supplies by air raids and transport difficulties.

Hitherto control has been voluntary. The prices of

certain materials, such as cement, cannot be raised without the consent of the Ministry; those of others, including bricks, are at present controlled through the Prices of Goods Act. It is the Ministry's policy to allow each of the industries a reasonable return, calculated, not on turnover, but on the working capital actually employed, and relaxed to normal output. Further, in order to prevent the fixing of prices by reference to the experience of the high-cost producers within each industry, the Ministry is understood to be working out schemes by which each firm whose earnings exceed a given figure would contribute to a pool, from which the earnings of the marginal producers could be supplemented. At the same time, the Ministry is trying, by advice and supervision, to keep down the costs of production of individual concerns. There is a department, working in collaboration with the Building Research Station of the Department of Scientific Research, to explore the possibilities of economy in materials by the modification and standardisation of designs and by the substitution of materials which are comparatively plentiful for those that are scarce.

The proper allocation of materials is an essential task which was neglected for over a year of war. In the case of steel and timber, controlled by the Ministry of Supply, it is now done by the Production and Materials Committee, which is a committee of the Production Executive of Ministers, over which the Minister of Labour and National Service presides. The Works and Buildings Committee, which is also a committee of the Production Executive, but works under the direction of the Ministry of Works and Buildings, obtains a global allowance which it allocates to the various Departments. In the case of non-ferrous metals, each of the Departments requiring them has to make direct application to the Non-Ferrous Metal Control of the Ministry of Supply. All other building materials are allocated by the Ministry of Works and Buildings. In the absence of agreement concerning allocation, the final decision rests with the Production Executive.

It is equally imperative that the plant and machinery required for constructional purposes should be used to the full and to the best advantage. Up to now, these aims have not been fully realised; there have been reports of scarce machinery standing idle for weeks in

contractors' sheds or on building sites; and the Ministry is now reported to be contemplating taking a census of available plant. It will be no less necessary to keep informed of its use, to supplement the information already secured from plant-hiring firms and from manufacturers and merchants supplying spare parts.

The supervision of a multitude of builders and contractors presents a host of difficulties. Steps have now been taken to secure their registration and to obtain regular returns of the nature of their work and of the plant and labour they employ. Small firms, unable to undertake any large contracts, are to be encouraged to form groups; and it is at these points that the Ministry is especially anxious to exercise closer control over costs of production. The ill-starred system by which profits are calculated as a percentage of costs—after completion of the contract—will be replaced, wherever possible, by the schedule contract, based on plans and specifications of the various types of work involved.

When the Ministry was formed, the labour situation in the building and civil engineering industries was chaotic. Not only were the industries losing labour to other trades and to the armed forces, but the ratio of unskilled operatives to skilled operatives was being dangerously upset by a too great withdrawal of the unskilled rank and file to the latter. Owing to this loss of balance between one category of workers and another, the efficiency of the labour force was seriously impaired. The inquirer into the building industry has always been struck by the absence of adequate statistics concerning the total size of the available labour force, its composition and its employment. Steps have now been taken to obtain this information and to keep it up to date at monthly intervals. The total number of building operatives was in the neighbourhood of 750,000 on May 1st, which compares presumably with 1,350,000 before the war. In order to prevent the further depletion of operatives and to reduce the wasteful turnover of labour, the Essential Work Order was applied to building and civil engineering on June 9th. By the Order, it will be possible to schedule, not only individual undertakings, but also individual building sites, and to protect their cadres of workers. In practice, all war work will probably be scheduled, but the maintenance staffs of private manufacturers and traders and the operatives of small builders—from which the Ministry hopes to recruit further operatives—are apparently to be left outside the scope of the Order. The Order makes provision for a guaranteed pay-week, for the introduction of payment by results, and is designed to reduce certain uneconomic practices, such as Sunday work at double pay, which have grown up during the period of *laissez-faire*. In order to reduce the waste of labour, an arrangement has been made with the Ministry of Labour and National Service for the setting up of a joint inspectorate of works in progress, for the consideration of such matters as supervision of the use of plant, as well as of labour problems. Again, the Ministry, in conjunction with the Ministry of Labour, has decided to set up regional clearing houses for labour; and in order to safeguard the labour force, employment exchanges have been instructed not to pass on building operatives to other industries.

Death on the Road

A STATE of war adds to the hazards of life in many ways. To a great extent this is inevitable. Enemy action must be responsible for an abnormal rise in the death rate. Indirectly, the heavy demand on the medical services and prolonged strain and overwork are bound to have some effect. It becomes the more important, therefore, to do everything possible to prevent an increase in those social ills which are more remotely due to war conditions, if at all. There is good reason to suppose that the recent rise in juvenile delinquency and the mounting total of road accidents can both be attributed in some measure to the war, but this kind of social loss is not

It was only after the assessment of the capacity of the building and allied trades that the new Ministry was in a position to tackle this second part of its task—the allocation of the available labour resources to the best advantage. The Ministry asked for a return of the programmes of the other Government Departments. It was found that the sum total of the programmes of the various Departments considerably exceeded the country's present capacity; and it became plain that co-ordination and drastic curtailment were imperative if complete dislocation was to be avoided. Negotiations were at once started between the Works and Buildings Committee of the Ministry and the other Departments; and the results were submitted to the Production Executive for approval. The programmes of individual Departments, expressed in financial terms, were translated into numbers of operatives; and each Department is now allotted a labour force, subject to alterations with changes in requirements, calculated on the basis of the total number of operatives actually available. (The reason for adopting labour rather than materials as a measuring rod is that the industry's capacity is likely to be much more restricted by the number of operatives than by the quantity of materials.) Of the labour force of about 750,000 men, about 400,000 seem to be engaged on the building programmes of the Government Departments; some 250,000 are with local authorities for the construction of shelters, for the repair of air-raid damage, and for the maintenance of buildings and highways; 80,000 are employed by public utilities and private interests. It will presumably be possible to transfer to urgent new works some in the last two categories. Some 20,000 are still unemployed.

The Ministry of Works and Buildings is not simply a co-ordinating department for the use of building resources. In addition to taking over the work of the Office of Works, it has been largely entrusted with the construction of all but the specialised buildings of other Departments. In fact, it is directly responsible for about one-sixth, by value, of the total official building programme. Individual Departments commonly have more experience in their specialised requirements, such as fortifications; but an increasing responsibility for the carrying out of a large part of all official building operations must inevitably fall on the Ministry. Control over the national building resources, together with a measure of co-ordination and supervision over the whole building programme generally, should secure the desired results. The Ministry has, too, set up an Emergency Works Department to deal with all construction and building requirements arising from air warfare. It aims at increasing the mobile corps of 5,000 operatives under its direction to some 100,000.

On the whole, the new Ministry has already done much to extricate the building and contracting industries from the morass in which they found themselves last summer. It has surveyed the country's building resources and has taken steps to prepare the fuller utilisation of its capacity. It has set out to evolve a national building programme, adjusted to the country's capacity. Something like a detailed and workmanlike plan has been produced; and it only remains to execute it.

beyond the power of man to control. Moreover, the fact that the war will inevitably take a heavy toll of life and limb makes it imperative to restrict the injury to mind and body imposed by early crime and careless driving.

The latest figures of injury through road accidents to the civilian population are only comparable with the early, shocking reports of the first factory inspectors. In April of this year no fewer than 726 persons died as the result of road injuries—a rise of 275 from the figure for April, 1940, when the position was already serious. If the present rate is maintained, some 8,700 persons will die on the roads in the current year. In May last, the total

of fatal injuries declined slightly to 701, an increase of 252 from the figure for May, 1940. The last pre-war figure for fatal accidents in factories in the course of a whole year was rather over 1,000, and, even allowing for an appreciable increase under war conditions, the extra danger of using the public highway, where the present rate of slaughter is nine or ten times higher than this, has become a scandal and an abuse.

An interesting attempt to analyse the problem has been made recently by the Royal Society for the Prevention of Accidents, which has reviewed some 2,500 inquest reports covering some two-thirds of the fatal road accidents in the period September-December, 1940. It can be assumed that these reports provide a representative cross-section—an unbiased sample. The conclusions of the investigation are illuminating. It appears that more persons were killed as the result of a collision with a lorry or van than with any other vehicle; one in five of all the vans or lorries implicated was a Service vehicle; nearly one in three of all the motor cycles involved was a Service machine. In all, some 11 per cent. of all vehicles concerned in fatal accidents were Service vehicles. Only 30 drivers of Service vehicles, out of a total of 237, however, failed to be either specifically exonerated or to secure a verdict of "accidental death" or "misadventure"; and little progress can be made by a simple assumption of the guilt of this or that party, except in relatively few cases of patent negligence. The War Office has just published other figures which do not bear out the common belief that Army drivers are especially prone to accidents. The real problem is the fundamental regularity with which road accidents are now occurring. It is too complex to be solved by assigning blame to individuals, a habit which only diverts attention from the conditions which make accidents common.

The latest inquiries reveal that one of the most tragic and wasteful features of road accidents is the rising loss of life among young children. Since the spring of 1940, the number of children killed on the roads has increased by over 50 per cent. It now averages more than three a day. As before the war, children between three and eight are the most numerous victims. It is remarkable that very few children are killed after dark, or at or near school premises. The blackout, which has clearly been an important cause of the increase in accidents among adults, does not explain the toll taken of children. Since there is also less traffic on the roads than before the war, the increase must rather be explained by a decline in the supervision of children, coupled with the failure of evacuated town children to appreciate the traffic dangers of country roads, and also by less vigilance on the part of drivers. "There is no doubt also," states the Royal Society for the Prevention of Accidents, "that the spirit of the times has infected children as well as adults." Thus, much the same factor appears to be operating to increase

the toll of road accidents as to swell the record of juvenile delinquency. In a sample of 217 cases, it is notable that only 10 children were killed on their way to school; 26 on their way from school; 21 when running errands; 73 on pleasure bent; 78 playing in the streets; and 9 otherwise. The importance of preventing road deaths, particularly among that section of the population whose expectation of life is longest, is self-evident.

Clearly, something can be done by a new campaign of advice and propaganda. Where supervision of young children cannot be provided by parents and guardians now engaged on war work, assistance must be given by the social service bodies. Drivers, particularly drivers of heavy vehicles, must be made more alive to the dangers to children when restarting, reversing, overtaking stationary vehicles or cyclists or passing groups of children. Lack of vigilance is a powerful factor in this slaughter. But when all is said and done, it is still probable that undue speed is a principal cause of road accidents. Obviously, no absolute speed can be laid down as the maximum consistent with safety. Actual speed must be related to traffic conditions, the type of road, the frequency of cross roads and many other factors. On the German *Autobahnen*, it is considered dangerous to drive at less than 30 m.p.h. In built-up areas in this country, it is an offence to exceed 30 m.p.h.—20 in the black-out—and there is no doubt that in most towns and villages that speed is too high. American evidence suggests that the use of an automatic speed governor has proved useful in reducing fatal accidents, and impressive documentary evidence to this effect was placed by the Pedestrians' Association before the House of Lords' Select Committee on the Prevention of Road Accidents.

By far the greater number of road accidents are, of course, not fatal. But all too frequently they result in disastrous injuries which permanently cripple the victim—both as a worker and as a member of society. The position of the injured British workman under Workmen's Compensation is particularly precarious, since the person who is injured on the way to or from work is not necessarily covered by industrial accident insurance, and the sole relief is that offered by the meagre benefits of National Health Insurance. Moreover, existing arrangements for the provision of specialised treatment and convalescence for those suffering from fractures and other injuries remain rudimentary, despite apparent goodwill and the general acclamation of the Delavigne Report. Modern fracture clinics are urgently needed; and present arrangements, which provide rehabilitation treatment for less than a hundred men, are ludicrously inadequate. Compensation for injury in cash is no real compensation, however generous. It must be accompanied by the means of recovery; and it must be made unnecessary by a much more urgent and forceful policy to reduce accidents of all kinds.

NOTES OF THE WEEK

The Campaign in Russia

For the first week of the Russian campaign, the German High Command's *communiqués* spoke in general terms of successful fighting, of the destruction of Russian aircraft and war material, and of the systematic bombing of the Russian lines of communication. These *communiqués* covered the first phase, during which the Germans, after launching a general attack all along the Soviet frontier, felt the line for its weak points and prepared for the strong break through which would follow the discovery of a crack in the enemy's armour. By Sunday, June 29th, the breach was made, and on the northern front three columns were crashing through, from East Prussia towards Dvinsk, from Vilna to the River Dvina, and from Grodno and Bialystok to Minsk and beyond. It is the old tactic. Tanks are thrust through, closely followed by motorised, heavily armed infantry, then by heavy artillery. Dive-bombers and long range bombers set out to pulverise the enemy behind and before. For a few days, it remains uncertain which army is encircling which. Then, in Germany's

other campaigns the opposing armies, sliced up by a series of German drives, lost contact with each other and with their reinforcements. Mass surrenders follow—often of men who have never seen any fighting. In Russia, the *débâcle* has not happened, and may not happen: but the first scenes have followed the familiar course. In the second week, it seems likely that the campaign has reached the decisive period at which, for a day or so, there will still be the possibility that the German advance may have overshot its mark. Heavy tank counter-attacks might be able, at this stage—in theory at least—to cut off the advanced tank units from their following infantry; and the Russians are still claiming that they have performed the feat before Minsk. However, the reference to artillery duels there suggests that the success may be temporary and that the Germans have brought up their men and guns, a stupendous piece of military organisation. The direction of the drive is clearly Moscow, and the little activity in the south suggests that the Germans may plan to isolate the Ukraine by an encircling movement, swinging south-east from the capital.

The speed of their advance has left Russian armies behind them, but these offer a threat to Germany's lines of communication only if they are still in possession of intact tank formations and above all of aircraft. In the north, the

Germans and Finns claim to have cut off Murmansk and this column is presumably to act as the upper prong of a pincer movement enveloping Leningrad, the lower prong striking up from Dvinsk.

The Next Stage

In the rear, the Russians are preparing for a long stand. The formation of a Defence Committee of Five, including Stalin, Molotoff and Voroshiloff, the three best-known men in Russia, is a guarantee of firmness and despatch at the centre, and there can be no doubt about the Russian people's response of straightforward patriotism to the call to defend their country. Yet, even though the will is undoubtedly there, the problem of the means remains. The Ukraine and Moscow together account for well over 60 per cent of Russia's industrial activity. The Caspian-Ural line, which includes the new oil centres at Emba and Perm, and the coal, iron, copper and manganese workings round Magnitogorsk, might give some industrial backing to further resistance, if the march to Moscow and the wheel to Kiev and the Black Sea is not halted. Behind that again is the Kuznetski or Kusbas Basin in Central Asia, and, at the end of everything, the Far East, with its comparatively self-sufficient army and economy. Since Hitler's purpose is primarily to smash Russia as an independent military power, he will be forced to attack all these fronts if the Russian forces are able to withdraw and regroup before they are seized or smashed in nearer places. It is admittedly a big "if." The campaign so far suggests that too much material has been brought forward, and that too many divisions are falling victims to encirclement. They cannot restore their position by guerilla warfare, for guerilla warfare cannot succeed on broad, open plains against tanks and aircraft. The opposition of small bands of Russians would be effective only if Hitler were primarily interested in long-term colonisation. For the moment he is only concerned with the knock-out blow. He can argue that there will be time to organise Russia when resistance in the west is crushed, and, if the blow in the east is fully successful, it is not Russian industry and agriculture that will absorb the Nazis' attention, but rather the task of switching their formidable and battle-scarred armies back to the western front for a really uninhibited invasion of these islands. True, after the attack on France—where there was no change of direction and hence no comparable transport problem—it was not possible to launch an attack on this country in the same year. But the Nazis have learnt a lot since June, 1940. What they did or did not do then cannot be used as any definite assurance of what they can or cannot do now. That this is Britain's last respite is the only safe assumption to make.

Peace Talk and Propaganda

It is difficult to gauge, within a fortnight of the launching of Hitler's campaign, the degree of success which is attending his Fourth Arm. The attempt at peace talks, at least, was completely ineffectual and it is difficult to believe that the Nazis had much faith in it. Their bolt was already shot when Hess landed in Scotland. It is true that von Papen passed on to the Turkish Foreign Minister a few equivocal hints on the desirability of Britain leaving Russia to her own devices and of concentrating on a division of spheres of influence with Germany; but the whole episode was probably no more than an unofficial wink from the Führer on the lines of "Try it if you like, Fritz." The propaganda implications of the new situation are potentially more serious, although, so far, this squib, too, has seemed a little damp. The Prime Minister's broadcast prevented any rift in opinion in this country and while Vichy has followed up its first crusading enthusiasm by breaking off relations with Russia, the situation in Spain has not grown worse. In the United States, Mr Hoover has, as might have been expected, risen happily at the first cast and issued an appeal to American "reason" to stay out of the war, arguing that "the ideological war to bring the four freedoms to the world died" when America made the promise to assist Russia. It may be remarked in passing that this is the first time Mr Hoover has shown any consciousness at all of any ideological issues in the conflict. So far, the greatest potential danger in the propaganda sphere to the Allied cause—that of a violent movement of opposition among the Catholics of the Old and New World—has not come about. Isolationists and pacifists were openly expecting a lead from the Vatican, and rumours circulated—their origin can be surmised—to the effect that the Pope would call for united action against the Russian menace. The message, when it came, proved entirely unsensational. Nevertheless, the danger remains of a hostile movement of religious opinion, exploited by Hitler for his own ends. And it may not be irrelevant to point out one of the only effective ways of scotching it is some official British statement on peace aims in the form of the commitments which

Britain is prepared to undertake in post-war Europe. The new situation caused by the entry of Russia into the war does not alter the fact which Mr Churchill very sanely clings to, namely, that it is impossible to draw, here and now, the new frontiers and constitutions of post-war Europe with any sincerity. The state of the world after the war, the balance of forces, the date of the Armistice—all are shrouded in uncertainty, and definite pledges would be a plain deception. But the appearance of Russia as a belligerent does make a difference. Britain has an unenviable reputation abroad of winning wars and leaving the organisation of victory to her allies. With Russia as an ally, it is possible for the suggestion to be made with some plausibility—and it is already being sedulously propagated by Hitler—that the defeat of Germany now means the triumph of Communism in Europe. Assurances that, while Britain and Russia have a common war aim—to destroy Hitler—their peace aims are quite at variance, would go far to counter Hitler's present exploitation of Europe's apprehensions.

* * *

The Meat Ration

It was the Ministry of Agriculture that first announced the impending increase in the meat ration, and gave it as a reason for countermanding the recent programme of reduction in cattle numbers. Yet there is no reason to suppose that the unexpected arrival of a few cargoes of meat has in any way affected the present and prospective shortage of feeding-stuffs. The experience of the last war showed that farmers, when deprived of their supplies of imported concentrates, tend to keep more animals than they can feed adequately from their own resources, in the hope that "something will turn up"—an exceptionally good grazing season, an extra ton of cake from their merchant or a sudden Armistice. One result is a highly seasonal variation in the output of meat; if cattle numbers had been reduced last winter, there would have been more hay and ensilage made this summer; a larger proportion of the survivors could have been carried into January and February; and the autumn glut of meat at the end of the grazing season would have been avoided. A steady reduction in the numbers of cattle was desirable during the early part of this year, even from the narrow standpoint of maintaining a more even supply of meat from the feeding-stuffs available. But from the broader point of view, the main job of British farming during the present phase of the Battle of the Atlantic is to produce the maximum amount of human food. And this will not be achieved if the Ministry of Agriculture continues to advise farmers to maintain their pre-war herds of cattle on starvation rations by devoting their new arable to fodder crops, rather than to wheat, barley, potatoes or vegetables for human consumption. During the last few weeks, the farming Press has reported that practically no home-grown oats have been on sale to meet the needs of the milling trade or of essential urban and colliery horses, and that milk-recording societies have experienced a heavy fall in yields. These are signs that there are more animals in the country as a whole than can be economically maintained. Yet the interests of the cattle feeders have again won the day. The British housewife will be permitted by the Ministry of Agriculture and the National Farmers' Union to eat what wheat and oatmeal can be spared by the beef cattle; she will be offered a surfeit of beefsteaks for two months of the year at the expense of a drastic cut in vital supplies of milk during twelve. The conflicting announcements on agricultural policy in the last few weeks are, indeed, only a symptom of the now well-known clash of opinion between the two Ministries on the proper functions of British farming; a combination of the two in a single Ministry of Food Supplies would at least indicate their proper, common and only function; and it might ensure that their controversies would be conducted in the decent obscurity of Whitehall and not in the sight and hearing of a confused public.

Food and Ships

Some weeks ago it was suggested in *The Economist* that it might be politic to consider the rationing of bread. It was not suggested that to ration bread was a desirable policy, in itself or at all times of food scarcity. The point was rather the plain necessity for bringing food policy quickly into line with the current serious shipping situation; the occasion for the suggestion was the news that the con-

sumption of bread had risen 20 per cent in three months, and was still increasing; and the argument was that the best use was not being made of shipping space by the importation of extra wheat or flour, in preference to other foodstuffs, the absence of which was the chief cause of the rise in bread consumption. In comment on this suggestion, it has been pointed out in general that it is easier, psychologically, to ration other foods if one staple foodstuff such as bread is available in unlimited quantities and that, since bread is available in unlimited quantities and that, since bread consumption varies between rich and poor, a bread ration would be unfair; and, in particular, that it would not be possible to import more meat instead of more wheat because of a shortage of refrigerated ships, and that, while sugar might be more economical of ships than wheat, consumers could not live on sugar. These are sound arguments. It is obviously necessary, if some foods have to be rationed, to divert consumption to others, and bread and potatoes are the obvious choices. More bread is being eaten because there is less of other things to eat. But the decision whether or not this or that food has to be rationed is not absolute. It is, or should be, a choice based upon a plan to make the best use of the shipping space available; and it is a bad plan which, in order to economise shipping space, restricts and rations the supply of certain foods to such an extent that more shipping space than is saved by the rationing has to be used to bring in extra wheat to meet the increase in bread consumption. *The Economist's* contention is that a food policy must also be a shipping policy, and the example of bread rationing—a very generous ration was deliberately suggested because of the unevenness of bread consumption—was given as an example of one way in which what appeared to be a serious and growing disparity could be checked. Ideally, of course, potatoes should be taking the strain and preventing an uneconomic increase in the consumption of bread. But, for various special reasons, this has not been happening, and the fact remains that, whatever the undoubted difficulties, the rationing of bread must surely be considered whenever the consumption of bread—that is, the importation of wheat now or in the near future—becomes uneconomically high.

Cut in Petrol Ration

On Tuesday, Captain Thurtle drew the attention of the House of Commons to the "strong and still growing indignation of the people, who see the lives of sailors . . . being sacrificed in bringing petrol to this country, and the evidence that it is being squandered in pleasure riding." The case for rigorous economy in the use of petrol and other oil products by civilians and the Services is unanswerable. It has recently been reinforced by criticism from the Eastern States of the United States, whose supplies are to be diminished by the transfer of fifty American tankers to this country. True, Mr Geoffrey Lloyd, the Petroleum Secretary, announced a concession to the critics at last. The basic petrol ration will be cut by one-sixth during August, September and October; strong measures will be taken against the misuse of supplementary rations, which have already been reduced by 10-20 per cent; and the Secretary for War has taken steps to eliminate waste in the Army. So long as Mr Lloyd's "strong measures" are not at the expense of vital business, commercial, industrial or military requirements, these are steps in the right direction. But the policy of giving the public "the benefit which is conferred by our still being in a position to allow a certain small amount of petrol and mileage within the free use of the individual according to his conscience"—the words are Mr Lloyd's—sounds more sensible and realistic than it actually is when tested by the few facts that are generally known. This country is clearly not in a position to import petrol for other than vital needs. It is not an in-frangible right of the individual to judge whether he should or should not run a private car. There are still people whose conscience allows them to license two (or more) cars—one of them often a large one—in order to obtain a bigger ration. The application of a rigorous needs test for all fuel that is used remains imperative; and, at the very least, the private motorist should only be allowed petrol for his "free use according to his conscience" if every essential requirement has first been fully met. As it is, this doctrine of democratic wartime motoring means that, in order to maintain the "rights" of every motorist, allowances of petrol for many important purposes are held down to an inadequate maximum, so that, out of the limited supplies available, the private motorist may be enabled to carry on.

Shortage and Maldistribution

The root of the present serious tobacco problem is actual shortage, which is due in most part to a demand that has been steadily rising and is abnormally high, but in part also to the reduced supply of leaf stock and to the inevitable lack of suitable factory labour in wartime. The nation is smoking far too much. The distribution problem, however, which the actual shortage sets, is hardly less important, because chronic maldistribution creates an impression of shortage far in excess of the facts; and the position is complicated by the great difficulty of rationing tobacco. In the circumstances, it was intolerable that maldistribution should be fostered by the practice of certain firms of wholesaler-retailers of issuing supplies predominantly to their own branches, to the detriment of the independent retail shops which were dependent on them for supplies. Apart from the commercial dishonesty which seeks to exploit the national shortage to procure a temporary monopoly and unmerited goodwill, the firms in question are guilty of a not inconsiderable waste of the nation's time and energy. One London firm of wholesaler-retailers has already had its retail licence withdrawn by the Tobacco Trade Association, and six others have also been penalised. The result—that the retail shops owned by the firms in question will be forced to close down—will be all to the good, provided the reports of successful evasion by the disbarred wholesalers are incorrect. The remaining shops will be better stocked and the labour released can be more profitably employed. There should be no tobacco problem. Fifteen per cent more tobacco is being released from bond than before the war, which is fantastic in view of the state of stocks and the shortage of shipping space to import fresh supplies—and it obviously cannot go on. All that is needed, and all that the authorities are asking, is that smokers should smoke no more than they smoked before the war. But so long as they continue to smoke 20 per cent more, the present shortage will remain.

* * *

Release of the *Scheherezade*

An important point of policy is raised by the decision of the British Government, at the request of the United States State Department, to release the oil tanker *Scheherezade*, now bound for Casablanca. The tanker, which has a capacity of some 16,000 tons, was intercepted by a British naval patrol and taken into Bermuda. It can only be assumed, as Mr Churchill recently suggested in the House, that the anxiety of the United States authorities to meet the Vichy claims is based on a realistic appraisal of the position in French Morocco. Grave doubts have naturally been expressed in this country about the wisdom of this action, and it is surely unthinkable that the British authorities should have been urged to release the *Scheherezade* and also certain food supplies unless there were good reason to believe that Vichy resistance to further German infiltration in North Africa would be effectively stiffened and that leakage to the Axis Powers would be negligible. The onus is on the United States. It has been suggested that Washington will exact a *quid pro quo* in the form of an efficient control organisation in Morocco to supervise the distribution and consumption of the supplies thus passed through the blockade. The case is plausible, and it is said that steps of this kind might have been taken some months ago but for the determination of the British authorities to keep the blockade absolute and not to use it as a conditional instrument of diplomatic pressure. But this is a late hour to make any change in policy, and opinion in this country must be satisfied the game is really worth the candle. It is emphatically not worth while if the supplies of food and oil, directly or indirectly, are permitted to assist the war effort of the Axis Powers. The Vichy Government is better known for what it is than it was some months ago when these questions first arose. No element in it has yet given evidence of its capacity to maintain neutrality, and there is no reason to exempt General Weygand or the Vichy authorities in North Africa from this estimate. In the present instance, it may be suggested that the termination of German infiltration into Morocco might well be enforced by Washington in return for the release of the tanker.

The End of the Syrian Mandate ?

The advance into Syria continues at its normal leisurely pace. After a week the fighting at Palmyra continues, but advance units are pushing on in the direction of Aleppo.

Beirut remains obstinately unreduced, and Allied troops are having a difficult time on the mountains and gorges of Lebanon, which form the cities' natural defences. The expedient of a coastal landing has not been repeated—*if*, indeed, it was ever tried. In spite of the snail's pace of the occupation, there is evidence that the situation is growing steadily more favourable to the Allies. The arrival of plentiful stores of food and fuel in Damascus, Sidon and Tyre has created a very good impression, and the precedent of plenty entering with the armies of occupation is one to be remembered later when the Allies face more formidable tasks. There will also be repercussions if the reports of General Le Gentilhomme's grant of Syrian independence and ending of the French Mandate are true, and become more widely known. The people of Beirut are restive, and disturbances have followed on their demand for a bloodless surrender. The effect on Aleppo may be striking, and if skilful use is made of the situation, the Allied offer of independence, bread and protection should be irresistible. But the propaganda campaign would have to be conducted with more dash than has been apparent in the military operations. The need for speed will be all the greater if the *demarches* made in Turkey by M. Benoit Méchain, Vichy Under-Secretary for Franco-German relations are a prelude to a more active Axis interest in the Syrian campaign. The purpose of M. Méchain's visit was first rumoured to be the modest one of securing the passage of Vichy's defeated armies through Turkish territory. Now it appears that he entertains the more ambitious scheme of drawing Turkey into a joint Axis-Vichy scheme for the Levant. It is unlikely, however, that the Turks will take this view of their commitments under their new Pact of Friendship with Germany. It remains to be seen whether the Germans will put on the screw.

India Watches

The course of opinion in India depends closely on the course of the war, and the loss of Crete was a setback, because belief in an ultimate British victory is necessary for the mobilisation of Indian sentiment behind the war effort. On balance, however, the development of events in Iraq and Syria has done something to restore confidence. At first, the repercussions in India of the war in Moslem Iraq were definitely threatening, but its quick end and the general Iraqi welcome to the British victory removed most of the danger—though it would not be true to say that, either in Iraq or in India, Moslem opinion is wholly pro-British in this matter, however minute the actual following of Rashid Ali may have been. In Syria, it is the French who are resisting the invaders, and the successes of Imperial and Free French forces, coupled as they have been with affirmations of Syrian independence, have been generally welcomed in India. The political crisis in India itself is less immediately acute. The Hindu Mahasabha has put off its threatened resort to "direct action"; and the civil disobedience campaign of Congress is running in low gear. The Moslem League is still publicly pledged to partition as

Exports & Imports

While the war has increased the already vital need for exports and imports, it has, at the same time, necessitated the introduction of numerous regulations and restrictions which add considerably to the trader's difficulties.

The Westminster Bank maintains specialized departments where its customers may obtain expert advice and assistance in dealing with such problems as arise, and it strongly advises those who are exporting or importing to consult it as soon as their intentions are known. Information is also available regarding Documentary Credits—so necessary to the financing of war-time trade.

WESTMINSTER BANK LIMITED

Foreign Branch Office: 41 Lothbury, London, E.C.2

the way out for India, but it is notable that the Premiers of Bengal and the Punjab, who do not support this intransigent and impossible programme, have been re-appointed to the League's executive body. The fact that India is relatively quiet, however, should not be misinterpreted. None of the major problems has been brought nearer to solution. It has been found necessary to ban the Moslem volunteer force known as Khaksars, which is trivial. Workers in the industrial districts are actively uneasy about the increase in the cost of living, which is more important. There have been the usual communal disturbances in Bombay and other towns; and on the north-west frontier the possibility of a move by the Faqir of Ipi has not been entirely removed. The echoes of events in the Near East have shown the tender places there are in India. It remains to be seen what effect the clash between Germany and Russia, with its implied menace to India's millions, will have there. At any rate, whatever the rights and wrongs of current controversies may be, it remains impossible for the men and the resources of India to be fully marshalled for the war while the Indians cannot agree among themselves and the British are convinced that there is nothing more that can be done. This is defeatism—on both sides; and, on the military side, there is vital work for General Wavell to do.

* * *

Japanese Dilemma

Nearly a fortnight passed after the start of the Russo-German campaign before any declaration of policy was vouchsafed by the Japanese Government. When it came, its assurance of noncommittal vigilance did little to clarify the position. It was obvious from the start that Germany's latest *volte face* must prove exceptionally embarrassing to her Far Eastern ally, bound both by the Tripartite Agreement and by the Russo-Japanese Neutrality Pact, the latter only some two months old. Since the choice of action is also limited by the necessity of concluding the Chinese war before entering into fresh commitments, it is hardly surprising that the Supreme War Council has been sitting almost continuously since Monday, June 23, and that interminable liaison conferences have been held between the High Command and the Government. The possibility of a threat to Japanese expansion through the establishment of an American zone of influence from Alaska to Vladivostok via the Aleutian Islands is an important consideration from the Japanese standpoint. So is the alleged possibility, ventilated by the inspired Japanese press, of the conclusion of a military alliance between China, the United States and Great Britain. Coupled with the somewhat tardy German recognition of the Nanking Government and the recall of Chinese diplomatic representatives from Berlin and Rome, it seems likely that the repercussions of the Russo-German conflict on the China incident will be the most cogent influence on Japanese policy. There is no measure for the designs and ambitions of aggressive nations; but it remains unlikely that Japan will, or could, intervene actively in any sense in the European war, and action will probably be limited to the continued cultivation of a pro-Axis, anti-Ally sentiment. For Japan, the Russian war is a side show.

* * *

While England Burns

It is impossible to feel any sympathy with the attitude of the TUC towards compulsory fire watching. The Fire Prevention (Business Premises) Order imposes an obligation on all male employees in premises to which it applies to undertake a certain number of hours of fire prevention duty a month. In no cases have the compulsory hours amounted to more than 48 a month, which in effect means one night a week; provision was made for full prior consultation between employers and employees; and the obligation extended to managements as well as to subordinates. If the TUC had objected that, in practice, the burden of fire watching fell only, or mainly, on the workers and that higher officials were securing exemption, they might have made more of a case. But the chief object of their complaint is the use of compulsion by the Order, which they have variously described as "the first piece of anti-social legislation put on the Statute-book since 1927" and a step towards Nazism. Thus, the old compulsion bogey has been raised again—this time by a body which does not hesitate to use strict compulsion on its own members. Most probably, however, the TUC are using it in order to conceal their jealousy of a scheme which provides for direct consultation between employer and worker—not through the latter's union. There are, it is true, many unsatisfactory

features—for instance, there are wide discrepancies between the conditions under which fire watchers in the same job, but in different firms, take turns of duty. Some are paid expense allowances and others not, for the Order does not recognise any obligatory payment. But to argue that the scheme is a bad scheme because it is a compulsory one is fatuous. In actual fact, as is shown in almost every heavy air-raid, there is not nearly enough compulsion—whether on business premises or private houses—and until fire prevention is made a disciplined part of the civil defence services, like fire fighting, there will continue to be a quite unnecessary destruction of factories, shops, homes and historic buildings.

* * *

Imperial War Conference Postponed

Owing to the inability of Field Marshal Smuts and Mr Mackenzie King to leave their countries, it will not be possible for an Imperial War Conference to be held in London in the near future. That Field Marshal Smuts should feel reluctant to leave South Africa is understandable. The political opposition to the war is as strong there as ever, even though it is out of all proportion to the opposition in the country as a whole: and Field Marshal Smuts may well feel that he cannot afford to allow political manœuvring to jeopardise his position in his absence. Moreover, though the war in Africa has subsided, it is liable to flare up at any moment—there is still a powerful Axis army on the borders of Egypt and from the Macedonian coast to Crete and Cyrenaica the enemy sprawls across the Mediterranean. Questions immediately affecting the Union, such as the transfer of South African troops to new theatres, may suddenly arise. No such difficulties, however, beset Mr. Mackenzie King, who has neither the same degree of opposition to the war nor the same personal authority in his country as Field Marshal Smuts has. Mr. King's excuse for his refusal of Mr Churchill's invitation, which has aroused strong protests in Canada, appears to be that he wants to inspect Canada's war effort for himself first, so that he can give a true picture to the people of Great Britain when he does come. It might have seemed reasonable to expect that his knowledge of this effort was already sufficiently close. He said, however, that he is willing to reconsider his decision. It may be that he thinks it an inopportune moment to leave Canada at a time when the conscription controversy is coming to the front once more. On his recent visit to Calgary, he was greeted with handbills asking for conscription, and there can be no doubt that the demand is gaining ground now in exactly the same way as it did last summer after Dunkirk. Now that the attitude of the French Canadians is complicated by the entry of Russia into the war, Mr Mackenzie King is probably wise in refusing to accept full conscription. Its effect on the French Canadians in the last war is still remembered. But it would be a great pity if the Canadian Prime Minister were to permit this one issue to cloud his whole attitude to the conduct of the war.

* * *

Australia Moves Ahead

Mr. Menzies, who is likely to return to this country for another visit, has begun to carry out the new war plans announced a few weeks ago. He is evidently spending no time on further advances to the Labour Party, and has enlarged and strengthened his Cabinet without them. The number of Ministers has been increased from 12 to 19, and the most significant of the appointments is a newly created Minister of War Organisation and Industry, who is to have the task of transferring non-essential civil industry to the war effort. The full Cabinet will meet only rarely; its work will be carried out by the War Cabinet and the Economic Cabinet, each with its separate personnel. In addition, a series of Parliamentary committees will be appointed, on which the Government and the Opposition will be equally represented, to share the administration of war measures, such as the allocation of manpower and resources, taxation, social measures and so on. It is not quite clear what the exact powers and functions of these committees will be, or what relation they will have to the Advisory War Council. Most probably, they represent Mr Menzies' attempt to effect a working reconciliation with the Labour Party. In this connection, his hand has probably been strengthened by the attack on Russia, which may rally the dissident rank and file of Labour to full support of the war. At Easter, 1940, the New South Wales Labour Party passed a "Hands off Russia" resolution, when feeling

against Russia over the Finnish war ran high, and since then there has been industrial unrest which has almost certainly been encouraged by Communists. Mr Curtin, the Labour Leader, who has wholeheartedly supported Mr Menzies' declaration in favour of help for Russia, has hitherto been handicapped in any negotiations for a National Government by his own party's extremists, who may now return to the fold. It is not, however, likely that a National Government has been made any more possible by the new war; Government and Opposition are too equally matched for either to give way—and a Prime Minister who is not Mr Menzies is in any case unthinkable. But at least it will strengthen unity in the country as a whole.

Grants to Local Authorities

In a written answer to a Parliamentary question, Mr Ernest Brown has given details of the Government's policy regarding grants to local authorities whose loss of income, owing to the war, is large enough for there to be a risk of a breakdown of essential local services. Normally, 75 per cent of any assistance ranks as a grant and the remaining 25 per cent is an interest-free advance, the question of repayment being left to be settled after the war. No precise formula for assessing the need for assistance has been devised, but factors taken into account are the estimated loss of productivity of a penny rate compared with the normal yield, the recent history of the rate poundage and the level of the rates compared with those levied by corresponding authorities. Before granting assistance, the Government must be satisfied that the local authority concerned has made all reasonable efforts to help itself, including in some cases an increase in rate poundage, but such an increase will not be required as a condition of assistance, if rates are already substantially higher than in the two preceding years or if the rate level is already very high. Some examples were given by Mr Brown to illustrate these principles:—

County Boroughs:—			Loss of Productivity of a Penny Rate	Condition of Grant
1. Rates, 1939-40	1940-41	1941-42		
1. Rates, 1939-40	12s. 5d.	13s. 10d.	53% (mainly by evacuation)	No increase in rates as a condition of assistance
2. Rates, 1939-40	21s. 6d.	21s. 6d.	38% (by evacuation and damage)	No increase in rates as a condition of assistance
1940-41	21s. 6d.	21s. 6d.		
1941-42	21s. 6d.	21s. 6d.		
Metropolitan Boroughs:—			Loss of Productivity of a Penny Rate	Condition of Grant
1. Rates, 1939-40	1940-41	1941-42		
1. Rates, 1939-40	13s. 2d.	13s. 2d.	11% (by evacuation and damage)	Increase of 3d. in the rates as a condition of assistance
2. Rates, 1939-40	18s. 0d.	18s. 0d.	43% (by evacuation and damage)	No increase in rates as a condition of assistance
1940-41	18s. 0d.	18s. 0d.		
1941-42	18s. 0d.	18s. 0d.		
Non-County Boroughs:—			Loss of Productivity of a Penny Rate	Condition of Grant
1. Rates, 1939-40	1940-41	1941-42		
1. Rates, 1939-40	9s. 6d.	9s. 6d.	40% (mainly by evacuation)	No increase in rates as a condition of assistance
2. Rates, 1939-40	14s. 0d.	14s. 0d.	57% (by evacuation and damage)	No increase in rates as a condition of assistance
1940-41	14s. 0d.	14s. 0d.		
1941-42	14s. 0d.	14s. 0d.		
Urban Districts:—			Loss of Productivity of a Penny Rate	Condition of Grant
1. Rates, 1939-40	1940-41	1941-42		
1. Rates, 1939-40	12s. 8d.	12s. 8d.	16% (mainly by evacuation)	Increase of 1s. in the rates as a condition of assistance
2. Rates, 1939-40	13s. 6d.	13s. 6d.	60% (mainly by evacuation)	No increase in rates as a condition of assistance
1940-41	13s. 6d.	13s. 6d.		
1941-42	13s. 6d.	13s. 6d.		

In most of these cases the rates were already high enough for the Government to decide that the fall in local income, which is mainly due to evacuation, should not be compensated by higher rates on those left behind. As a picture of local finance in wartime, the table is incomplete; it would, for instance, be interesting to have figures of reception area finance to show to what extent districts whose population has increased have benefited. It is as a possible peacetime solution of local finance problems that the Government policy of assistance is most interesting. Long before the war, it had been recognised that the present system of local finance is regressive; the rates are frequently highest in the poorest areas, and many Government grants are dependent upon local expenditure, which means that areas in most need receive less because they can spend little. The present policy of relating Government grants to income rather than to expenditure is a welcome development of the pre-war formula grant which served to counter-balance the local effects of derating and attempted to measure "necessitousness." Another important step is the attempt to introduce a more uniform level of rates by comparing the rates of the suppliant authority with those of others; at present there are wide discrepancies, even between neighbouring authorities. Unfortunately, it appears that uniformity will be secured by levelling up rather than levelling down, and some authorities will still have a level of rates quite disproportionate to the pockets of their inhabitants. The county borough in the table, with rates of 21s. 6d. in the pound, is enforcedly anonymous, but rates as high as this

are frequently found in towns with a mainly poor population. On the whole, however, it can be said that, under wartime pressure, a number of important and interesting principles are filtering into the financial relations of the Exchequer and local authorities; and, though the new grants are only a wartime measure, it is almost certain that they mark the beginning of the end of the old system.

* * *

Dominion Surpluses

The great producers and exporters of cheap primary products—chiefly the British Empire and Latin America—have been hard hit by the loss of European markets and by the reduction in Great Britain's imports, forced by the scarcity of shipping. Great Britain has already done much to assist Empire producers, by the purchase of the wool clips of Australasia and South Africa for example, and of the copper output of Rhodesia, while the United States is buying large quantities of coffee and metals from Latin America. In some countries, the reduction in food exports has been offset, at least in part, by an increase in the export of metals and other war materials. None the less, the reduction in the export of staple foods has given rise to a serious problem in countries such as Australia, New Zealand, and Argentina; and the Government's decision to assist the Australasian Dominions, announced by Mr Greenwood in the House of Commons last week, is welcome. The Government will continue to import food from these countries, in as concentrated a form as possible, within the limits of the shipping space available; and it will share with the Dominion Governments the cost of holding surplus stocks, pending their disposal. Arrangements will also be made to fix the prices of surplus products at a level which, while giving no incentive for an expansion in output, will ensure the maintenance of the industries concerned. The disposal of the wheat surpluses of British and other exporting countries is to be discussed at a conference of the International Wheat Committee in the United States. In addition to the temporary need for assisting surplus producers during the war, and for accumulating large reserves of food and materials for distribution on the cessation of hostilities, there is the wider peacetime problem of preventing economically and socially destructive booms and slumps in the prices of primary products. In so far as the present measures can pave the way to the solution of that problem they will serve a dual purpose.

* * *

Shorter Notes

On July 1, a further rationing of newsprint in Australia came into force. On July 1 last year, the cut imposed was 35 per cent of the tonnage used in 1938-39; this month the cut had risen to 55 per cent, and unless a good case is made for increasing the production of newsprint in Tasmania, it will become 60 per cent. on October 1.

*

Rarely, indeed, can a man have combined such a high degree of both patriotism and art as did Paderewski, who died this week at the age of 80. He was fifty years old by the time he first became prominent in politics; but afterwards he was pianist and statesman by turns, becoming the first Prime Minister of the new Poland at the end of the last war and ending his life as President of the Polish National Council in exile. The posthumous award of the "Virtute Militari," Poland's highest military decoration, is a fitting recognition of his country's debt.

THE WORLD OVERSEAS

America's Armament Problems

(From Our New York Correspondent)

June 12th

THE big aviation strike on the Pacific Coast has ended and work has been resumed. The strike was broken when the Army took over the plant. The grievance related to wages, and the occasion of the strike was the alleged slowness of the mediation proceedings. So much for the facts. Whether they are the relevant facts is beyond your Correspondent's knowledge, as the several accounts differ so widely as to be beyond reconciliation; and much seems to depend on personalities and the rivalries of internal CIO union politics. At all events, production has been resumed, and the basic grievance is now under discussion—this is said to be a demand for a 50 per cent increase in the minimum wage (from 50 to 75 cents an hour) and a general 10 cent an hour increase for all employees.

The first executive report on the operation of the Lease and Lend Act indicates that, of the \$7,000 millions appropriated, about \$4,300 millions has been allotted. Of this, the largest general items are aircraft and aeronautical materials, \$2,000 millions; ordnance and ordnance stores, nearly \$1,000 millions; vessels and water craft, \$500 millions; tanks and other vehicles, \$300 millions; and agricultural, industrial and other commodities, almost \$300 millions.

The prospect of two shortages is now beginning to appear—petrol and oil, and steel. The difficulty with petroleum products is not a scarcity of the commodity, but of transportation. For the North Atlantic seaboard, a good part of its supply came by coastwise tanker, and tankers are relatively scarce. There have been proposals for petrol-less Sundays and for reduced temperatures in homes this coming winter (many homes are heated by oil-burning furnaces), but no actual rationing has yet been announced.

Big Steel Demand

The steel problem is more complicated, since two alternatives are advocated. Steel capacity is about 80 million tons a year, or roughly double the average annual consumption. Current prospective demand is estimated to be in excess of capacity, if the indicated armament demand and the indicated civil consumption are combined. The suggested alternatives are an increase in capacity and a rationing of civil consumption which is, like all other civil demand, now at boom levels. The amount of steel in question is about 9 million tons, or say 9 per cent of current capacity.

Economically speaking, this country is now in its greatest boom in history, but its phenomena are different from either 1920 or 1929. The 1929 boom was concentrated in the stock market and in urban real estate; the 1920 boom was concentrated in commodity prices. Neither of these is a marked phenomenon of the present. The stock market has rallied in the past week; but it rallied from an extremely low level—about half the tops of 1937 and about one-third the quotations of 1929. While building is active, there is an absence of the conspicuous real estate speculation of 1929. And although commodity prices have been rising, there is no analogy with the feverish speculation in commodities that characterised the 1919-20 boom.

The rise in commodity prices is still not a conspicuous feature of either the statistics or of individual experience. The current Bureau of Labour Statistics index stands at about 85, against a recent low of approximately 75 in the summer of 1939. In early 1937, this index was near its present figure, although industrial prices are now higher and agricultural prices lower than in 1937. This is by no means a startling record; but it must be remembered that the forces now operating on the price structure did not become very powerful until near the end of the first quarter of the current year.

To an uncertain but not negligible extent, the current heavy consumer buying is motivated by the purchaser's conviction of the advisability of "buying now" before prices go higher.

BUSINESS INDICES

1935-9 100 for industrial production
1923-5 100 for all other series

Unadjusted for seasonal

	April '40	March '41	April '41*

* Preliminary.

Preliminary estimates indicate that the May index of industrial production was about 148, up 8 points from April and 5 from March. It is estimated that non-agricultural employment was about 3,200,000 above May, 1940—about 10 per cent.

The Russian Home Front

[BY A CORRESPONDENT]

June 30th

It is too early to give any opinion about the elasticity and adaptability of the Soviet economy in the transition from peace to war. It is also difficult to tell how the war is affecting the daily life of the Russians. Russia enters the war with a planned and a centrally controlled economy. Sudden adjustments, the introduction of war-time controls, rationing, the mobilising of various sectors of production by the Government, and the direction of essential war industries—these are not fresh problems. The entire economy can be ordered to shift from one branch of production to another, and the task of allocating and distributing supplies can be dealt with by the same national organisations as before. There are the disadvantages of an established bureaucracy, the tendency of officials and civil servants to put off decisions and to shift the responsibility for decisions to superiors or to other departments. Twenty years of socialist economy, however, have brought into being a large number of able administrators to run the war machine.

The Patriotic War Effort

The first proclamation, published immediately after the Nazis attacked the Russian frontiers, showed that the Soviet administration does not underestimate the importance of production and supplies. Only men up to 35 years were called up for military service, and the other military age groups were assured that their job in the factories was as important as that of the first line soldier. Working hours were increased to 48 a week, and a special decree was published empowering the directors and managers of

factories to force workers to do three hours overtime a week, and youths between the ages of 16-18 two hours weekly. Conscription of labour was also introduced, and workers can be shifted from one place to another according to the requirements of production.

The motif of M. Molotov's broadcast was his call to workers, peasants and intellectuals to defend themselves and the Fatherland. This remains the theme of the war propaganda. All the resolutions and declarations passed at the many meetings attended by hundreds of thousands of workers from different factories were similarly worded. The workers pledged themselves to do their utmost to help the Red Army to defend and fight the war for the Fatherland. No Communist ideas were mentioned, no world revolution preached. It is only a war against the Fascist aggressors who have attacked the Fatherland. Every possible means of propaganda is employed to emphasise that the only way to fight and defeat the enemy is to increase production, and do everything possible to keep up and improve the quality of the products. A drive for increased output has started all over the Soviet Union, and the Stakhanovite movement has been extended. Women are playing a great part in the patriotic drive. Young women are taking over their men's jobs in the factories. The Press, the radio, lectures, and special announcements are used to keep up the effort.

"Production heroes" are placed on the same pinnacle as fighting heroes; lists of achievements at the front by soldiers are published side by side with achievements on the home front—a worker who works well, a scientist who is responsible for some new way of speeding up production, an efficient administrator or efficient manager. The official communiqués of the Soviet Information Bureau deal not only with the position on the front and the military situation, but also with the home front; and workers are mentioned in these dispatches in the same way as soldiers and airmen.

Propaganda in Europe

The tolerant policy adopted towards the national minorities living in the Soviet Union is being used as a foundation for patriotic propaganda. The Commander-in-Chief, General Timoshenko, is praised as a national hero, and Russian and Ukrainian poets are writing special poems and composers special music for marching songs, in which he figures as the national leader. The fact that General Timoshenko is a Ukrainian is emphasised and used as a means to stir the patriotism of the Ukrainians.

The Central Information Bureau of the Soviet Union puts out communiqués twice daily; and the same bureau has taken over propaganda to foreign countries, especially to Germany. The Soviet short wave transmitters can be very clearly heard in England, and it can be assumed that the reception is extremely good in Germany. News and news-talks are being addressed to German soldiers, workers and peasants; the patriotic aspect of the Soviet workers defending their Fatherland is being strongly emphasised; the Germans are told that there is no reason for war between the Russians and the Germans. Broadcasts are being sent out to Sudeten Germans and Austrians, and no propaganda for socialism and world revolution is included, the main theme being the nationalist and patriotic sentiment of the oppressed Sudeten Germans and Austrians.

Soviet propaganda repeats over and over again that the Red Army will fight to the last and will not yield. The German soldiers are being warned against the patriotic fury of the Russian workers and peasants who are fighting to defend their homes, their freedom, and their socialist

country. Appeals are made to German soldiers and airmen to desert and commit sabotage; the names of soldiers and airmen who are said to have deserted already and gone over to the Red Army are given, with details of their regiments, and the names of places in Germany where they come from.

Trade Control in Hongkong

[FROM OUR HONGKONG CORRESPONDENT]

May 31st

It is only within the last few weeks that this last important stronghold of free trade has become enmeshed in the network of orders, regulations and prohibitions necessary to bring commerce in wartime under control. The process of applying these restraints has been no easy task for officials unversed in trade regulations, and has been irritating and irksome to foreign and Chinese merchants alike. Hitherto, formalities affecting trade have been confined to liquor, tobacco, and similar duties in the case of imports, and imperial preference certificates in the case of exports of local manufactures. Beyond this every merchant, shipper and dealer has been free to buy and sell as he wished; because of this freedom the colony has prospered and in the course of a century has built up commercial machinery of proved efficiency. To-day, nothing can leave the colony without an export permit, and few purchases can be made without first obtaining official sanction. Instructions from the Colonial Office have naturally been based on the urgent requirements of conserving shipping space and restricting supplies from Britain and America to material which will contribute to the general war effort or is necessary for the life of the community. But in a colony which has no natural resources, and is dependent for its existence on the interchange of goods or the products of its factories and shipyards, the withholding of any particular requirement may have wide-reaching results. The fear that restrictions of supplies might drive entrepôt trade to Manila or Shanghai has been shown to be groundless, as both these ports are as much handicapped as Hongkong, if not more so. In point of fact, a not inconsiderable amount of cargo shipped from the United States for account of Shanghai interests is lying here because of American restrictions on direct shipments to Shanghai, the ultimate destination of which has in many cases been Japan. It is, therefore, becoming evident to all concerned with trade here that control is unavoidable, if the realities of totalitarian war are to be faced, and so long as there is co-ordination between the various departments, civil, military and naval, the situation will be accepted with good grace.

The local government has been faced with the intricate problem of securing food and fuel supplies for a population of 1½ millions. The general disturbance to the normal flow of rice between producing and distributing centres of the Far East has been mainly responsible for the reduced quantities available for local consumption, but high freights have helped to increase prices to a level some 100 per cent above those prevailing in August, 1939. This has intensified malnutrition, and as a system of price regulation through licensed dealers proved a failure, the Government has now stepped in and has assumed control of the whole of the rice trade. A board of directors, mainly composed of British and Chinese business men, with the Financial Secretary as chairman, has been set up and is now taking over all stocks of rice in the colony. In the same way, the Government has taken charge of the firewood trade, after vain endeavours to control prices, and has had to arrange for the purchase and shipment of supplies from Borneo and Malaya. Rice and firewood are the main necessities for the subsistence of the population, and it is now hoped by Government action to improve the local supplies of fish, which is an important item in Chinese diet. Until the Japanese invasion of Kwangtung, abundant supplies of fish, eggs and vegetables arrived in the colony daily from many collecting points in the Canton River delta and along the coast, but owing to the Japanese blockade this trade has now become a small and uncertain trickle. So far, there has been little check on provisions for the foreign community, but delayed shipments have caused temporary shortages of certain things and have led to profiteering on the part of Chinese dealers hold-

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

ing stocks. These lines can, however, be classed as luxuries, and consumers have the remedy in their own hands.

A renewed outburst of Japanese military activity in the area of Kwangtung has now subsided. The main object of these operations was to stop once again the passage of goods into Free China, and, for the third or fourth time since October, 1938, the important market town of Waichow was occupied by the Japanese military forces. They have now evacuated the town, according to reports just to hand, and pressure from Chinese guerillas appears to have led to a general withdrawal of the Japanese to their original base.

Effect of Shipping Shortage

In his review of the trade of the colony during 1940 the chairman of the Hongkong General Chamber of Commerce expressed satisfaction that so little effect was felt from the world shortage of shipping, although the prospect for the current year was unsatisfactory. He made an interesting analysis of the trade statistics, showing that, while the entrepôt trade accounted for the preponderant share, exports of local manufactures increased by 46.8 per cent over the figures for 1939.

No less than five American standard cargo ships have arrived in Hongkong on their maiden voyage during the past two months. It is expected that they will be followed by others in the course of the year, and at a time when British shipping losses are mounting up, it is comforting for us here to see replacements already arriving, while our own local yards are busily engaged on building similar cargo ships for the Ministry of Shipping.

German Troubles in the Protectorate

[BY A CZECH CORRESPONDENT]

June 30th

THERE has always been, among the Czechoslovaks, a strong feeling of friendship, or at least of admiration, for the big Russian cousin. It was, therefore, only natural that the German authorities in the Protectorate took appropriate steps to prevent the Czechs from demonstrating their feelings about Russia's entry into the war. President Hacha had to broadcast a message against Communism, and the Gestapo is busier than ever.

The most important political event in the Protectorate, since the removal of former legionaries from the public service in March, and the seizure of the Sokol movement in April, has been the change in the leadership of the "National Solidarity Organisation," the only Czech political organisation which is allowed. Its former leader, Josef Nebesky, his three deputies, and its Secretary-General were dismissed by President Hacha, though they had all been prominent members of the Agrarian party, which long before Munich flirted with Hitler's "social" policy. These people have been replaced by a group which are even more subordinate to the Nazis. They are led by Jan Fousek, a big landowner and formerly a captain in the Austro-Hungarian army, who is also the president of the "League for Collaboration with the Germans." This league is trying to spread German philosophy and culture among the Czech intellectuals, and its final aim is to replace the last shadow of Czech politics—the "National Solidarity Organisation." Jan Fousek, now the president of both competing organisations, may be counted upon to lead the Czechs safely up the path in Hitler's Garden of Eden. His first statement was a promise to make the Protectorate "the most perfect

part of the Great German Reich." A paid agent of the Gestapo, the Fascist leader Jan Pavlik, is Fousek's deputy. Fousek also published an article stating that the Reich measures the sincerity and genuineness of the Czechs to the "new order" according to their attitude towards the Jews, and that anti-Jewish measures must be carried out thoroughly.

Germanisation is in full swing. All telephone exchanges have been ordered to reply in German, and afterwards in Czech only if particularly requested by the caller. The local school councils in Czech communes were hitherto chosen from the teachers and the Municipal Council. This trace of democratic self-administration has now been removed, and in future the local school councils will be appointed by the respective *Oberlehrer*. K. H. Frank, the Protector's deputy, has announced that only 40 per cent of Czech children who leave the elementary schools will be allowed to join the high schools. Czech good humour survives all such measures. It is said that, as all the leading personalities have had to be replaced by trustworthy people, the time has now come for the Apostles in the old City Hall's clock. They would be succeeded by Hitler *der Mächtige*, Goering *der Prachtige*, Goebbels *der Schmüchtige*, and the rest are *Verdächtige*. *Verdächtig* (suspect), however, is the whole nation.

Sabotage

The railways in the Protectorate are continually overloaded with German military transport; and it is obvious that the German account of the insignificant number of casualties in the Balkan campaign is completely false. The railways in the Protectorate have had to couple on 600 second-class coaches for the transport of wounded. German military transport towards the Soviet frontier goes on unceasingly. In this connection the reports of frequent sabotage on the railways are significant. Quite recently a military transport collided with an express train not far from Opava, and two days later a crash occurred between a military and a workmen's train in Plana; other serious derailments have also taken place.

Executions are frequent. A hundred and sixteen workers of the Skoda factory in Pilsen are said to have been shot in one month, because guns produced by them burst after the first few shots. Sabotage is sometimes on a large scale. It is reported that 3,000 tons of steel were spoiled by the workers, who poured zinc and sulphur into the metal. This steel was then used for the production of 7,000 guns which were distributed all over Germany and the occupied territory. Nevertheless, Czech workers are wanted badly to relieve the labour shortage in the Reich. There are about 132,000 Czech workers in Germany, 7,000 of them women.

In Prague alone there are now about 200,000 Germans. There is plenty of money at their disposal. The Union Bank, which represents private Nazi capital in the Protectorate, shows a balance-sheet total of 1,110 million crowns, which is considerably higher than during its best times in pre-Munich days. The "other assets" item of the National Bank grew from 5 milliards to 8 milliards during the last year. These assets are the Reichsbank debt to the National Bank, which shows how ruthlessly the Protectorate is being looted.

German Europe

Continental War Economy.—During the first stages of the war, Germany's war economy depended heavily on the resources of central and south-eastern Europe, and Russia. After the collapse of France, the conception of a Continental war economy slowly took shape, aiming at the balancing of the agricultural and mineral resources of the east and south-east with the productive capacities of Germany and the western countries, particularly France, Belgium and Holland. Germany incorporated the industrial areas of Czechoslovakia, Poland, Luxemburg, and Lorraine, and the most important industrial areas of Europe were thus unified under German administration, which private industry and the State shared. The next move resulted in active collaboration between German, Italian, French, and Dutch industries; and a central clearing system ensured the control of trade relations between continental countries. During the first months of 1941, the final object of Germany's economic policy became clear when the "Continental Oil Company" was founded, extending German cartels over the whole continent, and acquiring controlling capital interests in leading industrial and financial companies in all parts of Europe.

Slowly the emphasis of the German exploitation of other countries shifted from the Balkans to western and northern Europe. During the winter of 1940/41, Roumania and Hungary were disorganised by partitions and the cession of territory. Large scale troop movements; the war in Yugoslavia and Greece; the partition of Yugoslavia, and the creation of the state of Croatia—all these interrupted agricultural and industrial activities for a considerable time. Slovakia, Hungary, and Roumania are still fully mobilised; great parts of them are in the war zone. The war in the Balkans and the new war against Soviet Russia have put a heavy strain on agricultural production in south-eastern Europe, whose surpluses are needed in Germany and in western and northern Europe.

War Dividends.—In Germany another increase in industrial activity has been accompanied by greater concentration and by increased shortages of labour. The discussion about the position of private industries has flared up again. War orders benefit the big State-owned and private concerns. Repeatedly, the German Press has been compelled to give the assurance that small firms and private ownership are not threatened, and that concentration is a temporary war-time necessity. Actually, State-owned concerns and co-operative concerns owned by party or semi-party organisations have greatly increased their hold over industries.

Companies and shareholders, however, have found some compensation in increasing dividends. The Loanstock Law, which compelled the investment in Treasury bonds of dividends exceeding 8 per cent, was repealed in the spring of 1939. The recent campaign for a "dividend stop" shows that the population looks upon increasing dividends as war profiteering, and the government has been compelled to announce that a general "dividend-stop" will be imposed.

Since the Minister of Economic Affairs, Dr. Funk, announced a general limitation of dividends, more than three months have passed without any decision. There were rumours that dividends would be limited at 6 per cent. On dividends exceeding this limit, an excess profits tax, rising to 400 per cent, would be imposed. The latest statistics show that roughly 50 per cent of share capital earned a dividend of over 6 per cent. Any scheme aimed at limiting dividends would result in changes in the capital structure as well as in conditions on the capital markets. German as well as in conditions on the capital markets. German companies, which have been barred for a long time from the capital markets, are undercapitalised; on the average, the share capital of most companies has remained unchanged in spite of increasing activity and huge turnover. The companies were encouraged to build up large reserves which were only partly used for the so-called self-financing. The whole problem is a question of readjusting share capital to the increased scale of war-time activity, on the one hand, and to the persistent rise in share prices on the other. The index of the Berlin Bourse in the next column shows the movement of share prices since the beginning of the war.

The total share index has increased by 43.5 per cent. After a slump in March, caused by the announcement of a dividend-stop, the record level in February, 1941, was exceeded by the end of May. Average dividends increased

	Total Index	Mining and Heavy Ind.	Manufacturing Ind. (1,924-6=100)	Commerce and Transport
August, 1939	101.6	104.5	98.0	105.2
December, 1939	106.6	115.6	101.3	107.7
December, 1940	139.6	144.9	136.5	140.2
January, 1941	143.3	147.0	140.1	145.8
February, "	145.0	147.6	141.4	149.0
March, "	142.8	144.7	139.2	147.6
April, "	142.8	144.7	139.6	146.9
End May, "	145.8	147.8	143.6	148.0

from 6.4 per cent at the beginning of the war to 6.62 per cent at the end of March, 1941; average yields fell from 5.07 per cent in August, 1939, to 3.87 per cent at the end of March, 1941, which is very near to the yield on fixed interest securities.

Croatia.—Information about Yugoslavia, published by the German Press since the fighting ended, is exclusively related to the newly-formed state of Croatia, which covers roughly one-quarter of Yugoslavia's territory, and more than two-fifths of the Yugoslav population. The majority of the 7 million inhabitants are peasants. Wheat, maize, oilseeds, and fruit are the most important crops. The south of Croatia is favourable for the cultivation of olive trees and tobacco, and the livestock industry is fairly well developed. In recent years, German influence has been largely responsible for increased cultivation of oilseeds. Industrial centres are scarce and are mainly based on agricultural and forestry products; but the greater part of Yugoslavia's textile and chemical industry was in Croatia.

The Yugoslav resources of copper, lead, zinc, and chromium ore are in Serbia, but Croatia has bauxite as well as the only Yugoslav aluminium plant. Iron and coal, mainly lignite, are also mined in Croatia. The introduction of an authoritarian economic system is already fairly advanced. After an inventory of stocks and productive capacities, the rationing of textile goods, leather, and soap has been decreed. A price-stop and the prohibition of strikes have been proclaimed. The new Croatian central bank is about to issue a new currency which will replace the Yugoslav dinar. Jews and Serbs will be removed from all responsible positions in Croatia's economy. Plans have been made for the compulsory organisation of employers and workers. Apart from an agreement providing for the transfer of 54,000 workers to Germany, no details about the economic relations between Germany and Croatia have been published.

Synthetic Feeding Stuffs.—Norway, Sweden, and Finland are manufacturing cellulose for animal-feeding from wood in increasing quantities. In Norway and Sweden, output in the current year will reach 100,000 tons, and in Finland some 200,000 tons. Feed cellulose is used as substitute for carbohydrate natural feeding stuffs. In Sweden, it is called "wood oats," and it has good results when fed to cattle, horses, and sheep. Sometimes, it is mixed with protein substances, such as fish meal or soyabean meal. In Germany, where protein substances are particularly scarce, the sugarisation of wood has been practised for a considerable time. Recently a Government controlled company was formed by the name of "Berlin Cellulose Fodder," which will finance the erection of plants for the sugarisation of wood all over Germany. The plants will be equipped for the hydrolytic conversion of the cellulose into sugar, which is finally converted into a protein fodder. In the Scholler-Tornesch method sawdust and shavings can be used, and it is intended to erect the plants in combination with saw mills.

THE BUSINESS WORLD

Floating Debt Policy

BETWEEN the outbreak of the war and June 30, 1941, the floating debt increased from £1,167,500,000 to £3,062,970,000, and this expansion accounts for over 60 per cent of the increase in the National Debt during these twenty-two months. The proportion seems at first sight to be exceptionally and, indeed, dangerously high; so large a dependence on short-term borrowing suggests rash unorthodoxy; it appears to store up difficulties for the day when, with increased freedom, the capital market will again be in a position to reveal the dangers of a huge volume of debt regularly coming up for renewal.

First impressions are, however, fortunately deceptive. A considerable part of the expansion in the floating debt since the outbreak of the war represents the investments of various Government funds. For instance, as the substantial gold and foreign exchange assets of the Exchange Equalisation Account have been sold, the Exchange Account has taken up Treasury bills issued through the "tap." Tap bills were outstanding, at the beginning of the war, to the sum of £618,300,000, and they have more than doubled since. It is impossible to give the exact comparative figure for June 30th last, for since that day fell on a Monday it is impossible to divide accurately the outstanding volume of Treasury bills into those issued through the weekly tender and those issued through the tap; one can, however, assume that the total of tender bills on June 30th was, in fact, that which obtained at the end of the previous week, June 28th, that is, £945 millions, which would leave the latest total of bills issued through the tap—bills which may in toto be regarded as held by various public departments—at £1,411,995,000. This increase of £793,695,000 since the outbreak of the war is in large part the measure of the net liquidation of gold and dollar assets, though it also provides the counterpart of the £100 millions increase in the fiduciary circulation of the Bank of England. Over the same period, ways and means advances to the Exchequer by public departments rose from £49,200,000 to £158,725,000. Thus, the combined increase in tap Treasury bills and advances from public departments amounts to £903,220,000 and accounts for nearly half the total increase in the floating debt. In this light, the expansion in the floating debt loses much of the disquieting implication which it might otherwise hold.

The wartime increase in the "true floating debt," that is, the debt held in the main by the banks and the money market houses, thus shades down to the comparatively modest figure of £992,250,000. Of this, the major part, £519,000,000, is accounted for by the funds deposited directly by the banks with the Treasury in the guise of six months' deposits. Of the balance, £445 millions represents the expansion in the issue of Treasury bills made through the weekly tender from £500 millions to £945 millions. The remaining £28,250,000 is the ways and means indebtedness at the Bank of England, which the Exchequer had temporarily incurred over the turn of June, whereas no such debt was outstanding on the outbreak of the war.

In so far as the increases both in the tender issue of Treasury bills and in Treasury deposits represent the investment of funds accumulating here on behalf of central banks and issuing authorities in the sterling area, the wartime movement must be still further differentiated from short-term Government borrowing from the banks. The investment of sterling area funds in Treasury bills or deposits is virtually a compulsory investment, made as a result of the revolution caused by the war in the United Kingdom's balance of international payments and by the strict control of sterling exchange. It is, therefore, the investment of "good" money and, though made for the moment in the form of very short-term debt, it is an investment which it is reasonably safe to assume will be fairly permanent. If this factor is allowed for, particularly in the issue of Treasury bills by the weekly tender, it will be found that the financing of the war by means of floating debt borrowing from the banking system has been even

more modest than the above calculations suggest. This is borne out by the clearing bank statements, which show that, between August, 1939, and May, 1941, the banks' holding of bills discounted actually fell from £279,069,000 to £172,807,000. Even if an appreciable reduction in the volume of commercial paper over this period is allowed for, this fall probably indicates a decrease in their holding of Treasury paper.

This, at least, is the conclusion suggested by the experience of the clearing banks which separate their holding of Treasury and commercial paper in their balance sheets. In the case of Lloyds Bank, for example, the holdings of British Government Treasury bills fell between August, 1939, and May, 1941, from £38,319,000 to £25,115,000. This drop may not be exactly representative of the experience of the whole banking system, but as a guide it cannot be disregarded. It suggests that rather more than the increase of £445 millions in the issue of Treasury bills through the weekly tender has, in fact, gone to satisfy the investment requirements of sterling area countries whose funds in this country have been steadily increasing since the outbreak of the war.

If this increasing diversion of Treasury bills into channels that form no part of the true domestic credit structure is recognised, there has at no time since the outbreak of the war been any suggestion of an excessive volume of bills being foisted on the banks. It may, therefore, be asked why the Treasury and its financial advisers should have gone out of their way to substitute for the Treasury bill another form of short-term borrowing, namely, the six months' Treasury deposit, as the truly "dynamic" element in the floating debt. It is this item which now takes the impact of what remains of the seasonal fluctuations in the flow of revenue and expenditure. The issue of Treasury bills through the weekly tender, which previously fulfilled this function, has now been virtually stabilised. It remained, with very few exceptions, at £65 millions a week between November, 1939, and April last. Then, in two steps of £5 millions each, it was brought up to the present figure of £75 millions a week. There it remains, unaffected by the week-to-week variations in the gap between expenditure, on the one hand, and revenue plus receipts from the long-term Government loans, on the other. The balancing function is now performed by Treasury deposits, the week-to-week demand for these made on the banks eligible to subscribe fluctuating within wide limits.

This new form of short-term borrowing has certain advantages to both parties. The Government gets its money for six months at less than 1 per cent higher than the rate it pays on three months' Treasury bills. The banks, for their part, have in their Treasury deposits an investment which they can encash at par at any time during the currency of the deposit, if they wish to reinvest the proceeds in any one of the longer-term new issues of the Government. This in itself, however, hardly justifies the abandonment of the Treasury bill as the live element in the floating debt. Some other consideration must have been at work in the decision to use the Treasury deposit instead. This was no doubt the convenience and effectiveness of a form of borrowing which would establish direct contact between the banks and the Treasury. In the pre-war organisation of the London money market, no such direct contact existed. The banks did not tender directly for Treasury bills, and Government borrowing from the banks by this means had to be made through the discount market. There was an understandable objection to canalising the whole of the large expansion in floating debt borrowing through the comparatively narrow channel of the discount market. The market could undoubtedly have handled the additional business, but it may well have occurred to the authorities that the extra adventitious profit on this increased turnover would not be altogether justified.

In the early months of the war, this objection was to some extent overcome by the practice of feeding the banks

direct with Treasury bills originally issued through the tap. These special "back door" sales of bills developed into a new technique of open market operations which completely by-passed the discount market. They persisted from the autumn of 1939 until July, 1940, when the issue of Treasury deposits was begun. This new method of marketing Treasury bills was at no time officially acknowledged. It was evidently on trial for those few months, and apparently it was found wanting. It blurred the distinction which has always existed between Treasury bills issued to the market through the tender and the tap bills which have been issued for inter-departmental operations. Moreover, the machinery of the London market did not really lend itself to this form of direct operation in bills between the banks and the Bank of England. There was no tradition for such direct contact in bill business; the organisation for it had to be built up from nothing; and the attempts made to do so were not conspicuously successful.

It was therefore decided to achieve this direct contact between the banking system and the Treasury by a new form of borrowing which could be openly operated through the Clearing Bankers' Committee. Each week the amount which the Treasury wishes to obtain from the banks is communicated to the chairman of the committee, and the apportioning of this total among the rota of banks which

take part in these operations is left to the committee. This form of borrowing combines the advantages of extreme simplicity of procedure with the elasticity that comes from the direct contact established between the Government, which is now overwhelmingly the most important spender and recipient of funds in the country, and the banking system through which virtually the whole of the turnover of funds flows. The amount required from the banks week by week is carefully adjusted to the known requirements of the Treasury; and, as the banks themselves are given discretion as to the days of the week on which they make their payments of Treasury deposits, it may be assumed that the new form of borrowing minimises the disturbance of bank cash by Government income and expenditure as far as is possible in the abnormal circumstances of to-day.

The principle of direct contact between the banks and the Treasury represented by this form of borrowing found some kind of precedent in the practice of banks during the last war to deposit surplus cash at interest with the Bank of England. But at no time did this procedure acquire either the scope or the organised procedure which Treasury deposits have already achieved. The new system of direct Treasury borrowing from the banks bears the promise of permanence; and the London discount market will take due heed of this development.

Finance and Banking

Half-Year End Stringency

The turn of the half-year in the money market proved rather more difficult than had generally been expected. Although the discount market had succeeded in keeping a fair number of June 30th maturities in its portfolios and although payments for new bills this week were not begun until the turn of the half-year had been passed, the market found itself struggling for loans on the last day of June. A number of banks, particularly non-clearing institutions, were calling funds from the market. The supplies of cheap "outside" money thus vanished, and the market learned once again that however "good" such money may appear to be in normal times, it cannot compete in permanence with clearing bank money placed at its disposal. Faced with a fairly appreciable withdrawal of funds, the discount market would, in normal circumstances, have been driven to the Bank for a considerable amount. Such procedure has, however, become anachronistic in the present operation of the money market. Instead the "special buyer" came into the market, and bought bills from all houses which found themselves unable to balance their books. The fact that there were heavy maturities of Treasury Bills on Monday, and that payments for the new bills issued this week did not begin until Tuesday, compelled the Treasury to seek temporary accommodation at the Bank of England. Another factor in this decision was the deferment by the banks of all payments in respect of the £20,000,000 Treasury deposits due to be made this week, until after the turn of the half-year. Thus at the close of business on Monday ways and means advances at the Bank of England were outstanding to the tune of £28,250,000. These advances are reflected in the latest Bank return, which shows an increase of no less than £44,400,000 in Government securities. As this also includes the heavy official purchases of bills made in the open market last Monday, it may be assumed that some repayments of the ways and means advances had already been effected by the close of business on Wednesday.

Back to Abundance

By Tuesday the additional bank cash pumped into the credit circulation by the ways and means advances to the Treasury and the open-market operations of the Bank brought its full effect to bear on the money market position. Substantial amounts recalled on the previous day for balance sheet purposes found their way back to the market, and from stringency the position changed abruptly to abundance. The banks became keen buyers of bills again, and the market which had only obtained a 27 per cent allotment at the previous tender and which had sold fairly heavily to the special buyer on the previous day found itself unable

fully to satisfy these demands. The ease of the position is fully illustrated by the latest Bank return. This shows bankers' deposits at the 'exceptionally high level of £164,443,000, an increase of £51,907,000 on the week. This expansion reveals the effect on bank cash of the Treasury's ways and means borrowing from the Bank and of open-market purchases of bills. It is also accounted for in part by a running down of public deposits to the tune of £13,069,000. The increase in bankers' deposits would have been greater still but for a further expansion of £4,381,000 in the note circulation. This has carried the total of notes outstanding to the record level of £643,365,000 and leaves only £36,876,000 of unissued notes in reserve. Another adjustment of the fiduciary circulation is looming up on the horizon.

* * *

Over £3,000 Millions

The National Debt return for the end of June marks another milestone in the expansion of the floating debt, which for the first time in the history of British Government finance has passed the £3,000,000,000 mark. The increase over the month of June amounted to about £113,000,000, of which £41,600,000 was accounted for by the increased Treasury bill issue, £20,500,000 by Treasury

The War and Life Assurance

In these days of stress the necessity for assuring against the normal uncertainties of life is stronger than ever and you can provide in the very best way for those dependent upon you by taking out a Whole Life Assurance under THE DISTINCTIVE SYSTEM of The Scottish Provident Institution.

The rates of premium are low, thus securing a large assurance cover (excluding war risks) from the outset, while the right to participate in the surplus is retained.

FUNDS - £25,000,000

Founded for Mutual Life Assurance in 1837

deposits, £22,700,000 by ways and means advances from public departments, and the balance of £28,250,000 by temporary borrowing from the Bank of England. The fact that June 30 fell on a Monday makes it impossible to divide exactly the total of Treasury bills into tender and tap bills. The former issue has, however, been rising during the past month at the rate of £10,000,000 a week, and it may therefore be assumed that almost the whole of the expansion in the total of Treasury bills is accounted for by the tender issue. The tap issue of bills is thus stabilising itself at around £1,411,000,000. The gradual disappearance of the considerable fluctuations to which this item in the floating debt has in the recent past been subject must be linked with the exhaustion of the gold and exchange reserves of the Exchange Equalisation Account. It was the expenditure of these reserves and the reinvestment of the resources thus liberated in Treasury bills issued through the tap that accounted for the main part of the huge increase in this part of the floating debt since the outbreak of the war. It should be noted that at the end of March, 1937, when the gold holdings of the EEA were near their apex, the outstanding volume of tap Treasury bills was no higher than £117,600,000.

Building Societies' Rates

Building societies as a whole are coming into line with the general movement to reduce the rates of interest paid on deposit and share accounts. The first move in this direction was made by the Halifax Society, which last February reduced the rates on new accounts. This week the Abbey Road has given notice that, from October 1st next, it will reduce the rate of interest on deposit accounts from 2½ to 2¼ per cent and on share accounts from 3 to 2½ per cent. The move is justified on the ground of the additional burden placed on the Society by the War Damage Act and by the further increase in taxation. If account is taken of the fact that these rates are paid free of tax, it will be evident that the reductions just announced must not be taken as evidence

of a further general reduction in interest rates. The gross yields represented by these rates are still comfortably above the level of interest rates fixed by privileged gilt-edged yields such as those given by Post Office and Trustee Savings Banks and National Savings Certificates. Indeed, the flavour of lower rates provided by this move may before long be counteracted within the building society movement itself by an endeavour to increase the rates paid by mortgagors. Other rumours of a resumption of the trend towards yet cheaper money have lost their potency in recent days. It now seems unlikely that the next series of National War Bonds, which must make its appearance before August 15th next, will bear terms appreciably dearer to the investor than the current series. The Chancellor has again given the most categorical refusal to any countenancing of a lower Bank rate or to any compulsion on banks and discount houses to lower their short term money and discount rates.

Financing Expenditure

The following table summarises the Exchequer returns of the financial year to date, and shows the respective shares of revenue and borrowing in meeting expenditure:—

£000		£000	
Total ordinary expenditure	1,071,241	Total ordinary revenue	319,158
New Shaking Funds	1,506	Loans raised:	
Loans repaid:		3½ Def. Loan 1934-38	45,731
4½ Conv. Loan	45	3½ Def. Bonds (net)	57,238
Public Dept. Advances	13,535	3½ Savings Bonds	129,675
Miscellaneous Issues (net)	1,277	2½ Nat. War Bds. 1940-48	201,400

INSURANCE NOTES

Commercial Union.—In the life revenue account of the Commercial Union, extracts from which appear below, death claims display a marked rise; the statement circulated by the chairman (Sir Bertram Hornsby) explains, however, that the figure of £692,689 includes £50,221 due to enemy action and, even so, is within expectation:—

		Rise or Fall
New Business:—		
Net sums assured	£2,901,898	—£1,817,124 (38.5%)
Income:—		
Net premiums	£1,991,890	—£4,311 (0.2%)
Net interest	£819,509	—£49,302 (5.9%)
Outgo:—		
Claims by death	£692,689	+£146,305 (21.1%)
Claims by maturity	£965,017	—£2,469 (0.3%)
Surrenders of bonus	£172,899	—£58,119 (3.4%)
Commission and expenses	£223,104	—£16,159 (7.2%)
Commission and expenses — ratio to premiums	11.2%	— 0.8%

£171,920 has been written off securities in the life revenue account. The current bonus period ends on December 31, 1942; the question of interim bonuses is under constant consideration, and the directors hope to maintain the present scales for the remainder of the current year, at the same time reserving the right to change them at any time should circumstances so demand.

On a premium income which in the aggregate manifests but little variation, underwriting profits in the fire, accident and marine department exceed £1,000,000. In comparing these profits, however, with those for the previous year, allowance must be made for a change in accounting procedure; in 1939 Dominion, Colonial and foreign taxes were debited to underwriting, whereas in 1940 such taxes, amounting to £119,658, figure in the profit and loss account.

	Premiums	Rise or Fall	Underwriting Profits	Rise or Fall
Fire	5,554,418	+185,045	172,505	—190,108
Accident	7,533,871	—848,525	707,357	+256,303
Marine	1,337,716	+441,488	150,000	+75,000
	14,426,005	+21,992	1,029,862	+141,195

Fire business at home has been less profitable than for many years past, and in the United States, "despite a not unsatisfactory claims experience and a welcome reduction in the heavy burden of expense, the fire business left no margin of profit." The accident profit, although owing something to a substantial release of premium reserve, is exceedingly good; the American casualty account, which is handled by the "Ocean," again furnished satisfactory results.

Credit transfers to profit and loss, including net interest of £608,343, aggregate £1,664,088. Of this, Dominion, Colonial and foreign taxes, previously referred to, take £119,638; ARP expenses, freehold premises account and pensions £178,000, and income tax and NDC £356,156. Debenture interest requires £36,189. The dividend at the same rate as before costs £627,048; after providing for this and making a transfer of £335,000 to general reserve, the balance to be carried forward of £94,655 is higher by £12,056. The general reserve also receives a transfer of £114,391, representing accrued interest at December 31, 1940, an asset which apparently has not been taken credit for in the past; against these combined transfers of £449,391, the general reserve stands at £4,723,928, an increase of £162,695, the difference of £286,696 being mainly accounted for by losses sustained on the sale of certain United States railroad bonds. Assets in general are certified to be fully of the value stated taking into account the "provision for depreciation of investments," this presumably being an un-

defined part of the general reserve. There are additional reserves of £7,704,383 in the fire and accident funds.

Alliance Assurance.—Unfavourable mortality was experienced by the life department of the Alliance in 1940, the strain on the fund—the actual claims less the reserves held against the lives in question—being £45,000, against a mortality profit of £86,000 in 1939; these figures were quoted by the chairman (Mr. Lionel N. de Rothschild) in his address to the shareholders, but the extent to which the war has been responsible for the adverse results was not indicated. Extracts from the life revenue account are given below:—

		Rise or Fall
New Business:—		
Net sums assured	£1,226,174	—£1,568,053 (56.1%)
Income:—		
Net premiums	£1,431,185	—£54,865 (3.8%)
Net interest	£801,872	—£80,766 (9.1%)
Outgo:—		
Claims by death	£1,173,322	+£202,066 (17.3%)
Claims by maturity	£818,053	+£38,466 (4.7%)
Surrenders of bonus	£189,047	—£114,039 (6.0%)
Commission and expenses	£140,503	—£5,473 (3.9%)
Commission and expenses — ratio to premiums	9.8%	—

The fire account of the Alliance includes much of the "cream" of the business available at home, and even in a generally bad year registers a profit of over 10 per cent; the rise in claims is attributed in the main to an unprecedented number of losses caused by burst water pipes, a risk which is covered under comprehensive policies on private households. The experience of other offices will have prepared shareholders for a sharp drop in accident premiums, owing to

Investment

Short Money and Stock Values

Despite uncertainty, both as to the progress of the Russian conflict, and as to the Government's intention with regard to the possible replacement of the existing "tap" issues of National War and Savings Bonds, the market recovery was continued until Wednesday when a technical reaction set in. The indices of *The Financial News*, and the figures selected from *The Actuaries' Investment Index* show the Funds at a new peak for recent years, fixed interest, in general, fully up to their best, and industrial equities still making very good progress, after more than two months of recovery. The marked fall in yields in the last section arises in part from lower dividends on gas, oil and iron and steel shares, as well as from a general upward trend

stocks. This movement has been effected partly by the purchase of shares in concerns which had previously been avoided as being exclusively occupied on production for war purposes.

Moderation Probable

While the qualified success of Russia in resisting Germany may be accepted as the explanation of the maintenance of activity, it is doubtful whether the general background of price movements would have been very different had Germany not attacked that country, but had pursued instead her drive directly towards Suez. It is reasonably certain that the operative causes are still the search for means of maintaining net income, and the upward pull of a falling rate of interest. There is considerable doubt how far the movement owes anything to the possibility that the Treasury will take drastic measures to reduce

in quotations, even in these industries. If business is not quite so brisk as it was some days ago, this is due mainly to a reduction in the frankly speculative buying of developing kaffirs. With this exception, there has been some widening of the basis, including a spread into the high-yielding, lesser known industrials to which attention was directed in *The Economist* last week. Taking the month as a whole, the feature has been the renewed rise in the Funds, accompanied by a relative neglect of fixed-interest securities junior to corporation and Dominion loans, resulting in a widening in this particular yield margin, and a reduction in the yield margin between equities and any class of fixed-interest

still further the rate which it pays for short-term loans. In the more extreme form such a policy seems to invite trouble out of all relation to the benefit to be gained. To suggest a halving of all short-term rates would mean an adjustment downward of all long-term charges, which, it seems, would adversely affect the savings campaign. Whether this happened or not, it would markedly affect all long-term yields, for it would greatly widen the margin between the return obtainable on the old longer-dated Government stocks, and those on current offers, including the rate paid on Post Office deposits. A less drastic, and much more probable variant would affect longer-term rates

INSURANCE NOTES

(Continued from page 18.)
the loss of Continental business and to the laying-up of cars; the very satisfactory underwriting result includes a small profit on the motor section, which has shown a considerable improvement. Marine premiums advanced strongly in keeping with the general trend:—

	Premiums	Rise or Fall	Underwriting Profits	Rise or Fall
Fire	2,175,619	—20,790	242,350	—183,413
Accident	1,205,205	—166,435	134,744	+26,492
Marine	951,675	+369,103	74,223	+56,562
	4,332,499	+181,878	451,317	+100,359

Profit and loss account receives credit transfers of £827,180, including net interest of £287,958. Expenses not charged to the underwriting accounts and various other items, including £50,000 for pensions, take £195,624, and profits taxes £165,604. £100,000 is being utilized to form a reserve for contingencies arising out of the war. The dividend is maintained at the same rate as last year. The profit and loss balance, before making provision for the final dividend,

is £1,114,812, a reduction of some £36,000 on the figure brought in, but the chairman indicated that the final dividend will cost some £63,000 less than last year, so that the balance remaining will be slightly larger than the corresponding balance a year ago. In the balance-sheet, the paragraph of the directors' certificate applying to the life accounts states that book values of Stock Exchange securities exceed market values by an amount which is less than 2½ per cent of the total assets of the life accounts, but gives no information regarding the values of the other assets; in the other accounts the assets are certified to be, in the aggregate, fully of the value stated. In addition to the balance of profit and loss account and to the reserve for contingencies arising out of the war, referred to above, there is a general reserve of £1,900,000, as well as additional reserves in the fire, accident and marine funds totalling £3,740,000.

Standard Life.—Extracts from the life revenue account for the year ending November 15, 1940, are set out below.

Despite the fall in new business, premium income is well maintained, and the rate of interest remains remarkably high at a net figure of £4 8s. 4d. per cent. Death claims are lower notwithstanding the inclusion of £50,000 due directly to enemy action:—

		Rise or Fall
New Business:—		
Net sums assured	£2,244,913	—£1,785,495 (44.8%)
Income:—		
Net premiums	£2,569,691	+£27,478 (1.1%)
Net interest	£1,306,363	+£25,184 (1.9%)
Outgo:—		
Claims by death	£802,658	—£85,587 (10.7%)
Claims by maturity	£474,291	+£33,891 (7.4%)
Surrenders of bonus	£380,146	+£38,543 (10.1%)
Commission and expenses	£268,888	—£40,169 (13.4%)
Commission and expenses — ratio to premiums	10.5	— 1.7%
Consideration for annuities	£348,877	+£262,241 (75.2%)
Annuities paid	£584,201	—£11,024 (1.9%)

The life assurance and annuity fund has increased from £29,342,444 to £31,128,357. The chairman (Mr. H. A. Jamieson) stated at the annual meeting (Continued on page 29, column 2.)

only indirectly, through the usual machinery of encouraging banks, and other money houses, to take up a rather higher percentage of longer-dated securities. Since the banks' holdings of these are already unduly large, owing to the fall in advances, such a policy will meet with some resistance, and the effects of the change can easily be exaggerated. It is, however, very probable that the rise in long-dated Government stocks, which has been in progress for many months, will continue for other reasons, and it is only in so far as the recent movement has been based on exaggerated expectations of the effects of a further development of the cheap-money policy that it should be distrusted.

Australasian Investments

Since the war began, investors in Australasian securities have been little more immune from wartime disturbances than those whose holdings are exclusively at home. At the start, the outlook was extremely uncertain, but the situation was improved by the agreements to purchase staple products and the picture conjured up of an accumulation of vast sterling balances to be used for large-scale repayments or purchases of Government debt in this country. By this spring, the situation has been so far reversed by the demands of Australia for the raw materials to expand war-time industry and by shipping difficulties that the British Treasury thought it well to accord to the Commonwealth conversions the same support given to those of home corporations. Unfortunately, the shipping position has deteriorated further and, were it not for the new agreement, described on page 11 of this issue, the position of Australian balances might have given cause for anxiety, while the return of New Zealand to a healthy position would have been placed in jeopardy. The investment implications must await the working out of the scheme; but the main outlines are clear. Sterling payments by the British Treasury will remove all doubt of adequate funds to meet debt service, unless the shipping position grows much worse, and this should tend to accentuate the steady rise in the prices of the loans of the Commonwealth and the Dominion. Investors in manufacturing industry in the Commonwealth have had no cause for anxiety, but those in pastoral and land companies were less fortunately placed. It would seem that, if the new policy is a success, it should improve their position considerably, both by giving the producer an assured sale, at reasonable prices, during the war and by extending his market and leading to some modernisation of his product which may stand him in good stead over a longer period.

Company Notes

Elder Dempster Results

In common with other shipping concerns, the gross revenue of the operating company, Elder Dempster Lines, showed a substantial improvement in 1940, from £855,156, before expenses of £158,619, to £962,495 after expenses. Much of the increase is, of course, absorbed in income-tax and EPT, the provision for which has jumped from £150,000 to £425,000. Fleet depreciation remains at £300,000; in 1939 there was an additional allocation of £15,000 against German assets. Thus, the dividend, which is raised from 9 to 10 per cent, is covered by a rate of 16.4 against 13.0 per cent, and the allocation of £75,000, against nil, to general reserves permits a rise in the entry forward from £245,578 to £255,598. The holding company, with a net income from dividends of £136,533 for the year to June 15, 1941, against £144,907—there is, of course, again no dividend from the Belgian holdings—has raised the payment on ordinary shares from 8 to 9 per cent. The margin of cover, at £130,453, is extremely narrow for a payment absorbing £129,871, but the position shows some

improvement on that of the previous year, when the 8 per cent payment was supported by a rate of earnings of only 7.9 per cent. The directors state that general investments, standing in the balance-sheet of the holding company at £172,687 at cost, have, apart from the Belgian holdings, a market value in excess of book value. The balance-sheet of the operating company shows a substantial fall in the value of fleet at cost, after depreciation of £300,000, from £2,213,000 to £1,553,000, due in part to enemy sinkings. Against this, the company holds reserves of £1,693,000, of which £302,600 is, however, represented by reserve for fleet replacement in terms of the Government tonnage scheme, and is not yet available for the company's use. The company has invested some £1,167,000 in British Government securities at cost during the past year, while cash holdings are some £63,000 higher at £419,590. The jump in debtors from £295,000 to £1,868,000—a rise which exceeds the increase in creditors including taxation, and net receipts in open voyage accounts by some £340,000—is probably to be explained by sums owed on Government account. The whole of the company's fleet has, of course, been under Government requisition since mid-1940, and the directors do not expect that profits will be fully maintained during the current year. The £1 shares of the holding company, at 25s. 9d. ex dividend, yield £6 19s. 10d. per cent.

Ironfounders' Recovery

The full accounts of Allied Ironfounders for the year to March 31st last show a very minor rise in total income from £113,677 to £114,853, and a rather larger one in the main contribution to this total, namely, dividends from the operating concerns. Since these amounts are after tax in each case, they conceal a much more substantial recovery in earning power, and it is possible to raise the dividend on the ordinary capital from 5 to 6 per cent after providing the preference payment and placing £25,000 to income-tax reserve, in itself an indication that profits are expected to be fully maintained. A year ago, there were no reserve allocations, but the addition to the carry-forward was substantial. The table below summarises the position during the past three years:—

	Years to March 31st.		
	1939	1940	1941
Total revenue.....	203,389	113,677	114,853

------------------------	--------	---------	---------	---------

† Income Tax Reserve. ‡ After crediting £1,558 in 1940 and £1,052 in 1941 for refund of income tax

The group specialises in light castings, and has, in consequence, not found it easy to replace by Government work the heavy fall in orders resulting from the collapse of new building. In his speech accompanying the report Mr A. W. Steven, the chairman, refuses to make a forecast, but sees in the progress of the past year reasonable grounds for expecting even better things during the current period. The consolidated balance sheet shows that depreciation has exceeded additions to plant, and this, with the transfer to reserve, has improved the cash position. Work in progress is down on the year, but total liquid assets show a rise of some £157,000 against an increase in creditors of £110,000. The balance sheet still contains an item of some £320,000, representing the goodwill element in the original purchase price of the operating concerns. The price of the £1 ordinary shares is 16s. 10½d. ex dividend, offering a yield of £7 2s. 2d. per cent.

Distillers' Profits

The preliminary statement of Distillers, for the year to May 15th last, shows a fall in net profits—after tax, contingencies, directors' fees, debenture interest and an unspecified sum written off buildings and investments—from £2,399,467 to £2,110,936. In the previous year, the amount written off investments and fixed assets was disclosed as £29,374. The distributable surplus is increased,

in the year to May 15, 1941, by the inclusion of £78,137 over-provided for ordinary distribution in the previous year. Thus, it is probable that the reduction in equity earnings is moderate. The dividend is maintained at 16½ per cent, paid in 1939-40 on the ordinary capital after a 40 per cent scrip bonus, and the carry-forward is raised from £537,272 to £544,139 despite increased allocations to fire insurance fund and general reserve, from £100,000 to £225,000, and from £476,385 to £600,000, respectively. These results earned in a full year of wartime trading are highly satisfactory. The company was hampered last year by restrictions on distilling and by reduced retail sales in the home market. No information is yet available regarding the maintenance of exports to the United States, but it is probable that total receipts were up on the year and that higher taxation has been the main influence in restricting net earnings. The £1 ordinary stock, at 65s. ex dividend, yields £5 per cent.

Rubber Profits

The following analysis of the results of five leading rubber companies provides evidence of a further general and substantial improvement in profits last year. Of the five concerns included in the following table, all but two have interests located wholly or primarily in Malaya. *Sialang* is an important Sumatra company; *Grand Central* has no interests outside Ceylon. The results of the five companies tend to suggest that the past year has been more favourable for the Malayan concerns than for those situated elsewhere. None of the Malayan companies has failed to realise an improvement both in total profits and in equity earnings, and two of them, *Kepong (Malay)* and *United Sua Betong*, have raised dividends, from 11½ to 12½ per cent and from 12½ to 15 per cent, respectively. The setback to *Sialang* earnings is due mainly to a rise in NEI taxation, but estate expenses and freight charges are also much increased. Gross revenue actually improved from £71,573 to £105,008. The reduction in equity earnings of *Grand Central (Ceylon)*, despite higher total profits, from £84,414 to £82,762, is accounted for by the allocation of £75,000 against nil to tax reserve.

Company (Years to December 31)	Total Profits	Earned for Ord.		Divi- dend	Present

* Years to January 31. † After depreciation of investments.
‡ After amounts written off matured areas.
§ After estate expenses. ** 2s. shares.

The improved results for the past year have been based on a combination of higher selling prices and higher output for the second year in succession. In the majority of cases, these influences have been sufficient to offset the adverse effects of rising income tax and EPT, and rising freight and insurance charges. Despite the increasing use of synthetic products and the separation from German-controlled markets, absorption remains high in the countries to which producers still have access, and there is every prospect that the United States demand will increase still further in the coming year. Subject to the solution of shipping problems, shareholders may regard current prospects with temperate optimism. Yields range from £6 17s. 1d. per cent for *United Sua Betong* to £10 8s. 8d. per cent for *Grand Central (Ceylon)*.

English Sewing Cotton

The preliminary figures of English Sewing Cotton for the calendar year 1940 shows that revenue has been well

maintained. The net profit figure, after taxation, depreciation and fees, amounts to £205,812 against £214,329. Since the allocation to staff pensions is halved at £5,000, equity earnings are only moderately reduced from £154,329 to £150,812. With a repetition of the payment of a total 7½ per cent distribution on ordinary stock, the cover provided by surplus earnings, at a rate of 7.6 against 7.8 per cent, is extremely narrow. The position is, however, more satisfactory than in 1938, when the 7½ per cent ordinary dividend was only earned to the extent of 4.3 per cent and £50,000 was drawn from dividend equalisation reserve. In view of rising costs and taxation in 1940, the results must be considered highly satisfactory, but whether the level of net earnings and of dividends can be maintained in the current year is doubtful. It may be that demand will be maintained, but there is every possibility that charges against profits will continue to increase and no guarantee that these will be offset by a parallel rise in gross receipts. Further analysis of the position, however, must wait for the publication of the full accounts. The company's £1 ordinary stock, at 25s., offers the sound yield of £6 per cent.

Clan Line Earnings

Against the general trend of markedly higher earnings for both liner and tramp companies, Clan Line have suffered a fall in profit of £52,067 to £540,953 for the year 1940. This figure is after tax, which will doubtless account for most, if not all, of the decline, but does not explain the difference in the company's experience. The fall in earnings does not contain any immediate threat to the dividend on the ordinary shares, which is maintained at 20 per cent. The earnings percentage, which fell, with a break in 1937, from 94.0 for 1934 to 37.5 for 1939, probably dropped further last year. Possibly the anomaly will be explained in the report. Meanwhile the shares at 47s. yield £4 3s. 4d. per cent less tax, which suggests public confidence in a recovery in earnings.

Note: all dealings are for cash

THE resistance of Russia against the initial German attacks, and the news from Syria continued to serve as a background to the investor's need for higher yields. Before the week-end, the high level of activity in the gilt-edged market, further stimulated by fresh rumours of an impending loan, rather over shadowed the activity of other markets, which, however, closed extremely firm, small price increases being general. Monday witnessed a good opening with considerable activity, but the less encouraging news from the Russian front led later to much quieter conditions, although the general tone in all sections remained extremely firm until Wednesday, when some falls occurred.

Gilt-edged issues finished well up at the week-end, while after increases of $\frac{1}{8}$ to $\frac{1}{4}$ on Thursday and Friday, $2\frac{1}{2}$ per cent Consols, $3\frac{1}{2}$ per cent Conversion and 3 per cent Local Loans all attained the highest levels since 1937. Monday witnessed a further upward movement with $2\frac{1}{2}$ per cent Consols, Local Loans and others rising $\frac{1}{8}$, and both War Loans, the $3\frac{1}{2}$ per cent Conversion Loan and a long list all up $\frac{1}{8}$. Tuesday's news, however, saw the movement come to a halt, $2\frac{1}{2}$ per cent Consols losing $\frac{1}{8}$, although $3\frac{1}{2}$ per cent Conversion and $3\frac{1}{2}$ per cent War Loan and Victory bonds rose a similar amount, prices otherwise remaining unchanged. The $2\frac{1}{2}$ per cent and 3 per cent India Loans which had opened the week with increases of $\frac{1}{8}$ to $\frac{1}{4}$ added $\frac{1}{8}$ on Tuesday while the $3\frac{1}{2}$ per cent failed to recover the previous day's loss of $\frac{1}{8}$. In midweek, prices were generally easier, selling being concentrated on undated Funds.

A certain amount of optimism animated the foreign bond market before the week-end, particularly the Far Eastern issues, outstanding among which were the Japanese issues, led by the 5 per cent and 6 per cent bonds of 1907 and 1924 before the week-end, while on Monday the $5\frac{1}{2}$ per cent 1940 Loan rose 3 points. Tokyo Corporation loans moved in sympathy, while South Manchurian 5 per cent and Chinese loans, especially the Boxer Loan, gained point increases. In the European issues, German 7 per cent Potash bonds were strong before the week-end, while Tuesday saw a revived interest in French railway issues. Brazilian loans dominated an otherwise quiet South American market, and both before and after the week-end Egyptian Unified strengthened a point on the Syrian news.

Before the week-end, business improved in the home rail market, GWR ordinary and Southern deferred gaining $\frac{1}{4}$ while LNER 4 per cent Debenture and 4 per cent 2nd Guaranteed rose by $\frac{1}{8}$. Monday saw a considerable increase in the volume of business, the main feature being the improvement in LNER senior stocks, while GWR and LMS ordinary advanced fractionally, and LMS 4 per cent guaranteed and 4 per cent preference and 1923 preference all added $\frac{1}{8}$ point. The following day, however, business was slight, and apart from small gains by LMS ordinary and 4 per cent debentures prices remained unchanged. In the foreign railway market, Argentine issues were in favour and fractional price increases were general. As elsewhere business slackened off on Tuesday, although there were a few upward changes in the price of B.A. Pacific issues, while Canadian Pacific ordinary recovered the previous day's loss of $\frac{1}{8}$ and the 4 per cent preference added $\frac{1}{8}$.

Towards the week-end, business in the industrial market lessened, but the general tone remained very firm. Interest continued to be taken in motor and aviation shares but at the week-end movements

were irregular, although later a firm tone developed with small price changes, except Raleigh Cycle Holdings, which are $\frac{1}{2}$ up on the week. Breweries, however, were a strong feature, Benskins rising $\frac{1}{8}$ and a further $\frac{1}{8}$ on Monday, while Distillers, Guinness and Barclay Perkins were all up on Friday. After closing strongly at the week-end, stores were firm, but on Tuesday both Woolworths and Marks & Spencer dropped slightly. Steel shares found steady support but price changes were very slight with gains and losses of a few pence over a wide field. Electrical equipment shares were quiet but steady, while Cable and Wireless preference shares were up $\frac{1}{8}$ on Friday but the ordinary lost $\frac{1}{8}$, recovering this loss on Tuesday. Textiles were strong, Coats, Bradford Dyers and Calico Printers finding support at the beginning of the week, while Courtaulds, after closing strongly at the week-end, dropped $\frac{3}{4}$ on Tuesday. Emmies found considerable support on Monday, but suffered a slight setback on Tuesday. Elsewhere, tobacco shares were firm, but, on Tuesday, BAT lost $\frac{1}{8}$.

In the kaffir market there was little business either before or after the week-end, due to the fact that Cape prices were not ex dividend until Tuesday. The week opened with some buying of Government Areas, Grootvlei and New State Areas. On the following day, business was on a larger scale, but losses predominated, Blyvoors, Libanon, Venterspost and Rand Mines all being quoted lower. The rubber market closed on a firm note. At the beginning of the week, turnover was small, but prices were held, while on Tuesday Bukit Rajah, Sungai Way and Sua Betong all improved. At the beginning of the week there was a good demand for tea issues, Jokai, Jorehaut and Singlo attracting attention. Oil shares were very strong at the week-end in the absence of sellers, but in the current week there has been a marked decline in interest, Shell Transport ordinary losing $\frac{1}{2}$ on Tuesday. There was general support for Canadian and Mexican Eagles.

New York

BUSINESS on Wall Street was at an extremely low ebb both before the week-end and during the current week. Dealers were unwilling to enter into commitments without definite news on the progress of the Russo-German war. Opinion remained confused by the conflicting claims, and sentiment was also discouraged by the prospect of further heavy taxation. Fractional losses predominated in most sections, in particular among rail, chemical and motor issues. Steel stocks were also out of favour. In midweek, sentiment was again diffident, but toward the close a number of securities realised fractional gains.

The Iron Age estimates steel mill activity at 93.5 per cent of capacity against 100.5 per cent in the previous week.

Industry and Trade

The Coal Problem

One of Sir Andrew Duncan's chief and most urgent tasks at the Board of Trade will be an expansion in the production of coal. More than 50 million tons of coal were exported or shipped for the use of steamers in 1937; it is doubtful whether the current rate of shipments exceeds one-third this quantity. True, home demand has risen, but the increase in urgent requirements has hardly offset the fall in shipments. But output has been allowed to fall to dangerously low levels. Stocks at vital establishments are running down. Ever since last March, the Government has drawn attention to the danger; but the position has not yet been remedied. No further time must now be wasted, for the winter is already looming ahead. If there is reason to believe that the Government's aim of increasing stocks by 20 million tons by the end of October cannot be realised through exhortation and the appeal for the return of former miners to the coal-fields, more drastic measures must be applied—such as the restriction of the use of coal to vital purposes and the recall of miners from the Services.

Wages and Hours in Food Distribution

The Retail Food Trades Joint Industrial Council has reached an agreement covering the wages, hours and holidays of over a quarter of a million people. It fixes minimum wages in the following trades: retail grocery and provisions, cooked meats and other cooked foods (excluding fried fish), fresh, cured, dried and smoked fish, game, poultry and rabbits, fruit, vegetables and flowers, and excisable liquor (off licence). It does not include butchering and bakery. As from July 27th, the minimum weekly rates of pay for branch managers and manageresses will vary from 70s. for men and 58s. for women in London, where the weekly trade is under £60, and 90s. and 78s., where the trade is £200, plus 1s. for every £10 of trade up to £350. There are two categories of provincial shops. In "A" shops earnings will be from 67s.-87s. for men, and 55s.-75s. for women, and in "B" shops 65s.-85s. and 53s.-73s. respectively. Minimum wages for shop assistants, warehouse staff, van salesmen, cashiers and clerks are, in London, 21s. 6d. for boys of 16, rising to 65s. at 25. In the provinces they are 18s. 6d.-62s. in category "A," and 16s. 6d.-60s. in "B." The corresponding figures for women are: 19s. 6d. at 16 to 43s. at 24 in London; provincial "A," 16s. 6d.-40s.; provincial "B," 14s. 6d.-38s. Other male workers have a starting rate about 1s. lower, and rise at 24 to a full rate, which is from 5s. to 7s. lower than those for the classes specified. These rates are for a week of 48 hours excluding meals, and subject to a daily allowance of not more than 30 minutes for clearing up. Overtime, which does not apply to managers and manageresses, is at the rate of time and a quarter. A week's holiday on full pay is provided for all employees, except managers and manageresses, who get a fortnight.

Clothes Rationing Changes

The Board of Trade has gone a long way towards rectifying those discrepancies in the clothes rationing scheme, which resulted from the impossibility of consulting the trade before its first introduction. The principal general change is the further subdivision of many groups, and in particular, the more general use of a distinction between woollen (defined as over 15 per cent wool), and other articles. This removes such anomalies as the requirement of the same number of coupons for a substantial short coat which is a real and important garment, and a "bolero" which may amount to little more than a flimsy bit of trimming. One of the most important changes is the reduction from three to two in the number of coupons required for children's footwear. All handkerchiefs under one square foot will be sold at the rate of four to a coupon instead of two, as hitherto, and single, small handkerchiefs may be used, like the packet of pins which used to do duty as a "farthing change," to make up broken units of coupons when cloth is bought by the yard. The table in the next column shows the changes.

Ribbon and elastic over three inches wide require coupons, as do also scarves and handkerchiefs to be worn on the head. There are a number of exemptions, including rubber aprons and gloves, household gloves of undressed leather, American cloth, butter muslin, buckram, anti-gas garments and feminine collars, cuffs and ties. Certain heavy furnishing materials are also exempt. The second-hand clothes "racket" is to be stopped. It has taken two forms: the selling of clothes which are not genuinely second-hand, and the charging of exorbitant prices. In future second-hand clothes above a prescribed price will require coupons, and no clothes can rank as second-hand unless they have been in the possession of someone other than the retailer. The question of knitting wool in the Service colours is still under discussion. Negotiations are in progress with the

T.U.C. with a view to finding means of ensuring that dungarees and similar protective garments are not obtained coupon-free by anybody except workmen. Other difficulties arising out of the scheme are still receiving attention.

The Refugees' Contribution to Industry

The Christian Council for Refugees from Germany and Central Europe has published a pamphlet* describing the contributions which refugees are making to British industry. This contribution takes two important forms. In many war industries, their labour, often highly skilled, is proving very valuable, and employers, both in these industries and in agriculture, speak very highly of them and would be glad to employ more. As organisers of industry, they are also doing important work. Many of them applied for sites on trading estates established by the Government in depressed areas some time before the war, and most of them provided their own capital. Nearly a hundred such refugee undertakings, capitalised at over half a million pounds are now in existence, manufacturing, among other things, plastic goods, buttons, brushes, zip fasteners, gloves, Viennese leather goods, leather belting, knitted wear, silk, printing, cigarette paper, booklets and boxes, and electric batteries and torches. Many of their products are lines new to this country, for which the refugees have a ready market among customers with whom they had established connections before they left their own country. In this way, they have contributed to the reduction of unemployment among British workpeople and to the expansion of British export trade. Refugees are also responsible for numerous enterprises outside the Government trading estates. Their activities include the manufacture of toys, glass and optical glass; fur trimming and dyeing; and a flourishing plywood and veneer industry on Tyneside. Already these refugee industries employ between 20,000 and 30,000 British workers, and as many others are only awaiting the opportunity to start, it is hoped that they will be able to contribute to the solution of the post-war employment problem by increasing this number to 100,000. The story of these refugees and their work is an eloquent commentary on the wisdom of a liberal policy towards friendly aliens.

Rubber and Tin Under Control

Since the beginning of last week, the international rubber market has virtually ceased to function. On June 23rd,

* *The Refugees and Industry*. Bloomsbury Street, W.C.1.

COMMODITY AND INDUSTRY NEWS

A POINT of interest in the commodity markets has been the rise in prices of pepper. The spot price of white Muntok was 13½d per lb. on July 1st, and Lampong black, spot, was 8d per lb. These prices compare with 12½d and 7½d on May 30th. The increased demand for pepper for preservative purposes and a fear of control appear to be the causes of the rise.

Tin prices have suffered a further setback during the week. Standard cash closed at £256 10s-15s per ton on Wednesday, compared with £259 10s-15s a week ago. The forward quotation was £260 15s-£261 per ton against £262-£262 5s.

Raw Cotton Prices.—When the Liverpool cotton market was closed on March 31st last the Cotton Controller fixed prices for raw cotton at the official maximum rates for that day in Liverpool. A little later it was announced that there would not be any change before July 31st and that the Controller would endeavour to give one month's notice of any alteration. This week, he announced that prices will remain unchanged up to October 31st. This decision has been reached despite the fact that values in the New York market during the last three months have risen by about 2d per lb. Spinners of yarn who have been given nucleus status under the concentration of production scheme are now able to accept orders for delivery up to October 31st. The Controller hopes that licences to use raw cotton for August and September will be approximately at

the same rate as for July. These decisions have given considerable satisfaction to the trade and should result in more business being done. During the last few weeks' trading has been restricted owing to the uncertainty which has prevailed.

Cotton Concentration.—The Board of Trade have approved the scheme submitted to them by the Cotton Board for dealing with the cost of care and maintenance of spinning mills stopped under the concentration of production scheme. The amounts paid by running mills will be deducted from tax liability and the amounts drawn by stopped mills will be treated as trading receipts. It is estimated that the maximum rate of maintenance of a closed mill of 100,000 spindles will be £7,000, or equivalent to 1.4d per month for each spindle. From running mills, it is proposed to collect contributions at the rate of 1d per spindle per month for the months of April, May and June and contributions are not likely to exceed 1.455d per month for each spindle. The cost to running mills has been criticised in some quarters, but it is expected that margins of spinners will be improved, owing to the transfer of orders and operatives from mills that are stopped. The amounts granted to closed mills will vary according to any earnings which result from rental for sub-letting and storage or requisition.

Oils and Fats Prices.—There is only

the United States Rubber Reserve Company became the sole importer of rubber into the United States. All its purchases will be made at a price of 18½ cents per lb., free on board at an Asiatic port. Simultaneously, steps have been taken to reduce crude rubber consumption from its recent annual rate of 817,000 tons to one of 600,000 tons, by allowing consumers to use only a certain percentage—still to be fixed—of their past intake. The New York rubber market, after closing temporarily on June 23rd, has limited its business to the winding-up of old contracts. The fall in the London cash tin price from £270 per ton at the middle of last month to £256 early this week indicates that market operators expect the Government of the United States to take similar steps.

Ever since the fall of France, the menace of a possible war in the Pacific has played a predominant part in America's raw material policy. Steps were taken last summer to accumulate huge Government reserves of tin and rubber, two raw materials in which the United States is totally dependent on imports, chiefly from British Malaya and the Dutch East Indies. The necessary agreements, covering 75,000 tons of tin (just extended to 112,500 tons) and 330,000 tons of rubber (increased earlier this year to 430,000 tons), provided for purchases on the open market by the newly-formed Rubber Reserve and Tin Reserve Companies respectively. For tin the maximum price was fixed at 50 cents per lb., c.i.f. American ports, and for rubber at 20 cents per lb., c.i.f. American ports. The international regulation committees for tin and rubber with whom the United States reserve agreements have been concluded, agreed to release the tonnages required by raising their export quotas. But the introduction of minimum prices has not succeeded in stabilising the market prices, for the danger of a Pacific clash—the very reason for the accumulation of stocks by the United States—induced private consumers to raise their demand. The prices of the two materials have throughout the past five months been kept above the levels at which the American Rubber and Tin Reserve Companies are allowed to place contracts. As a result, their accumulation of stocks has fallen into arrears, and by the end of June only about 36,000 tons of tin and 200,000 tons of rubber—in each case less than half the final aim—were actually received. The introduction of import and consumption control should speed up the accumulation of Government stocks, and tend to stabilise prices, for the British and American Governments—the chief buyers of rubber and tin—are in agreement on policy and unlikely to compete with each other.

one alteration in the schedule of maximum prices of controlled oils and fats allocated to primary wholesalers and large trade users for the five weeks ending August 2nd. This is mixed soft acid oils, the price of which is raised by £1 to £19 per ton naked, ex store.

Raw Cocoa Controlled.—The sale or purchase of raw cocoa beans held or stored in the United Kingdom is prohibited except under licence by an order of the Minister of Food which came into force on June 23rd.

Fertiliser Distribution.—Arrangements have been made under the Control of Fertilisers (No. 12) Order, issued by the Ministry of Supply, for the controlled distribution next season of phosphate fertilisers, including basic slag, and of potash fertilisers. Potash is restricted in its use to potatoes, carrots, onions and flax, and maximum dressings per acre have been laid down. The Fertiliser Control is to set up a trade liaison with the County War Agricultural Executive Committees in order to facilitate the distribution of all fertilisers. Encouragement is given to farmers to order sulphate of ammonia early to avoid delays next spring by the special Government distribution allowance of 28s per ton on orders over 2 cwt. received by a producer during July. Before deducting the 28s allowance, prices will be the same as last year, beginning at £9 10s per ton for minimum 6-ton deliveries and increas-

(Continued on page 29)

COMPANY MEETINGS

FRIENDS' PROVIDENT AND CENTURY LIFE OFFICE

SPECIAL DIFFICULTIES SURMOUNTED

MR. HUGH E. SEEBOHM'S STATEMENT

The annual general meeting of the Friends' Provident and Century Life Office was held, on 2nd instant, in London.

Mr. Hugh E. Seebohm, J.P. (chairman), submitted a statement, of which the following is a summary:—

I propose to follow the example of other chairmen and make available in print with the annual report and accounts the remarks which I should in the ordinary course have made to the assembled members. They can then all be taken as read and the business of the meeting be merely formal.

NEW BUSINESS

The new life assurances effected by the office and its two associated companies, the Century Insurance Company and the English Estates Assurance, amounted to £1,393,793, compared with £2,123,575 for 1939, a reduction of 34 per cent.

The consideration for annuities granted was £453,808, as compared with £594,080.

New sinking fund assurances were granted in the Friends' Provident and the Century together for £223,392, compared with £360,264.

LIFE AND ANNUITY REVENUE ACCOUNT

Notwithstanding the reduction in new life business, the annual premiums showed a slight advance, which may be taken as a tribute to the general determination of our members to maintain their life assurances, a more valuable protection than ever.

The reduction in new business also contributed to a fall in the ratio of expenses.

As members are aware, we have always been proud of our excellent mortality experience, but the profit from this source was severely reduced in 1940 by a strain of £30,000 in respect of persons killed as a result of enemy action. There still remained, however, a small profit, and the relation of the amounts of actual to expected claims was 83 per cent. after inclusion of the war claims.

The rate of interest earned was reduced to £4 9s. 5d. per cent. before, and £3 4s. 1d. per cent. after deduction of income-tax. It should, however, be explained (as I have explained before) that if the alternative method adopted by many offices of applying the income-tax deducted from payment of annuities to the improvement of net interest income were used the net rate would be £3 18s. per cent.—that is, 13s. 11d. more than the rate for which we have taken credit.

INTERIM BONUS

In view of the special difficulties of the present time, the directors have reconsidered their policy in regard to the payment of interim bonus to with-profit policyholders. They have decided to continue to pay interim bonuses in respect of each premium due and paid for the years 1935-39, but to cease to pay interim bonus in respect of premiums due and paid for 1940 onwards.

The profits now being earned are so much affected that it is not deemed prudent to allocate part of them to the provision of interim bonus in respect of war years, but to reserve the whole of the profits becoming available towards meeting the various war costs, including special taxation, war damage contributions, war claims, and possible further depreciation.

Serious although the effects of the war have been upon the well-being of life offices, the directors feel that, in many respects, we have fared relatively better than might have been expected. Our business has withstood its special difficulties so far as they have yet revealed themselves, and this success gives us hope and courage to face the problems which are yet to come.

Mr. Robert H. Marsh, F.C.A. (deputy chairman), seconded the adoption of the report, which was carried unanimously.

CABLE AND WIRELESS (HOLDING), LIMITED

LORD PENDER'S STATEMENT

The twelfth annual general meeting of Cable and Wireless (Holding), Limited, was held, on the 30th ultimo, at the Incorporated Accountants' Hall, Victoria Embankment, London, the Rt. Hon. Lord Pender (the governor) presiding.

The secretary (Mr E. K. Jenkins, M.C., F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The following are extracts from the governor's statement, which was circulated with the report and accounts:—

The report and accounts deal fully with the financial position of the Holding Company and there is, I feel, very little that I can add as useful comment or explanation regarding the year under review, except to remark generally upon certain matters concerning the investments of the group.

PROBLEM OF REINVESTMENT

You will recall that last year I referred to the powers conferred on the British Treasury to requisition certain American and other securities, and I foreshadowed that further lists of such requisitioned securities would appear from time to time and that these transactions would naturally have an effect on the investment income of the companies in our group. In the year under review four such lists were issued, while since the end of 1940 a further two lists have appeared.

This requisitioning of comparatively high-yielding holdings, at a time when suitable stocks affording a moderate return have been in increasingly short supply, has presented investors, and particularly institutional investors, with a difficult problem as regards reinvestment. The necessity to support the war effort to the greatest extent possible, on terms which quite rightly demand the acceptance of a very small return, is another factor involved in this problem.

As regards the investments as a whole, the past year has witnessed some recovery in prices generally. The market for high-class fixed-interest-bearing stocks has continued strong, the rise in British Government securities being outstanding. On the whole, the experience of the holder of the leading Ordinary shares has not been so satisfactory, as increased income-tax, a 100 per cent. excess profits tax and limitation of supplies for civilian consumption have all tended to increase the hazards for equity holdings and to remove any prospect of recovery in the near future. I must point out that at the present time we have no knowledge of how the excess profits tax will affect your companies.

VALUATION OF INVESTMENTS

You will see from the report that the reserve fund investments, having a book value of £13,725,845, were valued at December 31st last at £11,150,093, thus showing a depreciation of £2,575,752, or 19 per cent., as against 17 per cent. at the end of the previous year.

The income from investments received in 1940 amounted to £540,234, which compares with £547,572 in the previous year.

In view of the nature of the duties upon which this great group of companies is engaged, the stockholders will appreciate that in the existing circumstances it is not possible for me, as was customary in normal times, to dwell in detail upon its worldwide activities, but I would like to add a word in recognition of the admirable work on the part of the staffs concerned. Apart from the difficulties and strain endured by all under present conditions, they carry on cheerfully and resolutely, even at times in the face of personal danger. Whatever the conditions and wherever they are, their work goes on.

My address to you is once more made under the shadow of war. For this reason I know you will not expect me to make any forecast concerning the results of the present year, a course which even in normal times is fraught with difficulty. Suffice it for the present that the associated companies are making no mean contribution to the national effort and playing a part we hope in the realisation of a new era when oppression and aggression are spectres of the past and sanity prevails in the counsels of all men.

The report and accounts were unanimously adopted and the dividend recommended was approved.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

VISCOUNT BEARSTED'S STATEMENT

The annual general meeting of the "Shell" Transport and Trading Company, Limited, was held, on the 1st instant, in London, the Right Hon. Viscount Bearsted, M.C., the chairman and one of the managing directors, presiding.

The following are extracts from a statement by the chairman circulated with the report and accounts:—

The investments show a decrease of approximately £700,000, but the cash, on the other hand, shows an increase of some £1,450,000. This item has since been reduced by investment in Government loan. It will be noted that as for many years past the financial strength of the company has been maintained.

Again this year it is impossible for me to give you any indication of the present trend of the earnings of the companies in which we are interested. More markets have been closed to trade and to the list to which I referred last year must now be added Roumania, Bulgaria, Yugoslavia, and Greece. Again, in these latter countries, destruction of stocks and property must have taken place.

We are still without information as to the extent of damage caused to our property in any of the occupied territories, but we fear it must be considerable. Hence the need for a cautious policy in the part of the operating companies.

Turning now to the United States of America, operations during the year under review have, of course, been largely dominated by the war. The increase in demand for petroleum products as a result of the National Defence programme has required considerable expansion throughout the industry. The industry is in an excellent position to cope with any demands which may be made upon its resources, and I am pleased to record here that Shell Union is playing its full part in this development.

Statistically, the year was noteworthy for the fact that record levels were obtained in the volume of crude oil produced, amounting to some 1,352,000,000 barrels for the year, or about 6.9 per cent. above 1939, in refinery operations, and, despite reduced export business, in the total demand for crude petroleum and its products.

A noticeable feature of the year has been the decline in flush production of the Illinois fields, which, as I mentioned last year, was then tending to become a serious threat to market stability. Although a number of new fields were found during the year, there was no discovery of outstanding importance.

Generally, crude oil producers in the major producing States have kept well in line with pro-ration requirements; as a result total crude stocks, after increasing by about 24,000,000 barrels during the first eight months of the year, mainly due to excess output in Illinois, have shown no important change since August.

Demand for motor fuel reached a new peak in 1940 of 589,424,000 barrels, or an increase of 6.1 per cent. over 1939, largely as a result of which stocks at the end of the year were only slightly higher than at the end of 1939. Although during the first quarter of 1941 the usual increase of stocks occurred in anticipation of summer demand, withdrawals this year have been at a much faster rate than during the corresponding period last year, and the statistical position to-day is measurably stronger.

The report and accounts were adopted.

KEPONG (MALAY) RUBBER ESTATES, LIMITED

BURDEN OF TAXATION

The thirty-sixth annual general meeting of this company was held, on the 30th ultimo, Sir Francis Voules, C.B.E. (chairman and managing director), presiding.

The chairman, in the course of his speech, said: The better price and larger output have resulted in a profit of £253,151 15s. 1d., which, after providing £130,881 9s. 6d. for taxation, has enabled us to set aside £25,500 to reserve and to recommend a final dividend of 7½ per cent., less income-tax, thus making a total distribution of 12½ per cent., less tax, for 1940, which compares with 11½ per cent., less tax, paid for 1939.

We are producing rubber at the rate of 1,100,000 lb. every month. As rubber is a wasting asset this production is on an

uneconomic basis from the stockholders' point of view, and is mainly to satisfy the Government's requirements: in fact, we are not only paying the greater part of the profit on our rubber sales in taxation but we are mortgaging our future. It seems to me only right that the Government should recognise the sacrifice we shareholders in rubber-producing companies are making in aid of the war effort, and some additional relief should be granted, to be treated as an advance repayable by the Government after the war without interest.

It is quite true that the company have been allowed to replant their older areas, but this rubber will come into production at a time when it is quite probable that demand may be less than the supply.

The report and accounts were unanimously adopted.

VIROL, LIMITED

DEMAND EXCEEDS RESTRICTED SUPPLIES

Speaking at the forty-first annual general meeting of Virol, Limited, held in London on 2nd instant, Lord Luke (chairman) referred to the difficulty of carrying on business in these times. In the case of Virol, or any other product made up of many ingredients, there might be a full supply of some part of the product and yet a shortage of one or more ingredients needed to make up a well-balanced food.

Some of his hearers, continued Lord Luke, might have played draughts and, at the end of serious games, decided to reverse the scheme and see who could get first off the board. It soon appeared that this game required nearly as much thought and skill as the other, and that was just what was happening in many long-established businesses to-day. Virol and Bovril and other old favourites were wanted by consumers in ever larger quantities, but they could not be supplied. Makers could not meet anything like the demand, and salesmen had to develop a new technique—that of rationing the shops in the hope that they also might see that their old customers got a fair share. This was more difficult than the reversed game of draughts, but shopkeepers were patiently doing their best with a very difficult job and were, on the whole, giving wonderful satisfaction.

A large quantity of the Virol sold went out carefully regulated through the Public Health authorities; the remainder through the chemists into homes, where young people ought to have the first claim on it. The company did its best to treat all chemists with equal consideration, and much appreciated their forbearance in the present difficulties.

NIRMALA (JAVA) PLANTATIONS AND LANDS COMPANY, LIMITED

DIVIDEND POLICY

The annual general meeting of the Nirmala (Java) Plantations and Lands Company, Limited, was held, on the 27th ultimo, in London.

Mr Walter Hilliers, the chairman, said: The profit under normal conditions would be sufficient for a fair dividend on the Ordinary stock. Unfortunately, there is uncertainty as to when remittances will be permitted from Java, and the directors are of opinion that the resources on this side should be retained and the question of dividend reconsidered as soon as possible. They hope it will not be long.

After allowing for the Preference dividend there remains £19,144, from which we allocate £2,000 to taxation reserve and £500 to staff furlough fund, leaving £16,644, against £10,984 last year.

The average selling price of rubber, 8.63d., is net in godown Java. If the export duty is taken into consideration the selling price works out at fully 1d. per lb. more. The same applies to forward contracts, and as the conditions free the company from shipping, freight, and insurance, the price must be considered advantageous.

As regards tea, the year was difficult and unfavourable, prices having been unprecedentedly low for the greater part of the time. Prospects for the current year are considerably better.

The Preference dividend for the half-year to June 30th will be paid on that date.

TANAH DATAR RUBBER ESTATE, LIMITED

INCREASED OUTPUT AND PROFIT

The twenty-ninth annual general meeting of Tanah Datar Rubber Estate, Limited, was held, on 25th ultimo, in Oxford.

The chairman, Mr. W. Arthur Addinsell, said in the course of his address: You will have noticed a change in the form in which the balance sheet is presented. The re-grouping of items enables the total of fixed and liquid assets to be seen at a glance. I would call your special attention to the current assets, £34,187, compared with liabilities of £4,343.

The year's working resulted in a profit, before providing for taxation, of £19,657, which compares with £9,884 in the previous year. The output was increased by 71,846 lb. and there was a rise of 2.64d. per lb. in the average net price realised.

It is estimated that approximately £8,500 would be required to meet taxation in Sumatra; and, with the liability for N.D.C. and British Income Tax, it is necessary to provide a total of £11,223. With the balance brought forward, there remains a credit of £11,002, which, despite the increased earnings, is some £1,400 less than the balance with which the directors had to deal last year, and that is the reason why the board are now recommending a dividend at the same rate as for 1939, namely, 10 per cent.

We also propose that the book value of buildings should be written down to the nominal amount of £1 and to transfer £500 to the Special Cultivation Reserve. After providing for Estate Staff Commission there will be a net carry-forward of about £1,730 as compared with £2,568 brought in.

Having regard to existing circumstances, I confidently ask you to approve the board's recommendations.

In his last report our visiting agent states, *inter alia*, that the property continues to be maintained in a splendid state of upkeep at a remarkably low average cost. The steady increase in yield from the younger area is most encouraging, whilst the growth of the clearing of 146 acres planted in 1939 is fully up to expectations.

GEDULD PROPRIETARY MINES, LIMITED

SATISFACTORY OPERATING RESULTS

The fortieth ordinary general meeting of Geduld Proprietary Mines, Limited, was held on May 15th, at Johannesburg.

Mr. P. M. Anderson, chairman of the company, presided, and in the course of his remarks said: Operating results continued to be satisfactory. The tonnage milled, at 1,370,000 tons, exceeded that of the previous year for the twelfth year in succession and, due to the increase in the price received for gold, working revenue rose by £291,575 to £2,631,916.

On the other hand, working costs per ton milled have increased considerably. During 1940 they averaged 17s. 10d., a rise of 3s. 0d. compared with the previous year, while current costs are in the neighbourhood of 19s. 5d. These increases are attributable to a number of causes, which are set out in the Consulting Engineers' Report. Increased gold realisation charges and the higher cost of stores are due to war conditions, but the expenses incurred in reorganisation of work underground and re-equipment in of some of the old workings is largely of a temporary nature. In addition, we have decided to explore the Black Reef, involving higher costs of development which it is hoped will be fully justified.

HIGHER WORKING PROFIT

In spite of working costs having risen, the working profit of £1,408,760 was £82,230 higher than in 1939. Revenue from investments and sundries, at £511,916, also showed an increase, due chiefly to higher dividends on our shareholdings in East Geduld Mines, Limited, and The Grootvlei Proprietary Mines, Limited. After providing for taxation £758,462, and adding income from investments, less sundry charges, there remained a net profit of £1,140,074. From this two dividends, totalling 15s. 0d. per share, were declared.

Development work consisted chiefly of splitting large low-grade blocks. Preliminary work was also commenced for the purpose of exploring the Black Reef by an incline in the No. 5 Shaft area and from No. 7 Shaft. We have no knowledge as to whether any substantial tonnage of payable ore is likely to result but there is every justification for a thorough exploration being undertaken.

The ore reserves at the year-end were estimated to be 9,000,000 tons of an average value of 4.5 dwt. over 53 inches, being an increase of 100,000 tons and decreases of 0.2 dwt. and 3 inches as compared with the previous year.

No change has occurred in our shareholdings in East Geduld Mines, Limited, and The Grootvlei Proprietary Mines, Limited. The operations of these two companies continue to be satisfactory. The report and accounts were adopted.

VAN DYK CONSOLIDATED MINES, LIMITED

INCREASED PROFIT AND DIVIDEND

The seventh ordinary general meeting of Van Dyk Consolidated Mines, Limited, was held, on May 16, 1941, at Johannesburg.

Mr. P. M. Anderson, chairman of the company, presided, and in the course of his remarks said: The ore milled during the year showed an increase of 101,600 tons over the previous year, the total being 1,128,200 tons, which is substantially in excess of the estimated capacity of the plant; and the yield per ton milled increased from 4.80 dwt. to 5.01 dwt.

The working revenue amounted to £2,387,217, or £551,116 more than in 1939, the increase being due to the larger tonnage milled, the rise in yield and the higher price received for gold. Working costs totalled £1,403,090, or 24s. 10d. per ton milled, which is 2s. 0d. more than in the previous year. The rise in working costs—which have increased still further during the current year—is due to increases in gold realisation charges, the development of redemption charge, the cost of stores due to war conditions and to more extensive support of workings having been found necessary in some parts of the mine.

The working profit was £984,127, or an increase of £319,577 over the previous year. After adding £61,834 in respect of over-provision for taxation in 1938 and 1939, and sundry revenue, and deducting £15,835 appropriation for capital expenditure, £368,381 for taxation, and sundry charges, the amount available for disposal after including the balance brought forward from the previous year, was £734,536. From this two dividends were declared, totalling 1s. 9d. per share—an increase of 3d. over the previous year.

INCREASED FOOTAGE DRIVEN

The footage driven during the year totalled 97,410 feet, being an increase of 33 per cent. over the previous year. Of 56,310 feet sampled, 15,850 feet, or 28 per cent., were payable with an average value of 11.1 dwt. over a width of 24 inches. While the total footage payable was maintained at about the same figure as in 1939 and the value remained satisfactory, there has been a decrease in the percentage of payability in some areas and development work in these areas is being energetically pursued in order to test ground for more promising conditions, which may reasonably be expected to exist. On the other hand, due to satisfactory disclosures in other parts of the mine, the ore reserves as at December 31st last show a substantial increase of half-a-million tons to a total of 3,100,000 tons having an average assay value of 5.4 dwt. over an estimated stopping width of 39 inches. While this position may be regarded as satisfactory it is sound policy further to strengthen the ore reserves by the maintenance of a high rate of development. Provision for this has been made in the development redemption charge, which in October last was increased by 1s. 0d. to 6s. 6d. per ton milled.

It has been decided to sink a shallow vertical circular shaft, which is much needed in the north-eastern part of the mine for ventilation purposes. The cost of sinking and equipping this shaft, which could also be used for hoisting if needed in the future, is estimated at about £57,000.

Turning now to the outlook for the current year, I would mention that, apart from the cost of the ventilation shaft which

I have previously mentioned, there are no other major items of a capital expenditure nature contemplated this year. With the increase in the development redemption charge to working costs, the amount to be provided out of profits under this heading should be much reduced. On the other hand we now have to meet an additional 5 per cent. in the Special War Tax.

The report and accounts were adopted.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

INCREASED TONNAGE MILLED

The thirty-fourth ordinary general meeting of The Grootvlei Proprietary Mines, Limited, was held, on May 15, 1941, in Johannesburg.

Mr. P. M. Anderson, chairman of the company, presided, and in the course of his remarks, said: The operations of the company during the past year yielded very satisfactory results. Compared with the previous year, the ore milled shows an increase of 287,000 tons at 1,234,500 tons; and the average yield per ton milled, at 5.21 dwt., reflects an improvement of nearly half-a-pennyweight. Working revenue rose by £1,048,064, or 8s. 9d. per ton milled, to £2,717,980. There was, however, also an increase in working costs of 10d. per ton milled, which is much more than accounted for by higher gold realisation charges, an increase in the cost of stores and sundry other items, all of which result from war conditions. The working profit of £1,277,239 was a little more than double that of the previous year.

After adding income from investments and sundry revenue, and deducting taxation £603,505 and sundry charges, the net profit was £668,983, from which two dividends, each of 2s. 3d. per share, were declared.

During the year under review an agreement was entered into to purchase the property and assets of the Palmietkuil Gold Mining Company, Limited. Arising out of this agreement we have to find for purchase price, etc., a cash amount equal to about 1s. 9d. per share on our present issued capital. It was originally anticipated that this money would be provided by additional profits during the current year without undue curtailment of the dividend distributions; but unforeseen delays in the shipment of certain essential items for the enlarged reduction plant will mean a delay of at least six months in reaching the full capacity of about 150,000 tons per month, with a corresponding deferment of profit. In addition, taxation has been increased by 5 per cent. on the profit before amortization, so that there is bound to be not only some curtailment of the dividend during the current year, but also, though to a lesser extent, next year.

A PROFITABLE INVESTMENT

The acquisition of this property should prove to be a profitable investment and the inclusion of the additional area of 400 claims lying between the two properties, the lease of which has not yet been formally concluded, will increase our mining area to approximately 6,625 claims, the second largest on the Witwatersrand.

Development work totalled 66,159 feet, of which 42,720 feet were on reef. The payable footage was 18,825, or 44 per cent., having an average value of 13.1 dwt. over 26 inches, which compares with 12.5 dwt. over 28 inches last year, while the percentage payable is somewhat lower. The charge of 5s. 0d. per ton to working costs for development redemption is at present in excess of the actual cost of current development, but it is being maintained at this high level to meet the cost of making underground connection with the workings of the Palmietkuil section. In due course the cost of development should be substantially reduced.

At the year-end the ore reserves were estimated at 7,500,000 tons of an average value of 5.2 dwt. over 49 inches, being an increase of 2½ million tons and a decrease of 0.3 dwt. and 3 inches compared with the estimate of a year previously. About one-third of the increase in tonnage is due to the inclusion of low-grade ore which has become payable owing to the increased price of

gold. Without such inclusion, the value of the ore reserves would have been fully maintained.

In addition, we have now acquired from the Palmietkuil Gold Mining Company, Limited, an ore reserve, as calculated by its consulting engineer, of 2,070,000 tons of an average value of 4.9 dwt. over 37 inches.

The report and accounts were adopted.

EAST GEDULD MINES, LIMITED

INCREASED WORKING PROFIT

The fourteenth ordinary general meeting of East Geduld Mines, Limited was held, on May 15, 1941, at Johannesburg.

Mr. P. M. Anderson, chairman of the company, presided, and in the course of his remarks said: During the year 1,910,000 tons were milled, being an increase of 81,000 tons. Working revenue rose by £714,571, or 5s. 8d. per ton milled, to £4,626,863, due to the increased tonnage milled and the higher price realised for gold. Working costs per ton milled, which have been steadily decreasing for a number of years, have risen by 1s. 0d. to 16s. 8d., owing to increased gold realisation charges and a considerable increase in the cost of stores as the result of war conditions. The working profit was £3,033,390, which exceeded the figure for the previous year by £557,074.

After deducting taxation £1,765,057, and adding the income from investments, less sundry charges, there remained a sum of £1,277,260 for disposal, from which two dividends, each of 7s. 0d. per share, were distributed.

SATISFACTORY DEVELOPMENT RESULTS

Development results during the year continued to be very satisfactory. 27,264 feet were accomplished, of which 19,305 feet were on reef and sampled. 13,125 feet, or 68 per cent., were found to be payable, averaging 13.2 dwt. over 32 inches.

The ore reserves at the year-end were calculated on a lower pay limit than in the previous year, to reflect the higher price obtainable for gold, and amounted to 15,200,000 tons averaging 5.2 dwt. over 57 inches. Compared with the previous year this was an increase of 3,700,000 tons, of which 2,600,000 tons was contained in blocks of low-grade ore brought into the reserves for the first time. Without the addition of this low-grade ore the value of the ore reserves would have been fully maintained.

The Grootvlei Proprietary Mines, Limited, in which company our shareholding remains unchanged, continues to make satisfactory progress.

The report and accounts were adopted.

MARIEVALE CONSOLIDATED MINES, LIMITED

SATISFACTORY RESULTS OBTAINED

The sixth ordinary general meeting of Marievale Consolidated Mines, Limited, was held, on May 16, 1941, at Johannesburg.

Mr. P. M. Anderson, chairman of the company, presided, and in the course of his remarks said: The year ended December 31st last covers the company's first full year of production. During this period operating results made such satisfactory progress that it was possible to declare a maiden dividend after paying off the debit brought forward from the previous year.

The ore milled amounted to 531,500 tons and the average yield per ton milled was 5.15 dwt. The working revenue for the year was £1,154,080, of which working costs absorbed £798,827, or 30s. 1d. per ton milled, leaving a working profit of £355,253, equivalent to 13s. 4d. per ton milled. After taking into account sundry revenue and deducting £51,128 for excess expenditure on development, £38,209 for taxation and sundry expenditure the net profit was £264,068. From this the loss of £19,518 brought forward from the previous year has been extinguished, £64,857 has been appropriated for capital expenditure and £56,250 was absorbed by the initial dividend of 3d. per share.

DEVELOPMENT WORK

Development work during the year showed an increase of about 20 per cent. over the previous year, the footage driven totalling 42,648 feet. The results obtained were satisfactory and of 26,665 feet sampled, 11,765 feet, or 44 per cent., were payable, the average value being 10.5 dwt. over 23 inches. The ore reserves as at 31st December last showed an increase of 300,000 tons to a total of 2,000,000 tons of an average value of 5.7 dwt. over an estimated stoping width of 39 inches, the value and width being respectively one-tenth of a pennyweight and one inch lower.

Results in the lowest levels of the No. 1 Shaft Area continue

to give cause for satisfaction. The No. 2 Incline Shaft area has had to remain flooded to the seventh level owing to lack of men to undertake the work of dewatering below that point. Arrangements are in hand, however, to drain the area from the 12th Level Drive advancing eastwards from the North-East Incline. As soon as this has been done development work in the No. 2 Incline Shaft area will be resumed.

The outlook for the current year is that provision out of profits for excess development and capital expenditure should be much reduced; on the other hand the amount payable in taxation will be greater.

The report and accounts were adopted.

(Continued from page 24)

ing by 1s 6d per ton each month until the maximum of £10 2s is reached. The price paid by the farmer will be the one relevant to the month in which delivery is made, less the allowance.

Control of Transhipment.—From July 15th the Board of Trade will control by licence all goods imported into this country for transhipment. Goods despatched before that date will need no licence, but a licence must be obtained before arrangements are made for the despatch after July 15th to the United Kingdom of any goods to be exported after transit through the country, or by way of transhipment. The control will not apply to goods remaining on board for onward carriage in the same ship, or to ships' surplus stores transferred under Customs Transhipment Regulations to other ships for use as stores.

INSURANCE NOTES

(Continued from page 19.)

that the directors have made a most careful and rigorous valuation of the assets; utilising market values of Stock Exchange securities, and converting currencies at the rates of exchange ruling on November 15th, a considerable margin in balance-sheet values was found. British Government securities now total £7,826,000, an increase since the outbreak of war of £3,149,000. Liabilities were valued at 2½ per cent on the occasion of the last valuation at November 15, 1938. There is a guarantee fund of £1,700,000. Intermediate bonuses are being maintained at the high rate of 30s. per cent compound.

Equity and Law Life.—The life revenue account of the Equity and Law Life for the year ending December 31, 1940, is summarised below:—

		Rise or Fall
New Business:—		
Net sums assured	£597,471	—£1,250,678 (67.7%)
Income:—		
Net premiums	£860,160	—£129,386 (13.0%)
Net interest	£1,072,401	—£12,883
" " rate earned	24.4.0%	+ 20.7.9%

Outgo:—

Claims by death	£835,055	+ £180,007
Claims by maturity	£710,327	+ £123,086
Surrenders including surrenders of bonus	£168,118	+ £27,906
Commission and expenses	£149,143	— £15,367
Consideration for annuities	£409,390	— £449,604
Annuities paid	£1,097,874	+ £18,256

Chief interest centres in the results of the society's triennial valuation and the accompanying drastic writing down of assets. During the triennium 1938-40, no less than £3,201,934 has been applied to revaluation of securities and transfers to investment reserves. The requisite funds have been found partly by utilising the profits of the triennium, in consequence of which the surplus amounts to only £142,950, against £1,266,803 for the triennium 1935-37, notwithstanding that the triennium 1938-40 had the benefit of a figure of £332,522, carried forward from the previous triennium as a special reserve. The balance has been derived from a modification of the valuation bases, which are now, for life assurance policies, at 3½ per cent interest for contracts effected prior to January 1, 1938, and at 3 per cent for contracts effected subsequently, against 3 per cent throughout three years ago, except for endowment assurances under house purchase contracts, for which the rate was 3½ per cent; and for annuities 4 per cent for contracts effected prior to January 1, 1940, and 3½ per cent for contracts effected subsequently, against 3½ per cent throughout three years ago. While these rates are within the present interest yield on the funds, to weaken the reserve bases, in view of the downward trend in interest rates, is not a happy step to have to take; the directors have, therefore, acted wisely in suspending all bonuses, both reversionary and interim, and in indicating that at future valuations it will be their primary concern to strengthen the reserve bases.

In the balance-sheet, after the revaluation referred to above, Stock Exchange securities stand at market prices on December 31, 1940, with the exception of Victory bonds allocated to specific policies, which are taken at 85, the price of issue; the directors certify that the assets are in the aggregate fully of the value stated, less the mortgage and investment reserve taken into account. The dividend is at the modest rate of 1s. per share, less tax, against 4s. 9d. per share, less tax, last year. The board has been substantially reconstructed during the course of the year, following the amendment of the Articles of Association to permit one-third of the directors to be persons not connected with the law, and reducing the minimum number of directors from twelve to nine; these changes have enabled the directors to make three appointments which, as the present chairman (Sir Geoffrey Ellis) stated at the annual meeting, "bring to our board that element of wide business experience which we felt to be so desirable." The tenor of the speech made by the chairman may be expressed in these words: "Our aim now must be to conserve the strength of the society, both in our treatment of the present and in our policy for the future. To that aim we shall steadfastly hold."

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the nine days ended June 30, 1941, total ordinary revenue was £38,144,000, against ordinary expenditure of £99,112,000, and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £756,629,000 against £508,244,000 for the corresponding period a year ago.

untiringly. Each blow struck now will be ten times as effective and will entail infinitely less expenditure and sacrifice than if it were delivered later." Direct aid to Russia is not easy to give. The distances are great; British commitments in the west and in the Middle East are still exacting; and it has been amply shown in battle this year that there is no margin of men and equipment to spare. To continue in resistance, Russia needs modern fighter planes, fire-fighting equipment, non-ferrous metals, rubber, railway equipment, machine tools, boots and shoes and clothing; and it is only from the United States—and from the eastern parts of the British Empire—that these can be forthcoming. If they are, the contribution will still be Britain's insofar as goods are diverted from the Atlantic and Red Sea routes to nourish Russia, and the order of priorities will be hard for either Americans or Britons to devise. But the issue of this eastern battle comes too close to the destinies of the English-speaking nations for parsimony to prevail. Russian resistance might save the world, just as a Russian surrender would place all the peoples—from China and India to Britain and the Americas—in the direst peril.

But it is not in supplies that the "quickest aid can be given. Supplies are essential, but the "war on two fronts" is no less so. Britain's opportunity is to make the Western Front a reality. The prelude to larger-scale day bombing is probably being played already in the continuous forays of the RAF, while the number of German towns sharply visited in darkness is growing nightly. True, the *Luftwaffe* has not been blasted from the sky. It has gone east to fight or stand in reserve; and it would be unwise to assume yet that what the Air Ministry, picturesquely but very stupidly, has called the air "invasion" of Germany is the beginning of supremacy and control in the west. It will be sufficient at this stage to force upon the enemy the choice between weakening his air artillery in Russia and suffering grievous wounds on the home front; and already he has resumed the night bombing of this country. Britain's part is, of course, limited by Britain's resources, and by the willingness to venture them in battle. It is very doubtful whether the bombers and long-range fighters yet exist to permit a massive day offensive against German territory while the *Luftwaffe* is still unbroken; and, publicity apart, it is questionable whether the daily attacks, which include much bombing that would surely be routine whether there was fighting in the east or not, have yet reached an intensity to shake the Germans' faith in the risk they are taking—though it may well be that a shrewd plan to raise the pressure by continuous steps is going forward day by day.

Action in other elements is not impossible—sea raids and landings from Murmansk and Norway to the Channel coast and the Bay of Biscay. There is no virtue in raiding for raiding's sake, and there will be no prospect of starting a re-invasion of Europe for a very long time to come. Dunkirk, Greece and Crete are too fresh in the memory for bloody escapades to be lightly undertaken, and evacuations will neither win battles nor earn the world's confidence. But the enemy's flank, for a time, is exposed. There may be points where damage and dislocation could effectively be caused. There may be northern places where straight aid to Russia would be welcomed, and there may be countries where determined and reinforced descents would yield a dividend of stiffened resistance against the Nazi invaders. The limiting factor is still resources—men, equipment, planes and ships; and the Germans have not withdrawn from western Europe. But the precedent of Lofoten is sound and the opportunity of the moment is unique.

If direct action below the skies can be taken, it will be sea power that will make it possible, and it is on the Atlantic that Britain's chance—and America's—is greatest. It is true that, most obviously, this is the time to clear up the Middle Eastern front in Syria and Africa, and to turn of General Rommel's men, if the strength is now in Egypt to do what the Imperial forces failed to accomplish in their last stroke against Sollum. America's part here, too, is considerable, for American supplies are

now moving to Suez. It will be common sense to make haste in preparing a stout and unthreatened line of resistance from Egypt to India before the German armies can wheel southward to Iran. But the Atlantic is still paramount. In the United States, both Colonel Knox and Mr Willkie have put on record their view that the war can be lost by Britain on the Atlantic and that, while the Germans are fighting Russia, it is the time for the American Navy to take their hand in winning it. It was with his own outstanding sense of the hour and the opportunity that President Roosevelt announced the landing of large American forces in Iceland to frustrate a pincer movement by the Axis in the Atlantic.

If the enemy's sea raiders—backed by the sea and air descents upon strategic outposts that the ill-starred expedition of the *Bismarck* seemed temporarily to threaten—could cut still more deeply into the commerce of the North and South Atlantic, the common stock from which the widespread resistance of Britain, Russia and the United States must draw its resources would dwindle and even fail. It is not known whether the American ocean patrol which now operates from Trinidad to Reykjavik is to be given more than its present watching brief, or whether American ships will sail to Iceland with materials of war under American convoy. The real question is still whether American aid at sea is to become active. American vessels could not take goods in bulk to Iceland to be transhipped for passage to the British combat zone, because there are not the handling facilities there to do the job. The reconnaissance duties of American patrols are notably useful. The defence of Greenland and Iceland by Americans is a great relief to Britain. The area of the enemy's depredations has been cut down by these passive interventions. But the Battle of the Atlantic will be won or lost at sea, and it can still be strongly waged from Dakar as well as from Lorient and the Norwegian coast. It will be beaten by sinkings and by fighting, not by manoeuvres, and there is not a single responsible leader in the United States who does not know this. It has been officially stated that the American naval commanders have been given "new instructions." The American Navy will clearly have to protect, and not merely to watch American supply ships *en route* for Iceland. The British and American navies will have common duties in the same waters. President Roosevelt has said again that it is the policy of the United States to ensure the delivery of supplies to Britain. But no one in authority has yet dared to tell the American people whether the new move means "shooting" or not.

It is among the American public and in Congress that the clear sight of the President has still to find a plain reflection, and the war in Russia has not been an unmixed blessing. The support of American labour for the war has grown; but there are new schools of apathy. It is not only that some menace in the Pacific is feared from Japan. There are those who would not risk their country's non-belligerency to aid the "Bolsheviks"; and there are those who loudly state that, when the Russians are striking hard at the German armies, it is no longer necessary to take chances and make great efforts for the Allies. It is a tribute to the President's skill and determination that, against this background, he has been able to make this important move in Iceland; and it will be a tribute to the general good sense of the people of America when they take in fully the counsels of their strategic leaders and decide "to take arms against a sea of troubles."

The issues of the hour are clear enough. Belligerency or no belligerency, ideology or not, there is a working alliance between Britain, Russia and America; and the link in the alliance is the freedom of the seas. Together, drawing their strength from a common pool of resources, they have the power to destroy a danger that threatens the existence of them all. For Britain and the United States to raise their output to a peak should be automatic. For them to reinforce the Russians to the utmost, and for them to seize this moment to clear the underwaters of the Atlantic of their acutest foe, would be simple self-preservation; and for them to hesitate or relax, to be complacent or apathetic, would be suicidal.

Japan Irresolute

THERE is no problem about Japan's fundamental policy in foreign affairs. Since the doctrine of "East Asia" was first pronounced in 1934, the efforts of Japanese soldiers and diplomatists have been directed towards the creation of what is called the "sphere of co-prosperity," a rather vague geographical phrase which covers China, Indo-China, Siam, and the Dutch East Indies and may very possibly include Burma, India and Australasia as well. This "sphere" is Japan's *Lebensraum*. Its future organisation is conceived very much on the lines of German Europe, with a single centre of overwhelming military and industrial power, ringed round by satellite States of colonial producers and organising the whole political and economic life of the area.

It follows that Japan's hand is turned against every Great Power that is already ensconced within this *Lebensraum* and, though less directly, against every Power that might eventually encroach upon it. Between Britain and the United States, on the one hand, and Japan on the other, there is an irreconcilable conflict of interests. The same is to a lesser extent true of Russia and Japan; and, if Germany were to succeed in the dream of a united Eurasia, it would also be true of Japan's relations with the Third Reich. Thus, there is no doubt that the Japanese aim with regard to all the Powers is quite simply either to get them out of East Asia or to keep them out.

The dilemma for Japan is that while the war in the west should offer a god-sent opportunity for creating an East Asian monopoly, the country is not really in a fit state to take advantage of it. With Britain and the United States preoccupied in the Atlantic, with France and Holland defeated and now with the Russians fighting for their lives on their western frontiers, it should in theory be easy, either by a direct attack or by blackmail, to secure their inheritance. Yet, in the year which has elapsed since the collapse of France, some concessions in Indo-China are the sum of Japan's achievement; and even now, with Russia added to the ranks of belligerents, it is doubtful whether more can be secured.

The primary reason for this inability to fish in the waters Hitler has conveniently troubled is quite simply the "China Incident." The war with China is entering its fifth year, still without any decision. Free China has even been strengthened in recent months, not only by loans from the democracies, but also by the German attack on Russia, which has brought the Communist faction in Free China to heel. It is true that General Chiang Kai-shek faces formidable difficulties. Commodities of every kind are short; prices are rising; and, although £500,000 worth of rice will be bought in Burma with the proceeds of the British loan, there is a dangerous dearth. But the armies of Free China are intact and fighting; and, as long as Chungking remains as a centre of resistance, Japan's problem of occupation will continue to resemble the laying of a picnic tablecloth on a windy day.

The drain of this inconclusive struggle affects most spheres of Japan's economic life. The impossibility of securing vital supplies without depleting the country's reserves of gold and foreign currency—the deficit for 1940 has been reckoned at \$200,400,000—has now been intensified by a growing unwillingness of the Powers to provide the supplies. With the exception of high octane motor spirit, the Japanese are still able to buy from America and the Dutch East Indies the types of petrol they require; but even so, civilian needs, including the needs of industry, have been cut to an irreducible minimum. In other spheres, even the supplies are not available. The American embargo on scrap metal, coupled with the British Empire's increasing unwillingness to sell its strategic raw materials, has reduced Japan's steel output by about 20 per cent. Most serious of all is the shortage of rice. There is a general shortage throughout the Far East and Japan, a country that counts on being self-

sufficient, has had to strip her dependencies and buy up supplies in Indo-China and Thailand to make good the deficiency. Even so, at the beginning of this year, rice was added to the list of rationed goods in Japan.

Since it is men and materials rather than money that give the decisive index of a country's strength these actual shortages in key raw materials and foodstuffs are more significant than Japan's financial stringency. Nevertheless, the fiscal position is very unhealthy. The national debt at the end of 1940 was 30 thousand million yen, far larger than Japan's national income and three times than in 1936. During the same period, the note issue rose by 250 per cent and in 1940 alone it is estimated that the cost of living increased by 20 per cent.

These conditions, which spring from Japan's fundamental dependence upon outside supplies and from the waste of men, money and materials in China, without any compensating economic gains, save some transitory advantage of loot, are now so serious that, although there is no question of collapse, it seems almost certain that Japan cannot risk a war with another Great Power. This cannot be argued with complete certainty, for a desperate situation may breed an equally desperate determination to "solve" the crisis by further war. Japan's domestic policy is dominated by two groups, representing these two opposed possibilities. The Conservatives, the party leaders, the Emperor's household and the business world, believe that the "China incident" must be settled before other adventures are undertaken; the military-fascist set are for forward action in the South Seas. Unhappily, it is the latter who are in close touch with the Germans, whose obvious interest and intention is to embroil Japan with the democracies.

The whole of the last year has been taken up by a fierce struggle between the conservative moderates and the militarists. The fortunes of this battle have ebbed and flowed with the tides of war in Europe and Africa. In June, 1940, with the collapse of France and the apparently imminent collapse of Britain, the army clique turned out the moderate Yonai Cabinet and brought in Prince Konoye, with the express purpose of creating a totalitarian state on Nazi lines. The first impetus was sufficient to lead to the dissolution of all political parties, trade unions and independent cultural associations. The churches, too, were brought into a unified Japanese system of control. Labour was organised on the lines of the German Labour Front, and a new organisation, the Imperial Rule Assistance Association, was set up to fulfil roughly the same role as that of the Nazi Party. It was during this first totalitarian frenzy that the Pact with the Axis was signed.

By September, 1940, however, the international situation was changing to the disadvantage of the extremists. The RAF were winning the Battle of Britain; the British Government had re-opened the Burmah Road and was about to reinforce Singapore; negotiations both with Indo-China and the Dutch East Indies were proving unexpectedly difficult; and, most important of all, it was becoming daily clearer that the United States was committed to the Allied cause—and was not going to be frightened out of the Pacific. The moderates began to fight back and their campaign centred upon two aspects of the totalitarian reform which were still unsettled, the regimentation of industry and the status of the Imperial Diet. The militarists had planned a total State organisation of industry, on the lines of their experiment in State-socialism in Manchukuo. The business world attacked it on the grounds of bureaucratic inefficiency, and won the case. The scheme, when it emerged, was so emasculated that the public corporations which had been planned were now nothing but private cartels under another name.

The struggle over the Diet at the beginning of 1941 took place under the shadow of the war in Libya, and, once again, the moderates had their way. Standing on the

ground of the inviolability of the Diet under the Meiji Constitution, they defeated the attempt to reduce its rôle to that of a Reichstag subordinate to the Imperial Rule Assistance Association. Instead, they secured the prolongation of the existing Diet by one year and a shelving of all the more objectionable laws of economic organization. Prince Konoye recognised the turn of events by taking some well-known moderates into his Cabinet.

It was with this double defeat to extremism behind him that Mr Matsuoka made his visit to Berlin, where he arrived for King Peter's *coup d'état*, and to Rome, where his visit coincided with the Battle of Matapan. The result of the European tour was not therefore a closer understanding with the Axis Powers, but a Neutrality Pact with Russia. It was made as a re-insurance against the democracies in the event of a Japanese move to the south. It is likely to be kept as a re-insurance against Germany in the event of a German drive into Asia. Both moderates and extremists hoped that it would reduce the flow of Russian supplies to China, but all calculations of policy were upset by the German offensive in June.

With Russia added to the belligerents, Germany is now engaging all Japan's political and actual rivals in East Asia. The extremists are under a heavy fire of propaganda, urging them that the hour of destiny has come and that they must fight to free themselves of the Western

yoke now, while Germany is doing the work for them. The moderates point out that the Nazis are, in fact, asking Japan to pull their chestnuts out of the fire, by engaging in yet another war while the "China incident," whose outcome Germany cannot influence one way or the other, is still unsettled. For a week, the dispute raged in the Cabinet and the Imperial Court. The outcome was inconclusive, a statement of vigilance and nothing more. To this extent it was a victory for the moderates.

The next phase of the war will determine the degree of Japan's participation. Every sign of strength on the part in Britain, America and now Russia strengthens the moderate element and postpones any adventures in the South Seas. The only campaign upon which both extremists and moderates might agree would be an attempt to take over Indo-China. It could be interpreted to the Germans as a move on Singapore; it could be glossed over to the democracies as the affair of Vichy; it would provide a cheap victory for the Japanese people. A more ambitious move, southwards to Singapore and the Dutch East Indies, will follow only on a turn of military events in the West more catastrophic than any envisaged at present. Like so many other battles, the battle of the South Seas, the battle of China and even the battle of the Diet and the Imperial Court are being fought out in the factories and on the fields and in the skies of Europe.

Wages and the War Effort

IN his Budget speech on April 7th, Sir Kingsley Wood announced his decision to "prevent or minimise," by means of subsidies, "the impact of increased costs . . . on the prices of essential goods and services, apart from any increases in their prices rendered inevitable by further increases in wage rates"—in the hope of creating "conditions which will enable the wages situation to be held about where it now is." The Chancellor's reference to wages was somewhat vague; he only expressed the hope of creating the conditions for their stabilisation. Nevertheless, the statement did seem to imply that no new claims for advances in wages should be made after some early appointed date. Since April 7th, the trade unions have not only pressed for the settlement of outstanding wage claims; many have put forward fresh demands; it has even been suggested that Sir Kingsley Wood's "hope" did not apply to bargaining by individual unions. There has been no statement of Government policy, though it is now reported that one may be coming; there has been no wage-stop, no appointed day. Nor, similarly, has there been a general price-stop, though the index of the cost of living has now been steady for three months. Both the price of coal—a key commodity—and the wages of coal-miners have recently been allowed to rise.

Thus, the stabilisation of incomes is still in abeyance. Its corollary, the establishment of a basic ration of necessities for all consumers, is still very incomplete; and the problem of the distribution of sacrifices among the various sections of the public—a problem which includes, but goes far beyond, the wages question—has consequently been rendered more acute with every fresh reduction in the supply of essential consumers' goods and services. The economic case for sacrifices all round, in order to engage all the country's available resources in the war effort, is generally recognised; but, in the absence of an all-round price policy, political resistance to particular sacrifices, not surprisingly, remains. It is plain that, if Great Britain's striking power is to be developed to the full, the standard of living of all but the poorest section of the community must be reduced still further for the duration of the war. It is no less clear that a general increase in incomes cannot augment the dwindling supply of essential consumption goods, or prevent an all-round reduction in the standard of living of individuals. In these conditions, any increase in the incomes of one section of the community—wage-earners, entrepreneurs, rentiers or salaried people—must be at the expense of the incomes of

others; and, within the field of wages, an advance in the wages of one industry must generally mean a reduction in the purchasing power of workers in other industries. These arguments are not disputed. But no section of the community will willingly risk a loss or accept a sacrifice which is greater than the price asked of its neighbours. There is no general policy of compensation for war losses of livelihood or remuneration; and there is no single plan to spread sacrifices evenly and fairly.

There is even some danger that discussions about the distribution of sacrifices may obscure the vital object of wartime economic policy, which is to expand the production of the goods of war. Everything else, including the problem of wages and prices, must be subordinated to this task; and the present emergency should not be regarded by any one section of the community as a chance to improve its position relatively to the lot of other sections. It is only fair that the sacrifices imposed upon the community by war should be distributed according to the capacity to bear them; and it is equitable and essential that rich people should be taxed to the utmost. But the main mass of the population is not rich, and their consumption and their spending, which make up the bulk of national consumption and spending, have to be held in line with the limited supply of civilian goods. Hitherto, trade union practice has not entirely conformed to these principles. Before the war, they often sought to justify pressure for better wages and conditions by reference to the profits in the industries concerned—or, if profits were falling, to their right to a decent standard of living. Since the outbreak of war, they have based their claims chiefly on the rise in the official index of the cost of living and on the deterioration of working conditions, though, as the experience of the past three months has shown, the stabilisation of the index has scarcely arrested the general demand for higher wage rates. With the EPT at its present level and with the Government as industry's chief customer, there is less incentive for employers to resist demands for higher wages. Moreover, the unions' present policy, which enables the strongest of them to obtain the best terms, is scarcely fair to the workers in the less well organised trades, or to those poor or unfortunate members of the community who are dependent on allowances from the Government. A continuation of this policy would wreck the scheme for stabilising prices and wages and accentuate, and not lessen, the problem of securing "equal" sacrifices.

It is now reported that Sir Kingsley Wood and Mr. Bevin have put a scheme for the stabilisation of prices and gross incomes (that is, including the varying parts paid in taxation) before the General Council of the Trades Union Congress and the British Employers' Federation as a basis for discussion. It is imperative that the problem of incomes and prices should be removed from the arena of politics. The broad outlines of the stabilisation that is wanted are clear enough. If wages are to be pegged, it is only equitable that all other incomes should be stabilised as well. The introduction of a standstill Order for wages would have to be accompanied by a similar measure to fix salaries, directors' fees and dividends—or to tax away the entire increment above the appointed level; and, in order to maintain incentives, provisions for promotion from one grade of work to another, better paid and more responsible, would be needed. For salaries and directors' fees, a standstill Order would not involve insuperable difficulties, though vigilance would have to be exercised over expense allowances. The remuneration of owners of capital has already been severely limited by EPT; and, in contrast to the majority of wage earners, shareholders as a whole have not been compensated for the rise in the prices of consumers' goods and services. On June 26th Mr Bevin announced in the House of Commons that weekly full-time rates of wages had risen, on the average, by 20 per cent between September 1st, 1939 and June 1st, 1941. If allowance is made for increased hours, up-grading and overtime pay, the rise in actual earnings has been considerably greater. There is no information concerning the average increase in salaries, but, as *The Economist's* analyses show, there has been no comparable rise in industrial profits or dividends. Indeed, many concerns will soon be using up their capital in that they will be unable to make necessary replacements or accumulate sufficient funds for replacements after the war.

The introduction of a general standstill agreement on all forms of remuneration would not in itself be enough. There are still members of the community who cannot buy their ration of essential goods and services. There are still gross errors in the distribution of food. A veto on increases in gross incomes should be accompanied by measures to guarantee a minimum of the essentials of life

to every member of the community; and, in order to prevent inflationary rises in the prices of individual commodities, rationing and price control would need to be extended further to cover all articles in common use.

The fact is that stabilisation—of incomes or consumption—is only one item in war economy, which should be a single whole. Even with compensation to even out the indiscriminate incidence of wartime losses, the sharing of financial sacrifices is only one aspect of the problem. Every individual is equally an agent of the State. The prime war need is for the closest collaboration between all sections of the community in the joint effort to raise production. The trade unions complain of inefficiency in industrial management, while others point to slackness on the part of labour. If production is to be speeded up, workers and managements must do their share together, and they must be directed by the Government, which is the chief employer of both. Many of the privileges of workers, such as the right to change their jobs, have been abolished in several industries, and salaried employees and managements must equally be regarded as servants of the community to be set to serve where they are most needed. There is a case for giving the representatives of labour every opportunity for contributing their share to management in so far as labour problems are concerned; and there is a case for replacing inefficient by efficient managers regardless of the "claims" of separate firms.

The time has come, in short, when the nation must cease to dissipate its energies, either in haggling over the distribution of sacrifices or in mutual accusations of inefficiency. It is true that it is, first, the task of the Government to establish the conditions of service—by stabilising prices as well as wages and by compensating the groups and individuals who suffer disproportionately by the chances of war. But there are no indications that labour's share in the national income has been diminished in the war. Its share has rather risen; and the introduction of a stop on wages, salaries and dividends, as well as prices, coupled with a national minimum, could do much to allay suspicions and, while resting wartime expediency on a foundation of social justice, to remove the political obstacles which still linger in the way of achieving the highest possible output of war goods in the swiftest and most efficient way.

The Druggist's Dilemma

THE Pharmacy and Medicines Bill, which implements Sir Kingsley Wood's decision to repeal the medicine stamp duties, is an important landmark in the centuries old conflict between pharmacists and other shopkeepers. As long ago as 1617, when the Company of Apothecaries was granted its first charter by James I, the king insisted that it was necessary to confer a privilege on the apothecaries in order to defend them against "grocers" who "bring home wrotten wares from the Indies, Persia and Greece, and therewith through mixtures make waters and sell such as belong to the Apothecaries, and think no man must control them because they are not apothecaries." But in spite of this privilege, by 1841, when the Pharmaceutical Society of Great Britain was founded, the practice of pharmacy had degenerated and was conducted by a miscellany of retail traders, most of whom had no scientific knowledge, but to whose care was entrusted, not only the sale of drugs, but also the sale of poisons.

The Pharmaceutical Society, which celebrated its centenary last April, was thus founded with the wholly laudable object of educating its members and protecting the public. Its formation was the prelude to a long series of important legislative enactments, which culminated only recently in the Poisons and Pharmacy Act of 1933. This measure made membership of the Society compulsory for all registered pharmacists; set up a Poison Board to advise the Home Secretary on the control of poisons; and provided for the establishment of a committee of the Society to exercise disciplinary control over pharmacists and companies carrying on business under the Pharmacy

Acts. But, though the Society claims that education is still its main concern, its individual members are also naturally concerned with their business interests. From the justifiable assumption that the sale of poisons and all medicines requiring strict prescription and dispensing should be in their hands alone, they have proceeded to the assumption that unregistered pharmacists and other retailers should not be allowed to sell any sort of drugs at all. Not all medicines are poisonous or need a doctor's prescription, and some tonics and aperients combine refreshment with cure. But the chemist resents bitterly the sale of aspirin, gargles and tonics by other shops, even though the other shopkeepers have had to pay an Excise licence of 5s. a year in order to do so.

In the new Bill a compromise has been reached. Hitherto, the registered chemist has been able to sell, free of medicine stamp duty, all remedies, "known, admitted and approved," so long as no proprietary rights are claimed. The ordinary trader must sell the same preparation stamped, even though he holds an Excise licence. For years chemists have been pleading for a big increase in the licence fee as an additional means of preventing poaching on their preserves, but the fact that there are 160,000 patent medicine licences and only 14,000 genuine chemists' shops shows how unsuccessful their restrictive efforts have been. Moreover, the chemists have weakened their position by advancing on to their enemy's ground. It is not easy for them to claim that theirs is a skilled profession, which none but the qualified must presume to enter, when on their own counters are displayed a vast

array of unmedical objects—ranging from cosmetics and cameras to carriers for gas masks.

From September 2, however, both the medicine stamp duties and the licence fees are to be abolished. This, at first sight, would appear to withdraw a considerable trading privilege from the chemists; but the Bill also embodies an agreement between the trade interests concerned, under which all articles recommended as medicines shall be sold only by doctors, dentists or chemists. Proprietary medicines not described in the British Pharmacopoeia or the British Pharmaceutical Codex—or, even though so described, if they are sold under their proprietary name only—together with certain other types of medicine, such as mineral waters and herbal remedies, can still be sold by ordinary retailers. Thus—apparently—aspirin and Epsom salts will in future only be procurable at a chemist's, whereas "Aspro" and "Eno's" you may buy where you will.

The dilemma confronting the pharmacist—how to maintain both his professional status and his business interests at the same time—does not concern himself alone. On the one hand, a skilled and efficient pharmaceutical profession is an essential part of a nation's health services; on the other, the public interest demands that monopolies and the restraint of trade should be fought wherever they are found. There can be no doubt that a public which in health matters was already far too given to the bottle habit has been confirmed in its addiction by the lavish promises of cures held out by patent medicine advertisers. And whereas Mist. ADT can give the patient mental satisfaction for a few pennies—or for nothing if he is insured—the same satisfaction purchased from a patent medicine manufacturer generally costs as many shillings. The positive harm done by quack cures is probably far less in these days than it used to be; but at the least they frequently postpone proper medical treatment and absorb money which in many cases the purchaser can ill afford.

It is not likely that the repeal of the medicine stamp duties will encourage the consumption of patent medicines. For one thing, under the new Bill the prohibition on advertisements of supposed remedies for venereal diseases and cancer is extended to similar advertisements for Bright's disease, cataract, diabetes, epilepsy or fits, glaucoma, locomotor ataxy, paralysis and tuberculosis, as well as for articles suggesting that they are abortifacients. For another, an end will be put to "secret remedies," which have proved so alluring, and occasionally dangerous, to the public, by a clause providing that the composition of all medicines must be declared on the wrapper or label.

The chemist's attitude towards the tax, however, has not been solely governed by a desire to educate the

public. He appears to have no objection to the sale of patent medicines, provided that it is in his hands alone—an ambition which has clearly not been achieved by the new Bill. This attitude is clear from the close connection between himself and the manufacturer. Most retail chemists are not only, in their professional capacity, registered with the Pharmaceutical Society; they are also members of the National Pharmaceutical Union and, through this, affiliated to the Proprietary Articles Trade Association, whose council consists of twelve representatives of manufacturers, twelve wholesalers and twelve retail chemists. This association is very powerful; its list of proprietary goods, which it tries to ensure are sold at a uniform price, contains some 3,000 lines, and from time to time it publishes a Stop List of offending wholesalers and retailers from whom supplies are to be withheld. For all his professional training, the pharmacist in practice has learnt the tricks of modern trade.

His professional representatives, the Pharmaceutical Society, fully realise the growing domination of the business side of this dual character, and, at the annual meeting of the British Pharmaceutical Conference last April, the chairman urged that "pharmacists would be doing far more for themselves and for the medical services of the country if they devoted their energies to fields of activity which did not involve legislation, rather than by striving for such politically unattainable goals as the reservation to them of the sale of all medicines." The Society itself, as a purely professional body, is powerless to interfere with the business habits of its members. A test case in 1920 decided that the Society's statutory powers were limited, and that it could not regulate wages, prices or hours of business, nor could it use its funds to subscribe to any body proposing to do so. Thus the National Pharmaceutical Union, which came into being as a result of this decision, is evidently independent of the Society, and for the individual chemist it may be difficult, if a clash comes, to decide which of the two bodies is paramount.

There is, of course, no reason why a clash of professional and business interests should come at all. Many chemists have to struggle hard to make both ends meet; and so long as they are mainly dependent for their livelihood on having things to sell, they are forced to have a business as well as a professional outlook—though the extension of compulsory health insurance to incomes up to £420 a year will put the dispensing of medicines more and more on a salary basis. What the public interest demands is, not that chemists should withdraw completely from the business arena, but that they should not use their professional status merely to further their business ends—that in claiming to protect the public they should not really be seeking protection for themselves.

NOTES OF THE WEEK

The Course of the War

The main attack on the Stalin Line has been launched and although the Germans have obviously made a deep and dangerous penetration at Bobruisk and have probably reached the Dnieper at this point, the Russians are holding them and using their defence system, not as a line of static fortifications, but as a basis for vigorous counter-attacks. There is obviously no shortage of mechanised material yet and tanks have been a feature of all the engagements. The position in the air is believed to be less favourable, and the Russians are very short of the most modern types of fighter plane. These counter-attacks, launched, in all probability, at the moment when the German army was beginning to feel the strain of its enormously rapid advance—the mere need to overhaul tanks and other vehicles would in itself account for a halt after two weeks' movement—have effectively held the Germans in the north of Ostrov, on the Dvina, at Polotsk and Lepel, and in the south on the Polish and Bessarabian frontiers. Everything depends upon the central sector where the main battle is raging along the Dnieper. The Germans claim that if the Stalin Line is broken, the advance to Moscow and into the heart of

Russia will go forward unimpeded, but the development of guerilla warfare behind the German advance positions and the adoption of the "scorched earth" policy do not bear this out. The Russians are fighting with dogged and tremendous heroism and, with Stalin's broadcast to the Russian people, the doubts which had been thrown on the resolution of Soviet leadership have been dispelled.

Russian Tactics

Whatever the outcome of the war in Russia, and the Germans still have the upper hand, it has already been established that in military matters the Russians have skill and ingenuity, as well as numbers, modern equipment and stubborn courage. At the opening of the campaign, there were probably errors which led to large bodies of men being cut through and encircled. More recently, in defence and counter attack, the Russians have been both fierce and cool. On the occasion of the twenty-third anniversary of the Red Army in February this year, Marshal Timoshenko, in an order of the day, outlined the training principles

which had been developed after the experience of the Finnish war, and after the example of the German campaigns in Poland and in Western Europe. Training must be confined to activities which are needed in actual warfare, and training conditions must be as warlike as possible. The activities of all other arms must be subordinated to the operations of the infantry which decides battles. At the same time, the Marshal demanded the organisation of small units within the infantry to be trained for independent action; and special emphasis was laid on mobility. Later, the Soviet Press explained that the military training and education of the mass of the civilian population was to be improved. Now the continued guerrilla fighting in the border provinces of Russia and the formation of civil guards announced by Stalin show that these steps have been put to good use. It may be assumed that the reorganisation of training was begun shortly after the Finnish war ended. Ever since the first days of the civil war in 1917 the military forces of the Soviet Union have often changed in character. The small bands of "partisans" of the civil war composed of workers or peasants existed for a considerable time side by side with the Red Army; and the independence and resourcefulness of these "partisans" played an important part in the Army's tradition; in some ways they were reminiscent of Irish models. Neither "partisans" nor the Red Army itself corresponded to the "militia" or "the people in arms" as socialist writers had imagined it before the revolution. At the end of the civil war the Red Army was reorganised to consist of a standing army and a territorial army; and in 1935, 74% of the Red Army was still on a territorial basis. But, in 1937, the regular army had increased to 77%; mechanisation and motorisation had become possible on a large scale because of the industrialisation of the Soviet Union, and a reduction in the territorial part of the army followed. But the principle of local fighting groups was still very strong, as was shown by the regiments and battalions formed by the workers of large factories; and the tradition of the civil war which still pervades the Red Army was particularly strong among the territorials. The new training programme outlined by Marshal Timoshenko and the present fighting in the border provinces, where the Red Army is fighting in small groups behind the German lines, suggest that a method of fighting in small units similar to the activities of the "partisans" in the civil war must have been part of their training; and the military education of the civilian population, which is again based on the tradition of the civil war, should make co-operation between small units of the Red Army and civilians easily possible. One of the weapons of these bands will probably only come into play when the German armies have penetrated deeper into Russian territory—that is, the weapon of political parley. The civil war showed that many battles could be won by politics. It remains to be seen whether the German war machine can be checked by words and slogans. At any rate, if the fighting in Russia remains as fluid as it has been lately there should be ample opportunity for the Soviet guerrillas to fight against as well as to parley with the German troops.

The United States in Iceland

Those who have hankered for action on the part of the President of the United States and have watched with some apprehension the recent drift of American opinion into a sort of doldrums of detached observation have had all and more than they hoped for in the past week. The President's decision as Commander-in-Chief to take over the defence of Iceland and to ensure the safety of communications "on the seas between the United States and all other strategic outposts," may have revolutionary consequences, not only in the sphere of American defence, but also in the Battle of the Atlantic and the supply of war materials to Britain. The President's move is in a sense the last act of the *Bismarck* drama, for it was the sea battle in Denmark Strait that roused American opinion to the proximity of the German threat. The fate of Crete was an added lesson, showing as it did the vulnerability of an under-defended island to air-borne attack. Finally, the provocation of the *Robin Moor* incident—a deliberate and direct provocation—called for strong counteraction. Thus by stages the American people were prepared for the inevitability of the act and have given it a wholehearted welcome. Since the President deliberately based his case upon the existence of a "pincer movement" towards the Western Hemisphere, there is some questioning whether he will complete his action by dealing with the Dakar pincer to the south.

American reinforcements on the west coast of Africa would have a sobering effect on the hotheads at Vichy and might even put some heart into the craven and disintegrated North African bureaucracy. In the meantime, the presence of American forces in Iceland and the patrolling of the sea route between Iceland and the United States should have a notable effect upon the Battle of the Atlantic. As

Mr. Churchill indicated in his statement in Parliament, a certain amount of Anglo-American naval co-operation is likely to be inevitable on the Newfoundland-Iceland route. This will enable the Navy to concentrate far more of its strength and attention upon the 500 odd miles between Glasgow and Reykjavik. At the same time, it may force Germany to make her decision about the "shooting." It is pleasant to reflect that for once it is not the Germans who are making the pace.

Priorities

After nearly two years of total war, it appears that there is still no satisfactory central direction of priorities in the allocation of the nation's resources. In the first months of Mr Churchill's Government, it was Mr Greenwood, chairman of the Production Council and virtually Economics Minister as well, who ostensibly had the say; but, in February, the decision was handed over to the new Production and Import Executives of Ministers, the earlier arrangement having proved unworkable. Then, in May, the final word was given to Lord Beaverbrook when he was made Minister of State, the Production Executive having to report to him on priority matters. This arrangement had some promise, though even at the outset it was wondered what the relations would be between Lord Beaverbrook and Mr Bevin, the chairman of the Production Executive. As it was, the plan was apparently never put into practice, and questions of priority are now to be handled by the Production Executive again, with Mr. Churchill, as Minister of Defence acting as final arbiter. Mr. Churchill will presumably act on the advice of his own secretariat; and it remains to be seen whether an *éminence grise* will prove any more successful, with the force of the Prime Minister's personal authority to press his decisions, than his Ministerial and more constitutional predecessors in co-ordinating and collating the use of resources so as to maintain order and balance in the flow of production required by strategic needs. The whole story is an astonishing one, and it is probable that history will record some conflict of personalities in its unfolding. Until May, 1940, it was stoutly affirmed that priorities were not necessary because resources were plentiful. Even now, it does not appear to be fully realised that, in total war, everything is scarce and that, without an authoritative plan, not only to set all manufactured goods in a strict order of general urgency, but also to allot materials, plant and labour selectively to individual contracts, there is bound to be waste and disorder in output. War economy is priorities; *par excellence*, war economics is the economics of scarcity; and so far there has not emerged any Minister with the inclination, the ability, the forcefulness and the time to impose the final decisions on his politically and departmentally minded colleagues. The blessed word is still "agreement" and the result flabbiness and inefficiency.

Bars to Output

Production has been debated for two days in the Commons this week. The matter had been rendered urgent by the realisation, at the time of the Germans' bold stroke

against Russia, that the rate of output was still below the pace needed to face coming dangers, and by the appointment of Lord Beaverbrook to bring the production of tanks and military equipment up to a safe level. In the debate there were widespread complaints of deficiencies. For a long time, both economists and business experts have claimed that output was well beneath the nation's true capacity, in spite of the monotonous announcement from official sources of rising and record "floods" of weapons, and Lord Beaverbrook's appointment is only one sign of growing Governmental concern. Mr Bevin has set up a central committee of employers and trade unionists to advise the Production Executive of Ministers on measures to speed up production, and the existing area boards, have been converted into production boards, with power to supervise all contracts and scrutinise the use of tools and industrial capacity in their regions, will assist in this work. Actually, there is still no complete understanding in official policy of what the real problems are. It is not, for instance, a series of "representative" committees that is needed to scrutinise and speed up production, but a force of expert technical inspectors reporting to a Controller of Production, without departmental ties and with power to act. The checks to production do not include a lack of boards and committees. With authority, the new regional boards may do valuable local work, but the real troubles will remain: the delays and frustrations which are due to inappropriate administrative procedure and Civil Service misunderstanding; the unrealistic attitude which still leads officials to regard output in terms of money, and not of man-hours and materials; and the inability of firms, on the one hand, and of departments on the other, to think except in sectional terms or to cease their frontier disputes.

War Economy

The flaws in the organisation of the community for war go deeper than individual or sectional deficiencies. War output is chronically insufficient because the community, as a community, is not on a war footing. There is a welter of war organisation, but it has simply been grafted on to the peacetime system of individual firms. The fact that, in war economy, every producer, worker or employer is the State's agent is not recognised. The *entrepreneur*, the trader and the farmer are still expected to manage their businesses at their own risk, and they naturally take steps to prevent wartime restrictions from causing them losses. In turn, they tend to be regarded by Civil Servants, and by the public, not as victims but as rogues. What are commonly called vested interests, including organised labour, in seeking to protect themselves will oppose restrictive measures. If they are strong enough they may actually block steps required for the war effort; at least they will slow them down; while weaker *entrepreneurs* may simply go to the wall. This inevitable push-and-pull of a peacetime community in a wartime strait-jacket is no help to the war effort. It is a definite deterrent to the introduction of the drastic policies that full production and a fair distribution of consumption would entail; every vital measure—the limitation of supplies, the mobilisation of labour, rationing and the concentration of industry—has been brought in too late and too slowly; and other equally essential steps, including complete rationing, communal feeding and the compulsory transfer and training of non-essential labour *en masse*, are still delayed because of the suffering or loss which it is feared they might cause to individuals and groups. Practically all the decline in import capacity has been met by reducing imports of raw materials and not of foodstuffs. What is needed is a temporary wartime system of collective control over all economic activities in which every individual would be fairly remunerated or compensated by the State, and in which every individual would receive no less and no more than a basic ration of food and clothing. This would be a wartime community. There would be no prejudice to its unfreezing when the war was over; and there would be no needless barriers to the introduction of the policies needed to make the utmost of all the nation's resources for war production.

Armistice in Syria

In little over a month since the advance of Imperial and Free French forces into Syria on June 8th, General Dentz, in the name of the Vichy authorities, has made formal application for an armistice. There can be little doubt that the failure of supplies and the strategic

implications of the capture of Damour have been responsible for the collapse of Vichy resistance. The evacuation of Damour by Vichy troops followed a fine action against a heavily defended stronghold by Australian units. The fortified positions round Damour constituted the outer defences of Beirut and there is no doubt that its abandonment after less than three days' fighting following the hazardous crossing of the Damour river by Imperial forces early last Sunday morning, was a severe blow to Vichy. Moreover, it was highly probable that Australian intervention on the coastal road to the north of Damour had cut off the retreat of the escaping troops. In the extreme north-east, an Imperial column had at about the same time taken Tell Kotchek and was presumably free to advance upon Aleppo, while forces advancing up the Euphrates had control of Deir ez Zor as well as Palmyra. This central force could be deployed against Aleppo in the north-west, or it could be used to threaten Homs in the west and, in conjunction with the Free French, to cut off Vichy forces in Lebanon. Thus the stage had been reached when Allied units were jointly threatening Beirut and Aleppo, and were in a favourable position to separate and encircle the troops defending these positions. There is no doubt that the realisation that strategic control of the country had passed from Vichy to the Allies played an important part in securing the request for an armistice.

Clothes Rationing

On the whole, the clothes rationing scheme, which was introduced by the Board of Trade on June 1st without previous consultation with the trade, has stood the test of criticism very well. Such modifications to the scheme as have been found advisable—the latest of these are described on page 55 have been in the nature of minor adjustments. Indeed, the Board of Trade has demonstrated that previous negotiation with the interests concerned is not necessarily always an advantage in the formulation of administrative schemes. It does not, of course, follow that the Board of Trade's procedure should be regarded as a rigid precedent for future policy. There have been good and bad schemes produced both after and in the absence of consultation. But while the clothes rationing scheme, as a scheme has been successful it might perhaps have been advisable for the Board of Trade to have followed it up with a campaign designed to draw the public's attention to the need for making the best use of their coupons. True, only 26 out of a total of 66 coupons were made available on June 1st, when the scheme was introduced, while only 20 of the remaining 40 coupons will be valid before the end of the year. But the announcement that the 40 coupons not yet issued can only be used after the first 26 have been utilised and the public's tendency to rush to the shops to buy their rations—which, naturally, was not discouraged by retailers, who have tried to restore all the atmosphere of peacetime "sales"—may have led to purchases that will be regretted in the winter.

Domestic Coal Restrictions

The announcement of the Secretary for Mines that, as from the first of July, no domestic coal consumer might receive more than one ton of coal a month, has met with heated criticism because of the apparent lack of discrimination between hotels, blocks of flats, hostels and clubs, on the one hand, and small householders, on the other. Whether this criticism proves to have been merited or not depends largely upon the local fuel overseers, who are empowered to licence larger deliveries where genuine hardship would otherwise occur. These overseers have presumably still in their files the detailed particulars, including numbers of radiators, gas and electric fires, of all the premises in their districts, and on the basis of these, brought up to date by the applicant, they should be able to deal intelligently with hard cases. It is emphasised by the Secretary for Mines that these licences will only be granted to relieve genuine hardship and not to enable people with means to live up previous negotiation with the interests concerned is not sumer is encouraged to build up small stocks during the summer if he can procure the necessary coal, but no coal will be delivered if the consumer had, on the first of the month, more than two tons of coal and coke if he lives in a self-supporting area, or two tons of house coal and one of boiler fuel if he lives in a coal-importing district. It is difficult to see why the first of the month, instead of the date of order or delivery, should have been chosen. It seems

likely to lead to deliberate extravagance towards the end of the month. There seems, too, much point in the criticism made in the House that the larger consumers cannot build up stocks on a ration of one ton a month. The fact is that all criticism of coal rationing is largely academic, since coal output has been allowed to fall so low that the prospect of obtaining the ration may be remote. Since the claim of industry is paramount, it might save local fuel controllers a great deal of trouble and householders much irritation if the Secretary for Mines would give some general idea of what he means by "hardship." Does hardship begin when the consumer has to forgo his daily bath, or when the whole family has to conduct incompatible activities in the same room, or only when there is absolutely no adequately heated room in the house? If people could be told how much they were expected to endure, most of them would adjust themselves with patience.

Re-registration and the Small Retailer

The word has gone forth from the Ministry of Food that a general re-registration is to take place between July 7th and July 19th. Normally, of course, this is a routine affair to provide consumers at regular intervals with an opportunity of changing their retailer. On the present occasion, however, re-registration is hedged with two important conditions. In the first place, registration for the whole fat ration must be made at one shop only, whereas at present butter and margarine can be bought at one shop and cooking fats at another; and the same stipulation will apply to registration for sugar and preserves. There is everything to be said in favour of the development of this form of grouping. It permits suitable freedom for the consumer, as he is still not compelled to register for all rationed goods at one shop. On the other hand, some restraint is thus officially placed upon spreading registration among as many shops as there are rationed commodities—and members of the household—which has frequently been done in order to secure an undue share of unrationed spoil. The second amendment to the registration system—that supplies of a rationed commodity are to be withdrawn from any retailer who has not secured a minimum of 25 registrations for that article before July 22nd—appears to be a more dubious innovation. In the first place, it is clear that it may lead to some canvassing by the small shopkeeper of potential customers, with a promise of undesirable most-favoured customer treatment. And the purpose of the order seems obscure. It may be intended to save the transport costs involved in distribution; but there will be no effective saving in large centres of population to which transport will have to take place in any case, and the transport saved in sparsely populated districts will be lost again if the inhabitants have farther to travel for their rations—anyhow, in such districts the ban on the small retailer will probably be relaxed. If, on the other hand, the order is intended to drive small retailers out of business as a step towards concentrating the distributive trades, it is the wrong way to do it. It has frequently been pointed out in *The Economist* that the greatest reserve of labour is to be found in such trades, and concentration is obviously desirable. But to do it by squeezing out the small retailer in a way that is reminiscent of the monopolist and trade association, without discussion and without compensation, is a most undesirable precedent.

Curbing the Quack

For a Bill which, on the great authority of the *Times*, "is of a controversial character," a surprising measure of agreement was shown during the second reading of the Pharmacy and Medicines Bill. Actually, the attitude taken up by the *Times* is, to say the least, surprising. So far from this Bill being an example of "hurried legislation," the consequences of which have not been fully considered, its main points have been under discussion for years; they were the subject of a Select Committee, not only before this war—in 1937—but before the last war as well, when a Committee reported in 1914 that new legislation "is urgently needed in the public interest." It is true that, since then, something has been done. Advertisements of remedies purporting to cure venereal diseases were prohibited by an Act of 1917, and a similar prohibition was extended to

cancer advertisements a few years ago. But the present Bill is the first occasion on which an attempt has been made to treat the problem of patent medicines as a whole. It contains four main provisions: the repeal of the Medicine Stamp Duties and the annual licence compulsory for proprietors, makers and vendors of dutiable medicines; the share of the trade as between registered chemists on the one hand and ordinary shopkeepers on the other; the extension of the prohibition on advertisements; and the declaration of the ingredients of secret medicines. The position of the chemist under the new Bill is discussed in an article on page 39. As regards the provisions to safeguard the public, all that need be said is that the Bill hardly goes far enough. Advertisements for the diseases mentioned are rare in these days, and the present tendency is rather to exploit the public's little learning in respect of vitamins and dietetics generally and the public's desire to cosset itself for any supposed ailment, however minor. Perhaps power could be given to add to the list of diseases as the occasion arises. Moreover, the clause putting an end to secret remedies should be amended to include the quantities as well as the nature of the ingredients. Otherwise, it will be possible for a manufacturer to declare that his product consists, say, of a substance containing Vitamin A, which on analysis may prove to be only a trace—of no value whatsoever. And if the ingredients are declared in Latin or Greek, most people will continue to be deceived. In short, a far too gullible public will be protected from danger by the new Bill, but not altogether from fraud.

No Change at the Ministry

It is to be hoped that the Government will reconsider its decisions with regard to the Ministry of Information. No one is satisfied, not even, one may believe, the Minister who opened and the Minister who closed the debate. Sir John Anderson announced three innovations which, he rather faintly hoped, would expedite the issue of news. Representatives of the three Service Departments are to reside in the Ministry of Information with certain powers of releasing news, subject to a veto on high policy. Questions raising high policy are to be referred to the Minister immediately, or, if he is absent, to a specially designated delegate. The third concession is that the Cabinet undertakes to issue no unnecessary vetoes. In a word, the changes, as an indignant House of Commons pointed out, leave the situation exactly where it was. The responsibility for issuing news remains with the Ministry of Information, the power of suppressing it rests with the Services, and there is no guarantee under the new system that they will show any more grasp of the needs of propaganda than they did under the old dispensation. As for the other problems, the creation of a really adequate system of foreign propaganda and information and the co-ordination of news on the home front through better contacts with the Press—these were barely touched on. A hopeful arrangement whereby all the Press relations officers would be brought together was nullified by there being no place or time at which they would meet, and the question of foreign propaganda was dismissed by referring it back to the Foreign Office. The appointment of Mr. Bruce Lockhart as an Assistant Under-Secretary for liaison and guidance work at the Ministry is probably a good one, but is no more guarantee than the presence of Service representatives that policy and propaganda will be properly co-ordinated. Altogether, it was a very sorry performance on the part of the Government.

The MERCANTILE BANK of INDIA LIMITED

Head Office: 15, Gracechurch St., London, E.C.3

Branches and Agencies throughout the East

FIXED DEPOSIT ACCOUNTS

Rates will be quoted on application

A Firm Hand

Mr. Hore-Belisha's persistence has elicited from the Prime Minister some account of the duties which are to be performed in the Middle East by the newest member of the War Cabinet. This explanation of the latest move in that shifting relationship between civilians and soldiers which is perennial in wartime was, of course, due to Parliament, to which Mr. Lyttelton will be personally responsible. In general, it appears that Mr. Lyttelton's task will be to confine the duties of the Middle Eastern commanders to the actual conduct of operations. He will take over the "extraneous responsibilities" that devolved upon General Wavell before his departure to defend India (and, it is now announced, Iraq as well), which was simultaneous with Mr. Lyttelton's appointment, and the Minister of State will give decisions on Government policy which otherwise might require reference back to a number of Ministries in London. The commanders will retain their direct contact with the Service Ministries, and the British Ambassador in Cairo will be able to communicate as usual with other British representatives in foreign countries and in the Foreign Office. But the powers of the Minister of State, if still not very clearly defined, are obviously to be very large; and it is plain that, in the Cabinet's view, in order to "smooth, hasten and concert action in the Middle East," it is necessary to keep the soldiers in their soldierly place.

The Rate of Spending

There have recently been attempts to assess the influence of Lease-and-Lend on the present rate of war expenditure. The line of argument has been that the rate of spending seems low because American supplies are no longer included, which is, of course, sound reasoning, except for the fact that supply expenditure in the first quarter of this financial year has not appeared low. The weekly average from April 5th to June 30th was £77 millions, which is equivalent to a rate of about £4,000 millions in a year, against a Budget estimate of £3,934 millions. In the first five days of July supply expenditure was £70 millions, which has been erroneously taken by some commentators as a low figure for a full week, while, actually, it is equivalent to £98 millions in a seven-day week or £5,000 millions in a year. It is true that the weekly average of £77 millions in the first quarter of this year is well below the weekly average of £88 millions in the final quarter of 1940-41; but it is not so far below as has been suggested. The comparison is not the aptest because expenditure is always highest in the final quarter; and, although it is the merest truism that expenditure is very materially reduced by Lease-and-Lend—Sir Kingsley Wood said in April that the inclusion of Lease-and-Lend commitments would raise a Budget total of £4,206 millions to "far beyond" £5,000 millions—there is no real evidence that the war effort as measured by the rate of expenditure is actually lagging. It is probable that it is still too small to fit the nation's capacity and to meet the nation's strategic needs; but that is another question.

Rumour War in Turkey

Turkey's reaction of strict neutrality to the new war is obviously and diplomatically correct, but it must be admitted that the entry of Russia into the war has complicated her position. Turkey's fear of Russia is endemic and it took a statesman of the forcefulness of Atatürk to advocate and pursue a policy of friendship and collaboration with the Soviets. Even he was constantly on his guard against Communist infiltration and the eastern provinces bordering on Russia remained under military government. The Russo-German Pact, which brought together two great and aggressive neighbours, simplified Turkey's attitude to the Allied cause. A German blow at the Balkans, coupled with a Russian drive through the Caucasus, was a nightmare of the Turkish Foreign Office, and in all their negotiations with Britain and France, the Turkish statesmen insisted that they should be compelled to take no action that would involve them in a war on two fronts. M. Sarajoglu's abortive visit to Moscow was followed by the series of Russian annexations and only confirmed Turkey's suspicions; and it was here that German propaganda found a fruitful field for action. In particular, Hitler's statement that Molotov had asked for bases on the Straits was expressly designed to magnify Turkey's alarm, and variations on the theme have been spread about discreetly by von Papen. The question now is whether Britain's fighting alliance with Russia will drive Turkey still further into the German camp. Nazi propaganda

is doing its utmost to suggest that in return for continued resistance, Russia will be compensated by the Allies with strips of Turkish territory. The story is not believed, but it creates a background of uneasiness against which other discreditable but slightly more plausible tales may be believed. That is the technique of German propaganda and if one thing is needed more than another in Turkey it is that British counter-propaganda shall be strong and effective; and the absence from Istanbul of any British propaganda officer since the death of Sir Denison Ross is disquieting in this context.

Incident in South America

There is still very little definite news about the reported clash between Peruvian and Ecuadorian troops on their common frontier. The Ecuadorians claim that the Peruvians launched the attack and, inevitably, the incident has been put down to sinister foreign intervention. The only odd feature is the foreign power picked on—Japan. It is true that Japan has business interests in Peru, but Italy's machinations in the past have far surpassed those of any Japanese agents that may have been at work. In any case, the activities of all foreigners have been considerably curtailed since the war began, yet it is probably safer to assume that the clash is simply a recrudescence of the frontier dispute between the two countries which has slightly embittered their relations for decades past. It is reported that both the United States and Chile have been asked to mediate, and it is to be hoped that the incident, trivial in itself, will not be allowed to develop into another Gran Chaco.

Belated Confession

On Sunday the chairman of the Imperial Tobacco Company came to the microphone to announce that it had been decided by the tobacco companies and the authorities to appeal to the public to smoke less. Lord Dulverton gave no explanation of why this obviously sensible and patriotic step was not taken months ago, when it might have been of some use in preventing the present fantastic scramble. It has been left to *force majeure*, in the shape of a well-founded fear that the country's tobacco stocks may be dissipated in a matter of months, to compel action. If it succeeds in stemming the run, its success will be an indictment of those responsible for not acting earlier. If it fails, its failure will be the newest chapter in an astonishing story of ineptitude. The "smoke less" advertisements which made their first appearance on Sunday put the position simply—and with some ingenuousness. "You have had to curtail your pre-war consumption of food and clothes," they said, "but we are not asking you to smoke less than before the war, only less than you are smoking now." And so the attitude persists which blandly regards tobacco on a par with bread and as more important than meat.

Shorter Notes

Including payments to local authorities for "first-aid" repairs, the total amount paid by the War Damage Commission up to June 13th in respect of the repair of war damage was just over £4 millions. The number of individual claims settled up to that date was 1,433, and the amount involved was £20,971. The largest sum paid to an individual claimant was £149.

Captain Budd's second application for a writ of *habeas corpus* has been refused by a majority judgment. The dissenting judge found that the material placed before the Court was insufficient for him to decide whether the Home Secretary had reasonable cause to believe that the applicant should be detained, and that, in his opinion, if the matter were determined on the material before them, Captain Budd should be released.

In recent months the number of persons detained under Regulation 18B has fallen steadily. In May, detention orders were made against only 4 persons and 25 persons were released. On May 31st the total number in detention was 781, compared with over 1,300 at the beginning of the year.

THE WORLD OVERSEAS

Switzerland Encircled

(By a Correspondent)

LANDLOCKED Switzerland is rapidly losing the measure of economic independence the country still enjoyed, in spite of the war, before the collapse of France. Outwardly, there is hardly any change in the "war economy" that was organised in Switzerland at the beginning of the war. Then, large stocks of foodstuffs and raw materials prevented serious difficulties; but now these stocks are disappearing, and industrial self-sufficiency is not possible in a mountainous country without coal, iron or metal resources. In order to be self-sufficient in cereals alone, Switzerland would need to double the area at present under cultivation, which would take five years at least. Lack of feeding-stuffs has resulted already in a reduction of the cattle and pig population, and the fat content of margarine has had to be reduced from 84 per cent to 75 per cent. In general, Swiss industry is caught between two fears. On the one hand, the elaborate organisation of the "war economy" is thought to be a menace to private industry; on the other hand, without it, German economic penetration would find no obstacle. So far, the interdependence of Swiss and German capital and industry has prevented direct German economic penetration. There are a number of Swiss holding and manufacturing concerns which have large capital interests in German and other European concerns. Because of the country's strong capital position, Swiss re-insurance companies have played an important part in Europe's insurance industry. The war, however, has ended the valuable tourist industry. Tourist arrivals from foreign countries fell from 1,000,536 in 1939 to 130,379 in 1940. Swiss income from capital investments in foreign countries is also decreasing, and a good many companies operating in German occupied countries are paying no dividends.

Formally, Switzerland's economy remains independent. But the domination of Swiss foreign trade by Germany and Italy make this independence precarious. The value of foreign trade has moved as follows:—

(Millions of Swiss Francs)		
	Imports	Exports
1938	1,607	1,317
1939	1,889	1,298
1940	1,854	1,316
1940 First Quarter	614	331
1941 " "	448	326

From July to October, 1940, exports exceeded imports, and the import difficulties are clearly shown by the further fall in the first quarter of 1941.

The most significant changes, however, have been in the direction of foreign trade. The shares of European and overseas countries in the first quarters of the years from 1939 to 1941 are shown in the following table as percentages of total trade:—

	Imports from		Exports to	
	Continent	Overseas	Continent	Overseas
First Quarter 1939	76.8	23.2	76.4	23.6
" " 1940	64.5	35.5	70.2	29.8
" " 1941	90.0	10.0	80.9	19.1

Before the collapse of France, Germany's share in Switzerland's foreign trade actually fell. Since July, 1940, British and French commodities have practically disappeared from the Swiss market, and American goods have become very scarce. Swiss exports to overseas countries, however, are still substantial. Since the Axis occupation of Yugoslavia and Greece, shipping difficulties have increased, however—and Switzerland chartered Yugoslav and Greek ships—and the creation of a Swiss merchant navy has made little headway.

There is no competition to German goods in Switzerland; only Italy and Sweden are also still offering goods in quantities comparable to pre-war imports. If Germany decided to end Swiss industrial activity or to put pressure on the country, the suspension of sales of coal and iron and steel

manufactures would be sufficient. Germany and Italy easily succeeded in securing autonomy for their transit traffic through Switzerland. The principle of the Central Clearing through Berlin has been accepted for Switzerland's foreign trade with Belgium, Holland and Norway. Swiss objections to German agents trying to negotiate trade transactions between Switzerland and German occupied countries have not been successful.

Eking out Supplies

Acute shortages of feeding-stuffs, fats, coal, petrol, metals and textile materials have to be met by rationing and by the creation of substitute industries. Plants for the sugarisation of wood for feeding-stuffs have been in operation since 1940. Electric power plants are rapidly being expanded, and wood-gas generators are extensively used in motor-cars. Disused mines in the Jura mountains have been reopened. The production of cellulose has been increased, and factories for the manufacture of cellwool after the German model are under construction. In the textile industry, Germany has used her position as the leading producer of cellwool to obtain a reduction in import duties, whereas before the war Switzerland persistently resisted this demand.

It is not surprising that industrial construction during the first months of 1941 was above the level of the first quarter of 1940. Residential building, however, declined by 50 per cent. The engineering and metal industries are working on orders from Germany and German occupied countries, and attempts are being made to keep up exports of textile goods. In April, unemployment amounted to 7,853 fully unemployed against 9,582 in April, 1940. Yet 9,500 workers are employed in emergency public works, in the labour service or in training centres—the majority are employed in building roads.

At the end of May, 1941, the index of wholesale prices had increased by 62.9 per cent from the level of August, 1939, and the index of the cost of living had risen by 23 per cent. The wages of roughly three-quarters of the workers have been increased since the beginning of the war—by some 6 per cent on the average. This compares unfavourably with the general increase in prices and the wartime increase in income tax of 16.5 per cent. The real wages of the workers have thus fallen considerably.

Switzerland's financial situation shows the familiar signs

of "war economy." The Budget deficit in 1940 was 845.5 million francs. Emergency expenditure was 1,165 million francs; national defence required 175.5 million francs and mobilisation 864.8 million francs. Additional wartime taxation yielded only 304.6 million francs. Since the start of the war, total notes in circulation have increased from 1,723 million francs to 2,095 million francs. The hoarding of notes, which was widespread at the beginning of the war, has diminished gradually. Average interest rates showed a tendency to rise, and official policy tried to counteract it by a reduction in the bank rate from 1.5 per cent to 1.25 per cent. Price increases and great financial liquidity have created a widespread fear of inflation.

Currency Moves in Shanghai

[FROM OUR SHANGHAI CORRESPONDENT]

May 28th.

SHANGHAI'S own free sterling rate during the first five months of this year fluctuated between U.S.\$3.80 and U.S.\$3.96, and for the past few weeks has vacillated around U.S.\$3.91. Hongkong, still outside the sterling bloc exchange control and the major source of sterling offers in the local markets, recently tightened the official supervision of exchange transactions and reduced its sterling sales here considerably below last year's level. On the other hand, the new British clearing agreements with Latin America have narrowed the outlet for Shanghai's sterling via that part of the world. With more sterling than required being continually supplied here, the quotation of a local free sterling rate lower than the London/New York cross-rate is expected to continue.

Hongkong sales of sterling on behalf of Chinese Government banks in support of local foreign exchange rates for Chinese national dollars have become insignificant. The chief sources of those sales now are three: (1) a continuous flight, via Hongkong, of capital from Asiatic parts of the British Empire; (2) a withdrawal of Japanese capital from sterling bloc areas; (3) Hongkong speculation on the difference between the valuation of Chinese dollar notes in the Crown Colony and at Shanghai. Chinese dollar notes here at Shanghai will buy more foreign exchange than at Hongkong, with the difference this year occasionally amounting to as much as 10 per cent. Speculators, therefore, sell Hongkong T.T.s to Shanghai for Chinese dollars, and pay here in Chinese bank notes smuggled up from Hongkong by misuse of the mails and by other ways.

The past few years' local preference for U.S. dollars is on the wane. The Chinese in Shanghai are increasingly afraid of United States inflation, devaluation, open war with Germany or with Japan—the latter might temporarily give Shanghai into Japanese hands. They worry also over how serious are the possibilities of an American decree freezing Chinese holdings in the U.S.A., for the double purpose of preventing Japan from taking advantage of such holdings, as well as of giving Chungking an opportunity to seize private Chinese foreign exchange assets. It is an open secret that a decree to such effect is being held prepared in Washington and may be immediately enforced whenever President Roosevelt chooses to sign it.

Transfer of Funds

To forestall freezing, large Chinese accounts in U.S. currency here and in New York have in recent months been converted into bearer drafts and American dollar notes. Another section of Chinese private capital holdings in the United States is being continually repatriated to Shanghai and reconverted into Chinese dollars. This repatriation, and the psychological effects of the recent American and British stabilisation loans to China, chiefly account for the recent firmness of Shanghai foreign exchange rates. In April, this repatriation easily provided the cover for a local import surplus of £2,500,000, which, without the simultaneous return of Chinese capital, might have disastrously affected local exchange rates. Shanghai exchange speculators discount German victories and Japanese threats by buying Chinese dollars, while they discard Chinese currency for foreign exchange when the situation favours the Anglo-Saxons. They thus disregard unreasonably Free China's position in the democracies' camp and the Chinese national currency's intimate link with the democracies' ultimate fate. Nobody here expects any substantial fraction of the pro-

ceeds of the new American and British stabilisation loans to China to be spent upon the support of Shanghai foreign exchange rates if it is once more required. Both these loans are to answer primarily, if not exclusively, Free China's foreign exchange requirements. The granting of still further loans and credits for this purpose, if necessary, is a certainty—at least from the United States. Yet it is understood that the United States will insist more strongly than in the past that its financial aid to China is expended in the interests of Free China's resistance against Japan, and not in those of the coastal private business circles, both foreign and Chinese. In the Chinese National Government camp at Chungking, too, an ever-widening influential circle is in favour of the financial abandonment of Shanghai, so long as the Japanese maintain their present hold upon this city and its hinterland.

The equilibrium of Free China's foreign payments seems perfectly assured by the new stabilisation loans. More than 80 per cent of Free China's foreign trade and foreign payments is being effected with the Anglo-Saxon countries, whose new loans to China will cover Free China's foreign exchange requirements on this account. Most of the remainder of Free China's trade is done with Russia on a barter basis which was recently extended. The problem of the Chinese dollar's internal value in Free China, however, is not solved, nor is its solution in sight.

Currency inflation continues to advance in Free China at an increasing pace. The Chinese National Government's revenue this year promises to cover at best one-sixth of their internal expenditure. The deficit of over Ch.\$6,000 millions has to be covered chiefly by means of new bond issues, the bulk of which is being placed with the Chinese Government banks; these, in their turn, raise the necessary funds by extending their note circulation. The Free Chinese dollar's purchasing power, with prices skyrocketing, continues to deteriorate. Notes, rubber-stamped with Free China places of issue, or of new sizes circulated in Free China only, are not considered here negotiable against foreign exchange. Shanghai dollars command a substantial premium over Free China dollars; this year it rose more than once to over 25 per cent, and it is paid in Free China on all remittances from Shanghai.

A Drainage Scheme for Eire

[FROM OUR DUBLIN CORRESPONDENT]

June 30th.

THE high rainfall and the flatness of the surface have rendered Ireland very susceptible to flooding, and considerable attention has been given to drainage. It is just a hundred years since the first arterial drainage Act was enacted. This legislation is criticised by a Commission on Drainage, whose report has recently been published, on the ground that it dealt with the problem in a piecemeal manner. The existing works are deplorably badly maintained and the system is pronounced a failure. A comprehensive scheme is outlined to cover the whole country. The cost is estimated at £7,035,000; 586,200 acres of land would be directly benefited at an average cost of £12 per acre; and large areas would be indirectly benefited. It is recommended that the cost of all drainage construction works should be a national charge, and that the maintenance cost should be borne by occupiers up to a maximum of 70 per cent. of the annual improved value of their land and the balance by county funds. The scheme should be operated by a Central Drainage Authority with very wide powers.

The Commission argues strongly that this scheme should be put into operation in spite of its being admittedly uneconomic in the sense that the capital value of the lands affected would not be increased to the extent of the cost incurred. Flooding is inimical to good farming, and, if it is not abated, the saturated land will still further deteriorate until its ultimate restoration will be very costly. Land reclamation would be facilitated as a result of drainage; public health would be improved, and pulmonary and rheumatic diseases reduced. "In an agricultural country such as Ireland, arterial drainage must be classed as an essential service and the provision of essential services should not be governed entirely by economic considerations. Apart altogether from the material consideration of benefit, we venture to suggest that national pride demands that flooding conditions should not be tolerated."

The suggestion that drainage would substantially assist in relieving unemployment is discussed with a rather disappointing conclusion. The areas which require drainage are not those where unemployment is most severe, and difficult problems of transport and housing would arise. The employment given would be localised, intermittent and seasonal, and would never absorb more than a thousand unskilled labourers. The saving in unemployment assistance would be negligible. Employment in other activities would, however, be indirectly stimulated. The full working of the turf development schemes depends upon an extension of drainage works, and the area of land available for reclamation would be increased by such works. The effect on employment should therefore not be measured by the employment directly given.

Proposals involving capital expenditure of £7,000,000 out of public funds deserve the closest scrutiny before being accepted. One member of the Commission makes reservations, in which he expresses the opinion that the comprehensive scheme cannot be justified in view of the conjectural nature of the economic return and in view of the competing claims for capital of housing and other schemes of social improvement. The scheme outlined by the Commission would involve large additional dead weight debt. In view of the recommendation of the Banking Commission that the dead weight debt should not be increased and of the growing financial burden caused by the war, it is unlikely that the whole of the ambitious programme of drainage will be put into operation in the near future.

Letter to the Editor

The Cost of Living

TO THE EDITOR OF THE ECONOMIST

SIR,—Your article on the Illusory Cost of Living Index in *The Economist* of May 31st is based on a simple and elementary confusion between the concepts of *standard of living* and *cost of living*. You argue that rationing, by reducing expenditure, lowers the cost of living. To prove this point, you compare pre-war expenditure, obtained by multiplying pre-war prices with pre-war quantities, and present expenditure, calculated on present prices and currently consumed quantities. If this argument were admitted, any reduction of expenditure, however brought about, would imply a reduction in the cost of living—whether it be due to rationing, or increased direct taxation, or simply a reduction of wages or loss of employment. In fact, all that would be needed to reduce the cost of living is to reduce wages.

But the meaning and purpose of any cost of living index is to show the increase in the sum of money required to purchase a given amount of real income. If objection is taken to the construction of the official index on the ground that the quantities on which it is based are no longer obtainable, the index should be revised by comparing pre-war and current expenditure on the basis of currently consumed quantities, rather than pre-war quantities. But in this case the increase shown need not be less than that of the official index, and might well be greater.

Even this method does not register fully the increase in the cost of living since the war. For any cost of living index, based solely on price changes, assumes that the goods and services entering into the index are freely obtainable at given prices. If this is not so, and expenditure is diverted through rationing, there is an additional increase owing to the fact that money spent on substitute commodities or on savings cannot secure the same real income as money spent on rationed goods (otherwise the expenditure would have flown into those channels in the first place). To maintain the same real income, the increase in money income will therefore have to be greater than what is obtained if only the rise in prices is taken into account.

In a sense, it is true therefore that the introduction of rationing renders the Ministry of Labour index "illusory"—but it does so for a reason, *precisely opposite* to that given in your article. It is because rationing causes the index to *understate* the true increase in the cost of living, and not because it *overstates* it.

It would be most unfortunate if the argument of your article were used by interested parties to oppose claims for wage increases based on the official cost of living index. For this index, in so far as its movements are not caused by higher indirect taxation, does give a rough indication of the rise in current money incomes; and if wages are raised in accordance with it, this ensures that the share of labour in the national income is not reduced. Even if everything were rationed, so that the increase in wages could not secure an increase in consumption at all, it would still be desirable that wage rates should be adjusted to the rise in prices in order to ensure that the working classes receive a fair share of current savings and to avoid an undue concentration of claims on future wealth in the hands of profit-earners.

Yours faithfully,
NICHOLAS KALDOR.

Cambridge.

[Mr. Kaldor's insistence on terminological exactitude is necessary and welcome; but he has misunderstood the intention of *The Economist's* argument. The object was to show, first, that the official index of the cost of living is no reliable guide to changes in the standard of living of the working classes, and, secondly, that the linking of wage rates to the index does not necessarily insure them against a fall in the standard of living. The cost of living index is based on a collection of family budgets made before the last war, and merely records what would be the changes in the cost of purchasing a given collection of goods if the average working class family chose to want exactly that collection (which it does not) and could get them (which it cannot). The point is that the supply of consumers' goods and services must be reduced in order to release labour, materials, plant and shipping for the war effort, and no general increase in money wages will ensure the maintenance of the pre-war standard of living. With regard to the last paragraph in Mr. Kaldor's letter, *The Economist* has never suggested, either in the article in question or in any other article, that the share of labour in the national income should be reduced during the war. (Its views on this subject are stated again in a leading article on page 38.) But the validity of Mr. Kaldor's own assertion that, to ensure that labour's share in the national income is not reduced, wage rates must be raised in accordance with the official index of the cost of living is very questionable.—EDITOR.]

Shorter Notice

"The War Damage Act, 1941, and the War Risks Insurance Act, 1939, Part II. (Commodity Insurance Scheme)." By G. Granville Slack, B.A., LL.M., and Special Contributors. Butterworths. 446 pages. 15s.

"The War Damage Act, 1941." By T. J. Sophian. Jordan. 312 pages. 10s. 6d.

The first of these books will be much in demand by lawyers and others seeking guidance in the interpretation of the War Damage Act. Mr. Slack has been working on the subject throughout the passage of the Bill, and this has enabled him to produce a legal treatise which bears all the marks of competent and authoritative handling. The volume is divided into seven parts. Division I contains a history of developments leading up to the recent statute, and a general outline, suitable for introductory reading; Divisions II and VII, which constitute the main body of the work, reproduce section by section the legislation cited in the title, with full interpretative notes, admirable for reference purposes; in Divisions III, IV, V and VI, there are articles, by special contributors, dealing with particular aspects of the legislation and related subjects—income tax and rating law are discussed, practice under the Act is compared and contrasted with normal insurance practice, and the problems facing local authorities and charitable organisations receive attention. Mr. Sophian's book covers much the same ground as Division II of Mr. Slack's work, and is presumably intended to satisfy a more popular demand. Incidentally Mr. Sophian has fallen into a curious error concerning the constitution of Lloyd's in referring to this body on pages 2, 167 and 173 as an insurance company; Lloyd's is, of course, not a company, but an association of underwriters, each transacting business for his own account.

THE BUSINESS WORLD

Plastics

ONE of the most interesting industrial phenomena in the past two decades has been the change in the status of those industries which synthesise their own raw material. Starting as a rather despised substitute for some costly natural material, such as silk or tortoise shell, synthetic textiles and synthetic resins have now become raw materials in their own right. This is precisely because their synthetic origin makes it possible for them to be far more than mere imitations; they can be, and are, made to exhibit combinations of virtues found in no natural product. That group of trades which is known as the plastics industry supplies a constantly increasing range of goods which for many purposes fulfil as well, or better, the functions formerly carried out by wood, metals, glass, porcelain, rubber and paper. Their peculiar molecular structure explains their plasticity and their toughness; and an attempt has been made in a "Pelican" publication* to explain this molecular structure to readers wholly ignorant of chemistry or physics. As this is an impossible task, success was not to be expected, but the chapter does help the reader to some idea of the general principles on which the synthesis of plastics rests.

Plastics are defined as materials which can be deformed under mechanical stress without losing their cohesion, and are able to keep the new form given to them. Their most important division is into two groups: "thermo-plastic" materials which resume their plastic state whenever the right amount of heat is applied; and "thermo-setting" materials, which under the application of heat and pressure, undergo chemical change which renders them permanently insoluble and infusible. This distinction involves considerable differences in the methods of manufacture.

The earlier plastics all belonged to the thermo-plastic group, which includes the natural resins and waxes, used alike by the ancient Egyptians and the modern manufacturer of gramophone records, and the pioneer synthetic, celluloid. In an attempt to reduce the inflammability of celluloid, cellulose acetate was evolved, and became a commercial proposition when aircraft "dopes" were required during the last war. After the war, an outlet was found for it in the production of acetate rayon, and the result was a cheapening of the product for use in the manufacture of plastics.

Bitumen products entered the field rather later than celluloid, but still retain a limited place. The glass-like or "ethenoid" plastics have only recently become available commercially, though styrene was first produced in 1831, and the vinyl resins are also over a hundred years old. The methacrylic acid products, which also belong to this group, scarcely date back beyond the present century.

The thermo-setting groups, which include the phenolic resinoids, the urea-formaldehyde products, the casein plastics and the glyptals (important as finishes), arrived early in this century, and Messrs. Yarsley and Couzens claim for them that they laid the foundation of the plastic industry of to-day. Dr. Bakeland's work on the interaction of phenol (carbolic acid) with formaldehyde led to the production of the well-known Bakelite, which, for many people, remains to this day a household covering term for all synthetic resins. The phenolic products, however, were dark and dingy in colour, and the search for a product having the same physical and mechanical characteristics, but capable of being produced in bright colours, led to the use of urea. By 1925, products in bright clear colours were on the market under the proprietary name of Beetle, the public was rapidly becoming plastic-conscious, and the prospects of mass production in this industry were assured.

* "Plastics." By V. E. Yarsley and E. G. Couzens. Allen Lane: Penguin Books. Harmondsworth, Middlesex, England.

The means by which the various plastic materials are produced from the basic raw materials and the methods by which the finished goods are manufactured from the plastic are too technical and too varied to permit of easy summarisation. The processes by which the principal plastics are fashioned into finished goods do, however, fall for the most part under three main heads. In the first place, the plastic may be extruded or cut into sheets, rods or tubes, and then moulded, blown, or stretched over a core. The second method, by which the raw materials, in the form of powder or chips, are moulded under heat and pressure, is particularly suitable for thermo-setting plastics, as they can be removed from the mould while hot. The speed of manufacture which this, together with the almost complete absence of finishing processes, renders possible makes it, in the opinion of the authors, the most important single method of plastic manufacture. Thirdly, injection moulding, which is applied to thermo-plastic materials, is similar in principle to the die-casting of metals. The raw material is fed into the mould in liquid form and set by cooling. These moulding methods presuppose a large output, since even the simplest moulds are extremely expensive. They also imply certain limitations on design, but as the limitations imposed by one method of manufacture can be overcome by another, the range of the industry as a whole is almost boundless. The ethenoids alone include such diverse products as optical lenses and transparent cockpit covers for aeroplanes.

The significance of this industry, both to the community and to the individual, is considerable. To the individual, it means greater cheapness and efficiency and often a more attractive appearance in many of the articles in everyday use, and the availability for everyday use of many things which were hitherto beyond his reach or did not exist at all. Both photographic film and gramophone records, for example, are products of this industry. To the community, it means even more. Instead of depending for its raw material upon access to supplies of an immense range of metals and other minerals and of timber and other vegetable products, its requirements are relatively simple, and as it needs no special climatic conditions, it can be established anywhere where the raw materials are obtainable. Owing to the simplicity of its raw material requirements, it can be used to make good the defects in a country's natural resources and to help in the execution of a policy of self-sufficiency. This partly explains the advanced state of the industry in Germany.

Most important, industrially, is the means which synthetic products afford of carrying out developments which have been envisaged, but which might have been held up indefinitely for lack of a suitable medium. If no material exists having the requisite properties there is now a fair chance of inventing one, provided, of course, that no two of the qualities required are mutually exclusive. Many of the recent developments in aircraft construction illustrate this. The exceptional electrical properties of some plastics and their unusual resistance to corrosion has enabled them to play a great part in the development of the electrical and chemical industries, and in the motor-car industry they are ubiquitous, from the safety glass windows to the "imitation leather" upholstery.

Since the authors, one as a research chemist and the other as a factory executive, have completely thrown in their lot with plastics, some part of their contagious enthusiasm must be discounted. That they are, for example, disposed to exaggerate the ease with which the industry can obtain its basic raw materials is shown by the present position in the United States. There appears to be a shortage there of methanol, used in the production of formaldehyde, and of phthalic anhydride. Users of these materials for less urgent purposes have to be diverted to alterna-

tives in order to leave supplies free for the plastics industry. In spite of these sobering considerations, there is probably a strong element of truth in the picture with which the book concludes of the "Plastic Man" of the future, who "will come into a world of colour and bright shining surfaces where childish hands find nothing to break, no sharp edges or corners to cut or graze, no crevices to harbour dirt or germs . . . He sits in a new kind of schoolroom with unscuffable walls at a moulded desk, warm and smooth and clean to the touch . . . The windows . . . curtained with plastic-faced cloth, entirely grease

and dirt proof, are unbreakable and transmit the life-giving ultra-violet rays, and the frames, like those of his house, are of moulded plastic, light and easy to open and never requiring any paint to prevent them warping and rusting . . . He may have the privilege of being beaten with a synthetic plastic cane, far more tough and resilient than the one which Nature, unaided, can provide." Later: "His own teeth are gone, and he wears a plastic denture with 'silent' plastic teeth and spectacles of plastic with plastic lenses . . . At last he sinks into his grave, hygienically enclosed in a plastic coffin."

Finance and Banking

Easy Money

Although the cash basis has been considerably contracted, following the repayment of ways and means advances at the Bank and the gradual maturity of the short bills bought by the Bank from the market over the turn of June, the position in the money market has throughout the week been extremely easy. The banks have been keen buyers of bills, their appetite being stimulated by the fact that they were called upon to pay only £15,000,000 by way of Treasury deposits during the week. The market obtained a 38 per cent allotment at last week's tender for Treasury bills, and has thus been a readier seller than for some weeks. The total applications for bills at the last tender were £153,140,000, or £11,000,000 less than the total applied for at the corresponding tender three months previously. This reduction must be viewed in the light of the fact that the syndicate now applies for £75,000,000 of bills, as compared with the quota of £70,000,000 which obtained three months ago. Outside applications have thus fallen off by some £15,000,000, which probably reflects the diversion of certain sterling area funds previously invested in Treasury bills into Treasury deposits. The past week's contraction in the credit basis began from so inflated a level that it is hardly surprising that it should not have made itself felt on short loan conditions. Thus, while bankers' deposits have fallen by £32,649,000 over the week to last Wednesday, they still appeared at the high level of £131,794,000 in the last Bank return. The counterpart to this movement is, in the main, to be found in the fall of Government securities, which over the corresponding period amounted to £29,535,000. There has, however, been an additional contracting influence in the shape of a further outflow of £4,664,000 notes into circulation. This carries the circulation to the new record of £648,029,000.

Concentration in the Discount Market

Negotiations are afoot for further amalgamations of firms in the discount market. One such merger is due to be announced within the next few days. The concentration movement in this market is of long standing. Since 1931 the number of firms, other than running brokers, has come down from 22 to 14. Even this number, however, leaves considerable scope for further integration. It may be assumed that the negotiations to bring about this further reduction in the number of units operating in the market are not altogether unconnected with the prompting and encouragement of the Bank of England. The fact is that the discount side of the discount market's business is steadily diminishing in importance, not only as regards turnover and in the attention it demands from management and staff, but also from the point of view of profits. The turnover in commercial paper is negligible, while the business in Treasury bills has become stereotyped to the point at which it could be transacted in a few hours on Friday of each week. Now that the Treasury bill has ceased to be the non-really live element in the floating debt, and the non-market competition for the virtually stabilised issue of Treasury bills may be counted upon to increase further, the return to the market on its discount business can only provide a small contribution towards the covering of overhead charges. The bond business, on which the market has for years past depended for its profits, involves a higher degree of risk and therefore demands a stronger capital structure than the smaller firms in the market command at present. Hence the need for further concentration. It has been suggested that the concentration movement should ultimately leave the discount market with no firm having

less than £1,000,000 of resources by way of capital and reserves. Only four of the existing firms can claim to qualify by this standard, and some of them may well provide the nucleus for further amalgamations. The fact that there should have been an official request for more concentration must not be taken to imply that the discount market is going through a difficult period. The reverse is probably the case. The three companies have maintained their distributions for the past half year, and there can be no doubt that the recent strength of the gilt-edged market has provided opportunities for profitable bond operations which the expert dealers have turned to good account.

Gold Prospects for U.S.A.

The May, 1941, issue of the Federal Reserve Bulletin contains an interesting analysis of the prospective gold movements affecting the United States. With Continental Europe blockaded and the available gold reserves of the British Empire close to exhaustion, the possibilities of further transfers of gold to the United States are greatly reduced. They are limited to the current output of gold in the British Empire and to transfers from the reserves of the U.S.S.R., Japan and Latin America. Many of the commodities which Japan and the U.S.S.R. have been obtaining via the Pacific can no longer be spared from the American defence programme, and this has reduced the need for shipping gold in payment. The latest development in the war situation—the attack on Russia by Germany and the promise of American aid for Russia—is likely to lead to an immediate stimulation of the flow of gold from the U.S.S.R. to the United States. Apart from the exhaustion of the free gold reserves of the British Empire, the main factor in the diminution of the gold movement to the United States is the tendency towards an export of capital from that country. This movement is taking several forms. In the first place, there is the repatriation of dollar securities previously held by foreign interests. In this same category may be included the liquidation of part of the British investment in plants of American war industries, investments made since the beginning of the war and already taken over by the U.S. Defence Plant Corporation to the amount of \$46,000,000. Thirdly, there is the increasing volume of credit assistance being given by the United States through the Stabilisation Fund and the Export-Import Bank. The credit of \$110,000,000 offered by these agencies to Argentina, for example, should considerably diminish the likelihood of further sales of Argentine gold to the United States. At the end of last March, the Export-Import Bank had credits outstanding to the amount of \$166,188,000 and commitments to make additional loans of \$265,957,000—mainly to Latin America and China. Finally, there has been a strong tendency lately for foreign investments in the United States to be withdrawn in anticipation of the freezing order which has now been put into effect. This was particularly apparent in the case of Swiss dollar assets which left the United States on a substantial scale earlier this year.

Gold for Dutch East Indies

The only country in the world, other than the United States, which found it possible to add to its gold reserves over the year was the Dutch East Indies. The Bank of Java shows an increase of Fl.141,000,000 in its gold reserve over the year to March 31 last. This increase was in part due to the revaluation of gold in September, 1940, at the current market price for the metal, but it is also the coun-

terpart of the substantial increases in the exports of tin and rubber from these territories to the United States and of the consequent favourable balance of payments of the Dutch East Indies. The annual report of the Bank of Java makes some interesting references to the monetary convention between the Netherlands Indies and the United Kingdom. By this, the Netherlands Indies agreed to maintain in London for the duration of the war their existing sterling balances and any surplus which might accrue from their trade with the sterling area. The ultimate conversion of these sterling assets into guilders has been guaranteed by the United Kingdom at a fixed rate of exchange, and the accumulation of these funds in London does not, therefore, involve an exchange risk. The monetary convention evidently allows the Netherlands East Indies to deal as they think fit with the surplus of their balance of payments with countries outside the sterling area. Their preference in this connection has been for gold, which is being held earmarked for their account in New York.

India's Public Debt

An authoritative statement on the public debt of India has been issued this week and gives a great deal of interesting information on the composition, burden and counter-part of that debt. The total interest bearing obligations of the Government of India on March 31, 1940, totalled Rs. 1,204 crores, or £903,000,000. Of this, Rs. 761 crores was expressed in terms of rupees and Rs. 443 crores or £332,000,000, in terms of sterling. The bulk of this debt represents capital invested by the Government of India in railway and other quasi-commercial enterprises and loans made by the Government to the Provinces and Indian States. These assets of the Government amount to Rs. 897 crores and thus represent about 75 per cent of the debt. The earnings on the assets of the Government are more than sufficient to cover the whole of the interest burden on the public debt. The gross interest on the Government of India's obligations in 1940-41 was Rs. 42½ crores. The interest charged to railways and other bodies to whom interest bearing advances had been made was Rs. 34 crores, thus leaving Rs. 8½ crores to be met from general revenue. Against this, however, there accrued to general revenues

a total of Rs. 11 crores as net profit from the railways and other commercial departments owned by the Government. The total debt charge was thus covered with Rs. 2½ crores to spare by the yield on the Government's assets. The policy of repatriating sterling debt made great strides in the year to March 31st last when over £88,000,000 was thus converted from sterling to rupee denomination. But the trend, though recently accentuated, is of fairly long standing. Since March 1936, this repatriation of Government debt has amounted to £120,500,000, from £376,250,000 to £255,750,000, and the interest charge on sterling loans, which was £13,000,000 in the year 1936-37 is estimated at £8,000,000 for the current financial year—a reduction of about 38 per cent.

War Risks at Sea

An important judgment was delivered in the High Court on July 4th in the case of Yorkshire Dale Steamship Co., Ltd. v. Minister of War Transport. The Lord Chief Justice upheld an arbitrator's award in favour of the ship-owners in a dispute arising on the question whether a casualty at sea is for insurance purposes a war risk or an ordinary marine peril. The circumstances of the case are that a steamer, the *Coxwold*, was requisitioned by the Ministry under the customary charterparty, by which the shipowners insure against all insurance case marine perils and the Minister assumes the war risk. In the morning of May 7, 1940, when in convoy from Greenock to Narvik, the *Coxwold* ran ashore on the Isle of Skye, and the arbitrator found that the casualty arose because (a) a certain light was not burning with full power, having been dimmed owing to the war, (b) the weather was slightly foggy and (c) there was an unexpected and unexplained set of the tide. He found, moreover, that there had been no improper navigation of the *Coxwold* and that the casualty was not due to any negligence of those on board. In all these circumstances the Judge affirmed the arbitrator's view that the loss was caused by the war risk. He refused, however, to hold generally that everything which happens in the course of a warlike operation is necessarily to be considered a consequence of such operations, thus leaving future disputes to be decided on the individual merits in each case.

INSURANCE NOTES

Legal and General.—This important life office records a less-than-average reduction in new business, attributable, in part at least, to its leading position in group life insurance, which fell by less than 1 per cent.:

		Rise or Fall
New Business:—		
Net sums assured	£9,028,648	—£1,042,640 (29.6%)
Income:—		
Net premiums	£5,135,242	+ £61,513 (1.2%)
Net interest	£1,690,476	+ £97,183 (5.8%)

Claims by maturity	£694,543	— £39,068 (5.6%)
Surrenders, including		
surrenders of bonus	£247,796	— £39,534 (15.9%)
Commission and ex-		
penses	£580,435	— £29,824 (5.1%)
Commission and ex-		
penses — ratio to		
premiums	11.3%	— 0.7%
Amortisation of out-		
standing	£543,480	— £325,373 (59.9%)
Amortisation paid and out-		
standing	£901,186	+ £66,523 (7.4%)

Death claims include 299 war deaths involving payments of £162,436, but, despite these claims, the experience was within expectation. The chairman (Mr. Ernest E. Bird) mentioned at the meeting that most of the ordinary life policies now being issued to civilians cover at regular rates the risk of death in this country from enemy action, so long as policyholders remain civilians; this concession, however, involves a very careful selection of lives, as well as the retention of smaller sums assured than formerly.

The society has relatively small fire and accident departments; the combined premiums amount to some £570,000, a slight reduction on the previous year, and after writing off £51,568 in respect of investments and cash deposits in enemy and enemy-controlled countries there is a

useful profit balance, excluding interest on departmental funds, of £30,145.

Total profit and loss credits, including net interest of £65,290 and £51,390 for profit on investments realised, amount to £149,825. £10,000 is transferred to staff pension reserve and the dividend, at the same rate as before, costs £78,750; after providing for this the balance carried forward is £238,072, an increase of £61,075. The assets are certified to be fully of the value at which they appear, less the investment and general reserves of £2,000,000; British Government securities now amount to £11,700,000, an increase during the year of over £3,500,000. There are additional reserves in the fire and accident funds of £185,000.

[The accounts of the associated offices, the "Gresham Life" and "Gresham Fire and Accident" will form the subject of a separate note.]

London and Manchester.—The principal features of the life revenue accounts of this office are exhibited in the accompanying table, covering the financial year ended March 24, 1941. As with most of the industrial-cum-ordinary offices,

production of new business has not suffered unduly, and for the two branches combined premium income actually shows an increase. Death claims include war deaths costing £20,253 and £45,506 in the ordinary and industrial branches respectively.

Liabilities have been valued on the same bases as last year, with interest at 3 per cent. Surpluses earned amount to £558,906 (£337,879 in the ordinary branch) and £221,027 in the industrial branch, against £619,422, a result which must be considered very satisfactory. Interim bonuses are being maintained at the rate of £1 per cent in the ordinary branch, compared with 30s. per cent last year, and in the industrial branch for certain classes of policyholders on the same scales as previously. £150,000 is being transferred to the additional valuation reserve, investments are being written down by £75,000, £45,000 is being transferred to the staff pension fund and £25,000 utilised to supplement pensions. Dividend at the rate of 7s. per share, free of tax, against 8s. 9d., free of tax, absorbs £86,449. Stock Exchange securities stand in the aggregate below

(Continued on page 51)

Advance in the Funds

With the renewed rise in gilt-edged prices this week, the movement in the Funds is beginning to assume proportions analogous to those of the rapid advance in the first two months of 1940. It may be recalled that, at the outbreak of war, minima were fixed which were anything from three to six points below the levels of mid-August, 1939,

	End Dec., 1939	High't 1st Qtr 1940	End June, 1940	End Aug., 1940	End Dec., 1940	June 6, 1941	July 9, 1941

but that, by the end of 1939, those levels had been passed by a point or two, except in the case of the "shorts," which were still rather below August valuations. A general outline of developments since then is sketched in the above table, and it will be noted that, since the collapse in the early spring of 1940, the great improvement has been in the "irredeemables," but that even in these the rise in the

INSURANCE NOTES

(Continued from page 50)

market prices, and taking into account the investments reserve fund of £400,000 assets are certified to be fully of the value stated in the balance-sheet. Free reserves comprise a common contingencies fund of £175,000, the balance of profit and loss account in the sum of £72,465 and surpluses carried forward in the various funds aggregating £710,934.

Atlas Assurance.—War deaths under 49 policies, costing £24,127, account for part of the increase in death claims revealed in the appended recapitulation of the principal features of the life account of the "Atlas":—

		Rise or Fall
New Business:—		
Net sums assured	£2,025,974	— £978,455 (32.5%)
Income:—		
Net premiums	£1,125,940	— £38,098 (3.3%)
Net interest	£565,246	— £14,360 (2.5%)
Outgo:—		
Claims by death	£356,005	+ £64,325 (18.1%)
Claims by maturity	£322,080	— £97,143 (30.1%)
Surrenders, including		
surrenders of bonus	£261,488	+ £72,256 (27.6%)
Commission and ex-		
penses	£125,782	— £17,533 (13.9%)
Commission and ex-		
penses — ratio to		
premiums	11.2%	— 1.1%

The annual valuation, in which liabilities are assessed at 3 per cent interest for assurances and immediate annuities and at 3½ per cent for deferred annuities, discloses an earned surplus of £205,335, compared with £264,852 for the previous year. After writing £231,570 off securities, applying £55,050 to strengthening reserves, and allocating £22,199 and £28,462 to policyholders and shareholders respectively, the balance carried forward is reduced to £2,311, against £134,545 brought in. The allocation to policyholders is to cover interim bonuses, consideration of the distribution of a reversionary bonus being postponed.

In the other departments a noteworthy feature is the excellent profit in the accident department.

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	1,802,027	+ 57,717 (3.2%)	94,131	— 41,420 (43.5%)
Accident	624,012	— 41,226 (6.6%)	80,089	+ 35,933 (44.9%)
Marine	338,234	+ 152,106 (44.9%)	15,000	— 15,000 (100%)
	£2,764,273	+ 168,597 (6.1%)	189,220	— 20,487 (10.8%)

Credit transfers to profit and loss, including net interest of £94,715, amount to £313,929. Expenses not charged to other accounts, staff pension fund and Colonial and foreign taxes on interest together account for £58,033; United Kingdom income-tax on profits and NDC take £81,463. £20,000 has been transferred to the capital redemption account in order to strengthen the fund. The dividend, which is maintained at 10s. 6d. per share, less tax, absorbs £131,037, and the balance carried forward at £390,447 is higher by £23,395. Stock Exchange securities stand at less than market value, and the assets in the aggregate are certified to be fully of the value at which they appear in the balance-sheet. Besides the balance of profit and loss account, there is an investment reserve fund of £110,000 and a general reserve fund of £2,000,000.

Liverpool and London and Globe.—In the life account death claims, which show a small increase, are 96 per cent of expectation; they include war deaths, which, happily, account for a very small proportion of the total:—

		Rise or Fall
New Business:—		
Net sums assured	£1,390,963	— £1,053,954 (75.8%)
Income:—		
Net premiums	£903,697	— £24,374 (2.7%)
Net interest	£408,910	— £14,814 (3.6%)
Outgo:—		
Claims by death	£365,363	+ £19,470 (5.4%)
Claims by maturity	£541,090	— £182,174 (33.5%)
Surrenders, including		
surrender of bonus	£122,066	— £64,901 (52.4%)

penses	£102,349	— £5,192 (5.0%)
Commission and ex-		
penses — ratio to		
premiums	10.3%	— 0.3%

Fire premiums are higher, both at home and in the United States, a less favour-

period of rather over nine months from the end of August, 1940, to early June this year was moderate, with, in fact, frequent slight pauses and reverses. The past few weeks have, however, seen a much more active rise, which would seem to argue the emergence of some new factor. The improvement of the early months of last year was due in large measure to the combined effects of cheap money, the first attack on the status of equities as an inflation hedge, and the beginning of vesting. It was a prelude to a sharper advance in equities, which was reversed by the institution of EPT at 100 per cent. The present rise has a rather different foundation, in that the adjustment for differential taxation of company profits is now nearing completion, while the possibility of applying temporary stimuli by repayment of other stocks is largely exhausted. It almost certainly takes a much smaller volume of business to produce a one-point movement in War Loan now than it did eighteen months ago, and it is probable that the moderate amount of personal, institutional and departmental accumulation, which does not go into the new "tap" issues, will always suffice to push up the Funds, and thus start a general rise, except when there are appreciable countervailing sales. No doubt the growth of rationing is doing something to offset the effect of anticipations of higher taxation, which had certainly led to some capital realisations. It may not be entirely fortuitous that the renewal of the rise follows immediately on the date for the payment of a tax instalment on a large part of income not subject to tax deduction at the source. It is probable that the movement also owes something to the resistance of Russia, but experience suggests that the effect of military developments, not of a character totally unexpected, is slight. The fact that buying continues to spread into the remoter recesses of the industrial market also suggests that it is the need for higher gross incomes which is the operative factor.

able underwriting experience being also common to the two countries. Like its associate office, the "Royal," the "Globe" has done well in recording a small reduction—only £88,000—in accident premiums; even at home, where most offices have experienced a sharp fall in income, the "Globe" figures were virtually the same as in the previous year, the reduction in motor income being offset by gains in other directions. The excellent profit in the accident department is contributed to by the American subsidiary, the "Globe Indemnity." Marine premiums tell the common story of marked expansion, and a small profit is released from the 1939 account:—

	Premiums	Rise or Fall	Under-writing Profits	Rise or Fall
Fire	3,826,861	+ 23,894 (0.6%)	147,661	— 149,587 (10.1%)
Accident	4,606,441	— 87,723 (1.9%)	495,818	— 21,286 (4.3%)
Marine	885,597	+ 339,815 (38.4%)	32,978	+ 82,978 (251.7%)
	£9,318,899	+ 275,986 (2.9%)	616,457	— 137,895 (22.4%)

Considering now the profit and loss account, the underwriting profit exhibited above is augmented by £28,000, being the members' proportion of the life profits, and with net interest of £374,205 the total credits come to £1,018,663. £100,000 is transferred to the trustees of the pension funds. There is a charge of £103,671 for loss realised on the sale of investments, and £150,000 has been written off investments and house property. Provision for British taxes takes £135,000. The cost of interest on debenture stocks is £19,845, and provision for the dividend at the same rate as before absorbs £389,324; £1,459,211 is carried forward, an increase of £120,323. In his statement accompanying the accounts the chairman (Mr. A. Kentish Barnes) reveals that the excess of market values over book values of Stock Exchange securities was considerably greater than at the end of the previous year, and again the general contingencies fund of £2,000,000 remains free. There are additional reserves of £3,025,000 in the fire and accident departmental funds.

A Costly Sale

With the announcement by Sir Kingsley Wood of the full terms of the purchase by an American syndicate of the American Viscose shares, acquired by the British Treasury, it is possible to take stock of that transaction. The contract provided for a minimum price, which was also to be the maximum if the shares were not re-sold within six months, of \$36,456,000. This should be compared with the valuation by Courtaulds, showing net cash, securities at market value and debtors, less creditors, of \$35,000,000. In the event, the gross proceeds of re-sale were \$62,295,146, so that the remaining tangible assets, valued by Courtaulds at \$93,000,000, plus goodwill, went for \$25,250,000 odd. Although there is no reason to suppose that the operations of the company suffered any interruption, this extremely valuable asset appears to have been sold at little more than its break-up value, and it seems open to the gravest doubt whether, even in the political circumstances of the moment, a sale on such terms was necessary. In any case, it is a matter of congratulation that there is now every prospect of loans being made against the security of the remaining direct holdings and marketable investments, so that, if these have to be sold, they can at least be realised in an orderly manner and not at rubbish prices. It is quite clear that the gross proceeds of the sale offer very little criterion as to the payment which ought to be made to Courtaulds, Ltd.

There remains another point, which is less important, but which strengthens the impression that those responsible for the operation were less concerned to achieve a reasonable bargain than to demonstrate the willingness of this country to accept sacrifices, so long as they helped forward the immediate receipt of munitions. (This may have been excellent policy, but it must be paid for by the country; not by Courtaulds' shareholders.) The contract of sale provided that, in the event of re-sale before six months, the British Treasury should find from the gross proceeds, the total expenses of recapitalisation of the undertaking, and sale of the shares; 5 per cent on the minimum payment, mentioned above, 1 per cent on the net re-sale price, and 10 per cent of the excess of the net proceeds of the sale, after these charges, over the minimum payment. Finally, underwriting commissions had to be found exceeding \$4,000,000. These deductions from the gross proceeds would have amounted in all to nearly \$8,800,000, but—in what circumstances it is not stated—the syndicate agreed to halve its claims under the penultimate head, with the result that an additional \$946,817 came to the British Treasury, raising the net amount to \$54,445,515. Even with the abatement mentioned, total costs and commissions amount to \$7,849,632, or somewhat over 12½ per cent of the gross proceeds. Judged by any standards with which London is familiar, this figure seems very high for an issue by a group of any standing. It is certainly high enough to warrant the expectation that syndicate and underwriters would be prepared to nurse the securities for some time. In the event, the sale prices to the public were fixed at a

level which proved highly attractive, both classes of share being over-subscribed and the preferred going immediately to a premium.

Half-Year's Capital Issues

The history of the new issue market in the second quarter of 1941 to June 24th has been uneventful. Total new issues, calculated on the "New Basis," which includes issues by "permission to deal," amount to £769,279,500 against £518,606,000 in 1940. Out of the latest total, British Government loans account for £765,970,500. Thus, the issue of Government loans during the second quarter of the year stands at £438,626,200 against £327,344,300 in the first quarter. Of the total of some £3,300,000 of non-Government issues in the current year, less than £400,000 was issued in the second quarter. Among the few industrial issues, £55,200 was raised by J. Brockhouse, £43,225 by Albion Drop Forgings and £142,500 by Llanelly Electric Supply, by permission to deal. Nearly half the total of Government issues—£348,160,421 in the half-year—has been raised by 2½ per cent National War Bonds on tap. Three per cent Savings Bonds have raised £208,291,372, and the remainder, £209,518,671 odd, is the proceeds of small savings. The most important capital market operation of the second quarter has been the conversion of £24,250,000 of municipal issues, figures for which are not included in the tables at the foot of this page.

Company Notes

Burmah Oil Reduced Profits

As was forecast in a note on the preliminary statement in *The Economist* of June 21 last, Burmah Oil has suffered a severe setback in income drawn from its substantial holdings in Anglo-Iranian and Shell Transport. The full accounts show a drop in receipts from this source of some £1,385,000 to little over £1,000,000. An increase in trading results of the subsidiary companies operating in the east of £839,905 to £2,768,233 has not been sufficient to prevent a decline in total profits. Thus, net profits, after taxation and fees, amount to only £2,676,848, against £3,623,719, and the cover for the dividend on ordinary stock, which is reduced from 21 to 15 per cent, is nearly £900,000 lower at £2,245,612, a rate of 16.3, against 22.8 per cent. Higher taxation has, of course, played an important part in the reduction of equity earnings, the amount due having risen by more than £400,000 to some £1,075,000. Moreover, the directors have seen fit to place £400,000 of the free surplus to taxation reserve against next year's liabilities. General reserve receives £250,000 as in the previous year, leaving the carry forward at £236,536 against £701,401. Little important change is shown in the consolidated balance sheet, but some £3,000,000 is transferred from miscellaneous investments to British and Indian Government securities. The £1 ordinary stock, at 48s. 1½d. ex dividend, offers a yield of £6 4s. 8d. per cent.

CAPITAL ISSUES JANUARY-JUNE, 1941.

Callender's Cable Results

The reduction in profits of Callender's Cable from £743,921 after taxation and National Insurance to a comparable figure of £700,555, in the year to December 31st last, appears to be due solely to the rise in tax liability. Unfortunately, the amount due in taxation last year is not disclosed, but it must have substantially exceeded the £230,000 provided in 1939. The total of expenses is reduced from £282,881 to £271,780 by the exclusion of National Insurance, and with a rise of only £10,000 to £80,000 in the depreciation provision, equity earnings are only some £56,000 lower at £279,275. The customary 15 per cent dividend is covered by a rate of 34.7, against 38.9 per cent, which exceeds the rate earned in 1938 by over 10 points. As in the previous year, uncertainty of outlook is stressed by the transfer of £125,000 to reserve for equalisation of dividends or for war contingencies. General reserve receives £6,538, which with the addition of £43,462, profit on sale of investments, brings the total of this fund to £1,300,000. The carry forward is consequently reduced from £398,369 to £377,518. The following table provides details of the trend of profits and allocations over the past three years:—

	Years to December 31,		
	1938	1939	1940
Profit	723,307	989,157	700,555*

* After Tax. † After £35,369 for A.R.P.

The directors state that the company's works have been fully occupied during the past year, and all the evidence goes to suggest that the volume of business handled has been very considerable. The balance-sheet shows a rise in debtors, including sums due on work in progress, from £1,352,874 to £1,779,613. Creditors, including taxation, are up rather more steeply from £1,290,876 to £1,835,786. There is a jump in stocks from £499,804 to £878,348, while expenditure on uncompleted work is some £77,000 higher at £427,446. Excluding investments, which are slightly higher on the year, the excess of floating assets over near liabilities is increased from £1,057,956 to £1,180,446. The accounts generally suggest that progress has been satisfactory last year, and that the increasing burden of taxation will for some years to come leave a generous margin for the ordinary dividend. The £1 ordinary stock at 65s. ex dividend offers a yield of £4 12s. 3d. per cent.

John Summers' Setback

The decline in total profits of John Summers for the calendar year 1940 from £888,360 to £558,388—in both cases after depreciation and general expenses—is highly disappointing. Despite the fact that tax provision, after deduction of a recoverable sum estimated at £107,000, amounts only to £158,905, against £302,162, the surplus available for dividends, after £30,000 against nil for War Damage Insurance, has fallen from £528,464 to £264,856. Thus, the dividend on "A" ordinary capital, which is reduced from 8½ to 6 per cent, is covered by an earned rate of 9.75 against 13.5 per cent, while the "B" ordinary dividend, cut from 4½ to 2 per cent, suffers a fall in the margin of earnings from 14.6 to 7 per cent. General reserve receives only £100,000 against £400,000, leaving the carry forward nearly £25,000 higher at £156,277. Net consolidated profits, before tax, are down from £953,812 to £590,688, while net tax liability is estimated at £246,973 against £452,567. In addition to maintenance of plant and machinery out of revenue, provision for depreciation of £343,337 against £258,152 is made in the combined accounts. The setback is probably to be explained by the difficulty of adapting the products of its highly specialised plant to the demands of wartime production. There may also have been some shortage of raw materials, but the consolidated statement

shows that stocks as a whole rose from £1,448,851 to £2,316,899. Total fixed assets, at £6,933,980, against £6,775,619, are covered by retained profits of £1,980,249. The rise in creditors, from £1,510,432 to £2,145,799, is substantially in excess of that in debtors from £1,564,148 to £1,837,849. Total cash holdings, moreover, are down from £947,795 to £418,800, but thanks to the rise in stocks, the surplus of liquid assets over current liabilities for the group as a whole is virtually stable at £2,288,000. The £1 "A" ordinary stock, in which United Steel Companies have a substantial interest, both directly and by the exercise of an option for seven years from February, 1939, on the holding of Bankers' Industrial Development Company, stands at 16s. 10½d. ex dividend, at which it offers a yield of £6 8s. per cent.

Distillers' Accounts

The full accounts of Distillers for the year to May 15, 1941—the preliminary statement was discussed in *The Economist* of July 5th—show a decline in profits after taxation and administration expenses from £2,441,253 to £2,122,390. The rise in the allocation to fire insurance from £100,000 to £225,000 is partially compensated by the absence of any provision for superannuation and provident fund, which received £100,000 in the previous year. Consequently, as was estimated, the setback to equity earnings is moderate, being in fact a decline from £2,149,641 to £1,814,986. Allowing for the higher standard rate of tax, the rate of earnings, and the cover for the total distribution on ordinary capital, maintained at 16½ per cent, is raised from 22.6 to 22.9 per cent.

	Years to May 15,

† And 40 per cent. capital bonus.

* After new issue expenses of £29,374.

† Including £78,137 over-provided for dividends in 1939.

It is a weakness of the accounts that there is no consolidated balance sheet nor any clue as to the size of the depreciation provision, although the directors state that an adequate contribution has been allocated from profits. The Government restriction on distilling forced the temporary closure of the concern's grain and malt distilleries, and there is little doubt that this factor is partially responsible for the setback in profits. Higher taxation and rising production costs have, of course, also contributed substantially to the difficulty of maintaining net income last year. The balance sheet value of stocks is up from £837,262 to £928,002, but there is some doubt whether this increase indicates more than the rise in the price level during the past year. Investments, including British Government securities, have risen from £7,378,632 to £11,018,076, an increase which has been largely financed by a reduction in cash from £7,471,258 to £4,854,988. Total reserves stand at £4,075,000 against £3,250,000 a year ago. The £1 unit, at 65s. 3d. ex dividend, yields £4 19s. 8d. per cent.

Clan Line Accounts

The full accounts of Clan Line for the calendar year, 1940, do not add very substantially to the information provided in the preliminary statement which was discussed in *The Economist* of July 5, 1941. It is clear that higher taxation is responsible for much of the fall in profits, struck after tax, from £593,021 to £540,953, but it is still unclear why the company's experience under the terms of the Government requisition agreement should have been less profitable than that of the average shipping line. The chairman, Lt. Commander Sir August B. T. Cayzer, states, in his speech circulated with the report, that the major part of the year's profit was earned before the requisition scheme came into operation and that there is little hope that earnings can be maintained in the current year. After providing the normal £7,500 for capital redemption reserve, equity earnings declined from £146,211 to £115,085, providing a cover of 35.7 per cent against 37.5 per cent for the customary 20 per cent dividend. Pensions fund received £50,000 against £25,000, but nothing, against £50,000 in 1939, is put to general reserve. The carry forward is some £490 higher at £89,972. The balance sheet value of fleet is down from £3,909,000 to £3,148,000, a decline for which enemy action is partly responsible. Against this total the company holds reserves of £1,938,500 including £193,000 on Government tonnage replacement account, blocked until the end of the war, and excluding capital redemption reserve. Elsewhere, the balance sheet shows little significant change. The total at cost of the company's holdings of Government securities, at £1,127,312 is slightly below the market value of £1,135,423. The £1 ordinary stock, at 92s. 6d. ex dividend, offers the normal yield of just over £4 6s. 6d. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

WITH sentiment well maintained in the markets through the continued Russian resistance and the new U.S. move in Iceland, gilt-edged issues continued to dominate all sections. The early part of the week also witnessed a considerable broadening of interest, and investors appear to be turning to leading equities in their search for better yields. Consequently all sections, particularly the industrial, have experienced small upward changes over a large number of shares, although the volume of actual business cannot be described as large. In later dealings the oil market became extremely buoyant.

Business in the gilt-edged market has not been on so large a scale as of late, but supply of stock was reduced and prices before the week-end showed increases in 4 per cent Consols, 3½ per cent Conversion, and Victory Bonds, while 4 per cent Funding eased. Monday's business provided increases in a long list of securities, including 2½ per cent Consols with a rise of ½ and Local Loans, which advanced ¾. Irish Land were prominent with a rise of 2 points, while 3 per cent India Loan rose ½. On Tuesday, business was smaller, but Local Loans were up ¾, while 2½ per cent Consols added ½, this rise being continued next day.

Before the week-end, the feature of the foreign bond market was the general decline in Japanese issues, with 5 per cent 1907, 6 per cent 1924, and 5½ per cent Conversion loans down 1½ points. On Tuesday a slight recovery set in but it was limited to ½ point rises in 4 per cent 1910, 5 per cent 1907 and 6 per cent 1924 loans. After losing a point before the week-end the Chinese 1913 5 per cent loan recovered 2 points on Tuesday. Brazilian issues were prominent and changes after the week-end were in favour of holders. In European bonds Spanish 4 per cent lost a point before the week-end, while on Monday both German Potash bonds rose a point, and Austrian 4½ per cent added ½.

London Tin Corporation

The results of London Tin Corporation for the year to April 30 last were the most satisfactory of the last decade. Total earnings jumped from £257,748 to £377,981, £174,966 of the increase being due to higher dividend receipts, while net profits on investments declined from £70,204 to £8,088. With no significant change in charges against profits, equity earnings are some £120,000 higher at £358,898, representing a rate of 9.9 against 6.6 per cent. The directors have wisely refrained from raising the 7 per cent dividend, and £150,000 of the surplus is allocated to investment reserve. The carry forward, after the addition of £12,663 adjustment of income-tax included in the balance brought forward from 1939-40 and £49,212, being the net amount of income-tax recoverable last year, is increased from £153,363 to £170,860. The substantial improvement in the profit position is due in part to the rise in the average rate of the quota during the financial year of the holding company from 98½ to 121½ per cent. The Corporation has also benefited from the higher cash price of standard tin, which rose from a London average of £226 per ton in 1939 to £257 in 1940 and £263 in the Corporation's financial year to April 30 last. The balance-sheet shows a decline in investments, at or under cost, from £3,341,933 to £3,109,998, for which the liquidation of the subsidiary company, Southern Siamese Tin Dredging, and the sale of part of the holding in Lower Perak Tin Dredging are mainly responsible. The value, at or under cost, of quoted securities, at £2,376,264, compares with a market value of £2,276,632. Loans to subsidiary companies are up from £278,500 to £399,000, and cash holdings from £402,318 to £537,287. The 4s. ordinary shares, at 3s. 4½d. ex dividend, yield £8 5s. 11d. per cent.

rises were secured by Turner Newall, Levers, Dunlop, Imperial Chemical, Tate & Lyle and Boots among others.

The kaffir market was quiet before the week-end, but Blyvoors, Libanon, Venterpost, West Wit. Areas and Western Reefs were all slightly up. On Monday further gains were obtained by W. Reefs and Blyvoors while Durban Deep, Sallies and Marievale were also in demand in the early part of the week. Oil issues were firm after the week-end, Anglo-Iranian rising ½ on Tuesday while on the same day Shell and Burmah both added ¾. The rubber market was quiet and changes were few and slight.

New York

BUSINESS on Wall Street was slow to recover from the holiday influences induced by the keeping of Independence Day. Turnover fell to a low level before the week-end, but the strength of Russian resistance inspired an underlying firmness and prices closed fractionally up in a number of groups, including steel, oil, aircraft and copper. In the current week, highly selective buying has been the chief feature of business. On Tuesday, heavy sales were well absorbed and steel issues continued to make modest progress. In midweek, early gains were not held and prices moved irregularly.

(Continued on page 55)

Industry and Trade

Changes in Supply Machinery

On July 1st Mr Bevin informed the House of Commons of two modifications in the administrative machinery of supply. First, there is to be a Central Joint Advisory Committee to the Production Executive, composed of 12 employers' representatives nominated by the British Employers' Confederation and the Federation of British Industries and 12 labour representatives appointed by the Trades Union Congress General Council. The new committee is to "advise the Production Executive on general production difficulties (excluding questions relating to wages and conditions in individual industries normally subject to joint negotiation) and on such other matters relating to production as may arise from the proceedings of Regional Boards or be referred to the committee by the Production Executive. As a channel of information for the Production Executive, the Committee should be able to perform a useful function, but more can hardly be expected from this new piece of machinery. Secondly, the Area Boards (of which there is one in each Civil Defence Region), hitherto directed by the Industrial Capacity Committee, have been re-named the Production Executive's Regional Boards and will in future be directly responsible to the Production Executive. The membership of the Boards has been extended and, besides three employers' and three labour nominees, they will have local representatives of the Admiralty, the Board of Trade, the Ministries of Aircraft Production, Labour and Supply, the Emergency Repair Organisation of the Ministry of Works and Buildings, the Regional Transport Commissioners, the Raw Materials Department of the Ministry of Supply, and the chairman of the Machine Tool Area Committee. The main function of the Boards will be to secure a better utilisation of industrial capacity in their districts. But, again, they are, in the main, advisory bodies, "except where powers have been handed on to them to act in advance." By strengthening the Boards and by placing them under the direction of the Production Executive, their usefulness should be increased. But the new arrangements represent a tendency towards, rather than the achievement of, that blend of strong direction at the top with local initiative and freedom of action, which is imperative for the full and most advantageous utilisation of Great Britain's resources.

War Production in Ulster

The Production Executive has taken steps to remove the obstacles impeding Northern Ireland's industrial contribution to the war effort, insofar as they arose from the

confusion created by the lack of delineation of the functions of the local Government and the various Departments of the Imperial Government. Hitherto, the Government of Northern Ireland has been responsible for labour supply, transport, power and electricity and the machinery of civil government, while production has been directed from Whitehall; as a consequence, matters which have been within the competence of the local government have had to be continuously referred to London. Under the new arrangement the Minister of Commerce of Northern Ireland will be the Production Executive's agent for ensuring the fulfilment of the war production programme. In consequence, the existing Regional Board, consisting of representatives of the various Imperial Production Departments, together with representatives of employers and the trade unions, will be replaced by a Production Committee. This committee will be appointed by the Minister of Commerce and will deal with questions affecting war production in Ulster.

"White Elephant" Sales

The Board of Trade has taken the wise middle course of allowing the sale of ephemeral summer goods, not coupon free, but at a reduced "pointing." The period—of six weeks during which such sales are permitted ends on August 16th. The restricted nature of these concessions is intended to prevent a scramble, with excessive buying and subsequent waste of such clothes. As the Board of Trade rightly observes, "although traders' stocks may be excessive, these goods are not 'white elephants' to the public." Retailers are allowed to demand the full number of coupons instead of the temporarily reduced number if they prefer to do so. A retailer with low stocks might prefer the extra coupons to the quick sale, though it seems highly improbable that competition would permit him to exercise this right. The new rate of coupons is as follows:—

GOODS OBTAINABLE FOR REDUCED NUMBERS OF COUPONS.
JULY 6TH-AUGUST 16TH.

Coupon Free.—Khaki knitting wool; oiled knitting wool; rubber bathing shoes.

1 coupon Men's and boys' white or cream socks.

2 coupons..... Non-regulation bathing costumes; bathing trunks.

Men's and boys' sandals with textile uppers; shoes or sandals with white leather or imitation leather uppers. (Not plimsolls or tennis shoes.)

Women's and girls' shoes and sandals with linen, canvas, crash or sisal uppers. (Not plimsolls or tennis shoes.)

(Continued from page 54)

The Iron Age estimates steel mill activity at 98.5 per cent of capacity, against 93.5 last week and 100 per cent in the previous week.

"Old Basis" includes public issues and issues to shareholders. "New Basis" is all new capital in which permission to deal has been granted.

- Child's unlined mackintosh or mackintosh cape, not over 42 inches long, at retail price not exceeding 7s.
- 3 coupons..... Unlined mackintosh or mackintosh cape not over 42 inches long, price not exceeding 10s. Woven cotton blouse. Small boys' white or cream trousers, not over 30-inch waist. White or cream shorts.
- 4 coupons..... Women's and girls' non-woollen slacks other than those of heavily corded cloth. Men's short-sleeved shirt, with collar attached, of knitted material or terry towelling.
- 5 coupons..... Men's or boys' white or cream trousers over 30-inch waist. Women's unlined summer coat or jacket of wool georgette, cotton, silk, rayon or linen. Frock of cotton, silk, rayon or linen (other than evening frock), in white or light plain colour, or in a combination of two or more printed or woven colours. Beach gown of terry towelling.
- 8 coupons..... Beach playsuit of three or more pieces of identical non-woollen material sold together, no one piece to be a frock.

This new scale seems nicely calculated to give just the necessary encouragement to intelligent summer purchases without provoking unnecessary buying.

Unemployed Mineworkers

The Government is supplementing its efforts to persuade miners to return from munition factories and other civilian employment to the coalfields by a measure of coercion in the treatment of wholly unemployed mineworkers. This problem has been under consideration by the industry, the Minister of Labour and National Service, and the Secretary for Mines for some time past, and panels have been appointed to discover the physical condition of these men and their fitness for re-employment in the industry or in some other occupation. The Mines Department has decided that in present circumstances it is essential that employment in the mines should be found for all unemployed men registered in mining occupations, and in a communication to the Chairman of the District Coal Production Committees, it has suggested that in the allotments of these men they should "work as a rule on the basis of allotting men who form, so to speak, difficult cases, to pits in the district employing 250 men or over on a percentage calculated by reference to the number of men who are difficult to place in relation to total existing personnel, allowance being made to pits who have voluntarily accepted such men." It is stressed that it is the patriotic duty of colliery owners to employ a fair proportion of these unemployed, and it is also pointed out that any failure to allot unemployed workers who are fit for further work to the mines in the districts immediately concerned "may have serious effects in securing the return of mineworkers from other industries to which they have migrated," as "the Minister of Labour and National Service regards it as a primary condition of the return of such men that all the present unemployed should be absorbed." Copies of the Department's letter to the District Production Committees have been sent to all colliery owners in Great Britain employing 250 men and over, and in a covering letter the Secretary for Mines expresses his confidence that in the majority of cases he can rely on their wholehearted co-operation. It remains to be seen how far such action will help to solve the problem of the continued existence of a considerable body of unemployed miners in face of the acute shortage of suitable labour. But the Production Committees are told that "in the event of colliery owners refusing to comply with a reasonable request for the re-employment of unemployed workers made to them by the District Coal Production Committees, the Secretary for Mines is prepared, on report being made to him, to consider the exercise of compulsory powers with a view to securing compliance."

Decline in Retail Sales in May

The average daily value of retail sales in May, as recorded by the Bank of England from the returns of a large number of shops, showed a reduction of 3.5 per cent compared with the figure for the corresponding month in 1940. Sales of food were 4.8 per cent lower and those of other merchandise 2.4 per cent lower, than a year ago. With the exception of piece-goods, boots and shoes, and sports and

travel goods, the turnover in all the non-food items separately listed in the returns, showed a decline. So far as the geographical distribution of sales is concerned, there was a decline, on the year, in central and suburban London and in the south of England, and a slight increase in the other districts. The value, at cost, of retailers' stocks at the end of May was 8.1 per cent greater than a year earlier in the case of foodstuffs and 5.8 per cent greater in other merchandise. In the absence of a suitable price index it is difficult to estimate how far the reduction in average daily sales in May was due to the rise in prices and the decline in the volume of turnover, respectively. But such evidence as there is on price movements suggests that the decline in the volume of sales has been appreciable compared with a year ago.

Imported Canned Meats Control

An addition has been made to the list of canned goods whose prices are subject to the control of the Ministry of Food. A schedule of prices of imported canned meats and canned meat products has been issued, with effect from July 28th, as follows:—

Description	On Sale by the Importer per lb. s. d.	On Sale by Wholesale per lb. s. d.	On Sale by Retail per lb. s. d.
Corned beef and mutton, boiled			
mutton.....	—	1 0½	1 4
Ox tongues	2 9½	3 0½	3 6
Briskets	1 9½	1 11½	2 3
	per tin	per tin	per tin
	s. d.	s. d.	s. d.
Lamb's tongues (12-oz. tins) ..	1 4	1 5½	1 9
*Australian minced meat loaf (12-oz. tins)	7½	8½	10
Australian or New Zealand Canned Rabbit:—			
(a) 2-lb. tins, including bone	1 11	2 1½	2 6
(b) 1-lb. " " "	1 1	1 2½	1 5
(c) 1-lb. " " boneless " "	1 5	1 6½	1 10
Bire stewed steak (16-oz. tins)	1 2½	1 3½	1 6
Bire ready or prepared meals (16-oz. tins)	†	10	11½
* Including all Australian canned meats containing cereals.			
† No special price prescribed, but not to exceed 10d.			

Corned beef, corned mutton and boiled mutton are at present to be kept in reserve to meet deficiencies in the carcass meat ration. Other varieties will be distributed through the normal trade channels and will be coupon-free. It is stated that in future licences will be issued only for varieties and packs included in the schedule. The Ministry is to requisition all imported canned foodstuffs for human consumption containing more than 25 per cent. by weight of meat, including edible offals, poultry and game, by an amendment to the Imported Canned Meat (Requisitioning) Order, which came into force on July 7th.

Dearer Kerosene

An advance of ½d. a gallon in the wholesale price of kerosene (paraffin oil) was announced by the Petroleum Board on Tuesday last. As usual, the Board gave no reasons for making the change—and the only apparent reason is the recent increase in demand. Although the world market price of most petroleum products has been steadily rising since the beginning of the year, kerosene has been unaffected by this upward movement and is, in fact, slightly cheaper on the Gulf market than it was in September, 1940, when the British price was last raised. Consumption of kerosene, which is used for lighting, heating and cooking in rural districts, and as a fuel for agricultural tractors, has lately been showing a marked expansion in consequence of the movement of population out of the towns and of the greatly increased use of tractors on the land. Because it is used for these essential purposes the demand for kerosene is very "inelastic." The rise in prices may therefore do but little to relieve the tight supply position. The wholesale price of "pool" burning oil now ranges from 11½d. a gallon in England and Wales to 1s. 1½d. a gallon in the remote parts of the British Isles; that of "pool" vaporising oil (for tractor use) ranges from 1s. to 1s. 2d. a gallon.

COMPANY MEETINGS

BLEACHERS' ASSOCIATION LIMITED

SIR ALAN SYKES'S REVIEW

The forty-second ordinary general meeting of Bleachers' Association, Limited, was held at the registered office, Blackfriars House, Manchester, on the 4th instant.

Sir Alan Sykes, Bt. (the chairman), presided. In proposing the motion for the adoption of the report and accounts, Sir Alan said:—

You will appreciate that under the conditions prevailing in these exceptional times my remarks must necessarily be restricted and mainly concerned with the accounts which are presented for your approval.

But before dealing with the accounts, I should like to refer to the appointment of Mr. Charles Schwabe Parker to the Board—an appointment which you will be asked to confirm at a later stage of this meeting. Mr. Schwabe Parker has, for many years, been in charge of one of the association's most important branches and under his management that works has established a reputation for the quality of its products that places it right in the front rank.

Your directors believe that under the changed conditions which will confront the cotton industry of this country in the future, we shall have to rely more and more upon the production of specialised finishes and less upon the type of work upon which the bulk trade of the industry has been built up. That means that we must rely more and more upon scientific research, and it is by his specialisation in this field that Mr. Schwabe Parker has made such a success of the works which he controls. We have invited him, therefore, to join the board in the capacity of director in charge of research. Our existing research organisation, which is occupied more with the day-by-day problems relating to the production and development of our present output, will continue under the control of our chief research chemist, but Mr. Parker, whilst maintaining a close liaison with this organisation, will cover a wider field.

Two members of the board, Captain A. M. Hamilton and Captain C. H. V. Elliott are serving with His Majesty's Forces and, therefore, are not with us to-day. Eleven other officials of the association who were occupying responsible managerial or administrative positions are also on service. We should like to record our appreciation of the services which are being given to the country by those to whom I have referred, as well as by the hundreds of our employees who are serving either with the forces or on whole-time civil defence.

BALANCE SHEET

If you will now turn to the balance sheet, there are one or two changes in the figures in comparison with last year which I should like to explain.

The first item on the assets side—land, buildings, plant and machinery, etc.—is reduced by the amount standing to the credit of the depreciation and obsolescence fund, which itself has been augmented by the usual sum of £140,000 charged against the profit and loss account for the year. The amount charged to the depreciation and obsolescence fund before making this deduction is £211,068, and this represents the outlay during the year on renewals, together with a further sum which has been written off the value of the assets of certain closed works.

This transaction, which does not affect the net value of the assets appearing in the balance sheet, is a continuation of the policy which your directors have followed whenever the opportunity has occurred of adjusting the capital value of those assets, which, through the contraction of trade, have ceased to be productive and for which, in part, the depreciation and obsolescence fund is provided. The net value of land, buildings, etc., appears in the balance sheet at £6,944,940, which is about £140,000 less than last year.

The value of shares in subsidiary companies at £1,325,314 shows no change in comparison with last year's balance sheet, but advances to subsidiary companies are about £180,000 higher at £1,057,387. The increase in this item—which represents the working capital employed by our branches—is primarily due to

the higher prices we have had to pay for the commodities which we use.

The small item of stock on hand is slightly lower than the figure in last year's balance sheet and sundry debtors at £108,225 are also lower.

Cash with bankers amounts to £184,183—about £88,000 more than last year, and investments at £757,146 are about £167,000 higher. The increase in these two items reflects the larger trading profit we have made, but of which so much is absorbed by taxation. The necessity for meeting these heavy taxation payments when due requires that we should carry much larger liquid resources than would be necessary under more normal conditions, and the largest item in the increase in investments is our holding of Treasury bills as a temporary investment of cash that will ultimately find a more permanent home with the Exchequer.

On the liabilities side of the balance sheet there are only three changes of any importance to which I need refer.

The item trade creditors and provisional accounts is nearly £235,000 more than last year, and this is almost entirely due to the provisions which we have had to make for increased taxation.

WAR DAMAGE PROVISION

There is a further provision of £100,000 for insurance premiums under the War Damage Act, 1941, and I shall refer to this again in dealing with the profit and loss account.

The balance of the latter account brought forward after payment of the three months' dividend on the preference stock last year was £149,691, and it will perhaps be easier for you to follow my subsequent remarks if you will turn to the front page of the accounts.

The balance of trading profit available for the year after providing for taxation amounts to £338,407—an increase of £45,000 over the corresponding figure last year. The charges for directors' fees, depreciation and debenture interest show no material change, and the increase of £45,000 is reflected in the net profit of £94,678, compared with £49,721 last year.

We thus have available, with the amount brought forward from the previous accounts, a total of £244,369, and your directors recommend a payment of six months' dividend on the preference stock in respect of the period April 1st, 1934, to September 30th, 1934, which will absorb the greater part of the net profit for the year and leave a balance of £175,963. Out of this balance, provision must be made for the payment of the insurance premiums due under the War Damage Act, 1941.

Although the Act prescribes that these premiums "shall be treated for all purposes as outgoings of a capital nature," they constitute an immediate call upon our liquid resources and, in effect, represent the conversion of a liquid asset into one which cannot be regarded as having a permanent capital value. We have, therefore, made provision for these payments by reducing the available balance of the profit and loss account and this leaves £75,963 to be carried forward to the next account.

SERIOUS BURDENS

It is hardly necessary for me to emphasise the serious depletion of profits by the very heavy provisions that we now have to make, both in respect of taxation and war damage insurance, and I should like to stress again the remarks which I made in addressing you last year on this subject. The burden is especially severe in the case of companies like our own where the standards for the ascertainment of liability to excess profits tax relate to years in which our trade was abnormally depressed, and I sincerely hope that we shall be able to secure a revision in our standard which will render the burden less onerous. The relief which it is proposed to afford by the deferred return of a portion of the tax for expenditure upon approved purposes is welcome, but it does nothing to remedy the obvious injustice of depriving shareholders of any participation in the increase in profits of the company

and strangling the undertaking by the accumulation of arrears of liabilities carrying preferential rights.

You will readily understand that for obvious reasons I am not at liberty to say anything of the contribution which the association is making to the national war effort, but I can assure you that we are doing everything within our power to help the Government in this supreme test of national unity.

Our contribution is not only direct and positive, but it also entails heavy sacrifices. The Government proposals for the concentration of industry will necessitate the closing of a number of our works, thus releasing labour and space for vital war needs. This cannot be other than serious in its immediate and ultimate effect upon the association, especially having regard to the extensive concentration which we have carried out voluntarily during the past 10 or 15 years to balance the contraction in the volume of trade.

These measures will add to the burden of redundant plant with which we, and other sections of the cotton industry, have been saddled by the pre-war loss of so much of the export trade. They will increase substantially the magnitude of the problem which we were facing at the outbreak of war and which we shall have to face again and solve before we can establish our trade upon a sound foundation.

APPRECIATION

Before closing my speech I should like, on my own behalf and also, I feel sure, on behalf of all present, to record our warm appreciation of the efforts which have been put forward by everyone concerned, not only in the management, but also in the execution of the varied types of work carried out under the auspices of this association. I believe that you would wish me specially to emphasise our indebtedness to the managing directors, upon whose shoulders the main burden and responsibility must necessarily fall. The year has been a particularly difficult one and has imposed a great strain upon all concerned. To one and all on your behalf I say "Thank you."

The resolution approving the report and accounts was moved by the chairman, seconded by Sir William Clare Lees, Bt., and carried.

The retiring directors were re-elected and Messrs. Jones, Crewdson and Youatt and Messrs. P. and J. Kevan were reappointed joint auditors.

The meeting terminated with a vote of thanks to Sir Alan Sykes, Bt., for presiding, proposed by Mr. E. R. Clark and carried unanimously.

WM. CORY & SON, LIMITED

EFFECT OF WAR CONDITIONS

Sir Arthur Cory-Wright Bart., chairman of the company, presiding on 10th instant at the forty-fifth annual general meeting of Wm. Cory & Son, Ltd., said that there was a net profit of £703,739, a decrease of some £53,000 as compared with the previous year. After transfer of £150,000 to investment reserve and payment of the final dividend of 15 per cent. on the ordinary and employees' stock, making 20 per cent. for the year, a balance of £1,044,677 remained to be carried forward.

The business of the company was considerably affected by war-time conditions both at home and abroad, as the National Emergency had brought about close control and far-reaching restrictions to which they had cheerfully submitted. Every effort had been exerted to meet fresh problems as they arose, and the extensive organisation and exceptional facilities which they possessed had been successfully employed.

In the coal exporting section, the company had experienced a steady diminution of business owing to the closing of many markets and the difficulties arising in production and exporting of coal. They had, however, concentrated their efforts on these alternative areas of coal production which had a geographical situation suitable to meet the needs of consumers who were deprived of adequate supplies from this country.

The vessels of the fleet had been engaged exclusively in coastal traffic under controlled rates of freight, and the time occupied in voyages had varied considerably from month to month, irregularity having been caused by war conditions at sea, and altering conditions in the districts in which coal had been available.

The report was unanimously adopted.

AMALGAMATED DENTAL COMPANY, LIMITED

IMPROVED TRADING

The thirty-sixth annual general meeting of the Amalgamated Dental Co., Ltd. (formerly Claudius Ash, Sons & Co., Ltd., and De Trey & Co., Ltd.), will be held on July 18th in London.

The following is the statement by the chairman (Mr. E. Russell Polden) circulated with the report and accounts:—

Our company, in common experience, has had to contend with many difficulties arising from the present distressing circumstances. The accounts evidence that the efforts made to overcome them have produced results which show some improvement in trading and enable the directors to recommend payment of a dividend on the deferred ordinary stock.

I do not propose and I am sure that members will not expect me to make any attempt to forecast the future as affecting our company. My statement must, therefore, necessarily be brief. I can but assure the members that all that can be done to maintain and to improve the activities of our business is being and will continue to be done, and so endeavour to overcome obstacles as they arise from day to day.

The profit from trading, etc., is £192,153, against £163,668, an improvement of £28,485. The balance standing to profit and loss account, after providing for taxation and the dividend of 5½ per cent., less tax, paid on the preference stock, available for appropriation is £119,308, against £86,148. The full dividend of 8 per cent. less tax (4 per cent. of which was paid on June 30th last), absorbs £59,386, and the dividend of 5 per cent., less tax, on the deferred ordinary stock requires £10,000, leaving to be carried forward £49,922, against £26,762 brought in, an increase of £23,161.

I have much pleasure in making a well-merited reference to the untiring devotion to work and loyalty by the management and staff during these very strenuous times.

HARLAND AND WOLFF, LIMITED

ANNUAL GENERAL MEETING

The fifty-sixth annual general meeting of Harland and Wolff, Limited, was held, on the 3rd instant, at the Grand Central Hotel, Royal Avenue, Belfast.

Mr. F. E. Rebbeck, D.L., J.P., chairman of the company, presided.

The Secretary (Mr. A. T. Marshall) having read the notice convening the meeting and the report of the auditors,

The chairman intimated that in accordance with the notification to shareholders issued with the directors' report for obvious reasons it would be impossible for him to make his usual speech covering the firm's activities. He therefore formally moved the adoption of the report and accounts.

Mr. John Craig seconded the resolution, which was carried unanimously.

The retiring directors, Mr. Charles Payne and Mr. H. P. Harland, were re-elected, and the auditors, Messrs. Price, Waterhouse & Co., were reappointed.

ECONOMIST BINDING CASES

Attractive binders to hold three months' issues of *The Economist* are still available.

These binders have no wires, clips or metal contrivances so that each issue can be bound in an instant for permanent reference. Bound in full cloth (blue) and lettered in gilt.

UNITED SUA BETONG RUBBER ESTATES, LIMITED

RECORD OUTPUT AND PROFITS

RUBBER INDUSTRY AND THE WAR EFFORT

SIR JOHN HAY'S REVIEW

The thirty-second annual general meeting of the United Sua Betong Rubber Estates, Ltd., was held on 8th July at 19, Fenchurch Street, London, E.C., Sir John Hay (chairman of the company) presiding.

The chairman said: The great struggle in which we are now engaged, with its daily recurring events with all that they portend to every one of us, overshadows all other interests. It is with a consciousness of that fact that I now propose on this occasion to review only very briefly the company's affairs.

Sir John pointed out that the company's output of rubber and profits for the year under review were the largest in its history, but that the benefits to stockholders were not to be measured by the extent of the profits. The chief beneficiary was the public revenue. The company's estimated accumulated liability for taxes exceeded £200,000, and out of a net profit of approximately £300,000 the net amount to be distributed to stockholders would be little over £70,000.

Reports received from all of the company's estates were uniformly good, particular emphasis being laid on the growing strength of the company's position through its replantings and new plantings. The improvement in its rubber producing capacity was being acknowledged in a steadily increasing assessment, which for 1941 was fixed at over 17,000,000 lbs.

Sir John then spoke of matters of general interest to the industry as follows:—

AMERICAN RUBBER SUPPLIES

The first agreement with America for rubber supplies in volume sufficient to provide for the accumulation of a reserve stock and at the same time to meet current needs was concluded in June, 1940. This was followed by a second agreement in the same year, and just before I left America in November last a provisional agreement was reached for a further increase in the reserve stock. This latter arrangement was subsequently adopted and formalised in March of this year. These three agreements provided in total for the eventual accumulation of a reserve stock of 430,000 tons. In this way America's policy in the matter of rubber supplies both for defence and industrial purposes was gradually unfolded and her needs clearly defined. Without this open declaration of policy, expressed as far as was practicable in terms of a definite tonnage for delivery in specified times, it would hardly have been possible for the I.R.R.C. to have performed satisfactorily its task of regulating world supplies of rubber to known demands, nor to have won so readily the willing and understanding co-operation of producers in providing for abnormal requirements.

THE EXPORT POSITION

As you know, permitted exports during this year have, for the first time in the history of the regulation scheme, been at the rate of 100 per cent. At the time of preparing these remarks the figures for June are not available, but taking the six months December, 1940-May, 1941, the amount of permitted exports was equivalent to over 800,000 tons—or nearly double the quantity permitted in the last corresponding pre-war period. Due to adverse seasonal influences and, in a lesser degree, to some labour unsettlement in certain of the territories where European supervision had been largely withdrawn for training in defence duties, actual exports fell below that figure, but, even so, as between the two periods mentioned they were increased by no less than 300,000 tons. Having regard to the growing and serious shortage of shipping, the hazards and uncertainties of overseas transport, and all the difficulties inseparable from a state of war—from the influence of which rubber producing territories are by no means immune—such an increase in production and exports to a figure which exceeds anything hitherto attained, is remarkable and is the measure of the

co-operation which has been given so readily in fulfilment of the agreements, the terms of which have been generally accepted as being fair between the parties.

In accordance with our agreements, all the rubber required continues to be purchased in the open market within a stipulated price range, and the essential functions of the market and distributing intermediaries continue to be utilised and exercised by those who from long knowledge and experience are best qualified to do so. Our experience so far has confirmed the belief on which the agreements were based, namely, that these abnormal demands will be best satisfied by allowing supplies to flow along channels worn by long usage, rather than by resort to expedients which, however apparently simple and plausible, when put to the practical test invariably encounter unexpected difficulties and hindrances and in the end prove to be much less efficient.

AMERICA'S RESERVE STOCKS

Notwithstanding the great increase in exports to the extent which I have mentioned, the accumulation of America's reserve stock has not proceeded at the rate anticipated. This is due primarily, but not solely, to an increase in American consumption well beyond what was estimated. As a corrective to this situation, America has announced her decision to take measures to restrict current consumption to the more normal figure of 600,000 tons per annum and thus set free a greater surplus for the more rapid accumulation of a reserve stock. Simultaneously, and as a natural consequence of that measure, it has been decided to centralise all purchases for America through the Rubber Reserve Company, and it is only for purchases made by the Reserve Company or its agent that export licences to America are now being granted. In more normal times this concentration of such great buying power might be regarded with some alarm, but these are by no means normal times, and since the purpose which the measure is designed to serve is none other than the more equitable distribution of supplies and the more rapid accumulation of stocks, the continuance of our ready co-operation is assured along lines which maintain unimpaired the essential functions of the market.

This matter of rubber supplies to America is one of many transactions with that country which, in present circumstances, are fraught with tremendous consequences. We were never in doubt as to the side on which America's sympathies lay; that sympathy, happily for us, has developed to a stage of material aid ever-increasing in volume and in power and expressed in ships and all the modern equipment of war. It is largely on the reliance of the continuance of that great and powerful aid that our hopes of victory are based. We as an industry have an opportunity of supplying to America one of the products now necessary for defence as well as for the conduct of modern war—an opportunity we should embrace readily. It is in this larger setting that we should view the matter of rubber supplies to America and, by the ready manner in which we discharge our obligations, and by our resourcefulness in overcoming any incidental difficulties that arise, demonstrate our gratitude for their great and vital aid which becomes daily more potent.

This is the first time I have had occasion to speak to you since I returned from America, and I would like to take the opportunity of saying publicly how greatly I appreciated the sympathetic and understanding manner in which my representations were received. Since I returned to this country I have been the medium through which suggestions have been made and criticisms offered regarding operations under the agreements, and I need hardly say that these have been received in the same spirit of friendliness.

SUPPLIES TO THE UNITED KINGDOM

Almost simultaneously with America's decision to centralise through one agency the buying of the whole of her rubber require-

ments, there has been put into operation in this country a similar measure under the designation of Rubber Control. From henceforth, therefore, for the world's main requirements of rubber there will be only two buyers. One of the many functions of the London rubber market was to act as a distributing centre for the rubber requirements of Europe. Owing to the misfortunes of war, this function has for the time being ceased, whilst speculative business, permissible in peace time, is no longer appropriate to present war-time conditions and has been gradually eliminated. The weight of these losses has become increasingly felt, and in these circumstances, and despite the fact that rubber control in this country relates only to a quantity of rubber which is a mere fraction of what America uses, it is not surprising that the decision to control and all that it implies is viewed with great apprehension in the London rubber market. It is appreciated that in the circumstances in which the appointment was made the chief function of the Rubber Controller must be to discourage all unnecessary trading and to bring rubber supplies in the most direct line from the producer to the consumer. None the less, this involves a great deal of hardship and loss which falls upon intermediaries who, in normal times, exercise a useful function and make their valuable contribution to the general trade of the country. That these problems should arise without any prior consideration for their treatment is but another example of the many distressing consequences of our piecemeal and departmentally-minded approach to war economy. Those who by present circumstances are deprived of their livelihood should not be left to the haphazards of war. Total war has its casualties in the field of commerce as well as on the field of battle. The former require treatment as well as the latter.

THE WAR EFFORT

The measures taken in relation to our own industry, as well as all other measures affecting industry as a whole, must be considered in their larger context and they can only be judged in relation to how they serve the supreme purpose, which is the successful prosecution of the war. Our war effort, with its countless examples of courage, endurance, devotion and sacrifice, has in part been magnifi-

cent, but in other respects, even at this advanced stage, it still is inadequate and deficient. In the economic sphere, using that phrase in its widest sense, there has been a too evident lack of the vision to conceive and the courage to apply the measures that are necessary for the effective mobilisation of our manpower and for the direction of our efforts towards our one overriding purpose.

We contend against an enemy superlatively equipped by long years of preparation, endowed with exceptional powers of organisation, possessed of high executive capacity expressed in swift and skilful action, and sustained by the fanatical devotion of a people whose numbers greatly outstrip ours. The fight against this formidable Power demands our utmost exertions, which can only be rendered fully effective by a thorough-going organisation which brings to bear in the proper place and in full measure the services of every one of us, inspired and sustained by a single-minded devotion to the State in this time of crisis.

You will probably recall the closing passage of Shakespeare's "King John," with its brave boast that:—

"This England never did, nor never shall,

Lie at the proud foot of a conqueror,"

but then there immediately follows this qualifying line:—

"But when it first did help to wound itself."

Any and every diversion from the war effort, neglect or inefficiency, are wounds on the body politic, weakening our resistance and leading to infirmity of purpose. In present circumstances, we can no longer have "business as usual," and whether in Government or in trade or commerce we must be prepared to abandon our peace-time practices and forego all activities other than those which contribute to the war effort. Immersed and engrossed in the performance of our daily peace-time tasks, we are often too apt to think of the immediate dangers to our own particular interests. We have to remind ourselves that far greater issues are involved, and it is only in so far as we make the sacrifices adequate to safeguard our security and liberty that our more immediate and lesser interests can be preserved.

The report and accounts were unanimously adopted.

COMMODITY AND INDUSTRY NEWS

WORLD visible tin stocks stood at 38,600 tons on June 30th, a decrease of 2,177 tons from May 30th. It is thought that this is only a temporary drop, and due to the small shipment of 8,950 tons of Straits tin. Tin prices rose on Friday to £261-£261 5s. per ton for standard cash, presumably on the news that shipments of tin from the Straits were likely to be sent to Russia. The price was not maintained, however, and by Wednesday it was £256 15s.-£257, which compares with £256 10s.-15s. per ton a week earlier. Wednesday's price for three months' tin was £260 10s.-15s., which compares with £260 15s.-£261. The rubber market has been extremely quiet. Smoked sheet, spot, was quoted at 13½d. per lb. on Tuesday. Pepper prices continue to rise: white Muntok, spot, was 14d. a lb. on Tuesday and Lampong black was 8½d., compared with 13½d. and 8d. respectively a week before.

Cotton from America.—The United States is to make available to this country, under the Lease and Lend Act, 600,000 bales of cotton which will arrive here at the rate of 20,000 bales a month. The cotton will be drawn from the American Government's stocks, not bought in the open market. The announcement was well received by the trade as an indication of greater security about supplies.

Even before the announcement inquiry in the market had broadened and more business was done in yarn and piece goods. Purchases for the Government have only been of moderate extent, but fair orders have been placed in essential goods for the Home Services. Export buying continues irregular, though rather more business has been put through in fine fabrics for the Dominions and the United States. Dyed fancies have been in request for Java, and a steady business has been

done in finishing qualities for Argentina. Buyers have welcomed the fact that more manufacturers have been prepared to sell. Yarn demand has continued active and some spinners have only been prepared to accept part of the business put before them. In some quarters the opinion is held that the Controller may widen spinners' margins in the near future.

Animal Glandular Products.—The manufacture for medicinal purposes of glandular products from slaughtered animals is an industry new to this country. It has been made possible by the reduction of slaughtering centres since the war from about 10,000 to 800. The removal of the glands is an expert process and some of them must be put into cold storage within fifteen minutes of slaughter. Notable progress has been made with pancreatic extracts from which insulin is obtained. The extension of this by-product of slaughterhouses may prove a source of revenue, as it is to abattoirs abroad.

Food Control.—The Ministry of Food announces that it is intended to control the prices of apples, plums and damsons, and the new season's honey. Control prices have been announced for imported canned meats (see page 56), soft and curd cheese, producers' prices for eggs, and the new jam prices. Biscuit manufacturers are to be licensed from August 4th. Arrangements have been made to encourage domestic rabbit clubs, on the lines of pig clubs.

Control of Bus and Coach Sales.—The Minister of Transport has made an Order under which it will be an offence, as from July 7th, to acquire or dispose of a registered omnibus or coach without his authority. Unlike the regulation relating to new or unregistered coaches, this Order applies to dealers as well as other persons. Its object is to secure that vehicles are made available in the

places where they are most urgently needed.

GOVERNMENT RETURNS

For the five days ended July 5, 1941, total ordinary revenue was £26,426,000, against ordinary expenditure of £33,114,000, and issues to sinking funds of £401,221. Thus, including sinking fund allocations, the deficit accrued since April 1st is £813,717,000 against £568,648,000 for the corresponding period a year ago.

say that aircraft production must be made balanced and orderly. It is the further progress that can still be made that is the supreme question of the hour. The safety of the England that Mr Churchill leads so inspiringly and stands for so signally is still at stake. It is still a Minister of Blood, Toil, Tears and Sweat that is needed in the van; and it would be a perilous day for England if the fleeting impatience shown in Mr Churchill's exasperated description of Commons criticism as "quarrelling" were to endure, if the dull professional indifference shown in the Admiralty's proposed silence on shipping losses were to become general, and if the old-style complacency

Le Quatorze Juillet

THE Fourteenth of July has come and gone and the anniversary of France's freedom has been spent for a second time under the shadow of a régime which is both a denial of and a disgrace to the honour of France. On this very day another Armistice was signed—between Vichy France's commanders in Syria, who had fought without success the fight of Nazi Germany against the Allies, and the soldiers of Free France and Britain. Whatever feelings of reverence may still be spared for the aged Marshal, whose faculties have long been beyond the work of grasping and interpreting the complex and tragic situation of France in defeat, effective power is with Darlan, Brinon and the other creatures of Nazi domination whom the apparent certainty of the triumph of the "new order" tempted away from the path of honour.

Yet the last weeks have shown that there are limits beyond which even Darlan cannot force his enslaved and unhappy France. There is an essential distinction between those like Pétain and Weygand and possibly Noguès, who lacked the courage to carry on an apparently hopeless struggle and, as a result, have been caught up in a policy of collaboration with which they feel no real sympathy, and those like Laval, Darlan, Brinon, Bouthillier, Barthélemy, and a number of other Vichy bureaucrats who desired collaboration as an end in itself, and rejoice in their rôle in the "new order." This distinction accounts for much that is superficially bewildering in the twists and turns of French policy since the weeks in May this year when it seemed virtually an accomplished fact that Vichy France had allied herself with Germany under terms of full economic and military collaboration.

The Pétain group accept co-operation because they look on it as the only way in which France can survive; and they envisage it primarily and almost solely as economic collaboration. Such was the policy accepted at Montheoire. Pétain has had ever in mind the appalling economic state of France, the prisoners of war, the unemployed, the "Chinese Wall," the costs of occupation. But his advisers, first Laval and then Darlan, have had in mind the political status and future of France in the "new order"; and part at least of their readiness to sell away France's birthright has sprung from their desire to outdo Italy in ignominy and take her favourite's place. This radical difference of approach explains why, each time a Laval or a Darlan has been empowered by Vichy to negotiate, he has gone far beyond the terms of reference—always economic—laid down by the Marshal. The danger is that, with each increase in economic collaboration, Pétain is less and less in a position to refuse political or military concessions—an *impasse* which a wiser statesman would have foreseen as early as Montheoire.

During April and May this year Darlan was constantly in contact with the German authorities. It was the time of Germany's maximum effort—so far—in the Mediterranean and the Levant. The pressure on France for military concessions was heavy and it was not resisted, at least by Darlan. On May 14th it was announced in Vichy that the French Government had accepted the terms negotiated by Darlan. Only the German concessions were made public—the reduction by 25 per cent of the costs of occupation, the return of some 10,000 prisoners

shown in Lord Ironside's latest "assurance of victory" were to filter into the nation's leadership.

Mr Churchill is the latest, and some would say the greatest, of the great ones of the Commons. He cannot surely forget when he rises to answer the critics that it is the substance and not the manner of their charges that he is there to answer. He cannot surely forget that something much more than the oratorical triumph which he could so easily win will be expected of him. He cannot surely forget that, but for the grace of God and the unceasing vigilance of the Commons, he himself might still be there among the questioners.

of war, an easing of the communications between occupied and unoccupied territory. The *quid pro quo* of Vichy France was not reported; but German aircraft appeared on Syrian airfields and rumours circulated that the passage of troops through France, the use of Southern French and North African bases, and even the use of the French fleet, had all been conceded.

The situation was then grave enough to enable President Roosevelt to override the predominantly Franco-philic policy of the United States State Department and to place guards on all Vichy ships. His warning followed that France was being compelled to choose between the friendship of the United States and the "friendship" of Germany. At the same time Mr. Eden announced his Government's intention of taking whatever action seemed necessary to deal with the new situation created by the unconditional collaboration of Vichy with the enemy.

It is difficult to say whether it was this sudden squall of international disapproval which alone drove the ship of unlimited co-operation back into harbour. There is evidence—for all the fog that hangs round Vichy—that opposition was no less strong within. On examination, it was found that Darlan's economic concessions were no concessions at all, for the removal of internal traffic hindrances had been purchased at the price of giving Germany complete control of Vichy France's foreign trade, while the reduced payments for occupation were to be made only in gold and foreign securities. The alarmed protests which were raised, even on the economic front, by such men as Le Hideux and Romier, only rendered more unacceptable the plans for military co-operation which Pétain had in principle always refused to consider.

Here his hesitations were reinforced, it seems, by General Weygand. The myth of Weygand's ultimate loyalty to the Allied cause has been far too readily accepted, particularly in America. There is no reason to suppose him Anglophile. On the other hand, he is no friend of the *Boche* and incapable of the time-serving of a Darlan. There is little doubt that the General refused categorically to allow North Africa to be used as Syria was being used, to attack the Free French colonies or to countenance action by the French Fleet to "break the British blockade." Later, when the British advance into Syria came up for discussion, it was almost certainly Weygand's advice that led Vichy to distinguish between Mandated territory and the Empire and not to regard the occupation as an act of war.

Pétain may well have been the more ready to listen to Weygand's counsels of moderation because the people of France were growing restive and hostile under the constant reports of Darlan's collaboration with Germany. The Admiral had a bad reception in Northern France, and it was found necessary to arrange for him to broadcast his assurances that neither France nor the French fleet would attack their old ally.

It is doubtful whether all this internal and external pressure would have been enough of itself to check Darlan's plans—especially when the mood of Washington underwent a rapid deterioration in the weeks that followed the President's warnings. The real reason

for the sudden slackening of pressure on Vichy was, of course, Germany's decision to postpone the invasion of Britain, the movement to Dakar and the drive to Egypt, and to embark instead upon a war in the East. This does not for a moment mean that collaboration has ceased. It is estimated that about 10,000 French firms are now working on German orders. Greater deliveries of steel from Germany are being balanced by a campaign to increase France's coal output. The costs of occupation are being duly paid in gold. German Customs officials supervise all Vichy France's foreign trade. The difference is that, for the time being, pressure for military collaboration has slackened.

The situation which confronts Britain and America to-day is of a France greatly divided against itself. The French people are solidly for the Allies, and General de Gaulle is a legendary figure. Vichy is split between the extremist supporters of collaboration, the Darlans and the Brinons, and those who accept collaboration only as a necessary economic consequence of Hitler's victories. Behind Vichy lies North Africa, where General Weygand has pledged himself to defend the Empire in its integrity, but where economic and military weakness are constantly playing into the hands of the Germans. It is unfortunate that these divisions are to some extent mirrored in the policy of Britain and the United States. For a variety of reasons (discussed in an article on page 76) many people in America have been far more ready than all but a minute few in this country to condone Vichy's disastrous policy and to cling, against all reason, to the belief that the France of Lafayette lives on in Vichy. This attitude has complicated Britain's blockade policy in the past, and there are signs that even to-day, with the full perfidy of Darlan exposed, there are elements in the United States who would

be ready to risk helping Germany in giving aid to France.

It is essential that the attitude of Britain and the United States towards Vichy should be properly co-ordinated, and perhaps the very divisions in the Vichy front offer the possibility of a common policy. Britain can afford no concessions to occupied France. The evidence of full economic collaboration is too detailed, too certain and too inclusive to allow to Vichy, on the pretence of its neutrality, privileges which are denied to the Norwegians or the Dutch. On the other hand, the Americans' desire to help can perhaps be diverted towards North Africa, where American Consular authorities are in a position to exercise some control, and where the extension of commercial relations would mean that a number of commodities which may at present be spilling over to the Axis via Marseilles would find their way to American markets. That any such transactions should be carried out with the utmost care and on a modest scale hardly needs saying. Behind all of them is the permanent risk that the Axis Powers might in some way profit. The release of the *Scheherazade* with 16,000 tons of oil was not a wise or a promising beginning.

At the same time, all the possible political advantages that can be wrung from these exchanges must be secured. Here the responsibility is American rather than British. General Weygand is not convinced of Britain's power to win the war. The possibility of American intervention, even if only limited Atlantic intervention, could perhaps supply the stiffening of the resolution which is what the General chiefly lacks. Now that Germany is fully occupied in the East and the armies of General Auchinleck are free for new tasks, the time has come to ensure that any economic concessions the Western Powers can make to North Africa are accompanied by a reasonable political *quid pro quo* from the French.

The Coal Shortage

THE public was profoundly shocked when the Secretary of Mines told the House of Commons on May 28th that the output of coal was insufficient to meet current needs; that stocks in the country had fallen to the low level of 14 million tons—equivalent to little more than three weeks' production; and that the position would not be safe unless at least 20 million tons were added to the country's reserves before the end of October. Consternation increased when it became known that the operation of vital public services was endangered because they had only a few weeks' supplies left and that factories were held up for lack of fuel.

The public's immediate reaction was that someone must have made a terrible blunder. Great Britain had not only produced its own requirements for years, but had also sent abroad many millions of tons. For years the public had been told that the coal-mining industry's capacity to produce coal appreciably exceeded the demand; and preparations had been made early in the war to supply, not only domestic needs, but those of France and other Continental countries as well. The Continental markets were closed a year ago, and the layman could not but assume that there should be no difficulty whatever in producing sufficient coal for domestic needs. At first, it was said that the bottleneck was in transport, as it had been in the winter of 1940-41, owing to the reduction in coastwise shipping traffic and the war-time strain on the railways. Now the cold fact appears that the output of coal—the only important raw material which is available in abundance in Great Britain—is falling short of requirements at a time when every year consumption normally falls.

It would probably be idle to spend much time in an attempt to apportion the blame for this truly extraordinary state of affairs. But diagnosis must precede the prescription of a sound remedy. It must be asked how and why this shortage has come about. Clearly, there has been a lack of foresight. The coal industry's labour force was

allowed to run down after the loss of the European markets last year; the drift of unemployed miners to other industries was encouraged by the Government, and many were called to the Colours. The number of persons working in the industry last month was about 690,000, a decline of about 80,000 since the first quarter of 1939. In the second half of last year many pits in the export districts were closed down or put on a care and maintenance basis for lack of labour or orders, or both. Moreover, it is possible that the legislation of the pre-war decade, which was designed to deal with the problem of surplus capacity in the coal industry, instituting control over production by means of quota schemes, had introduced an element of rigidity into the structure of the industry, which may have hindered its adaptation to war conditions. And it was mainly the restrictive and not the reconstructive elements in pre-war reorganisation which succeeded. Very little progress has been made with the merging of the multitude of separate concerns into single undertakings in each geographical area; and twenty-two months of war have gone without the concentration of coal production and distribution in the most suitable producing and marketing units.

The responsibility for allowing the coal industry actually to disintegrate after the collapse of France, and for not taking steps to adjust the structure of the industry to war-time needs, is plainly the Government's. It was the duty of the Government to calculate the nation's war-time requirements of coal in advance; to see to it that the industry's capacity did not fall below these demands; and to build up stocks to ensure the most efficient possible utilisation of capacity. The crisis has arisen because these duties have very largely been left undone or, if done, have been done belatedly. There have perhaps been faults among managements and miners; but, although the target of an addition of 20 million tons of coal to stocks by the end of October is probably unattainable now, it is in the power of the

Government alone to make some amends before winter comes, with its promise of heavy coal demands, renewed air raids and transport difficulties.

It may be assumed that, by now, the Mines Department of the Board of Trade is in possession of estimates of the total requirements, in each class of coal, of industry, the public services, transport and shipping, and private consumers, as well as of details of the distribution of these needs by areas. The sum total of the requirements almost certainly exceeds the coal industry's capacity by an appreciable margin; and the first task is to bring it within the limits of possibility by rationing without impairing either the war effort or the people's health. Non-essential consumption must be prohibited, while the most drastic steps must be taken to ensure the prevention of waste. In practice, this may even mean the closing down of non-essential undertakings or at least a strict curtailment of their activities. It may involve the pruning of passenger train services, a reduction in coal supplies to public utilities in areas with diminished populations, and the cutting of household supplies insofar as this can be done without injury to health. It should be made plain, however, that no one class of consumer can be asked to shoulder the whole burden of sacrifice. Distribution must be according to needs, and the scheme already at work in the steel industry might be adapted, with modifications, to eke out supplies of coal.

The second task is obviously to ensure that the goods are delivered, that the minimum supplies needed with this strict apportionment are in fact produced and distributed. The industry's total productive capacity has been allowed to shrink dangerously during the past year by the depletion of the labour force and by the closing of pits, and it must be built up again with all speed. So far as its labour force is concerned, the exodus of miners from the industry has been arrested by the application of the Essential Work Order to coal-mining on June 7th. The campaign to entice back to the industry miners who have taken up other, and often more remunerative, employment, has, not unexpectedly, failed; and Mr Bevin has at last been constrained to order theregistration of ex-miners between the ages of 20 and 60, with the object of mobilising some 25,000 additional men, some of them for a temporary period of at least three months. Mr Bevin has also taken the common-sense step of consenting to call back miners from the armed forces; the crisis is too acute for punctilio. A fresh examination is being made of long-unemployed miners to secure their re-employment in the industry, if only in a subsidiary capacity; and, in order to secure the good will of miners, which is vital, they have been granted a guaranteed weekly wage, supplemented by a bonus of 1s. per shift,

conditional upon regular attendance, as an incentive to greater effort and less absenteeism. A minority of miners has objected to this new status, but their leader, Mr Lawther, was speaking only sober truth when he declared that this was the charter of security that miners have been seeking for generations. All this could, and should, have been done months ago; and if the additional men it is now possible to bring back quickly at this late hour are insufficient to meet the country's minimum requirements, the possibility of lengthening working hours may have to be seriously considered.

But it will not be enough simply to reinforce the industry's labour strength. The workers must be used efficiently by the concentration of production on the pits which give relatively high outputs and which are placed most conveniently for distribution. This may involve some redistribution of miners between, as well as within, the different areas, which will entail the provision of adequate transport and housing facilities; and if the industry's quota schemes or any of its customs or traditions stand in the way of adapting the structure of the industry to wartime needs, they must be set aside. No financial interests, for instance, must be allowed to serve as obstructions, and managements cannot expect to be exempted from the principle of compulsion already applied to the workers.

It will have to be remembered, too, that while production has temporarily displaced transport checks as the chief bottleneck, transport is still a major obstacle and one which will grow more menacing in the winter. Something can still be done by increasing production in areas which are either near important centres of consumption or easily accessible and by swelling stocks near centres of consumption before the winter comes. But the possibilities of accumulating stocks in the next few months are now limited, and the fact has to be faced that the coal position will depend crucially, whatever other steps are taken, on transport being available.

The remedies are still to hand. A careful estimate of requirements, pruned of all unnecessary and wasteful uses, will provide the Department of Mines with its target. And the swift measures which are required to reach this target—in recruitment, in production, in distribution and in transport—are plain enough. The enemy now is time; and the nation must face the fact that procrastination and clouded vision have made some sort of shortage in the later months of this year probable. It would be intolerable if the war effort were to be impeded for lack of coal; and there is no doubt that considerable sacrifices will be required of producers, workers and consumers to avert this fantastic outcome.

Help for the Colonies

MORE than a year after the Third Colonial System—the stage of construction after the stages first of tribute and then of self-support—was inaugurated with the passing of the Colonial Development and Welfare Act, an official statement has been made on the progress that is likely to take place during the war. A warning was given during the Act's passage through Parliament that it would be impossible in wartime to give the colonies anything like the maximum help authorised. It was the hour of need when, for the time being, the emphasis was laid not on what England could do to help the colonies, but on what the colonies could do to help England; and that the colonies wanted it so was shown by the spontaneous gifts to the Imperial Exchequer that came flowing in from all parts of the dependent Empire.

Soon, however, the emphasis changed again in spite of the war; and since last December, when the late Lord Lloyd described five "black spots" in colonial economic conditions, attention has once more centred on what the colonies need rather than on what they can give to the

war effort. But it was not until last week that any official statement of the Government's policy was forthcoming. More than once recently on non-Parliamentary occasions Lord Moyne has announced that colonial development, as envisaged by last year's Act, would go forward; and in the House of Lords he was much more explicit. Briefly, his statement fell into two parts: a fairly detailed description of relief measures made necessary by the war and of the extent to which colonial development can take place in war conditions; and a somewhat vague outline of the larger planning that will be a part of post-war reconstruction.

Under the head of relief come the crop purchase schemes which were described in some detail in an article in *The Economist* of February 22nd (on page 236). Here it need only be repeated that though they may have prevented the worst forms of distress, these schemes are not over-generously conceived. Their total cost to the Exchequer, after allowing for resales, is only some £1 million to £2 millions a year. Whereas under the agree-

ment recently made with Australia and New Zealand, payments for their surplus produce will aim at "keeping the industry operating efficiently," the colonial producers will be kept going, but that is all. In Palestine, where the citrus growers have merely been granted bank advances on which they have to pay 6 per cent. interest, a large proportion of the orange groves are being uprooted and neglected. Moreover, Lord Moyne, when asked in the House of Lords whether the British taxpayer was making a profit out of the West African cocoa producer, first of all denied the intention of making any profit, and then expressed the hope that if there were a profit it would be given back "in some form or another" to West Africa. But he did not deny that this year, for whatever reason, the price has been raised by 10s. a cwt. to the wholesaler in Great Britain, and reduced by 3s. to the grower in West Africa—who will draw his own conclusions, however erroneous.

The crop purchase policy, in fact, shows that, in spite of the new system, the attempt is still being made to run the Empire on the cheap. It would, of course, be bad policy to give the producers the pre-war financial return for their crops if, as a result, they had no inducement to turn to alternative crops and subsistence farming. But it is worse policy to give them less than their pre-war real income, without giving them adequate encouragement and assistance to make the change-over. Almost from the beginning of the war, it is true, the Colonial Office has impressed upon Colonial Governments the importance of self-sufficiency in food, but clear instructions and a statement on the financial help that might be expected do not appear to have been given. In planning what is for many colonies an agricultural revolution, the Governments concerned must decide what are the best crops to be grown, having regard to tradition as well as to nutrition; they must provide agricultural instruction; and they must arrange loans for the purchase of seed and for cultivation. The loans and the marketing would preferably, especially in Africa, be carried out on a co-operative basis. An example of how successful a Government inspired and supervised native agriculture can be is provided by cotton growing in Uganda. An opposite example is the food production campaign in Jamaica, where the Government has suddenly withdrawn its guarantees from several crops which last year the peasant farmers had been encouraged to grow. Agricultural credits are obviously within the scope of the Colonial Development and Welfare Fund in wartime, for money spent in this way fulfils Lord Moyne's condition that schemes submitted should not involve imported materials or staff. Soil erosion (which is the subject of a note on page 73) is in need of even more urgent treatment.

It is easy to think of other schemes which need not await the end of the war. In the House of Lords debate, Lord Hailey mentioned the tsetse fly and rinderpest, which must be defeated before mixed farming can be introduced in some African colonies. In the Leeward Islands, under the supervision of Sir Frank Stockdale, the Comptroller for Development and Welfare in the West Indies, proposals have already been made, not only for agricultural improvements, but for the complete reorganisation of the medical services. Something of the nature of a national health service is proposed, which would be free for certain classes of the population; and health centres in the villages, which will promote better sanitation and preventive medicine, are envisaged. Measured in terms of money, the development and welfare schemes for the Leeward Islands are not large—they do not involve the expenditure of more than about £40,000 a year. But they show that even the much larger programme that would be necessary to provide Nigeria, for instance, with an adequate medical service would not be extravagant in terms of either money or men.

Plans such as these, for agriculture and the social services, need only financial support from the Imperial Exchequer and the energy and enthusiasm of local administrations. The first is now promised; the other will be more difficult to obtain. It will be hard indeed for the colonial servant, who may have seen plan after

plan defeated through lack of means, to set himself to the task anew—especially when his heart and mind are centred on the struggle at home. The Colonial Office should, therefore, see that the dispatches which have now been sent to the Colonial Governments are followed up; progress reports should be requested; the appointment of Comptrollers, like Sir Frank Stockdale, for the African colonies might be considered; above all, the colonial administrators should be encouraged to realise that this is war work for a peace aim which will have propaganda value throughout the world.

But there is one wartime difficulty which at this stage no amount of financial assistance can relieve. The colonies, like other countries at war, are suffering from a shortage of consumers' goods. Much more than other countries, they are most of them entirely dependent for the reduced quantities available upon shipping which is equally scarce; and they have not been able to live on their fat, for colonial import trade has always fluctuated so much with the fortunes of exports that importers have not been disposed to carry large stocks. Attention is being given to this problem. The West Indies, which—dollar considerations apart—can still import necessities from the United States and Canada, are to confer, under Sir Frank Stockdale, on a common policy in import control; and all Colonial administrations have been advised to divert spending power by levying higher taxes on persons living on European standards. Taxation has recently been increased in Kenya; but it is still nowhere near the British level, and personal extravagance and expensive entertaining of the British troops are at present a common feature of European life there. But, even if taxation on wealthy colonists is raised considerably, the difficulty of finding essential consumer goods for the great mass of the poor will remain; and the Colonial Office should consider the possibility of some form of rationing among the settler population so that goods for the native peoples secure a fair share of the shipping space available.

In the Dominions, circumstances such as these in the last war gave a big impetus to secondary industries. In the colonies, the lack of capital, machinery and some materials is a stumbling-block. Funds could to a limited extent be provided by the United Kingdom under the Colonial Development and Welfare Act, but machinery and materials are a different question. Here again, however, it might be possible to obtain the co-operation of the United States and Canada. The United States has already concerned itself with the economic difficulties of South America and might well be willing to help the West Indies, in which it is now directly interested through the lease of naval bases. Similarly, equipment for some of the African colonies might be obtained from the Union. Nevertheless, during the war secondary industries can probably be established in the colonies only to a very limited extent. But there is no reason why plans should not now be made for the larger industrial development that after the war will surely be an important part of colonial construction. On the whole of this subject of post-war policy Lord Moyne was disappointingly brief. He spoke of the need for regulating colonial trade and development on a regional or continental rather than a local plane; he referred to the close touch that is being maintained with the Governments of the Free European colonies; and he announced that a small official committee under Lord Hailey has been set up at the Colonial Office to collect information on which future policy can be based. But on such fundamental questions as colonial finance and industrialisation he was silent.

Something like a revolution in the official attitude towards the relationship between Great Britain and the colonial empire has taken place in the last eighteen months—since the West India Royal Commission reported. It is now accepted that the dependent peoples are dependent economically as well as politically, and that trusteeship covers their material as well as their spiritual progress. That is a tremendous advance; and it is from no lack of appreciation that the Colonial Office is now urged to get on with the job.

NOTES OF THE WEEK

The Anglo-Russian Pact

The essence of the Treaty between Britain and Russia signed on July 12th is, in Mr. Churchill's words, that "both the British and Russian Governments have undertaken to continue the war against Hitlerite Germany to the utmost of their strength, to help each other as much as possible in every way and not to make peace separately." All three points follow logically from the war situation, and the third, given the present course of the war, is obviously pure gain from the British standpoint. There is nothing in the Pact to upset the most apprehensive opponents of Communism, and, to reassure them still further, the Prime Minister went out of his way to quote General Smuts. "Let no one say that we are now in league with the Communists and are fighting the battle of Communism. . . . Hitler has made her [Russia] his enemy and not us friendly to her creed." It is a fact and not a quibble that the alliance is with Russia and not with Communism, any more than it was with Tsarism in the last war. In spite of this, and in spite of the fact that the Russians themselves have based none of their war propaganda, at home or abroad, on Communist tenets, there are still traces of ideological uneasiness in the air, and there is clearly some pressure, on the one hand, to read implications of much closer friendship into the alliance than in fact can possibly exist, and, on the other, to boggle even at so innocuous a document as the Treaty as a pact with Anti-Christ. The extent to which this division will develop into a real cleavage depends, of course, on the length and strength of Soviet resistance; and it is perhaps logical to suggest that if Russia stands up sufficiently to Hitler's onslaught to remain intact and influential at the time of the Armistice, the question of peace aims may create an almost insoluble problem.

Does the guarantee not to conclude a separate peace necessarily include within it the further promise to concert on common peace aims now? Certainly it makes infinitely more urgent the British Government's duty to furnish some general idea of its commitments to Europe in the post-war period. Russia's record as a dictatorship and as an aggressor nation is undeniable; and there is a curious unwillingness among the friends and sympathisers of Russia Soviet, as distinct from Russia belligerent, to believe that any small country lying to the east of Germany can either be maintained in independence or prefer German to Russian domination. This belief may spring in part from a basic lack of understanding in Britain's highly industrialised and urbanised community for the status of a free peasantry. There is little in the recent history of Finland or the Baltic States to suggest that this eastern fringe would welcome incorporation or collectivisation. Therefore it is essential that Britain should refuse to sacrifice small peoples to strategy or interest as strenuously as she refused in the summer of 1939. The negotiations with Poland are an augury that an agreement, and perhaps even a guarantee, can be secured. Britain's duty is simple enough. In the war it is to strain every nerve to defeat Hitler and to give all possible aid to those who are fighting against him. In the peace it is to refuse steadfastly to allow any extraneous consideration to modify the motives which impelled the British people to take up arms. The Russian alliance may vastly alter the course of strategy. It cannot surely change the aims of the embattled democracies; and there is not a tithe of evidence that Russia has asked for, or expects, a change.

On the Stalin Line

The German advance goes on. Nowhere have the attacking armies been decisively held; in the centre, Smolensk has been "reached," and in the north and south two ugly thrusts have developed, one by way of Narva and Pskov towards Leningrad, the other beyond Novgorod Volynsk to Kiev. The loss of Leningrad itself would not be dangerous to the land fighting, but it would obviously jeopardise the efficiency of the Red Fleet in the Baltic. The fall of Kiev might well be the prelude to cutting off the Ukraine from the armies in the north; and it is relevant to recall that the interpretation given by German propaganda of the Russian decision to divide the front into

three sectors under three popular leaders was the suggestion that the Red Army had ceased to fight as a united whole and that the task of the three commanders was to ensure that local resistance continued, in spite of the "collapse" of the High Command. Yet the Germans are achieving their steady progress only at terrific cost. The Russians are still counter-attacking in the central sector, and the Russian air force is still active and effective. The long bloody struggle for the Dnieper and the carnage on its banks are evidence both of the fierceness of the resistance and the strain of the advance. The fantastic German claims made over the week-end—the Stalin Line pierced, the "roads open" to Leningrad, Moscow and Kiev—so strangely at variance with the usual reticence and sobriety of the German land communiqués, are perhaps a measure of the impatience and anxieties felt by the German General Staff. The Russians have not yet shown their ability to hold the Germans, it is true; on the other hand, there is nothing to suggest a collapse of resistance and the Germans have both a time and a wastage factor to consider which grows more formidable with each week.

The Silent Service

Mr Shinwell's forecast of a fortnight ago that the announcement of sinkings was to be stopped has proved correct. The shipping losses for June announced on Tuesday are the Admiralty's swansong. The policy of announcing sinkings has always been anathema in some official circles and the compromise after March, when monthly instead of weekly totals were given, did not remove the pressure for secrecy. Now it is stated that losses will not be announced in future "because valuable information is by this means given to the enemy." Although Service opinion must, of course, be weighed, this explanation is not really convincing. Oddly, it is accompanied by the total for June, which is apparently not informative to the enemy because it is the smallest since January, and by the cryptic statement that the Lords of the Admiralty will consider the publication of losses from time to time "as may be required"—which, by the same process of reasoning, would mean when they are not too big. It is very hard indeed to see how the publication of monthly losses, with a lag of, say, a month or even six weeks, if need be, could aid the enemy more than their suppression will disquiet the people most concerned on both sides of the Atlantic. In the United States, the only figures will be German exaggerations; in this country the feeling is bound to be that no news is bad news—that, just as the totals announced "from time to time" are likely to be the small ones, so those not given are likely to be large. It may very well be that this inference will be quite unjustified. But it will be made; and the case of coal, where if the regular statistics of production had been continued, non-official expert opinion would have been sounding the alarm many months before the present fantastic state of shortage had developed, is a dire precedent for any extension of the statistical secrecy that bureaucrats, lay and Service, delight in. The details of shipping losses up to their suppression are given in the following table:—

	British	British, Allies, Neutral
September, 1940	311,511	439,637
November, 1940	303,627	372,617
December, 1940	242,726	325,616
January, 1941	205,473	309,731
February, 1941	275,574	350,884
March, 1941	348,118	515,763
April, 1941	346,208	589,273
May, 1941	380,035	497,847
June, 1941	228,284	329,296
Total from beginning of war	4,605,132	7,118,022

The June total is still dangerously high—11,000 tons a day—but it shows a very encouraging fall below April, May, and March. Defence measures are having greater success; and there is probably work for U-boats now in the Baltic, which may keep the July losses down as well. The May total has been raised by over 36,000 tons from the original announcement to just under half-a-million tons; and it is possible that the June losses also will require some revision as further information comes in of distant sinkings.

Food and the Lords

Lord Woolton had to face some fairly heavy criticism in the House of Lords this week, mainly directed against the Government's policy in relation to milk and eggs. Lord Dawson of Penn made a serious appeal for the prevention of a further shortage of these two products, and claimed that some millions of gallons of milk had been allowed to go sour during the summer. Lord De La Warr affirmed that hundreds of thousands of eggs have gone bad during the past few weeks. The weakness of Lord Woolton's statement, and of the reply of the Duke of Norfolk, Joint Parliamentary Secretary of the Ministry of Agriculture, lay in the fact that no attempt was made to give a direct answer to these two disturbing statements. Lord Woolton suggested that the food position is, in fact, much more satisfactory than is generally realised, that there is less malnutrition than before the war, and that there is no prospect of any serious shortage. "We can look forward to the future with confidence," Lord Dawson's alarm at the prospect of a milk shortage in the ensuing winter was countered by the affirmation that "during the coming winter, I have no doubt that, with the help of New Zealand and the United States, we shall secure all the milk we require in one form or another." The trouble about this assurance is that it deliberately bases the security of the milk supply on the ability to import. The suggestion of the critics is that the milk supply should be increased by the vigorous elimination of waste, as well as by the immediate training of specialised labour for dairy farms. On the egg question, too, Lord Woolton would have been more convincing had he met and answered the criticism that the channel between producers and packing stations is imperfectly developed, instead of merely recounting statistical evidence of progress since the first week of the egg control scheme. These assurances are, admittedly, encouraging, but they hardly go far enough.

Whither Concentration?

At the beginning of March, Mr Oliver Lyttelton, then President of the Board of Trade, launched the scheme for concentrating the production of consumers' goods into fewer units, in order to release men, plant and factory space for war activities. Mr Lyttelton invited the submission of voluntary schemes by the trades concerned, subject to a time-limit, and proposed to impose schemes upon those firms that failed to respond by the appointed dates. These time limits were reached some time ago, and it was widely supposed that Mr Lyttelton was about to announce a plan for compulsory concentration when he was transferred to Egypt. If this supposition were true, the change of Ministers at the Board of Trade has given rise to some delay—not unnaturally perhaps—and Sir Andrew Duncan's statement in the House of Commons on Tuesday gave no indication of the methods he proposed to adopt to carry his predecessor's programme to its logical and stated conclusion. Sir Andrew confined himself to the general statement that the concentration scheme had met with "very satisfactory response"; that "nearly 110,000 workers had been released or were being made available for release under arrangements now in hand"; that some "16,500,000 square feet of factory space had been placed at the disposal of the Controller-General of Factory and Storage Premises"; and that the completion of the process was being hastened. No details were given of the procedure to be adopted in the case of recalcitrant or tardy firms. No time-limit has yet been set for compulsory concentration. The impression that Mr Lyttelton's own intentions are being reconsidered may, of course, be quite erroneous; but, whatever the cause or causes of delay, it is to be hoped that this indispensable and urgent scheme for releasing resources for the war effort is not to be allowed to fizzle out at its crucial stage.

The Problem of the Draft

The question whether the men drafted for National Service a year ago are to serve for more than twelve consecutive months, and whether geographical limits are to be set on the place of their service, is bound to raise passionate discussion in the United States. The President has, probably wisely, decided that it is a decision that must be taken by Congress, and it is possible to forecast that the opportunity, will be taken to debate hotly, not only the question of the draft, but also the whole isolationist-

interventionist controversy. For some months now, the President has been making use of his executive powers to ensure more aid to Britain. The hotheads will be all the more eager to make their protest for the weeks during which action and debate were conducted outside Congress. Even apart from this general and rather highly charged situation, the question of the draft is itself inflammable material. There is no more emotional issue in the United States than that of "sending our boys overseas" to die in foreign wars, and no more cruel or unjust accusation was made against the President than that his policy was "to plough every fourth American boy under." Now the Americans are being asked to face squarely the fact that they cannot carry out even the oceanic garrisoning duty they are prepared to accept as inevitable, unless some modifications are made both in the duration and place of service. The figure of 80,000 American troops has been spoken of in connection with Iceland. If Japan is likely to commit provocation in the South Seas, the problem of Philippine defence is immediate and urgent. Yet, if this draft of nearly a million men is allowed to break up, the United States will have almost literally no army—a ludicrous position in the deepening world crisis. The Chief of Staff, General Marshall, summed up the position when he said that failure to alter the conditions would be "a national tragedy." Unfortunately, the issue will not be decided by reason and national interest alone. The whole question vibrates with emotional significance; and it raises important economic issues, too. Britain and the United States—and to some extent, it is to be hoped, Russia as well—draw for their war equipment on a common stock of materials or finished goods. If America is to make and maintain the army its responsibilities require, without cutting damagingly into supplies for Britain, the people and the industries of the United States will have to face the hard choices of war economy even more squarely than they are yet willing to do.

The Syrian Armistice

The terms of the armistice between the Allies and the representatives of the Vichy Government in Syria, which were agreed on July 14th, will reassure those who, recalling the rather ineffectual conditions imposed on Iraq, feared that the collapse of Vichy's resistance would not be fully exploited to give the Allies complete military and political control in the Levant. Allied forces will occupy Syria and Lebanon; the French forces, while retaining their individual weapons, will surrender all war material, which Britain will either use or destroy; Allied prisoners will be set free at once, and French prisoners once the occupation is completed; all public services will be handed over intact, as will all airfields, aircraft and fuel stocks. Finally, every French soldier and civilian will have the choice of joining General-de Gaulle or of returning to France. The armistice brings to an end one of the most painful episodes of the war, and the importance of securing complete control throughout Syria and Iraq is doubly important now that the German war machine is pushing East. The armies used in the attack will now be free, apart from garrison duties, for use elsewhere, and since it is only in the Libyan sector that Allied and German armies face each other across a land frontier, it may be that here an effective blow could be struck to reinforce the Russian effort and to carry a step further the purging of Germany from the Middle East.

An Avowed Stop-Gap

Since the Government openly proclaimed that the National Health Insurance, Contributory Pensions and Workmen's Compensation Bill is only an interim measure to meet immediate necessities, there was little opposition to the Bill itself on the second reading. First, it provides for an increase of 3s. a week in both sickness and disablement benefit; secondly, it raises the income limit for compulsory insurance from £250 for health and pensions, and £350 for workmen's compensation, to £420 a year, which will bring in 450,000-500,000 persons; and, thirdly, increases the premium by 2d. a week. Most Members, however, though willing to accept the Bill as an improvement of sorts, considered that even now it might have stopped a larger gap. Any large-scale reorganisation of the existing system must necessarily wait upon Sir William Beveridge's survey—though not necessarily, as the Government declared, on the end of the war—but some anomalies

might have been rectified in the meantime. There seems no reason, other than the financial one, why grants should not be given to the poorer approved societies to enable them to allow additional benefits, such as dental and ophthalmic treatment, without which national health insurance is a mockery. But the most serious anomaly is still the absence of any dependants' allowances. An injured worker, who comes within the scope of workmen's compensation or who is incapacitated, either temporarily or permanently, by enemy action, receives such allowances. But the children of a worker suffering from cancer or any other illness, mild or serious, are left to public assistance. And the only reason the Minister of Health could give for this distinction was that dependants' benefits in cases of sickness would cost £9½ millions a year.

Essential Work and Wages

The problem of wartime wages is not simply a general problem of putting a stop to indiscriminate increases—in the interests of the workers themselves as well as of national economic stability. It is also a technical industrial problem upon the solution of which the actual efficiency of war production depends. In May last year, the Emergency Powers Act was passed, to enable the Government to mobilise the entire resources of the country to the full. In introducing this measure to give the Government full control over persons and property, Mr Attlee declared that "the Minister of Labour will be given the power to direct any person to perform any services required of him... the Minister will be able to prescribe the terms of remuneration, the hours of labour, and the conditions of service." It seemed logical and likely that these powers would be applied at once to everyone, or at least to the most important industries, and that approved and set standards of wages, conditions and welfare would be centrally imposed forthwith. Actually, as Mr Henderson Stewart declared in the Commons last week, "the bright flame has spluttered and fizzled out." The bastard and overdue child of the Emergency Powers Act is the Essential Work Order. There is no question now of the Minister of Labour directing or prescribing anything. Before this Order, which properly applied would, of course, be an indispensable part of war organisation, is applied to any industry, an elaborate procedure of negotiation with employers and trade union officials must be gone through; and it is therefore quite fortuitous whether more or less important firms get scheduled first as essential and protected. Some vital industries have not yet been scheduled. Many important firms have so far been left out, while other less important or less efficient ones have already been included. There is no plan or system about the setting of wage standards in different occupations.

It is still left to the relative attractiveness of wage levels in different occupations to secure the shifting of labour from peace to war work; and, since wages are still fixed in accordance with the bargaining power of the unions concerned—on the basis of the industrial values accepted in peacetime—there is no allowance for the relative wartime urgency of jobs or for special wartime living costs due to evacuation and the expensiveness of travelling and billeting. Thus Essential Work Orders, when at last they are applied, tend to perpetuate peacetime differences in wages which are inappropriate and even harmful in wartime conditions. Heavy workers are underpaid. Labour has to be dragooned to many vital but poorly remunerated war jobs. War workers may find themselves underpaid by Order, if by historical accident their occupation has not acquired a powerful trade union, as in the case of drop forging, while the staffs of beauty parlours and millinery establishments can be paid whatever the traffic will bear. While the employees of essential industries must remain at their present jobs, workers in retail trade and domestic service can wander wastefully at will from post to post, without any pressure or inducement to enter the war effort. Thus, the Essential Work Order tends to reduce rather than promote the movement of labour into war industries; and the absence of central planning and direction to allocate man-power and fix remuneration and working conditions means that workers, as well as the national effort, suffer. The official policy, which is designed to preserve the minutiae of collective bargaining at all costs, may be a good trade union policy. It is not a working class policy, for the real sufferers are those who belong to, or move into, occupations that are essential in wartime, but poorly paid by tradition.

Hanging Fire

No solution has yet been reached in the struggle between the TUC and the Government over fire watching. The Government still holds, rightly, that fire prevention is an obligation of citizenship, and has now agreed that, in view of this, the State should assume some financial obligation. It has, therefore, proposed a uniform allowance of 3s. for a twelve-hour period of duty, with possible adjustments for unusually long or short periods, which corresponds roughly with the rate of allowances for other civil defence duties. The employers, not unnaturally, have accepted this proposal in principle; in many cases it will presumably relieve them of a considerable financial burden—though the Government wishes to avoid unnecessary interference with existing agreements. The TUC, on the other hand, has decided that the basis of negotiation has been so completely altered by the Government's statement that it must withdraw for consultation—at a time when, as Mr Churchill said at a civil defence rally this week, "all engaged in our civil defence forces... must prepare themselves for further heavy assaults." Meanwhile, the supervision of fire prevention has been improved. As Mr Morrison indicated when he announced the appointment of additional Deputy Regional Commissioners, the functions of the Regional Commissioners are now to include the general supervision and control of all fire prevention arrangements in their regions. This means that the Commissioners will control not only the fire watching of private houses, shops and other business premises for which the local authority is responsible, but also the arrangements made in factories, including those working for the Government. Owners of factories and occupiers of business premises are still under the obligation imposed by the Fire Prevention (Business Premises) Order to notify their fire prevention arrangements to the "appropriate authority," which may be a Government Department or the local authority; but the Regional Commissioners will have general executive control and will be assisted by regional councils, composed of representatives of Government Departments, local authorities, employers and trade unions, whose functions will be to receive reports, suggest remedies and keep the Commissioners in touch with industrial problems. There will thus be ample opportunity for fire watchers' grievances to be heard by an independent authority, on the spot, who will have the power to remedy them. But neither this arrangement nor the 3s. has yet convinced the TUC.

The Middle Eastern War Front

The German drive into Russia and the appointments of Generals Wavell and Auchinleck to Commands which together stretch from Libya to the frontiers of Tibet,

suggest the creation of a new war front on which the military and economic resources of Africa, India and Australasia could be deployed to strengthen Russian resistance and to stem the tide of the German advance eastwards to China or southwards to the oil of Iraq and Iran.

Unfortunately, the geographical and political layout of the new Middle East is not favourable to any type of co-operation. Russia and her allies are separated from each other by a chain of buffer states, Turkey, Iran and Afghanistan, and none of these states is likely to make concessions which would embroil them with Germany. Turkey's reactions to the new Anglo-Russian agreement have been distinctly tepid and her fears of "Russian Imperialism," skillfully played on by the Nazis, are making the balance between German friends and British allies increasingly difficult to maintain. Were Turkey participating in the struggle, the question of contact with Russia would be partly solved, since there is direct railway communication through Erzerum linked with the Baghdad line. Iran is strictly neutral, but there exists a fear, parallel to that of Turkey, of Russian expansionism, and there are also strong Germanophil elements at Teheran. It is significant that the Iraqi rebels and the Mufti of Jerusalem are still finding sanctuary on Iranian soil. The country's neutrality is all the more unfortunate in that, strategically, its road system could be used to advantage to bring up material from Basra or Bushire to the Russian frontier. Afghanistan is mountainous, without railways and without good roads. Whatever its political attitude—it is one of neutrality—it would be geographically impossible to establish a working connection with the Russian railheads at Kushk and Termez. This is the rather unpromising strategic position at the junction of General Wavell's and General Auchinleck's Commands. The question whether strong diplomatic pressure on Iran and Britain's Turkish ally would induce them to permit that species of transit for arms and material and men which has not been held to interfere with Sweden's "neutrality" can be answered only with knowledge of the Allies' strength in the Middle East.

Japan on the Verge

Prince Konoye's Cabinet has resigned *en bloc* "in order to make room for a stronger Government to cope with the national and international situation." This suggests that the year-old struggle between the militarist extremists and the moderates, which has been maintained at a pitch of furious energy since the Germans launched their attack on Russia, is likely to be decided in favour of the extremists. Germany has been urging by every known method of propaganda and pressure that Japan must at last enter the war and play her part beside the Axis. The Nazis find a ready audience in army circles, who are either insatiable in their ambition or, driven desperate by their inability to finish the "China incident," feel that more war is a better way out than continued stalemate. If the extremists are really to be in the saddle now, then an attack upon Russia or an open drive southward, or even the double stroke, is possible. But it is unwise to under-estimate the strength of the moderates. It is they who have faced the economic and financial realities of the situation, and they may still be in a position to check action which would bring Japan into direct collision with Britain or the United States. Nevertheless, it may still be argued that an occupation of Indo-China would not lead to international repercussions, and this still remains the most likely course.

Africa's Dust Bowl

Out of all of Africa's many problems, the one that commands general agreement among both official and unofficial observers is soil erosion. Hardly a single report on the continent has been issued which does not emphasise the gradual but inevitable deterioration of the land and the consequent piling up of a legacy of social and economic troubles, some of which are already apparent. Yet little has been done to combat the danger, except by a measure which presses most hardly on the African—the compulsory destocking of cattle in native reserves. Little has been done in the way of prevention by steps such as the building of contour bunds and afforestation. It is therefore good news that, towards the end of last year, a Land and Water Preservation Amendment Ordinance was passed in Kenya, where the problem is perhaps most urgent, giving the Government wide powers to make rules controlling the Government wide powers to make rules controlling the clearing of land for cultivation, the grazing of livestock, the firing or clearing of vegetation, afforestation, the repair of gullies and so on. Moreover, for the first time, financial provision is made for soil erosion measures. Land-owners may apply to a land bank for Government advances, which are granted at low rates of interest. Yet it appears

that this essential work is still being held up. No funds were voted this year, because, it was said, there was not the staff to carry out the work. In the meantime, the war has caused a heavy demand for timber, so that the problem will be aggravated by the too rapid cutting down of forests. In combating this malignant growth of soil erosion there is surely a great opportunity for the Colonial Development and Welfare Fund; the measures to be taken do not require shipping or essential materials. Great Britain has a very real responsibility in the matter. The old native shift system of cultivation was bad enough, but there can be no doubt that the advent of the white settler, which in Kenya and Northern Rhodesia at least has crowded the Africans into inadequate reserves, has quickened the progress of the evil, and the white settlers themselves have been guilty of over-cultivating the soil. The land is the African's only asset. It must not be allowed to waste.

Shorter Note

The following table gives the number of civilian casualties in air raids since mass raiding began last September:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Total Sept.-Dec., 1940	21,669	30,556	52,225
1941:—			
January	1,502	2,012	3,514
February	789	1,068	1,857
March	4,259	4,794	9,053
April	6,065	6,926	12,991
May	5,394	5,181	10,575
June	399	461	860
Totals to date	40,077	50,998	91,075

In June, of those killed 175 were men, 160 women and 64 children under 16. In addition, 7 men are missing and believed killed.

THE STANDARD BANK OF SOUTH AFRICA LIMITED

Bankers to the Imperial Government in South Africa; and to the Governments of Southern Rhodesia, Northern Rhodesia, Nyasaland and Tanganyika.

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

America's Defence Programme

The Arsenal's Progress

[FROM OUR WASHINGTON CORRESPONDENT]

June 19th.

THE President's speech fell almost exactly on the anniversary of the first year of defence effort. The question that was then being asked—how much difference has a year of defence production made?—has since turned into the question—how much difference has the President's speech made?

The anniversary progress reports differed according to the temperaments of the reporters. Those on the optimistic side pointed with pride to the 41 billions appropriated or authorised by Congress for defence. Acres of new plant have been planned and laid out, and are either nearing completion or already operating. Anyone driving at midnight through the industrial cities sees the lights of night shifts silhouetting the outlines of factory upon factory. The "by 1942" deadline for mass output is only six months off.

Those statements are all true. Also true is the fact that actual disbursements to date under the arms programme amount to only \$6½ billions—which looks less like a capital expenditure than an interest rate—and even contracts let amount to less than 17 billions. The President's first report to Congress on Lease-and-Lend operations showed that during the first 90 days of the Act the newly produced supplies transferred under its provisions amounted only to \$11,000,000, of which \$8,000,000 represented agricultural products. As the stepping up of monthly expenditures currently in view materialises, defence spending, by the end of the year, will still be only about 20 per cent of the national income. On a percentage basis, this is less than the expenditure of Canada, and notably less than that of England and Germany. More important, it is much less than Germany is spending—on an absolute basis. And this is the case in spite of the fact that the United States' standard of living leaves a larger margin above necessities than that of other countries, and that the nation's economy—because of America's only recently finished transcontinental expansion—included at the start of the programme an exceptional proportion of equipment for the production of durable goods.

Why is this so? The matter can be explained in segments. It can be said that the army and the navy have in some cases gone at their contracts with the specific accuracy of engineers about to build a bridge, and borrowed the assumption from the Negro spiritual that to get to Jordan there is "jes' one mo' river to cross." It can be said that some of the civilians in the defence agencies have been opposed to the establishment of backlog orders of big dimensions because of the present and future pressures they would create. It can be said that the attitude of business-as-usual-with-a-defence-sideline has been too prevalent in industry, the attitude of more-butter-if-more-guns too prevalent in labour.

Summed up, this amounts to a national underestimate of the job. After the President's speech, officials, who for weeks and months have been privately aware of the need to double—at least—our current effort, have been free to advocate it. The resulting shifting of decimal points can be illustrated—an extreme example—by a Press release of the Office of Production Management dated June 13:

The Office of Production Management has recommended the expansion of facilities to produce magnesium metal to a capacity of 400,000,000 pounds annually. Present production is at the rate of approximately 30,000,000 pounds a year and additions to plants already under way will raise that capacity to approximately 75,000,000 pounds annually.

Tremendously increased requirements for aircraft and other military uses, arising out of the expanded national defence and Lend-Lease programme, require a productive capacity of approximately 400,000,000 pounds a year by the end of 1942.

This shift in attitude regarding production is probably the most important change this last month. It is a recognition that a job well done in previous terms of reference may be bad preparation for larger output for earlier delivery.

Because of the upward revision of defence demand, the defence programme can doubtless not be divided into a period of construction followed by a period of production in so sharp a manner as has hitherto been thought possible. As recently as six months ago, acute shortages of basic materials were not expected. Now they are at hand—many of them in industries where close control had previously limited unused capacity to a minimum. A continued expansion of facilities therefore seems likely to remain a feature of the months ahead.

The shift in attitude toward production also includes developments with regard to labour. The record of the National Defence Mediation Board, established after the strikes of January-March, has been exceptionally successful; at the same time, various no-strike agreements, on a union or an area basis, have been negotiated between employers and employees. The strike at the North American Aviation plant at Inglewood, California, was one of the small number of cases where a strike has been called in violation of an understanding to hold off pending the Board's consideration of a case. Under legislation enacted after the declaration of total emergency, and after the strikers had been urged to return to work by both Mr Thomas, President of the United Automobile Workers of America, and Mr Philip Murray, head of the Congress of Industrial Organisations, to which the United Automobile Workers belongs, Federal troops took over the plant and reopened it. It was announced that any strikers who had received deferred status under the Selective Service Act because of their defence employment would become subject to calling-up. The national union suspended the local leaders.

Labour Leadership

This case brought the problem of left-wing leadership into the open. It is a problem which union heads have been wary of touching—Red-baiters have flung the term Communist around so promiscuously during the last twenty years that the charge sounds odd on the lips of a union official. Yet, in a number of unions and city central bodies, a small group of followers of the "party line" is undoubtedly in effective control, and progressive union leaders are under the disadvantage of having not infrequently played union politics with the Communist element in order to outdo the right-wing groups. The current choice before these leaders is to undertake a difficult house-cleaning job themselves, or to see further public action taken with the concurrence of a considerable part of labour as well as the public at large.

Very shortly, the changed attitude toward the defence effort which is now measurable in respect of production will be making itself felt with regard to consumption goods. Now, defence stimulus of business is reflected, not only in the windows of little general stores in the Tennessee mountain areas of summer manoeuvres, where the ratio of troops to doughnuts is said to run as high as 50 to 1, but in the solid indices of department store sales compiled by the Federal Reserve Board, whose national average for May stood at 105, compared with 89 a year before. Sales of automobiles and chain grocery store sales tell comparable stories, exaggerated in areas where defence concentration is heaviest.

But in the last month there has been talk of restricting the production of automobiles, not by the 20 per cent previously discussed, but by 50 per cent. Reduction in the variety of models and colours in which goods are offered is being

talked all along the line—consumers may not have to tighten their belts, but they will have to choose from fewer styles when they buy them. Purchasers of refrigerators discover that the number of aluminium trays for ice-cubes is limited. In Richmond, Virginia, and Madison, Wisconsin, house-to-house salvage collections of used aluminium utensils have been made with a fanfare of bands and Boy Scouts. Housing shortages have reached the stage where model fair rent laws are being drafted. To relieve pressure, instalment buying conditions are being tightened. Defence bond sales are being pushed as alternatives to consumption.

These changes in attitude apply to the mechanics of the defence effort. It is less easy to say to what extent they reflect a change in the policy for which defence production will be used. At the least, they indicate preparation for a long haul. In his speech on May 27th, the President asked for unity; his request was seconded by Mr. Willkie in Chicago some days later. But within 48 hours full-page advertisements in a Washington paper announced: "On Tuesday you heard the President speak. Friday, May 30th, our spokesmen will answer." In the face of the facts of last November, the Lindbergh-Wheeler-Flynn demand for "new leadership" goes on.

But support of the President goes on also. The last Gallup poll shows 55 per cent replying in favour of present policies and 22 per cent more in favour of them as far as they go, but convinced they do not go far enough. In a country that normally divides on a 55-45 range of difference, this 77 per cent is a very large majority. The questions, moreover, were asked before the news of the *Robin Moor*, before the freezing of Axis assets and before the closing of the German consulates.

The Training of Labour

According to the latest available bulletin of the National Industrial Conference Board of New York, the number of persons employed in the United States in all branches of activity at the end of last March was 49,373,000, an increase of 3,682,000 on the figure for the corresponding month a year ago. Employment rose by 2,016,000 to 14,510,000 in the constructional and manufacturing industries, and by 1,265,000 to 11,407,000 in the service industries. The number of unemployed fell by 3,052,000 to 6,142,000, but as 2,472,000 of these were employed by the Government's various emergency organisations, only 3,670,000 persons were without work at the end of last March.

The number of unemployed is still large, while the number that can be transferred from their present occupations to manufacture the goods of war is even larger. But, in spite of the enormous labour force potentially available for enlistment in the defence programme, there is already a shortage of skilled labour, a shortage which is likely to become acute when the new munition factories and shipyards are completed, unless steps are taken now to train the requisite labour. Indeed, America's problem is very similar to Great Britain's two years ago and the rate of expansion in the production of defence equipment in America will be conditioned by the rate at which labour is recruited and fitted for the new tasks.

There are indications that the Government is alive to the problem, and the schemes it has devised for the purpose may be considered under three headings:

First, there are the *college training courses* sponsored by the Office of Education. Many engineering colleges have special facilities for training which can be utilised, without prejudice to the regular students and to research, for making available competent specialists to the defence industries and the armed forces. Last October, Congress appropriated \$9 millions to be used for the purpose of reimbursing engineering colleges for the expenditure incurred in training engineers up to the end of last month. Over 50,000 of the engineers and supervisory staffs employed in the defence industries are now enrolled at engineering colleges; they attend classes, twice or three times a week, chiefly in their spare time. Some of them attend refresher courses; the majority receive advanced training in design and in industrial engineering.

Secondly, and also under the auspices of the Office of Education, the Government has provided refresher courses at *vocational schools* for skilled workers who have become "rusty," as well as classes designed to facilitate "upgrading." These public vocational schools exceed 1,000 in number and they possess training equipment valued at more than \$1,000 millions. Congress has already appro-

riated \$66.5 millions for a vocational programme designed for skilled workers. Nearly two million workers are already enrolled in the regular programme, and more than three million persons are expected to attend training courses during the year ended June, 1942.

Thirdly, there is a scheme, sponsored by the Labour Division of the Advisory Commission to the Council of National Defence, designed to assist the training of additional workers by industry itself within the *factories*, and at the expense of individual companies. The organisation, set up at the Government's request, consists of experts borrowed from industry who tender advice concerning training programmes upon request.

Work in Progress

General Motors expects to need some 60,000 additional trained workers for its defence orders. Training is carried on simultaneously in forty of the Corporation's plants, with the General Motors Institute at Flint, Michigan, as the headquarters. Lathe operators, milling machine men, drilling press hands, welders and tool grinders, set-up men, foremen, technicians, and, not least, instructors are undergoing training. Experienced men drawn from regular production departments constitute the nucleus of the scheme, and trainees are taken in to work with them. The methods of training employed naturally vary to fit local needs and problems. Thus, in some plants, trainees are taught "on the job," working either as assistants to experienced operators or alone on a machine under the eye of set-up men. They are started on single operations, and those showing promise are upgraded to more complex machines to make way for those at the bottom. Another method uses the "vestibule school" by which trainees are given preliminary instruction on machines set aside for the purpose before they enter a manufacturing department. Then there is the "group" method by which small groups are placed under individual instructors who give their charges one hour of classroom work a day and supervise them in the shop the rest of the time. The institute under Chrysler's management has enrolled over 4,000 trainees since 1933, and is further expanding its training facilities. Ford, who normally provided training for between 4,000 to 5,000 students a year, has to-day over 8,000 trainees under 350 full-time instructors, and is extending facilities to coach over 10,000.

The training programme fostered by the Wright Aeronautical Company will enable it to increase its personnel from the 17,000 now employed in the Paterson factory to nearly 30,000 before the end of the year. The Republic Aviation Corporation of Farmingdale, New York, has started a training course for foremen and would-be foremen. Ford has also set aside 20,000 square feet of floor space in the new aero-engine building as an aircraft apprentice school. The General Electric Company, in addition to the regular 4-year apprentice training programme in its nine major plants with 1,015 undergoing training, has inaugurated practical short-term courses in which men are trained to do one specific job to meet the demand for skilled and semi-skilled labour.

While a good deal is thus being done in training additional labour for the production of war equipment, it is still too early to ascertain whether the programme is likely to be adequate. But, apart from its large reservoir of labour available for employment in the defence programme, America has a "hidden" reserve of man-power that can be drawn upon in case of need. According to the National Industrial Conference Board, the average number of hours worked in 27 industries last March was only 41.2 per week. True, the average weekly working hours in certain industries, such as machine tool manufacture, are above the average. But in case of need it should be possible to lengthen the working week quite appreciably to increase the output of the existing labour force.

THE BUSINESS WORLD

The Future of the Discount Market

THE merger of two firms in the London discount market, Cater, Brightwen and Co. and Roger Cunliffe, Sons and Co., was announced this week. In itself, the news may seem of no outstanding importance. It follows a long-standing trend towards concentration in the discount market which, in the space of little more than a decade, has reduced the number of its constituent firms from 22 to 13. The significance of this latest amalgamation lies in the fact that it is the first response to renewed official requests for such concentration and that, in retrospect, it may well prove to have been the forerunner of a series of such operations which, within a comparatively short period, will have reduced the membership of the market to about half its present figure, each unit having capital and reserves in excess of £1,000,000. The merger, therefore, raises the whole problem of the future organisation and function of the London discount market.

The discount market has provided a specialised and highly elastic market in bills of exchange. On the one hand, it has brought to the grading and discounting of commercial bills a knowledge born of long experience and tradition. On the other, it has provided a pool of bills from which the banks have been able to satisfy their requirements far more easily than if they had been dependent on the sales of bills from their own clients. In the course of maintaining and financing this reserve of bills, the discount houses have provided the basis for a short loan market—an essential adjunct to any highly developed deposit banking system. Through that short loan market, and by its contact with the Bank of England, the market has, by tradition provided the principal connecting link between the deposit banks and the central bank, and has thus become an integral part of the mechanism of credit control. Finally, by its participation at the weekly tenders for Treasury bills, and by its operations in the market for short term Government bonds, it has provided some contribution to the cheap financing of the Government's deficit. In the days of the supremacy of sterling as the international currency and of the bill on London as the instrument for financing international trade, the London discount market rose to great importance and considerable prosperity.

Little, however, remains of this functional importance. The commercial bill has virtually disappeared, and the specialised knowledge of trades and names which the discount market brought to its trade counts for very little to-day. The collapse of the London acceptance credit which formed the basis of most of the discount business handled by London began in earnest in 1931, with the departure of sterling from gold and the freezing of much of the credit extended on acceptance terms to central Europe. The process was completed by the outbreak of the war. Some attempts were made in the immediate pre-war years to replace the international bill by the domestic acceptance, and in some directions they bore fair fruit. But the results at no time provided more than very fractional compensation to the discount market for the business lost by the decline of the international acceptance. The war—and its resultant concentration of trading activities in Ministries and Government controlled organisations—has resulted in the collapse of most of the domestic acceptance business laboriously built up over the few preceding years. The discount market is thus almost wholly concerned in its discount business with turning over Treasury bills. These require no grading, no skill in handling. Even the determination of the rate at which they are to be discounted is a feat which no longer demands special aptitude or flair. The market syndicates its tender, and the rate at which each house applies for its fixed quota is dictated to it week by week. Neither is skill required in selling these bills. The banks take them at a fixed rate, and if, on the rare days of credit stringency, the bankers are not buyers,

the broker acting for the Bank of England is always ready to accept them—not at a penal Bank rate, but at the clearing banks' buying rate. This highly stereotyped procedure probably covers more than 95 per cent of the bills passing through the market—a ratio which can be estimated from the balance sheets of those banks which separate Treasury from commercial bills. It is a business which could be handled by a small fraction of the existing personnel of the market, working at most one day a week.

The discount market, however, still provides the basis of the London short loan market. No structure of banking assets, as banking operates in this country, would be complete, without a second line of defence in the shape of interest-bearing assets available at call or short notice. If the discount market were not there to provide the banks with this particular type of asset, it would have to be found in some other direction. It could, for example, be provided by an inter-bank short loan market. But for the discount market, there would certainly have to be a change in the tradition which prohibits direct rediscounting of bills by the clearing banks at the Bank of England. In other words, the discount market, by providing a short loan market, fulfils a function which in its absence would have to be performed by some other mechanism. And it is a moot point whether the substituted article would function as well and smoothly as this market after over a century of experience and adaptation.

The discount market is also the link between the commercial banks and the central bank; and there have been significant signs of a weakening of this traditional rôle also. The Treasury deposit receipt method of short-term Government financing has, in fact, created a direct contact between the banks and the Bank of England—complete with rediscounting facilities. Moreover, for some months in 1939 and 1940, the banks were fed direct from the Bank of England with Treasury bills originally issued through the tap, and there developed a new open market technique, which allowed direct operations in bills between the banks and the Bank of England and wholly by-passed the discount market. On this score, therefore, the claims of the discount market to indispensability are beginning to wear thin. A direct bridge has already been thrown over the gap between the central bank and the commercial banks; and the choice between the use of this bridge or of the long-established detour via the discount market is one which will ultimately be decided on grounds of expediency and economy.

The discount market thus remains as an organisation representing a considerable capital and even more considerable goodwill reflected in its power to borrow on attractive terms from the banking system. These resources are now almost wholly mobilised in the financing and turning over of Government paper, ranging from three months Treasury bills to gilt-edged securities of short to medium currency. For its profits, the market depends almost wholly on the bond side of its business. It can borrow from the banks—and particularly from non-clearing banks—against the security of bonds at an exceptionally cheap rate, and the running profit on its investments plus the jobbing profits on its operations in the gilt-edged market have no doubt provided all the profits distributed by the market for many years past. Does this function of dealing in and financing Government paper justify the existing organisation of the market? The authorities have evidently decided that it does not, and for more than ten years the Bank of England has persistently pleaded the virtues of concentration and curtailment to the members of the market. These promptings have not gone altogether unheeded; over this period the number of firms in question has nearly halved. And the latest prompting has behind it not merely the power of the Bank, but that of the Treasury.

The problem has probably been somewhat blurred by the

insistence on the virtues of amalgamations for their own sake. If it is admitted that holding and dealing in bonds involves a greater measure of risk than comparable operations in bills, it is reasonable to demand from the market more solid standards of capitalisation than the smaller firms can provide to-day. But it is not merely the grouping of the smaller units which will achieve this strengthening of the market. It will only be attained by the imposition on the smaller firms of the ratio of capital to bonds adhered to by the larger units and especially by the companies whose balance-sheets have to run the gauntlet of public criticism. The orthodox criteria of the structure of assets have varied widely over recent years and vary to-day as between different firms. During the past four or five years, there is good reason to believe that the total "book" of the market, that is, the bills and bonds financed by it, has fallen considerably in relation to the aggregate capital employed. On

the whole, it is the smaller units that tend to build up the most extended holding of bonds on the basis of their own capital resources. It would now be regarded as normal for a discount house to maintain a total book of about 30 times its capital and reserves and to distribute this book as to 25 in bills and 5 in bonds. Exact standards of orthodoxy cannot be formulated because bonds vary in currency and quality, and it would, for example, be unreasonable to require the same capital reserve for 2 per cent Conversion Loan 1943-45 as for 2½ per cent National Defence Bonds 1947-49. But it can be said that the larger houses tend on the whole to maintain smaller bond positions relatively to their own capital resources and, if these more conservative standards are applied to the whole of the market as a result of current and future mergers of the smaller firms, the required strengthening of the capital structure of the market will have been achieved.

Finance and Banking

Over £650,000,000

The circulation continues its steady upward secular trend, which is now helped by such seasonal factors as remain operative. During the week to last Wednesday a further £2,890,000 of notes went into circulation, bringing the total for the first time above the £650 million line. The unissued notes in reserve in the Banking Department are now down to £29,321,000. This expansion in the circulation has been one of the minor factors in the credit situation, making for somewhat scarcer supplies of money. The banks this week have been diffident buyers of bills, and the market has found it none too easy to balance its books day by day. Most of the ½ per cent non-clearing money has disappeared, and 1 per cent has been the general rate for such accommodation. The main factor in the depletion of bank cash has been the heavy payments which have during the past week found their way to the Exchequer. Some of these have been in respect of revenue, which normally makes a spurt at this time of the year, but another powerful influence has been the acceleration in the flow of subscriptions to war and national defence bonds. The result of these influences is to be found in the latest Bank return in a reduction of £23,685,000 in bankers' deposits, which have fallen to the comparatively low level of £108,108,000. The counterpart of this movement is in the main to be found in an increase of £18,352,000 in public deposits. Government securities are down by £9,965,000, indicating the gradual running off of the July bills purchased in the open market over the turn of June. Discounts and advances have risen by £4,129,000, a movement which must not be taken to indicate direct assistance to the discount market.

Rate on Tap Treasury Bills

Mr Stokes, who so indefatigably pursues the Chancellor of the Exchequer with his questions on money rates, occasionally succeeds in extracting interesting information from the Treasury. This week we have learned through him that the total amount of interest on Treasury bills issued through the tap, paid, during the six months from June 30, 1941, was rather less than £4,000,000. Generally speaking, added Sir Kingsley Wood, this sum accrued directly or indirectly for the benefit of the Exchequer. During the period in question the issue of Treasury bills issued through the tap averaged around £1,400,000,000. It follows that the average rate of discount charged on these bills was slightly over ½ per cent, the actual figure working out at 11s. 5d. per cent. It should be reasonable to assume from this that on those tap bills which go to one or other of the public departments, and in particular to the Exchange of the public departments, and in particular to the Bank Equalisation Account and the Issue Department of the Bank of England, a nominal rate of ½ per cent is charged. The actual rate is immaterial since the Exchequer both pays and receives the amount in question. On the small minority of tap bills, the interest on which does not, on the Chancellor's evidence, accrue to the Exchequer, it seems probable that the rate charged is the open market rate of 1 per cent. That was certainly the rate at which tap bills were made available to the clearing banks during the period when these institutions were being plied with such bills through the official broker.

War Damage Premiums

Each of the last two weekly Exchequer returns has revealed a source of receipts new to these documents, namely, the sums received under the War Damage Act, 1941. In the first five days of July these amounted to £5,920,000, and a further £1,800,000 appeared under this head in the return covering the week to July 12th. These are not the gross sums collected by way of premium on the War Damage Insurance for buildings and chattels. They are only the surplus of premiums collected over current expenditure incurred by payment of compensation under the Act. That expenditure appears in the Exchequer Accounts under Supply Services, the amounts being paid out of the Vote of Credit to meet such outlay. A corresponding amount of revenue collected in premiums is credited week by week to miscellaneous revenue, and it is only the surplus of premium income over current expenditure under the Act which appears separately in the Exchequer return. It must not be assumed that the experience of the first twelve days of July is likely to prove representative of the financial year as a whole. The voluntary scheme for the insurance of chattels has been launched with a rush of initial premium payments, and much of the total collected in the first twelve days of July represents the premium for the whole year on the sums insured under the voluntary scheme. This, moreover, is the time when Schedule "A" income tax payments are due, and some of the £7,720,000 shown as the surplus of premium income over expenditure under the Act may represent premiums on the compulsory scheme which are being collected with Schedule "A" income tax.

Cater, Brightwen and Roger Cunliffe

It was announced this week that subject to Treasury permission the discount market firm of Cater, Brightwen and Co. had acquired the business of Roger Cunliffe, Sons and Co. It was in October, 1939, that the firm of Cater and Co. absorbed Brightwen and Co. and the product of this amalgamation became easily the largest of the private firms in the market, ranking only after the three public companies. The merged concern first made its balance sheet public last month when it showed capital and reserves of £830,000, a bill portfolio of £16,052,000 and British Government securities of £7,307,000. Though Cater and Co. was established in 1908 only, and is thus one of the youngest members of the market, it is evidently marked out as one of the nucleus firms in the current concentration movement. The firm of Brightwen and Co. which it absorbed soon after the outbreak of the war was founded in 1860. The firm of Roger Cunliffe, Sons and Co. which is now being acquired is of even longer standing, having been established in 1819. The three directors of Roger Cunliffe, Sons and Co. will join the board of Cater, Brightwen. The merger will call for an increase in the capital of Cater, Brightwen, and it may be assumed that, when the absorption has been completed, the capital and reserves of the firm will comfortably exceed the figure of £1,000,000 which has been set by the authorities as a desirable minimum capitalisation for firms operating in the discount market.

Life Assurance and Income Tax

In the House of Commons on July 1st, Captain Crookshank, Financial Secretary to the Treasury, moved a new clause to the Finance Bill providing that the limit of income tax relief in respect of life assurance premiums may be calculated by reference to pre-war income. At present, the limitation to one-sixth of income operates harshly where incomes have been reduced. For example, if an income has fallen from £3,000 to £1,800, relief is now restricted to premiums representing one-sixth of the latter figure. The new clause, which was read a second time and added to the Bill, remedies any hardships by providing that the taxpayer's total income for 1939 may be substituted for that of the year of claim. This concession is especially welcome in view of the provision introduced last year, which pegs the income tax rebate on premium payments at 3s. 6d. in the pound, against the previous figure of half the standard rate. Actually, policy holders enjoy not inconsiderable privileges in the matter of income tax—rightly so, by reason of the importance of life insurance as a medium of saving—for, in addition to the direct rebate on premium, there is a concession restricting income tax on the offices' interest earnings to 7s. 6d. in the pound, a concession which helps the offices to maintain their profit earning capacity and from which participating policy holders at least will derive some benefit.

Ionian Bank Dividend Passed

The directors of the Ionian Bank have this week announced that they will not recommend the payment of a dividend for the year 1940. The accounts of the bank, excluding those of branches now in enemy occupied territory, will be submitted at the adjourned meeting fixed for August 12 next. They will show that the directors have decided to transfer to contingencies fund the whole of the year's net profits. The passing of the dividend breaks a long record but can cause no surprise in view of recent events in the bank's particular sphere of activities. Its main network of branches is to be found in Greece. It was established just over a century ago to develop trade between Great Britain and the Ionian Islands which were then a Protectorate of Great Britain. Later it spread its activities to the mainland. Fortunately it has also extended its branches and agencies to Egypt and Cyprus, and these, together with the London Office, provide a

nucleus from which renewed development will be possible when peace has returned and Greece is again freed from enemy occupation.

European Assets in U.S.A.

The United States Treasury has up to now issued four exemption orders to the freezing of European assets decreed by the President on June 14. Immediate exemptions were granted to Switzerland and Sweden, the nationals of both countries being thus immediately allowed to dispose freely of their dollar assets. Similar treatment was given to Soviet Russia following the German invasion of that country. The latest country to receive such exemption is Spain, whose assets in the U.S.A., estimated at about \$30 millions, were released from the freezing order this week. The delay which occurred in lifting the restrictions on the assets of this particular neutral needs no elaborate explanation. Before issuing its exemption order the American Treasury naturally wished to satisfy itself that the freedom given to Spanish assets in the United States would not be used to benefit the Axis Powers, and Spain's answers to this general request may not have been so readily forthcoming or so immediately satisfactory as those of the other countries concerned.

Half-Year's Money Rates

The following table shows the average level of short loan and discount rates in the first half of 1941 compared with previous years:—

AVERAGE MONEY RATES.				
Year	Bank Rate	Market Rate 3 Months' Bills	London Deposit Rate, Banks	Short Loans
1930	£ s. d. 3 8 5	£ s. d. 2 12 3	£ s. d. 1 8 5	£ s. d. 2 0 0
1931	3 18 7	3 11 0	2 1 0	3 0 10
1932	3 0 2	1 16 9	1 5 2	1 15 7
1933	2 0 0	0 13 10	0 10 0	0 15 5
1934	2 0 0	0 16 7	0 10 0	0 16 10
1935	2 0 0	0 11 3	0 10 0	0 14 10

1941 (Jan.-June 30)	2 0 0	...	0 10 0	...

Investment

Course of Equities

Following a rise which, with minor interruptions, had lasted for more than three months, the markets in general experienced a check in the early days of this week. The publication by Germany of extravagant claims to success on the Russian front may have been the occasion of this halt, but it was scarcely the principal cause, and it is to be noted that, while the rise has been halted in many sections, there has been no appreciable reverse in prices. What has occurred is that a movement, which was tending to become definitely speculative, and to spread, both to a wider public and to an extended range of equities, has been nipped before it had time to develop fully. The improvement in equities

	June 26, 1940	End Sept., 1940	Jan. 29, 1941	End April, 1941	Mid-July, 1941

Fine Spinners	2/4½	3/-	3/4½	2/9	3/3

at the close of last week has been continued, but at a much reduced tempo. The above table gives the movement over the year in a small selection of industrial leaders, and also

Pinedo Plan Rejected

According to a semi-official statement made this week, the Pinedo Plan for the outright acquisition by the Government of Argentina of the British owned railways has now been finally rejected. Possibly, it would be better to say its operation has been indefinitely postponed, for it is probably still the policy of the Argentine authorities to obtain control at an appropriate moment, and the explanation given for taking no action now is that the funds are not available at the present time to make what the Argentine Government considers a reasonable payment. Put in another way, this means that Argentina prefers to take something other than railway stock in exchange for any "hard" currency she can lay hands on, for it is improbable, in the changed circumstances, that this country would be prepared to accept payment in any other form. Nor was it ever very clear why the United States should elect to finance the purchase—as some have suggested—since this would

mean taking Argentina's name to a bill instead of our own, scarcely a profitable exchange, despite the deservedly high standing of the Republic as a debtor. With this possibility out of the way, the expectation of any early improvement in the position of Argentine railway stocks seems slight. At the moment, our import policy is ruled by the shipping position. South America is much nearer than the antipodes, but with that exception—and for the time being that of India—it is our most distant source of supply, and most of her other markets are closed. Until the shipping position is relieved, and that must at best be a matter of months, the outlook is distinctly poor. Holders who have seen their stocks fall to the existing prices are not, however, thinking of prospects in terms of months but of years.

Economic Co-operation Necessary

What is the longer term outlook for investments in Argentina, and indeed in the whole of South and Central America? No doubt the answer to this question will depend in no small degree on diplomatic action during and after the war. It may, however, be assumed that, once the compulsion of a single aim, imposed by the need for victory, has been removed, the objectives of diplomacy will be largely economic. At least it cannot be harmful to attempt to sketch in the main lines of the economic background against which they will be set. It may be taken as axiomatic that raw material and foodstuff-producing countries will continue to engage more in secondary industries. The desire to do this will be increased by inability to purchase abroad, but this inability will to some extent limit the imports essential for the establishment of these industries. It is reasonable to assume that there will be, after the war, a substantial unsatisfied demand for such products from some at least of the South American republics, including Argentina. Whatever limitations may be imposed on British exports by the exigencies of reconstruction at home, or on imports of foodstuffs by agricultural policy, there should be room for some marked revival in trade between the two countries, and this should bring a more than proportionate increase in the national income of the

Republic and, in due course, an improvement in its balance of trade, and consequently remove that *bête noire* of the railway stockholders, the depreciation of the *peso*. As to the attitude of the Government to the railways, as was pointed out in *The Economist* of November 16, 1940, when the Pinedo Plan was discussed, it has recently been more favourable. Supposing, as we must, that the movement for joint action among the Americas will take account of the need of markets for foodstuffs, it seems probable that this attitude will improve with improving conditions. There is, in fact, some hope that more may be saved from the wreck of investments in that area, whether it be in railway equities or in oil shares, than seemed at all probable in the early stages of the war, always provided that policy is governed by economic considerations.

Company Notes

Bank and Discount Dividends

The interim statements of all the leading English banks, and of the three discount houses whose shares are publicly held, are now available, showing in every case that the payments of a year ago have been maintained. The public and the market would have been surprised at any other result, so quickly has the scare of a year ago been forgotten. At that time, bank shares slumped on the collapse of France and numerous other adverse factors, until the yield was 6.12 per cent at the end of June, according to *The Actuaries' Investment Index*, against 4.38 four months earlier. A year later, at the end of February last, it had recovered to 4.81, while the latest figure is 2s. per cent lower. Recent fluctuations have been moderate, and the outlook for bank shares seems reasonably secure for the duration of the war regime. The shares selected for mention in the following table are the "equities" of this section, and among equities those with callable capital. Although the prospect of calls being made is extremely light, the fact that they are possible affects the yield, and the absence of this danger accounts

AUDITORS' CERTIFICATE AND REPORT.

We report that we have examined the above Balance Sheet with the Books of the Bank, and have obtained all the information and explanations we have required, and we are of opinion that such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Bank's affairs according to the best of our information and the explanations given to us, and as shown by the Books.

largely for the low return on Barclays Bank "B" and Union Discount. The banks have found their costs mounting and their advances—their most remunerative asset—falling away. They have had to rely on increased total assets to make good a decreased margin, and apparently this has sufficed. They will have been helped by the fact that the rise in the Funds has made any provision for

depreciation unnecessary. The discount houses have had to rely on such opportunities as arose for operating in securities on a rising market to make good a decrease in the turnover in non-Government bills, which, of course, yielded a much more substantial margin of profit than operations in Treasury paper, the total holding of which has perhaps not been greatly increased. The longer term prospects for bank shares is intimately bound up with the continuance of the cheap money policy.

* * *

W. and T. Avery Earnings

Profits after tax of W. and T. Avery for the year to March 31st last are moderately reduced from £207,715 to £185,365. The decline is, however, no more than can be accounted for by the expansion in tax liability during the year. After meeting depreciation at £44,704, against £46,616, and service on preference capital, the rate of earnings for equity is up from 24.0 to 26.7 per cent. The 15 per cent. dividend which has been paid on the increased capital since 1935-36 is maintained, and, after transferring a total of £55,000 to general and contingencies reserves, as in the previous year, the carry forward is only slightly lower at £63,751, against £65,207. There is no doubt that these results are, in war conditions, highly satisfactory. The company is, of course, separated from its considerable markets on the continent, although it is well placed to satisfy overseas markets which are still open from its associated companies in the Dominions and India. Conditions in the home market, where the demand for the company's weighing, counting and testing machines is likely to have been large, were doubtless the deciding factor in the result. The balance-sheet indicates a moderate expansion of business. Debtors are some £82,000 higher at £448,993; creditors, including taxation, are up from £574,730 to £676,016. Total reserves, excluding pensions fund, stand at £430,000 after the latest additions. Stocks are up from £336,642 to £390,007, while cash, other than cash in pensions fund, is approximately stable at £31,435. The chairman, Mr. Walford H. Turner, points out in his statement circulated to shareholders that while investments in and advances to subsidiary companies have declined from £719,000 to £687,000, amounts represented by trading in countries under enemy occupation have already been written off. The £1 shares, at 66s. 3d. ex dividend, offer a yield of £4 10s. 7d. per cent.

Two Textile Reports

The reports of *Patons and Baldwins* and *English Sewing Cotton* for the years to May 31st and March 31st, respectively, both show a setback in profits struck after taxation. In the case of *Patons and Baldwins*, the directors state that higher tax liability in respect of the year in question, and retrospectively for the two previous years, is mainly responsible for the fall in profits from £687,453 to £448,728. Despite a reduction of some £41,000 in depreciation to £143,143, which goes far to finance the provision of £47,915 for war damage premiums, equity earnings have fallen from £434,110 to £195,855, representing a tax-free rate of 10.2 against 22.6 per cent. The dividend on ordinary stock is reduced from 8½ to 5 per cent tax free, equivalent to 10 against 13.6 per cent less tax. War contingencies receives £100,000 against £270,000, leaving the carry forward only slightly reduced from £74,989 to £74,886. The full accounts of *English Sewing Cotton* add little to the information contained in the preliminary statement, discussed in *The Economist* of July 5. Profits after tax are down from £261,779 to £253,421. Depreciation is approximately stable at £42,142. As was already estimated, the dividend, which is maintained at 7½ per cent, is narrowly covered by equity earnings of 7.6 per cent. The balance-sheets of both companies show a rise in stocks. For *Patons and Baldwins* from some £2,682,000 to £2,915,000 and for *English Sewing Cotton* from £691,000 to £871,000. *Patons and Baldwins* show no separate item for cash, but the total of debtors, bills receivable and cash is up from £2,259,721 to £2,513,819. Creditors including taxation are rather over £400,000 up at £2,087,506. Elsewhere, the accounts show no significant change. The £1 ordinary stock of *English Sewing Cotton*, at 25s. 7½d., offers the normal yield of £5 17s. per cent. The *Patons and Baldwins* £1 ordinary stock, after the recent rise, stands at 45s. 7½d., at which price it offers a yield of £2 3s. 10d. per cent tax free.

* * *

U-Boat Results

Gross income of United British Oilfields of Trinidad, including value of oil stock, increased last year from £2,116,765 to £2,963,445, largely as a consequence of a jump in purchases of crude and refined oils from £968,000 to £1,412,000. General costs rose from £646,995 to £925,348, while the depreciation charge was raised and tax provision called for £270,000, against £152,000. This reduces the surplus available for ordinary shareholders from £112,070 to £67,756, representing a rate of 6.5 against 9.8 per cent. The ordinary dividend is reduced from 8½ to 7½ per cent, leaving the carry forward at £24,266, against £34,557. The chairman, Sir Robert Waley Cohen, in his statement circulated with the report, expresses the hope that the company may ultimately benefit from recent legislation affecting the taxation of wasting assets. He points out that United British Oilfields suffers from an extremely unfavourable EPT standard. As in the previous year, for reasons of security, no details of output of crude or refined oil are published, but the directors state that in one area exploration is still going on. The balance-sheet shows a rise in material in stock and in transit from £431,118 to £659,611 due partly to higher prices and partly to increased purchases, and in oil stock from £121,554 to £137,908. Net additions to wells, equipment and other fixed assets is reduced from £304,956 to £280,021. The liabilities side of the account shows a transfer of £100,000, following the previous year's transfer of £200,000, from share premium account to exploration reserve, bringing the total of that fund to £350,000. Liquid assets exceed current liabilities by £10,000, compared with £487,000 a year before. Of a total of creditors and taxation reserve amounting to £633,174, taxation reserve represents £307,000. The 6s. 8d. ordinary shares, at 8s. 3d. ex dividend, offer a yield of £6 1s. 3d. per cent.

* * *

Scribbans' Improved Results

The improvement in Scribbans' profits, after tax, from £91,602 to £115,370 for the year to April 30th last, has permitted the resumption of dividends on ordinary and deferred capital, neither of which received any payment since 1936-37. Tax provision last year is not disclosed, but there is every reason to suppose that it must exceed the

£50,294 required in the previous year, while depreciation is raised from £26,978 to £34,154. The 5 per cent dividend on ordinary shares, the same rate as was paid four years ago, is covered by earnings of 6.8 per cent, against 4.2 per cent in 1939-40. The deferred capital receives 14.166 per cent, against 7.083 per cent in 1936-37, the rate of earnings last year amounting to 19.4 per cent. The allocation of £50,000 to general reserve is repeated, but there is no provision of £5,000 for civil defence work as in the previous year. The carry-forward is nearly £30,000 lower at £64,850. It was clear in the previous year that the profit position of Scribbans had considerably improved and that, if the improvement continued, resumption of dividends should shortly become possible. That a further improvement has been realised in the face of limitation of supplies, higher costs and higher taxation is highly satisfactory. The progress is no doubt due in part to a vigorous sales policy,

in part to the disappearance of some competition since the outbreak of war, and possibly to the growth of ARP and military canteens. The improvement in the profits position has been accompanied by progress in the financial position of the company. The bank overdraft of £91,770 is eliminated and an increase in cash from £3,135 to £103,453 removes the acute shortage of liquid capital which hampered the management at the date of the previous balance sheet. The decline in stock, in view of the rise in the price level, from £131,543 to £118,235, is somewhat disquieting, since it carries a hint that the progress of the past year may have brought the realisation of irreplaceable stores. This and the future level of supplies will determine the prospects of the concern in the current year. Other items of the balance sheet show no striking change. The £1 ordinary shares, at 8s., offer a yield of £12 10s. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

WHILE the undertone throughout the markets remained steady, the upward movement in all sections resulting from active and selective buying had by Friday come to an end. A desire to await developments was strengthened by the news from Russia, while decreased shipping losses and the Prime Minister's speech gave no cause to change this attitude. The markets opened rather dull on Monday, and while prices throughout remained steady, small losses were general during the earlier part of the week, although brewery issues were a notable exception, and on Tuesday both the kaffir and rubber markets presented a rather more cheerful front.

*

After some earlier weakness, the gilt-edged market closed firm on Friday, when 2½ per cent Consols and Local Loans were down ¼, while 3½ per cent War Loan dropped ½, the 3 per cent adding a similar amount. Lack of support on Monday brought further slight declines, 2½ per cent Consols losing ¼, 3 per cent and 3½ per cent Conversion, 4 per cent Funding and Local Loans ¼, while 3½ per cent War Loan eased ¼. The following day saw little improvement with 4 per cent Consols and Local Loans down ¼, although 2½ per cent Consols recovered ¼. Brazilian and Chinese issues were prominent in a firm foreign bond market at the end of last week, but some weakness developed in the early part of this week. On Tuesday, Japanese issues were down, the 5 per cent 1907, 6 per cent 1924 and 5½ per cent 1930 all losing a point, after smaller losses the previous day. Brazilian issues lacked support and fell back slightly on Tuesday, but many European loans were brighter. German Potash 6 per cent and 7 per cent bonds each gained 2 points on Tuesday, while Spanish Fours were prominent with similar gains on Monday and Friday. Later, conditions became quiet with prices remaining firm.

*

The home rail market was fluctuating and irregular, the prospect of an ultimate agreement with the Government being offset by the NUR's decision to demand further wage increases. The market opened well on Monday, GWR and LMS ordinary recovered Friday's losses of ¼ and ½ while the Southern deferred and preferred were up ¼ and ½. The following day saw falls of ¼ and ½ in GWR ordinary. Southern deferred and preferred ordinary, with LMS down ¼, and the downward movement was continued in midweek. Canadian Pacific ordinary dropped Monday's rise of ¼ on the following day when the preference issue was down a similar amount. There was a fair demand for Argentine rails.

New York

At the close of last week, trading on Wall Street was narrow and irregular. Sentiment, however, remained firm and no weakness was evident. Pending some clarification of the war situation in Russia and of the ultimate intentions of Japan, dealers were unwilling to buy stock and, in general, prices stagnated. This week, the continued absence of definite news gradually caused business to fall away and by Tuesday price movements began to be irregular as well as narrow. In midweek, buying was selective with turnover at a low ebb.

The American Iron and Steel Institute states that production of steel ingots fell from 7,102,000 tons in May to 6,801,000 tons in June.

Industry and Trade

Unemployment at 300,000

Between May 12th and June 16th the number of unemployed on the registers of employment exchanges in Great Britain showed a substantial and widespread decline, from 368,988 to 301,939. There were reductions in unemployment in all the administrative divisions and in all the principal categories. The number of unemployed normally in casual employment fell from 12,932 to 10,550, while the category of the temporarily stopped was reduced from 65,744 to 47,733 and that of the wholly unemployed from 290,312 to 243,656. The number of wholly unemployed men declined from 127,733 to 110,428 and that of women from 122,002 to 102,181; 34,763 men and boys and 3,975 women and girls have been classified by interviewing panels as unsuitable for ordinary commercial purposes. While the application of the Essential Work Order to the coal-mining and building industries last month may have contributed to the decline in the official unemployment statistics, the extent of this contribution cannot be measured. The transfer of workers from unessential and overstaffed occupations (now the main reservoir of labour) to war work is still proceeding all too slowly; and it is interesting to compare the bold training schemes sponsored by the American Government, outlined on page 75, with the haphazard procedure in this country in the early part of the war.

* * *

Education by the Ministry of Labour

The idea of telling the world what they are doing is gradually spreading among the Government departments. Its newest manifestation is a monthly Engineering Bulletin inaugurated by the Ministry of Labour and "designed to help the engineering industry to solve current problems of labour utilisation." Profusely illustrated, this bulletin is of intense interest, not only to employers and to actual and potential munition workers, but to all who appreciate that Britain's existence as a nation depends upon the use that is made of our labour force. The first issue, dated June, is largely, but by no means exclusively, concerned with training. The account of the work of the Government training centres is encouraging. Training now appears to be planned soundly and calculated to produce a semi-skilled workman who will have nothing to unlearn if he later shows a capacity to develop further, but not aiming at too ambitious an immediate result. Special courses, both for beginners and for men who are to be upgraded, are often arranged to suit the needs of individual employers, who can visit the centres and examine for themselves the progress being made by their employees-designate. This, in present conditions, must be a valuable service. The training, at a technical college, of women as machinists is described in another article, and yet another gives a most glowing account of the part played by women in war industry. It appears that they can be used for heavier work than had hitherto been believed possible, especially when aided by

intelligent adaptation of the job, as, for example, by the provision of slightly smaller shovels for stoking. Far more important, they are successful in precision work—some are employed in optical grinding and polishing to the limit of .0000025 in.—and particularly good at inspection and as machinists, while in certain work requiring delicacy of feel they are measurably better than men. Though not apparently designed for that purpose, this bulletin should have a very considerable recruiting value, for it conveys a definite and attractive idea of the sort of work likely to be encountered by those who "go on munitions." For those who seek information at a crucial point in the war effort, the vital fact—the number of trainees coming forward to do war work—is not made plain.

* * *

Pooling Technical Knowledge

In view of the many technical problems involved in the adaptation of industry to the production of military equipment, and of the need to utilise resources as efficiently as possible, the pooling and dissemination of technical knowledge is a matter of vital importance. As a contribution to this end, the Institution of Production Engineers, which has a large membership of works managers, has set up a technical and publications committee. One of the committee's means for the dissemination of knowledge is a monthly bulletin, the first number of which was published recently. It contains useful notes on designing for production, on the functions of Area Board clearing centres, on a new advisory service on welding, on methods of training in an engineering factory and on other problems. The notes on designing are particularly interesting in that they emphasise the need for closer collaboration between the designer and the production expert in the interests of economy in materials and speed of production; for example, it is often possible to achieve an appreciable simplification of production processes by comparatively minor adjustments in designs. And since both labour and materials are in scarce supply, anything that leads to their more efficient utilisation and to greater speed in production is an important contribution.

* * *

Road Haulage and Essential Work Order

In view of the important part played by the road haulage industry in maintaining inland communications, it has been necessary to safeguard its labour resources. The Ministry of Labour and National Service has therefore agreed to accept for scheduling under the Essential Work (General Provisions) Order, 1941, firms engaged in the industry which operate 20 or more vehicles. (The position of the smaller firms is still under consideration.) All firms holding either A or B licences can apply for the application of the Order. Holders of C licences are only eligible if they can properly be regarded as engaged in road haulage

and have a separate and identifiable department or staff, and in their case the application is to be confined to the department concerned. It remains to be seen whether the decision to allow road haulage undertakings to be scheduled is the prelude to the extension of official control over road traffic; this was initiated on a small scale last January, when the then Ministry of Transport decided to enter the business on its own account by hiring lorries from the hauliers for the purpose of carrying goods for the various Government Departments.

* * *

Winter Clothes in Good Time

The introduction of the coupon system for clothing has made possible a temporary modification of the limitation of supplies regulations, designed to make winter clothing available at the beginning of the season. A general licence has been issued enabling registered hosiery and clothing manufacturers and wholesalers to supply, until August 30th, children's clothing and the cheaper kinds of adult clothing against coupons, but outside the home-trade quotas. No further authority is required for this extra trade, but persons supplying under the general licence must afterwards furnish the Board of Trade with a list of the amount and kinds of goods so supplied during the period July 11th-August 31st. Where manufacturers are unable to supply from stock, and where there are likely to be difficulties about raw materials, they can apply to the Board of Trade, and the appropriate Control will make the necessary arrangements. The garments covered by this licence are: children's garments in sizes exempt from purchase tax; suits up to £2 5s. each; sports coats up to 15s. 6d. each; trousers up to 8s. per pair; woollen cloth up to 6s. 6d. per yard; shirts up to 55s. a dozen (these are all wholesale prices); and the cheaper grades of men's and women's underwear, socks, stockings and corsets. Most of the goods specified are cotton, but woollen vests, pants and socks of the cheaper grades are also included. The limitation of supplies quotas remain in force, at any rate until the end of September, but these goods, for the time being, are entirely outside it. This enables purchasers to use their coupons at the time most convenient to themselves, which will normally be before the beginning of the winter, instead of having to wait until their sold-out retailers receive their next quota, as they frequently had to do last autumn. The Board of Trade states that "the continuation of these quotas will be reviewed in due course," and it seems likely that they will be superseded now that the more elastic system of coupons has been established.

Rice versus Wheat

In its March issue of *Wheat Studies*, the Food Research Institute of Stanford University makes an interesting examination of the parts played by wheat and rice as staple cereals. About four-fifths of the world's population depends upon one or the other for at least half of the cereal calories in its diet. The conditions of supply and demand for these two cereals are remarkably different. Rice requires a hot climate, is grown in flooded fields, requires a great deal of labour, gives a higher yield than almost any other similar crop, and is very reliable. Moreover, the land on which it is grown can often be double cropped. In densely populated countries with hot damp climates it is thus unrivalled as a staple cereal, while wheat would be out of the question. Marketing technique for rice is not nearly so highly developed as that for wheat, so that trading is more individualistic and therefore more risky. This leads to a wide spread between producers' and retailers' prices and to a tendency for the farmer to be victimised. Recognition of this in the Far East has led to Government intervention in many instances. A further disadvantage under which rice labours is the much greater difficulty of storing it. Only Japan undertakes this systematically, and even she does not store on a very large scale. On the demand side, rice and wheat differ equally widely. In wheat-eating countries, wheat only furnishes 25-35 per cent of all the food calories available or ingested, while rice provides 70-90 per cent of the calories available or ingested in the Orient. Moreover, rice is eaten whole (after various processes of milling and polishing), and served freshly cooked, whereas wheat is ground into flour and then made up into bread or other dishes. This means that the ultimate consumer can and does distinguish between different kinds of rice in a way quite impossible to the wheat eater. It also means that the substitution of wheat for rice involves far more complicated changes in the dietary than the mere substitution of one cereal for another, for the accompaniments which an oriental uses to flavour and add nutriment to a dish of boiled rice are fundamentally different from any which are used in conjunction with bread. The latter, if obtainable at all in rice-growing countries, would be beyond the peasant's means. In any case, the much more elaborate processing which wheat undergoes before it reaches the table makes it far more expensive, relatively to rice, than a comparison of the grain prices would suggest. Thus, though wheat has certain advantages over rice, it seems likely that traditional preference, convenience, economy, and the absence of any alternative employment for either the land or the labour of most of the rice-growing countries will prevent any substantial change from rice to wheat for a long time to come.

COMMODITY AND INDUSTRY NEWS

PEPPER prices show further rises, with white Muntok a penny up on the week and Lampong black $\frac{1}{4}$ d. higher. On Tuesday white Muntok, spot, in bond, was 15d. a lb. and Lampong black was 9 $\frac{1}{4}$ d. Tin, standard cash, closed at £256 15s. £257 per ton on Wednesday, the same as a week ago; three months was £260 5s. 10s. compared with £260 10s. 15s. The rubber market has again been quiet, but a feature of the week was the announcement of the dealers' fee of $\frac{1}{4}$ d., discussed below. The price of smoked sheet, spot, quoted on Tuesday was 13 $\frac{1}{4}$ d. a lb.

Rubber Dealers' Fee.—Rubber Trade Association members have welcomed the Rubber Control's announcement that dealers will be paid a fee of $\frac{1}{4}$ d. a lb. on all rubber bought through them by the Control. This fee will enable many of them who were considering closing down for the duration of the war to carry on. It is thought that the Rubber Controller may have had in mind the potential importance of the Exchange in post-war business in reaching this decision. The United States Government recently made a similar arrangement in that country. The London dealers' fee was payable from July 14th, but details of how it is to be paid have not yet been announced.

American Cotton Crop.—The Department of Commerce of the United States Government has estimated the area under cultivation for cotton for the 1941-42 season at 23,519,000 acres. This is 5.4 per cent less than a year ago and is the smallest total on record since 1909, when the present system of reports was begun. It is too early in the season for any reliable estimate to be issued as to the probable output, but some authorities are forecasting only about 10,000,000 bales for the current season, as against last year's 12,500,000 bales. In view of the acreage report and further news of unfavourable weather in the belt, cotton prices in the United States have continued to advance. The position in Lancashire is not affected by these recent developments, as prices are fixed until October 31st.

Cotton.—There has been further evidence in the Manchester market of demand exceeding supply, and it would seem that owing to the concentration of production scheme producers cannot satisfy the requirements of customers. Government supplies and export business receive first consideration, but the Controller is now allowing rather more raw cotton for home trade fabrics to

make certain that coupons can be met. The Controller has advised spinners that all contracts arranged must be for deliveries to be completed within three months.

Tinplate Industry Concentration.—A committee has been appointed by the Minister of Supply to consider and report on the application to the tinplate industry of the policy of concentration of industry, having regard to the measure of redundant plant existing in the industry. The Right Hon. the Lord Essendon, J.P., is chairman, and the other members of the committee are Captain H. Leighton Davies, C.B.E., J.P., Mr. J. E. James, Major Llewellyn David, Messrs R. G. Lewis, John Brown, and P. Owen. Mr. J. C. Carr, Raw Materials Department, Ministry of Supply, will act as secretary to the committee.

Paper Box Industry.—It has been decided to set a limit to the period within which voluntary arrangements for concentration of production in the paper box and carton industries can be submitted to the Board of Trade, and the closing date has been fixed as July 31st. Application for voluntary concentration

Shorter Comments

Allied Sumatra Plantations, Limited.—In his speech at the ordinary general meeting, the chairman, Mr. A. I. Mathewson, drew attention to the satisfactory rise in gross profits for which the higher price of rubber and the increase permitted in standard production were jointly responsible. The failure to pass on to the shareholders a corresponding increase in distributable earnings is due to the very heavy rise last year in Netherlands East Indies taxation and to the fact that the company is liable to double taxation on a considerable scale. The prospect for the current year suggests that the exportable crop will reach a new record, but that, as before, taxation will absorb a large slice of gross profits.

Cunard Steamship Company Limited.—The £3,683,615 outstanding of the 5 per cent mortgage debenture stock of this company is to be redeemed on February 2, 1942.

COMPANY MEETINGS

IMPERIAL BANK OF IRAN

SATISFACTORY RESULTS

DIVIDEND MAINTAINED

The fifty-second ordinary general meeting of the Imperial Bank of Iran was held, on the 16th instant, in London.

Colonel Sir A. Henry McMahon (the chairman) said: Gentlemen, You will have noticed that the rate of exchange at which the rial accounts are converted to sterling is about 6½ per cent. higher this year, which would have the effect of reducing the sterling equivalent, in the balance sheet, of the items in Iranian currency. Deposits, when allowance is made for this factor, show very little change, and the same applies to bills payable.

The acceptances item reflects a substantial reduction, in guarantees issued for railway contractors whose commitments have run off, and in credits opened mainly in respect of imports from America. Trade with Russia, and with Germany by transit through the Caucasus, has for some years been conducted under barter and clearing agreements, and even in times of peace would therefore not come into the picture so far as we are concerned. Trade with India has been normal, but business with America and with this country has been reduced by war-time difficulties.

The figures of cash and investments are practically unchanged. Discounts, loans and advances show an increase which is more than accounted for by money lent by us on short term in London and by deposits with our bankers in India and America on behalf of our customers.

Bills receivable show a reduction of £240,000—reflecting the reduced trade with America and this country which I mentioned when speaking of credits opened by us.

RESTRAINED ACTIVITIES ABROAD

You may recall that a year ago I referred to our increased commitments in Iran and Iraq, where we had found ourselves able to utilise more of our resources. This year our activities abroad have been more restrained, and our present position is such that we can face all possibilities of the future without undue anxiety.

Notwithstanding our reduced commitments, and in spite of heavier taxation, we are able to show a profit which is only £1,000 less than last year. We propose therefore to pay the usual dividend, and to increase the amount carried forward by £7,440.

Iran is happily at peace with all the world, and if the will of her statesmanlike ruler, and the desire of her industrious people, can prevail, she will remain so. Her foreign policy is still centred on good neighbourly relations with the countries on her borders. The preservation of her own integrity is obviously essential to the material and moral development in which she has steadily progressed in the past twenty years. The signs of stability and progress have been most evident, over the year under review, in the general activity of residential, municipal, and industrial building construction throughout Iran, and in the energetic pursuit of railway construction eastward to Khorasan, northwestward to Agerbaijan, and southeastward towards the Baluchistan frontier, where we reopened our Zahedan Branch last summer.

The expansion of internal activity calls for more currency, and the authorised limit of note issue, supported by adequate reserves, has recently been raised to two thousand million rials. The actual circulation is much below this figure.

POSITION IN IRAQ

In Iraq, the poor harvest of last year left no surplus of wheat, and little of barley, for export, and the Basra date crop was partly unsold. The cotton crop which was a good one was taken by Japan. In the late spring of this year the normal process of trade was abruptly halted, as you know, by political misadventure. Our Baghdad branch was under hostile control from May 2nd till June 10th, but no irreparable damage was suffered in this brief interlude. I take the opportunity of expressing our thanks to the British Ambassador for his hospitable care of our British staff in Baghdad during a somewhat trying period.

Our British, Iranian and Iraqi staff have once more fully merited our cordial appreciation of their good work. To them and to those who have joined the fighting services, we extend our thanks and good wishes.

The report and accounts were unanimously adopted.

NATIONAL BANK OF NEW ZEALAND, LIMITED

RESULT NOT UNSATISFACTORY

The sixty-ninth ordinary general meeting of the National Bank of New Zealand, Limited, was held, on 17th instant, in London.

The Rt. Hon. Lord Balfour of Burleigh (the chairman) said that deposit and current accounts at £15,181,000 were up by £275,000 and bills payable and other liabilities by £165,000. Those increases were reflected in an almost exactly similar increase of £433,000 in their advances to £11,713,000. New Zealand Government Treasury Bills, which stood last year at £450,000, did not appear in this year's balance sheet, and there were counter-balancing increases of £272,000 in the cash in hand and balances with bankers and £245,000 in investments, £65,000 of the latter increase being in British Government securities and £180,000 in New Zealand Government securities. The figure for bills receivable in London and in transit was lower by £175,000 and now stood at only £125,000, due to the fact that the bulk of New Zealand exports were now financed by the New Zealand or United Kingdom Governments instead of by the trading banks. The rise of £210,000 in bills receivable in New Zealand and in transit was chiefly due to delays in arrival of mails to New Zealand. After the allocation of £10,000, premises appeared at £3,000 lower than last year.

The year's accounts showed a net profit of £81,736, which was £4,413 less than last year. Considering the difficult circumstances in which the past year's work had been carried on and remembering the large increases in rates and taxation that had occurred, he thought that was not an unsatisfactory result on the year's working. They had not yet thought it desirable to close any of their branches, but economies in expenses of administration had been effected wherever possible. In January they had paid an interim dividend of 1½ per cent. less United Kingdom income tax. No allowance was then made for Dominion income tax relief. They now proposed to make that adjustment by paying a final dividend of 2 per cent. free of tax. There would then be left £115,849 to be carried forward, which was £486 more than last year. It was not their present intention to continue to pay the dividend free of tax in future years.

The Dominion Budget figures for the year to March 31, 1941, showed that the total revenue exceeded the Budget estimate by well over £3,000,000 and that there was a surplus of £1,726,000. Those results were very gratifying, but it was important to remember that those were the figures of the consolidated fund only and did not include those of the war expenses account or of the social security account. During the same period the trading figures were most satisfactory, the excess of exports being £18,609,000 sterling as against £11,257,000 for the year to March 31, 1940. He would, however, again draw attention to some of the less favourable features of the situation. The United Kingdom Government had found it necessary to curtail imports of meat from New Zealand and the effect of that upon New Zealand's overseas assets was bound to be serious. It might be that in the difficult shipping position New Zealand would suffer a further shrinkage in her income from exports, and it would be folly for her to neglect that danger and to squander her sterling balances by relaxing the import restrictions which had led to so great an improvement in the external position.

TRIBUTE TO N.Z. FORCES

He must refer with special pride to the great feats of arms performed by New Zealand troops. Tribute had been paid to their behaviour by the Prime Minister and they had earned the admiration of the world. Faced with so much sacrifice they did well to keep constantly in mind the object for which they were fighting and in defence of which the Empire was unitedly at war. That could hardly be better defined than in the words of President Roosevelt as the four freedoms—freedom of speech, freedom of religion, freedom from want and freedom from fear. It was his own conviction that, if they were to have the best chance of securing those great objects not only for themselves but for the whole world, they must somehow or other find time to give thought now to the physical and economic problems involved in their attainment. There could be no greater stimulus to the people than to know that there was a prospect of a smooth transition from war to peace, and that this time they would have the foresight to avoid the mistakes which had led them again to war within twenty years of triumphant victory.

The report and accounts were unanimously adopted.

ALLIED SUMATRA PLANTATIONS, LIMITED

SUBSTANTIAL CONTRIBUTION TO THE WAR EFFORT

RECORD CROP EXPORTED

R. A. L. MATHEWSON ON INTERNATIONAL GOOD WILL

The fifteenth ordinary general meeting of Allied Sumatra Plantations, Limited, was held, on Wednesday, the 16th instant, at 19, Fenchurch Street, London, E.C.

Mr A. L. Mathewson, the chairman, presided. The chairman's review of the company's affairs, which had been circulated with the annual report and accounts, contained the following and was taken as read:—

In all but one respect the year 1940 was a satisfactory one from a profit-earning point of view. The net revenue from the sale of produce was over half as much again as in the previous year, but for reasons which I shall explain the dividends paid to us by our local companies total only £75,000, as compared with £88,000 in 1939, and we are in a position to distribute only the same rate of dividend as for that year.

Our estates were entitled to export in 1940 77½ per cent. of standard production, as against 55½ per cent. in 1939. This enabled our local companies to bring into the accounts under review a crop of 9,245,056 lbs., compared with 6,606,808 lbs. in the previous year.

After taking in the unsold portion of the crop accounted for at a conservative valuation, our average sale price is equivalent to approximately 1s. 0½d. per lb. London landed equivalent.

These improvements, both in the crop accounted for and in the sale price, resulted in a striking increase in the net revenue of our local companies, from which, by way of dividends, Allied Sumatra derives its main income.

Compared with £158,464 for 1939, for 1940 the equivalent in sterling of the combined profits of the local companies before charging taxation was £274,035

Interest earned by Allied Sumatra in London	£6,922
was	
Deduct London office expenses and directors' fees	3,760
	3,162

The total of £277,197 represents almost 20 per cent. on the issued capital of Allied Sumatra. It is natural for stockholders to enquire why, if nearly 20 per cent. has been earned, only a meagre dividend of 4 per cent., less tax at 10s. in the £, can be distributed to them. The following figures provide the answer:—

Provision for Netherlands Indies Government export duties, war profits and company taxes takes	£170,700 = 12½% on the issued capital.
--	--

(Compared with £46,300 for 1939.)	
Reserve for British N.D.C. is	£4,650
Provision for income-tax by transfer to reserve £17,000 plus by deduction from proposed dividend	£45,000
£28,000	49,650 = 3½%
	£220,350 = 15½%

Provision for depreciation of mature areas	£22,991
And for writing off the year's expenditure on buildings, machinery and plant	4,981
	27,972 = 2%
Dividend of 4%, less tax at 10s. in the £ takes	28,000 = 2%
Balance of profit added to the carry forward of local and Allied Sumatra companies	875 —
Total	£277,197 = 19½%

The following is the explanation of the greatly increased provision for Netherlands Indies taxes. Ordinary export duty payable on rubber shipped from that territory was continued at the 1939 rate of approximately ½d. per lb. The rate of Defence Export Duty was trebled for the second half of 1940, and in August a

War Export Duty equivalent to about ½d. per lb was imposed. The War Profits Tax levied on the statutory excess of profit over pre-war standard was continued at 63 per cent., but company-tax now takes 40 per cent. of the balance of statutory profits remaining after deduction of the War Profits Tax: the 1939 percentage was 35.

All estates' expenditure was kept to the minimum compatible with upkeeping the properties at the desired high standard of agricultural efficiency.

In continuance of our policy of gradually replanting older rubber areas with up-to-date material, the old trees on 379 acres were removed during 1940 and replaced with budgrafts of the finest available strains.

The planting during 1940 of 515 acres of oil palms marks the completion of a programme designed to extend our oil palm plantation up to an economic unit.

CURRENT YEAR'S PROSPECTS

As regards the financial year now current, it seems highly probable that we shall be permitted to export an even larger crop than in 1940, which was a record one for the company. If the present market price of the commodity is maintained throughout the year we should show a further improvement in gross earnings, but there is no doubt that once again the lion's share will go to the Netherlands Indies and British Exchequers.

The only consolation stockholders have in bearing this fantastically disproportionate burden of double taxation is the knowledge that a magnificent contribution in cash is thus meantime being made towards the common war effort and that the estates are producing a commodity so vital to that effort. Looking ahead, however, it would, I fear, be wishful rather than realistic thinking to expect an early return to pre-war scales of taxation when victory for our common cause ultimately brings us peace. Obviously, this company and other British enterprises engaged in tropical agriculture in the Netherlands Indies cannot permanently continue to hand over to the two Governments the greater part of their profits and themselves shoulder future periodical losses. To do so could hardly fail sooner or later to undermine the efficiency or even lead to the gradual liquidation of this section of the plantation industry, representing an investment of at least 30 to 40 million pounds of British capital. Another consideration, far from unimportant, is that enterprises such as ours employing both Dutch and British staff living side by side engaged on similar work and problems exemplify one of the best means of promoting mutual international respect, understanding and good will. The framing of post-war relations between ourselves and all other nations who value our way of life and who support us in the present grim battle to preserve it will obviously demand wise and far-seeing statesmanship. A primary aim must surely be to strengthen and by every practicable means further develop the economic and social ties uniting us. In this connection the finding of ways and means of providing a reasonable measure of relief from a double tax burden so severe as seriously to threaten certain of these ties is clearly one of the questions which should receive the attention of our own statesmen and those of gallant Allies now in our midst. Fortunately, it is one that ought to prove easier of adjustment than some of the other problems that will confront them.

The report and accounts were unanimously adopted.

THE TRUSTEES CORPORATION, LIMITED

DIVIDEND MAINTAINED

The 53rd ordinary general meeting of The Trustees Corporation, Limited, was held, on the 16th instant, at Winchester House, London, E.C.

Mr W. Sandford Poole, chairman of the Corporation, in the course of his speech, said that they would appreciate that throughout the year to May 31st last the business of Investment Trusts was confined and restricted as never before. For the 12 months to May 31st last income from interest and dividends, before providing for British taxation, amounted to £184,671, compared with £187,429 for the previous year, a result which he believed in the circumstances would be regarded as not unsatisfactory.

There had been one outstanding exception to the lack of opportunity for new investment. They, in common with all other financial institutions in the City of London, had felt an urge, irrespective of the comparatively meagre financial return to be derived,

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended July 12, 1941, total ordinary revenue was £25,106,000, against ordinary expenditure of £27,338,000, and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £866,078,000 against £605,488,000 for the corresponding period a year ago.

and the Ministry of Information, which has already defeated the efforts of three older men than Mr Bracken, must be regarded, in its present constitution, as a labour of Sisyphean, in which the responsibility is great but the authority minute.

The status of Mr Duff Cooper's assignment, which is to examine and report upon the co-ordination of political, administrative and military arrangements in the Far East, is hard to assess. In one aspect, it is another chapter in the Great Dispersal of Ministers which has sent Lord Halifax to Washington, Mr MacDonald to Ottawa, Sir Ronald Cross to Canberra, and Mr Lyttelton to Cairo. It is Mr Churchill's sensible intention that, in this world-wide battle, neither authority nor understanding shall be weakened by mere distance; and his Government has now been given a special personal foothold on four continents. But Mr Duff Cooper is not a member of the War Cabinet like Lord Halifax and Mr Lyttelton, or a permanent ambassadorial representative like Mr MacDonald and Sir Ronald Cross, who are distinguished from other High Commissioners because they have been important Ministers in the recent past, and still remain members of Parliament. As Chancellor of the Duchy of Lancaster, Mr. Duff Cooper remains a member of the Government, but he will not be a pro-consul or political commissar of the stature of Mr Lyttelton, who is the Cabinet-in-small in Cairo. He is a missionary who will show Tokyo and the world that the eye of the British Government is on the Far Eastern scene, and his temporary stay may result in the closer knitting of the many scattered activities of British authorities from India to Australasia. The last word has not been said about the division of functions in distant theatres between civilians and soldiers.

The only change which is plainly of the first importance is the choice of Mr Bracken; and, unless the conditions under which the Minister of Information is asked

to do vital work with inadequate powers are modified, the only question which arises is the new Minister's ability to square a circle. Mr Bracken is an unknown quantity, for his quick rise to influence as the *éminence rouge* of Mr Churchill has not been in the public eye. He is young, vigorous and determined. Compared with his predecessors, he has the advantage of a close connection with the newspaper business. He has stated that he was "conscripted" to the Ministry, and that he will "get news" or go. He has the Prime Minister's ear. In a special sense, Mr Bracken is Mr Churchill.

Mr Churchill's final solution of every obdurate problem of wartime administration is to do the job himself. He has his emissaries in Washington, Cairo and Singapore. He has his *fidus Achates* in Bloomsbury. As Minister of Defence, he has even shouldered the burden of deciding priorities in production in his own Cabinet—pending his second thoughts on last week's criticisms. Probably it is as hard for him to act otherwise as it is for him to be uniformly successful in all his rôles. In past years, when discussions were going on—outside the jealous circles of Cabinet and caucus—about the candidates for any office of vital importance to the nation, the answer was always Mr Churchill. Minister of Defence, Minister of Production, Minister of Information, Ambassador in Washington, Minister of State on eastern fronts—the best choice would still be Mr Churchill. But Mr Churchill is Prime Minister, and he cannot play every instrument in person. The crucial problem is the search for men of character and vision to bring harmony out of discord wherever it is heard in the war effort. It is not solved when all the best men in the Government have to be engrossed by the overtime tasks of the Supply and Service departments. Mr Churchill cannot lead the orchestra while he conducts and, in war production, it is still a leader that is wanted.

The Middle Way

THERE is no doubt that the one exclusive aim of the hour is to win the war, and it is with no desire to embarrass the Government or to involve Britain in advance in troublesome or untenable commitments that the significance of Mr Sumner Welles' statement on peace aims must be underlined. Mr Welles urged that free governments and peace-loving peoples should be preparing now for the better days after Hitler's defeat; and his plea reinforces the fact that certain practical and immediate problems of the first importance are now bound up with the clarification of peace aims, while actual damage might well be done to the war effort if British statesmen were to succumb to the temptation to drift.

In the Near East, the problems of Syria, of the position and future of the Arab States, of the future relations between France and Britain are all being raised as matters of urgency. It is not suggested that a detailed settlement could be worked out now for these problems. But it is of great importance that the Government should have a sufficiently clear picture of its own future policy in the Near East to prevent decisions from being taken now which might prejudice solutions in the future. The immediate task, it is true, is simply to make the Near East impregnable against the Nazis. But even this can only be done by displaying a policy that will remove friction, allay resentments and cause justice to prevail. Not even expediency is purely momentary and empirical. And in the Near East there is the lesson of last time. If the Wilson Points, which were in no way a detailed programme, had been adopted as the general basis of future arrangements in the early days of the war, it is perhaps possible that neither the Treaties of London nor St Jean de Maurienne nor the Sykes-Picot Agreement would have conspired to create the Levantine confusion of 1919.

In Europe, it may be that the problem of the future is not so urgent. The sole task of the moment is to beat and drive back the invader. But here, too, it is obvious

that there is need for some general body of principles to provide the framework for a future settlement and to serve as a yardstick whereby particular agreements are judged. The free Governments of Europe are already consulting together; the Poles and the Czechs have reached an agreement; the Poles and the Russians are negotiating; and the presence of the exiled Allied Governments in London is an obvious invitation to continue this process of consultation which may well avoid much friction and misunderstanding in post-war Europe. The nations need to know by what criterion they are to judge whether their individual arrangements will fit into the general framework of a larger settlement. And the criterion can only be set by Britain. It is useless to boggle at this fact. Britain is the only industrial centre in Western Europe comparable to Germany, the only remaining Great Power. The question must be asked whether its strength is to be exerted in the interests of Europe as a whole. It is a responsibility Britain can either accept squarely or refuse. What is inadmissible is that the issue should not be faced.

It is not a question of frontier agreements and constitutions. Immediately, the problem of ordering Europe or the Levant is connected most closely with the propaganda arm. Mr Brendan Bracken takes over the Ministry of Information in a delicate hour. Germany's war on Russia presents the danger that the old rift between Left and Right in Europe may be reopened. It is Hitler's strategy that the Conservative elements in civilised Europe should be persuaded that their vital interests lie with Nazism in the struggle against Bolshevism, while the progressive elements should correspondingly feel themselves drawn towards Bolshevism in its struggle against "world fascism."

Thus there are very practical reasons why some attempt must be made to state the principles for which Britain stands in this mêlée. No one doubts this country's will, above everything else, to stave off the German

assault and win the war; and it would be foolish either to underestimate the difficulty of stating principles while the battle is on or to overestimate the degree of precision which could be given them. They could only refer to reconstruction after the defeat of Nazi Germany; and both Russia and the United States will have participated in that defeat. To what extent will these Powers be able or willing to participate in any settlement? To what extent will Russia be prepared to accept the peace aims for which the Allies took up their arms? To what extent will the United States be prepared to join in? These are unsolved problems which make the advance phrasing of a peace settlement impossible. But at the same time, they are questions which underline the importance of providing the prolegomena to a settlement now.

It cannot be questioned that, in the clash between Left and Right, Britain stands for a middle way, a democratic faith. The real question is what does Britain intend to do about it. After the storms of the French Revolution and the Napoleonic Dictatorship had passed, it was the theory and practice of constitutional government, the British way, that swept the world. To-day, the revolution of the Left and the dictatorship of the Right have produced a situation that is, in many ways, the same as then; and Britain stands midway again between contemporary extremes. In order to solve the tremendous problem of technical organisation in an industrial society, to meet the challenge of war and unemployment and to recreate a unified community out of an anarchy of warring groups and classes, Russia and Germany evolved the Party State, all-planning, all-controlling, all-enslaving. With it was abandoned the whole Western tradition of political rights, responsible action, spontaneous co-operation, representative government and free creative action on the part of individuals—all that Britain and the United States still stand for.

The unsolved problem of the democracies, and therefore the unfound key to the "embattled idea" with which they must arm themselves and reinforce the crushed peoples of Europe, is the reconciliation of freedom and growth with the degree of control in economic and social life that is necessary to create conditions of freedom in a highly complex and interdependent industrial order. Freedom, fruitful work and a rising standard of living cannot be secured without some measure of control; but the limits and the perils of that control—centralisation, bureaucratisation and tyranny—are plain.

If the problem is considered in this light, clearly the case of Europe and the case of the democratic community are not very different. The solution for one free country is the solution for the entire free world. The general framework that the people of Britain must find—for themselves and for other peoples—is one in which the measure of economic control and centralisation necessary to ensure the fair distribution of raw materials and the creation of steady markets is combined with the freedom of the nations to develop on their own lines and to make their distinctive contributions to the life of the com-

munity of Europe and the world. Only in this way can the "securities" from want and fear—of which Mr Welles speaks—be combined with the "freedoms" for which President Roosevelt has already spoken.

This is practical and pressing politics. The conquered peoples cannot yet be given arms. But they can—and must—be given ideas, inspiration and encouragement. As important as the blueprint itself of peace, order and plenty is some commitment here and now from the British Government that Britain will play its due part in bringing about this system of ordered freedom. Europe's memories of the British record are not happy. André Siegfried once wrote that "Britain is a ship moored in European waters, always ready to sail away." The nations of Europe are now used to being left on the bank to make what arrangements they are able with Britain's continental Allies—and the latest ally in this world struggle has a militant "new order" of its own.

The commitment has in a veiled way been given already. It is not impossible that the Government is fully conscious of its aims, and it needs to sign no affidavit simply to satisfy civilian anxieties. Mr Churchill has spoken of a better day for the common people; Mr Eden has declared that while "social security must be the first object of our domestic policy after the war . . . it will be our policy abroad not less than at home." But it is all-important, for the present rallying of the world as well as for its future ordering, that the military and economic obligations that such a policy will entail in the military anarchy and economic dislocation of the German collapse should be squarely considered. If their implications have been considered and officially accepted, then the attempt should be made to convey the assurance of Britain's constructive and co-operative rôle in post-war Europe to the peoples of Europe—and to bring home to the people of Britain itself the sacrifices and high courage that such a positive post-war policy may involve. It is not the duty of the Minister of Information to make policy. But if the mind of the War Cabinet has been made up on these matters, and if the Allied Governments in London have been given the measure of the contribution that Britain is prepared to give, it is surely one of the first tasks of Mr Brendan Bracken to make it known on the home and on the foreign fronts. The theme of a dynamic democracy prepared to make sacrifices and take risks, so that both its own people and the peoples of Europe may know "a new birth of freedom," could give British propaganda a unity, a clarity and a drive which it has so far signally lacked. Propaganda is only one arm; and machines and munitions count most in battle. But "the people without a vision shall perish." This vision, this picture of the future, lies there to hand, like a jig-saw puzzle which is half completed with the pieces lying about on the board and no more than a hint of the final picture. Britain must put together, not only the framework of a future Europe, but the weapon which will sap and split the Europe of Hitler's building.

Prelude to Planning

LAST week's report of the expert Committee set up by Lord Reith to consider the public control of the use of land will serve as a rough and ready milestone in the record of planning. At the beginning of the war, a generation of concern and discussion about land-use had reached a climax in the report of the Barlow Commission. The disadvantages of inconsequent development were widely accepted. The best and most fertile agricultural land was rapidly disappearing as towns grew. In the towns, overcrowding and congestion had made the need for redevelopment pressing. The depressed areas of the industrial north and west had come to be seen as strong arguments for a better and more diversified balance of industries throughout the country. More daylight, more open space and less congestion and traffic had come to be accepted as the desirable objectives of public policy.

The Barlow Report merely set down these accepted

conclusions. Control of the development of rural land and of the re-development of urban sites; and the establishment of balance between town and country, light and heavy industries and industrial and residential needs—these were common opinion. There was little or no disagreement with the Commission's recommendation that the powers of public planning should be strengthened and that the means should be discovered for the public guidance of new and migrating industries. Since then, the war has added new arguments. Air-raids have caused scattered and indiscriminate destruction. War factories have been dispersed about the country. Firms and offices have moved to "safer" places. These happenings mean that, to the pre-war reasons for a planning policy, has been added the certain need after the war to restore and restrict. There are vital economic questions to be answered. Will the heavy industries ex-

pand or contract again? Will it be possible for the production of capital goods for re-equipping the civilian industry to re-absorb the army of war workers? On the answers must depend the steps taken to make development and re-development consciously conform to national policy, industrial efficiency and social amenity.

The point is that planning is now practical politics. For the first time, there is an enthusiasm for planning which is comparable with the enthusiasm for housing which marked the end of the last war. Better conditions of life and work are expected; and in the change and confusion of war-time, people and undertakings have become accustomed to movement and to new surroundings. What is more, the question has, in principle, left the realm of controversy. In February this year, Lord Reith told the House of Lords that he would act in his investigations in these matters on the assumption "that the principle of planning would be accepted as national policy; that some central planning authority would be required; and that this authority would proceed on a positive policy for such matters as agriculture, industrial development and transport."

The interim report of the expert Committee under the Chairmanship of Mr Justice Uthwatt starts with this assumption. The report lays down that a central planning authority is essential to an effective physical reconstruction of this country after the war. It takes it for granted that this authority would be set up and organised at an early date, not only to work out a national plan for the future, but also to guide all works carried out in the meantime. It does not admit that the war-time controls on the use of land and on building, exercised by the Ministry of Agriculture, the Ministry of Works and Buildings, the Ministry of Health and the local authorities are adequate, even temporarily, to discharge the duty of planning. In its view, they should, therefore, be vested as soon as possible in a central planning authority.

The Government has not agreed to set up such an authority. It is content to rely in the main upon the strengthening of existing controls; and it has deputed to Lord Reith, the Minister of Health and the Secretary of State for Scotland the task of using existing planning powers in a more positive way. These powers are well known. Together, the Ministry of Health and the Department of Health for Scotland administer the Town and Country Planning Acts and supervise local bye-laws about street widths and building spaces. The Ministry of Transport administers the Ribbon Development Act and is responsible for the design and lay-out of main roads. Unfortunately, however, these powers have been largely ineffective in the past; and the demand for a new planning authority has arisen from precisely this ineffectiveness.

The administrative difficulties which have rendered planning ineffective have been very largely financial. One of the main tasks of planning is to keep undeveloped rural land free from building. Another is to thin out over-built areas. In both cases, effective planning means the lowering of values in the properties affected, and the question of compensation becomes crucial. Usually it is beyond the means of local authorities; and, moreover, since city corporations draw their rate income from urban properties, they have a common interest with property owners in maintaining congestion and overcrowding. In the case of the Kingsway scheme in London and of the Corporation Street scheme in Birmingham, an attempt was made by the city authorities to make redevelopment schemes pay for themselves. The adjoining sites were acquired by the authorities for "improvement," and the result was that one symptom of over-centralisation was alleviated by fostering still more centralisation.

This financial problem is not the least of the reasons why a national planning authority is imperatively needed in addition to a plan; and it is a matter for regret that the Government has not seen its way to accepting the strong recommendation of the Uthwatt Committee. The expedient of a Council of three Ministers, with Lord Reith as chairman in the strange position of Minister with and without portfolio at the same time, is a sign of

compromise and indecision. It is admittedly an attempt to meet the argument that the administration of town and country planning must proceed in conformity with long-term planning policy; and it may well be the embryo of a Planning Ministry. But it is hard to see how Lord Reith, without an office or personnel for planning, will be able to impose upon the Ministry of Health and the Scottish Office a more positive attitude than has characterised their planning activities in the past. It would be churlish to underestimate the advance which the new attitude represents. The rubicon has been crossed. In the Government's own words, the new compromise arrangement is only "pending the more complete formulation of long-term policy and the establishment of the central planning authority in its final form." But it must remain doubtful whether Lord Reith will in fact be able, in his proposed ambiguous position, to seize the great opportunities of the moment.

The financial problem remains. It is not enough to formulate a plan. It is not enough even to set up a planning authority. The instrument and the means are also needed. The instrument is the building industry; and, as Minister of Works and Buildings, Lord Reith has powers to achieve that reorganisation of building efficiency without which planned development now or in the future would be impossible. The means are financial. The Uthwatt Committee have decided that the public acquisition of land or of development rights in land will be indispensable in the working out of a national plan. It was one of their tasks to provide against war-time speculation in land values; and they recommend that in no case should public compensation be paid at a higher price than the value on March 31st, 1939. They further express themselves favourably inclined towards the suggestion that the development rights of all undeveloped land should be acquired by or on behalf of the nation; and they also recommend that damaged and other areas which are plainly in need of redevelopment should be scheduled as reconstruction areas in which all development will be stringently controlled immediately and in which the public acquisition of land for development purposes must be regarded as probable.

The principle of limiting compensation to pre-war values can be accepted, in so far as its intention is to rule out any special and unearned war-time increment. It would not, however, be just or reasonable if landed property were to be treated differently from other properties. It may at least be necessary in the case of land to add on to the 1939 value whatever increase may be due to a fall in the value of money between then and the date of compensation.

Nevertheless, this criticism in no way invalidates the general soundness of the Committee's project. Implicit in their interim and tentative proposals is the conviction that whoever plans land-use must own the land over the field of the plan. This must be so, if only because, when the use of land is being altered by order, fair financial adjustments are not calculable as between one piece of land and another. In theory, the values which are reduced by planning should be compensated from those which are bettered by planning. The stopping or restriction of building in one place does not mean that there is less building. Building may be stimulated elsewhere. Land values are redistributed, but how precisely they are redistributed is almost impossible to ascertain. The problem of finding out to what place and to what owners the advantage goes is for the most part insoluble and it is in fact impracticable to make betterment pay for compensation.

Thus, every argument seems to lead to public planning, public guidance and the public acquisition of land values; and, indeed, there may be some reaction from this unanimity when its implications are more generally realised. Meanwhile, the Uthwatt Report is important because, diffidently and tentatively, it has faced these facts. What is needed now is action—the establishment of an authority with power to act; the making of a plan; and the devising of the means, financial and administrative, to execute the plan.

No Policy for Wages

THIS week the Government has at last spoken on wages policy; and the Trade Union Congress has at once joined battle. A memorandum issued by the general secretary of the TUC restates the view, which was expressed eighteen months ago, that "any attempt to control movements for increases of wages is impracticable and undesirable"; and there is the prospect of a serious political controversy. Actually, it is hard to see why this White Paper on Price Stabilisation and Industrial Policy should have aroused such instant indignation. It contains nothing that has not already been stated as official policy and proposes no new means of restraining increases in wages. It is a footnote to Sir Kingsley Wood's Budget statement of April, a gentle reminder to employers, workpeople and arbitrators of the dangers of inflation.

The Trade Union view is that the effect will be to induce employers to refuse advances and arbitrators to support their refusal. The TUC memorandum makes it evident that the White Paper's timid exhortation to workpeople to assist in maintaining wages at a reasonable level and in preventing costs of production from rising will go unheard; and, by inference, it is now plain why this Government statement has been so long delayed, why it is framed as the most careful of compromises and why the name of no individual Minister of the Crown appears upon it. It has been found impossible to persuade the leaders of labour to agree upon any policy for wages except the maintenance of voluntary, collective bargaining—in which the White Paper entirely concurs.

It is probable that this opposition rules out any prospect of a positive policy for wages. The White Paper presumably represents the limit and the last word. In principle, its general argument is sound, and the issue is stated tersely. In wartime it is not enough "to cut out luxuries." There must also be "a reduction in the consumption of goods which in peace-time had almost come to be regarded as necessities." The goods are not there to buy, and increases in wages or other incomes "would not raise the general standard of living; they would merely tend to send up prices and to denude shops, making it difficult to secure a fair distribution of the limited supply of goods." And it might have been added that, with the exception of a few commodities, such as bread and potatoes, consumers cannot expect to be able to offset the reduction in the supply of staple commodities by increased purchases of substitutes. The demand of the war effort for labour, plant, factory space, shipping and land makes this impossible; and a large proportion of civilian demand must inevitably go unsatisfied, whatever the size and distribution of incomes.

There are two ways, in theory, of meeting this situation in such a way as to prevent a scramble for goods, a general and continuous inflationary increase in costs and prices, and an unfair and indiscriminate fall in real incomes. One is to curtail spending power by taxation and saving. The other is to curtail spending by rationing and price control. In practice, both methods must, and have been, adopted together. "Severe additional direct taxes have been imposed which should have the effect of restricting the expenditure of those most able to bear the burden." Savings have been screwed up to the limit of exhortation. There is widespread control of the prices of articles in common use. And the rationing of foodstuffs and clothing has done a great deal to ensure a more equitable distribution of available supplies. Moreover, the degree of actual inflation that is so far discernible in the movement of prices is still comparatively small.

Nevertheless, the problem of inflation and, fundamentally, of the fair distribution of the strictly limited supply of goods—which cannot possibly be increased by any financial device or by merely nominal increases in money incomes—remains acute. Measured by the rise in bank deposits since the war started, by the expansion in

the volume of bank credit and by the steady advance in earnings, spendable incomes have increased markedly in spite of taxation and savings. It is only because the propensity to spend has fallen and remained low for a variety of reasons (see *The Economist*, June 21, 1941, p. 817, "Bank Credit and Inflation") that this latent or potential inflation has not become actual. The danger remains, and has been seen in action in the run on tobacco, in scrambles for unrationed foodstuffs and in perpetual queues. It is not because the Government's controls on consumption and expenditure, by rationing and other means, have been made complete that the menace has remained in the background.

The chief increase of spending power has been in wages and salaries. The rate has been quickest in wages; and, in sum, wages make up much the biggest fraction of the incomes commonly spent on the consumption of goods that are in short supply. An article on page 109 shows how successfully spendable industrial profits have been held down by contrast; and it is only because inflation has not in fact broken into a trot that the need for measures to prevent any further increase in spendable incomes, including the bulk of wages, has not become inescapable. It would be nonsense to suggest the "freezing" of all wages—or of any other incomes—at their present level. The principles of up-grading and promotion to higher categories of earnings must be preserved. The present differentials between the wage or salary for one job and the wage or salary for another are often wholly out of line with the necessities of the war effort—those differentials being, in fact, dependent on the past power and success of individual unions, associations or individuals in peacetime bargaining. In many cases of low-paid grades and categories of workers, there are good and immediate grounds, as the White Paper admits, for higher wages. In wartime, more than at any other time, it is important to ensure, by family allowances and other means, that there is an infrangible minimum standard of living below which no man, woman or child will be allowed to fall. There are reasons, too, for adjustments when the method or volume of production alters.

But the peril and the inequity of indiscriminate increases in spending power cannot be argued away. The stock of civilian goods is restricted and shrinking. If any group or individual does gain in the competition to buy them, it must be at someone else's expense. The Government is nevertheless still not prepared to put a stop upon wages and salaries. The White Paper states that "it will . . . be necessary to bear in mind, particularly when dealing with general wage applications, that the policy of price stabilisation will be made impossible and increases of wage rates will defeat their own object unless such increases are regulated in a manner that makes it possible to keep prices and inflationary tendencies under control." This is unexceptionable doctrine; and it is because it is a clear direction to employers and trade unions that the TUC is in revolt. Actually, the efficacy of this appeal in restraining the increases in wages and salaries is not likely to be greater than the efficacy of former exhortations. And without labour's co-operation it will remain a dead letter.

Thus the financial stability, the economic efficiency and the social justice of the war economy will continue to depend upon the physical control of spending rather than on the restriction of spending power. The political obstacles to checking incomes make all the more urgent the need for complete rationing and control of distribution. The system of price control is still incomplete and imperfect, and it could only be really successful if the increase in spendable incomes on the one hand, and in labour costs, on the other, could be arrested. Rationing has gone a long way. But distribution is far from fair and efficient, and the White Paper is devoid of any refer-

ence to further measures for securing a fair distribution of essential commodities. The extension of rationing is not dealt with.

The White Paper is an honest expression of anxiety, but it is a barren compromise. It does not try to call a halt to the increase in spendable incomes but merely seeks to restrain the tendency; and it leaves out of account the only alternative, which is to make the increase in incomes of whatever kind valueless by placing the entire community on a rationing basis. It is of no use to cry "a plague on both your houses." This is no time for political controversy. Whatever the Government or the TUC may decide, the facts will not alter. The supply of civilian goods is set and short. The problem is

purely one of distribution. The trade unions, and, it must be admitted, most other people, wish to retain competition for goods by means of catch-as-catch can sectional bargaining. They put the pay packet before the shopping basket. The Government has encouraged this attitude by its indifference to the entire problem. And, though the cost of living has now been steadied, which is a powerful answer to many of the trade unions' familiar and understandable arguments, other increases in prices no less important in the national economy than the price of labour have actually been fostered—in fuel, and transport. There has been drift and muddle; and the task now is simply to render the actual size of money incomes as unimportant as possible by devising the same basic ration, no more and no less, for everyone.

NOTES OF THE WEEK

Japan Before Action

The composition of the new Japanese Cabinet belies the expectation that the extremists had gained complete control. Prince Konoye remains Prime Minister; four business men, among them Mr. Ogura, head of the Sumitomo interests, are included; and the disappearance of Mr. Matsuoka to make way for Vice-Admiral Toyoda, the new Foreign Minister, can be variously interpreted. Mr. Matsuoka was both the close friend of the Axis and the negotiator of the Russo-Japanese Treaty of Neutrality. Vice-Admiral Toyoda has the reputation of being a friend of the United States and Britain; at the same time, he is a naval man and, as such, must be presumed to resent Anglo-American naval power in the Pacific. On balance, the change of Government appears as a clearing of the decks for action, but not necessarily for novel or extreme action. The times for this are unpropitious in that the "China incident" is always with the High Command. The outcome of the Russian war is not yet so certain that a descent on Vladivostok can be considered immediately—although preparations have doubtless been undertaken against the day of a Russian collapse. Only in one direction can it be said that Japan's potential profits seem to outrun her risks, and here, in Indo-China, the next step in the creation of "East Asia" has been taken. The Vichy regime which "defends" its colonies only against Britain has consented to a further cession of military bases and strategic points to the Japanese; and presumably political and economic control will now pass even more decisively to Tokyo. The immediate tactic is that of German penetration in the Balkans, just as the larger strategy is the Japanese version of the "new order." The new move, which will bring the Japanese forces to within 600 miles of Singapore and the Philippines, cannot be glossed over as the affair of Japan and Vichy. Britain and the United States are in consultation and, at the least, the new aggression—for Vichy's rubber stamp does not alter the fact of aggression—should call forth stringent economic counter-measures. It is not as though the two democracies had any surplus supplies to spare for the furthering of Japan's conquests.

The Western Front

It is in no way belittling to the skill and force of the RAF's bombing of German Europe by day and by night to say that the most important lesson of Germany's war in Russia is the inability of Britain to bring the enemy to battle on a second front in the west. Long range raids on towns, industries and communications in the Reich itself are serving German centres as parts of this country have been served in past months—with a maximum of striking power per plane employed; the weight of bombs being dropped reaches new high records monthly. Continuous harassing attacks on docks and shipping on the Western seaboard fit in shrewdly and effectively with the master-plan to disorganise the strained transport system of blockaded Europe; and it is no longer a safe option for the Germans to manufacture and distribute war supplies in the conquered territories. The British bombing programme has proceeded from the first according to a methodical and expert assessment of the strength and weakness of the enemy's war

economy; and it has shown none of the fitful changes in policy and direction which have characterised the German air offensive. The blows that are being delivered now are simply the latest phase of an orderly and scientific process which grows in scope and effectiveness as the number of machines available increases; and, indeed, it was to be hoped that, even if there had been no war in Russia, counter-attacks like those would have been possible. It may be that Germany's preoccupation in the east has thinned resistance to the RAF. It is at any rate certain that, if there had been no war with Russia, the German High Command would have been constrained by the present rate of damage to output and transport to take extraordinary defensive measures. But the risk must have been foreseen by the Germans; and it does not seem likely to be disastrous—unless the Russians can succeed in doing what the rest of the world is still unable to do.

The Long Road

The advantage gained by Britain because of Germany's gigantic effort on the other side of Europe is only one of degree. It cannot be said that the Germans are, in any crucial military sense, fighting on two fronts; and it is a measure of the tremendous endeavour that is still required of the entire free world that there is plainly no possibility of winning the war against Germany in the west while the great bulk of German might is engaged in Russia. To argue in this way is not to carp or criticise. It was not to be expected, after so many delays and disappointments and with the world-wide commitments that Britain has to sustain throughout the continents, that the power of the democracies could reach the strength to strike a *coup de grâce* for a very long time to come, and the present shipping position is no aid to accelerated progress. The RAF is playing a vital part. The Allied strategy is still to defend, to delay, to disturb and to disorganise; and British bombing now will earn a dividend in the future. The reasons for stating these facts, which may seem needlessly sobering, are two. In the first place, it would be foolish and dangerous if the false optimism of some people who, in spite of their own unrivalled experience of the effects of bombing, are inclined to take too literally such official statements as the one which declared that a single night's raiding had "wrecked" hundreds of miles of German communications, were to prevail. In the second place, it would be a waste of time and earnestness if every speaker, Minister or back-bencher, in next week's renewed debate on production did not bear constantly in mind the fact that there is only one aim worth talking about—to make and to ship in sufficient quantities weapons and supplies of war to make decisive action on every front a possibility as soon as human effort, ingenuity and sacrifice can conceivably achieve it. The nation's "finest hour" did not end with the first Battle of Britain.

The Russian Campaign

A decisive stage in the campaign in Russia has now been reached. According to German claims, the break through at Smolensk resembles that of Sedan. The German

divisions are pouring through the gap, spreading out behind the Stalin Line, and encircling the Red Army in a "ring of steel." The claim to have opened the road to Leningrad, Moscow and Kiev of last week-end has been modified to the annihilation of Russia's military power—the avowed objective of the original German attack. What can be said of this German claim? On the whole, the facts do not bear it out. Germany is attacking along a tremendous front and, with the exception of the Smolensk sector, the line is holding and the Russians are delivering constant harassing counter-attacks. It is extremely unlikely that the Germans have the reserves to pour through the Smolensk "gap"—if indeed there is a gap—and fold up the Stalin Line. The pause in their advance suggests that they are reorganising for a new drive to Moscow and the gap which they thought to have opened a week ago has since been unaccountably filled by fiercely fighting Russian troops. If this interpretation is correct, the war is not going according to plan. At this stage in the French campaign, Paris was about to fall, and there is fairly general agreement that the German armies which reached and overshot Paris were exhausted—both men and machines. At this point, however, the French political system collapsed and, in part, as a consequence, the army disintegrated. The campaign in Russia has been no less fierce than the onslaught on the West. It is not fantastic to argue a comparable degree of exhaustion and wastage. If the Germans are to secure a sudden smashing victory, the conditions on the Russian side must to some extent resemble those in France. Clearly they do not. There is not a trace of political disintegration, upon which the Nazis may well have counted. On the contrary, Stalin has consolidated his position by taking over, in Churchillian manner, the supreme direction of defence. Nor is there any sign of a disintegration of the Red Army. Unlike the French and British forces of May, 1940, the Russian army was not fully mobilised when the blow fell. Four to six weeks were needed for total mobilisation. The gigantic resistance beyond and on the Stalin Line has given the Russians four weeks at least, and there is reason to suppose that much of the mobilisation has been going on behind the Leningrad—Moscow—Kiev line, out of the reach of the German bombers. It follows that the Russians have fresh reserves and can bring up new units to meet Germany's battered hordes. Whether the Germans can force a pitched battle between Smolensk and Moscow depends upon a calculation only the Russians have the knowledge to make. Does the political and industrial risk involved in an ordered retreat from Moscow and Kiev towards the Urals offset the risk of losing the Red Army in a pitched battle?

Loan for Britain

The Reconstruction Finance Corporation's loan of \$425 millions to the British Government is very welcome news. The operation kills two birds with one stone. In the first place it will help materially in paying the sums owing by this country to the United States for deliveries of war materials ordered before the enactment of the Lease-and-Lend Act. Reserves of gold and readily marketable securities are scanty, and the bills falling due for these deliveries were a matter of some concern. The help which is now coming from the Reconstruction Finance Corporation will be accepted with a sigh of considerable relief on this side. Secondly, the technique of this operation satisfactorily solves the problem of mobilising direct British investments in the United States. Such investments, including the considerable earning power of British insurance companies operating in the United States, provide the major part of the collateral of \$500,000,000 against which the loan of \$425,000,000 is being made by the RFC. The full market value of these investments is made immediately available for meeting the dollar requirements of the British Treasury, but the control and management of the concerns in question remain in British hands. The valuable equity represented by these direct investments is thus retained, and after the precedent set by this operation there should be no excuse for forced sales, such as the unfortunate disposal of Courtaulds' American Viscose assets. The RFC loan belongs to the pre-Lease-and-Lend era of Anglo-American finance. It is a business deal, and it is dominated by the dollar sign. The British Government is paying a fair market price for accommodation which it urgently requires, but for which it is offering ample security.

Lease-and-Lend

The American loan to Britain bridges the gap between Lease-and-Lend and Cash-and-Carry. Lease-and-Lend is now the means by which the common stock of supplies is drawn upon by the free nations, and the claimants to drafts upon America's power to produce the goods of war are growing in number. There is Britain, and there is China. There is Russia, and there is the United States itself. The American decision to maintain and expand a war army will be a concrete sign that the people of the United States are prepared to fight for American security; but it will mean a new drain upon American resources. Russian resistance has been remarkable; but, however effectively the invader may be militarily checked, that resistance will only last if supplies of the things that Russian soldiers and citizens immediately need for the coming winter are forthcoming from Britain and America. The United States has welcomed the Anglo-Russian alliance; but aid to Russia, which in many ways might prove to be the best aid to Britain, is not a first principle of American policy. There is urgent need for a high control of priorities among the free nations, for co-ordination between the Governments and supply departments of Britain, the United States, China and Soviet Russia, and the need for increasing war output to the limit in every free country is imperative. The measure of the defence of freedom is the sum of their joint resources, and the success of that defence will depend upon the strategic wisdom with which those resources are deployed on the battlefields and in the back areas of the world. The needs of the American army and those of the belligerents cannot be satisfied in compartments from the same stock. The needs of Britain and Russia cannot be dealt with separately. The war against Hitler is indivisible.

American Aid

There should be no room in the pattern of world economic warfare for the absurd use of Lease-and-Lend to import vitamin powder into this country as a civilian necessity only for it to be manufactured for re-export. This has been reported. It has been complained about. But it must surely be untrue; and, if true, the amounts must have been minute. Consternation has also been caused in American oil circles by the request that an additional 100 American tankers should be placed at the disposal of Britain. Fifty American flag tankers have already been transferred in recent months, and are now being employed to transport oil from Caribbean ports to the Atlantic seaboard of the United States for trans-shipment to British vessels. The withdrawal of these 50 tank ships from the American service has doubtless been of great value to this country; but it has seriously disturbed the oil position in the highly industrialised eastern states, which are responsible for 40 per cent of all American consumption and are supplied almost exclusively by sea. Not unnaturally, therefore, some of the interests affected have been asking why Britain needs these tankers. The accession of Norway and Holland to the Allied cause raised the tanker tonnage at Britain's disposal from approximately 3,000,000 to 6,000,000 tons gross—a

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

tonnage which, it is argued, should be sufficient for all Britain's requirements, even if the most ample allowance is made for sinkings and for delays due to the convoy system. The request for more tankers must, therefore, be expected to arouse vigorous protests across the Atlantic. If, as has been suggested, the vessels are to be used to carry oil from the ports of the Dutch West Indies or the Gulf of Mexico as far east as Iceland, the question immediately arises why British or Norwegian bottoms cannot be used for the purpose. The handing over of another 100 tankers would certainly cause the most acute crisis on the eastern seaboard; for it would mean that the tonnage engaged in supplying these states had been reduced by 60 per cent since the beginning of this year. Mr Ickes, the Petroleum Co-ordinator, is reported this week to have asked the governors of 16 Atlantic states for a "voluntary" reduction of one-third in fuel consumption in those states. But even this cut would be inadequate to solve the immediate problem if the industry was deprived of the services of another 100 tankers. Meanwhile, the rising demand in the House of Commons for further stringent restrictions on the use of petrol in this country has been described by Mr Geoffrey Lloyd as "heresy hunting"—which will not comfort these American states, who have their own part to play in the democratic war effort.

Congress and the Draft

The sudden evidence from Bolivia of German activities much nearer to the United States than Paris or Smolensk may help to give the whole question of extending the period of service of the draft an easier passage through the American Congress. The President's Message was a straightforward appeal not to weaken the American fighting forces disastrously at a time when, with "each elimination of a victim . . . Nazi domination" has come "closer to this hemisphere, while month by month their intrigues of propaganda and conspiracy" seek to "weaken every link in the community of interests that should bind the Americas into one great western family." The psychological problem before the President is to get the American people, or rather Congress, which on this issue does not fully represent the people's mind, to see that they are already involved in a struggle for the preservation of their own security. The fact that they are not fighting now is no more relevant to their ultimate commitment than the fact that Britain is not engaged in land fighting in Europe while the Germans are attacking Russia. It seems nearly certain that Congress will see the issue in this light, but not before the Isolationists have mobilised to the full the emotional campaign against risking American lives.

Revolt in Bolivia

The trouble which flared up in Bolivia on July 19th with the proclamation of a state of siege and the dismissal of the German Minister, Wendler, has been brewing for some time. It is one more consequence of the current of unrest caused by Axis propagandists which runs right through Latin America. It comes within a week or so of the discovery of a network of Nazi activity in Argentina. Uruguay has already had occasion to ban a fully articulated local Nazi movement; more recently Venezuela was constrained to abolish German control of its civil airlines. There is hardly a state in which Nazi influence is not at work to undermine the Government and to create centres of anti-British and anti-American activity. The United States' interest in the matter was shown by Mr Sumner Welles's assurance to President Peñaranda of Bolivia that he could count on the United States' loyal co-operation in getting rid of *persona non grata* in the German diplomatic corps. Wendler has appealed for proof of his subversive activities, presumably to gain time, but it seems likely that the Bolivian Government will evict him without ceremony. From the reports, it is hard to judge how much support Wendler and his pro-Nazi puppets in the Bolivian army could count on. A puppet President in the person of the Bolivian Military Attaché in Berlin, one Belmonte, was designed to replace General Peñaranda, and presumably the state would have been reorganised under German control on the totalitarian lines attempted in 1938 and 1939 by the ill-starred dictator, General Busch. The present regime, which re-introduced republican institutions in the winter of 1939, after General Busch's suicide, is strongly pro-Ally, and there is no reason to suppose that the anti-totalitarian

revulsion which followed the Busch experiment is completely spent. Nevertheless, it was found necessary to ban four Bolivian newspapers—one significantly called the *Busch*—and an interesting feature of the revolt was the co-operation of Socialists with the Nazi-minded officers. The Nazis are still prepared to make use of any form of extremism or discontent. They are not allowing the "holy war" against Bolshevism to interfere with the flexibility of their approach in other continents.

Move in India

The decision of the Viceroy to enlarge his Executive Council and to set up a new National Defence Council does not mean that the constitutional deadlock in India has been brought to an end. The ostensible reason for the Viceroy's decision is the increased pressure of work which has fallen upon Ministers because of the war; and the enlargement of the Executive Council is made necessary by the creation of five portfolios which will be held by Indians. On the other hand, in spite of these reasons which serve to rebut any suggestion that the Viceroy or the British Government have revised their earlier view that there was nothing further they could do towards satisfying Indian opinion about Indian government, it is plain that these developments represent a second attempt to do what the Viceroy attempted last August. Then, he suggested an enlargement of the Executive Council and a separate advisory War Council—precisely in fact what has been done now. The difference is that last winter the Viceroy refused to proceed with his scheme because he was unable to secure the support of Congress, the Moslem League and the other principal parties in Indian politics. This time, he has not waited for their acceptance of these innovations. The Executive Council is now a dominantly Indian body and the National Defence Council is deliberately designed to associate Indian non-official opinion as fully as possible with the prosecution of the war. It is a welcome sign that the Viceroy and the British Government have thought again. It is perhaps, unfortunate, however, that they have thought again on such precisely similar lines. It is not that the authorities could be expected to accept the impossible and intransigent demands of either Congress or the Moslem League. The one asks for complete independence at once, the other for partition, and neither can be regarded as more than a slogan of party politics. The real issue, if the Viceroy is to attempt to obtain the participation of Indians in Indian government, is the authority and the status of the Executive Council. As it is, the Executive Council is a decorative piece of administrative furniture. The Indians who hold portfolios do not necessarily exercise any more authority than the purely advisory functions of the new Defence Council. These moves are an attempt to associate Indian opinion with Indian Government and India's war effort, and it is necessary that this association should be brought about. There is a large body of moderate opinion, and even of opinion within the extreme parties, which would welcome genuine participation in the conduct of Indian affairs, but these reforms may not, on the face of it, give any assured and responsible participation. On the other hand, able and representative Indians have been found to occupy these posts and it may be that the intention of the Viceroy is to make the Executive Council something more like the real administrative body it was intended to be, and to use the new Defence Council, not as an ornament, but as a vital part of the free organisation of India for the war—on the course of which, especially at this present moment, the destiny of India directly depends.

An Undignified Outburst

Hitler is putting the screw on Spain once more. It appears that, once again, the garrisons of German troops on the Spanish frontiers are being increased and the general relaxation of tension which followed on the attack on Russia has come to an abrupt end. Mr Sumner Welles' solemn warning that the defeat of Russia would immediately be followed by a new offensive on the few remaining "free" countries in Europe is a reminder, not only for the Darlans and Francos of the west, but also for the puerile optimists in this country and America, who believe that the Atlantic world will, in some miraculous way, be spared further Nazi attention, now that Hitler has turned east. This renewed state of tension is the background of the Caudillo's unseemly attack upon Britain and the United

States in a recent speech celebrating the fifth anniversary of his successful *pronunciamento*. That the lesser and wilder men of Spain should long have acted as mouth-pieces of the Power without whose help they would not be enjoying their present position is understandable, even if there is no shadow of reason for condoning their servility. Foreign Governments have, however, the right to expect dignified and measured language from the responsible Head of a State. It is obvious that in blackguarding Britain and America, and blaming them for the economic distress prevailing inside Spain, General Franco was trying to "give all aid short of war" to Hitler, and there is still no reason to doubt his own preference for neutrality. But the Spaniards can hardly expect to gain either sympathy or practical help for their desperate economic straits by taunting with their "wealth and decadence" those States which have shown their willingness to assist. It is poor diplomacy, deplorable logic and very bad manners.

Trade in Wartime

Lord Woolton has announced that the number of shop-keepers registered as entitled to receive supplies of rationed foods is far in excess of the estimated number of food traders in existence before the war. He stated that traders in other goods register as food retailers in order to buy food for their families on wholesale terms; and the local food committees are to investigate the position with a view to confining licences to legitimate food retailers. This move, which is naturally welcomed by the food traders' organisations, put into actual practice the suggestion made by the London and Liverpool Chambers of Commerce that, to hold down the price of foodstuffs to the public, the number of traders should be restricted. The object of the suggestion of the Chambers was to eliminate speculators; the Government's is, in addition, to slim the body distributive. The danger is that existing wholesalers and retailers will be given a vested and exclusive right to trade. It is no accident that representative bodies of traders are anxious to crystallise the present structure of distribution. Without doubt, the desire to stop speculation and inflated prices is genuine, but the choice of method plainly springs from the established traders' very natural outlook. Actually what is needed in the distribution of food and other necessities is not simply the limitation of trading to existing traders, but rather the actual curtailment of the present distributive facilities. A leading fault in the policy of the Ministry of Food has been the wasteful and expensive attempt to keep in being the entire pre-war apparatus of distribution. Indeed, too much attention is being paid to traders who speculate or "profiteer" and to consumers who persistently queue—to the indignation of Chief Constables—and too little to the official policies of which this misconduct is, to a considerable extent at any rate, merely the symptom.

Absenteeism and Discipline

The Select Committee on National Expenditure has adopted the report of the sub-committee on Supply Services dealing with labour in filling factories. As many of the operations in these factories are conducted by hand in small shops, absenteeism causes even more dislocation than in large works. The sub-committee takes the view that the bulk of the absenteeism is not culpable, but is the product of factors which could be eliminated. The chief of these factors seem to be—the long distances which workers have to travel, with very inadequate transport facilities; the absence of adequate accommodation near the factories; the conditions of work, especially the canteen arrangements; and the seven-day week. The sub-committee recommends that it should be a primary duty of the Ministry of Supply to arrange for transport facilities; that the provision of hostels as near as possible to the factories should be speeded up, and the scale of charges revised; that canteens, in which at present both cooking and serving arrangements are unsatisfactory, should be the subject of special and urgent consideration, and their charges be revised; and that Sunday work should be abolished except for maintenance of plant and in real emergencies. The sub-committee suggests that time rates would have to be adjusted to keep earnings up to the present level in a six-day week. If, as is generally considered likely, output were maintained, or even increased, this would present no difficulty; otherwise it involves a most dangerous concession of principle. The sub-committee further calls for the removal of legitimate

grievances and of causes of industrial fatigue, and for all possible steps, including the introduction of piecework, where appropriate, to increase incentive. When these steps have been taken, and they must be taken quickly, any residue of culpable absenteeism can be remedied by appropriate action. Meanwhile a step in the direction of tightening up discipline has been taken by the revision of the Essential Work (General Provisions) Order. The original order, by requiring the uninterrupted payment of wages to employees suspended from work, meant that this form of punishment became a holiday on full pay. The Joint Consultative Committee of employers and trade union leaders has approved a revision of the Order allowing wages to be withheld during a period of suspension not exceeding three days. The worker has the right of appeal to a local appeal board. A similar amendment of the Essential Work orders governing particular industries is now to be discussed.

Lull in the Levant

The Levant is full of the legacy of old problems and the premonitions of others still to come. The position in Syria is satisfactory as far as it goes. Probably both the Free French and the British can agree on an ultimate solution of the problems of the Mandate—Syrian and Lebanese independence coupled with a treaty relationship with France on the lines of the Anglo-Iraqi Treaty. In the meantime, it is important not only for the prestige of General de Gaulle, but for the rehabilitation of France in general, that the Free French leader, General Catroux, should have the substance as well as the outward seeming of authority in Syria. Obviously the last word must remain at Cairo for the duration of the war, but responsibility can perhaps be exercised from Cairo, rather than through British intermediaries or a British Commander on the spot. This is an immediate issue for Mr Lyttelton. In the east, it is important to know whether the military situation in Iraq is entirely satisfactory. If the German advance into Russia is to be followed by a swing to the south, Syria and Iraq together become one of Britain's most vulnerable battle fronts. The idea that, with the end of the Abyssinian campaign, armies and material would be released in quantity for other fronts is dispelled by the news that General Cunningham had at no time more than 20,000 men and 68 field guns with which to conduct his campaign—a fact which reflects extremely creditably indeed on his performance, but not so encouragingly on the British supply position in the Middle East. The attitude of Turkey is, of course, crucial to the maintenance of an effective front in Syria or Iraq. There are reports that, if Russian resistance continues to prove stubborn, then Germany may seek an easier route through Turkey, designed to turn the Russian flank and capture the oil of the Caucasus. Troops have been mobilised in Bulgaria, and it is not certain whether they are to keep order against the Russophiles at home, to reinforce the Bulgarian claim to Macedonia against Italy, or to serve as a prelude to German pressure on Turkey. The Turks are unanimous in their resolution to defend themselves, and their resistance to Vichy's demands in recent weeks is at least a good augury of further firmness.

Colonial War Gifts

A very welcome passage of Lord Moyne's recent statement on colonial policy dealt with the Government's attitude towards colonial war gifts. From the outbreak of war, gifts, both in cash and kind, and loans have been made to the United Kingdom, and the total sum of money received by the Imperial Exchequer now amounts to over £20 millions. Obviously, a direct contribution to the war effort is only provided by the gifts in kind. The fifty live turtles sent by a Jamaican firm to the Royal Navy and the bags of beans, cocoa, maize and rice from other territories are of more immediate value than the surplus balances of Nyasaland or the hundred thousand Straits dollars given by the Sultan of Brunei. The colonies' money gifts and loans are, in fact, in precisely the same position as Spitfire funds in this country. By themselves they contribute nothing; they cannot purchase the materials or weapons of war, and since colonial currencies are tied to sterling, they do not even rectify a possible favourable balance of payments with the United Kingdom. But the gifts from individuals do supplement taxation and divert money which would otherwise have been spent on consumption goods, which are doubly wasteful in that they need shipping to bring them; and there is to be no change of policy about accepting these. Gifts from the colonies' reserve funds and the renunciation of Imperial grants, on the other hand, are a different matter. In this case, it has frequently meant that the colonies in question have forgone, not personal expenditure on unnecessary consumption goods, but development and welfare schemes which are necessary if the standard of the vast majority of colonial peoples is to be brought up to the minimum. British Guiana, which, in spite of a big deficit, renounced an Imperial grant for drainage, is a case in point. And even if such schemes had to be postponed for the duration in any case, owing to a lack of men and materials, the depletion of its reserves would mean that a colony could not undertake them when peace returns. In future, therefore, such gifts will be regarded as interest-free loans to the British Government for the duration of the war, after which they will be repaid, when desired by the colony concerned, for post-war development. Colonies with adequate reserves will still be able to make outright gifts. It would clearly be ungracious to reject completely colonial offerings, and this solution is a happy compromise.

* * *

Undesirable Modesty

It is to be hoped that the latest appointment to the Board of Education will be the last—at least, until after the war. It has always been exasperating to all concerned with education, but particularly now when education is in the melting-pot, to see the post of President of the Board treated as a sort of musical chair to be grabbed by any Minister who happens to be displaced in a Cabinet shuffle. To the public at any rate, Mr Ramsbotham was not an inspiring President. His ideas on educational reform seemed limited to raising the school-leaving age to 15 or—when he was in a daring mood—to 16, though in his last public utterance as President, to the Conference of Head Teachers, he did appear to go so far as to accept the recommendations of the Spens Report as a basis for the reform of secondary schools. Yet it seems that Mr Ramsbotham has been sponsoring educational reconstruction on the quiet. A document has been published by the Board, which is not intended to set out official views on post-war education, but which is the considered views of some officials in the Board, and is intended to serve as a basis for discussion. Owing to the distinction between official views and the views of some officials, this document is not to be made public. Copies have, however, been sent to certain outside bodies and individuals—presumably for their views to be added to the views of the officials, so that an official view can be formed. This coyness is very regrettable. If the President disclaims responsibility for the proposals contained in the document, it ought not to be circulated under the auspices of the Board at all. If, on the other hand, they have his blessing—which seems most likely—the whole country has a right to pronounce upon them, not only a few favoured bodies. It looks, in fact, as though the Board wished to try out their effect on the teaching profession before daring to launch them on a startled world. Or perhaps they are so innocuous that the world would not be startled at all. Mr Butler should give the world the chance to find out.

Straining at a Gnat?

The incidentals of the Russian alliance are proving more awkward for the Government than the alliance itself. A considerable controversy has arisen, first, through the decision not to add the *Internationale* to the list of the Allied national anthems played by the BBC on Sunday evenings, and, secondly, by the refusal to lift the ban on the *Daily Worker*. In the first case, the Government was possibly guided by the desire to cause the least offence to the greatest number. Probably, most people in this country are quite indifferent to whether the *Internationale* is played or not, but regard the hasty dropping of all national anthems—presumably for good, for whenever one is played it will be an invidious distinction *vis-à-vis* Russia—as a timid and rather ridiculous solution. Those who feel strongly about it, one way or the other, are perhaps of equal strength—though those to whom the tune is a clarion call to workers all over the world to fight against tyranny appear to forget that to just as many people it is a symbol of sabotage and subversion. More of a case might be made that the omission is a mistake in that it offends Russia, but it can hardly be contended seriously that the shrewd Stalin, who has secured the substantial prize of the British alliance, is likely at this stage to worry about incidentals. And against Russia must be set the United States, which has swallowed the Russo-British alliance as a necessary expedient but still clings to the Ciceronian principle that expediency should not be divorced from right. It is important to convince the American people that Britain's attitude to Communism is still completely unchanged. The case of the *Daily Worker*, on the other hand, is purely domestic. The paper was suppressed, not because of its Communist views, but because it had consistently pursued an anti-war policy. On the face of it, therefore, the Russian alliance makes no difference. But the changed circumstances have caused the sponsors of the paper to change their attitude, and there is no doubt that, so long as these circumstances continue, its guarantees of support for the war will be kept. Thus there are some grounds for letting the *Daily Worker* out on probation. It could not be regarded as a sign of weakness on the part of the Government—it is Mr William Rust who has changed his front, not Mr Morrison. It would, on the other hand, be a friendly gesture to the small minority which accepted the paper's views before, and like it are now prepared to say "I will be good."

* * *

Shorter Notes

The Pharmacy and Medicines Bill has passed its third reading in the House of Commons. The most important amendment, so far as the public is concerned, deals with the declaration of the composition of patent medicines. The Bill now provides that the constituents must be given their "appropriate designation," which is strictly defined, in order that the public should not be misled by pseudo-scientific terms. It also provides, as an additional precaution against fraud, that the "quantitative particulars" of the constituents must be given. Thus, the two chief drawbacks to the original clause have been removed.

*

Since the prices of practically all important foodstuffs are now controlled, it has been decided that the Food Price Investigation Committees should cease to function. The local food office will now receive complaints in regard to food prices, whether controlled or not. The committees were set up in August, 1940, and were responsible for investigating complaints of high prices charged for food commodities. The chairmen and members are the same as those of the Price Regulation Committees, set up under the Prices of Goods Act, whose work will be continued under the amending Bill now before Parliament.

*

The discussion in Parliament on the motion to extend the Emergency Powers (Defence) Act by another year centred very significantly on the Home Secretary's power over the liberty and opinions of individuals, not on the Minister of Labour's powers to conscript their services. Thus criticism was expressed on Regulation 18B, under which people can be detained without trial, and Regulation 2D, under which the *Daily Worker* was suppressed, but Regulation 54C, 55 and 58A, which authorise the use of compulsion on employers and employees, were not called in question.

THE WORLD OVERSEAS

The Fall of Hungary

The End of an Epoch

[BY A CORRESPONDENT LATELY IN HUNGARY]

July 21st

COUNT PAUL TELEKI poisoned himself in the early hours of April 3rd. For more than two years, following the fall of Imrédy, early in 1939, Teleki had danced along the tightrope of non-intervention and non-belligerency, the abyss of a German alliance yawning beneath him. Until the fall of France he was successful; Hungary was committed to nothing more than tacit non-military support of Germany; the pengő had not been devalued against the Reichsmark—thanks to the skill and courage of the president of the National Bank, M. Baranyay, it was never really devalued up to the last; certain trade arrangements—no matter how formal the British blockade might have made them—still existed with the United Kingdom; British official news was still widely circulated in the Press; and the majority of the ruling class still believed that Britain's chance of victory was greater than Germany's.

After the fall of France, this attitude had to change. And, because in Hungary there was only one possible set of rulers, the only men to whom political initiative and experience had not been denied, it was automatic that the Government of Teleki should remain in its place, changing its policy and trimming its course according to the prevailing wind. The wind began to prevail from the German quarter, and soon was blowing at gale strength. It was clear that Hungary's fate would be decided at Berchtesgaden. Roumania collapsed almost at once; early in September, the Hungarian army was marching into Transylvania; and the link with Germany had become unbreakable.

The shadow of the coming struggle with the Soviet Union appeared upon the political scene. Teleki had secured not the "vertical" partition of Transylvania which most Hungarians had expected—that is, a strip of territory running all the way from north to south of Transylvania—but a "horizontal" share instead, a piece of territory running only halfway south but extending to the crests of the Carpathians. In exchange, the Government of Teleki and Csáky made two further steps into the German orbit. They signed a treaty whereby Hungary would fight on the side of Germany if Germany were to become engaged in war with Soviet Russia; and they signed a minorities agreement which gave the German minority in Hungary rights amounting almost to extra-territoriality. It did not need the news of furious road-building in Slovakia to convince those who knew the terms of these agreements—and the terms were hushed up as far as possible—that war between Germany and Russia was sooner or later certain.

The Army's Part

If it is possible for a small Central European nation badly harassed by Hitler and divided within itself to refer to its "honour," then it was certainly the Hungarian army which was responsible for losing Hungary's honour. The army was on the side of Germany because it believed that the Germans would win the war—at least to the extent of remaining in command of Central Europe; because the Germans had smashed the Treaty of Trianon; because the army's guns and ammunition had come from Germany; because the younger officers were all Nazis and the older ones decrepit and fearful; in short, because for a multitude of reasons they were in no condition to be anything else but pro-German.

What actually happened in those last few days before Hungary threw away her two months' old treaty of "eternal friendship and non-aggression" with Yugoslavia is still not clear. Immediately upon receiving the news of the *coup d'état* in Belgrade, the German High Command began to move troops from Roumania and Austria into Hungary

in order to man the vulnerable Banat frontier. These movements were made with the cognisance of the Hungarian Government, under arrangements concluded long before with the Hungarian General Staff and the directors of the Hungarian railways (at the head of whom was the younger son of Admiral Horthy). A few days before the blow was planned to fall, the Hungarian Government, already at odds with its army command over the question of general mobilisation, was asked by the German Government for full military co-operation against Yugoslavia in return for territorial concessions in the Banat. Faced with the insubordination of its army command—Generals Bartha and Werth, the Minister of War and Chief of Staff respectively, have much to answer for here—the Government gave in.

It is a miserable story of perfidy and fear. The country which had stabbed Czechoslovakia, Poland and Roumania in the back now stabbed Yugoslavia. There are about ten thousand men in Hungary who affect aristocratic descent. They rule, or try to rule, the remaining thirteen millions. A majority of them regarded Hitler and his methods with acute and perfectly genuine distaste. Quite a number of them went to gaol for the outspokenness of their views. The minority who favoured Hitler, eccentrics like Festetics who formed the first pseudo-Nazi party in Hungary, never carried much weight. Why was it, then, that their collapse came so easily? Certainly not because the peasants and the workers (except in the areas inhabited by Germans to the west of the Danube) were pro-German or pro-Nazi.

Political Suicide

The explanation is simple. For a dozen years after the last war the aristocracy to which the Horthy restoration had given full power lost no opportunity of stifling every attempt to interest the common people in politics. By the early 'thirties Communism had been murdered, tortured, or exiled out of existence; the trade unions had lost practically everything but their membership; the Social-Democratic party had learnt in fear and trembling to place a very careful interpretation upon its activities. To this lamentable state of affairs the flamboyant pro-Hitlerism of General Gömbös put the finishing touches; during the régime they might have cried: "The people are dead. Long live Hungary!"

But what the aristocracy dared to do against the opponents of Socialism and popular government they had no courage to carry out against the pro-Nazi parties, groups and propaganda bodies financed by Berlin or by blackmail on Jewish industrialists and bankers in Hungary. By 1939 there were something like seventeen Arrow-Cross factions, each striving to get the leadership of all the others and out-doing the next in virulence and violence. The country stood by and laughed at them. But in spite of their contemptible antics, the Arrow-Cross movement made headway. Arrow-Cross adherents were arrested from time to time, but they were never treated as the "Reds" had been treated. Inconsequent half-wits like Hubay, rogues like Kovárcz, German agents like Milotay and Raynis, little men who could have made no mark in normal times, were allowed to swagger and swindle their way about the country unimpeded.

The conclusion is clear. The aristocratic oligarchy had destroyed every outlet for democratic or anti-Nazi or even honestly patriotic sentiment. They were now faced, alone, by an exceedingly strong complex of pro-Nazi and anti-democratic organisations. They saw this for themselves when it was far too late. The non-political organisations which Teleki tried to mobilise "in defence of the State and Constitution" late in 1940 turned out to include so many Arrow-Cross members that they had to be abandoned hastily. Sporadic efforts of this kind had been made before. Late in 1938, Imrédy formed his "front of National Regeneration," a perfectly respectable body of middle-aged gentlemen who paraded every now and then in green felt

helmets, carried staves and wore buttonholes and achieved precisely nothing. Teleki was the Chief Scout of Hungary.

But the real counter-move, the formation of a popular political party, was never made. Instead of banding together the many thousands of men of goodwill who might have been ready to oppose to the last any German demands which trenched still further upon Hungarian independence, the oligarchy evolved a wonderful piece of nonsense called "the Government Party." This ridiculous body was neither the Government nor a party. It consisted of all those Parliamentary Deputies, a substantial majority of the Lower House, who wanted nothing better than to go on representing themselves in Parliament, appealing periodically to the patriotic support of the country, which they certainly did not represent. The frantic desire of the oligarchy was to prevent anyone else from getting a finger into the pie; and, when the test came, the Government and the anti-German aristocracy found themselves with nothing better to support them than this band of capering loons. Against them were ranged the numerically strong Arrow-Cross groups, the army commanders, the whole course of events and the minatory tones of the German Minister in Budapest. The Government collapsed.

The future cannot be forecast. Too much remains unknown. A new Government, headed by a colourless diplomat in László Bárdossy, duly declared war upon Russia in July, and it is to be presumed that the Hungarian army is once more hallooing along in the rear of the *Reichswehr*, this time in Galicia. In whatever way Germany is defeated the Hungarians will suffer correspondingly. They were disillusioned before they began; and before the end they will be desperate. Whatever comes out of this confusion, it is plain that the epoch of oligarchy and Hungarian Chauvinism is dead.

War Economy

[BY A CORRESPONDENT]

July 23

FROM the Vienna Award in 1938 to the partition of Yugoslavia by the Axis Powers in April, 1941, Hungary increased her territory by 83 per cent and her population by 60 per cent to 14½ millions. Apart from small mining areas in Slovakia and Transylvania the new districts are mainly agricultural. The percentage of industrial population in Hungary has thus fallen from 50 to 35 per cent; but a corresponding increase in the exportable agricultural surplus is hardly to be expected. Last year Hungary experienced a bad harvest of cereals. Widespread flooding in the autumn of 1940 and the spring of 1941 have not helped this year's harvest. In 1940 a bad cereal crop and the poor quality of the maize crop were compensated by a good root crop.

HUNGARY (WITHOUT TRANSYLVANIA)			
CROPS (thousands of metric tons)			
	1939	1940	
Wheat	3,050	2,070	
Rye	890	720	
Maize	2,330	3,030	
Potatoes	2,221	3,440	
Sugar beet	1,160	1,760	

The acreage under oilseeds which was considerably extended in 1940 yielded no appreciable increase, and the fruit and wine harvest was also very poor. In spite of the bad wheat harvest, Hungary was forced to export some wheat to Germany and Italy. Total exports were roughly one quarter of those of 1939. The requisitioning of wheat and oilseeds and the adulteration of bread by potato and maize flour were unavoidable. An acute shortage of feeding-stuffs resulted in a decrease in the pig population. Exports of live pigs decreased from 355,000 in 1939 to 154,400 in 1940, and of lard from 12,780 tons to 4,350 tons respectively. Between September, 1940, and March, 1941, Germany received no lard at all from Hungary.

The planned agriculture that Germany wants is very difficult to achieve. The big Hungarian landowners are trying to oppose the scheme for reducing the acreage under wheat in order to increase the cultivation of oilseeds. Complaints have been made about Germany's depletion of Hungary's stocks of food. The cultivation of wheat is heavily subsidised by the Government. The wheat price

was raised from P7 in 1933 to P20 in 1939 and P23 in 1940; and, generally speaking, landowners seem to be willing to carry out the plans for German-Hungarian agricultural collaboration so long as prices for all leading agricultural products are guaranteed at a higher level, like the wheat price.

Meanwhile, there has been widespread hoarding of food-stuffs, until stocks laid in by individual consumers were limited to 25 kilogrammes of flour, 2 kilos of pulse and 3 kilos of fats. The newly incorporated Yugoslav province normally exported considerable quantities of wheat, maize and pigs; but Transylvania is deficient in bread grain. In spite of considerable price increases, receipts from agricultural sales fell during 1940 by roughly 6 per cent, and the Government prolonged the moratorium on agricultural debts until December 31, 1941.

The German Connection

Industrial production under the so-called Five-Year Plan adopted in 1938 reached its peak during the last quarter of 1939. At the end of 1940, the index of industrial production (1929 = 100) had fallen from the record figure of 172 to 169.5. Since Italy's entry into the war, Hungary has been cut off from supplies of overseas raw materials; and increased supplies of artificial textile fibres from Italy and Germany have not been sufficient for the normal activities of the textile industry.

The coal, iron and steel industries, on the other hand, have reported increasing output; and there is no doubt that the production of oil, bauxite and aluminium has been energetically increased. Germany's interest in these industries is obvious. The German concern *Wintershall* acquired oil-prospecting interests in February, 1941, by forming the "German-Hungarian" Oil Company. The actual output of oil in Hungary is estimated to cover peacetime demand. The capacity of two leading aluminium plants has been extended and a new plant with a final capacity of 10,000 tons is in building. Expansion must be slow because of the lack of electricity, which has been rationed for civilian consumers since the autumn of last year.

In 1940 the total capital expenditure under the Five-Year Plan was increased from P1,000 millions to P2,800 millions, of which P1,650 millions has already been spent. The plan has been financed by additional taxation, which yielded P570 millions. A Government loan was subscribed with P400 millions, and the Government advanced P200 millions. The gap will be covered by a special capital levy, by more taxation, and by a new loan amounting to P500 millions.

The organisation of Hungary's war economy grew without any plan. Rationing was extended, for example, when commodities were in short supply; and a central supply department for industrial raw materials was set up in January, 1941.

FOREIGN TRADE (HUNGARY WITHOUT TRANSYLVANIA) (millions of pengoes)

	Imports	Exports
1938	410.6	522.4
1939	489.9	603.7
1940	597.7	503.6

The bad harvest was largely responsible for the adverse trade balance in 1940. At the same time, the normally considerable export of machines and manufactures fell because of increased orders for the home market; and it can safely be assumed that armament orders were responsible. Because of the bad harvest, imports of maize and sugar were considerable, and the prolonged spell of cold weather caused larger imports of coal. Lastly, import prices increased, but the price of agricultural exports fell. The share of leading countries in Hungary's foreign trade moved as follows:

PERCENTAGES OF HUNGARY'S TRADE

	Imports		Exports	
	1939	1940	1939	1940
Germany & Czechoslovakia	52.4	60.3	52.8	55.2
Italy	7.1	9.3	15.5	15.2
Switzerland	2.8	3.1	3.6	6.4
Roumania	5.9	4.0	2.8	2.1
Jugoslavia	4.8	5.5	2.3	4.4
United Kingdom	4.9	1.0	5.0	2.3
U.S.A.	4.6	5.9	2.5	1.0

In 1940 Germany and Italy accounted for 70 per cent. of Hungary's total foreign trade. Trade with the United Kingdom and the U.S.A. is now at a standstill, and the control of foreign trade relations has virtually passed into German hands.

Conscription Issues in Canada

(From Our Ottawa Correspondent)

June 25th

THE King Government is considerably embarrassed by the growing agitation in the English-speaking provinces for the removal of the restrictions on full conscription. In Alberta, Mr. Mackenzie King felt it necessary to deal with the issue in some of his speeches, and he reiterated emphatically his opposition to conscription for overseas service; he argued that such a measure would split the country and that Canada's adherence to voluntary enlistment for overseas service gave her contribution to the common effort additional moral strength. He even hinted in one of his addresses that, if the advocates of conscription continued to press their case, it might be necessary to hold a general election on the issue; and the *Winnipeg Free Press*, one of his most influential supporters, takes the line that, in view of the pledges given by all the political leaders, full conscription cannot be imposed without a fresh popular mandate. But additional momentum has been given to the demand for full conscription by two recent developments. It has been disclosed in the Canadian press that isolationists in the United States are now making extensive use of the argument that Canada, a partner nation of the British Commonwealth, has not yet imposed full conscription to fortify their case against active American participation in the war. Then there has been published this week, in all the leading Canadian papers, an interview given by General Wavell to the Cairo correspondent of the *New York Times*, in which he is reported to have declared that there was a limit to Britain's manpower and that the manpower of the United States would be needed to win an effective and permanent victory. The Canadian advocates of full conscription are therefore now provided with the very forcible argument that, as long as Canada shrinks from a measure which will make her youth liable for overseas service, it will be hard to induce the American people to consent to the despatch of an expeditionary force to Europe and that the war may be prolonged indefinitely.

The industrial side of Canada's war effort is making satisfactory progress, but in certain cases it has been hampered by strikes for higher wages, which have not had much public support; and the Federal Government, whose tenderness towards strikers brought protests from the Canadian Manufacturers' Associations at their recent annual convention, now shows signs of adopting a firmer attitude. It has passed an order-in-council establishing an Industrial Disputes Inquiry Commission; its function will be to determine whether disputes or threatened disputes justify the appointment of a conciliation board. When it advises against a board, the result will be to bar any strike in such a case except at the risk of heavy penalties for the strikers and heavier ones for their leaders. The miners of the Cape Breton area, who have been causing much trouble, have also been brought under the Defence of Canada regulations, which makes them liable to penalties for interfering with war production, and legal action has been taken against promoters of a strike among the workers of the Canadian General Electric Co., which was called without any award by a conciliation board.

Owing to the frequency of strikes for higher wages, the Government has decided to try to prevent them by a generous wage policy. It had evolved a scheme for anchoring wages to the cost of living through a cost-of-living bonus which workers could apply for, and some time ago it made this bonus mandatory in all industries classified as war industries. An amending order states that "a wartime cost-of-living bonus, separate from and in addition to basic wage rates, shall be paid except for good cause shown to the contrary." Next the Government set aside the decision of a conciliation board, which dealt with an application by the railwaymen's unions for a cost-of-living bonus. The board awarded a bonus of \$1.93 per week to all railway workers earning under \$25 per week, but refused to concede it to those earning higher wages. The Government, however, decreed that the bonus should be available to all railway workers. Obviously, in view of this decision, it will be difficult to resist demands from workers in other non-war industries for the cost-of-living bonus, and Ministers are understood to be considering seriously its compulsory extension to all industries in the belief that it would

accomplish the dual purpose of stabilising wages and banishing industrial disputes for the duration of the war.

The demand of the war industries for steel is almost insatiable. As a result, steel production in May at 197,114 tons, compared with 190,179 tons in April and 168,703 tons in May, 1940, reached the highest figure for any month in Canadian history. The mining industry remains very active, and gold production has been rising, the receipts of gold at the Mint in May being 448,436 ounces, compared with 385,488 ounces in April and 401,431 ounces in May, 1940.

The Russian Home Front

[BY A CORRESPONDENT]

July 21st

THE Soviet Union is adapting its administration to the requirements of war. Neither the suddenness and swiftness of the attack nor the occupation of nearly all the territories which had been seized since September, 1939, as well as parts of Russia proper, has caused any breakdown. The Soviet authorities realised at the outbreak of hostilities the great importance of the home front; and everything is being done to secure the co-operation of all civilians in the war effort.

The greatest attention is now being given to the harvest. The attack started when the crops were still standing and harvesting just begun. While peasants in the battle zones are being urged to destroy anything and not to leave any grain or livestock for the enemy, an enormous campaign is being carried on all over the rest of the Soviet Union to rush through the harvest with all speed.

The walls of Moscow, Leningrad and the other cities are plastered with enormous posters calling upon women and young persons to take over men's jobs on the farms. Women are enlisting as tractor-drivers. The hot weather caused an early ripening of the crops, and in the Kuban, Ukraine, Volga and Siberia harvesting started in the first week of July. Reports show that the crop is good. Farmers are urged to deliver the grain as soon as possible to national warehouses, where it will be under complete Government supervision, to be used where it is most required. Farmers are paying taxes (including the special war taxes) in kind, so that the Government is assured of control over the crops.

The wartime increase in taxation has been followed by a campaign for increased savings and propaganda for increased production. There is no shortage so far of any staple commodity, and no large-scale rationing has yet been introduced. The people are, however, being given to understand that, as the war goes on, the civil population will have to give up a large part of their share in the national income, as priority is given to supplies for the forces.

Reports from all over the country show that an intensification of production is already taking place, though it is difficult to estimate what this amounts to, because the reports only quote percentage increases without giving actual figures. Workers all over the country have pledged

The Malayan Information Agency exists to provide authentic information on all aspects of trade and travel in British Malaya. Agriculture, mining, commerce, transport—illustrated handbooks, etc., on request.

THE MALAYAN INFORMATION AGENCY
MALAYA HOUSE, TRAFALGAR SQUARE, LONDON, W.C.2

themselves to increase the quantity and the quality of their products, and everybody is being told that, in no circumstances, must they sacrifice the standard of workmanship for greater output.

The civil population is being gradually prepared for a long war and for participating in civil defence as well as in guerilla warfare. The *Osoviachim*, an ARP organisation, is fully mobilised; London and the other English cities are given as examples. The evacuation of children is gradually carried out, mainly through the schools, and the children are in most cases being billeted in summer schools and camps. This evacuation, for the time, is linked with the usual peace-time scheme for giving the children of large industrial cities a chance of staying in the country for two months a year during the summer holidays.

The black-out in Moscow and the other Russian cities is blacker than in London, because cars are not allowed to have any lights at all, and no light signals are to be seen anywhere. Air raid shelters are prepared in the basements of the huge tenement buildings, and the Moscow underground stations have been turned into shelters. In the large Russian cities many buildings are built of steel and concrete; and the comparatively large number of stout basements and cellars will minimise the need to build outside shelters.

Moscow and Leningrad are preparing for defence. New defences are being erected in the streets, and factories are barricaded. No mass evacuation is taking place, and the civil population has been ordered to stay put.

The Anglo-Soviet Alliance was praised by the whole Press and by enthusiastic mass meetings, where resolutions were passed calling for close collaboration between the two peoples. The Government has given the widest publicity to a pact of alliance with a Power which until lately was denounced as imperialist and capitalist. Everything is being done to keep the people awake to the great dangers of the military situation. Posters displayed in the city squares give a graphic description of the position on the front.

The people are contemptuous of the Nazi "Socialistic" broadcasts from Berlin, and Hitler's expectation of political unrest has so far failed completely. No quislings have appeared, and the German hope of gaining Ukrainian support by the promise of "independence" and a Ukrainian State has been in vain.

Argentina's Budget Deficit

[FROM OUR BUENOS AIRES CORRESPONDENT]

June 16th

THE majority report of the Budget and Finance Committee of the Chamber of Deputies recommends the application of the 1940 estimates up to July 31st next; by then Congress is expected to have sanctioned the 1941 Budget. The minority report advocates that the extension be operative until such time as the 1941 estimates are voted.

In presenting the majority report, Sr. López Merino stressed the urgent need for Congressional sanction of a Budget adequate to the country's present grave economic situation and outlook. The report contains an interesting analysis of the national finances, summarised below:—

THE ANGLO-SOVIET JOURNAL

Pesos	
Estimated Revenue for 1941 (against 921,200,000 pesos received in 1940).....	719,700,000
Deductions for Public Debt service, Pensions and Army and Navy estimates	536,290,000
Surplus	183,410,000
Remaining Administrative Expenses totalling (on the basis of Government estimates presented last December).....	545,710,000
Deficit	362,300,000
Expenditure which although falling to be paid out of revenue is to be met by bond issues.....	26,000,000
Total deficit.....	388,300,000

Government outlay on crops purchased under minimum price legislation is estimated to result in the following losses:—

	Present Deficit Pesos	Estimated Deficit Pesos
Wheat and Linseed 1938-39	129,482,135	129,000,000
Maize 1939-40	151,082,014	151,000,000
Wheat and Linseed 1940-41	332,253,506	132,000,000
Maize 1940-41 (to be purchased)....	...	100,000,000
Barley 1940-41.....	21,971,335	20,000,000

Loss without taking into account the next fine harvest

532,000,000

Adding the estimated losses on crop purchases to Budget deficits gives the following statement of actual obligations to be met by the country:—

	Pesos	Pesos
Deficit for 1940	164,400,000	526,700,000
Estimated Deficit for 1941	362,300,000	532,000,000
Loss on Crop Purchases	...	1,058,700,000

and concludes by showing the following position:—

1940 and 1941 Budget Deficits	526,700,000
Estimated losses on crop purchases	532,000,000
Purchase of next fine crop	150,000,000
Expenditure on armaments (Bill before Congress) ..	300,000,000
Public Works Bills.....	226,000,000
	1,734,700,000
Add net increase in consolidated debt during 1940 ..	111,600,000
Increase in debt during 24 months (40-92%)....	1,846,300,000

In referring to this analysis, the speaker indicated that the Government will require to invest 500,000,000 pesos in the purchase of the next fine harvest within a few months, and that the estimated loss of 150,000,000 pesos on this account is optimistic.

The Minister of Finance, Dr. Carlos Alberto Acevedo, disagreed with the estimate of crop losses given in the majority report, but stated that, should they reach this amount, the Government still had at their disposal 370 million pesos in the shape of Exchange Control profits with which to finance the purchases, also that they were authorised to issue a further 263 million pesos in bonds. He added that this figure of 370 million pesos had been increased since December 31st last to 381 millions.

THE BUSINESS WORLD

Profits Under Control

IT would not be far from the truth to say that the only change in the realm of industrial profits during the past quarter is the destruction by enemy action of much of the past records on which *The Economist's* quarterly articles are founded. The successive quarters of the past year have told substantially the same story. Total profits have been increasing, though their rate of increase has slowed down perceptibly; net profits have been falling, largely as a result of increasing taxation; and equity shareholders as a whole—the supposed beneficiaries of peak wartime production and lavish finance—have, in fact, experienced a continuing decline in rates of earnings and dividends ever since the war became a serious reality eighteen months ago.

These trends are evident in the normal tables which accompany this article. The first shows that the total profits of 497 companies whose reports were received last quarter

TABLE I.—PROFITS OF SECOND QUARTER COMPANIES—1941

497 Companies	Previous Financial Year	Latest Financial Year	Adjusted Net Figures before Taxation
Total Profits*	£104,198,463	£105,306,160	...
Depreciation	8,242,941	8,242,941	5,194,464
Debt interest	4,502,215	4,502,215	...
Other charges†	41,024,302	41,024,302	...
Net Profits	£58,928,691	£51,536,702	£66,547,908
Preference dividends	11,955,144	11,955,144	15,550,876
Ordinary dividends	...	32,424,900	43,840,374
Added to free reserves....	...	7,156,658	7,156,658

* After depreciation where not separately stated. † Incl. taxation.

increased by little more than 1 per cent, from £104,198,000 to £105,306,000. Second quarter companies are predominantly home industrial companies, and for that reason their results are a true reflection of the trend of profits of British industry. "Profit," of course, has always been rather an equivocal term, and the total profit disclosed to shareholders is commonly reduced by undisclosed provisions to depreciation and other reserves, and by EPT and taxation. Nevertheless, these qualifications do not gainsay the evidence that, in the second year of total war, no inflationary break-away of business profits has occurred.

Net profits, after deduction of depreciation, debenture interest and other charges, including taxation, fell by no less than 12½ per cent from £58,929,000 to £51,537,000.

TABLE II.—DISTRIBUTION OF PROFITS AND RETURN ON CAPITAL

	Proportion of Adjusted Net Profits (%)			Rates of Payment (Gross)			
	Prof. Div.	Ord. Div.	To free Reserves	Deb.	Prof.	Earned Ord.	Paid Ord.
1940							
1st Quarter	17.5	71.6	10.9	4.2	5.5	15.1	13.1
2nd Quarter	20.3	65.0	14.7	4.8	6.2	12.3	10.0
3rd Quarter	29.4	55.9	14.7	4.9	6.9	12.2	9.6
4th Quarter	23.6	61.4	15.0	4.8	5.8	12.1	9.8
Whole Year	21.5	65.1	13.4	4.6	6.1	13.2	10.9
1941							
1st Quarter	17.7	73.1	9.2	4.0	4.7	11.4	9.6
2nd Quarter	23.4	65.9	10.7	4.0	5.2	8.2	6.7

What that net figure means in terms of reward for shareholders is better understood from Table II, in which the net figure of £51,537,000 is replaced by an equivalent figure, before deduction of income-tax, of £66,548,000. This latter

figure—precisely the same as the net profits figure, but struck at a different accounting stage—is used for the calculation of the distribution of net profits among share capital reserves and for rates of payment and earnings. No very obvious trend is visible in the distribution percentages—the second quarter companies this year followed much the same policy as in the previous year of distributing slightly less than two-thirds of their available earnings. The significant change is evident in the second part of the table. Throughout the past 15 months the gross percentage rate of ordinary share earnings has been falling. In the first quarter of 1940 it was 15.1 per cent; then the rate steadied to slightly over 12 per cent, to fall in the first quarter of this year to 11.4 per cent, and now to 8.2 per cent. The cut in the average rate of ordinary dividend from 13.1 per cent in the first quarter of 1940 to 6.7 per cent in the latest quarter is a necessary consequence. The lot of the equity investor has been harder, not easier, in the war to date. These figures, moreover, are on a gross basis, before deducting standard income tax. This other prong of the Chancellor's fork digs deeply into the eventual return to equity capital.

These figures suggest clearly that in the realm of company finance, with its corporate saving and corporate taxation, wartime control has been made very effective indeed. If the essence of policy is to allow the equity shareholder

TABLE III.—A YEAR'S PROFITS—1940-1

	No. of Cos.	Total Profits		Net Profits		Latest Net Profit figure re-calculated before Charging Taxation
		Previous Year	Latest Year	Previous Year	Latest Year	
1940						
Third Quarter ..	428	74,758,540	78,723,575	45,326,480	37,704,376	48,610,103
Fourth Quarter ..	558	65,267,000	74,685,000	30,155,000	29,027,000	36,345,000
1941						
First Quarter ...	439	94,300,714	98,954,489	55,682,007	60,628,042	70,936,000
Second Quarter ..	497	104,198,463	105,306,160	58,918,691	51,536,702	66,547,908
Total Year to June 30, 1941.	1,922	338,524,717	357,669,224	190,082,178	168,896,120	222,439,011

less and less, as the results indicate, it is probably better to achieve that end by the familiar way of tightening the screws of control and taxation rather than by limiting dividends to a flat 6 per cent, German fashion. The semblance of reward may be almost as effective as reward itself in evoking output, even though the Exchequer gets the eventual benefit in increased tax-receipts.

Meanwhile, *The Economist's* profit index (whose statistical basis was described on January 14, 1939, and March 1, 1941) shows a further fall in the June quarter. This index employs certain statistical expedients which may well distort its movements to some extent. But the steady fall in the index from 120.5 for the second quarter of 1941 (July, 1935-June, 1936 = 100) to 114.2 for the December quarter, thence to 112.3 for the March quarter of this year, and now to 108.3, is not due to statistical bias. Net profits are falling, and recently they have been falling fairly rapidly.

It is usual, when reviewing June quarter companies' results, to regard them as completing a calendar year of production and earnings. Calendar years have little place in the wartime record, but the third table gives some indication of the diminishing gain in total profits as the year progressed and of the increasing inroads into net profits

caused by taxation and other charges. It would be interesting to compare the increase of £19 millions in total profits and the fall of £27 millions in net profits with previous movements in the profits of the same companies. That piece of research—which is far more complicated than it sounds—must, however, wait until the war is won. But the totals (backed by the industrial analysis of profits on page 122)

will not give great cheer to the equity shareholders. Shipping, rubber and newspapers are conspicuous beneficiaries. The rest is a story of lower profits and lower dividends. It is also a story of the Exchequer's paramount desire to keep money off the consumers' goods market, in which success is partly measured by the dwindling rewards for equity investors.

Finance and Banking

Treasury Bill Issue Cut

The flow of funds to Government accounts is running in full spate at the present moment. In the normal course this would be a heavy revenue collection period; but in addition the flow of subscriptions to Government loans appears to have been stepped up to a permanently higher level than that maintained in the last financial year. Moreover, heavy payments are being made in respect of premiums on the Government's war damage insurance scheme on buildings and chattels. The Treasury have therefore found it possible to effect some net repayment of floating debt this week. Last Friday, they under-allotted the Treasury bill issue by £5 millions, and as £75 millions of bills matured this week and only £70 millions had to be taken up, the amount of these bills issued through the tender will have fallen from £965 millions to £960 millions over this period. The Treasury has, moreover, abstained from calling on the banks for any Treasury deposits this week. There are no maturities of Treasury deposits this week and there will be none for the next five weeks. The scaling down in floating debt borrowing, plus the persistently heavy Government disbursements, has had a substantial deflationary effect on bank cash and bankers' deposits rose over the week to last Wednesday by £16,237,000 to the comfortable level of £124,345,000. The counterpart of this movement is in the main provided by a fall of £14,754,000 in public deposits, while a smaller element in the expansion of bank cash has been an increase of £4,089,000 in the Bank's holding of Government securities. The note circulation continues its monotonous upward movement, and rose by £1,734,000 during the past week to the new high record of £652,654,000.

Clearing Banks' June Statements

The clearing banks' returns for June show the position of each institution at the end of the month and thus provide a composite picture of the banking situation at that date. Comparison with the figures for May is vitiated by the fact that the half-year ends in June, but they can be compared with the December 31 and June 30, 1940, returns. The main feature of the June returns is

In £ millions						
	June 1940	Feb. 1941	Mar. 1941	Apr. 1941	May 1941	June 1941
Capital and reserves	130.7	140.1	140.1	140.2	140.2	140.2
Acceptances, etc.	123.2	101.1	100.5	104.9	107.8	106.2

Investments	636.2	814.4	821.0	819.7	848.3	880.2
Loans and advances	982.5	899.6	908.1	883.7	873.0	859.2
Investments in affiliated banks	23.6	23.8	23.7	23.8	23.8	23.8
Cover for acceptances, premiums, etc.	168.3	145.5	145.0	149.4	152.3	150.2
Total assets	2,733.7	2,951.5	3,006.4	3,075.1	3,073.4	3,193.7

their revelation of considerable contrary movements in investments and advances. At £880,249,000, investments exceed advances by over £21,000,000 and, for the first time, take pride of place over any other asset item. Many individual clearing banks have had this position forced upon them for some time past, but the passing of this milestone for the clearing banks as a whole deserves a special mention. Over the twelve months, the increase in the banks' investments amounts to £244,040,000, while advances have fallen

over the same period by £103,275,000. Allowing an average rate of 4 per cent on the advances repaid over this period, and 2½ per cent as the average return on the additional securities acquired, these offsetting changes in assets should leave the earning power of the banks slightly improved. Another set of balancing changes over the past twelve months has been the reduction in short loans and bills (both the reflection of the smaller total of Treasury bills issued to the discount market) and the countervailing expansion in the banks' Treasury deposit receipts. This last item, which had not begun to figure in the June 30, 1940, statements, had risen to £482 millions by June 30 last and at that date occupied third place among banking assets. The combined fall in bills and short loans over the same period amounted to £205,692,000. Again, the gross earning power of the banks should have improved by these changes in the more liquid assets. Deposits over the year have risen by £476,495,000, of which the comparatively small amount of £28,309,000 may be attributed to the spuriously inflationary effect of a net expansion in the items in transit and cheques in course of collection over the period. The cash position on June 30 was somewhat tauter than a year previously, the ratio to deposits having fallen from 10.92 to 10.55 per cent. But this was more than offset by the strengthening of the ratio of total quick assets which has risen from 38 to 43 per cent.

American Banks and Government Securities

The recent increase in the British banks' holdings of Government securities and the accompanying reduction in their loans and advances stands in interesting contrast to the experience of banks in the United States. In that country the supremacy of investments among bank assets was gained in the early 1930's following the enormous liquidation of loans in the depression years, a movement which about halved the loans of American banks in the four years 1930 to the end of 1933. But over the past year there has been a remarkable recovery in bank advances whose expansion has about kept pace with the rise in investments. The weekly reporting member banks of the Federal Reserve System, which in April, 1940, had outstanding loans of \$8,646,000,000 and investments of \$14,843,000,000, had by the end of last May increased their loans to \$10,046,000,000, while their investments had undergone an approximately similar relative increase—to \$17,752,000,000. Conscious official pressure is now being exerted to retard the growth of the banks' investment holdings. For example, the sale of the current issue of Defence Savings Bonds in the United States is limited to investors other than commercial banks. In the Federal Reserve Bulletin for June, 1941, this restriction is justified at some length as one of several steps being taken by the Government "to reduce the stimulative effect of large defence expenditures on private spending and investment." The commercial banks in the United States with their huge excess reserves could readily absorb further substantial amounts of Government paper. But the authorities regard the existing supply of bank deposits as sufficient to finance a considerably increased volume of business and deem it better for the Treasury to borrow funds out of current income or accumulated savings than to sell securities to the commercial banks, thereby further increasing the supply of money. This is a line of reasoning to which due heed might be given in this country before making further demands on the banks to swell the totals of subscriptions in future War Weapons Weeks.

Pre-Lease-and-Lend Finance

The \$425,000,000 loan which the Reconstruction Finance Corporation is making to the British Government will ease appreciably, though it will not entirely solve, the

urgent problem of financing pre-Lease-and-Lend commitments to the United States. According to the account of the United Kingdom's dollar obligations officially published in Washington earlier this year, the 1941 commitments in respect of Government orders in the United States were placed at \$1,274,000,000, whereas at the beginning of the year, remaining available gold and cash assets were put at \$295,000,000. The picture has changed considerably since then as a result of further liquidation of marketable investments in the United States and of the transfer to the American Treasury of capital invested by the British Government in the American armament industry since the outbreak of the war. But it can be safely assumed that even with this help and that of our increased exports to dollar countries, to say nothing of Lease-and-Lend assistance, the dollar position remains extremely taut. It will be greatly eased by the RFC Loan. This is to be secured by collateral valued at \$500,000,000, of which \$205,000,000 consists of listed investments which though marketable have not been marketed yet; \$115,000,000 represents unlisted direct investments of British firms in American undertakings; and the balance of \$180,000,000 represents the share capital of British owned insurance companies registered in the United States and operating in that country. The collateral is to be further strengthened by pledging, in favour of the RFC, the earnings of American branches of British insurance companies. These branches have assets of \$200,000,000 over and above the reserve required to be set against their liabilities on policies in the United States. The dividends and earnings represented by the collateral should total \$36,000,000 a year which will suffice to meet the 3 per cent interest on the RFC loan and to amortise it over a period of 15 years. As such earnings accrue, they will accumulate in three dollar accounts providing respectively for current interest, minimum sinking fund and reserve. The operations to which the loan agreement will give rise, that is, the servicing of the loan, the receipt of the dollar income on the pledged assets and the payment of the sterling equivalent of that income to the British owners of these, will be made through the Exchange Equalisation Account. The Financial Powers (U.S.A. Securities) Bill makes it quite clear that it is the intention of the authorities to borrow from the existing owners the American assets to be pledged with

the RFC, other than the listed securities which have already or may in future be vested, for which outright payment has been or will be made. The borrowed securities will be released to the owners when they are no longer required by the Treasury for the purpose of the loan agreement. The British Treasury has the right to retain such assets (they may be sold by the RFC in the event of default on the loan) and to compensate the owners by paying the market value, or if that cannot be agreed upon, a sum to be determined by arbitration.

Banking in West Africa

The report of the Bank of British West Africa for the year to March 31st last gives little indication of the difficult conditions under which the bank has had to operate in this period. These difficulties need no stressing. As a result of the collapse of France, the three branches in French Morocco have been forced to close. The office at Tangiers continues to function, but under handicaps arising from the drastic amendment of the international status in that territory. In the bank's main field of activity, West Africa, the boundaries of the various French possessions are contiguous with those of the British Colonies, and the experience of the bank is that "the administration of those territories, though by no means friendly, is not actively hostile." The bank has played a useful part in devising the machinery for financial collaboration between the British Government and the Free French territories of Equatorial Africa. The scheme of financial collaboration is working smoothly, and the bank is already helping to finance both the export and import trade of the Free French territories. The principal crops of West Africa are being bought by the Ministry of Food at prices which are fairly remunerative to the native producers. There has, therefore, been a background of reasonable economic prosperity behind the bank's activities. An increased turnover is reflected in the accounts, which show loans and advances over £1,000,000 higher at £3,410,000 and a bill portfolio which has risen from £681,000 to £1,002,000. The restoration of the dividend to 4 per cent is another solid indication of recovery.

INSURANCE NOTES

and foreign taxes, which are debited to profit and loss:—

	Premiums	Rise or Fall	Underwriting Profits	Rise or Fall
Fire	833,520	— 8,182	46,375	— 14,487
Accident	78,945	— 9,787	18,164	— 1,077
Employers' Liability	256,332	+ 16,686	— 154	+ 1,416
Motor	1,075,757	— 497,826	32,919	+ 13,037
General	454,433	— 57,076	78,760	— 21,474
Marine	691,882	+ 264,982	50,000	+ 25,000
	3,389,869	— 291,181	227,054	+ 1,767

Chiefly noteworthy is the heavy drop in motor premiums, resulting from the laying-up of private cars and the requisitioning of commercial vehicles by the Government. The profit margin in this account is very slender, notwithstanding that some benefit is derived from a release of premium reserve.

Net interest earnings in profit and loss disclose a severe fall of £87,013, from £335,552 to £248,539; the reduction in gross earnings is £74,157, the balance of £12,856 being accounted for by higher income-tax. Total credits to profit and loss come to £521,987. Of this, miscellaneous expense items—including £92,705 for management expenses not charged to other accounts, £46,945 for colonial and foreign taxes, and £41,524 for A.R.P. expenses—take £191,646; this sum is only £35,408 short of the year's underwriting profit from the non-life branches. British taxation requires £11,500, and reserve for war damage contributions £18,500. After providing for dividends at the same rates as before, costing £270,432, the balance carried forward at £523,273 is higher by £29,908. In the balance-sheet the directors' certificate testifies, in regard to the shareholders' funds, that the assets are in the aggregate fully of the value stated, taking into account the balance of the

profit and loss account; the investment reserve of £650,000 appearing as at December 31, 1939, no longer figures in the balance-sheet. Concerning the life funds, the assets of the "Eagle" and "English and Scottish" are certified to be fully of the value at which they stand, following the provision made for depreciation mentioned above when discussing the life revenue account. Stock Exchange securities in other funds are taken at market values at the dates of the last valuations, or at cost if since acquired, and the chairman indicated that there are ample surpluses to cover any depreciation which has so far arisen. There is a general reserve of £2,500,000, as well as an additional reserve of £100,000 in the fire fund.

Guardian Assurance.—Net new life, business completed by the "Guardian" in 1940 was £824,015, a reduction of 39.5 per cent on the previous year, and premium income fell by £38,740 (5.5 per cent) to £666,399. The net rate of interest earned on the funds was lower by 3s. 9d. per cent at £3 6s. 10d. per cent. Death claims at £290,720 were only about £6,000 higher, notwithstanding that war deaths cost £32,000; even allowing for these war deaths, the mortality experience was within expectation. Commission and expenses fell slightly from 13.4 per cent to 13.3 per cent of premiums. The company has charged £12,500 in the life account as provision for war damage contributions and has also, out of revenue, increased the investment reserve fund from £80,000 to £222,500; as an undistributed balance of £121,529 was carried forward from the last quinquennial valuation at December 31, 1939, there is doubtless an adequate margin of

(Continued on page 112)

balance sheet total of the fund at £908,350, after the transfer of £500,000 from general reserve, the appropriation of £250,000 to subsidiary companies and of £46,650 to write off war damage to retail premises. The freehold property reserve, after the inclusion of the latest provision, stands at £324,812. Total depreciation reserves amount to £1,425,657 and general reserve to £1,500,000 against total fixed assets of £5,618,703. Stock is up by £357,301 at £1,931,906. Cash holdings at rather over £45,000 show a rise of some £2,000 on the previous year, but a bank overdraft has been incurred amounting to £502,298. The 5s. ordinary shares at 36s. offer the conservative yield of £3 6s. 8d. per cent.

Guest Keen Report

Allowing for the rise in tax liability during the year to March 31 last, profits after tax of Guest, Keen & Nettlefold reached the satisfactory total of £1,165,507, against £1,302,134. The stability is no doubt partly due to the abandonment of the practice of valuing stock on a conservative basis—presumably involving writing down stock out of profits—for valuation at cost or market price, whichever is lower. Charges against profits, except for the allocation of £40,000 for war damage insurance, are at the customary level, depreciation receiving £200,000 as before. Consequently, the sum earned for ordinary stock is reduced from £675,290 to £500,489, representing a tax-free ordinary rate of 7.8 against 10.5 per cent. The following table indicates the trend of profits and allocations over the past three years:—

	Years to March 31,		
	1939	1940	1941
Profits after Tax	1,286,311	1,302,134	1,165,507
War Damage	...	...	40,000
Depreciation	200,000	200,000	200,000
Debiture Service	100,525	98,964	97,139
Preference Dividends	326,732	327,880	327,880
Ordinary Stock (Tax Free):—			
Earned	659,054	675,290	500,489

THE STOCK EXCHANGES

London

Note: All dealings are for cash

CONTINUED uncertainty as to the true progress of the Russo-German campaign and of the direction of Japanese policy, coupled with the fact that the technical position indicated a pause, has prevented an upward movement of prices. The undertone remained firm in all sections and price changes were few, although certain industrial groups moved irregularly. Interest was centred on the market for foreign bonds, where some important gains were realised. In the gilt edged market, price changes were reduced to a minimum, while in the commodity share markets turnover was also at a very low level, with price changes unimportant except where results announced have been unexpectedly good or bad.

The gilt edged market displayed considerable firmness, both before and after the week-end, and most issues were somewhat higher on balance, business being concentrated on undated stocks. The announcement of the United States loan to Britain had little effect on prices, although it served to encourage sentiment. At the beginning of the week, 3½ per cent. Conversion put on ½, 3½ per cent. War Loan ½, and there was also some demand for Indian Government issues. In mid-week, trading was again quiet and a number of leading issues eased ½. Dominion and colonial stocks were strong on Monday. In the foreign bond market, the previous Friday's falls in Chinese

issues were corrected by gains of 1½ points for the 4 per cent. loan of 1898 on the first two days of the current week, while the 5 per cent. issues of 1912 and 1913 also attracted attention. Japanese stocks generally reacted after the pre-week-end rise, but S. Manchurian 5 per cent. and City of Tokyo bonds continued to improve. Other features were the strength of the San Paulo Coffee loan, a jump of 3½ points for both Belgium 4 per cent. issues, and a rise in French rails on Tuesday. There was some demand for 6½ and 7 per cent German Potash issues and Brazilian stocks returned to favour after general falls of ¼ at the beginning of the week.

The home rail market was quiet pending dividend announcements. Ordinary stocks moved irregularly. Great Western ordinary fell ½ point after the week-end when Southern deferred dropped ½. On Tuesday, the 4 per cent debenture issues of LMS and Great Western also lost ½ point but later in the week some revival took place; "Berwick" 5 per cent preference, 1955, jumping 2 points on Wednesday. There was very little business among foreign rails. Prices mainly held firm and Canadian Pacific ordinary improved ½ on Tuesday.

The strength of brewery shares continued to be a striking feature of the industrial market. Gains of the order of 1s were common, being realised on Tuesday by Courage, Meux and Mitchell and Butler, while Guinness and Ind Coop:

Total allocations to reserves, including war contingencies, amount to £160,000, against £250,000, and the carry forward is raised from £463,671 to £482,437. The company's plant has presumably been fully employed during the past year, and advances to subsidiaries are increased by some £464,000, while other debtors are up by almost as much. The balance-sheet shows a rise in stock from £624,026 to £903,246, due in part to the change in the method of valuation. The adoption of the new practice does not mean a draft on past accumulations, which built up an adequate reserve during the years in which the more conservative basis was employed. General reserve stands at £2,930,339, including the allocation of £100,000 provided in the current accounts, and after the transfer of £500,000 to investment reserve. The assets side of the statement shows a fall of some £480,000 in the value of investments at or under cost, including associated companies, to £2,786,008. Net additions to fixed assets have risen from £126,803 to £195,181, bringing the total after depreciation to £2,445,751. Other items show movements which are now common. The £1 ordinary stock at 23s. 7½d., ex dividend, offers a tax-free yield of £4 4s. 8d. per cent.

"Johnnies" Recovery

The improvement in net income of Johannesburg Consolidated Investment from £269,945 to some £531,000 for the year to June 30th last is highly encouraging. Equity earnings are up from 6.8 to some 15.9 per cent, and the dividend, which is maintained at the reduced rate of 10 per cent, absorbs £395,000 gross. Thus, in the absence of allocations to reserve, the directors are able to restore the carry forward from £95,205, to which it was reduced from £220,262 in 1938-39, to a level of approximately £231,000. Last year's improvement must be attributed largely to the possibility of undertaking profitable share transactions and to the upward movement in the market valuation of investments which has presumably obviated the necessity of making further costly depreciation provisions. Prospects for the current year are intimately related to the course of market prices, but in any case it is satisfactory that progress of the companies in which "Johnnies" is substantially interested has been generally satisfactory, despite the increasing weight of Union taxation. Further analysis must wait on the publication of the full accounts. The £1 shares, at 34s. 4½d. ex dividend, offer a yield of £5 16s. 4d. per cent.

were also strongly supported. In the motors and aircraft group, Raleigh Cycle Holdings, Leyland and Rolls-Royce, on the preliminary figures, were conspicuously good. GEC, among industrial equipment issues, slumped 4s. 6d. before the week-end on the announcement of the cut in bonus but later ruled steady. Heavy industrials moved irregularly, price changes in either direction amounting only to a few pence. Boots, ICI and Lever and Unilever were fractionally lower among miscellaneous industrials. In the textile group, Courtaulds eased 7½d. on Tuesday and Coats was also offered during the week. There was some demand for shipping shares, notably for Cunard, P. and O. defd. and Union Castle, while, among the tobacco leaders, BAT and Gallaher fluctuated uncertainly.

Dealings in the kaffir market were on a small scale. Before the week-end, a strong demand for Sub Nigel raised the price by ½ while in the current week Durban Deep, Rand Mines and, among developing concerns, West Wit Areas all improved. Crown Mines and Springs suffered moderate losses. Business in rubber shares was at a minimum, but prices remained steady at the previous Friday's levels and, at the beginning of the week, Straits Rubber put on ½. The oil market enjoyed a number of small gains, but, here, too, turnover was small. Anglo-Iranian ordinary, Shell Transport and Burmah put on ½ at the beginning of the week, followed by gains of ½ for

(Continued on page 118.)

Industry and Trade

Tightening Steel Control

The control of Iron and Steel (No. 15) Order, 1941, which came into force on July 17th, is designed to tighten still further the control over the use of iron and steel. It provides for the incorporation in the distribution of steel supplies scheme of all iron products (except pig iron) from September 1st; the prohibition of the treatment, use and consumption of articles not controlled by the Order or for maintenance of articles not controlled by the Order or for the construction, alteration or repair of any building, without authority to treat, use and consume; and the limitation, by quantity and value, of purchases which may be made without authority by any one person from the supplies of a stock-holding merchant in any one quarter. The new schedule of maximum prices appended to the Order shows little change. In so far as the Order establishes still closer control over the utilisation of iron and steel it is to be welcomed, as are the steps taken to economise steel by the standardisation of specifications. True, the iron and steel industry has had a measure of success in overcoming the difficulties caused by the loss of some of its pre-war sources of raw material supplies. In fact, the output of steel compares favourably with the sorry experience of the coal-mining industry. But steel, and especially alloy steels, remains one of the scarcest commodities, and its use for unessential purposes cannot be tolerated. Indeed, the measures designed to tighten the control over the distribution of steel do not remove the need for a vigorous effort to increase domestic production still further and to make the most of home supplies of raw materials, such as iron ore and scrap.

Rayon Prices

For a very long time after the outbreak of war the price of rayon did not increase in the same proportion as that of other textiles. The increase in the price of the basic raw material was not large, and the proportion of the cost of raw material to the finished yarn is much lower in the case of rayon than it is with either cotton or wool. Gradually, however, the increased costs of shipping and insurance and the large increase in the cost of chemicals, together with the rise in wages and overhead charges, brought about a steady rise in the cost of production. It has now been announced that the price of yarn will be increased by 2d. per lb. on September 1st; this means that the price of a standard 150 denier rayon will be 55.7 per cent above the pre-war level. The increase in cotton yarn, however, is about 80 per cent, and of wool yarn 75 per cent since the war, so that rayon still enjoys a relative advantage. The price increase will have no effect upon the market, as demand is out of all proportion to available supplies. The price of staple fibre, which was raised a short time ago, is apparently to remain unchanged.

Farm Wage Decision Postponed

The Agricultural Wages Board has succeeded in deferring the question of farm workers' wages until after the harvest. So far, so good, since an increase just at harvest time would have had a particularly marked and immediate effect on the cost of living. None the less, the question will have to be faced squarely, and the fact that the farm workers' demand for a 60s. minimum has been under discussion for several weeks will not make it easier for the Government (whose business it is) to take the firm line about which it seems so hesitant. As was pointed out in *The Economist* of June 14th, the increase in farm wages since the war has been greater than that in almost any other category of wages. This relative improvement in the agricultural labourer's standard of living was certainly desirable, but it is very doubtful whether there is any justification at the present juncture for a further attempt at improvement. Such an improvement would prove largely illusory, since it would raise the cost of living; it would be obtained, for the same reason, partly at the expense of other poorly paid workers;

and, worst of all, it would directly conflict with the avowed policy of the Government to stabilise wages and prices as nearly as possible at their present level. This policy is being pursued far more by exhortation than by action, but agriculture, with its national machinery of wage regulation, offers an opportunity for more decisive measures by the Government.

Co-operative Trade

The trade of the Co-operative Wholesale Society for the quarter ended April 12th reflects the limitation of supplies. Sales, at £32,882,983, fell 1½ per cent below the level of a year ago, but supplies from the society's own works were 8 per cent higher at £11,624,940. The directors claim that the experience of the societies has been a great help in the general introduction of further rationing, and in the controlled distribution of limited supplies. One of them has been appointed by the Ministry of Food to deal with the problem of unrationed food supplies. Sales to the Ministry of Food for the quarter were £1,122,556, and the turnover of the export and contracts department rose by £476,855 to £849,005. Among the distributive departments there were decreases in grocery, drapery, men's wear, and furnishing, and increases of 13 and 18 per cent respectively in coal and boots and shoes. The largest increase among the productive works was in the output of the flour and provender mills, but this was only a money increase, and by weight the output was 2 per cent lower. The margarine output was £1,181,634, and showed an increase in both weight and value. At the quarterly meeting donations were recommended of £300 to the International Co-operative Alliance, and £900 to the Co-operative Union. Annual donations of 3,941 guineas to various charities were also made.

American Trade Pact

Geography and the investment of American capital in Mexican enterprises, have made for a close commercial relationship between the two countries. In 1939, for example, over 75 per cent of the exports of Mexico went to the United States, and 65 per cent of the country's imports came from its northern neighbour. The new trade pact, which Mexico signed with the United States on July 16th, brings the two nations even closer together. It provides for the purchase by America of all Mexico's surplus products, and for the control over the destination of shipments from Mexico of raw materials required for making munitions. Re-exports of United States materials are specially prohibited by the pact, which is valid for a period of eighteen months. An American representative of the Federal Loan Agency is now in Mexico working out details. Mexico is an important producer and exporter of petroleum, base metals, ferro-alloy minerals, mercury, antimony, arsenic, graphite and silver. The output of the principal minerals in recent years is shown in the accompanying table:—

MEXICAN MINERAL PRODUCTION †

The agreement seals yet another loophole in the Allied blockade, and it enables the United States to secure additional strategic materials from her neighbour.

Diamonds in War

Since May last year the diamond cutting and polishing industry working for the international market has been confined to a few small works in Great Britain, the United States and South Africa, which, owing to their limited facilities, can only treat the larger and better quality stones. The cutting and polishing of the smaller diamonds, formerly the mainstay of the industry, is largely in abeyance. Sales of industrial diamonds, true, have been stimulated by the war, but their prices have been kept at pre-war levels. The economic difficulties of the diamond mining industry, together with the calling-up of many miners for military service were responsible for the suspension of mining last autumn in South Africa and South-West Africa, although in the latter territory prospecting operations are continuing. Stocks, however, are sufficient to meet any likely demand. While the control of the British and international markets in rough diamonds has proved effective, it appears that between three-quarters and three-fifths of the stones cut in Great Britain are being purchased by residents in this country as a hedge against inflation, instead of being exported to the United States and that the equivalent in dollars of £650,000 to £700,000 per year are lost through these transactions. In reply to a Parliamentary question, Sir Andrew Duncan has stated in the House of Commons that he was already considering whether steps could not usefully be taken to achieve the object of securing the export of all diamonds cut in this country. In view of the comparatively small number of cutting establishments that there are, it should not be difficult to control their operations. Meanwhile, reports from neutral European countries indicate that the Nazis are aiming at the establishment of a diamond cutting and polishing monopoly on the Continent. The German Government is reported to have concluded agreements with the "Forminière" (the chief Belgian-Congo producers) and the Angola Diamond Syndicate for the supply of rough stones. These agreements, however, have at present little practical value, for the Belgian Congo is controlled by the Allies and shipments from Angola can easily be stopped on the way to Portugal.

COMMODITY AND INDUSTRY NEWS

TIN, standard cash, closed at £258 5s.-10s. a ton on Wednesday, compared with £256 15s.-£257 a week ago, and the three months' price was £261-£261 5s., compared with £260 5s.-10s. Pepper continues firm; on Tuesday white Muntok, spot, in bond, closed at 15½d. a lb., compared with 15d. on the previous Tuesday, while Lampung black was 10d. a lb., compared with 9½d. The new crop of maize, La Plata, is being quoted at 13s. 7½d. per 480 lb., f.o.b., compared with the former quotation of 10s. 6d. for old crop. This has resulted in a jump in the crop figure of *The Economist* Sensitive Price Index (1935 = 100) from 108.1 on July 18th to 114.4 on July 21st. The complete index figure rose from 135.7 to 139.5. From August 11th the maximum price for straw, baled on the farm, will be £5 a ton for oat straw and £4 for wheat, barley and rye straw.

Brazilian Coffee Shipments.—A message received by the Bank of London and South America gives figures of Brazilian shipments of coffee during January to April, 1941. A total of 5,114,765 bags (last year's total was 4,480,464) was exported, of which 4,528,214 bags (88.5 per cent) went to America compared with 2,492,968 bags (55.6 per cent.) in the corresponding period of 1940. The following shipments were made to other countries (last year's figures are given in parentheses):—Argentina, 117,791 bags (114,831); Canada, 36,893 bags (18,098); Egypt, 37,967 bags (50,554); Finland, 117,505 bags (20,269); other countries, 219,395 bags (1,783,744). Except for Finland, exports to Europe have been almost non-existent. The United States appear to be buying large quantities of coffee as an insurance against a possible future shortage of supplies.

Cotton Market.—Difficulties of trading in yarn and piece goods are still very pronounced and, owing to the limited supply of raw cotton and the concentration of production scheme, producers are not in

a position to meet the requirements of customers. Manufacturers of cloth are able to pick and choose their orders. The Controller is now allowing a larger use of raw cotton for the home trade, especially hosiery goods, but the deep engagements of most firms make it difficult to fit in special orders of this kind. Export cloth buying has run on much the same lines recently, most of the contracts being for South America, Java, the Dominions and the United States. Government buying has for several months been comparatively small but more inquiries are now reported. In the yarn market, it is almost impossible to buy certain counts and qualities, and many adjustments are having to be made to meet the abnormal conditions.

Import Licences.—From July 21st the Open General Licence permitting the importation without separate licences of cork, raw, granulated, shavings and waste, from all countries, and the one permitting imports of bones from the British Empire and other countries, were revoked. From then separate licences will be required, except for goods despatched before July 21st and imported into this country before September 21st. From August 11th separate licences will be required for the importation from Eire of honey, ice cream and similar preparations, jam and marmalade.

Willow Rod Prices.—Maximum prices for willow rods under an Order of the Ministry of Supply, came into force on July 23rd. Prices range from £18 a ton for ground willow rods, to £50 a ton for white or buff yearlings less than six feet long. Willows known as "Dicky Meadows" are not subject to the Order.

Miners' Clothes Ration Concession.—Miners returning to the collieries from other industries may now obtain their first new outfit of pit clothing and boots coupon free. Production of a certificate signed by the Mine Manager and one of H.M. Inspectors of Mines, stating that

Russia's Engineering Industry

While machine tools, plant, equipment and instruments have been the most important items in Russia's imports—chiefly from Germany, the United States and Great Britain—a determined attempt has been made during the successive Five-Year Plan periods to develop an adequate domestic engineering industry. Detailed figures of the growth of the industry are not available. But according to a report prepared for the Eighteenth All Union Congress of the Communist Party in February, 1941, the value of Russia's total industrial output increased by 44 per cent between 1938 and 1940, the first three years of the third Five-Year Plan. During the same period the value of the engineering industry's output increased by 76 per cent. The economic plan for 1941 emphasised the need for the production of specialised machinery and machine tools and demanded a further increase of 26 per cent in the industry's output in that year. The output of automatic and semi-automatic machine tools was to be increased by 76 per cent. Some indication of Russia's machine-tool equipment is given by a census taken in November, 1940. According to this census the total number of metal-cutting machines had increased by 200 per cent since 1932. The number of forging machines and presses had increased by 250 per cent during the same period. The census disclosed, moreover, that 30,000 machine tools were not installed and that another 38,000 were standing idle. Delayed delivery of parts, repairs and shortage of labour, it was stated, were the causes. There is no doubt that these machine tools could be a valuable reserve for Soviet Russia's war economy. The general plan published by the Commissar for the "machine-building" industry reveals the nature of the difficulties. Rationalisation of production, standardisation and improvements in the quality of output was the aim for the production plan for 1941. The actual programme was confined to 250 different types, mostly types important for the armament industry. The most interesting point in the 1941 plan for the "machine-building" industry is the construction of new factories in the Ural and Siberian industrial districts far away from the Moscow-Tula and the Donbas regions.

the clothing is essential, will take the place of coupons, and the retailer can use the certificate instead of coupons for his replacements.

Wholesale Tea Distributors.—Licences will be required after August 11th by wholesale tea distributors, and unless these are obtained from the Ministry of Food, distributors will not be permitted to sell. The sale of tea by wholesale for the purposes of the Tea (Licensing and Control) Order, includes a sale by wholesale to a catering establishment.

COMPANY MEETINGS

UNION CORPORATION, LIMITED

The ordinary general meeting of shareholders of the Union Corporation, Limited, was held in Johannesburg on May 27th, Mr P. M. Anderson presiding.

The chairman, in the course of his remarks, said: You have already been advised that we made a profit last year of £611,512, which was slightly lower than that of the previous year, so that, after allowing for the dividend declared, the balance on profit and loss account is reduced by £4,487, leaving £122,150 to be carried forward.

The declaration of an interim dividend of 2s. 6d. last October and of a final dividend of 5s. 6d. in March brought the total to 8s. for the year and absorbed £616,000.

On the whole, there has been no important change in our accounts. The reserve account remains unchanged at £2,000,000. Exploration expenditure amounting to £36,325 has been charged to exploration reserve account, for which purpose that account was established in 1937. Our current liabilities, arising in the main from deposits made with us on short-term both here and in London, are adequately covered by immediately available cash assets.

TAXATION OF INDUSTRY

The price obtained by producers for their gold last year averaged 168s. per ounce fine, as compared with 149s. 2d. during 1939, in which year the average market price of gold was 155s. 4d. and the difference was appropriated by the Government. Working costs on the Rand increased, on an average, by 1s. 3d., to 20s. 8d. per ton milled, due chiefly to increased cost of stores and additional realisation charges. The working profit of the gold-mining industry, excluding miscellaneous producers, reached the record figure of £47,525,000, due to the higher price obtained for gold and the larger output. Of this amount, about £26,500,000, or 56 per cent., went to the Government by way of direct mining taxation and share of profits. Excluding the duplication of dividend declarations due to some companies holding shares in other companies, the total net dividends received by shareholders amounted to £20,360,000.

The Government decided to abandon, as from January 1st last year, the procedure of appropriating the proceeds from the sale of gold in excess of 150s. per ounce fine and allow the producers to retain the full market price. In place of this appropriation they substituted a tax of 11 per cent. on gross taxable income before making any deductions for redemption allowance. From this source and a levy in lieu of realisation charges the Government last year raised an additional amount of about £7,200,000 over and above the proceeds from normal taxation and share of profits, which together amounted to approximately £19,200,000. As from January 1st this year the special war tax has been increased by 5 per cent., to 16 per cent., thereby increasing the estimated amount of additional taxation imposed on producers since the outbreak of war to about £9,400,000 per annum, based on last year's results. Furthermore, a tax of 5 per cent. has been imposed on dividends accruing to shareholders not resident in the Union and to bearer shareholders wherever resident.

The adoption of a principle of differentiation against overseas shareholders is regrettable in that it is just another barrier to international trade and enterprise. The burden will fall mainly on United Kingdom shareholders, as overseas investment in South African enterprise is dominantly centred in that country.

The chairman then reviewed the main features of the operating results of the gold mining companies on the Witwatersrand under the administration of the corporation. He then proceeded:—

ORANGE FREE STATE

In regard to our activities in the Orange Free State, I have little to add to the information given in the directors' report. We have purchased the mineral rights over 4,024 morgen adjoining the property of Western Reefs Exploration and Development Company, Limited, and further exploration work in that area will be carried out when world conditions permit.

Western Holdings, Limited, with whom we are collaborating, has obtained the Government's approval to the grant of a prospect-

ing and mining lease in respect of certain farms in the area north of the Sand River, where drilling disclosed encouraging values. We participate with Western Holdings and other mining houses in this venture and will assume the technical management of all operations. Further exploratory work by means of underground prospecting will be commenced as soon as conditions are favourable.

OTHER INTERESTS

We have a dominating holding in Bay Hall Trust shares. It is, therefore, pleasing to be able to tell you that the trust repeated its dividend of 6½ per cent. for the year and placed £10,000 to the credit of realisation reserve account, leaving its unappropriated balance practically unchanged at £71,328.

British Enka continued to make excellent progress for the greater part of last year, but more recently profits have been slender.

San Francisco Mines of Mexico continue to open up excellently; but low lead and zinc metal prices, labour troubles, and taxation based largely on revenue rather than on profit, have deprived the shareholders of any reward for the year's work.

Our Rhodesian copper interests lie in Rhodesian Selection Trust and Roan Antelope. The former depends for its income upon the dividend it receives from the Mufulira Copper Mines. That company, in spite of earning a net profit last year of £1,608,000 as compared with £1,041,000 for the previous year, was obliged to reduce its dividend to 2s. 3d. per share as a consequence of two-thirds of the profits having to be set aside to meet taxation liability. The company suffers from a most unfair profit standard for excess profits tax, which, in common justice, must sooner or later be amended. The reduction of the Mufulira dividend resulted in Rhodesian Selection Trust's dividend being reduced from 10d. to 8d. per share. Roan Antelope also earned a much increased net profit but, contrary to the Mufulira experience, it was able to raise the dividend from 9d. to 1s. as it, fortunately, does not suffer so much from the peculiarities and incidence of excess profits tax.

The report and accounts were adopted.

HENDERSON'S TRANSVAAL ESTATES, LIMITED

DIVIDEND OF 10 PER CENT

The 29th ordinary general meeting of Henderson's Transvaal Estates, Limited, was held on July 23rd in London.

Mr. W. L. Castleden (chairman and managing director) after referring to the loss they had sustained by the death of their chairman, Sir Abe Bailey, Bt., said that in the balance-sheet sundry creditors showed an increase of £26,700 to cover prospective taxation and the increase of £2,800 in the next item on the balance-sheet represented a higher deposit with them by a subsidiary company. At the same time, cash, investments and sundry debtors were reduced by £22,900. Against that, however, temporary advances to subsidiary companies, £11,808, and dividends and interest outstanding, £35,228, were increased by £44,500, and with the exception of a few pounds those had all been received since the closing of the books. According to the above figures they had a drop in liquid assets amounting to £7,900, and that was due to the dividend last year exceeding the profit earned by £9,300.

They had called attention in the report to the fact that the market value of quoted securities as at March 31st was below book value, and with the severe depreciation in most markets that was inevitable. In the majority of cases where there was depreciation they could reasonably look for a substantial recovery in happier times. All the same, they were indeed in a fortunate position with a reserve gradually built up in past years which amply covered any writing off they might have to consider at some future date, and which was ample even if no recovery took place. Revenue showed no serious decline and it was a matter of satisfaction that their net profit was reduced by no more than £755 for the year. As a result they were able to recommend the payment of a dividend of 10 per cent. and to increase the carry forward to £49,212.

It would be most unwise to speak of the future, except to stress the fact that the increasing load of taxation and increasing costs both in this country and in South Africa must affect the incomes of individual and business concerns alike.

The report was unanimously adopted.

OHLSSON'S CAPE BREWERIES,
LIMITED

CONSIDERABLE EXPANSION

The ordinary general meeting of Ohlsson's Cape Breweries, Limited, was held, on the 24th instant, in London.

Mr Geoffrey Dent (the chairman) said that there had been an increase in the profit on trading and rentals of £100,525. That very considerable expansion reflected the great increase in the demand for their products. All their breweries had in fact been working to capacity throughout the year under review. The main factors contributing to that demand had been the development of war industries in the Union, the large numbers of men in training in camps throughout the country and the diversion of convoys and shipping round the Cape. They had had the benefit during the year of considerable stocks of brewing materials, purchased at favourable prices. Those materials would, of course, have to be replaced during the current year at higher cost. There was bound to be some difficulty in importing all their requirements. Fortunately they were able to obtain a large proportion of them

within the Union. The development of the hop-growing industry in South Africa, which had been jointly undertaken over a number of years by the South African Breweries and themselves, was now proving its value. It was proposed to pay a final dividend of 10 per cent. on the ordinary shares, making a total distribution of 15 per cent. for the year.

They would all be aware of the increases in taxation that had been imposed in this country. In addition the rate of Union income tax had been raised from 1s. 9d. in 1939 to 3s. 6d. and the excess profits duty in South Africa had gone up from 50 per cent. to 66½ per cent. It was still to be determined how the excess profits tax was to be adjusted as between the Governments of Great Britain and South Africa. In addition new taxes had been imposed in South Africa in respect of dividends paid to non-resident shareholders and a tax on undistributed profits if those exceeded a certain proportion. It seemed clear that the non-resident shareholders' tax could not be passed on to the shareholders who were outside the jurisdiction of the Government imposing it. The whole charge would, therefore, fall upon the accounts of the company.

The report was adopted.

(Continued from page 114)

the two latter on Tuesday, when Royal Dutch improved ½. Mexican Eagle ordinary was in demand and there was some improvement in VOC and Trinidad Leaseholds.

New York

BOTH before and after the week-end business on Wall Street was slow and listless. Price changes were extremely narrow and showed no definite trend, sentiment being dominated by the uncertainty of Japanese policy, the future of the Russo-German campaign and the possibility of new tax legislation. Later in the week, a strong improvement took place. Most leading issues improved in active trading, while steel and rail issues were dominant. Profit taking eliminated much of the improvement, but some net gains were retained. In midweek, news of the United States loan to Britain had little effect on prices and the market closed easy after profit taking.

The Iron Age estimates steel mill activity at 99.5 per cent of capacity against 97.0 per cent in the previous week.

Work in Progress

IN his statement on production to the Commons on Tuesday, the Prime Minister denounced complacency and captious criticism with equal vehemence. He told the numerous "V for a vicarious victory" enthusiasts that "it would be madness to suppose that Russia or the United States is going to win the war for us." Categorically, with no mention of the likely fortunes of the Russian armies by that date, he mentioned September 1st for the *qui vive* against invasion. His refusal to appoint a Controller of Production he justified by explaining that one existed already in himself—and later he told the House that the watch for bottlenecks was kept on his behalf by Lord Cherwell, his personal statistical assistant.

It is impossible not to agree with the Member who said in Tuesday's debate that, if a speech of the calibre made by Mr Churchill had been made in the original debate a fortnight before, this further discussion would not have been necessary. It was an impressive and revealing story that he told. On the actual process of planning, the Prime Minister informed the House that in the first quarter of the year he himself, as Minister of Defence, prepared a composite programme of production and imports based upon the revised strategic needs of the three Services. This "war supply budget for 1941," which "comprised a perfectly clear apportionment of reserves and tasks," was approved by the War Cabinet on March 31st, and it was then left to the three supply departments, the Admiralty and the Ministries of Supply and Aircraft Production, to execute the scheme, with the Production and Import Executives of Ministers to allocate resources. "In the last four months (Mr. Churchill declared) no question of departmental rivalry has been brought to me or to the War Cabinet from the Production

Executive." Most important of all, "we have no more of those arrogant, absolute priorities in virtue of which one department claimed all there was of a particular commodity and left nothing to the lesser but indispensable needs of another. The method of allocation of labour, materials and facilities has to a large extent replaced the scale of priorities. Allocation is the Government principle."

Here was the answer to many of the earlier questionings; here were the man and the method so widely asked for. But the doubt will remain whether it is humanly possible for Mr Churchill to serve as Captain-General and Controller of Production, as well as Prime Minister, at one and the same time. Moreover, it was not as an end in itself that this kind of Cabinet and departmental organisation was called for, but as a means of translating resources into the maximum war output. Production for the Ministry of Supply in the last three months was one-third greater than in the three hectic months of "the Dunkirk period"; and output in the seventh quarter of the war was equal to production in the fourteenth and final quarter of the last war. This is notable progress. But the real question is whether more even than these very formidable achievements can be accomplished. Every proposal that has been made by the vast majority of the Government's critics has been designed to secure a still higher yield of weapons and equipment.

Mr Bevin startled the sceptics—and many responsible business men—by saying that, in spite of the Battle of the Atlantic, there was no raw materials problem. But in the earlier debate, Mr Macmillan had stated "by the Minister of Labour had satisfied every need and air Ministry of Supply for workpeople. It is and is greatest. ask whether, in these conditions, the me of the country's capacity, and it is h

conclusion that the utmost effort is being put forth when, in spite of the fact that the labour working for the Ministry of Supply has risen by a third since the "Dunkirk period," there are still so many men and women engaged on non-essential tasks, and when the life of the nation is still so far from a full war footing. Among the limits which Mr Churchill listed to the power to produce were the workers' need for rest and relaxation, and it is difficult to see why this plain need has not been met more generally by training and taking on new recruits instead of by slowing factories down. Actually, Mr Macmillan speaks with two voices. Also in the earlier debate, he said that double shifts were impossible to contemplate because of the large additional employment that they would imply, and it is probable that, in fact, both manpower and materials are actual or potential restraints to output. It is certain that quite the most important task at the moment is to make the utmost use of materials by stringent allocation, efficient methods of manufacture and successful salvage; and it was precisely because of this problem of making the most of limited resources that the soberer critics asked for a Controller of Production. They did not want a super-Ministry or some Napoleon. They wanted the tightest possible means to be devised of running, day-to-day control over the progress of production in the factories so that no energy should be lost at any point in the war machine through slipping of the cogs because of inefficient management or local frictions.

Naturally, Mr Churchill had not the time to go into all the detailed cases that critics had advanced of production shortcomings, though these details (which will shortly be discussed at some length in an industrial article in *The Economist*) are in fact the nub of the matter. They may not represent the main corpus of production—which was the Prime Minister's point when he described them as merely the "fringe." But these ragged edges—and Mr Churchill did not deny their existence—do represent wastage of resources and lags in achievement; and it is to spot and apply the scissors to them that this whole-time controller with a roving staff of expert technicians and power to act has been called for.

Actually, the real issue probably goes deeper than either forms of administrative organisation or industrial symptoms. It is not that a plan for wartime production is lacking but rather that the plan for wartime society is incomplete. It is still the policy to rely upon "normal processes" to man the war factories and to run them, while at the same time, as Mr Churchill pointed out, almost all firms are working under Government control. The result is neither flesh, fowl nor good red herring.

Sanctions Against Japan

AGGRESSION marches by familiar ways. In 1931 the Japanese invaded Manchuria, and since 1937 Japan has been waging a war of aggrandisement against China—and against every foreign interest in Chinese territory—with only a sequence of formal protests from Britain and the United States. It is only now, when the aggressive activities of Japan, an Axis partner, have become part of the pattern of world conflict which has its centres in Europe and on the Atlantic, that protests have hardened into threats and threats into the promise of action. By "agreement" with the dishonourable Vichy Government of unfree France, Japanese forces have taken up their station in the ports and on the landing grounds of Indo-China—to "protect" the country from the imaginary designs of Mr Churchill and Generals de Gaulle and Chiang Kai-shek. Pressure is being put upon neighbouring Thailand for concessions. Free China is directly threatened; still at a distance, the Netherlands are menaced; and the decision to apply sanctions against the aggressor has apparently been taken. In neither Britain and the British

Where a worker will sign on and how hard he will work is, of course, still decided by the relative wages he can secure; rightly, and the motive of an employer is still the incentive of profit. And, in fact, it often happens that both workers and employers are neither forced by the State nor induced by the promise of reward to make their maximum contribution to the war effort. They do not move quickly into place for the battle; they may even be reluctant to participate at all—because wages are higher elsewhere, because war measures mean personal loss which is not compensated or because they cannot give up their peace work on account of the monetary obligations which they cannot escape. There can be no real pooling of managerial skill or technical ability while it is the responsibility of individual firms to bear the risks of policies over which they have no control; there is no principle of compensation for necessary losses. In the distribution of food as well as in output the same anomaly appears. It has been left, in many directions, to "normal trading" to eke out supplies on an equitable wartime basis; and the interest of the individual and that of the community have not always coincided. There is a no-man's-land where there are neither incentives nor commands.

It can be argued that, within the limits set by these social drawbacks, something which will approach a maximum effort is being developed. The Prime Minister did argue thus. But few engineers or economists would wholly agree. Yet there is no disagreement about what the objective is. Mr Churchill phrased it straightly enough—"a superb, intense and prolonged effort . . . the utmost endeavours of our strength and virtue and, if need be, the last drop of our heart's blood." Simply, it is victory—at any cost.

Mr Churchill spoke of the "flouts and jeers" and "vulgar abuse" that had cried "stinking fish" on the British war effort; and there are tiny knots of splenetic and jaundiced people here and there, often "experts" and usually ambitious politicians, journalists, engineers and economists, who have made criticism their business and cavilling their creed. They are the professional "knockers," the Woe Woe men who never have a good word to say of any act of public policy. But they are negligible in numbers and a thousand times less influential and subversive here where they can shout than in Germany where they can only whisper. The overwhelming majority of the critics are not like these. They are Mr Churchill's best friends; and, in his own words, it is their duty and their mission to be "a prompt and vigilant alarm bell, ringing when things are not going right."

Dominions nor the United States can orders be carried out affecting Japanese balances, gold or securities without official licence. In Britain the three existing trade agreements with Japan have been denounced. In the Netherlands Indies, after some days of delay, monetary dealings with Japan have been arrested; exports to Japan, Manchukuo, China and Indo-China have been made subject to special licence. But the report that the Dutch agreement to supply Japan with 1,800,000 tons of oil this year had been suspended has since been denied—"it all depends."

Until now, the policy of the Powers towards Japan has been one of unmodified appeasement. The ways of the democracies on the defensive have been no less familiar than the course of aggression; and last week Mr Roosevelt frankly stated the long-standing attitude of the American, British and Dutch authorities towards Japan when he declared that American oil had been shipped to Japan in the hope that the Japanese Government would not attack in the Pacific. The sop has been to little purpose. The Japanese war machine has been supplied and stocked—until the democracies' own defence and

war needs reduced the flow of metals and materials.

It will perhaps be argued by the supporters of soft words in the Far East that, until now, with the United States still on a peace-time footing, with Britain at close grips with the German enemy and with Holland captured, discretion was the better part of valour until action became inescapable; that action was impossible until Singapore and Manila, Malaya and the Philippines were fully manned and reinforced. It will perhaps be argued that, even now, Japan has not finally cast the die. Indo-China is the property of demoralised France; and between Saigon and the rich East Indies lie the naval and air forces of Britain and the United States. Japan, it may be said, is still too cautious and too insecure economically to invite a conflict with Hitler's enemies and the chief suppliers of Japanese industrial imports. But these are old delusions. They contradict each other, for they depict a

Japan that is too strong to be provoked at one moment and too weak to be dangerous at another. In fact, only Japan has benefited. Aggression has not been checked but fortified, economically and strategically. Thailand and Indo-China have been brought within the military sphere of Japan without loss of men or materials; and the strategic disadvantage to Free China and the democracies is plain enough. Very likely it was physically impossible for Britain and America to forestall or prevent this manoeuvre—even though it has been conducted at a distance of some two thousand miles from Japan's home bases. For a decade, it has been weakness, and not the statesmanship of free choice, that has been disinclined to "provoke" Japan, that has watched bastion after bastion in the East fall into hostile hands, that has seen properties and prestige trampled upon along the China coast, that has left Hong Kong encircled, that was even tempted momentarily to barter Chinese resistance for a few more comfortable months and that now finds a foe on the very threshold of the Indies.

Whether this past weakness was mostly moral or material perhaps hardly matters. The question now is whether Britain, Australia, New Zealand, the United States and the Netherlands Indies are willing and able, severally and jointly, to stand firm at last. It is obvious that a complete blockade of Japan would be a grievous blow, for Japan is one of the only two really blockadeable

Powers in the world—the other, another island, is Britain. In peacetime, over half of all the imports of Japan came from the United States and the British Empire. The Japanese textile industry is dependent upon raw cotton from India and America. It is upon the British Empire, the United States and the Netherlands Indies that Japan has to rely to make up grave deficiencies of iron and steel, scrap, nickel, ferro-alloys, aluminium, rubber, oil, lead, copper and tin. Something like nine-tenths of Japan's war supplies are said to have come from the United States and the British Empire; the war against China has been nourished by China's "friends"; Japan's war reserve is British and American built. Japan has been an importer of British and American capital and a dependant for the means of payment, as well as for goods. The freezing of British and American assets in Japan is, in itself, a heavier blow than the freezing of Japan's assets in Britain and the United States, for Japan is a large debtor on balance. Over a third of Japanese exports in 1938 went to the United States and the British Empire, and the British Colonies depend largely on imports of cheap Japanese goods. Almost all Japan's important export trade in silk, which has been used to subsidise rice-growing, is directed to America.

The first steps towards blockade have been taken; and the freezing of Japanese assets is intended to make it possible to stop trade at the source. The full implications of the blockade are discussed on pages 131, 136, 143 and 148. It is obvious that, without the means of payment, Japan cannot buy. Every shipment of goods from Britain, the United States and the Netherlands Indies will now need Governmental authorisation, so that it has become possible to sever every trade link between those countries and Japan at once; and, outside the ring, Mexico and Venezuela would find it hard to do business with Japan without American dollars. But trade relations have not, in fact, been cut off. Britain's denounced commercial treaties do not expire for six months or a year; and the decision whether some American trade with Japan will go on is to depend, like the similar decision of the Netherlands Indies, on the "international situation." Apparently, there are still loopholes, and bargaining is not ruled out. The Eastern aggressor is threatened, but still not uncompromisingly resisted, and it has been threatened before.

It is not a sign of strength in the democracies that Indo-China has been occupied by the Japanese without any military or naval steps to counter it. It will be a sign of positive weakness if more time elapses without a joint statement by the Governments concerned that a total blockade is intended—without parley—so long as Thailand is threatened and Indo-China is held as a dagger towards Burma, China, Malaya, the Dutch islands and the Philippines. Mr Menzies has spoken about his country's desire for peace in the Far East, when it is security, and not any illusory peace, that the countries of the Pacific, the Netherlands Indies as well as Australia, need and will not get from Japan. It is said that certain Far Eastern oil interests are alarmed about the loss of markets. But Japan will not grow weaker by concessions. To be effective, sanctions must be backed by force, economic sanctions by military ones. It has been the American thesis that, the more effectively Japan was blockaded, the more ready Japan would be to fight. The need now, therefore, is not to search for some way out, some formula or patch-work bargain. What is wanted is, not only an uncompromising statement of blockade while these Japanese threats are maintained, but also a straight pronouncement by the Powers that they, too, are ready to fight.

The threats offered by Japan should be neither over nor under-stated. Danger to the Burma Road and to the democracies' Chinese ally there undoubtedly is. It is not impossible that some plan to circle round Singapore to Borneo and Celebes in the south-east and Sumatra in the south-west is being held in readiness by the Japanese commanders. But the peril of land and air penetration from Indo-China and Thailand is greatest.

Distances on small maps are deceptive; Manila is athwart the route from Saigon to Nagasaki; and Singapore, which is surely no less strong than Malta and Gibraltar, which still stand unconquered in the narrow Mediterranean, masks the Netherlands Indies. The "China incident" is still Japan's first concern. But it is not Japan's last. Soon, if not now, the whole South Seas are in danger from this aggressor; "the uniting of all these regions under a single sphere" is Japanese policy; and the occupation of Thailand and Indo-China by Japanese forces will advance the day when caution will be over-mastered by ambition.

It is not possible to rely on economic collapse, even under blockade, to bring Japanese aggression to a swift end. The drain of the war in China has indeed been very considerable. There is rationing and there are serious shortages, even of food. Japan, at peace and unaggressive, could perfectly well have spared the exchange and shipping to import rice and other foods to fill the gap. There would be sufficient supplies of fish oil and fish in Japan if heavy exports had not been sent to Germany in the last eighteen months. Much of the abnormal quantities of copra, coconut oil and castor seed imported by Japan in 1940-41 have gone on to Germany. It is true that large armies in China and Japan have required feeding, that Japanese labour has tended to move from farming to the war factories, and that crops have somewhat fallen. Fertilisers have been scarce because of the diversion of Japan's electric power from fertiliser to other production, and because of the use of nitrates for explosives; and the policy of keeping down food prices has discouraged producers. Japan, like Nazi Germany, has blockaded herself in peacetime. But Japan is normally nearly self-sufficient in foodstuffs; exports to Germany are now cut off by Russia; and heavy stocks of cereals and fats have been built up against the event of war in the Pacific.

There are war stocks of materials as well. Japan is

economically very vulnerable; and Japanese staying power must be measured in months rather than years. But Japan will not burst like a pricked bubble if a new war in the Far East does start; and the Japanese people are as used to privation as any eastern people, or as the helots of Nazidom. In Indo-China there is rice and fish, zinc, tin and wolfram. In the scattered region towards which the tentacles of Japanese ambition are feeling their cautious way—Burma, Thailand, Indo-China, Sumatra, Borneo and Celebes, Malaya and Java—there is all the world's rubber and three-quarters of its tin. There is oil, sugar, coffee, tea, rice and tobacco.

It may be that Japan will be content to snatch these fresh footholds and then to wait—for a new opening for further advances. It may be that a limited drive into the Russian sphere in the north of China is projected, though the Japanese Government clearly has no interest in fighting Hitler's war. Probably Japan has no desire to fight at all; and in spite of the freezing of British, American and Dutch assets in retaliation, by Manchukuo and puppet China as well as by Japan, there are signs of a Japanese desire to keep the doors of commerce and finance open. But the demonstration of any similar desire on the Allied side might well be fatal. It would only be taken to mean that the democracies were too weak to stand in league against the common danger.

It is not enough to voice regrets and warnings. The framework for an economic front has been made; and Britain and the United States have taken military and naval precautions. Singapore is strongly supplied and manned. The land, sea and air forces of the Philippines have been placed under American command. It is still true, as Bismarck said, that the most important factor in world history is the fact that Britain and the United States speak the same language; and what they say together in the Far East now must be strong, forceful and without reserve. It is not a question of wilfully electing Japan as a new foe. Japan has nominated herself.

Food and Farming

LAST week's Commons debate on food production and distribution was the first full-dress debate on the combined activities of the Ministries of Agriculture and of Food. The Minister of Agriculture stated categorically that in the third year of war as much food in sum should be available as in peace-time; and the discussion turned upon the production of food for direct human consumption instead of for feeding animals, upon the diversion of war-time diets to replace lost or lessened staples and upon the mechanics of distribution—upon the necessity for the fair and reasonable distribution of those unrationed foodstuffs that are at present scrambled for or forestalled, and upon the need for complete price control and for preferential treatment for special classes.

The task is one of adaptation and readjustment, in which the factors to be redisposed are land, labour and shipping space. And the war-time problems of dairy farming stand out. The direct consumption of liquid milk is rising while production falls; the margin obtained earlier in the war by diverting supplies from manufacture and the making of butter and cream has been exhausted; and working stocks are endangered. Despite the recent assurance that imports of tinned milk from New Zealand and the United States will prevent an absolute shortage of milk in the coming winter, it is more than likely that supplies of liquid milk may fail to meet demand from, say, November this year until next February. The Minister of Agriculture admitted in the Commons that "if conditions are very difficult this winter, the public may expect some slight shortage"; and the facts suggest that the position may in fact be worse.

Milk production in this country reached record levels in the two years before the war. Since then, the difficulty of obtaining feeding-stuffs, skilled labour and suitable transport has caused production in England and Wales

to be reduced only to within 10 per cent of this record output. But consumption has risen "from 760,000,000 gallons in the last pre-war year to 880,000,000 gallons in the current year"; and, owing to the highly seasonal nature of milk production, it will be in the winter months that the gap will become evident. Last winter there was a moderate shortage. Next winter the shortage of liquid milk, however much it may be alleviated by the use of tinned supplies, will probably be worse.

This prospect has serious implications for national nutrition, to which attention has been recently drawn by Lord Dawson of Penn in the House of Lords and in the Press. Liquid milk is of great value for both children and adults. In war-time, when many other sources of protective food are unobtainable or in short supply, it is an essential food for which there is no substitute; and there is no doubt that the maintenance of milk supplies so far has done much to bring about the excellent health record enjoyed by the public despite rationing, bombing and shelter life. Mr Hudson gave an assurance in the Commons debate that "the Government realises the importance of milk"; but it is still not absolutely sure that the Government has taken every possible step to give precedence to dairy farming.

It is clear that the whole output of home-produced milk should go into the liquid milk market rather than into the production of, say, butter. In fact, of course, very small quantities of home-produced milk, if any at all, are used for the production of butter, of which almost the entire supply is imported, though the domestic milk supply is still not exclusively reserved for liquid consumption. Home supplies of milk, which are limited most strictly by supplies of feeding-stuffs for dairy cattle, can only be increased at the expense of beef production. This is the immediate point. Admittedly no simple switch-over

from meat to milk is possible, because the accommodation and labour that are suitable for beef cattle are in many cases not suitable for dairy farming; and many farms that could make themselves self-supporting in fodder for beef cattle could only do so for considerably fewer dairy cattle. Supplies of imported oil cake are necessarily limited, and the change would mean a net reduction in the cattle population which would no doubt result in some loss of soil fertility through the deprivation of natural manure. But the maximum production of milk remains paramount for war-time needs; and it is by no means certain that, even in the more normal context of peace-time farming, cattle farming merits the deference that it receives.

The future of British agriculture is still undecided. It is probable that, in any case, the farming community must prepare to embark after the war upon dairy farming in a larger way in order to keep pace with the rising secular trend in milk consumption for which education, cheap milk schemes and the spread of medical advice have been responsible, despite the high cost of milk to the normal consumer. It is perhaps not widely realised that, even in peace-time, the Milk Marketing Board was only just able to meet demand and hold normal stocks in the winter months despite record production and that, without any war, there might well have been some shortage of liquid milk during the winter months in the course of the next few years. Now, in war-time, unless dairy farming capacity can be expanded, there is every reason to expect something like a permanent shortage of milk in the winter months. It seems plain that, while the war lasts, the Ministry of Agriculture will have to aim at higher milk production even if it must temporarily be at the expense of beef production; and, in the long run, the prosperity of British agriculture may well depend on its being able to give the public milk, rather than on any insistence on protection to keep out cheap meat from the Argentine or cheap grain from the United States and the Dominions.

Light is shed on the consumption of milk by the publication of a preliminary report on a survey carried out in 1938 and 1939 by the Oxford Agricultural Economics Research Institute. The survey covered 17 areas, two of which were the London electoral divisions of Poplar and Marylebone, the remainder being widely distributed throughout the country. The populations of the towns visited, according to the 1931 census, ranged from 239,000 in Leicester to 7,000 in Brynmawr. Considerable trouble was taken to ensure that in each district a random sample of householders should be visited. The total number of complete records obtained in the first survey taken in May-June, 1938, was 11,987. In the second survey, taken in January-February, 1939, 11,489 records were obtained. There is every reason to believe that these records are an unbiased sample and present a fairly accurate picture.

The survey endeavoured to obtain answers to five questions: the size and occupation of the household; the amount of milk used per week; the use to which the milk was put; the quantities of milk products bought each week; and the amount of the weekly food expenditure which was spent on milk. The results throw considerable light on the extent to which, in peace-time, England and Wales were dependent on the consumption of milk and convey some impression of the degree of hardship and the nutritional danger which would be involved in a decision to reduce still further the supply of milk for liquid consumption.

The survey brought to light the surprising fact that, while the average number of persons per household was between three and four, over 56 per cent of a total of 11,495 households contained no children at all. Households containing two adults accounted for 49.2 per cent, and households containing one child for 22.7 per cent of the total. Less than 10 per cent of the households contained more than two children. The average weekly consumption of liquid milk per head, including that drunk

* "Milk Consumption Habits." K. A. H. Murray and R. S. G. Rutherford. Oxford: Agricultural Economics Research Institute. 112 pages. 2s. 6d.

at school and at work, was found by the earlier survey, for 10,987 households, to amount to 3.71 pints. This figure is higher than the estimate provided in Sir John Orr's study, *Food, Health and Income*, which places the weekly average at 3.10 pints per head. Of the total of 3.71 pints, it is estimated that 92 per cent was consumed at home. The average cloaks a considerable disparity between the actual towns visited, ranging from an average weekly consumption per head of only 2.04 pints in South Shields to a high level of 4.38 pints in Oxford. The following table, which shows average weekly expenditure on food, average size of household, and average weekly consumption of milk per head, indicates that there is a rough correlation between food expenditure and milk consumption:—

ESTIMATED WEEKLY MILK CONSUMPTION 1938 AND 1939.

Town	Average weekly food expenditure per head	Average size of household	Average weekly consumption of milk in the home per head	Proportion of milk used raw	Proportion used for tea, coffee and cocoa
	s. d.		pints	%	%
Brighton	10 5	3.11	4.11	19	31
Leicester	10 4	3.41	3.96	19	35
Wallasey	9 11½	3.42	4.17	19	31
Newton Abbot	9 11	3.28	3.90	18	41
Oxford	9 10	3.65	4.38	16	45
Huddersfield	9 7	3.27	3.38	26	28
Salisbury	9 7	3.37	4.26	16	31
Poplar	9 5½	3.69	2.59	20	36
Crook	9 1	3.44	2.34	18	33
King's Lynn	9 0½	3.62	4.01	14	38
Penrith	9 0	3.43	3.75	20	41
Blackburn	8 11	3.51	3.47	17	45
Wrexham	8 8	3.87	2.48	14	37
Llanelli	7 11	3.47	2.10	19	49
Brynmawr	7 8	3.54	2.04	24	41
South Shields				20	27

The table also provides some indication of the proportion of milk used raw and in hot drinks not made mainly of milk. In the survey as a whole, 19 per cent was consumed raw; 36 per cent for drinks not mainly made with milk; 27 per cent for cooking; 11 per cent for drinks mainly made with milk; and 7 per cent in miscellaneous ways, including with breakfast foods and stewed fruits. Thus, approximately one-fifth is drunk raw and rather over two-thirds is used either for cooking or in tea, coffee or cocoa.

The Oxford survey appears to have established beyond doubt that any cut in average milk consumption would mean reducing average consumption to less than half a pint a head per day, an allowance which would impose considerable hardship on large numbers of consumers whose taste for milk is formed and whose health benefits thereby, but would still leave unaffected many millions of consumers in the lower income groups. If a cut had to be made, there is a good case for extending the preferential treatment, contained in the cheap milk scheme, to those households containing children under 15. There is also a good case for maintaining that where a taste for milk is formed, its satisfaction is the first and most important step towards adequate nutrition.

In so far as it will be necessary to eke out liquid milk supplies next winter with tinned milk, account should be taken of the preference for the latter commodity among certain sections of the population. If there is any liquid supply left over after meeting the needs of mothers and children, it would be wasteful to ration it with arithmetical accuracy among the entire population. A more satisfactory method would be to ration it jointly with condensed milk, thus allowing some play to individual preferences. The Oxford survey found that in certain geographical areas there was a well defined preference for tinned milk as being more convenient and actually more agreeable.

On the wider issue, it cannot be urged too strongly that the production of milk in the short run should be preferred to the production of beef, and that, in the long run, a chronic winter shortage of liquid milk can only be avoided if the capacity of dairy farming is increased. There is a good case for attempting to do this in war-time when the need is particularly urgent.

NOTES OF THE WEEK

Russia Fights Back

In the sixth week of the Russo-German campaign, the tempo of the German advance has been slowed almost to a halt. The battle still sways in ding-dong fashion along a line which stretches from some 50 miles west of Petrozavodsk in the north through the Porkhov-Novgorod and the Smolensk-Mohilev sectors to Zhitomir in the Ukraine; and no significant progress has been made in the sixth week in the attacks towards Leningrad, Moscow or Kiev. This rough line, which broadly indicates the directions in which the main German pushes and Soviet counter-thrusts are taking place, is, of course, no line in any exact sense, but a front of some 150 km. in depth, in which both armies have in many instances encircled each other and gained local successes. In the past week, the net German gain appears to be almost negligible, and it has probably been found necessary to refit material and reconstitute exhausted troops. It is important that the German Press last week-end endeavoured to bring home to the German public the impossibility of ending the war simply by mechanised advances. The German infantry is now to be engaged on a large scale. The next week may see a determined attempt to force the Russian defences, which are restraining the southern pincer of the advance on Leningrad between Porkhov and Novgorod, and also to reduce the oft-claimed Smolensk. The advance of Marshal Mannerheim's Finnish forces on Petrozavodsk is among the most serious threats to Russian cohesion, since success in this operation would cut the Murmansk-Leningrad railway. Good proof of the inconsiderable success which has attended the German advance so far is contained in the moderate claims of captures in the communiqués of the German High Command. *Blitzkrieg* tactics, successfully carried out, yield a by-product of large numbers of captives. An outstanding feature of the campaign has been the ability of the Russians to fight on when surrounded, or to withdraw intact; and this means that, inevitably, the German method of advance must be, not by the swift swoops and scoops of earlier campaigns in this war, but by the slow, methodical, punishing and exhausting process of finding, holding and reducing every considerable force of Russian troops within or behind the battle zone. The German claim that the objective is to destroy the Russian armies rather than to make large territorial gains quickly should not be scouted as merely an excuse for failure. Russian tactics make no other method militarily wise or even possible; and, in any case, it was surely to eliminate the eastern menace of Russia's military strength that Germany embarked upon this invasion.

On the March

It is a remarkable index of the new alignment which the German attack on Russia has brought about that, by the agreement between the Soviet Union and Poland which was signed on Wednesday in London, Russia and Poland; so inveterately hostile in recent years, have now become military allies. It is a tribute to Polish statesmanship, Russian common sense and Britain's steadfast concern for the rights of aggrieved nations. After the events of September, 1939, there was very little difference, from the Polish standpoint, between the German invader from the west and the Russian invader from the east; and no agreement would have been possible—or could have been urged by Britain, the ally of both Poland and Russia—until the Russian Government unreservedly foreswore the brutal and cynical partition they then carried through with the Nazis. This has been done—though, even now, there are a number of Poles who apparently find it hard to stomach this "unnatural" association, and there is uneasiness because the *status quo ante* has not been given a specific and unconditional post-war guarantee. Russia recognises that the Soviet-German treaties of 1939 as to territorial changes in Poland have lost their validity. Diplomatic relations are to be restored at once. The two Governments agree to give each other full aid against "Hitlerite" Germany—which is, of course, now in possession of the disputed territories. A Polish army will be formed in Russia under the Russian Supreme Command; and all Polish prisoners in Russia are to be released. This is more than a pact of expediency for, under British guidance, a principle has been established which is applicable to all Europe, including the Baltic States, as well as Poland.

The Common Effort

It is the Prime Minister's view that invasion may be expected from the beginning of September onwards. It is not clear whether this means that Mr Churchill doubts the ability of Russia to engage the strength of Germany for longer than the month of August. But it is not improbable that, even if Russian resistance continues to be successful, something like a stable front in the east may be arrived at, in which event it would be possible for the Germans to attempt invasion in the west without being simultaneously engaged at full stretch on both sides of Europe. Mr Churchill did not mention the scale and character of the democracies' aid to Russia. It has been stated that large supplies are moving from the British Empire to Russia; and Mr Harry Hopkins, Lease and Lend administrator, with two military observers, has gone to Moscow, at the request of President Roosevelt, to discuss the expediting of war materials from the United States. In a very real sense, it is probably true that one of the best defences against the menace of invasion will be the strengthening of Russian resistance at every point. The demand of Members of Parliament for news of aid to Russia and of more forceful action by land and by sea in Western Europe cannot be satisfied, of course, without conveying valuable information to the enemy. It is consequently the case that criticisms of British strategy on the basis of the absence of such news can be neither helpful nor convincing. But it is nevertheless neither unhelpful nor unconstructive to suggest that the difficulty of acting more offensively in the west is the measure, not necessarily of production failures, but of the extent to which the output of the democracies must be stepped up if victory is to be made possible; or to suggest that no amount of skill and heroism on the part of the Russians will avail to frustrate the Germans if the back areas of the Russian front are not furnished from now onwards with all available supplies from American and British sources. The cause of Russia, like the cause of China, is the cause of Britain and of the United States; and it will be the merest self-interest for the supplies and the forces of the democracies to be marshalled and dispersed in such a way over the world battlefield as to secure the maximum advantage for the common cause.

The Turn of the Tide

To the critics of war operations so far the Prime Minister might have pointed to the fact that, although Britain has been fighting alone for a year, no inch of British territory, apart from the Channel Islands, is in enemy hands. He might have pointed to the notable success with which convoys can still, in cases of need, be taken past the enemy's bases through the length of the Mediterranean. He might have pointed to the fact that, in spite of every threat and strategic advantage, the enemy has failed to reduce Malta or Gibraltar, and that the latest determined attack by air and by sea upon Valletta was wholly frustrated. He might have pointed to the dangers in which the Axis forces still stand in Libya, where Tobruk stands as solidly in British hands as Acre did against the assaults of Napoleon. If defence is still demanded of Britain, it is being carried through with striking success—which makes the anxious question of when the tide will turn to attack and then to victory the more important. Ministers do not make the easy promises that were usual not many months ago. It was with diffidence that Sir Archibald Sinclair again promised that the RAF would soon reach parity with the *Luftwaffe*. It is not easy for the directors of British strategy to make firm pledges when grave and growing commitments have stretched their front of operations from the Atlantic, through the Mediterranean to the Black Sea, the Caspian and the Pacific. In Western Europe, the systematic development of increasingly heavy attacks against vital industrial targets and communications proceeds unbroken. It remains the most consistent theme in British strategy. It is easy for amateur strategists to win the war in the west on small maps. It is impossible for the Government and the fighting forces to win it without the men, the machines, the equipment and the long time that it will take to bend, to fracture and, finally, to break the armed strength of Germany. There is a belief that the first

attack on the German territories, whether it comes from Russia or from the Allies in the west, will bring victory. Actually, the first attacks will only be the beginning of a new phase in which, for the first time, the Germans will not enjoy the initiative; and until the invasion of Britain has been abandoned or beaten off, it cannot be said for certain that the initiative does not still rest with them.

Japan in Indo-China

The disembarkation of some 40,000 Japanese troops in Indo-China, which is said to have begun last Monday, and to have been completed in the middle of the week, brings Japanese forces some 400 miles nearer to Singapore. No doubt the force is now in process of spreading out over the country, and of taking over the eight aerodromes which the Vichy authorities have agreed to hand over, one of which is close to the border of Thailand. The agreement for joint "defence," negotiated at Saigon on July 24th, was signed in Vichy by Admiral Darlan and the Japanese ambassador on July 29th. The Japanese occupation of Indo-China is now a *fait accompli*; and measures of economic retaliation have been undertaken by the British and United States Governments. It is believed that 20,000 of the force used for the occupation of Indo-China have been drawn from the Canton region, and the remaining 20,000 from Formosa, Shanghai and Japan. How far the venture is approved by Germany is uncertain, and a number of reports suggest that a move against Vladivostok and the Russian maritime provinces would have been more appreciated by the senior partner in the Axis. As usual, Japan has been moved solely by the dictates of self-interest, and it remains unlikely that there will be any Japanese attack in the north while "the China incident" continues to drain away Japan's military and economic resources.

The Next Three Million

It is at least some consolation that the Ministry of Labour realises that the effects of its measures for recruiting labour for war work are "wholly inadequate." Of the 1,233,000 women in the 1920 to 1917 classes who have registered, about half were not clearly shown to be doing work of national importance and are being interviewed. Up to the end of June 196,000 had been interviewed, but only 25 per cent were found available for transfer to war work. An even worse result has been shown by the registration of men in the 1898-1900 classes. Nearly 595,000 registered; about 100,000 were selected for interview; some 40,000 of these were found to be doing work of national importance; and by the end of June 11,500 had been placed on the national work register or transferred. This means that out of a total of 1,828,000 men and women, only some 200,000—if the 25 per cent holds good for the remaining 400,000 women to be interviewed—are being "called up"—and it is not even certain that being placed on the national work register means effective calling up. Owing to this poor result, another three million men and women are to register before the end of the year, men of the 1895 to 1897 class and women born in the years 1910 to 1916 inclusive; it is also probable that further age groups of women will eventually register. But there is no guarantee that the new registrations will yield a better crop; on the contrary, the higher age groups are likely to have a greater percentage of women with home ties or employed in responsible positions. If a quarter of a million are found available for war work, on the present system, the Ministry of Labour will be lucky. Yet the ATS alone will want nearly this number of recruits in the next eighteen months. It is quite certain, in fact, that this method of skimming a few from a great number of age groups is wasteful. That the older age groups are to be called up is welcome. But it would have been much better to have placed a more searching definition on essential work at the beginning in order to obtain the maximum harvest from each age group as it registered. As it is, the Ministry has given warning of "drastic action," which must mean that if the wanted numbers are to be found the age groups already registered will be rescrutinised. A more wasteful and unsettling procedure could hardly have been devised.

Tighter Price Control

The passage last week of the Goods and Services (Price Control) Act, 1941, which is to supplement the earlier Prices

of Goods Act, represents a serious attempt to control the upward trend of prices. Based on the experience of two years of war, it fills many gaps in the earlier legislation which have been successfully exploited by unscrupulous trading. Thus, inspectors are now to be appointed by the Board of Trade to report cases where maximum prices are exceeded. Under the Prices of Goods Act, the duty of reporting was left to the initiative of the private citizen with highly unsatisfactory results. The Board of Trade may now require that invoices be supplied and produced on request, and that the number of transactions between manufacturer and retailer be limited. Unlike the Prices of Goods Act, the new legislation applies to the prices of certain second-hand goods and to services. The Board of Trade now has power to fix prices of any commodity at any stage of trading by determining profit margins. Clearly, the new Act can be used as an effective instrument of price control, and evasion will be more dangerous in the case of goods and services for which the Board of Trade has fixed maxima. The shortcoming of the new Act is, of course, that it is still largely permissive. It places no obligation on the authorities to introduce complete price control promptly for all marketable goods and services at all stages from producer to consumer. Yet, nothing less will effectively control the danger of inflation. Partial price control must foster attempts to push up prices which are not yet controlled. Price-controlled goods will be offered for sale only when uncontrolled goods are also bought. If the cost of living is to be pegged and the black market eliminated, price control must be all-embracing. The new legislation provides an adequate technique if it is used promptly. It is to be hoped that the keen interest which Parliament displayed in the matter will encourage the Board of Trade to use its new weapon wholeheartedly in respect of the goods within its jurisdiction.

America's Contribution

actually arriving in this country, whether they are of the right kind and whether anything else was needed, gave a cheerful message to Britain in a broadcast last Sunday.

Your Prime Minister (he said) asked us for the tools. I promise you that they are coming; that an endless assembly belt stretches from our western coast to this Island and to the Middle East; that nothing will be allowed to interfere with the full efficiency of this supply line.

Mr Hopkins's picture of a "ceaseless tide of ships coming here daily" is reassuring. The United States has already sent thousands of aircraft and hundreds of tanks and the stream of supplies is mounting rapidly. The Americans are becoming alive to the fact that, in order to turn their country into the arsenal of democracy, they will have to cut down their consumption not only of motor cars and other industrial products, but also of food. "America" said Mr Hopkins, "has decided to reduce the consumption of food and to increase production." Plans have been made to send "huge quantities of cheese, pork, eggs, canned salmon, raisins, evaporated milk, and concentrated fruit juice." But while the promise of overwhelming American supplies in the future strengthens Great Britain's faith in ultimate victory, the onus of providing the weapons needed to hold the Nazis this year rests largely with this country.

Intrigue in Iran

The centre of diplomatic activity in the Middle East has shifted to Iran. The incursion of German troops into Russia has temporarily left Turkey behind the front line and, with the failure of the Iraqi *coup d'état*, Iran now provides the most promising field from which to organise pro-Axis sentiment in the Middle East and to foment, if possible, fifth column activity in the Ukraine. All the "customary symptoms" are being reported from Teheran and Tabriz. German "tourists" proceed through the country in a continuous stream, new pleasure-seekers replacing old as soon as the permits of the latter expire, and the number of Germans present at any one time is estimated at 4,000. This activity has an important bearing on the conduct of the Russian campaign. Although the Germans have so far made little progress in the use of quiescent agitators in Russia, the Georgian, Ukrainian and Armenian racial minorities in the provinces lying immediately north of the Caucasus are regarded as providing a more favourable ground for the gospel of treachery than the remaining Soviet and Socialist Republics. The creation of an independent Ukraine has long been an aim of local patriots who have maintained propaganda agents in Teheran and in many of the European capitals. It remains to be seen whether the dubious benefits which Germany can offer these members of the Russian family will be sufficient to offset their loyalty to the Soviet regime. No doubt memories and stories of the German occupation of the Ukraine in the Four Years' War will help to counter the work of the German agents in Iran. On the whole, it behoves Germany to proceed carefully, for to invite a repetition of the swift punishment which followed incautious action in Iraq would be bad for already dwindling Axis prestige in the Arab world.

The Co-ordination of Civil Defence

London's first bombs for nearly two months almost coincided with a statement by Mr Herbert Morrison on the central and local co-ordination of civil defence policy and administration. It is now recognised that civil defence has two sides: ARP and welfare—which includes, according to Mr Morrison, evacuation and rest centres; emergency feeding; relief of distress; repairs to houses; transport; restoration of shopping facilities; salvage of furniture; restoration of public utilities; and the clearance of sites which are a danger to public safety or health. Before air raids started attention had been concentrated almost entirely on ARP, and it has taken a winter of raiding to get the whole of the welfare side properly organised—in fact, it was feared that even now it is not properly organised that prompted the recent proposals for a single Ministry of Civil Defence which would take over all the duties enumerated above from the other Departments. Mr Morrison claims that they are particular aspects of the normal work of these Departments and could not be separated from the work which they do in ordinary con-

ditions. He also claims that co-ordination, both centrally and locally, has been successfully achieved. At the centre, he himself presides over the Civil Defence Committee of the War Cabinet and its Executive Sub-Committee, which meets at least twice a week and is also a planning body calling for reports upon particular problems. Locally, the policy decided upon at the centre is carried out through the regional representatives of the Departments and through local authorities, subject to co-ordination by the Regional Commissioners, who are responsible for ensuring that all the interests concerned make plans in advance and act quickly and effectively when an emergency arises. Taken at its face value, this statement suggests that a very efficient machinery has been devised. But it is justifiable to doubt whether in practice the machinery is as perfect as a description of it implies. The Select Committee on National Expenditure was not convinced that co-ordination either at the centre or regionally has been successfully achieved, although it is, of course, true that conditions may have improved since it reported. Its recommendation that all the civil defence functions, except evacuation and hospital services, of the Ministry of Health should be delegated to the Regional Commissioners has been adopted with regard to first-aid posts and ambulance services. And the Regional Commissioners themselves have been strengthened by the appointment of two Deputy Commissioners in each region, one of whom is to be concerned with the whole of the welfare side of civil defence. But complete reassurance will not be felt until the next tests have been passed.

Oil Tankers

In a statement at Ottawa last week, Mr E. E. Soubry, a member of the Petroleum Board, is reported to have made an appeal for economy in the use of petrol, in order to ensure an adequate flow of oil supplies to the British fighting Services. In justification of the appeal, Mr. Soubry stated that Britain had lost one-half of her ocean-going tanker tonnage. While it is not yet clear whether these include vessels temporarily put out of commission owing to damage or whether they cover Allied as well as British tanker tonnage, the statement came as a shock to this country. It explains the urgent request for the transfer of an additional 100 American tankers to assist in maintaining supplies to Great Britain—a transfer which must seriously reduce the supplies of oil in the Eastern States of America which, pending the construction of pipe lines, depend in a large measure on shipments from the Gulf ports. If the tanker position is as serious as is suggested by Mr. Soubry's statement, it calls for the most stringent economy in their use and in the consumption of petroleum products in this country. While it is not known whether British tankers are still being used to transport oil to this country from distant sources of supply, such as the Persian Gulf and the Dutch East Indies, it is to be hoped that sectional interests will not be allowed to obstruct their employment on the shortest routes. It may be possible, as a result of improvements in the protection of convoys, to resume shipments on a larger scale direct from the Gulf ports, for the arrangement whereby oil is brought in American vessels to New York, and thence transferred into British vessels, has proved to be costly in time. The withdrawal of the Norwegian and other non-Japanese tankers hitherto engaged in supplying Japan from the Dutch East Indies and California would also bring a measure of relief. The time has nevertheless come for the application of a severe needs test to all consumers of petroleum products. The need for a still greater economy in the consumption of petroleum products, moreover, is emphasised by the fact that tankers can carry edible as well as mineral oils and that for every gallon of petrol imported for pleasure driving it would be possible to transport the raw materials for 8 to 9 lb. of margarine.

The Small Shopkeeper

Whatever was really in the mind of the Ministry of Food when it originally announced that shopkeepers with less than 25 registrations would not receive supplies of rationed foods, it has now given way. In country districts, the Ministry never intended to enforce the rule if hardship to consumers would have resulted. Now it has decided that, both in town and country, food control committees can

suspend the operation of the order if, after consideration, they find that hardship would be caused to consumers or to the traders themselves. But Major Lloyd George still believes, rightly, that if the order were generally enforced—or, at least, in towns—considerable economy in distribution would be achieved. In a debate on the subject last week, he cited the example of a man with 24 registrations, to whom the largest parcel of a rationed commodity that could be delivered in a week was 12 lb. and the smallest 3 lb., while to his knowledge a 3 lb. packet of cheese was divided into two because a small trader dealt with two wholesalers. However, in view of the protests, the regulation will only apply to retailers who are not *bona fide* food traders. An investigation in several towns recently showed that out of 2,000 retailers 23 had less than five registrations and that 83 had less than ten, and Major Lloyd George is convinced that they only took out retail licences for food in order to supply themselves and their families with food on wholesale terms. It is these retailers who, by the less than 25 rule and the withdrawal of licences, will now be eliminated from the food trade. Thus, everybody—with the exception of these families—is satisfied: the small shopkeeper, the villager, and, of course, the whole body of grocers who were getting alarmed at poaching on their lands by other traders. But though this storm in a teacup has shown how not to do it, the curtailment of distribution facilities is still necessary if the maximum economy in civilian trade is to be effected. It is not a question of the small shopkeeper's rights or the chain store's. It is the need for restricting the numbers engaged in the whole of the retail trade—large traders, chain stores and small traders alike—to the minimum consistent with efficiency.

Japan's Oil

The Anglo-American decision to "freeze" Japan's assets gives Britain and her allies the power to deprive the Asiatic aggressor of some 70 per cent of his present-day oil supplies. In the absence of official import statistics for recent years, the details of the Japanese oil position are somewhat obscure; but the main outlines are clear enough. Japan normally covers only a small proportion of its oil requirements from domestic resources, its annual crude oil production of about 4,500,000 barrels being supplemented by an output of benzole, alcohol and related substitutes equivalent to about 500,000 barrels of motor fuel. Its principal overseas suppliers during the past few years have been the United States, the Dutch East Indies and Mexico, though the relative importance of the United States has shown a considerable decline. Last year's exports from the United States to Japan (apart from lubricating greases) totalled 22,750,000 barrels, including 11,500,000 barrels of crude oil for treatment in the local refineries, 3,151,000 barrels of petrol and smaller quantities of other refined products. The Dutch East Indies have lately been a source of growing importance, and appear to have consigned about 4,000,000 barrels to the Japanese Empire last year. After prolonged negotiations, a new agreement was reached between the Japanese and Dutch authorities last November, and this was reported to provide for total shipments of the order of 13,500,000 barrels of crude oil and finished products during the present year; whether consignments have been on this scale during the first seven months of 1941 is not known. Mexico sent approximately 2,400,000 barrels (mostly of crude oil) during the twelve months ended April, but whether the Mexican authorities will now come into line with Britain and the United States in the matter of supplies to Japan remains to be seen. It is evident, however, that the stoppage of American and Dutch supplies would be an extremely serious matter for Japan. It would force it back upon the emergency reserves which have been accumulated. These reserves are doubtless large. If due allowance is made for military consumption (which has probably been offset by rationing at home), it remains true that a substantial proportion of last year's imports—perhaps even one-half—must have gone to swell the country's stocks. Japan may therefore be able to eke out her supplies for a year or so. But the further outlook is bleak.

Route Through Afghanistan

But for political fears and jealousies in the past, progress might have been made in developing rail communications in Iran and Afghanistan, thus providing not only the essential means of developing the economies of those countries, but also that access to the sea routes, without which the riches of Central Asia can hardly be developed

to the full. Moreover (as was pointed out in a Note in *The Economist* of July 19th on page 72), a supply route for Russia on the Middle Eastern war front would have been ready to hand. The difficulties have been geographical—but in a political rather than a purely physical sense. It is not, perhaps, generally realised that the railway from Karachi to Quetta has already surmounted and turned the main obstacle on this route to Central Asia, the Bolan Pass, and is on the plateau, when it reaches Quetta, from where it drops gently to Chaman on the frontier. Kandahar is only some 80 miles farther, still slightly downhill, whence

a good and easy route leads to Herat, 350 miles away. A number of rivers draining into the Helmand Lake cross the route, but would present no great engineering difficulties. From Herat, as the crow flies, the Russian terminus at Kushk is only some 60 miles distant. If direct attack through a considerable range of mountains which bars the way proved impracticable, an alternative but considerably longer route is available. This bears north-west down the valley of the Hari Rud to near Zulfikar, and then turns north-east to Kushk. Throughout, the line would traverse country with a considerable population practising agriculture based partly on irrigation and partly on rainfall. With branch lines and feeder roads from Kandahar north-east to Ghazni and Kabul and west to the oases of Seistan, a very considerable local traffic could certainly be added to the transcontinental traffic. The possibilities are indicated by the trade of Quetta which, from a group of dilapidated mud buildings with a neglected orchard cultivation, has become the trade mart for Western Afghanistan and Eastern

Exports & Imports

While the war has increased the already vital need for exports and imports, it has, at the same time, necessitated the introduction of numerous regulations and restrictions which add considerably to the trader's difficulties.

The Westminster Bank maintains specialized departments where its customers may obtain expert advice and assistance in dealing with such problems as arise, and it strongly advises those who are exporting or importing to consult it as soon as their intentions are known. Information is also available regarding Documentary Credits—so necessary to the financing of war-time trade.

Piccadilly

Persia with a great fruit trade in European fruits from Kandahar. There is, moreover, reason to believe that Afghanistan has considerable undeveloped mineral wealth. The route from Peshawar to Kabul and thence to Termez presents several considerable obstacles in the mountain ranges between Kabul and Termez. While the lowest passes rise above 10,000 feet, Kabul itself stands at over 6,000 feet, and the obstacles might not prove insuperable to railways—and good roads certainly could be built; routes alternative to the Bamian one also exist, for instance, via the Panjshir Valley. In Iran the terminus of the railway which connects the Caspian with the Persian Gulf is no more than 200 miles from the Krasnovodsk-Merv line in Russian territory, while Teheran needs rail connection with Tabriz. The considerable physical obstacles can be overcome. Is it possible to remove the military and political difficulties that have hindered the economic progress of Iran and Afghanistan, that prejudice the full fruition of the recent great developments in Kazakhstan and Siberia and that now perhaps deny Britain the means of reinforcing Russia.

Exhortation in America

President Roosevelt has sent a Message to Congress on price control. "We face inflation [he said] unless we act decisively, without delay." Authority is asked for to set up "flexible" machinery for stabilising prices, and the general issue is clearly stated. The plainer lessons of war economy are now being recognised in the United States. It is realised, for instance, that even in "God's own country" with its continental riches, the expansion of war output means the transfer of resources from civil manufacture and the corresponding curtailment of civilian consumption; that, in other words, the characteristic and inescapable feature of war economy is shortage. This involves, not only the allocation of priorities in the use of resources, which is already being administered in the United States, but also the need for measures to prevent inflation, for while the supply of goods is restricted, the supply of purchasing power in the hands of the public steadily grows as employment and earnings in war work rises, and there is increasing upward pressure on prices. In the past, it has been somewhat naively supposed by the Administration in the United States that it was possible to hold down the prices of key materials without restraining wages. Now the President has appealed for the voluntary co-operation of labour, citing the detrimental effects of inflation to the workers themselves—and it remains to be seen whether the Message will be any more successful in this than the British Government's recent White Paper.

* * *

The German High Command

The German war machine is now engaged in its greatest operations so far, and it is of interest to recollect its organisation and system of command—especially where these questions, as applied to the British armed forces, are being discussed with a new earnestness. Before 1935 Germany's fighting forces, the army and the navy, were called the *Reichswehr* and its administration was in the hands of the *Reichswehr-Ministry*. In March, 1935, Hitler announced conscription and added the *Luftwaffe* to the fighting forces, which were now renamed *Wehrmacht*; this is an untranslatable collective term for the three arms. The peace-time administration of the *Wehrmacht* was unified in the Ministry of War, which replaced the *Reichswehr-Ministry*; and, after Hindenburg's death in 1934, Hitler became Supreme Commander. In February, 1938, shortly before the march into Austria, the High Command (*Oberkommando*) of the German *Wehrmacht* was established; and, by special decree, the High Command was declared the legal successor of the Ministry of War. Actually, it carried unity of command and administration of the fighting forces a step further, for the High Command of the *Wehrmacht* is at once the supreme commanding body and the supreme administrative body for the army, navy and air force—*Heer, Kriegsmarine* and *Luftwaffe*. The Chief of the High Command is Field-Marshal Keitel, who is a member of the Defence Council of Ministers, that is, the War Cabinet. The German Press usually refers to Field-Marshal Keitel as Hitler's military adviser. The commanders in chief of the army, navy and air force—Field-Marshal Brauchitsch, Admiral Raeder and Reichs-Marshal Goring—are the subordinates of the Chief of the High Command. Field-Marshal Keitel; they also hold Cabinet rank. Their actual status is, in a rather

work which

remote way, comparable to the Secretary of State for War, the First Lord of the Admiralty and the Secretary for Air in this country, except that the three Germans are Service men and not the political heads of separate departments. According to Prussian tradition, the Commander and the Chief of the General Staff share in the leadership of the *Wehrmacht*. General Halder is Chief of the General Staff; and by historical precedent he should be credited with the actual as distinct from the formal leadership of the *Wehrmacht*. Actually, the real importance of Field-Marshal Keitel is somewhat obscure. It is possible that he only amounts to the personal military secretary to Hitler; and there is nothing on record to show that Keitel or any of his legal subordinates, Brauchitsch, Raeder or Goering, is an outstanding military leader. It is traditional that the Chief of the General Staff and the General Staff itself are not brought before the public eye; and Hitler's position as Supreme Commander effectively prevents the popularisation of the most outstanding soldiers in the way that Hindenburg and Ludendorff were popularised in 1914-18.

Disabled Workers

The Fabian Society has chosen an opportune moment to publish a study* of the problem of reinstating the victims of industrial illness and disease who are permanently but only partially disabled. The tendency has been to regard such cases as relatively unimportant, because they form only a small proportion of the total number of claimants under the Workmen's Compensation Acts. Actually, of course, owing to the duration of these disabilities, they represent an important total of man-hours lost. Medical and training services do much—and could be organised to do much more—to restore a degree of working power to these unfortunate people; but there is a distressing amount of evidence to show that they often meet with nearly insuperable difficulties in obtaining employment, even at work which they are in fact able to do. Dr. Levy suggests that the abolition of lump-sum payments would go a long way to give insurance companies a direct interest in the rehabilitation of workers. He also suggests the establishment of a special register of partially incapacitated unemployed workers with special employment committees to advise and place them.

* * *

Shorter Notes

It is with the greatest regret that people in this country have learned that, acting no doubt under German pressure, the Finnish Government has decided to break off diplomatic relations with Great Britain. It had been hoped that the fortunes of war, which have now ranged Finland on the side of Germany against Russia, need make no change in the official relations between Finland and Britain. Hitler has ruled otherwise; but it is certain that nothing that has happened since can alter the sympathy and respect which Finland's fight for independence aroused here—it is only doubtful whether the Finnish people realise that they have now made themselves the dependants of Germany.

*

Mr. Morrison is quite adamant about the *Daily Worker*. In announcing his decision not to raise the ban on publication, he implied that the Government draws a clear distinction between the British Communist Party and Russia. Thus, he said that "if the British Communist Party are now prepared to aid our Russian ally by giving to the war effort assistance which they previously were not willing to give to their own country" he welcomed the change so far as it went but that it would be premature to treat this latest conversion as proof of a lasting change of heart. Mr. Morrison is right in regarding the case of the *Daily Worker* as a purely domestic concern; but it might perhaps have been wiser if he had shown more tolerance.

*

The news of the end of the "war" between Peru and Ecuador is as indefinite as the news of the fighting itself. It was reported last week-end that the incident was to be closed following an agreement between the two parties, and that through the mediation of the United States, Argentina and Brazil the cease fire would shortly be ordered. But the terms of the agreement, no less than the causes of the original dispute, are still obscure.

THE WORLD OVERSEAS

The St. Lawrence Waterway

(From Our Ottawa Correspondent)

June 27th

THE project known as the St. Lawrence Waterway has a long history, extending back more than eighty years, but it is only during the last decade that it has begun to approach consummation. The St. Lawrence, draining the Great Lakes in the heart of North America, is one of the mighty rivers of the world, and thanks to canals, which overcome the obstacles created by rapids in its course to tidewater, it has long been navigable for small vessels. A deep-water channel, which would permit ocean-going vessels to sail direct to the western end of the Great Lakes, offered obvious advantages for commerce, and when the scheme was first mooted chief stress was laid upon the navigation aspects. But, in recent years, the increased use of electrical power for industrial purposes has caused equal emphasis to be placed upon the possibilities, provided by the project, of developing a large volume of hydro-electric energy. It has been the subject of exhaustive investigation by several governmental commissions, and all their reports have agreed about the practicability of the enterprise from an engineering standpoint.

Since the St. Lawrence for a considerable distance forms the international boundary between Canada and the United States, problems connected with it have been continually affecting the relations of the two countries, and a series of treaties concluded by the British and American Governments between 1783 and 1909 defined the respective rights of Canada and the United States in regard to the river and its tributary waters. One fundamental provision of the later treaties was that navigation on it should be equally free and open to the inhabitants of both countries and their vessels. Now, for more than thirty years, the settlement of problems connected with the St. Lawrence and other boundary waters has been entrusted to the International Joint Commission, a body created in 1909 by the Boundary Waters Treaty and manned by representatives of both countries; and Canada through her own Government has been conducting all negotiations arising from the Commission's reports and decisions.

Re-birth of the Scheme

It was the advent of the Roosevelt administration which brought to active life the scheme of the waterway, and the impelling force was the keen desire of Mr. Roosevelt, who as Governor of New York had been waging war against the exactions of the local power trust, to acquire a weapon against it by developing under a system of public ownership the vast resource of hydro-electric energy available on the St. Lawrence and easily accessible to the people of the State of New York. Many Canadians were surprised at the responsiveness of the Conservative Ministry of Mr. Bennett to the overtures from Washington, but there was added to them the bait of a trade agreement on generous terms. However, the treaty, which was eventually negotiated in 1932, proved abortive, through its failure to secure in the United States Senate the two-thirds majority necessary for ratification.

But President Roosevelt had set his heart upon carrying this project through, and, soon after the Liberals returned to power at Ottawa in 1935, fresh approaches from Washington were given a sympathetic hearing in Canada. There were further investigations by experts and technicians, and the original plan was modified, after prolonged negotiations, to a substantial degree. It was finally found possible to conclude last March an agreement embodying a definite plan for the construction of the waterway. Owing to Mr. Roosevelt's doubts about his ability to secure the requisite two-thirds majority in the Senate, the two Governments, instead of making a formal treaty, have agreed to adopt a special method of ratifica-

tion by concurrent legislation by the Congress of the United States and the Federal Parliament of Canada. But the consent of another authority has also had to be secured, that of the Provincial Government of Ontario, which is vested with the power rights on the Canadian side of what is known as the international section of the waterway, and after some complicated negotiations the original opposition of this Government has been overcome.

Its Cost

The treaty as now negotiated provides for the construction of a 27-foot channel from Montreal to the upper lakes and a large development of hydro-electric energy. By its terms the project is subdivided into three main divisions:

the Welland Canal connecting Lakes Erie and Ontario; the international section lying between the eastern end of Lake Ontario and the town of Cornwall; and the section between Cornwall and Montreal, which is wholly within Canadian territory. In settling the financial arrangements, the United States has made a very generous allowance to Canada for the expenditures which the Dominion had already incurred for the construction of canals, and particularly for the deepening of the Welland Canal, upon which Canada will expend \$1,100,000 for further improvements. Upon the works on the international section, an expenditure of about \$266 millions is contemplated, and a further sum of \$83 millions is required for the purely Canadian section. The official estimate of the cost of the scheme is, therefore, \$350½ millions, and of this total sum

 West End Branch: 198 Piccadilly, W.1

the United States will furnish \$218½ millions, leaving Canada to find \$131½ millions.

The Federal Government of Canada will pay all the costs involved in the Welland and Canadian sections and contribute \$22½ millions for the international section, making a total of \$106½ millions, but its net outlay will ultimately be much smaller, as the Province of Ontario, in addition to supplying \$25 millions for power machinery and equipment, will reimburse the Federal Treasury to the extent of \$64½ millions in return for the power works and rights, which will be transferred to the Hydro-Electric Commission of Ontario. The plans contemplate the completion of the whole project by 1948, but it is hoped to have the important power development near Cornwall finished by 1945.

The Opposition

Inevitably, the scheme has not commanded universal approval in either country. In the United States, it has always had the enthusiastic support of all the communities on the Great Lakes and of the people of the Middle Western States, who visualise from it cheaper costs of transportation for their exports, but it arouses fierce antagonism in all the ports of the Atlantic seaboard, who foresee a great diminution of their business; for the same reason all the railway systems of the United States, whose traffic might be adversely affected, are bitterly opposed to it. The opponents of the waterway are said to have organised the most powerful lobby ever operated in Washington for the purpose of frustrating the project, but President Roosevelt is exerting all his influence for the passage of the necessary legislation, and is using the argument that the development of the power resources of the international section is essential for the American war programme.

In Canada, the King Ministry will await the verdict of the United States Congress before it invites the Canadian Parliament to pass the concurrent legislation, but, as it now commands a majority in both Houses, it should have no difficulty in securing passage for the Bill. The project has, as in the United States, the support of the communities on the Great Lakes, who expect an increase of water-borne trade, of industrialists in Ontario, who fear a shortage of power, and of the western farming and grain interests, who hope for cheaper freight rates for grain when transshipment becomes unnecessary. But the scheme is anathema to the business and shipping interests of Montreal, who fear lest the grass will grow on the docks of their great port as soon as it becomes possible for ocean-going vessels to sail straight through to the Great Lakes. Led by the *Montreal Gazette*, these interests have been conducting a persistent campaign of propaganda against the waterway, but it has not had much effect upon public opinion outside Quebec. Ports on the St. Lawrence like Three Rivers and Quebec also dislike the scheme, but the rural element of the French-Canadian population is apathetic, and Mr Godbout, the Liberal Premier of Quebec, has given the project his blessing. The Canadian railways, too, are unfriendly to the enterprise, and there are a number of Canadians, without any personal interests involved, who object to the immediate construction of the waterway on the ground that it will divert labour and materials urgently required for the war efforts of both countries. There are other critics who think the estimates of the cost too rosy, and point out that the final cost of all the great canals of the world has always far exceeded the original estimates. If the project has to be postponed, it will be through successful opposition in the United States, not in Canada, but sooner or later its accomplishment will be a fact.

Japan's Metal Shortage

[BY A CORRESPONDENT]

July 29th

SELDOM in history has an act of aggression secured the aggressor so little economic benefit at such heavy economic risk as Japan's occupation of Indo-China. The establishment of Japanese bases in Indo-China, of course, may represent only the first phase of a much wider campaign in which the problem of securing raw material supplies is paramount; but, when it is considered that the whole of the Far East, while abundantly supplied with raw materials like rubber, tin, tungsten and antimony, is seriously short of such vital war materials as copper, lead and spelter, the move is in any event a great gamble.

The occupation of Indo-China will bring Japan, in addition to about 1,000,000 tons of anthracite a year, some 65,000 tons of rubber (enough to cover Japan's rubber requirements), as well as some 1,500 tons of tin and insignificant tonnages of other metals. Almost all these supplies, however, were already promised to Japan under the trade agreement with Indo-China signed last April. It is true that the establishment of Japanese bases in Indo-China intensifies the country's pressure on Thailand and may induce the Thai Government to divert sufficient quantities of tin ore to Japan to cover the deficiency of about 8,000 tons per year between Japan's supply from Japanese mines and Indo-China and its annual requirements of about 11,500 tons. But the problem of smelting capacity remains, as neither Thailand nor Indo-China owns tin smelters, and Japan's capacity does not exceed 5,000 tons a year.

Against these "gains" must be set the possibility of enormous losses if the British, United States and Dutch authorities actually stop raw material shipments to Japan. The textile industries, and particularly the cotton and wool industries, have in the past secured the foreign exchange surplus with which Japan has financed its imports, of which roughly three-fifths consisted of raw materials and semi-manufactures. With the exception of silk and rayon, however, almost all textile raw materials have to be imported into Japan. Japan imported 2,860,000 bales of cotton in 1939, of which 805,000 bales came from the United States and 1,113,000 bales from British India. In 1937, Japan imported 258,000,000 lbs. of wool, and the three British wool Dominions (Australia, New Zealand and South Africa) were the only suppliers of importance. In these cases, therefore, Anglo-American counter-moves can prove extremely efficient; and in the field of the most important war materials—ferrous and non-ferrous metals—Japan's dependence on foreign supplies is not less pronounced. Japan is the only industrial country in the world whose metal industries have from their very beginning been almost entirely based on imported raw materials.

In iron and steel production Japan has made enormous progress in the past ten years, and if the new supplies from Korea and Manchuria are taken into consideration, the output of pig iron appears to have passed 3,000,000 tons a year and that of steel 5,000,000 tons. Less than one-third of iron ore supplies and less than one-tenth of scrap supplies, however, are derived from domestic sources and Japanese-occupied territories. The Philippines and the Unfederated Malay States are the chief suppliers of iron ore, and the United States has been responsible for the bulk of Japan's scrap supplies. There are sizeable low-grade iron ore deposits in Korea, but their development only started early in 1940. Even if development could be speeded up, the value of this ore would be greatly reduced by the almost complete lack of coking coal supplies in Japan. The same difficulty greatly hampers iron production developments in Manchuria.

Japan now produces over 100,000 tons of copper from domestic sources, but its vital consumption covers more than twice that quantity. Here the United States and South America used to be the chief suppliers. As the United States now takes the whole of the Latin American supply, Japan has hardly any chance of securing copper abroad. There is one other major metal-producing industry in Japan—the aluminium industry. Beginning production in 1934 with 664 tons, this industry now supplies about 30,000 tons a year against the country's consumption of at least 50,000 tons. But, in this case also, the raw material has to be imported, as there are no bauxite deposits worth mentioning in Japan. In the past, the Dutch East Indies, the Unfederated Malay States, British India, Greece and the South Sea island of Palao supplied the bauxite, and Canada, the United States, Norway and Switzerland the deficiency

in aluminium metal. All these sources, with the insignificant exception of Palao, may now be cut off.

With the exception of roughly 10,000 tons of lead and 20,000 tons of zinc from domestic sources, the whole of Japan's lead and zinc, of which 120,000 tons and 100,000 tons respectively are required every year for vital purposes, has to be imported from abroad. In both cases, Canada, Burma, Australia, Mexico and the United States used to be the chief sources of supply, and all of these may now be lost as the United States concluded an agreement for the whole Mexican surplus a fortnight ago. In steel alloy metals and antimony, Japan is as seriously deficient as in the other metals, but a more or less adequate supply of tungsten and antimony can be secured from occupied China, although the main Chinese deposits are still in the hands of Chungking. There is, however, an acute shortage of other steel alloy metals, including manganese, which used to come from British India. Japan has probably prepared for the emergency that has now arisen and stocks of all imported materials must be substantial. Nevertheless, if the United States, the British Empire and the Dutch East Indies now apply sanctions strictly, the Japanese war industries will soon feel the strain.

Curious Politics in Chile

[FROM OUR SANTIAGO CORRESPONDENT]

June 9th

ON May 21st Congress reopened its session, and in view of the extremely confused political situation it is worth giving the party alignment in both Houses. In the Senate, the Government, that is, the Left Wing Parties, hold 24 seats out of 45; there are 13 Radicals, 5 Socialists, 4 Communists and 2 Democrats. The Opposition holds 21 seats, consisting of 11 Conservatives, 8 Liberals, 1 Agrarian and 1 Independent. The Government can only count on 19 certain votes and the Opposition on 20.

In the Chamber of Deputies, the position is more confused. The Government parties consist of 42 Radicals, 16 Communists, 15 Socialists, 6 Democrats, 2 Independent Radicals, 1 Radical Socialist and 1 Workmen's Socialist—a total of 83 seats. The Opposition consists of 31 Conservatives, 22 Liberals, 3 Falangists, 3 Agrarians, 2 Democrats, 2 Nazis and 1 Independent Liberal—a total of 64 seats.

At the moment, owing to political pacts, the Government have not an absolute majority, and the Socialists, who refuse to recognise the Popular Front, tacitly accept it by having three ministerial posts. A bitter controversy rages between the Socialist and Communist parties. A section of the largest Government party, the Radicals, approves the Socialist thesis regarding the Communists, but this section is not sufficiently powerful to sway the majority, and a bitter fight took place at the elections, when the Radicals made an electoral pact with the Communists which was damaging to the Socialists. The Communists, by the operation of the pact, increased their representation in the Chamber of Deputies, which was formerly seven seats, at the expense of the Socialist Party. A law has been voted in Congress outlawing the Communists as a party, but the President of the Republic, a Radical, refused to place his signature to the Bill. The veto was sustained, as Congress could not obtain a two-thirds majority, which, according to the Constitution, is necessary to override the President's objection.

Therefore, at the moment, the Government receive only the occasional support of the Socialist Party, which has been known to vote in the opposite camp at other times. The Government also receive support at times, particularly on domestic policy, from such groups as the Nazi and Falange Parties. On the other hand, the Opposition can sometimes count on the Socialists, Democrats, Independent Radicals and Radical Socialists to support it—hence the extremely confused position.

The Communists, unlike the Socialists, have no direct ministerial post in the Government, but wield great power in politics through their alliance with the Radicals and through the control exercised on the trades unions.

To add to the confusion, the controlling body of the Radical Party recently called for the resignations of the Radical Ministers in the Government, and they, counting on the support of the President of the Republic, refused to accept the party's directions. They were expelled from the party, but afterwards reinstated, except the Minister of the Interior, Arturo Olavarría, with whom the party does not

see eye to eye on matters of policy. He refuses to accept the orders or jurisdiction of his party and to tender his resignation while he still retains the confidence of the President; he alleges that he is only interested in the country's welfare and not in party politics. It is likely that the Radical Party will again call on its representatives to resign as a result of the Minister of the Interior's attitude.

The von Marees Case

A strange and amusing episode in Chilean politics was the recent Government order calling for the arrest of the head of the Chilean Nazi Party and his transfer to a lunatic asylum, pending his examination by mental specialists. Jorge Gonzalez von Marees, the man concerned, was detained for a few days and then released. There was a storm in Congress as a result of this action, which was regarded as a breach of Parliamentary immunity from arrest. No doubt this incident has been one of the major causes of the quarrel of the Minister of the Interior with his party. Gonzalez von Marees was accused of inciting his youthful followers to cause trouble at a meeting of the Radicals, when one of that party's members was shot.

It is more than likely that the present confusion in political circles will continue until such time as the President of the Republic can come to some arrangement with the Socialist Party to give him their full support, but this would mean the abandonment of the Communist Party and its subsequent outlawry. This appears to be the logical solution, but, in any case, it seems more than probable that the President, with a Left Wing majority in both Houses for the first time, will lead the country more and more towards the Left.

Agricultural Outlook in Eire

[FROM OUR DUBLIN CORRESPONDENT]

July 14th

EXPORTS of cattle have been resumed after an interruption of six months caused by the worst outbreak of foot-and-mouth disease that ever took place in Ireland. The plague first appeared in Eire in January, having spread from Northern Ireland, and affected cattle in thirteen counties in spite of the most vigorous precautions. The total number of outbreaks was 442, and 19,358 cattle, including some valuable dairy herds, 5,600 sheep and 2,270 pigs, were destroyed. The direct cost of the disease to public funds was £233,000, but of course the total cost to the country was much greater. One result of the stoppage of exports is that the number of cattle has increased, and, now that trade has been resumed, it is to be hoped that it will be in excess of its normal volume in other years. As long as Great Britain adheres to the policy of slaughter, Ireland, which depends so greatly on the British market, has no alternative but to follow the same policy.

Owing to the great reduction in imports of meat and animal feeding-stuffs this year's harvest will be of vital importance. The area under cultivation has been considerably increased as the result of the compulsory tillage order, and forecasts of yields per acre are not unfavourable. The wheat crop is slightly late, but promises a yield higher than the average. The yield of oats promises to be satisfactory, but barley and root crops will probably be rather light. Even if it proves necessary to mix barley and oats with

THE COMMERCIAL BANK OF SCOTLAND LIMITED

RESERVE FUND - - - £3,150,000

ESTABLISHED 1810

wheat for bread-making, it is unlikely that there will be any shortage of barley for the breweries and distilleries, which are two of the oldest and most flourishing Irish industries. The difficulties next winter will be much greater in respect of fuel than of food. The prospects of the turf harvest are not nearly so reassuring as those of the main agricultural crops. It may be that Ireland will be faced with the problem of having plenty of food but difficulty in cooking it. The provision of communal kitchens in the large towns is under discussion.

The preliminary returns of the Census of Production for 1940 indicate that there was no decline of output compared with 1939. This is remarkable in view of the fact that the production of transportable goods in 1939 was 5 per cent higher than in 1938. Unfortunately, production has not been maintained at this level in the present year, owing to difficulties in importing raw materials, and the position threatens to get worse in the future. Employment in rural areas has increased as a result of the extension of the acreage under tillage and the turf-cutting campaign. These factors, together with the increase of the Army and the Construction Corps and a certain amount of emigration to Great Britain, have prevented the unemployment problem from assuming the dimensions feared at the beginning of the war. The Minister for Industry and Commerce recently stated that unemployment in urban areas has declined since last year by 4.5 per cent.

The Bill to rationalise the trade union movement by the elimination of overlapping unions has aroused considerable opposition by the spokesmen of organised labour. Curiously enough, the measure was at first greeted by these interests with approval, which has since changed into strong opposition. It has long been apparent that the organisation of Irish labour was disorderly and inefficient, and this has on several occasions been admitted by trade unionists and by the Trade Union Congress. A reorganisation of the unions on the lines proposed by the Government is overdue, and legislation was introduced only when the movement had failed to remodel itself internally. The opposition to the Bill is inspired by certain vested interests, who are threatened with damage if they find their occupation gone. Opposition dictated by such motives will not deter the Government from proceeding with the proposals, which are clearly meant to improve the position of organised labour.

Distribution of Trade

The relatively slight extent of the changes in Irish external trade brought about by the policy of protection and self-sufficiency which was so vigorously pursued after 1932 is revealed by statistics included in a study entitled *Europe's Trade*, published by the League of Nations. The percentage distribution of Irish imports and exports in 1928 and 1938 was as follows:—

Percentage of imports derived from:	1928	1938
United Kingdom	78	50
Germany	3	4
Rest of Europe	6	13
Rest of World	13	33
Percentage of exports absorbed by:		
United Kingdom	96	93
Germany	1	4
Rest of Europe	1	1
Rest of World	2	2

The reduction in the share of imports derived from the United Kingdom is the result of the policy of industrialisation which led to the substitution of imports of raw materials for imports of manufactured goods. That there is room for considerable expansion of the production of many agricultural commodities is suggested by the fact that, of the total European imports of pork, butter and eggs, Ireland supplied no more than 7, 4 and 7 per cent. respectively.

Bolivia To-day

[BY A CORRESPONDENT]

July 21st

CONSIDERED from the angle of mineral resources, Bolivia is one of the most important of the Latin American republics. It is, therefore, a cause for satisfaction to this country that she has given ample evidence of her sympathies. The Government has been swift to discover and suppress the

recent Nazi plot and to deal summarily with the German Minister. The Press has been, with some unimportant exceptions, most cordial to the Allied cause. The principal minerals are pledged to the United States or Great Britain. The aviation company, Lloyd Aéreo Boliviano, being suspected as a centre of German intrigue, and a convenient cover for the presence in Bolivia of numerous German personnel, has at last been removed from German control. Under ordinary circumstances, and in view of the special position of this country in South America, the time would have seemed ripe for an extensive survey of the possibilities of further development, particularly of the eastern plains, with British or North American capital. The country stands third as a world producer of tin, after British Malaya and the Netherlands East Indies. The output is about 16 per cent of world production, and in normal times about 80 per cent of the ore is shipped to England for smelting. The main obstacle to the development of local industries has so far been the lack of cheap fuel. But on the whole it is surprising how successfully Bolivia has been able to surmount the disastrous years of the Chaco war. La Paz, the capital, is being rapidly modernised. The Yungas, a zone intermediate in altitude and readily accessible from La Paz, is being developed agriculturally with great success. There remain, however, two outstanding obstacles to general development to be tackled—the absence of easy communications in this country of excessive heights and tremendous valleys, and the general social backwardness which means a scarcity of intelligent labour and a prevalence of crass agricultural conservatism.

War Risks and Australian Shipping

[FROM OUR SYDNEY CORRESPONDENT]

June 24th

ON February 27, 1941, the National Security (Marine War Risks Insurance) Regulations were issued under the National Security Act to provide for the Government insurance of Australian vessels against war risks. During the last year the Commonwealth Government eventually decided to accept responsibility for war risks on Australian vessels. Under that scheme there was no insurance, but the Government undertook to replace vessels lost as a result of war. The policy recently introduced departs from the practice of the 1914-18 war by providing for replacement by ordinary insurance methods under a Government scheme.

There are important reasons for this fundamental change of principle. Under the Commonwealth system of price control, shipping freights are strictly regulated and premiums for war risk insurance are important items in the field of shipping costs. It is of fundamental importance to minimise shipping freight increases to relieve the upward pressure on the general price level inevitably caused by higher costs of transport. By stepping into the field of war risk insurance the Government has ensured that an important item in shipping costs will be supervised and so can be made to conform with the widest requirements of national price policy. A further reason is that the remittance of funds overseas to pay for covering Australian vessels in the British insurance market constitutes an appreciable drain on Australia's London balances. It might be argued that insurance within Australia fails to provide overseas funds for the replacement of lost vessels. But against this argument must now be considered the possibility of vessels being replaced in Australian shipyards.

The regulations cover only vessels on the Australian register, and provide that these vessels cannot be insured against war risks except with the Commonwealth Marine War Risks Insurance Board, established under the regulations. Thus, the object is not to make war risk insurance compulsory, but to prevent Australian vessels being insured against those risks abroad. It is important to note that the Board has power to approve of the insurance of a vessel against war risks in overseas markets, if it so desires.

A country with the main centres of population relatively far apart on a long coastline is dependent upon shipping to a marked degree, and Australia's coastal shipping service is of vital importance to her. The decision to provide for war risk insurance of hulls in the coastal trade by a Government insurance scheme marks another step towards building Australia's total war economy.

German Europe

Crops and Food Supplies.—At the beginning of the third harvesting season under war conditions, there is no prospect of substantial surpluses from the Danubian countries on which German plans for the agricultural "reorganisation" of Europe have depended. Germany's attack on Russia ended Russian grain exports to Germany and German occupied countries. The 1940 harvest of cereals was far below normal because of bad weather conditions; and the war in Western Europe added destruction and disorganisation. Apart from maize there were hardly any exports from Danubian countries.

There is no doubt that Germany and Italy have been forced to draw upon stocks. In Poland, France, Belgium, Norway, Spain and Finland bread rations had to be introduced which are well below those of Germany and Italy. Throughout the Continent adulteration of bread has been practised; in Central Europe, a good root crop made the admixture of potato-flour possible; in Italy and the Balkan countries, maize was added.

During 1940/41 determined efforts were made in German Europe to increase the area under cultivation, and there is no reason to doubt the statement made by the "International Agricultural Institute" in Rome that the acreage under cereals did rise. But weather conditions were again unfavourable during the growing season. Agricultural activities in the Balkan countries were hampered by internal strife, by frequent mobilisation and, finally, by war with large-scale destruction in Yugoslavia and Greece. The occupation of Greece added another food importing country to the Axis Bloc; and the new war against Russia will undoubtedly affect harvesting in Poland, Hungary, and Roumania.

Crop prospects for the entire continent, including Soviet Russia, are therefore estimated by Broomhall's "Corn and Trade News" at 25 per cent below normal. Before the Russian war started, prospects were above the actual harvest of 1940 and only some 12 per cent below normal. Naturally estimates, with a complete statistical blackout in all the leading countries, vary considerably. Without a major war in the east, it could, however, be reasonably assumed that the 1941 harvest of cereals would not be below the 1940 output. The record root crop of 1940 will hardly be repeated in 1941, and the production of livestock and dairy products will be considerably smaller than in 1940. Wholesale slaughter in Denmark, Norway, Holland, and quite recently in France, was necessary because of the shortage of feeding stuffs.

The supply position of foodstuffs in 1941/42 will therefore deteriorate unless Germany is able to extort from a defeated Russia large quantities of cereals, livestock and oilseeds; and the course of the war against Russia makes it doubtful whether Germany will, in fact, be able to supply herself and the Continent with Russian agricultural products. The overstrained European transport system will make it hard to transport bulky foodstuffs from surplus to deficit areas. The shortage of fats and meat will become more pronounced during the year.

There is, however, no prospect that the situation in Germany will be critical. Large stocks of cereals and fats were intended to last well into 1942. The shortage of labour has been met by employing roughly 1,500,000 foreign workers, mostly prisoners of war. During 1940, stocks were replenished by foodstuffs requisitioned in occupied countries. Apart from a 25 per cent reduction in the weekly meat ration the quantity of foodstuffs supplied to the German population has not changed since rationing was introduced. Meat and fat rations are small, but no noticeable deterioration in the standard of health has been reported so far.

In Italy, the situation is more precarious. Stocks were smaller. Distribution is less efficiently organised. But current production of rationed staple foodstuffs will probably prevent an acutely critical situation even here. Conditions in France, Belgium, Norway, and even in Holland will be very different. There is little prospect that the situation at present marked by rations lower than in Germany will improve. In all these countries production was disorganised by war, and German requisitioning exhausted the stocks accumulated before the invasion. In France, the much-advertised increase in agricultural activities is obviously behind plan. Large numbers of farm workers and farmers are still prisoners of war in Germany. Draught animals are short because of war losses and German requisitioning. The new harvest may

relieve the situation, but the shortage of fats will remain serious. In Belgium the situation is critical. The substantial increases in the acreages under cultivation can hardly relieve the food situation of a country that is normally a heavy importer of all kinds of foodstuffs.

In Hungary, Roumania, and Bulgaria there will be hardly any surpluses; and in Yugoslavia partition, destruction and shortage of labour must prevent normal activities. Sweden and Switzerland expect to be able to maintain their much reduced rations. No marked improvement is expected in Spain, and the situation in Finland has gone from bad to worse since the attack on Russia. The general situation on the continent is thus marked by the failure of Germany's plan to achieve a reasonable measure of self-sufficiency in the occupied countries for the new agricultural year. It is the crop failure in 1940 and the war in the Balkans that have caused the trouble.

German Banking.—Since the occupation of Czechoslovakia, German banks have rapidly expanded into foreign countries. The main direction has been into South-Eastern Europe. In Western Europe the process has been slow and limited. In the Protectorate of Bohemia and Moravia, German banks acquired majority interests in the two leading banks and minority interests in a third bank. Several branch banks were established in Prague. The two leading banks in Slovakia are now owned by two German banks. A Hungarian bank is owned by a Viennese bank, and the *Laenderbank* in Vienna has established a branch in Budapest. The "Deutsche Bank" acquired majority interests in the *Kreditbank* of Sofia.

The main object seems to have been the banking business in Roumania, where German banks have acquired interests in five leading banks. The latest acquisition was the *Banca Commerciala Romana* of Bucharest, whose capital was controlled by a Franco-Belgian Group. In Yugoslavia, the Big Five acquired jointly the majority interests in the General Yugoslav Banking Union. The *Dresdner Bank* has also established a branch bank in Belgrade.

It is stated that this expansion is only a preparatory move for the big expansion which will begin when the war is ended. The leading expansionists among the German banks are the *Deutsche Bank* and the *Dresdner Bank*; next in importance are two Viennese banks. In other words, the expansion was left to the German banks which had large interests in South-Eastern Europe.

Cellulose.—The leading German cellulose producer, the *Waldhof* concern, with interests in the former Finnish cellulose factories in Kexholm, increased its turnover in 1940 by 6 per cent to Rm. 229 millions. During the year, the change-over from fir to beech was stated to be satisfactorily done, and the output of by-products, especially spirits, tanning material, and yeast for feeding purposes, increased. Demand for paper cellulose and paper exceeded production because of war orders. Exports decreased. The report throws an interesting light on Germany's shipping difficulties by stating that the large purchases of Scandinavian cellulose did not compete with German production. Lack of tonnage prevented shipments to Germany.

Order Bourse in Brussels.—An exhibition on the model of the Paris exhibition of German manufactures has been opened in Brussels. German and Belgian industrialists collaborated in organising the exhibition which is sponsored by Dr Todt, German Minister for Munitions. The purpose is to attract Belgian industry for German orders. In the German department, 300 German firms exhibit 3,000 different manufactures. Machine tools, motorcar accessories, and railway material dominate. In the Belgian department, everything is shown that Belgian industry is able to manufacture under the restrictions placed on raw materials. The exhibition will be permanent, and considerable space is being devoted to German substitute materials. Because orders may be placed as well as taken at the exhibition, the German press suggests that it should be called an "order bourse" instead of an exhibition.

THE BUSINESS WORLD

A Railway Subsidy?

ON Friday last week, the main line railways and London Transport announced their interim dividends to an apathetic market. Stockholders (as an Investment Note on page 145 shows) are to receive exactly the same gross payments as a year ago. There is no evidence of earnings (save the announcement by the Southern Railway board that earnings should suffice to cover the 2½ per cent payment on the preferred ordinary stock), for on this occasion the Pool estimates are not published. Instead, the Government has expressed to the companies its desire to amend the financial agreement of February, 1940, though they have not set any proposals before them. In these circumstances, the railways state that the net revenue accruing to the companies for the first half of 1941 cannot be ascertained, and they present no figures.

The financial agreement is dead. Intimations of approaching mortality were given by the Chancellor of the Exchequer in his Budget speech on April 7th. He then announced that the Exchequer was considering how far it could help to avert further increases in railway rates and fares. The solution by subsidy could have been little more to the liking of the Chancellor than it was to *The Economist*, which advocated the same policy, in default of anything better, at the beginning of March. The Budget speech showed a commendable awareness of the economics of inflation, and it was precise in its comprehension of the part which had been played in this process by the railway agreement. Nearly four months have passed, yet the Chancellor's impeccable statement of principle remains unadorned by practical detail. But railway stockholders had clear warning that the agreement would be modified, and last Friday's news of revision cannot, therefore, have come as a surprise.

Before considering precisely how a subsidy could be applied, for a subsidy is what the two announcements must mean, it is useful to examine the results of the agreement in practice. There is no need, at this stage, to rehearse once again the inevitable mechanics of inflation which it set in motion. Those processes were inherent in the agreement, as many critics realised when its terms were first announced. Its terms imposed a duty on the Railway Executive Committee to report regularly to the Minister of Transport any changes in working costs, and these could then be offset by higher railway charges. Increased costs have almost certainly outstripped increased receipts during the past six months. Even in the previous half-year, an extra £15 millions of gross receipts produced only £1 million of additional net revenue. In the first half of this year, the lag between rising costs and increased railway charges was even more prominent. It was surely something more than disinclination which stayed the hand of the Minister of Transport from ordaining the increase in charges, which, after all, was the railways' right under the agreement. But already that right had been tested against public policy, and had been found not to prevail. A system under which transport charges were automatically increased to counteract increases in costs could not logically be supported by a Chancellor who was alive to the slippery perils of wartime inflation.

That is the first point for the railway stockholder who feels tender about his "rights"—the cost-adjusting machinery under the agreement could not be kept in motion. But, in addition, the maximum dividends permitted under the agreement pre-supposed a degree of inflation of transport charges which would have been utterly insupportable and intolerable. This conclusion was already plain from the Pool results of 1940. It has become even more inescapable in view of subsequent increases in costs, and

the prospective increases which would be entailed by the claim for a £3 minimum wage and a war bonus affecting 150,000 railway workers. The past half-year, in fact, must have brought railway net revenues close to, if not to, the minimum guaranteed level. The agreement, on paper, looked like a perfect inflation hedge; it has, in fact, suffered from the recoil of inflationary impulses which it did so much to generate.

The question of the desirability of a subsidy can be simply posed: if the community as taxpayers pay less than they would otherwise have to pay in increased transport charges, then to subsidise will be sound economy. This proposition, however, entails two corollaries: the return on railway capital must be reasonable, and there must be no systematic increases in the costs of materials and labour to the railways. On the costs side, the withdrawal of the automatic rate-fixing arrangements under the agreement would spare the community the somewhat cynical spectacle of suppliers of materials at increasing prices to the railways complaining of consequential increases in railway charges. On the labour side, the general principles of the recent White Paper must apply, though these principles are expounded with a deference which might be interpreted at Unity House as weakness and lack of conviction. In any event, the removal of a quasi-automatic means of transferring the cost of successful wage claims to the public's broad back would do much to temper the measure of these claims.

To lay down that the return on railway capital must be "reasonable" is easy. But what rate, in the context of war and the terms of financial agreement, could be regarded as reasonable? It may be assumed that such a rate would cover the guaranteed minima of 3.3 per cent on Great Western ordinary, 1.0 per cent on LMS ordinary, 1.2 per cent on LNER second preference and 0.8 per cent on Southern deferred. It may equally be assumed that maximum rates of 8.1 per cent for Great Western and LMS ordinary, 4.7 per cent for "Berwick" deferred and 3.2 per cent for Southern deferred are completely ruled out of the calculation. The addition to the minimum guarantee, of course, cannot be determined by any process of cold logic. Last year's experience, however, did suggest that stockholders would be wise to regard stage 2 net revenues as the maximum which would be attainable in practice under the process of adjusting rates to increased costs.

The two limits, then, are the minimum guarantee and stage 2, at which Great Western ordinary would receive 4.6 per cent, LMS ordinary 2.3 per cent, LNER second preference 2.5 per cent and Southern deferred 2.7 per cent. Such earnings were almost achieved last year. If the volume of traffic were the governing factor in net earnings (as the railways wished it to be), 1941 results would in all probability be higher. But if the railways are to receive a subsidy to enable them to pay dividends on capital at rates intermediate between stage 1 and stage 2, they cannot at the same time qualify for a commission on total traffic turnover.

The difficulty is to combine with a subsidy the incentives to efficient management and economy. Some share of any improvement in the operating ratio should be allowed to the companies, though such opportunities are likely to be rare in wartime. In the end, a subsidy must be adopted. It will defend the railway user and help to stabilise the general structure of costs and prices; it will tend to prevent—though not decisively—the drive for increased wages and higher prices for railway stores. And it should be possible to give the stockholders a return which, for many months past, has seemed as high as is practicable under the existing and moribund agreement.

War, Government and Insurance

IN the past two years British insurance has passed through great changes, as insurance in wartime always must. The close and intimate relations which existed between British companies and the Continent of Europe have for the most part been severed. In the occupied countries, Germany has handed over to her own companies connections that formerly were Britain's, and although it is certain that they will, after the war, be re-established, the business has for the time passed out of British hands, and it is impossible to foresee how and when the frozen assets and liabilities of the London insurance market on the European Continent will be thawed. That is the most that can be said of insurance relationships with former Continental friends; but, fortunately, connections with other overseas markets, so far from dying a temporary death, have probably become both closer and wider. The interests of the London market in the United States, for example, have almost certainly increased since the outbreak of war, and the confidence of American policyholders in British companies and underwriters appears to be greater than before.

At home the war has naturally presented British business with a multiplicity of problems—problems of management, of staff, of a thousand adaptations to the new conditions; and general and departmental managers have had their hands full to overflowing in dealing with the variegated difficulties that have come up day by day for solution. But to the student of insurance the most interesting of all these war developments is the intrusion, the necessary intrusion, of the Government into insurance enterprise, which goes far beyond the activity of the Government in the last war, and has given to the Treasury a gigantic premium income and correspondingly large liabilities. There are six main schemes of wartime insurance, and they may conveniently be dealt with separately.

First, there is the insurance of commodities. This is a Government monopoly, which is managed by the Board of

Trade through companies, brokers and the Corporation of Lloyds. It is compulsory on sellers of goods, and the full value of stocks must be covered, so that the figures of premiums received by the Government at 7s. 6d. per cent per month should be enormous. The value of the scheme is beyond question, and its only serious weakness has been delay in settlement of claims, which in the earlier days of the air raids was very bad indeed, though recently there has been a considerable improvement. Traders owe a debt of gratitude, which they may not all appreciate, to the officials of the Board of Trade for their patience and adaptability in managing a most difficult and complicated experiment.

Secondly, there is the insurance of hulls. Ships are insured with a club of the owner's choice, which retains 20 per cent of each risk and re-insures 80 per cent with the Government. It is not a monopoly, although the British fleets which do not come into it are few in number. It follows, in general, the lines of the 1914 scheme, but differs from it in the much tighter control over insured values. The highest permitted value is 125 per cent of the pre-war insurance, and, unless the consent of the club managers is obtained, no insurance of excess values may be placed in the open market. In case of loss, the immediate payment is 100 per cent of the pre-war value, the remaining 25 per cent being earmarked for replacement. The object of this restriction is, of course, to check the inflation of values.

Thirdly, there is the insurance of cargo. This, in theory, is not a Government monopoly, and, theoretically, the scheme does not differ in this respect from the arrangement of the last war. Actually, it is a monopoly because marine underwriters have bound themselves not to accept cargo, which the Government will write, at less than 125 per cent of the Government's rate. By this agreement, the Government has avoided the rather scandalous competition of the 1914 war, when underwriters swallowed all the available delicacies and left the Government War Risks Office to fill its belly with

the husks. Except for some delay in the settlement of claims, the scheme has worked well, and with as much elasticity as in the circumstances any one could have anticipated. Its success is due very largely to the fortunate choice of a committee of underwriters who know the marine insurance market thoroughly, are always accessible to brokers, and have the supreme merit of understanding what merchants need in the way of cover. It has been especially fortunate in having a chairman of committee who enjoys the confidence both of the insurance market and of the Government departments.

Fourthly, there is the War Damage Act, which covers buildings, equipment and chattels, the insurance of buildings and equipment being compulsory and that of chattels voluntary. This scheme is too recent to need any explanation, and, as no claims are paid until after the war, it is impossible to say how good or how bad the working of it may be. The subtle questions which have already cropped up are almost numberless, and, if London were combed out with a small tooth-comb, the search would scarcely produce half a dozen experts who could confidently face an examination on the details and minutiae of the Act, and of the recorded interpretations of it. The most noticeable feature so far is the comparatively small number of householders who have insured their chattels—probably not more than 20 to 25 per cent of the total number of ordinary domestic policy-holders in the country.

Lastly, there is the insurance of food and supplies. This is different from all the other schemes in two points: it covers marine and fire risks, but not war; and the Government, which is the insurer in all the other schemes, is the insured in this. What is covered is merchandise bought by the

Government f.o.b., or in warehouse abroad—merchandise which, being Government property, would normally run uninsured, but by a special arrangement made between the Government and the market is insured for marine and fire risks by a consortium of companies and underwriters. The market's object in pressing for this scheme was to maintain its long connection with the insurance of commodities, and the Government, against its standing principles, yielded to the pressure, and agreed (though it did not desire cover) to take out insurance in order to keep the peace-time machinery running. This insurance has so far proved profitable for the Government, and anything but profitable for the insurers.

On the whole, the Government's intervention in insurance has been of great value to the country in its war effort, and great credit is due to those civil servants and underwriters who have combined to work the various schemes. On the other hand, it is certain that peacetime international trade could never be served, as it needs, by Government schemes. If an underwriter has to keep his liabilities within the prescriptions of an Act of Parliament which permits or forces him to write risk A, which he does not want, and forbids him to write risk B, which he does want, then he will be unadaptable; and if an underwriter is unadaptable, he is of very little use to international trade. While all the credit to which they are undoubtedly entitled must be given to the men inside and outside the Civil Service who manage the Government schemes, it remains true that a scheme of marine insurance or fire insurance, which is laid down by Act of Parliament and managed within the terms of an Act of Parliament, can never be either elastic or economic.

Finance and Banking

Abundance of Credit

Exceptionally abundant supplies of credit have been available in the money market this week. The basis of bank cash remains swollen by the Government's ways and means borrowing at the Bank of England revealed in the

The Canada Life in its 94th Year

OUTSTANDING FEATURES of the COMPANY'S REPORT for 1940.

The net new life assurances completed in the year amounted to £7,480,851. Of this, £997,015 was written in the United Kingdom and in Eire. In addition, the sum of £543,519 (£366,461 in the United Kingdom and Eire) was received by way of single premium annuity considerations.

Income from all sources amounted to £7,372,824. Payments to Policyholders and annuitants and sums paid as a result of death claims totalled £5,097,886.

The rate of interest earned on the funds of the Company was £4 1s. 2d. %.

The assets at the 31st December, 1940, amounted to £56,626,744.

Special reserves and surplus funds increased to £2,774,228.

ESTABLISHED 1847.

Incorporated in Canada as a Limited Liability Company.

Chief Office for the British Isles:
9 CHARLES II STREET, LONDON, S.W.1

last floating debt return, and this is reflected in the Bank return in a rise of £11,840,000 in Government securities, while on the other side of the account bankers' deposits are at the high level of £132,081,000, a rise of £7,736,000 on the week. The demand for accommodation in the market has been exceptionally small, as the discount houses have this week had to be content with a subnormal allotment of Treasury bills. At last week's tender they obtained only 24 per cent of their applications. The applications for the £75 millions of bills on offer rose steeply, namely, from the previous week's total of £146,785,000 to £163,550,000. Many of these must have been lodged at £99 15s., for the average rate of discount worked out at 19s. 11.84d. per cent, this being the fourth occasion since the outbreak of the war when the Treasury bill rate has dipped below 1 per cent. The banks, moreover, have again had no payments to make during the week in respect of Treasury deposits. The margin of available credit has been such that every clearing bank has been a buyer of bills on its monthly making-up day. The note circulation continues its steady upward progression, the movements during the past week being accentuated by the usual August holiday factor. Thus the circulation rose by £5,775,000 to the new record of £658,429,000, which at the existing level of the fiduciary circulation reduces the reserve ratio to 12.1 per cent.

* * *

Expansion in Tap Bills

The most interesting movement brought out by the latest monthly Floating Debt return is the expansion in Treasury bills issued through the tap. The return is dated July 26th, and exact comparison of changes in the tap and tender issues of Treasury bills must take in a two-monthly period because the previous monthly return was dated June 30th and did not fall on a Saturday. Comparing the latest return with that for May 31st, the tap bill issue has risen from £1,410,385,000 to £1,491,675,000. This expansion over a period when the Exchange Equalisation Account is no longer losing gold (because it has next to none left), and is therefore not accumulating tap bills, obviously requires an explanation other than the absorption of tap bills in Government departments which has hitherto served to explain the bulk of the expansion in this item. That explanation will probably be found in the direct issue of tap bills to Empire and sterling area central banks. The London funds of these institutions are now accumulating at a rate which probably renders it inconvenient to satisfy a consequent demand for Treasury bills wholly through the weekly tender, and it may be assumed that part of the recent expansion in tap bills is attributable to the issue

of such bills in those quarters. The only other item of interest in the debt return is the fact that ways and means advances at the Bank of England should have been outstanding to the amount of £12,000,000 last Saturday. There is no special seasonal explanation to account for such accommodation, and the current abstention of borrowing on Treasury deposits hardly indicates stringency in the Exchequer's ways and means position.

Japanese Assets Frozen

The simultaneous American and British Treasury orders blocking Japanese assets in their respective countries provide the basis for the economic counter-measures of the democracies to Japanese aggression in the Pacific. These orders have been supplemented by parallel decisions on the part of all members of the sterling area, Canada and the Dutch East Indies; and a formidable financial front thus faces Japan. The immediate objective of these freezing orders is not the sequestration of the assets involved. They are in any case small and overwhelmingly exceeded by the American and British assets in Japan and Japanese controlled territories of China, against which immediate retaliatory measures could be anticipated as a matter of course. The intention of the freezing orders is to submit to the control of the American and British authorities the financial machinery through which trade between Japan and the sterling and dollar areas must be financed. Control of that machine provides the quickest and most effective method of controlling that trade. It renders unnecessary the promulgation of specific embargoes on the export of this or that commodity. It has all the advantages of lack of clear definition in that the authorities can interpret the orders and grant exemptions as they think fit, and so command maximum freedom of action in a situation which may still give scope for the exercise of such elasticity. The special licences which will have to be granted for every commercial or financial operation between dollar or sterling countries and Japan will allow a discriminatory control of that trade which will achieve all the immediate purposes of the American and British Governments.

London and New York Credits

The Japanese assets attached in the United States are estimated at \$131,000,000, of which about half is in the form of bank balances and half in securities. For many months past the statistics of capital movements to and from the United States have shown a steep running down of Japanese assets—partly as a precautionary measure anticipating the step which has now been taken, partly in payment for imports. Exports of Japanese gold to the United States have been dwindling, partly because reserves are falling, and partly because the Japanese authorities have pursued the policy of keeping their dollar balances at the minimum level required by the trade between the two countries. The Japanese assets in London are likely to prove even smaller than those attached by the American freezing order. Japan has by tradition been a borrower and not a lender in the international money market, and in normal times it is probable that Japanese acceptances in London tended to exceed the balances maintained here on Japanese account. For a period in the middle of 1930's there was evidence in the London market of a fair volume of Japanese accommodation paper, to the creation of which the highly interrelated nature of important Japanese commercial, shipping and financial concerns lent itself admirably. The movement was soon checked, however, and ever since Japan became an adherent of the Tripartite Pact it has been virtually deprived of the facilities of the London discount market. With the disappearance of these facilities the need to maintain balances here has gone, and the British Treasury order will in fact be found to affect a very small amount of such funds.

* * *

Japan's Answer

The immediate riposte of the Japanese Government has been to order a similar blocking of American, British and Dutch assets in Japan. The move is at first sight more than compensatory. Allowing for long-term capital investments in Japan, there can be no doubt that the exchange of these mutual freezing orders works very much in Japan's favour, especially if account be taken of American and British investments in Chinese territories now under Japanese control and in the Shanghai International Settlement, which may before long fall under such control. Since however, the intention of the American and British freezing orders was not to achieve a favourable swap of assets but to lay the basis of a commercial embargo on Japan, there can be no question as to the side on which pressure will be felt with the greater severity. In order to complete the financial blockade of Japan, the United States and British Governments have extended the freezing order to Chinese dollar and sterling assets. This has been done with the active approval of the Chungking authorities who will continue to operate their dollar and sterling accounts with complete freedom. It is the intention that these freezing orders should apply to the Shanghai International Settlement as it is clear that the exemption of this greatest of the Far Eastern markets would provide a potential channel of evasion wide enough to defeat the main purpose of the orders. The problem of the inclusion of Shanghai assets in the freezing order is, however, one which must take some time to solve effectively, and meanwhile that market has been thrown into considerable confusion although, as was pointed out in an article from our Shanghai correspondent in *The Economist* of July 12th, page 46, the move had for some time been anticipated by Shanghai speculators.

INSURANCE NOTES

Friends' Provident and Century.—The total new life business written in 1940 by this office and its associated companies amounts to £1,393,793, a reduction of £729,782 or 34.4 per cent on the previous year. Life premiums in the "Friends' Provident and Century" fund at £753,844 record a slight advance while the ratio of interest earned on the funds was lower at £3 4s. 1d. per cent, against £3 11s. 5d. per cent. Death claims amounted to £261,966, being lower by £170,026, and include over £40,000 arising directly from the war. The strain on the fund in consequence of these war deaths was £30,000 but, even so, mortality was only 83 per cent of expectation. Following a valuation of the assets the

directors are satisfied that depreciation does not exceed 1 per cent, that is, £170,000. Interim bonuses are being maintained in respect of premiums for the years 1935-39.

Non-life business is transacted through the Century Insurance Company, Limited, which has a total premium revenue, including the sinking fund account, of £109,000, and the small life account of £63,000, amounting to £1,095,000; there is a small underwriting profit of £2,524 which, with a transfer of £4,302 from the life and annuity account and net interest of £34,432, gives total net credits to profit and loss of £41,258. Expenses, etc., charged in profit and loss take £23,959, and the dividend, which is reduced from

20 per cent to 6½ per cent, costs £15,000; the balance carried forward at £100,562 is higher by £2,300. The directors certify that, after making prudent reserves, the book values are in the aggregate fully of the value stated. There is a general reserve of £550,000, as well as additional reserves in the fire and general accounts of £127,500.

The Gresham Societies.—Because of the part the "Gresham Life" has played in developing British life assurance on the Continent, more than ordinary interest attaches to the 1940 accounts of this office. New business naturally shows a marked recession, the overseas figure being only £532,362, against £1,544,294, but production at home was fairly well main-

buyer of shares will not know what has happened. He will have to ask his broker, and if the latter does not inform him, whether asked to do so or not, the client will be dealing under a misapprehension. The regulation seems designed to cause the maximum of trouble with the minimum effect; it infringes a vital principle of market dealing, and strengthens the growing impression that the public, and in particular the investing public, is thought worthy of no consideration by those in authority.

Conversion Results

The final results of the 19 municipal conversion offers, made at the end of April, and the preliminary statement by the Commonwealth of Australia as to its operations of a month later, are of considerable interest. It may be recalled that, instead of allowing the usual method of offering to the public any stock not taken in conversion, the Treasury decided, in both cases, to provide any funds required itself. Had the former method been adopted, there can be no certainty that all the money would have been provided, but the market fully expected that the call upon the Treasury would be negligible. In all, £23½ millions of municipal repayments had to be covered, of which some £4,500,000 was to come from accumulated sinking funds, leaving £19 millions to be found. In fact, the Treasury has had to find £1,305,000 out of this total, but, despite this, all the new stocks are quoted at well above the issue price of par. Although the terms of the Australian conversion were equally favourable, the preliminary figure is some £23 millions out of a total of £30 millions. It seems probable that this new stock will settle down at a slight premium on the issue price of 99 for a 3½ per cent stock, 1961-66, but the slightly shorter date and lower price proved insufficiently attractive in the strictly limited market which the new procedure imposes. On the whole, the new method does not compare favourably with the old, however necessary it may appear in the interest of limiting competition with Government loans. The market has always differed from the Treasury on this point, and experience suggests that the former has the truer measure of the position. A further conversion is now announced which will also benefit by Treasury assistance, namely that of some £2,600,000 Port of London Authority 4½ per cent stock, holders of which are being offered at 99 a 3½ per cent issue, repayable 1960-65. Both date and price are more favourable than the municipal stocks and the life is one year less than the Commonwealth. Probably the Authority has funds to cover repayment of some stock not converted.

Company Notes

Courtaulds' Interim Maintained

The payment of an interim dividend of 2½ per cent on ordinary stock is specifically stated by the directors to carry no implication that the Courtaulds' total dividend will be maintained at 8 per cent in the current year. In 1940, the ordinary payment was stepped up 1 per cent in view of a rise in gross profits, after depreciation, from £2,598,600 to £3,314,869, and an improvement in the earnings percentage from 8.2 to 9.4 per cent. With, however, a jump in total tax liability from £991,257 to £1,764,808, the actual amount of equity earnings declined somewhat from £1,321,255 to £1,296,584. The directors state that earnings in the first six months of 1941 have been satisfactory, but that the outlook remains obscure. Income for that period also included £684,313 from a 7 per cent dividend on the Viscose holding. Whatever the company receives in compensation can scarcely be invested in wartime to yield as much. While the demand for the company's products is likely to remain fair, despite restrictions on civilian buying, it is understood that there are considerable difficulties due to raw materials. Last year's margin did not leave a great

deal for further rises in tax liabilities and other costs, which continue to mount, and the outlook cannot be described as reassuring. It is to the readjustment and restocking period of the post-war world that Courtaulds' stockholders must look for further unhindered progress. It is too early to say how the Viscose transaction will affect the profit position, but it is clear that there is a strong possibility that this year's total payment may fall below 8 per cent, despite the welcome maintenance of the interim. The £1 ordinary stock, at 30s. 10d. ex dividend, yields £5 3s. 8d. per cent on last year's total payment.

Royal Dutch Allocations

Accounts of Royal Dutch for 1940 show no dividend will be paid on preference or ordinary capital. Profit for 1940, including Fl. 364,312 profit on sale of U.S. dollar securities, amounts to Fl. 23,625,294 against Fl. 26,200,000, the decline being due to a fall in income from dividends from Fl. 26,000,000 to Fl. 23,193,086. After deducting administration expenses, amounting to Fl. 155,744 against Fl. 400,000, the whole of the balance is added to the carry forward and earmarked as reserve against loss on investments amounting to Fl. 25,243,272. The assets side of the balance sheet shows a fall in securities from Fl. 2,052,396 to Fl. 800,000, the result of the sale of American holdings. The remaining Fl. 800,000 are the company's holding in 4 per cent Netherlands Loan, 1940, II, valued at par. Part of the proceeds of the sale have swollen cash holdings from Fl. 1,634,000 to Fl. 2,064,875. On the liabilities side, creditors amount to Fl. 4,191,314 against a total of Fl. 4,200,000 for creditors and unclaimed dividends. General reserve is unchanged at nearly Fl. 72,000,000 and the suspense account created in the previous year, in view of the destruction of documents, has fallen from Fl. 1,104,203 to Fl. 748,965. There is grave doubt whether the Royal Dutch Company will be in a position to pay further dividends until the situation in the Far East is in hand. Recent developments there constitute an acute threat to its existing income from dividends. In the circumstances, there can be no doubt of the wisdom of the decision to earmark all undistributed profits as investment reserve. The fact that the Fl. 100 shares stand at some £19 is a clear indication of confidence in eventual powers of recovery.

Imperial Tobacco Interim

The maintenance of the Imperial Tobacco interim payment on ordinary stock at 7½ per cent tax free for the year to October 31, 1941, was well received by the market. The £1 ordinary stock improved 2s. 6d. to 106s. 10½d., and a sympathetic rise took place among the other leading tobacco issues. It is, of course, generally recognised that there is a slight possibility that the total payment for the year can be maintained at the 20 per cent tax free to which it was reduced from the 23 per cent tax free of 1938-39. The rise in the standard rate of tax alone would probably make a reduction necessary, while it is increasingly unlikely that sales income has continued to offset rising costs and special war expenditure. Net profits last year declined from £10,220,150 to £8,872,829 and the tax free rate of equity earnings fell from 24.9 to 21.4 per cent, which provided narrow cover for the total ordinary payment. The market appears to have discounted a halving of the 5 per cent tax free bonus, making a total distribution of 17½ per cent tax free, and this should probably be regarded as the maximum which stockholders are likely to receive. The £1 ordinary stock yields some £3 15s. 11d. per cent tax free on last year's total payment.

John Lewis Group

The full accounts of the John Lewis group, for the year to January 31st last, present an excellent cross section of retail trade experience in the first full year of war. The greatest interest attaches to the results of the two holding companies, *John Lewis and Company*, and the newly-acquired *Suburban and Provincial Stores*. Taken as a whole, the results are far better than could have been expected a few months ago. The earnings of the London company are, of course, vitally affected by the loss of the Oxford Street premises through enemy action. Total profits dropped from

£249,563 to £131,776 and a net deficit for ordinary capital of £29,804 replaces equity earnings of £39,482 in the previous year. The management has decided to attempt to maintain the 5 per cent cumulative preference service, but to default on the 7 per cent preference issue. After paying 2½ per cent on ordinary shares in May, 1940, the carry forward is down from £73,834 to £29,968. These results, of course, reflect not only the fortuitous loss of the Oxford Street business, but also the decline of retail trade in central London, for which evacuation, the black-out, rationing and limitation of supplies are all responsible. For the first seven months of the year, *Suburban and Provincial Stores* suffered by comparison with 1939, owing to the disappearance of the hire-purchase business which, until the outbreak of war, had been a feature of the six suburban shops. In the remaining five months, like conditions prevailed in each year, and not only the further decline in London, but the whole of the earlier loss, was more than made good by expansion in the provinces, part of which resulted from the transfer of business from John Lewis after the Oxford Street loss. Total profits of the holding company, before crediting refund of income tax in either year, increased from £104,760 to £115,322. No dividend is paid on ordinary stock, the whole of the surplus being used to raise the carry-forward from £27,474 to £51,538. A marked rise in stocks has heavily depleted liquid cash. *Suburban and Provincial Stores* propose to raise £300,000 additional capital in £1 cumulative preference shares, of which £293,315 would be offered in exchange for existing preference issues of subsidiary companies, thereby placing the obligations of the operating concerns on a cumulative basis. Bank loans, shown in the consolidated statements, are substantial in both cases, having risen

from £526,072 to £547,294 for *Suburban and Provincial*, while *John Lewis* have a newly-acquired debt of £512,071. None the less, there is every prospect that the group as a whole will manage to keep its head above water until a genuine revival of retail business is possible after the war. In the meanwhile, the possession of *Suburban and Provincial Stores* provides an invaluable counterweight to the inevitable difficulties of the London concerns.

Henley's Telegraph Earnings

Preliminary figures of W. T. Henley's Telegraph for the year to December 31st last show net profits of £320,565 against £343,853. The total payment on ordinary stock is maintained at 20 per cent, including a 5 per cent bonus, and the carry-forward, after the allocation of £50,000 to war contingencies against £100,000 to general reserve, is reduced from £384,331 to £382,396. Since the net profits figure is struck after taxation and after special war and ARP expenditure, it is highly satisfactory and no doubt cloaks a considerable rise in the gross figure. Trading profits, after tax, fell in the previous year from £445,159 to £415,204. Equity earnings can be estimated at £311,565 against £334,853, providing cover of 27.8 against 29.2 per cent for the 20 per cent ordinary payment. There is little doubt that the electrical transmission section of the company's output has made the most substantial contribution to earnings last year, and that its record is in line with that achieved by Callenders' Cable. Further interpretation of the year's results must wait on the publication of full accounts. The 5s. ordinary stock, at 22s. offer a yield of £4 12s. 6d. per cent.

THE STOCK EXCHANGES

London

Note: All dealings are for cash

At the close of last week, conditions in all markets were subdued, and dealers were disquieted by news of the impending Japanese occupation of Indo-China. There was, however, little selling and the generally cautious attitude expressed itself in a minimum of price changes and low turnover. Japanese issues were an exception and dropped heavily both before the week-end and on Monday. Later in the current week, a revival in sentiment took place inspired by the generally favourable war situation and possibly by the Prime Minister's statement in the production debate. Dealing was still on a small scale, but most markets enjoyed a number of moderate rises.

After a subdued but steady close last week, the *gilt edged* market suffered a number of small losses on Monday, many of which were recovered the following day. Thus 3½ per cent. Conversion and War Loan and 4 per cent. Funding regained on Tuesday the previous day's loss of ½, while 2½ per cent. Consols improved ¼ on balance during the two days. Local Loans were unchanged after a movement of ¼ each way. Further improvements in midweek, raised old and new War Loan by ¼, though 3½ per cent Conversion fell by the same amount. The most striking feature of the *foreign bond* market was the heavy losses in Japanese issues which were not fully made good by improvements on Tuesday, due to bear closing. Thus, the 5½ per cent loan of 1930 which dropped 3 points before the week-end and a further 6 points on Monday, gained 2 points only the following day. The 4 per cent, 1899, 6 per cent, 1924, and 5½ per cent City of Tokyo loans were also heavily offered, but shared in Tuesday's gains which were based on the assumption that the position was oversold. Austrian 4½ per cent and Czech 8 per cent loans were in demand, but there was moderate selling of Greek 6 and 7 per cent loans and of Egyptian Unified. Among South

American securities, Brazilian and Chilean loans and the San Paulo Coffee loan were all strong.

The *home rail* market showed no marked reaction to the dividend announcements, which had already been generally discounted. Before the week-end, LMS ordinary lost ¼, followed by the same amount on the first two days of the current week. On Tuesday, Great Western ordinary and Southern deferred also lost ground. Debenture issues of all the main line railway companies were sold in a small way at the beginning of the week. Midweek saw a general improvement in the junior stocks, which raised LMS ordinary and Southern preferred by ¼. There was little business in foreign rails, but Canadian Pacific preference eased on moderate selling.

The tone remained moderately firm in the *industrial* market. Price changes were small and somewhat irregular. In the brewery group, recent progress was continued by Bass, which gained 1s. on Monday, by Barclay Perkins and Guinness. Benskins and Distillers lost ground on Tuesday. The heavy industrial section was in general firm, moderate rises being realised by John Brown, Bolsover and Colvilles, although Babcock and Wilcox was sold in a small way and Wm. Cory fluctuated uncertainly. The textile group was marked by steady buying of Wardle and Davenport, and Fine Cotton Spinners also made small, but consistent progress. Miscellaneous issues fluctuated without trend. The maintenance of the Imps interim had a good effect on leading tobacco shares which improved generally on Tuesday and in midweek.

The *kaffir* market profited from Cape buying before and after the week-end, and in consequence prices remained more buoyant than in other directions. By Tuesday, the tone became definitely strong and gains of ½ were common. West Wit Areas improved as much as ¾ and both Grootvlei and New State Areas

were up ½. Selling was predominant in both *tin* and *rubber* markets. In the former, Mawchi and South Malayan lost ground, and among rubber companies, losses of ¾ were suffered by United Sui Betong, Batu Caves, Glenshiel and other leading issues, the approach of Japan to the Singapore area being mainly responsible for the setback. In the *oil* market, prices held firm and by Tuesday a general advance took place which included gains of ¼ for Anglo-Iranian ordinary, Burmah and "Shell" Transport. Canadian and Mexican Eagles were consistently supported.

New York

News of the latest Japanese aggression caused prices to move irregularly on Wall Street at the end of last week. Dealers were hesitant and sentiment generally disturbed. On Monday, markets opened firmly and later in the session there was a demand for steel, aircraft, copper and chemical issues, which all improved fractionally. The progress was not, however, fully held and on Tuesday steel stocks lost up to 1 point. The Japanese freezing of U.S.A. credits had already been discounted and was not in itself responsible for the uncertain trend. In midweek, anxiety regarding domestic taxation induced further falls under the leadership of steel issues.

The *Iron Age* estimates steel mill activity at 99 per cent of capacity, against 99.5 per cent in the previous week.

Industry and Trade

The Price of Coal

The Mines Department has recently made an important change in the procedure by which it has been authorising increases in the price of coal since the outbreak of war. It has discontinued its practice of giving these authorisations a more or less uniform national application, and has informed the industry that in future claims for increases in prices will be examined and determined independently on a district basis. Under these new arrangements, the Department is now considering claims to meet the cost of the guaranteed week, of the recent war wage addition of 4d. per shift, and of increases in the charges for other services. By the Central (Coal Mines) Scheme (Amendment) Order, sanctioned by Parliament on May 28th, the Central Council was authorised to impose a levy on all colliery undertakings at a uniform rate not exceeding 6d. per ton calculated on commercial sales, and out of the Central Fund so created to pay the owners the actual costs incurred by them in meeting their statutory wage obligations under the Essential Work Order. It has been realised, however, that because of the different local conditions, these costs vary appreciably from colliery and colliery, and from district and district, and accordingly the South Wales Executive Board applied for authority to raise their prices by an amount considerably greater than that of the estimated charge of 6d. per ton to cover the cost of the guaranteed week and the conventional estimate of approximately 1d. per ton for each rd. advance in the average wages per man-shift worked. The Mines Department, however, has authorised increases in the price of South Wales steam and bituminous coal of only 10d. per ton from July 19th, and of 1s. 8d. per ton in those of all grades of anthracite coal. The Welsh coal-owners have protested against this award, and their representations are now under consideration by the Department. Decisions relating to the other coalfields of the country have not yet been announced. This is the seventh occasion on which Welsh coal prices have been raised by the authority of the Government since the outbreak of the war, and the aggregate increase amounts to 7s. 9d. per ton for steam and bituminous coals supplied inland and 8s. 1d. per ton for export, and to 9s. 7d. and 9s. 11d. respectively for anthracite grades. Between July, 1939, and last May the average pithead proceeds of the industry per ton raised rose by 6s. 3½d., or 33 per cent, but during the same period the official index of wholesale coal prices showed a rise of 42 per cent and the general wholesale index number one of 55 per cent.

American Trade with Japan

The formal rupture of United States' commercial relations with Japan would only give finality to a state of affairs which has been developing for some time. United States exports to Japan in the first quarter of this year were only \$32,808,000, 47.8 per cent below those of the corresponding period of 1940. In the first quarter of 1939, exports to Japan were 10.6 per cent of total United States exports; in January-March, 1940, they constituted only 8.3 per cent and in January-March, 1941 only 5.5 per cent. Exports of crude oil during the first quarter fell from \$3.8 millions in 1940 to \$2.4 millions in 1941, and in the month of March this year no exports of copper, aluminium, carbon black, ammonium sulphate or potash fertilisers were recorded. Some idea of the key products for which the United States has in the past been an important source of supply to Japan is given by the following table:

Quantity lb.	Value \$	Quantity lb.	Value \$
Total Exports.....	239,662	Lead pigs, bars, sheets, pipes, etc.	60,406 2,100
Cotton (ex linters) .lb.	534,389 52,850	Nickel-chrome elec- tric resistance wire	48 78
Sulphite wood pulp, bleached.....	60 5,585	Radio apparatus.....	129
Crude petroleum bbl.	21,272 29,858	Lathes.....	4,665
Gas oil and distillate fuel oil.....	5,297 6,675	Milling machines.....	5,693
Lubricating oil.....	307 2,789	Grinding machines & parts.....	4,657
Iron & steel scrap tons	1,366 21,685	Rolling mill machines and parts.....	3,233
" " rods.....	65,226 2,718	Motor trucks, buses and chassis.....	2,129
" " plates.....	27,046 714	Automobile parts for assembly.....	3,624
Tin plate and taggers' tin.....	28,263 1,631	Automobile parts for replacement.....	2,753
Ferro alloys.....	2,382	Aeroplanes.....	5,515
Aluminium ingots, scrap and alloys lb.	396 201	Aircraft parts, instru- ments & accessories	5,055
Aluminium plates, sheets, bars, strips and rods.....	1,459 203	Potash fertilisers tons	1,222
Refined copper in in- gots, bars, etc. .lb.	217,880 21,813	Phosphate.....	159 667

As well as petroleum products, discussed on page 133, Japan has been accustomed to draw upon the United States for many important materials. Its dependence was greatest in raw cotton, iron and steel and copper, but machine tools, other non-ferrous metals, and fertilisers are also important commodities for which Japan may soon have to look elsewhere. The United States, on the other hand, imported no single essential commodity in any great quantity from Japan, except raw silk, of which its Japanese imports in

1938 were 51 million lbs, valued at nearly \$84 million. Timely action to conserve existing stocks would probably prevent the cutting-off of these imports from interfering with any essential use of silk. For the most part, Japanese exports to the United States consisted of the cheaper grades of non-essential goods, such as toys, slide fasteners, china and musical instruments; of not particularly important food products, as for example, crab-meat and tuna fish; and of a few important but not irreplaceable commodities such as creosote, menthol and camphor. A United States embargo on trade with Japan would be no two-edged sword, but a weapon with a single cutting edge of great sharpness.

Inventors and the State

To have worked eagerly over a long period on an idea which seems full of promise engenders a hypersensitive state of mind. When that idea is rejected, almost in silence, by a Government department, the originator is apt to feel that he has been treated with contempt, and to have a strong suspicion that it has never been examined at all. This is a dangerous state of mind, at a time when the country needs all the originality it can command, and the Ministry of Supply has done well to make a public statement of the procedure that is followed in respect of all inventions submitted to the Government. The Directorate of Scientific Research has a staff of examiners who are specialists in the various subjects likely to be of interest, and each proposal undergoes a preliminary examination by the appropriate member of this panel. If he thinks it likely to be useful he sends it on; with his comments, to the department it seems likely to concern, sometimes accompanying it with suggestions which go beyond the scope visualised by the inventor. Sometimes, even if the department rejects it, he returns it for reconsideration, and perhaps gives the inventor an opportunity of meeting the criticisms. If the invention is not immediately useful, but might be of use in the future, it comes up for periodical review. Unfortunately, if it is rejected, the reasons for rejection cannot always be given without revealing military information, especially as it is not always possible to be certain that the alleged inventor is not an enemy agent angling for just such a result. It is this inevitable uncommunicativeness that has sometimes produced an unfortunate impression. Even terseness can be tactful, however, and the general practice of Government departments in dealing with individual members of the public does not give much foundation for a conviction that the rejected inventor is always assured that there was a good reason for the decision in his case. Once a proposal has commended itself to an examiner, its chances seem good. Every month a list of all such proposals is circulated to the branches and establishments of the Ministry of Supply and the War Office, to the scientific research departments of the Admiralty and the Ministry of Aircraft Production, to the Ministry of Home Security, and the Department of Scientific and Industrial Research. By this means it may find application in a direction not thought of by the original examiner. The routine procedure seems sound enough; whether the country gets the full benefit of its inventors' ideas must in the last resort depend upon the interest and imagination shown by the people working the system.

The Location of Industry

Earlier this year the Board of Trade created a "clearing house" for factories and storage space in order to ensure the utilisation of factories and storage capacity in the national interest and to facilitate the speedy substitution of alternative premises for those that may be damaged or destroyed in air-raids. In view of the danger of confusion and dislocation of munition production arising from the uncontrolled movement of industry, the Board of Trade has now decided to go a step further. The Location of Industry (Restriction) Order, 1941, provides that no person may, without a licence issued by the Board of Trade (a), "carry on at any factory or warehouse having an area of 3,000 or more feet super any trade or business not carried on there previously" or (b) "carry on at other premises having an area of 3,000 or more feet super, whatever their previous use, a business of production or storage." The Order, which came into force on July 25th, does not, however, apply to shops or to new buildings; a general licence provides for the use of premises for temporary storage purposes; and special consideration will be given to applications by firms dispossessed by enemy action or through other causes outside their control, to use alternative premises in the immediate vicinity of their former place of business. The control

of industrial location was clearly necessary, and the new Order, made under the stress of war exigencies, may pave the way towards the control of industrial location which will be essential during the period of reconstruction after the war.

Aluminium in Russia

Although Russia's aluminium industry is only about ten years old, the production of this metal, so important in the manufacture of aircraft, is already substantial. The U.S.S.R. has large reserves of both bauxite and other materials, like aluminium-rich clays and nepheline, from which aluminium can be extracted. The bauxite deposits are found in the Urals and the Ukraine, and readily available reserves are estimated at 8,900,000 tons. The extensive nepheline deposits of the Kola-Kandalaksha region have latterly been employed for producing aluminium on a semi-commercial scale. The growth of aluminium production since 1937, on the basis of Soviet statistics obtained by the American Bureau of Mines, is shown below:—

	1937	1938	1939	1940
		(In Metric Tons)		
Aluminium (primary)	37,650	43,800	45,000	55,000
Aluminium (secondary)	10,970	13,000	15,000	18,000
Total	48,620	56,800	60,000	73,000

Last year the Dnepr plant accounted for 32,000 tons and that at Volkhov for 13,000 tons. The Ural plant, which started operations much later than the others, yielded about 10,000 tons. The third five-year plan calls for a total annual output of 220,000 tons of virgin and secondary aluminium. To this end, the capacities of the Dnepr and Volkhov plants are to be increased to yield about 110,000 tons per annum, the ultimate capacity of the Ural works is placed at 50,000 tons, another 60,000 to 65,000 tons are to be supplied by the Kandalaksha (Karelia) and Rybinsk works and the rest is secondary metal reclaimed from scrap. Although Russia has become very nearly self-sufficient in aluminium, the Soviet authorities are reported to have built up substantial emergency stocks of the metal, partly, no doubt, because of the vulnerability of the Dnepr and Volkhov works.

Help for Diamond Exports

The July diamond "sights" realised a turnover of slightly over £450,000 which is well above the monthly average hitherto maintained during the current year. Special significance attaches to the last sights because they provided the first application of special measures designed at one and the same time to stimulate the export trade in polished stones and to check the tendency towards domestic hoarding of these stones to which reference was made in *The Economist* of July 26th. To achieve this double objective, the selling syndicate, acting with the approval, if not on the prompting, of the Government, requested from all British cutters buying rough stones at the London sights an undertaking that they would export at least 75 per cent of the stones so bought. The stimulation of export trade cannot, however, be achieved merely by blocking the flow of stones into domestic hoards. It is also a matter of price differential arising from the fact that in competition with the United States cutting industry the new British industry is handicapped, firstly, by the U.S. tariff on polished diamonds, and, secondly, by the comparatively heavy war damage insurance premiums which diamonds have to bear while in process of manufacture in this country. In order to offset these disadvantages, certain concessions to the domestic trade were introduced last month. Among these was a cut of 30 per cent in the prices of "cleavages," i.e., stones of an unwieldy shape which require cleaving before cutting and polishing.

COMPANY MEETINGS

BOOTS PURE DRUG COMPANY,
LIMITED

A VERY SUCCESSFUL YEAR'S TRADING

COMPANY'S VITAL PART IN WAR EFFORT

INCREASE IN SALES AND CUSTOMERS

LORD TRENT'S REVIEW

The annual general meeting of Boots Pure Drug Company, Limited, was held at Beeston, Notts, on the 31st ultimo.

Lord Trent, chairman of the company, presided.

The chairman's statement, issued with the report and accounts, which were taken as read, is as follows:—

The activities of the company during the past year have been closely bound up at every point with the national effort. Some 2,500 employees are serving with H.M. Forces or on full-time Civil Defence service, and there has been an enthusiastic readiness to supply the company's own needs for ARP duties, fire watching, spotting, auxiliary fire fighting, Red Cross, and so forth.

I have to report with deep regret, but also with a feeling of pride, that during the year 27 of our employees lost their lives while serving with H.M. Forces and 17 through enemy action at home. To all their relatives we offer our sincerest sympathy.

BRAVERY OF THE STAFF

One member of the firm, a chemist, employed in our Lambeth branch, has been awarded the George Cross for an act of superb gallantry in rescuing a wounded comrade from a blazing aeroplane loaded with bombs.

With branches of the company spread all up and down the battlefield of Britain we have inevitably been exposed to dangers. Many of our premises have been damaged in air raids, some have been totally destroyed. The staffs of the offices, laboratories, warehouses, and shops have carried on magnificently under increasingly difficult conditions. From all parts of the country we have received warm tributes to the morale and courage of those engaged in defence work, and one of our employees in Surrey has been awarded the George Medal.

When the full story can be told I am certain that the shareholders will be proud of the contribution which the firm has made and is making to the war effort, and particularly of the cheerfulness and resourcefulness with which the staff have met dangers and difficulties, and the splendid way in which they have responded to all the calls made upon them.

COMPANY'S IMPORTANT PART IN THE WAR EFFORT

This company, in normal times, plays a valuable part in the life of the nation. In war we have an even more vital part to play, and I feel that I can claim that our organisation has more than lived up to its peace-time reputation in every field of its manifold activities. To help in the work of healing the sick and keeping fit people well is even more important in war than in peace, and in addition our staffs have done their full share in giving first-aid to the injured.

It has been a source of great satisfaction to us to be able to give effective assistance to the national "Dig for Victory" and allied campaigns aimed at a greater production of food, and I may perhaps refer in this connection to a booklet produced by the firm on "How to Make Good Silage," which has won high praise from the Ministry of Agriculture and all who read it.

SUCCESS OF WAR SAVINGS GROUPS

Another branch of our war effort which I should mention is National Savings. For some time past our branches have been selling War Savings Certificates on behalf of the Government, and our own War Savings Groups in the shops, offices, and works have been growing. There are now over 12,000 employees con-

tributing by deductions from wages and salaries, and to date they have subscribed over £75,000.

RECORD SALES AND NUMBER OF CUSTOMERS

Let me now come to our own internal affairs, about which, for obvious reasons, my report this year can only be in general terms. Our total sales last year were easily a record, and in view of the limitation of supplies, the closing of a number of departments other than chemists', and all the other factors which adversely affected business, I am sure you will consider that this record reflects the greatest credit both on our buyers and on our sales staff.

The total number of customers also reached record figures in spite of the damage to shops to which I have already alluded. Some of the shops damaged or destroyed were among our most profitable branches, and I should mention that in replacing them we have been guided not so much by considerations of the profit formerly earned as by the real need of supplying medicinal services which they could meet in their particular locality.

Depreciation on the usual scale has been adequately provided for against all fixed assets.

There are other alterations in the balance-sheet, some of which are substantial. As all of these arise out of the war, it is at present impossible for me to comment upon them.

HEAVY BURDEN OF TAXATION

To give shareholders some idea of the extra burden of taxation, if you compare this year with our standard period for EPT we have to pay £623,490 more this year in taxation. That is in addition to purchase tax, which up to March 31, 1941, amounted to £611,700. In these ways we are making a valuable contribution to the National Exchequer.

Our veterinary and horticultural sections both show largely increased business, and our export sales, in spite of many difficulties, are much higher than for any previous year in our history. Believing in the importance of keeping in the forefront of scientific development, we have continued to develop our research work alike on the medical, veterinary, and horticultural sides.

TRIBUTE TO CUSTOMERS

I cannot conclude my brief report without a grateful acknowledgment to our customers. They have shown a sympathetic appreciation of the difficulties with which our reduced staff has been faced and have accepted as inevitable the impossibility of our maintaining our previous high standard of service, which, however, we are making every effort to preserve.

Owing to the recent changes in the schedule of reserved occupations, we are faced with the loss of many more of our employees during the next few months. I should mention that we are continuing to make allowances to all our employees in H.M. Forces.

Finally, let me assure you that, in spite of all the difficult problems with which the war has confronted us, we are doing our utmost, not without success, to maintain and even increase the confidence which the public has in Boots.

The report and accounts were unanimously adopted and the auditors reappointed.

GLOBE TELEGRAPH AND TRUST
COMPANY, LIMITED

The annual general meeting of the Globe Telegraph and Trust Company, Limited, was held, on the 29th ultimo, in London. The Right Hon. Lord Pender presided, in the absence, through indisposition, of the Right Hon. Lord Midleton (the chairman).

The following is an extract from the Chairman's statement circulated with the report and accounts:—

There is a reduction in our net income of £23,000, due chiefly to increased income-tax, deducted at the source from our receipts, and this will be still further reduced next year when the full effect

GENERAL ELECTRIC COMPANY,
LIMITED

INCREASED PRODUCTION

The annual general meeting of The General Electric Company, Limited, was held, on the 31st ultimo, in London, the Rt. Hon. Lord Hirst, of Witton, chairman and managing director, presiding.

The following is an extract from a statement by the chairman circulated with the report and accounts:—

In days of peace it has always been my pride and pleasure to give you an account of the company's manifold activities, and the successes achieved in salesmanship, production and research. To-day I do not propose to go into detail, though I can assure you these successes are continuing and are contributing their full quota to the national effort.

You will have seen from the directors' report that our numerous factories have all been fully employed and our pay roll has increased. Our production, despite all the difficulties and interferences which the war has brought, has not only been maintained, but considerably increased. You will see, however, from our report that our net profit has been affected by the incidence of Excess Profits Tax at the rate of 100 per cent., whereas last year it was only 60 per cent., and by similar tax legislation in the Dominions.

Naturally, I regret that the expansion of our net profit figure, which has shown itself for many years past, could not continue this year, and that all our hard work has resulted in somewhat less being available for allocation and for distribution.

ADEQUATE RESERVES

We regard our general reserve of £4,700,000 as adequate for the normal requirements of the company, and we consider that under to-day's conditions there is no necessity to augment it. At the same time we are anxious to avoid, if we can, any possibility of having to draw upon the reserve to meet those contingencies which may arise from war-time conditions. We have, therefore, set aside the sum of £50,000 to inaugurate a fund for that purpose, and we have allocated an additional £50,000 for depreciation.

We recommend to you a dividend of 10 per cent. and a bonus of 7½ per cent. Whilst this distribution entails a small decrease in the bonus figure, it is in fact the same as in the period which under legislation we have to regard as our "standard" year. Personally, I cannot but regret the imposition of an Excess Profits Tax at the rate of 100 per cent. I am sure none of us have any desire to make additional profits out of the war. It is, too, gratifying to think that our efforts are making a considerable financial contribution to the Empire's war effort. We do desire, however, some margin, which will allow us not only to deal, as prudent business men, with that kind of expenditure which though necessary is not classed as an allowable expense for taxation purposes, but also and more particularly to prepare adequately for the vast problems we shall have to face when the war is over.

PROVISION OF FINANCE

The expansion of our manufacturing activities has made necessary the provision of additional finance. We had always anticipated that this would be needed and had made provision for it when arranging the original loan to which I referred last year. We were thus able to borrow an additional £1,000,000 on terms which both we and our financial advisers regard as very satisfactory. It is difficult, under to-day's conditions, to foretell what the financial requirements of the future may be—it is possible that we shall require even further finance, but I would like you to know that we have already made arrangements under which ample resources would be at our disposal should they be required.

Our absorption in the requirements of the home market has by no means diminished the attention we have always paid to export. It would be idle to pretend that the difficulties and restrictions in the path of export business have not increased. In spite of these, however, by the united efforts of all concerned, both here and overseas, we have managed to maintain our export trade at practically the same figure as the previous year.

The report was unanimously adopted.

of the 10s. income-tax is felt. Your directors, however, have felt justified in paying the same final dividend as last year, which we feel sure will be appreciated by the stockholders in these difficult times. Our main source of revenue, Cable and Wireless, shows every sign of reaping the reward for encouraging all classes of the community to become "telegraph minded," and bringing overseas communications within the reach of all at home and in the Dominions and Colonies.

Lord Pender added that as the accounts covered a period of thirteen months a further ½ per cent. would become payable on the preference stock for the extra month, and it was proposed to adjust the matter in the next interim dividend, which would be 2 per cent., less tax.

The report was adopted.

BRITISH TIMKEN, LIMITED

MR JOHN PASCOE'S SURVEY

The twenty-first ordinary general meeting of British Timken, Limited, was held, on the 25th ultimo, at 65, Cheston Road, Aston, Birmingham.

Mr John Pascoe (deputy chairman) said:

Our chairman, Mr Michael Dewar, is not able to be with us to-day. He has been for some months working in the United States on behalf of the Ministry of Supply. I am sure he carries our good wishes for the success of his mission.

The profit of £114,400 before taxation for the year under review is approximately the same as last year and is well below our excess profit standard. We propose to pay the same dividend, namely 15 per cent., on the slightly increased capital.

The balance sheet figures this year reflect the purchase of our subsidiary company, Fischer Bearings Company, Limited, and, by the increased figure of stocks and work in progress, the higher turnover compared with 1939. The reserves are increased by the balance of the share premium account from our issue of 40,000 new shares and by the transfer to a reserve for contingencies of £20,000.

During the year your company's manufacturing facilities have been employed to their maximum capacity, as also have those of your subsidiary company, Fischer Bearings Company, Limited, under the able direction of Mr L. W. Moritz.

You have heard from time to time of our service organisation which, having been built up over many years, has proved so valuable in times of peace. I am glad to be able to tell you that its activities now embrace the military users of our products who have expressed their appreciation of the assistance we have been able to give. Our technical service department has been proud to serve the needs of the country's technical forces.

It is impossible to forecast what the profits are likely to be in the coming year. As is only proper in war time, the company's price level is continuously subject to searching cost investigation. The only prospect of which we can be certain is that the resources of the company will continue to be devoted wholeheartedly to the national war effort.

During the past year the staff and workpeople of your company have worked and lived under conditions as difficult as anywhere in the country. Their output is great and their spirit high, and I am certain that they will continue to give of their utmost, confidently looking forward to the time when the product of their labours will once again assist the dissemination of health, comfort and happiness.

In consequence of the continued absence of Mr Dewar in the United States, it has been found desirable to appoint a substitute to act as deputy chairman and deputy managing director and, under a resolution of the board, I am now exercising the duties attached to these offices.

The report and accounts were adopted.

ORIENTAL TELEPHONE AND ELECTRIC COMPANY, LIMITED

SIR HENRY McMAHON ON GOVERNMENT'S OFFER

The forty-seventh ordinary general meeting of the Oriental Telephone and Electric Company, Limited, was held on the 29th ultimo at the Great Eastern Hotel, E.C.

Sir A. Henry McMahon, G.C.M.G., &c. (the chairman), in the course of his speech, said: The ordinary dividends have been shown as gross figures, subject to the deduction of income-tax, the final dividend of 11 per cent. gross which we now recommend making a total of 16 per cent. for the year. You may be interested to learn how the total distribution for the year 1940 compares as "net" dividend with the ordinary dividend for previous years. As you know, a dividend of 12 per cent., free of tax, has been paid for many years past, which is equal to £12 net, whereas the gross distribution of 16 per cent. for the year 1940, after deduction of income-tax, is equal to £10 2s. Having regard to the heavy charges for taxation which the company has now to bear, this result must, I think, be considered very satisfactory.

As regards the profits generally, you will notice that there has been a very satisfactory increase at our Singapore branch, which is due partly to an increase in subscriptions and rentals and partly to the reduced charge for depreciation and obsolescence to which I have previously referred. The reduction in the amount of dividends from associated companies is explained briefly in the report. It is in effect due to the fact that the offers of the Government of India for the shares of the companies, to which I refer later, were subject to the condition that no further dividends would be paid until the offers were accepted or rejected.

Our report shows the development which took place in all these centres during the year and also indicates the dividends which have been brought into our profit and loss account for 1940. The Hongkong Telephone Company continues to make progress and has paid a dividend of 14 per cent., as for 1939, and the China and Japan Telephone and Electric Company, Limited, has thus been able to make its usual distribution of 6 per cent., free of tax, for the year. The Rangoon Telephone Company, Limited, has also shown excellent development and has paid its usual dividend of 6 per cent., free of Burman income-tax.

THE INDIAN COMPANIES

I come now to the position which has been reached in respect of the three Indian companies—namely, the Bengal Telephone Corporation, Limited, the Bombay Telephone Company, Limited, and the Madras Telephone Company, Limited. I explained to you last year the difficulties in regard to capital expenditure in which the companies were, owing to the right which the Government of India had to take over the undertakings in 1943 after giving only one year's notice, and how it had been provisionally agreed that probably the right solution was for the Government of India to buy out the companies now. The Government of India made a careful valuation of the assets of the three companies, but eventually they decided to make an offer to buy the shares. These offers proved to be slightly in excess of the market values of the Bengal and Bombay shares, but slightly below the market value of the Madras shares.

The offers were carefully considered by the boards of the companies in consultation with your board, and they had no difficulty in deciding to recommend to their shareholders that the offers should be accepted.

The position is that the offer has been accepted by the shareholders of the Bengal Telephone Corporation and we have been paid for our shares. The requisite majority for the acceptance of the offer relating to the Madras Company has not been secured, but we are considering a suggestion of the Government of India that we should sell them our shares in the company by private treaty. Regarding the offer made in respect of the Bombay Telephone Company, the poll has been concluded and the results are now being scrutinised by the Government of India.

I am sorry that I cannot yet make any proposals as to the course our company should ultimately pursue. That will be considered as soon as we know definitely the result of the Bombay poll and of our negotiations with the Government of India in respect of our Madras shares.

The report was unanimously adopted.

GUEST, KEEN AND NETTLEFOLDS, LIMITED

MR S. R. BEALE'S STATEMENT

The annual general meeting of Guest, Keen and Nettlefolds, Limited, was held, on the 29th ultimo, in Birmingham.

The following is the statement of the chairman, Mr S. R. Beale, which has been circulated with the report and accounts, and was taken as read:—

As war conditions make it impossible for me to give the comprehensive review of the activities of the G.K.N. group that it has been the chairman's privilege to give you in past years, it has been decided that the annual general meeting will be entirely formal.

So that stockholders may be kept in touch with their company, I am having this letter circulated with the annual accounts.

During the past year, the company suffered a grievous loss through the death of Sir David Llewellyn. Sir David's intimate knowledge of the coal trade was of great service to the company for many years. His keen mind and sound judgment were always ungrudgingly at our disposal. The company has lost a great director, and his colleagues a much valued friend.

CHANGES IN THE DIRECTORATE

The board have elected Mr E. C. Lysaght and Colonel H. B. Sankey as directors of the company, and confirmation of their election will be submitted to the annual general meeting. Mr E. C. Lysaght has succeeded his father as managing director of Messrs John Lysaght, Limited. Colonel Sankey has been managing director of Messrs Joseph Sankey and Sons for some years. Both these gentlemen have given proof, over many years, of high business ability. These two appointments to the board of your company strengthen in a desirable way the liaison with these two important allied companies.

Since March 31st Mr T. S. Peacock has intimated his intention of retiring from the position of managing director, which he has held for the past twenty-two years. The board, however, is glad that Mr Peacock has consented to remain on the board as deputy-chairman; his long and intimate knowledge of the business will, therefore, be still available to the company.

The various items in the balance-sheet call for no particular comment. They show the various features which are the inevitable result of war conditions.

"GRIM BUT GAY"

So much has already been said about the effects on industry of income-tax at the present rate, coupled with excess profits tax at 100 per cent., in relation to sufficiency of working capital for post-war enterprise, that I will confine my comments within very strict limits.

When the year's profit is shown free of tax, as ours is, an increase of tax automatically reduces the total of profits available. In addition to this, there are a number of expense items for which provision must be made in the accounts which are not allowed as a deduction from profit as calculated for taxation by the Inland Revenue. With excess profits tax at 100 per cent., and with industry continually having imposed on it increasing burdens, it is inevitable that the profit available for distribution should show a decreasing tendency.

I feel sure you will accept this position in that "grim and gay" spirit in which many others are accepting much worse experience than some reduction of income.

As to our activities, I can tell you that, thanks to the unflagging energy of all the directors, staff and workpeople in all the companies concerned, there has resulted an effort in production that cannot be praised too highly.

PRODUCTION PARAMOUNT

From the national point of view, the paramount requirement at the moment is production, and this effort to produce what the country must have will be continued. At the same time your board is always doing what it can to conserve your interests so that the company's peace-time activities may be resumed with as little delay as possible when that happy time comes.

The report and accounts were unanimously adopted.

THE BURMAH OIL COMPANY, LIMITED

SIR JOHN T. CARGILL'S STATEMENT

The thirty-ninth annual general meeting of the members of the Burmah Oil Company, Limited, was held on the 30th ultimo in the Merchants' Hall, 30 George Square, Glasgow.

Sir John T. Cargill, Bart., chairman of the company, presided.

The following statement by the chairman was circulated with the directors' report and accounts:—

Inclusion with the report and accounts of this personal statement in place of the speech in which normally I review the company's affairs, and particularly conditions which have governed results submitted at general meetings, will make it possible both for us to confine the business at this year's meeting to the formality of putting and adopting the various necessary resolutions and for directors and stockholders alike, whose attendance involves the use of railway facilities, to observe the desire expressed by the Government that railway travelling in to-day's circumstances should be reduced to a minimum.

In ordinary times we talk of many things at these annual functions. There are to-day not less, but possibly even more, matters affecting our business about which ordinarily I might have a great deal to say. But all that must be reserved for a more appropriate occasion, since here again the Government has warned all public companies to be on guard against reports or chairman's speeches containing anything of possible use to the enemy.

BOARD'S DIVIDEND POLICY

Disorganisation of mail services by exigencies of war is alone responsible for the delay in submitting our accounts and holding our meeting; and, by declaring as a second interim dividend what we recommend should be the final dividend for 1940 on our ordinary stock and posting this to stockholders with the report and accounts, we have reduced at least the delay to stockholders in receipt of their dividend. So that we may in future have at any rate the latitude of time for submission of accounts provided by the Companies Act, an extraordinary general meeting to alter our articles accordingly has been convened to precede our annual meeting.

Our products, and in various ways our large and efficient organisation of equipment and personnel, are proving of increasing value to the war efforts of India and Burma besides continuing their service of civil needs.

SATISFACTORY DISTRIBUTION

In the face of greatly increased taxation, including EPT, and advances in the cost of materials and services the decline in investment income anticipated in my speech last year could not be fully compensated for by trading results of our operating subsidiaries in Burma and India. But that our distribution should, in the circumstances, be reduced by no more than the bonus of last year after providing adequate depreciation and further strengthening of reserves will, I feel sure, be regarded as highly satisfactory and that you would wish me to take this opportunity of conveying our appreciation to every member of your own organisation, that of your wholly owned operating subsidiaries, and of associates who, under specially difficult conditions, including those of staffs depleted by calls to war service of one type or another, have been concerned in securing these results.

The high level of taxation and the fact that it is due in any one year on the results of the preceding year make some strengthening of our taxation reserve desirable which has been done at the expense of our carry forward.

To-day one can safely speak of current prospects only so far as they may have been realised at the time, but with this limitation I venture to hope that we may be able next year to submit results up to the standard of those now before you.

The report and accounts were unanimously adopted.

The second interim dividend of 10 per cent. (2s. per £1 unit) paid on July 9, 1941, was confirmed as the final dividend on the ordinary stock for the year 1940.

Mr H. S. Ashton and Sir Louis J. Kershaw, K.C.S.I., C.I.E., the directors retiring by rotation, were unanimously re-elected, and the auditors, Messrs Brown, Fleming and Murray were re-appointed for the current year.

At the extraordinary general meeting held immediately before the annual general meeting the special resolution altering the articles of association was passed unanimously.

MINING TRUST LIMITED

STRONG CASH RESOURCES

The twelfth ordinary general meeting of Mining Trust, Limited, was held on the 29th ultimo at Winchester House, Old Broad Street, E.C.

Earl Castle Stewart, M.C., chairman of the company, presided.

The following is an extract from the statement by the Chairman which was circulated with the report and accounts for the year ended December 30, 1940:—

With regard to the accounts, the share capital remains unaltered. The item "Creditors" contains no unusual features, and investments at cost have been slightly increased by the addition of 500 First "B" Mount Isa debentures and by the purchase of a further 9,600 shares of 5s. each in Saudi Arabian Mining Syndicate. Advances to subsidiary companies remain the same as in last year's accounts. Debtors and payments in suspense are also normal, and have since been received in so far as they are due.

With regard to the income and expenditure account, revenue for the year amounted to £136,066 13s. 8d., details of which are clearly shown in the accounts. Expenses have been reduced by £1,986, while the charge for income-tax deducted at source amounted to £36,707. The balance of income over expenditure of £79,202 10s. 5d. has again been applied to the reduction of the debit balance on income and expenditure account, which now appears in the balance-sheet at £738,149 5s. 1d.

MOUNT ISA AND NEW GUINEA GOLDFIELDS

The accounts, the report of the directors and the speeches of the chairman both of Mount Isa Mines Limited and of New Guinea Goldfields Limited are being circulated herewith.

Mount Isa Mines Limited operated throughout the year mainly upon Government contracts under conditions laid down by the Ministry of Supply, which enabled the company, as forecast at the last annual meeting of Mining Trust, to make a small profit without placing anything to reserve or depreciation. It is hoped that during the ensuing year the Ministry of Supply will again be able to place contracts with the company, which will enable it to continue in production, upon terms not dissimilar from those which obtained last year.

Having regard to the difficulties experienced by rapidly rising costs and lack of shipping, the results obtained by Big Bell Mines Limited and by the Saudi Arabian Mining Syndicate, as disclosed in the Mining Trust directors' report, must be considered satisfactory.

The cash balance of Mining Trust, Limited, shows an increase of £79,532 over last year. At to-day's date our total cash stands at £454,000 and in addition we hold £20,000 of 2½ per cent. National War Bonds. Your directors still feel that it is of the utmost importance that this cash should be retained until the end of the war to meet possible emergencies. So far we have been very fortunate and no serious damage has been done to any of our properties, but it will be appreciated that considerable reserves must always be kept available in case of damage to our Britannia lead refinery, which is situated in this country, as also against fluctuations in the price of silver, and to cover any advances that might be required by Mount Isa in the event of delays in the shipment of bullion to this country.

Finally, your directors feel that The Mining Trust Limited and the companies in which it is interested have withstood the shocks of war more successfully than could have been anticipated twelve months ago, and that strong cash resources are being maintained in hand adequate to tide the company over any difficulties which might be experienced during the period of transition, when it comes, from war to peace.

The report and accounts were unanimously adopted.

EASTWOOD'S FLETTONS, LIMITED

MR HORACE BOOT'S STATEMENT

The fourteenth ordinary general meeting of Eastwoods Fletttons, Limited, was held, on the 1st instant, at 47, Belvedere Road, S.E. Mr Horace Boot, M.Inst.C.E., M.I.Mech.E., M.I.E.E., the chairman of the company, presided.

The review of the chairman of the operations of the past year stated, *inter alia*: The accounts show the company continues to make satisfactory progress. The financial position is strong.

Stock shows some reduction. Although fully engaged, we were practically clear of bricks at March 31st. In previous year owing to temporary failure of demand due to extreme weather conditions, we were carrying large quantities of bricks in stock. These were sold during current period with consequent improvement of trading profits which increased from £38,365 to £40,984.

In addition to interim dividend of 3 per cent. we are able to declare a final dividend of 6 per cent. on preferred ordinary shares together with 4d. per share on deferred shares.

We are operating under the Essential Work Order, which, while granting some measure of stability in regard to labour employed, also secures for employees guaranteed pay at standard rates—whatever the weather conditions. I am still far from convinced that the extent to which industry is called upon to hand over management to interests not necessarily skilled in such tasks, will eventually prove satisfactory, either to workpeople or employers.

The constant adjustment of wages to meet increases in cost of living is having more than any other single factor the effect of forcing manufacturing costs steadily upwards.

Excellent work is being done at Ministry of Works and Buildings under able guidance of Lord Reith and expert controllers responsible for supply of various groups of building materials.

There undoubtedly lies ahead an era of progress and prosperity for well managed and modestly capitalised concerns who are best equipped to meet the requirements of a building programme which it is hoped will have been wisely planned to meet the new national need.

COMMODITY AND INDUSTRY NEWS

PEPPER prices reacted to rumours of a Government decision to control its price. It is expected that an announcement will shortly be made and it is thought likely that the price fixed will be lower than Tuesday's prices of 16½d. a lb. for white Muntok, spot, in bond, and 9½d. a lb. for Lampong black. A week earlier these prices were 17½d. and 10d. respectively. Tin prices were above the £260 level for standard cash between July 24th and 28th, but dropped again. On Wednesday the price was £257-£257 5s. a ton, compared with £258 5s. 10d. a week ago. Three months was £259 15s.-£260 a ton, as against £261-£261 5s. Rubber has been quiet and smoked sheet, spot, closed at 13½d. a lb. on Tuesday. In the United States the Office of Price Administration and Civilian Supply has requested the New York Commodity Exchange to suspend dealings in silk futures until further notice. The Exchange has also ordered the settlement of outstanding copper contracts at 11.80 cents a lb. for July to September, 11.65 cents for October, and 11.55 cents for December and January.

Clothing Workers Enquiry.—The Director-General of Civilian Clothing is sending a questionnaire to makers-up of clothing (other than hosiery, footwear and headgear) who employ more than 200 direct factory workers. The object of the enquiry is to give further help to manufacturers of cheap essential clothing. The information obtained will assist the Director and the Ministry of Labour in considering the position of the key workers needed to produce such clothing.

Cotton Position.—Trading in the market has reached almost a deadlock owing to the fact that most spinners and manufacturers are heavily sold and do not want to extend their order lists further ahead. Demand has been plentiful, but only a limited turnover has been made. A vital factor in the situation at the moment is the scarcity of raw cotton supplies, particularly of certain qualities. The supply position in the yarn market remains very tight: medium American numbers and coarse Egyptian counts have been practically unobtainable. A return of cotton yarn stocks (including yarns spun from cotton waste) in the hands of merchants has been asked for by the Cotton Control.

Concentration in Pianoforte Industry.—Under the Board of Trade's plans for the concentration of the pianoforte manufacturing industry in this country, seven nucleus firms will undertake production for all the principal makers. When these arrangements have been concluded the industry is likely to release 270,000 sq. ft. of factory space in addition to the 100,000 sq. ft. already released for Government purposes.

Feeding Stuff Maximum Prices.—The Ministry of Food announced that maxi-

mum prices were fixed from July 28th for wet grains when sold by measure. The prices are 6d. a bushel for brewers' wet grains, &c., and 7½d. a bushel for distillers' wet grains, &c.; these correspond to the maximum prices of £1 2s. 6d. and £1 8s. 6d. a ton already fixed for wet grains sold by weight. From July 28th maximum prices, per ton gross, sacks included, were fixed for the following: Wheat malt bran, £8 12s. 6d.; barley malt bran £3 10s., pea and lentil by-products, in the form of meal, £13, and in the form of chaff or chips, £11.

Food Control.—The following maximum prices have been fixed for canned meats now arriving from the United States—Corned pork, wholesale, 1s. 0½d. a lb., retail, 1s. 4d. a lb.; lunch tongues, wholesale, 2s. 6d., retail, 3s. 4d., and luncheon meat, including chopped ham, wholesale, 1s. 9d., and retail, 2s. 4d. The retail prices of tongues and luncheon meats are reduced by 4d. and 3d. a lb. respectively on sales of more than 1 lb. at a time. The first consignment has been wetted with sea water, but the tins have been dried and are being released for immediate consumption.

Ministry of Supply Orders.—The Ministry of Supply has made the Chrome Magnesite and Wolfram (No. 2) Order, which subjects to licence the acquisition and disposal of "Basic or neutral refractory material," defined as including bricks, refractory cements and other refractory materials containing any compound of magnesium or chromium, other than those manufactured wholly from dolomite. Another Order, the Foundry Bonding Materials Order, makes subject to licence the acquisition and disposal of

bentonite and colbond and fullers' earth, except for certain uses. The Orders came into force on July 30th. It is announced that the Chrome Controller will in future be responsible for the production and distribution of dolomite with a view to ensuring adequate supplies and the most advantageous use of the material.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended July 26, 1941, total ordinary revenue was £28,676,000, against ordinary expenditure of £27,242,000 and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £959,088,000 against £688,581,000 for the corresponding period a year ago.

know nothing of what he had done; he had in his favour the deep dislike of every Englishman for imprisonment without trial; and there was a chance of his surviving the war with a reputation speckled but not wholly blackened. By coming into Court, he threw away every shred of hope that he might be re-instated and shut himself permanently from the company of decent men and women. There was no need for the gods to make a fool of Captain Ramsay before ruining him. He saved them the trouble.

But if the man is such a fool, how comes he to be a Member of Parliament? That is the question which must be burning into the mind of every Englishman who has been watching this astonishing scene and believes in the health and power of free institutions. How did Captain Ramsay persuade the Peebles Conservative Association to adopt him and a majority of the Peebles electors to vote for him? *Who's Who* supplies the answer:—

Captain Ramsay, M.P. for Peebles since 1931, o.s. of late Lieut.-Col. H. L. Ramsay, elder son of Gen. the Hon. Sir Henry Ramsay, K.C.I.E., C.B., m. Ismay Lucretia Mary, o.d. of 14th Viscount Gormanston and widow of late Lord Ninian Crichton-Stuart, M.P., Educ. Eton, R.M.C. Sandhurst, joined 2nd Battalion Coldstream Guards.

He is M.P. for Peebles because he comes of the right sort of family, because he married a daughter of the peerage and the widow of a very rich man, because he went to the right school and joined the right regiment. If his father had been a bank clerk and his wife the daughter of an insurance agent, if he had been educated at the local grammar school, gone with a scholarship to Oxford and made his way by his own brains to a moderate competence in a respectable trade or profession, then he might have bombarded every political association on the books of the Central Office for a constituency, and every time the odds against his getting into the House would have been 1,000 to 1.

Finance of Empire

THE accepted doctrine of the proper economic relations between a metropolitan power and its dependent colonies is, at the moment, in transition. The first idea of colonies as sources of tribute passed away 150 years ago. The second phase of self-support has lasted until our own days. The whole structure of administration and policy of the Crown Colonies is based on the assumption that the colonies shall neither pay tribute to, nor receive subsidies from, the Imperial Government. But to be self-supporting is now seen to be not enough. It is in the interests both of Great Britain and of the colonies that their standard of living should be raised as rapidly as possible; justice and self-interest coincide in this object. But if the colonies are left to do the best they can with the resources they can themselves produce, buy or hire, their progress will inevitably be very slow. The establishment of the Colonial Development and Welfare Fund to replace the previous Development Fund, a final report on which was issued by the Colonial Development Advisory Committee last week, marks quite a definite stage in the development of the new idea of financial and economic interdependence. At present, it is true, the new idea has not developed very far beyond the purely charitable and humanitarian stage. But the climate of opinion is rapidly changing towards a much more positive policy of "nation-building" in the colonial empire.

It is in this framework that the public finance of the colonies should be studied. It is a subject which has been almost entirely neglected, outside the expert circles of the Colonial Office. Even Lord Hailey's monumental "African Survey" contained only one chapter that touched on the subject, and that only on the periphery. The figures are available in the Colonial Office's admir-

The fact that one unworthy person made his way into the House by virtue of his wealth and social position might not in itself be of much importance, and there is no evidence that Captain Ramsay, as a fifth columnist, is not the one black sheep in a clean flock. But, unfortunately, in his capacity as a silly ass, he does not sit in the House alone. It is common knowledge—and many people can check it from their personal acquaintance—that the intellectual level of the House of Commons has been, since 1931, deplorably low; and when the historian of the future comes to write the story of the pre-war years one of the things he will need to bear in mind (if he is to read aright the disastrous record) is this intellectual poverty of the men chosen as the people's representatives, this profusion of men who at the very best can only be described, in the words of Jane Austen, as "persons of strong, natural, sterling insignificance." These tenth-rate nonentities who have been jobbed into the House of Commons because they were men of the "right type" provided just the background that the Front Bench required for its calamitous foreign policy and for its blindness to the danger in which the country stood. The Government needed behind it a solid block of M.P.s stupid enough to jeer at Mr Churchill, to admire the moral grandeur of Stanley Baldwin and to applaud the foresight of Mr Chamberlain; and the political bosses saw to it that the right men were provided in Captain Ramsay and others of the same intellectual and social build. And if the historian gets to the heart of the matter he will put high on the list of those responsible for the present troubles the wire-pullers who chose a House of Commons with infinitely less sense of duty than a selection committee would feel in choosing an English fifteen for Twickenham. It will not be the shadow of an answer to say that the selection of trade unionists by seniority also filled the scanty benches opposite with mediocrities. Power lay on the Right; and there is a long score to settle with the men who put Captain Ramsay and the like into Parliament.

able "Economic Survey of the Colonial Empire," an annual publication, in which the public accounts of each colony are recalculated in standardised form. But the tables at the foot of page 161 are probably the first occasion on which the figures for the whole empire have been published. Even with the standard form of return, the summation involves some arbitrary assumptions, but the figures present a broadly accurate picture of the position in a favourable year. It should be added that both revenue and expenditure figures are exclusive of Colonial Development Fund grants and grants-in-aid from the Imperial Exchequer. These amounted to £772,551, a very small sum in proportion to the total. In the eleven years of its existence, the total financial assistance recommended from the Fund, which was limited to £1 million a year, was £8,875,083.

The colonies are, then, financially self-supporting. The first question to be asked is whether the general burden of public finance is heavy or light. This is a very difficult question to answer. The total for the whole empire, it will be seen, is approximately £1 per head per annum. The figure for the United Kingdom in peacetime was in the neighbourhood of £17, or perhaps £20 if local government finance is added. But a numerical comparison is impossible to establish. Estimates given in Mr Colin Clark's book, "The Conditions of Economic Progress," suggest that the national income per head in tropical colonies is between one-tenth and one-sixth of that of the United Kingdom. But taxable capacity is not proportional to national income. Perhaps the only conclusion that can be reached with any confidence is that some parts of the colonial empire are very lightly taxed, while others are carrying a very heavy burden. It is difficult,

for example, to believe that a revenue of £2 per head in the Eastern Dependencies (of which Ceylon, Malaya and Hongkong are the chief), or of £3 in the Mediterranean territories (Gibraltar, Malta, Cyprus and Palestine) is even nearly so heavy a burden as £3 per head in the West Indies. The average is somewhat pulled down by the large population and small revenue of West Africa. Without this group of colonies, the average revenue is £1 10s. per head per annum.

On the side of revenue, the outstanding fact is the dominance of import duties. To a very large extent this is unavoidable. In many primitive communities external trade is almost the only activity that is both definable and on a cash basis, and the budgets of all primary-producing countries are based on Customs revenue. Nevertheless, it has certain grave disadvantages. When a colony has to import almost all the elementary necessities of life, a Customs tariff is a very regressive form of taxation. An example—admittedly an extreme one—can be taken from British Guiana. Revenue from import duties amounted to as much as £614,585, while the total value of imports amounted to only £2,442,775. Duties thus, on the average, added about 25 per cent to the price of imported goods. The nature of the burden can be guessed from the fact that more than half of the total imports consisted of food, drink and tobacco, and cotton piece-goods.

The second disadvantage of dependence on import duties is that the revenue they produce fluctuates widely from year to year. In a developed country with a capital market, it may be desirable to have a system by which a deficit is automatically produced in a bad year and a surplus in a good year. In a small colony, expected to be self-supporting, these fluctuations may be very disturbing. An extreme case of the disadvantages of import duties is reached in wartime, when through shortage of ships and supplies, the volume of imports is very much reduced. In the past eighteen months several colonies have found themselves under the necessity of increasing their customs duties, and even so have been gravely embarrassed by the lack of funds to meet the call for relief expenditure arising out of the parallel decline in export.

The alternative to Customs duties is direct taxation. Not much, however, can be raised from native populations, and where direct taxation is imposed on them, it is as often for non-financial purposes as with the idea of raising revenue. (It would be interesting, incidentally, to

have a full explanation of the reason why native taxation in Kenya is a third as heavy per head as in Tanganyika and four times as heavy as in Nigeria.) The direct taxation of non-native incomes is gradually developing, and many colonies now have some form of income-tax and death duties. In spite of the fact that none of these taxes is heavy, and most of them very light, any attempt to increase them, or to impose them where they do not exist, meets with fierce opposition from the European population. Examples have occurred in the present year in Jamaica and in Malaya. The Malayan case borders on the scandalous. The European population of British Malaya is one of the most prosperous communities in the world, but the attempt to impose a very slight income tax for the duration of the war was met with arguments that would have sounded antiquated to Peel or Gladstone. Prosperous European subjects of the King, wherever they are, should count themselves fortunate if they pay income-tax at less than 10s. in the £. That the Colonial Office accepts this point of view is shown by the White Paper published this week (summarised on page 166), in which the colonial governments are expressly told to impose heavier direct taxation on the wealthier peoples.

There is one by-product of colonial income taxes that merits closer inquiry. Arrangements exist between the colonies and the United Kingdom for avoiding double taxation on individuals and institutions which would otherwise be liable to pay in two places. The usual form of arrangement is for tax to be levied at the higher of the two applicable rates, and the product divided equally between the colony and the United Kingdom. Where a resident in the United Kingdom draws an income from a colony, the arrangement is not unjust, though perhaps not over-generous to the colony. The anomalies arise in the case of companies registered in the United Kingdom but operating in a colony. The Imperial Exchequer receives half of the tax, not only on the dividends that such a company pays to residents in the United Kingdom, but also on the sums it puts to reserve. Because of this technicality, it is probable that a British colony derives less fiscal advantage from the investment of overseas capital than an independent country. Northern Rhodesia is the chief sufferer—a very poor colony to which the retention of all the taxation on the copper mines would make a very great deal of difference, while it would hardly matter a scratch of the Chancellor's pen in Great Britain.

(*) Year ended December 31, 1937, except South African territories (1937-38); Gold Coast and Nigeria (1937-38); Ceylon (1937-38); Malta and Palestine (1937-38); Barbados and Jamaica (1937-38); Gilbert and Ellice Is. and British Solomon Is. (1936-37); Tonga (1936-37); total customs and excise for Bechuanaland, Swaziland and Gold Coast; including excise and licences for Straits Settlements.
(2) Including opium revenue for Kedah, Kelantan, Perlis and Trengganu; and opium revenue, licences, and other internal revenue for Johore.
(3) Including excise for Ceylon, Brunei and Leeward Is., and farms and stamps for Kedah.
(4) Total direct taxation for Nigeria and Basutoland; including licences for British Solomon Is.
(5) Including income tax for Kenya, N. Rhodesia, Nyasaland, Bechuanaland, Swaziland, Ceylon, Mauritius, Aden, Cyprus, Barbados, British Guiana, Jamaica, Leeward Is., Trinidad, Windward Is. and Fiji; including land and forest revenue for Johore, Kedah, Kelantan, Perlis and Trengganu; including some form of house, land, property or poll tax for Palestine, most West Indian Islands, British Guiana and Fiji.
(6) Total social services for Basutoland.

When attention is turned to the expenditure side of the accounts, two outstanding facts immediately emerge. The first is the very high proportion of the relatively non-constructive items of expenditure. Debt service, administration, defence and non-effective charges together make up 64 per cent of the total. No one who knows the British colonies would make accusations of over-elaborate or wasteful administration. The sums spent on defence are particularly tiny by any absolute standard. Nevertheless, the cost of administration is very heavy, and little is left for "nation-building" expenditure or social services.

The second outstanding fact is that a large part of this administrative expenditure is spent out of the colonies. This is obviously true of debt service, and hardly less so of non-effective charges, of which the largest are for pensions. Even of the current costs of administration, a large part is made up of the salaries of British officials, who must spend most of their incomes in Great Britain, when imports, periods of leave, education of children, etc., are considered. It will come as a shock to many people to be told that British members of the Colonial Service have their salaries and pensions paid out of revenue raised in the colonies. Their work is arduous and devoted, and their salaries are certainly not large by European standards; but they are very large in relation to the taxable capacity of the people who pay them.

It is undoubtedly in this department of colonial public finance that relief could most justly and expediently be given. The principle might be promulgated that, so far as possible, sums raised by taxation in the colonies shall be spent only for the direct benefit of the native populations. This would involve taking the cost of British

officials on to the United Kingdom Budget, but the cost would not be large in British terms, and the reform would be just as well as generous. Assistance might also be given to the colonies in equipping themselves with capital resources. The Act of 1940 remitted colonial debts to the Imperial Exchequer, and the total of those that remain—in the neighbourhood of £100 millions—is not excessive. But the burden could be reduced if assistance were given in converting to lower rates of interest. There is a strong implied guarantee by the British Treasury behind every colonial loan, and the advantages of Imperial credit might as well be enjoyed. For the future, the least that the United Kingdom can do is to provide what capital the colonies need at the lowest practicable rates of interest. A really constructive policy might well go further than this. There will be occasions in the future when the home Government engages in a public works policy—that is, spends money on capital projects without hope of monetary return. It might very well be that if the gifts of capital were made to Northern Rhodesia as well as to Northumberland, to St Helena as well as to St Helens, to Jamaica as well as to Jarrow, the indirect results would be just as remunerative to the United Kingdom in tangible economic benefits—let alone in pride and virtue. It is certain that there could be few economic events more favourable for the expansion of the British economy than a general rise in the standard of living in the dependent colonies. There is nothing of which the British people need feel ashamed in the finance of their empire. But there is much that is old-fashioned, unimaginative and unconstructive. It is to be hoped that this little-known corner of imperial policy will not be overlooked in the post-war reconstruction.

Next Step in Syria

THE immediate problem facing the Allies in Syria is, of course, defence. The loss of Crete was a rude but salutary lesson that no occupations are definitive so long as the German Army remains intact; and with the extension of the war to the east and the possibility that Germany may seek to force a decision in Turkey, the Levantine front, from the Hatay to the shores of the Caspian, may develop into one of the decisive centres of the world struggle. This task of defence covers two separate spheres, the actual military measures taken to reinforce the Allies and the political background against which the armies of occupation must operate. Both raise formidable problems which go far beyond the geographical limits of Syria.

Of the actual defence position, there is still little to be said. War material is coming into the country, and the opening of the Suez route to United States' supply ships is given a new importance. Manpower is a greater problem, in that the Allies are still faced with the difficulties of allocating an insufficient number of troops to almost equally important yet competing fronts. The number of Vichy troops to rally to de Gaulle has not yet been published, but the apathy and demoralisation of these men make it all too likely that most of them will make the choice of returning to France.

In the political sphere, the Allies take over a very unfortunate legacy. Syria is a country which, since it has formed part of a succession of empires, each leaving a legacy of tribal and sects, has never achieved a well-legalised national community of its own. It follows that there is little or no centripetal force to hold together the mutually distrustful Syrians and Lebanese and Alawayites and Druses and Armenians and Kurds, or Shiites, Sunnites, Maronites, Ismailians and Israelis—which co-exist but do not coalesce within the frontiers of the French Mandate. Since the creation of the Mandate in 1920, the situation has resembled, though in a much exaggerated form, the political position in India. Most groups are unanimous in their desire to be independent of the foreign overlord. They are equally unanimous in

pendent of each other. The difference is that in Syria, the process of partition according to criteria of race and religion has already begun. There is already a species of Pakistan in the separation of Moslem Syria from the Maronite Christian Lebanon and the creation of two "sovereign" independent republics.

During the last war T. E. Lawrence wrote that "only by the intrusion of a new factor, founded on some outward power of a non-Syrian basis, can the dissident tendencies of the sects and peoples of Syria be reined in sufficiently to prevent destructive anarchy," to which he added the rider that the task of this "outward power," whatever form it took, would be intensely difficult since the country's ideal was "not an efficient administration but the minimum of central power to ensure peace and permit the unchecked development of customary law." The French administration had therefore to choose between creating a military state, based on a firm foreign administration and allowing the religious and ethnic groups to work out their own administration under much looser control. The bitter opposition to the entry of the French and the toll taken of their military resources in a constant series of revolts among the minorities appear to have convinced them that separation was the only policy. At first, the area was divided into five territories, but since 1925 a number of modifications have created the present position, in which Lebanon and Syria are two independent republics, while three districts in Syria have a measure of autonomy, the Jebel Druse in the south, Latakia in the north-west and the Jesireh in the north-east.

In spite of constant political turmoil, this organisation did at least provide a framework within which the economic development of the region went forward. Roads were built, schools opened, industries fostered and irrigation extended. On the material side, the French did well. They would have done even better had they not allowed French companies to monopolise the entire economic life of the country. The Syrians could not make money. They made politics instead. The Lebanese, whose Maronite Christian majority had long enjoyed French protection, accepted their status as a Mandate with gratitude. They

had been given not only Maronite territory but the rich valley of Baalbek and the Moslem enclave of Tripoli as well. The Syrian nationalists, however, saw the settlement as a French trick to "divide and rule" and claimed the right to control an independent Syria. To some small extent, the position of the Lebanese resembled that of the Jews in Palestine. They felt that they enjoyed some measure of security only under the protection of France. If the Mandatory Power withdrew, they would be at the mercy of the Syrians. The same fundamental distrust of the Syrian nationalists' intentions was felt by the Assyrians and Armenians of the Jesireh. Nevertheless the French could not stifle the Syrians' insistent demand for independence. The example of Iraq and Egypt decided the day and in 1936 treaties of independence on the Iraqi model were negotiated with Syria and Lebanon.

These treaties were still unratified when, over five years later, the armies of Britain and Free France entered Damascus and proclaimed Syrian independence. The troubled years in between give the measure of the problems which face the new administration. The solutions arrived at in 1936 broke on the reef of the minorities, including the large independent "minority" of Lebanon. The dispute between Syria and Lebanon took the form of a customs war. Beirut is the natural harbour of Damascus, some two hours' drive away across the mountains of Lebanon, and anti-Lebanon. Under the French mandate, the customs receipts at Beirut were divided by the French between the two countries. When after 1936 the transfer of many administrative powers to the two Governments brought up the question of allocation, agreement was impossible, and as a substitute for agreement a customs barrier was raised on the Lebanese frontier. This absurdity has had the effect, not only of embittering the already strained relations between the two republics, but also of damaging Syria's precarious economy further and thus increasing political extremism among the Syrian Nationalists.

The problems raised by the minorities nominally inside Syria, the Alawayites of Latakia, the Druses of Jebel Druse and the Armenians of Jesireh, finally put a stop to all trace of constitutional government in Syria. The military safeguards for these minorities were held by French critics to be inadequate and by Syrian extremists to be insulting. When in July 1939 the suggestion to enforce them still further came up, the French High Commissioner took the matter into his own hands and appointed local representatives. With that the Syrian Government resigned and a temporary administration carried on until the fall of Damascus two years later.

The internal position was aggravated by the neighbouring problem of Palestine. The French were not beyond a certain discreet satisfaction at the embarrassment of Britain, the "model" Mandatory Power, and relations between the French and British administrations were strained and unco-operative. At the same time, Axis propagandists exploited Arab discontent against both France and Britain, and for some time the Mufti of Jerusalem was a centre of disaffection in Damascus.

The problem in Syria to-day—apart from the overwhelming problem of defence—is to restore cordial Franco-British collaboration, to rescue the administrative machine from the corruption and apathy into which it has fallen, to restore a viable economy to Syria without disturbing the more promising though precarious economic conditions in Lebanon and to face clearly the long-term problem of a post-war settlement, so that no decisions are taken now which will prejudice the final issue. The country is for the time being under martial law, and the strategic situation makes it likely that military government will be maintained. But the attempt should be made to give the Free French the responsibility for administration. It must be made clear to the Syrian Nationalists, that the guarantee of independence given them on the entry of the Allied Forces is absolute, and the saner statesmen among them must be closely associated both with the administration and with the working out of the final settlement.

The economic straits of the community are such that

provisioning and distribution are the first call on the administration. It is significant that the Lebanese Prime Minister, M. Nakkache, has already proposed a customs union for the whole area and clearly the farce of a tariff barrier between Beirut and Damascus must come to an end. The trade agreement between Syria and Palestine might at the same time be reconsidered with a view to an eventual extension of the customs union. So much of the political ferment has been due to the cramped and confining economic framework within which the minorities have had to work that any step towards creating prosperity would immediately lighten the task of the politicians. In this context, the question of the oil reserves in the Jesireh might be re-examined.

The external situation depends entirely on the course of the war but, with the pre-condition of an Allied victory fulfilled, the forces at work in the Levant are not unfavourable to a lasting settlement. The Axis Powers will be discredited, while the British and Free French, by working together now, can achieve a closer understanding of the problems involved. They are probably

already in agreement upon the solution to be sought—the independence of Syria and Lebanon under protection. It seems obvious, however, if a sane economic order is to be created on the one hand, and the aspirations of the Syrian Nationalists are to be satisfied on the other, that the Allies should seek for a broader solution than one which merely creates a number of Iraqs in the Levant, without cohesion and without a working alliance into which to fit their legitimate separate interests. Seen in this light, the problem of the Levant resembles very closely the problem of Europe or indeed of any future world order.

The era of completely unshackled national sovereignty is going out into the blackness of totalitarian "New Orders." Only the democratic Powers have still the opportunity or the experience to achieve a middle way of federation and autonomy. The Levant, like the Balkans or Central Europe, is split across by racial rivalries and political suspicions. Here, too, the stifling economic atmosphere of tariff walls and trade war has only raised the political temperature. But here, too, the only alternative to being part of a predatory Power's *Lebensraum* is local co-operation linked with the police power of a strong and non-aggressive State. As a start, a customs union and a loose confederation of Syria, Lebanon, Palestine and Transjordan is practical politics. The relations of this bloc with a larger federation including Iraq, Saudi Arabia and possibly Egypt raise difficult problems of leadership, prestige and competing economic interests. But it is in this direction that enlightened opinion in the Levant has been moving for the last twenty years and it is in this direction that enlightened Allied statesmanship should be looking for a settlement.

NOTES OF THE WEEK

A Sober Survey

In the Commons on Wednesday, Mr Attlee and Mr Eden summed up the state of the war. Mr Churchill was otherwise engaged. There was no setback or outstanding success to be made part of Parliamentary history by the Prime Minister, but simply a story of steady progress which was ably told by his lieutenants. As Mr Attlee put it, it was "difficult to prevent cheerfulness breaking in." Invasion has been postponed for over a year. The Russian army and people are putting up a magnificent fight against the massed German forces. British bombers are delivering heavier and deeper blows against German Europe and in the Middle East. The course of the Battle of the Atlantic has been much more favourable during the summer months than in the previous spring; and the enemy's shipping has suffered great destruction in all waters. In the Near and Middle East, a front is being fortified from Egypt, on whose borders the Axis forces in Libya are nervously awaiting the "next forward thrust to India." Behind the fronts, there is the great material aid and generous sympathy of the United States and "the rising tide of resistance to Hitler's rule in the countries which he has invaded." In the Far East, Mr Attlee said, the British Government is maintaining the "utmost vigilance." Mr Eden assured the House that the economic measures taken against Japan are "seriously intended" and will be "seriously executed"; any action threatening the independence and integrity of Thailand will be "a threat to the security of Singapore." In the Near East, Britain's intention is to bring independence and not conquest; and, in the Government's view, Britain and Turkey have a "lasting contribution" to make to world peace. In Europe, the agreement between Russia and Poland shows the way to a "happier future." But to indulge in "dangerous optimism" is "our greatest temptation." "Our better situation is only comparative; we are still fighting for our existence against a strong and ruthless enemy." Invasion is a constant possibility; and "it would be foolish for anyone to attempt to forecast the outcome of the struggle in Russia." On the Atlantic, severe losses continue—and may increase again; and there is danger in the Pacific. Hitler has not only to be held; he has to be beaten; and the historical parallel for his situation now is not the reeling German retreat in 1918 after the last offensive failed, but rather the defeat on the Marne four years earlier.

The Russian Front

From the extreme north to the shores of the Black Sea, the fighting continues, and for the first time in a fortnight there are signs that the Germans have gained a little ground; but they appear to have done so at the cost of abandoning, at least temporarily, a number of their original objectives. For example, in the north, the drive towards Leningrad through Porkhov has slackened. Instead, the Germans are moving directly to the east, below Lake Ilmen in the direction of Kholm, an advance which brings them into difficult, marshy country, but offers some possibility of swinging either north to Novgorod and Leningrad or south to attack the Russian flank at Nevel. In the centre, the battle of Smolensk sways to and fro. The Russians claim that the front holds, the Germans that the last effective concentration of Soviet troops has been destroyed. Both sides admit terrific losses. In the south, the direct attack on Kiev from Zhitomir may have been abandoned—the fate of the armoured units which reached the outskirts of Kiev, like that of the advance guard at Vyasma beyond Smolensk, has presumably been annihilation—and the Germans are now developing a pincer movement through Korosten to the north of Kiev and Byelaya Tserkov to the south. This southern drive, were it to develop successfully, would bring the German armies across the Dnieper and cut off the Ukrainian industrial and grain centres from the main territories of European Russia. Both here and in the Kholm area, the Germans are still trying to divide the armies under Voroshilov, Timoshenko and Budyonny from each other—a feat they claimed to have performed three weeks ago. These new German movements may well preface the third offensive. It is difficult to believe that it will be more devastating or far-reaching than the second. The Germans' lines of communication are appallingly difficult, and the road builders and railway

workers of the Todt organisation have to perform their feats under constant guerilla attacks. The Russians, on the contrary, have completed their mobilisation, and considering the chaotic state of Russian transport at the time of the "purges," their supply system is working wonders.

Supplies for Russia

As the likelihood increases that the Russian front will hold fast, the question of Russia's economic staying power becomes one of the most urgent problems of the war. Russia is not to come under the provisions of the Lease and Lend Act—so long, presumably, as the Soviets have gold and assets to be absorbed in America—but Mr. Harry Hopkins' visit to Moscow has borne fruit in the shape of an announcement from Washington, on the occasion of the renewal of the annual United States-Soviet trade agreement, that the United States will give all practical economic aid to Russia. This pledge, with the important statement that priorities in orders will be given to Russia, is a great step forward, if it means that the task of allocating scarce military means among the rival claimants and rival fronts is really being seriously tackled. No hint has been given of the scale of Russian purchases in the United States—last year they amounted to some \$40 millions—nor have the Russians, somewhat naturally, given any publicity to their greatest shortages or needs. Their need for certain metals, for ferro alloys, rubber, clothing, and aircraft is well known. There remains the problem of transport. In an exchange of notes, the United States has promised to speed up the delivery of war material, and to consider Russia's request that shipping facilities should be made available. Here is a new turn in the kaleidoscope which is gradually working into the design of two world fronts—of aggressors and aggressed. If United States ships are to bring war materials to Russia, they can only land them at Vladivostok, where the goods will pass into the bottleneck of the Transiberian railway, or at Russia's northern ports. The Russian coasts are not a combat zone, and for a brief space yet the north-west and north-east passages are still open. The arrival of war material at Vladivostok was a matter of relative indifference to Japan so long as Russia was Germany's ally, and the United States a correct if unfriendly neutral. Today Russia and Germany are at war, and the United States is leading a world embargo on Japanese trade. In these circumstances, it is questionable whether United States ships can hope to ply between San Francisco and Vladivostok without adequate naval protection. And the prime question in the Pacific, as in the Atlantic, will be whether naval protection is effective if it does not imply "shooting."

Facing Reality in the Far East

It looks as though the Japanese may really have taken the bit between their teeth. The reinforcement of Indo-China goes forward rapidly; the Japanese air force is established at Saigon; the Japanese navy is already at work on and in Camranh Bay; heavy bombers have arrived at the ceded aerodromes on the Burmese frontier; and the papers of Japan are filled with "Imperial destiny," "Co-prosperity" and the "threat of encirclement." The next mouthful is apparently Thailand, and outward signs of the pressure which is being exercised upon the none too dependable government of Luang Bipul Songram is the recognition by Thailand of Manchukuo and the granting of a Thai credit to Japan to encourage their foreign trade. It is not known whether Japan has made demands for bases yet, but the diplomatic preliminaries are obviously being carried through with all speed. It is now obvious that any kind of appeasement at this point could have no effect, whatever, except perhaps to encourage Japanese arrogance. Strong action on the part of the democracies might, admittedly, goad Japan into open military action. But any weakness will merely ensure that Japan will be able to take military action later after a comfortable period of undisturbed preparation. Moreover, there is always the possibility that strong action might strengthen the hand of the Japanese moderates, who still have some influence in the councils of the nation. In fact, it is still, unfortunately, difficult to determine whether the action contemplated by the democracies is really firm

enough to correspond with the realities of the Far Eastern situation. Since the freezing of Japan's assets, the machinery for a total embargo exists. If no licences are granted, there will be no trade. The British Empire and, in most statements, the Dutch East Indies have shown their readiness to follow a definite lead and British statements insist on the wish of the Allies to take "parallel action" with the United States. Only with United States co-operation, in all spheres, can sanctions be made effective. Parallel action implies, moreover, that someone lays down a line, and here the responsibility lies with the United States Government both to determine how seriously it means its threat of embargo and how logically it is prepared to work out the military implications. The President has already put a complete embargo on the export of aviation spirit and motor fuel except to the Western Hemisphere, the British Empire and countries resisting aggression. Other kinds of oil product are to be reduced to pre-war purchases. But the licensing system can be used to cover all other American exports to Japan, among them, the great bulk of cotton exports. Will the obviously firm intentions of the Administration once more be weakened by the State Department's habit of appeasement?

Mr Churchill's Task

Afterthoughts on the production debates can be simply summarised. No one believes that whatever short-falls there may be in output are likely to be disastrous; and the Prime Minister's account of his own co-ordination of planning and achievement has been accepted as a recognition, in formal terms at any rate, of the system that the critics had called for. But it is felt no less strongly than before that there is still need for the most constant pressure to secure improvements in productive methods and wartime organisation—and an attempt is made to strike the balance between achievements and possibilities in an article on page 175; and there cannot be complete confidence that Mr Churchill, even with the aid of his versatile and ubiquitous statistical department under Lord Cherwell, is capable of making his control over production work as well as it sounds. If it does, Mr Churchill will not only have made political history by his own performance; he will also have made constitutional history by making his unconventionally staffed personal "cabinet"—which is on the face of it an appendix to the body administrative with ambiguous functions—into a major instrument of government. The point is that leadership alone will not win the war either in the factories or on the battlefield. The goods must be delivered and plans must not only be made but also executed down to the last detail. It is probably untrue to suggest, as Mr. Aneurin Bevan did, in a characteristic attack in the Commons on Tuesday, that the Prime Minister is solely, or even mainly, responsible for substituting slogans and exhortations for planning and command in economic organisation. Mr Churchill is the nation's orator, but there are men beside him with much greater claims to the title of publicist. But Mr Churchill is in charge, and he has assumed a greater responsibility, in detail as well as in general, than even his most fervent admirers would have believed him humanly capable of performing.

The Coal Debate

The debate on coal in the House of Commons last Tuesday did little credit to those hitherto responsible for the wartime output of coal. Mr Grenfell, who opened the discussion, admitted the seriousness of the position, though his account of the difficulties and their causes scarcely absolve him—and the Government—from blame. He stated that, owing to the shrinkage in exports, some 100,000 men had left the industry since the beginning of the war, 75,000 of them during the past twelve months. He also pointed out that he had foreseen the danger of a wholesale exodus of men from the coal-mining industry, and he attempted to justify inaction in correcting this on the ground that it was difficult to retain miners without regular employment who had seized the opportunity of taking up other, and presumably often more remunerative, positions. Mr Grenfell also admitted that, even in recent months, the output of coal has been insufficient to meet the growing domestic demand and to provide adequate stocks for the winter months—Mr Bevan suggested that, in some districts, output was actually declining. At the Board of Trade, Sir Andrew Duncan is taking more interest in the coal problem than his predecessor, Mr Oliver Lyttelton, did, or than he himself did during his previous tenure of this office; and, while admitting that the situation was one that gave cause for concern, he deprecated

its description as a crisis. Of the 97,000 ex-miners who, according to Mr Grenfell, had registered as a result of the recent appeal, Sir Andrew stated that 25,000 men would be forthcoming and that 6,264 of them had already reported for duty. He also pointed out that the stocks in the hands of public utility companies, railways, industry, merchants and in Government dumps were actually bigger by at least one million tons than a year ago. He informed the House of Commons that further efforts would be made to raise output and that, by eliminating waste, economies in consumption could still be made. It might even be necessary in the winter to introduce a comprehensive system of rationing not only for coal, but also for light and other forms of fuel. In conclusion, Sir Andrew suggested that the war effort in the coming winter was not likely to be impeded by lack of fuel and power and that the public would not have to suffer an unreasonable rationing scheme. True, there need be no serious shortage of coal; but if it is not to arise, the problems of both production and distribution must be tackled much more seriously than they have been yet.

Hopes for India

Last week's Commons debate on India showed that second thoughts about the extension of the Viceroy's Executive Council to include more non-official Indians and the simultaneous establishment of an All-India National Council had been generally favourable. Mr Amery's explanation of these steps was accepted by all parties as earnest of a genuine intention, in spite of the intransigence of the Moslem League and the "anarchism" of Congress, to accord to Indians a greater share in the conduct of administration and the war effort; and the chief doubts that were expressed were three. It was widely questioned whether many Indians could possibly have the same faith in British intentions when they believed themselves to have been misled so often in the past by words and promises, when a large number of prominent Indians were still in gaol and when the British Prime Minister and national leader, well-known in the past for his opposition to constitutional advance in India, still remained stubbornly silent on Indian affairs. The proof of British sincerity will, of course, be found in the share which the co-opted Indians will in fact have in Indian government; it is not easy to release prisoners who have gone to gaol by their own deliberate wish and intention; and it would put the new Councils in quite the wrong perspective if it were not made perfectly clear that the men who have joined them, including four provincial Prime Ministers, do represent a large portion of India's millions. Nevertheless, it is still the task of statesmanship, in Britain and in India, to remove the fact that a majority of India's politicians are still in opposition; and no one could do more, by a single speech, than Mr Churchill to open a new chapter.

Diversion to the West?

After Vichy's sorry performance in the Far East, it is difficult to accept that Government's assurances that no foreign Power will be permitted to assist France in the defence of her North African empire. It is doubtful whether Germany has actually put forward demands on Japanese lines for the "protective" occupation of Dakar and Casablanca, and the Mediterranean bases. But it is all too

probable that, if some such demands have been made, Marshal Pétain will go through the formality of saying "No," and then the bases will be handed over. General Weygand's reaction to a possible betrayal is hard to assess. He is no friend of the Germans. On the other hand, he is "a man subject to authority," and completely loyal to the Marshal. It is an ominous sign that Pétain has given Darlan responsibility for the defence of North Africa. If Vichy France has not yet abandoned the bases, it is probably because Germany has not yet demanded them. The Germans have only one reason for holding back, the usefulness to them of the Vichy myth in America. Mr. Sumner Welles' stern warning that America's recognition of Vichy depended upon its willingness to defend the integrity of its Empire was a danger signal to the Germans, and pressure slackened. The fate of Vichy and North Africa probably depends upon a practical calculation of the German High Command. Does the value—to diplomacy, to propaganda, to espionage, to military supplies—of a "neutral" France, diplomatically represented in the United States, outweigh the military and psychological advantages of occupying the Atlantic seaboard? If the decision is that the need for an immediate easy victory and a psychological diversion from Russia outweighs the less spectacular advantage of blockade-busting, then the independence of North Africa, as well as that of Spain and Portugal, will depend on the amount of local resistance and the extent to which an effective measure of Allied help can be mobilised to counter a lightning German attack. The present uneasiness in Spain and Portugal is a sign that a decision for a spectacular coup is felt to be more likely.

Directive to the Colonies

Two months ago, the Secretary of State for the Colonies sent a despatch to the Colonial Governments on "certain aspects of colonial policy in wartime." This despatch has now been published as a White Paper. For the most part its contents were covered by the statement made by Lord Moyne recently in the House of Lords, but it goes into the principles then laid down in more detail; and it may be described briefly as a lesson in the wrong and right use of resources. To prevent the former, the Governments are urged to do all they can to curtail spending by those enjoying a comparatively high standard of living. It is pointed out that the restriction of consumption saves shipping, foreign exchange and productive capacity; and the lesson, which has at last been learned in this country—that saving money is only subsidiary to the primary objective of saving material resources—is now handed on. The directive is unimpeachable and unmistakable: "an increase of taxation, especially direct taxation, above what was thought necessary before the war should be a definite object of policy." As an article on page 160 points out, the main source of colonial revenue is the import duties, which fall most heavily on the poorer members of the colonial communities; direct taxation on Europeans is light—which is hardly surprising since to many of them one of the chief objects of settling in the colonies is to escape income-tax—and the rebuke to certain colonies regarding extravagance makes agreeable reading. To supplement taxation and other fiscal measures in reducing spending, the despatch also urges a comprehensive system of import licensing, the present position in this respect being regarded as "disappointing." Colonial Governments have frequently decided that certain articles are essential, when in the opinion of the Imperial Government they are certainly not; and it is declared that there are a number of articles the import of which ought to be entirely prohibited, while most others should be cut down to a small percentage of normal. These are stern words, but the despatch then turns from the need for lowering the standard of living of the few to the equally pressing necessity of raising that of the great majority of colonial peoples—the right use of resources. Here again the directive is clear: "it is an imperative duty to do all that is practically possible to fulfil this obligation even during the war." The limitations imposed by the war were described and discussed in an article in *The Economist* of July 19th (page 68), but Lord Moyne is rather more lenient in the despatch than in the House of Lords debate, for in it he says that, in special cases, materials and personnel may be made available from outside sources if the work is sufficiently urgent. He also emphasises the importance of making plans now, so that there can be "rapid progress" in colonial development

after the war. Colonial Governments are urged to relate their development and welfare schemes to a general plan, instead of merely submitting isolated projects. A central agency in each colonial administration is envisaged, which would co-ordinate the various departmental plans into a general framework covering a period of at least five years. Moreover, particular importance is attached to the training of local personnel as rural teachers, health workers, agricultural demonstrators, and so on, in order to provide an adequate number of subordinate staff for post-war construction. This latter instruction is especially welcome, since the education of the native peoples to educate themselves has long been recognised as a guiding principle of trusteeship. In fact, the tone of the whole despatch is unexceptionable; the Colonial Office must now insist that it is acted upon.

On the Fringe of the Fighting

In the Mediterranean the air and sea battles continue, and, since Italy's *Regia Aeronautica* is the RAF's principal opponent, the initiative rests with Britain. In the course of British attacks on shipping, several supply ships have been sunk, and a cruiser torpedoed, and probably hit. Air attacks have been made on Crete, on Reggio on the Italian mainland, and the attack on Sicily of last week has been followed up by another smashing blow—this time at Sardinia. The Navy has also been active in Sardinia, and in two daring raids, units of the Fleet raided Porto Conte and Alghero at dawn; destroyers were able to get right inside the harbours, and to damage port installations and an aerodrome used by Italian reconnaissance seaplanes. All the while, the hammering of Libya continues, and the only effective counter blow given in any quarter was the Axis raid on the Canal Zone, which caused considerable loss of life. It is, of course, difficult to speak of a Mediterranean front. There is no land fighting, while the armies sit and swelter in the violent heat. The Levant is quietly settling down to Allied occupation. Yet it is the quiet of a coming storm, for in no part of the Near East can it be said that the battle is decided. If Russian resistance continues to be as stiff as at present, and the German need for an easy victory grows, Constantinople is an obvious choice for an alternative blow. The Turks are watchful, but are inclined to rely upon their Pact of Friendship with Germany. They are still not happy about Britain's Russian connections even though the Russo-Polish Pact has had a reassuring effect. Syria and Iraq are also watching the course of the Russian war. Any brilliant successes there on the part of Germany might well have disturbing consequences, particularly in Iraq, where the weak armistice terms imposed by Britain have allowed a good deal of anti-British influence to prevail in the Army. Finally, in Iran, although a few German "tourists" have been given their *congé*, the situation is not at all satisfactory.

Beggar My Neighbour

These is no sign that the trade unions have been in any way deterred by the Government's White Paper in their determination to run up money wages as far as bargaining can take them. The obvious argument about the dangers of inflation is now being answered in trade union circles by the claim that, by what the organ of the Transport and General Workers' Union calls "a proper system of price control and rationing," inflation can be prevented. It is, of course, true that rationing to the hilt could, by making all the spending power in the hands of the public over and above a minimum worthless (that is, useless to buy anything), prevent inflation. It would be interesting to know whether trade union officials, in pressing their money claims, are making it plain to their members that the extra wages which they are asking for will in any case be worthless—either because of the inflationary rise in prices which their expenditure would cause or because of the "sterilising" effect which measures to prevent inflation by complete rationing would have. It is perhaps doubtful whether, in practice, rationing can possibly be made as watertight or as comprehensive as its use as a single defence against inflation would require, though every effort to render it so should be made. But the important thing is that the real, as distinct from the monetary, issue should be put before every member of the public, including, not only wage-earners, but every income-receiver from bottom to top of the scale. In so far as they are not taxed away, high incomes are just as dangerous in essence as rising incomes. The simple fact that more wages—or salaries and

profits—cannot bring more goods into being under conditions of wartime restriction is still not fully understood. Trade union spokesmen, of course, do know, or should know, that all-round wartime increases in money wages cannot increase real wages or actual purchasing power all-round. But they also know that, so long as the present scramble for goods goes on, those who are most successful in the scramble for money may benefit—at the expense of some other section of the community which they hope will be the rich but who will probably be the very poor. Moreover, they look ahead to labour's claims under less stringent conditions of supply after the war—and they argue that the higher the level of money wages is then, the bigger the workers' share will be of an expanding supply of civilian goods. The new trade union argument that the situation can best be controlled by controlling expenditure and consumption is the right one; but it will be a pity if all this jockeying for position were to prevent every step from being taken, co-operatively, to ensure that the danger of inflation, now and after the war, shall remain at a distance.

Compensation for Casualties

On the whole it was a satisfactory account of his Department's activities that Sir Walter Womersley, Minister of Pensions, gave to the House of Commons last week. Various anomalies which have been brought to his attention in past months have been corrected. For instance, men passed as Grade 1, who are discharged from the Services on account of a disability shown to have existed before enlistment, but not detected at the medical examination, have hitherto been refused pensions. Now, if effective service is found to have caused an aggravation of the disability resulting in discharge, a pension is granted. Further concessions are the grant of full Service pensions where a member of the armed forces is killed or injured by enemy action while on leave; the application of the principle of the new Determination of Needs Act to parents' need allowances; the continuation of children's allowances, when the children are still being educated, up to the end of July following the sixteenth birthday; and special temporary allowances of 50s. a week for ten weeks to widows before a war pension is issued. Moreover, a Royal Warrant will be issued confirming the provision that a member of the Home Guard, while on duty, comes under the same regulations as a member of the armed forces. But, because it is a new departure of the Ministry, most interest lies in the compensation scheme for civilians. About 10,000 pensions have been granted in respect of deaths in air raids. The number of disablement pensions granted for cases of permanent injury due to air raids is over 1,000, a reassuringly small number when it is considered that by the end of June over 50,000 persons had been notified as seriously injured in raids. It is very satisfactory that the great majority of injured people are not permanently incapacitated—though as the qualifying period before a disablement pension is granted is usually six months, more of the 50,000 may come under the disabled category in the future. There does, however, appear to be a lack of rehabilitation facilities for those that are permanently disabled. The Ministry of Pensions has increased the number of beds in its hospitals to 7,647, but apparently they are mainly occupied by disabled soldiers. There is said to be a rehabilitation centre for civilians, but there appears to be no system of following up cases of serious injury on discharge from hospital. It is not fully realised that casualties, particularly adolescents, who have lost a limb or limbs, have to reorientate their whole lives, and that complete physical and mental rehabilitation of a serious casualty should accompany financial compensation.

They Have Been Warned

Local authorities have received a circular from the Ministry of Home Security warning them of the prospect of as heavy air-raids in the coming months as any yet experienced, if not heavier. It is not proposed, the circular says, to make any fundamental change in the relations between Government Departments, Regional Commissioners, local authorities and other interests, which were described in a recent statement by Mr. Morrison in the House of Commons. The existing machinery for the settlement of policy and the co-ordination of action is considered capable of meeting the prospective calls upon it. Nevertheless, power is being given to the Minister of Home Security to give orders to local authorities who are

neglecting their civil defence duties. At present, under Regulations 29A and 54B, the Government has power to direct local authorities, both specifically for civil defence purposes and for the more general purposes of the Emergency Powers (Defence) Act. But the civil defence purposes defined in Regulation 29A are those covered by the Civil Defence Act of 1939 and fire fighting; and although late last year this was amended to include the care of the homeless, there still remain a vast number of functions enumerated by Mr. Morrison which in the age of ARP were never contemplated as belonging to civil defence. Regulation 54B is, therefore, being supplemented to give power over local authorities regarding the detailed execution of measures considered necessary, whether falling within civil defence functions or the wider field at present covered by the regulation. Moreover, this power, the circular says, is to be delegated to the Regional Commissioners, so that orders given by them to local authorities must be obeyed. Not so long ago, in the civil defence debate in June, the Government spokesman said that the Commissioners' powers of direction need not be increased. Withdrawal from this position does not mean that the new powers will be used, except when local authorities are clearly inept, but a very effective sword is now hanging over their heads.

Wolf, Wolf

Before Bank Holiday it was the Government's view that the public had earned its rest, but that the need to distribute and economise made it obviously imprudent for holidaymakers to travel by rail. Posters were displayed exhorting people not to travel, which is now the usual way of publishing the Government's wishes. Probably it was because this technique of exhortation, as a substitute for commands, is so familiar that, to a considerable extent, the public merely accorded it the pinch of salt which they are now accustomed to give to the posters of other advertisers, and went on their way by train. To travellers the question whether coal could be spared for their holiday-making or not was simply answered by the fact that, in the event, trains were put on to carry them. The railways' claim that they are compelled by law to provide trains for all who purchase tickets may be sound, but it will surprise many people who have failed to find transport on bygone peacetime holidays, and it will only exasperate those who worked on Monday, and had to make their way by a skeleton Sunday service while the holiday "reliefs" went by. Actually, the extent to which "unpatriotic" journeys were indulged in has probably been exaggerated. There was not the chaotic scramble that some people and newspapers had ghoulishly anticipated. Many people were visiting evacuees. Officially, it is said that little harm was done. The point is not so much that people did travel to the detriment of the war effort, but rather that they were allowed to travel. The difficulty of deciding which were necessary journeys and which were not was obviously considerable. But to leave it to individuals to decide for themselves simply meant that most of them would inevitably—and very humanly—decide in their own favour. If vital coal supplies were, in fact, held up or wasted, the fault is the Government's, and no one else's. The practice of attempting to conduct the war on the home front by appeals and slogans, which is a symptom of what was described by one member in the coal debate as "the wicked state of mind of imagining that economic problems can be solved by emotional crusades," was never very effective—except among a relatively few devoted workers in the obviously perilous

weeks after the fall of France. Posters can never replace orders, not because people are unwilling, but because they cannot be expected to decide for themselves what it will be best for them to do in the national interest; they cannot know. Now, the practice has been worn threadbare. The armed forces did not travel by train last week-end because they were ordered not to. The civilians did travel because there have been too many appeals, too many slogans, too many exhortations. It is as absurd to allow travellers to waste coal and impede the passage of essential goods, with only the admonitions of a poster to restrain them, as it is for the Ministry of Food to prove to the public on yet another poster how vital shipping space could be saved if they would eat wholemeal instead of white bread, and then to do nothing more to compel them to do so. Either these are matters of free choice for the public, or they are not; and in the cases of coal and shipping space they obviously should not be.

* * *

Milk Rationing

The announcement that registration for milk supplies will now be compulsory is hardly unexpected. It has been clear for some time that supplies of liquid milk would fall substantially short of demand this winter. In the Commons on Wednesday Major Lloyd George repeated the assurance that there will be adequate supplies of condensed milk to make good the shortage, and registration is to be the preliminary to a scheme which will rightly be designed to reserve liquid milk supplies for those who need them most. It appears that the plan is to guarantee one pint a day for expectant mothers, and for infants up to five years, and $\frac{1}{2}$ pint per day for children between five and seventeen years. If a shortage of liquid milk is inevitable, there must be unreserved praise for this system of priorities, which will perhaps need to be extended to invalids. But it must be strongly deplored that a shortage was not prevented. For a long time it has been clear that the demand for liquid milk was outstripping the available supply. Liquid milk is an absolutely invaluable source of nutrition for adults as well as for children as a protection against the short-comings of war-time diet; and it would be far better to have initiated a switch-over from beef to dairy farming a full year ago than to be forced into this rationing, which must leave many people insufficiently supplied with milk.

* * *

Balbus and the War Effort

It is not long since Mr Bevin, in a forthright "appeal" to the building trades, said that the construction of certain aerodromes and factories was behindhand; and it is known that at least one vital public utility extension has been hampered for lack of heavy labour. Yet, the Londoner can still see cinemas and restaurants that have been largely rebuilt after bombing; he hears of more—and even of a lecture hall at a well-known academic institute that is being restored. These may be slight instances, but in sum they do suggest that, in practice, the admirable principles of priority and allocation which have been announced since the formation of the Ministry of Works and Building last year are not yet being relentlessly applied. The cause may very well be the disposition of the authorities, in the absence of any policy of war compensation for lost livelihood, to restore even non-essential enterprises if there are people whose living depends upon them. This is understandable, but it is not war economy. Building, like coal-mining, has suffered a grievous loss of labourers, and there is no margin of men—or of materials—to be spared for restoring non-essential activities whose damaged buildings should rather be regarded as sources of scrap than as proper objects for reconstruction.

* * *

Hey Presto

It was not Maskelyne's practice to explain his vanishing tricks. The Ministry of Food is more frank. In one of the latest of the series *Food Facts* it is pointed out, in the simplest of language, that when the price of goods that are scarce is officially fixed at a level within the reach of most purchasers the goods must disappear. The price is within most purchasers' reach, but the supply is not; there is not enough to go round, and the normal process by which the price rises until demand and supply match is suspended by price control. The explanation is common-

sense, but the light thrown on food policy is somewhat disturbing. The proper object of policy is surely not simply to secure the quotation of reasonable prices, whether there are goods to buy at those prices or not, but rather to guide the distribution of goods. Price control is no more than a means to that end—in combination with rationing, registration and the reservation of goods for specially needy persons. It is plainly not possible to fix any all-round ration of individual commodities of which there is not enough to go round. But the goods have to be distributed somehow, and, apart from the attempts of honest shopkeepers to eke them out fairly by their own empirical methods, the present position is that price-controlled foodstuffs are usually snapped up swiftly by the leisured and the fortunate or by the hangers-on of the trade, the forestallers, regraters and engrossers, who carry them away to the hoards and the black markets. The possibilities of the device by which a number of foodstuffs, singly in short supply, are grouped together for rationing have not been exhausted; and the campaign to eliminate the speculators and the parasites who batten on shortages has not passed the stage of threats and exhortations.

* * *

Shorter Notes

The Trades Union Congress and the Labour Party have issued a statement on their attitude to Communism. They declare that they appreciate warmly "the great efforts of the Soviet Union in the common struggle against Hitlerism," and welcome "the fulness of the co-operation . . . between Great Britain and the U.S.S.R.," a co-operation which they hope will result in a common understanding between the two peoples "which is a necessary condition of an enduring peace." But, as was to be expected, there is no suggestion of any *rapprochement* between the Labour movement and the Communist Party, which until June 22, 1941, took "every opportunity to obstruct and weaken the national effort," and has "again demonstrated its irresponsible and unstable character."

*

The road deaths for June at 618, though lower than May's total of 701, were 139 higher than in June last year. In addition, 3,592 persons were seriously, and 11,593 slightly, injured. Obviously, with the double summer time in force, the black-out cannot be blamed for the increase on last year; in fact, only 41 of the fatal accidents this June occurred in hours of darkness, compared with 92 in June, 1940. One by one the reasons for accidents which are put up by private motorists—the black-out, Service vehicles, cyclists—have had to be strongly qualified. Will they eventually come down to careless driving by themselves?

*

On July 31st the House of Commons was informed by a message from the King that Sir Paul Latham, member for Scarborough and Whitby, had been arrested, and was to be tried by court martial for alleged offences against military law. This method of informing the House of the arrest of a member serving in the Army is in accordance with Parliamentary custom, but as no such member has apparently been arrested since 1815, the procedure was new to the present House of Commons.

*

The Prime Minister of Southern Rhodesia has said that he has agreed to the request of the Secretary of State for the Colonies that the question of the amalgamation of the two Rhodesias should be temporarily deferred. He added that the matter is in abeyance because Lord Hailey's report on the alleged differences in native policy in the two Rhodesias has not yet been received. The most surprising feature of his statement, however, is that the Southern Rhodesian Government is not going to be put off by the possibility of difficulties in the House of Commons, and that there was no reason why the more enlightened people [sic] who migrated and built up the Commonwealth, should be dictated to by the insularity of those who stayed at home. Dictation, evidently, can only come from Southern Rhodesia, which would impose amalgamation on the 1,366,000 natives of Northern Rhodesia. Sir Godfrey Huggins appears to forget that responsibility for their welfare still lies with the House of Commons.

THE WORLD OVERSEAS

China's Export Trade

(From Our Shanghai Correspondent)

June 25th

CHINA'S export season started in June. The various districts had one feature in common—no increased production of any export commodity, but a very general decrease. Obstacles to exporting, such as inland transport difficulties, Chinese and Japanese control of trade and foreign exchange, as well as a scarcity of shipping space for transport overseas, are all considerably greater than a year ago. But in other respects, export conditions vary substantially in the different regions.

Free China now relies for exports upon the Yunnan-Burma Road almost exclusively. The Road continues to be improved on the Chinese side, and some 150 miles of new railroad track to relieve the road traffic are under construction from Kunming westward; but the rainy season is just ahead threatening to curtail, if not to block entirely, the outgoing road traffic. The recent month's extension of Japanese naval operations on the South China coast, and especially the quasi-piratical Japanese raids on a large number of coastal or near-coastal points still controlled by China, sharply reduced what remained of Free China's commercial and shipping intercourse with Hongkong in the sphere both of legitimate trade and smuggling. In the interior of Free China, many chronic bottlenecks and traffic jams also obstruct the outflow of export commodities. The Chungking Chinese Government early this month amalgamated the semi-official Foooshing and Fuhua export monopolies in order to centralise Government-managed exports, but the immediate result is not important. The growing of agricultural export produce in Free China for the past year and a half has been discouraged by the comparatively low prices which Government monopolies allow for such produce, and farmers prefer to cultivate produce for their own requirements and the domestic market. Free China's metal output does not promise any further increase in the near future.

In the countryside of Japanese-occupied North China, the output of export produce has also not improved. The recent large-scale military campaigns in Honan and Shansi Provinces; Japanese inability to oust from this territory the Chinese Government and Communist armies; the revived guerrilla warfare everywhere behind the Japanese front lines; Japanese monopolist regimentation and seizure of farm produce by methods and at prices which make these measures appear to Chinese farmers little short of confiscation—all these factors combine to keep production for export by North China at a very low level and far below pre-war standards. Moreover, exports to countries outside the yen bloc are permitted only under the export-import link system at an artificial rate of U.S.\$0.115 per Peiping F.R.B.\$1.00, which is paid by the Japanese Yokohama Specie Bank for foreign exchange proceeds from all exports. Japan's efforts to divert additional export trade from Tientsin's British Concession to Tsingtao, which is dominated by Japan and since early this spring has enjoyed direct railroad connection with West Hopei and Shansi, are also upsetting export trade. North China transit trade via Shanghai is being systematically obstructed by Japan's treatment of North and Central China as different countries.

In Central China, the forwarding to the coast of all produce from Japanese-occupied areas is now subject to strict regimentation by the Japanese military and to payment in military yen. This regimentation has had the same adverse effects on production as elsewhere in China. Non-Japanese Shanghai exporters may secure supplies of export produce only on the condition that the Japanese are allowed a share in the export profits and part of the foreign exchange proceeds. Except for tea, arrivals at Shanghai of Free China produce have practically stopped since the recent Japanese onslaught against the East Chekiang coast. The production of Central China's major export commodity, raw silk, is being discouraged by the Japanese in an effort

to relieve the silk market of Japan proper; the 1941 spring cocoon gathering in Central China yielded 30 per cent less than the past year's crop. However, high silk prices, almost reaching the peak quotations of November-December, 1939, compensate for the reduction in output. Shanghai's silk stocks are extremely low, and domestic demand competes sharply with export requirements.

Shanghai's Share

Shanghai's exports continue to dominate the exports of the whole of China. During the first half of this year, North China and Free China accounted for one-sixth each of the whole of China's export trade, while Shanghai alone accounted for two-thirds. This is now primarily due to the fact that produce coming from the interior plays but a secondary part in Shanghai's exports while the products of Shanghai's industries rank first. Most important among these products are cotton yarns and piece-goods, followed by iron, steel and other metal manufactures. These textiles and metal manufactures sell successfully in South-East Asiatic countries and British India, taking the place of former imports from Continental Europe, Great Britain and Japan. More than half of Shanghai's exports in January-May, 1941, were contributed by these and other local industrial products, while the share of raw silk in local exports declined to 12.5 per cent.

Shanghai's chief foreign customer remains the British Empire, which in January-May this year purchased 40 per cent of Shanghai's exports. In this trade, Hongkong ranked first as the leading distributor of local textiles and metals in South-East Asia; British India as a large-scale buyer of the same goods was second; while the United Kingdom ranked third owing to its continued purchases of raw silk, bristles, egg products and vegetable oils. The United States maintained a 25 per cent share in Shanghai's exports, so that the two great Anglo-Saxon Powers together accounted for two-thirds of all local export shipments. The Japanese Empire with a 19 per cent share was third, but a large part of Shanghai's shipments to Japan's Kwantung Leased Territory (Dairen) went via Siberia to Germany, and this latter trade has been completely interrupted by Germany's attack on Russia.

Iceland Since the Occupation

[BY A CORRESPONDENT]

July 31st

THE Icelanders look upon the occupation of their country with mixed feelings. Being very politically minded people, they were not in the least surprised when first Great Britain and then the United States took steps to ensure control

FOR ALL US

INSURANCE

NEE

on, ited

ndon, E.C.

Head Of

LIVERPOOL BRANCE

North John St.

over the northern passage between America and Europe, and to protect the shipping of supplies for Great Britain in the North Atlantic. It is also important as a refuelling station for the aircraft flown from the United States to Scotland. Moreover, Germany had shown great interest in the island.

At first the Icelandic Government protested against the occupation of their independent and neutral State, but it seems to have been more a matter of routine than of conviction, as they realised that this occupation brought them the protection of the British Navy against an invasion by Germany. When Britain explained that her troops were needed elsewhere, the Icelandic Prime Minister, Hermann Jonasson, invited the United States to take over the protection of Iceland during the war. This invitation was accepted, and "picked troops" and "sufficient aircraft for defensive purposes" were landed by America early in July this year. In spite of the fact that they have had to fight for their independence for hundreds of years, the population appreciates the need for these strategic measures, and also the economic advantages which arise from them.

These benefits are obvious. The soldiers spend money, and the military establishments occupy so much labour that unemployment has ceased. Exports have risen from 50 million crowns before the war to 132,900,000 in 1940, while goods worth 72,317,200 crowns were imported. Fish, such as clippish and uncured saltfish, and fish products like herring oil, cod-liver oil and fishmeal, which is in great demand as meal fodder, represent by far the greater part of exports. The wealth of the country is mainly derived from the fisheries. About two-fifths of the total import figure consists of consumption goods, while the rest consists of various goods necessary for production, including fuel and lighting materials. Thus, coal; iron and ironmongery; timber wrought and unwrought; materials for the fishing trade (yarn, thread and rope); cereals; coffee; sugar; tobacco; and clothes are the chief goods imported. Great Britain is at the moment the largest source of supply, being responsible for about 70 per cent of all imports. Before the war, 30 per cent of the imported goods came from Britain, while 23 per cent were supplied by Denmark, 13 per cent by Germany and 12 per cent by Norway. The export trade is mostly directed to Britain and also to the United States, the latter trade having been encouraged by a grant from the American Export-Import Bank in March, 1940. Portugal and Spain are also customers for cod-liver oil and wool. Formerly, in order to regulate the disparity between imports and the comparatively small exports, strict import regulations were adopted, thus saving foreign currency. The country's stock of imported goods diminished, however, and it became increasingly difficult to cut down imports. Now the situation is changed, and the Icelandic Government would like to purchase more commodities from Great Britain than the latter is willing to sell during the war. It is hoped in Iceland that an agreement will be reached, so that necessary goods, such as coal and cereals, can be obtained. Since the whole population of the island is only 121,000, which equals the population of a middle-sized town, their needs are not excessive. The Icelanders feel that they make certain sacrifices in this war and that their modest wishes should be considered.

Need for Imports

It must not be forgotten that Iceland has no coal, and though the area of the country is 10,285,000 hectares only 40,000 of these are cultivated land. Some 200,000 hectares are natural meadows, 60,000 are forest land (mostly brushwood), and about 3,500,000 are grazing grounds, mostly unfit for any kind of cultivation of all. The average potato crop yields only about two-thirds of the quantity required. The country therefore depends to a large extent on its food imports. The present Government (a coalition composed of the Independence Party with 17, the Progressive Party with 18 and the Labour Party with 7 members in the Althing) hopes to extend and improve farming and to lessen in that way the country's dependence on imported foodstuffs.

Iceland is, however, also experiencing some disadvantages from the occupation. The labour shortage has become acute, as workers from all over the country rushed to the towns to find well-paid employment by the occupying forces. The population of Reykjavik (40,000) has increased by 10 per cent during the last few months, and it is almost impossible to find accommodation in the overcrowded capital, especially as the building trade has been stopped entirely, except to serve the army of occupation. The lack of labour available for agriculture and factory work is

already felt. The employment index has gone up from 100 (three months before the war) to 155, and wages have not increased in proportion. Iceland has introduced, for security reasons, rationing of bread, sugar and coffee (the main drink). Alcohol is also rationed to two bottles of whisky or gin per month, or eight bottles of light wine—women are granted only half the ration.

In spite of these disadvantages, the pro-British feeling of the Icelanders is obvious. English lectures are overcrowded, and the recent Icelandic mission to this country made it clear that their sympathies are entirely with the Allied cause.

Defence Expenditure in America

[FROM OUR NEW YORK CORRESPONDENT]

July 12th

THE American fiscal year closed on June 30th. The table following is a condensed summary of revenue and expenditure.

REVENUE (\$000,000)		
	1939-1940	1940-1941
Income tax	2,125	3,470
Miscellaneous internal revenue ..	2,345	2,967
Customs	349	392
	4,819	6,829
Other receipts	1,106	1,439
	5,925	8,268
Deduct insurance trust funds ..	538	661
	5,387	7,607

The item listed above as other receipts is mostly social security taxes in 1940, and in 1941 social security taxes and a windfall return of funds from Government agencies.

EXPENDITURE (\$000,000)		
	1939-1940	1940-1941
I. General expenditures	7,177	6,564
II. National Defence	1,559	6,048
III. Revolving funds	54	(returns) - 136
IV. Trust accounts	208	234
	8,998	12,710
Net Deficit	3,611	5,103

The general expenditure includes the following major items:—

	1939-1940	1940-1941
Departmental	810	811
Agricultural Adjustment	1,020	968
Interest on public debt	1,041	1,111
Works Progress Administration ..	1,477	1,285
	4,348	4,175

These items include only about two-thirds of the general expenditures. Such agencies as the Civilian Conservation Corps and the Youth Administration add another half-billion, Social Security about as much, and the Veterans' Administration rather more. The other elements are mostly either under the general category of farm aid or public works.

National Defence Expenditures (\$000,000)		
	1939-1940	1940-1941
War Department	667	3,635
Navy Department	892	2,217
Other items	...	196
	1,559	6,048

Among the "other items" is one listed as Defence Aid (Lend-Lease) at \$21 millions. The net increase in the National Defence item for 1941 over 1940 is given as \$4,489 millions. Since total expenditures were \$3,712 millions greater, it appears that one way and another almost \$800 millions was saved elsewhere. Of this, the largest element was the recapture of \$300 millions from the Federal agencies and \$100 millions from the Federal Land Banks;

the bulk of the remainder came from savings on relief, especially WPA and PWA.

The general outline for the fiscal year 1941-42 is estimated as follows:—

	(\$000,000)	1940-1941 (actual)	1941-1942 (estimated)
Defence		6,050	15,500
Other costs		6,650	6,800
Total		12,700	22,300
Revenue		7,600	12,500
Deficit		5,100	9,800
Debt at year end		48,500	57,500

Such figures for the current fiscal year must be taken as being indicative rather than definitive.

The steady step-up of defence costs is shown in round numbers as follows:—

(\$000,000)			
July, 1940	175	Jan., 1941	570
Aug., "	200	Feb., "	590
Sept., "	220	Mar., "	740
Oct., "	290	Apr., "	760
Nov., "	380	May, "	840
Dec., "	470	June, "	825

At the present time armament expenditures are running at about \$1,000 millions a month, and are expected to reach double that figure during the current fiscal year.

The deficit is not identical with the increase in the public debt. The net deficit for 1941 was \$5,100 millions. The gross public debt on June 20, 1940, was \$43,000 millions; on June 20, 1941, \$49,000 millions, or about \$1,000 millions greater—mostly reflected in an increase in the General Fund Balance.

Full figures of the increase in the debt are not yet available, but very roughly one can say that the debt in the hands of the public rose about \$4,000 millions, of which something more than one-quarter was taken by individuals in U.S. savings bonds and about three-quarters by institutions. The Reporting Member Banks showed an increase of \$2,000 millions; the balance mostly has gone to other banks and to insurance companies. The differential would be accounted for by Government agencies, trust funds and the like. Broadly, about half of the actual deficit was met out of individual savings, whether by direct or indirect investment, and the other half by the credit mechanism.

Greater Bulgaria

[BY A CORRESPONDENT]

July 12th

A MAP of "Greater Bulgaria," distributed throughout the country and recently reproduced in the German Press, shows the frontiers of Bulgaria as including Greek territory as far down as Mount Olympus, extending into Albania, and including most of Central Serbia almost up to Belgrade. In actual fact, Bulgaria is not satisfied with the territories of Thrace, Macedonia and Moravia and the access to the Aegean Sea allotted to her after the dismemberment of Greece and Yugoslavia. Her claims to more of these two countries are, however, opposed to Italian aspirations in this sphere. The Bulgarians are particularly anxious to obtain Salonika and are disappointed that Italian troops there are replacing their own. Actually, Germany apparently intends to make Salonika a German free port on the Aegean. The Bulgarians also fear that the Yugoslav Moslems in the Priep, Bitolj and Ohrid districts, now occupied by them, will be incorporated in Albania. Germany, to appease the conflicting appetites of the various claimants, has emphasised that the military occupation of certain zones in the Balkans, and even the installation of civil administrators, do not yet indicate the final solution. It is, however, stressed that Bulgaria will in future be the largest and most influential Balkan State, "thanks to the ability and maturity of the Bulgarian people and the close friendship with Germany." The Bulgarian Press, in its turn, stresses that the fate of Bulgaria has never before been linked up so closely and inseparably with the German Reich.

A number of people have been arrested for spreading subversive propaganda against the Bulgarian army and officers upon instructions from the U.S.S.R. It is, in fact, in the army that pro-German tendencies have always been

particularly strong, whereas the man in the street is pro-Russian, pro-Russian sympathies being perhaps more pronounced in Bulgaria than in any other Balkan State. It will be remembered that it was Bulgaria with whom the Soviet concluded, only last year, the first comprehensive trade agreement, as an indication of Russia's opposition to Germany's advance in the Balkans.

Meanwhile, Germany has lost no time in establishing closer economic relations with Bulgaria. As far back as 1938-39, 63.4 per cent of Bulgaria's total exports already went to Greater Germany, while 57.8 per cent of Bulgaria's imports came from the Reich, Austria, Bohemia and Moravia. An agreement has now been reached between German and Bulgarian industrialists, aiming at co-operation with various Bulgarian industries. The authorities have been advised to reduce their duties for goods imported from the Reich. The extent to which manufacturing within Bulgaria can be promoted will be investigated. This is obviously part of the programme of industrial decentralisation by the Reich. Chemical industries and Bulgarian manganese and lignite deposits especially are to be investigated with a view to effective development. The realisation of these plans will, however, take time. Since the incorporation of the new territories the transport shortage has, moreover, become marked in Bulgaria.

Above all, Germany is endeavouring to increase the production in Bulgaria of those agricultural products which she needs—soya beans, flax, cotton and tobacco. The area under cotton cultivation has, since the annexation of Greek and Yugoslav territory, increased from 47,000 hectares to 70,000 hectares. According to German plans, Bulgaria is to become the greatest cotton producer in Europe. She has also become the greatest tobacco producer. Whereas Greece produced before the war an average of 55,000 tons annually, Bulgaria's tobacco harvest amounted to only 44,000 tons. It increased last year to 50,000 tons, and will probably yield a total of some 65,000 tons this year.

Land Hunger

There are, however, considerable difficulties owing to the structure of Bulgarian agriculture, which neither German assistance nor the acquisition of new territories is able to solve immediately. More than half of all Bulgarian farms are under 3.5 hectares, and to increase them to only 5 hectares, as is envisaged, requires some 2 million hectares of new agricultural land. The incorporation of Greek and Yugoslav territories may have appeased this land hunger, but it cannot possibly satisfy it. A four-year plan, put into operation early this year, aims at improving this situation, but, an amount of 20,000 to 25,000 million leva, or twice the amount of this year's total budget, would be required to realise this programme of agricultural intensification, in which the Germans take a special interest. These problems constitute, incidentally, a permanent danger from the political point of view. The large village proletariat has been and continues to be a source of social tension and unrest. According to a census taken by the Sofia Institute for Economic Research some time ago, one third of the agricultural labour is not employed at all.

Bulgaria's needs for technical equipment, and particularly for agricultural machinery, have greatly increased since the recent annexations. The country is reported to require some 600,000 ploughs, 370,000 harrows and hundreds of thousands of other agricultural implements to intensify her agricultural production. Whether and when Germany will be able to supply such quantities under present circumstances is very uncertain, and it is feared that the clearing system will once again benefit Germany, as the value of Bulgaria's exports to Germany will soon exceed those of imports from Germany. German Press comments, however, endeavour to console the Bulgarians with the argument that "it is the human ties and not goods or capital that bind these two nations together."

FOR ALL CLASSES OF INSURANCE

THE BUSINESS WORLD

Life Assurance in War

LIFE assurance differs from other forms of insurance in two material respects. First, a life insurance contract carries with it, not a conditional, but an unavoidable, obligation to meet a claim; only the time of payment is left to chance. A life office must, therefore, accumulate funds which, by comparison with the funds required in other branches of insurance, are much bigger in relation to the volume of business transacted. Secondly, while the duration of a life policy normally extends over a period of years, other insurance contracts are usually on a year-to-year basis. A life policy may be for as long a term as an individual life, during which the whole foundation on which the premium structure was built—rate of interest, rate of mortality, cost of conducting business—may not only change, but undergo a whole series of changes. Provided the policyholder is able to maintain his premium payments, or there is sufficient margin in the surrender value to cover these obligations, the life office is bound to the contract. By contrast, if, in other branches of insurance, the underwriter finds cause to modify his original judgment of the risk, he can, with reasonable notice, increase the premium, restrict the scope of the cover, or even cancel the policy. The special problems of the life offices arise from these characteristics. The accumulated reserves, held against

future liabilities, must be invested, and capital values must be maintained, so that there is no deficiency to be made good when liabilities have to be met. Each office must choose between a "safety first" investment policy, with the risk of depreciation at a minimum but a low return, and a more adventurous course designed to offset any capital losses by a high rate of interest. Between these two extremes there is an infinite variety of gradations of policy. British life offices, very wisely, have preferred safety to adventure, and they are now reaping the fruits of their care and caution. Moreover, the serious fall in the value of investments which was a feature of the last war has this time been avoided by strict Government control of the capital market. In view of the dislocation of trade and the destruction of property, life offices could not escape some measure of depreciation in their assets. But too much significance need not be attached to the test of market values, for actuaries know broadly the limits within which they may be called upon to realise investments in any one year, and a high degree of marketability for the bulk of the portfolio is not essential. In support of this contention, it may be mentioned that property investments are recognised as quite suitable for a proportion of life offices' assets, although concentrated interests in large blocks of flats or offices in the centres of cities are clearly in a less desirable category than first mortgages on well-spread residential property. So far, no office appears to have suffered any serious loss; the United Kingdom Provident, for example, which is interested in real estate to the extent of some £10 millions, puts the proportion of properties partly damaged or wholly destroyed by bombs and fires at between 2 per cent and 3 per cent, and the Clerical, Medical and General, with property investments of about £7½ millions, finds war damage to have been less than 1 per cent of book values.

If the offices have not enjoyed complete freedom from anxiety in watching the status of their old investments, they have at least been spared the major part of the responsibility in deciding on the investment of new funds. As one chairman said in his address to the shareholders, the problem of new investment has "assumed a rare simplicity," for there has been a clear duty to lend to the Government, not only the greater part of premiums, but also the proceeds of maturities and of requisitioned foreign securities. Consequently, the holdings in Government securities of the forty offices listed in the first of the three accompanying tables rose from £288 millions at the end of 1939 to £346 millions a year later, and the proportion of such securities to total assets from 20.8 per cent to 24.4 per cent. The increase of £58 millions in their holdings of Government securities is, in fact, considerably greater than the increase of £36 millions in their total assets.

There remains the group of problems arising from the second characteristic of life assurance, namely variations in the three elements entering into the calculation of the premium. Of these the most vulnerable is probably the rate of interest—certainly this is providing most food for thought at the present time. The rate of interest earned on new, as distinct from past, investments is now between 2½ per cent and 3 per cent gross, so that the net rate after deduction of income tax—even allowing for the concession limiting the rate of tax to 7s. 6d. in the £, against the standard rate of 10s., and for the rebate for expenses—cannot be above 2 per cent. Compared with this figure, the most conservative rate for valuation purposes has been 2½ per cent net and, in the past, business has been accepted which assumed that 3 per cent or more would continue to be earned. While, as the second table shows, the average net rate earned on all investments showed a further slight reduction in 1940, it is in most cases still well above the valuation figure; but unless a reversal of present trends is not long

TABLE I.—LIFE ASSETS OF 40 OFFICES AND HOLDINGS OF BRITISH GOVERNMENT SECURITIES

REFUGE ASSURANCE COMPANY LIMITED

OXFORD ST., MANCHESTER, 1

delayed the point cannot be far distant at which an actual loss, as distinct from a diminished profit, will become manifest under this head.

Mortality, the next important factor in the equation, affects the situation in marked degree because, for policies issued before the outbreak of hostilities, the offices based their premiums on tables which made no allowance for the war risk, yet did not exclude this hazard from the policy cover; certain industrial policies are the exception, but even here claims are being met as if the exclusion did not appear. Some of the chairmen, in their annual reviews, gave information concerning the cost of this concession; the figures quoted in the third table show that, for the offices in question, the cost of war deaths amounted to £1,408,000, against normal death payments of £13,106,000. How much of this is "strain"—the excess of claims met over reserves carried—cannot be estimated, but the proportion may well be high, since the young lives, on which the reserves carried are small, will be chiefly affected; one office mentions that the "strain" arising from war deaths costing £40,000 is £30,000—a high ratio. A remarkable feature is that most offices were able to declare that, notwithstanding war deaths, mortality has been within expectation; it seems, therefore, that, as with the interest rate, it has in general been a question of diminished profit rather than actual loss, although it would be rash to assume that this will continue. In the realm of expenses a downward tendency, mainly attributable to reduced new business, has been the rule during the past two years, but this may well be reversed if the present upward movement in prices is not arrested.

In view of the uncertainty of these factors, the stress commonly laid on new business figures seems misplaced. With all the elements in the premium calculation in a state of flux, life offices might have been disposed to adopt a wait-and-see attitude pending the clarification of the situation. In fact, such falling away in new business as has been experienced—for ordinary life business, 20 per cent in 1939 and a further 32 per cent in 1940—is due almost entirely to influences beyond the control of the offices. Contenting themselves with increasing premiums—but certainly not to the extent justified by the present return on new invest-

ments—and excluding the war risk, except against additional premium, a policy subsequently abandoned by some offices, new business has been freely accepted; moreover, in recent months, efforts have been made to attract a share of "patriotic" saving accruing from Lord Kindersley's campaign by offering endowment policies, for a term of fourteen or fifteen years, under which the sum insured is payable in savings bonds in lieu of cash. Some of the influences mainly responsible for the fall in new business have been the reduction in sales staffs, absorption of potential *clientèle* into the armed forces, financial stringency resulting from increased taxation; it may be remarked in parenthesis that the recession has been considerably less marked in the case of the industrial offices than the ordinary offices, an indication of an improvement in the position of the working-classes.

If it were asked how it is that life assurance finds itself able to go full steam ahead in conditions of such poor visibility, the answer must lie in the immense strength of the offices' resources and in the confidence engendered during a long history by successful negotiations of many similar patches of bad weather. But as an important contributory factor must be cited the profit-sharing system, a system singularly well adapted to a business in which contracts are made for long periods of years, while the underlying conditions are subject to fundamental and far-reaching changes. Without this system actuaries would need to be far more cautious in their forecasts of future trends. It has served the public well, for during the twenty years of peace between this war and the last, handsome bonuses were paid on participating contracts, the share of the profits taken by shareholders being relatively modest. Now the "shock-absorber" function of the bonus system has come into play and participating policyholders are passing through a lean period. This is as it should be; in those offices, however, where the participating and non-participating funds are merged, and in consequence with-profit policyholders are not only affected by lower profits in their own group but must also absorb a share of any losses on without-profits contracts, these equity holders are entitled to ask that their interests are considered in framing the attitude towards new non-participating insurances.

Efficiency in Production

WHILE the recent debates on production in the House of Commons have left an impression of solid and, indeed, striking achievement, they did not remove the feeling that the war effort on the home front is still not entirely commensurate with the country's resources or with the dangers which have still to be confronted. The Prime Minister's account of the increase in war output since the collapse of France was impressive; but it did not prove, or even claim, that it was the best that could have been achieved in the circumstances. The critics, on the other hand, have tended to confuse the issue. It is impossible, with the scant evidence at the disposal of the public, to measure the extent of any deficiency that there may be in the rate of total output, or, which would be more significant, in the quality of the individual implements of war and the proportions in which the different weapons are being produced. This is *terra incognita*.

Nevertheless, it is possible, on the basis of known facts, to apply three general tests. First, it may be asked whether Great Britain has yet engaged in war production all the resources at its disposal, that is, all except the resources that are essential for the provision of the bare needs of the community. The answer to this question is hardly in dispute. Nobody would suggest that all the able-bodied men and women of Great Britain are at war stations; nobody would claim that the use of materials for civilian purposes has been cut to the bone, that all waste has been eliminated or that there is no further plant and machinery that can be turned over to war purposes. These may be counsels of perfection. But so long as these points can be made, there can be no doubt that war output has not yet reached its maximum, and there can be no grounds for any restraint upon constructive criticism.

Secondly, it may be asked, since there is still this margin of untapped resources, whether the rate of their transfer to war production is as rapid as it could be made. Compared with the first two years of the last war, the rate of the transfer of men, materials, plant and machinery to the production of the goods of war has certainly been speedier this time. It is perhaps worth while to quote the conclusions of a recent comparison of the German and British war efforts made on behalf of the Royal Institute of International Affairs:—

Germany had already attained by 1933-34 the degree of conversion to a war basis which this country had achieved by 1938. By 1938, Germany had reduced civilian consumption to the level relative to national income which was not attained here until the third quarter of 1940, but, by using up our foreign assets and our domestic stocks of materials, we managed by then to give the Government control of goods and services to a higher value (relative to our national income) than had been possible in Germany in 1939. In the last quarter of 1940, again largely by virtue of disinvestment at home and abroad, the Government secured probably as much, in proportion to the national income, as did the German Government at the same time. The proportion which Government purchases of goods and services formed of our national income increased as much between the first and last quarters of 1940—i.e., in about nine months—as did the corresponding proportion for Germany in the two years 1938-40. In view of this far greater rate of mobilisation of resources, it is perhaps not surprising that the mobilisation in our case had to be carried out largely by selling existing foreign assets and using existing stocks of commodities rather than by the far more difficult but ultimately necessary method of adapting the whole machinery of production.

There is of course no finality about this sort of comparison, which is based upon a number of factors which are extraordinarily hard to measure. But, in all probability, it is true that the rate of economic mobilisation at least since Dunkirk has been very high. The point is that the "far more difficult, but ultimately necessary" task of "adapting the whole machinery of production" is now at hand.

As Mr Churchill pointed out in the House of Commons on July 29th, the Ministry of Supply has one-third more people working in its factories than during the Dunkirk period and its output has risen by an equal proportion. But it is none the less true that the actual, physical change-over of the apparatus of production from peace to war work is still not as rapid as it will have to be. For example, it is probable that the training of labour for war work has been far too slow in relation to the actual or prospective increase in the supply of plant and machinery and to the actual or prospective supply of raw materials. It is true that it has been necessary to wait for the building of new factories for

the employment of fresh labour in them; and the supply of imported materials has not been unlimited, easy or really uniform. But there has been—and still is—a shortage of labour for particular tasks, a deficiency which might at least have been minimised by greater foresight and more planning ahead in training; and a number of the justifiable complaints which are heard, especially in aircraft work, about the poor quality of their recruited labour might have been less justifiable if efforts had been made on a wider scale to prepare the new industrial army. Some factories might perhaps have been constructed more quickly and other existing factories, with their workers *in situ*, might have been turned over to war work sooner. It is certain that the process of concentrating the output of consumption goods is taking longer than was originally envisaged by Mr Oliver Lyttelton, and control over the movement of private industry was only instituted towards the end of last month. The committee set up to advise on the concentration of the distributive trades—still the largest reservoir of available labour—has only recently started its deliberations. The use of shipping space and of raw materials for civilian purposes has been very drastically curtailed since June, 1940, but even so, the rate of diversion might have been still faster. Tanker shipping space, for example, which might perhaps be used for the import of edible oils, or left to nourish the American war effort, is still carrying petrol to Britain for otiose uses.

Thirdly, it may be asked whether the labour, materials and plant actually available for the war effort are being used as efficiently as possible. This test is more difficult to apply than the first two without full knowledge of the facts, full appreciation of the technical problems involved and of the difficulties created by air-raids, the black-out, the dilution of labour, the dispersion of factories, the reduction of food supplies, and in the absence of definite and measurable standards of efficiency for each type of work and for each of the multitude of factories that have been enlisted in the war effort. But, at the moment, and in the light of the many detailed criticisms which have been given publicity, this is probably the most important question of all; and for the purposes of this brief analysis the problem of efficiency may be examined under two heads: the intensity of work and the technique of production.

According to the text-books, the full and efficient utilisation of machinery and labour depend on the organisation of production as a continuous flow. Orders must be placed well ahead. The tooling of the factories, the intake of labour and raw materials and the rate of production of the component parts of any mechanism must be carefully planned in order to secure balance and efficiency in output. In times of peace, it may be possible for individual factories to follow the text-books, though even then the ups and downs of demand in the markets upset the industrialists' calculations. In times of war, though demand is concentrated in the hands of a single buyer, the Government, it is often impossible to place standard orders for long periods ahead, to secure an adequate and suitable supply of labour or to ensure the regular delivery of raw materials. During the early months of the war, when the Government rapidly became industry's chief customer and when the much-enlarged staffs of the purchasing departments still had to gain experience in dealing with a multitude of contractors, the efficiency of production inevitably declined by peace-time standards.

A good deal of headway has been made since then and the collaboration between Whitehall and industry is gradually improving. Yet, many experienced industrialists still claim that production is often thrown out of gear and held up by faulty ordering. In particular, the lack of continuity of orders is frequently cited as the main cause of loss of output by individual concerns. In some cases, this lack of continuity can be explained by changes in technique or policy, or even by indecision about the precise types wanted on the part of the fighting Services. But in a number of instances it still appears to be due simply to the lack of appreciation of the processes of production by the Supply Departments. The difficulty of supplying individual concerns with the kind and size of orders which will enable them to employ continuously all their labour and machinery is another problem of the same order; and its consequence is idle plant and labour. The solution for idle plant, which is being worked out, is the "capacity exchange," a clearing house which is designed to enable individual manufacturers who have machinery to spare for given periods to let them out, often

on the spot, to others who may be in need of them. What can be done in this respect has been demonstrated by the London and South-Eastern Area Board which has set up 10 exchanges dealing with something like 15,000 firms owning machinery in its area. The solution for idle labour is bound up with this development. Lack of continuity in orders, by causing temporary stoppages of machinery, also involves unemployment among the staffs of individual firms. And, in view of the general shortage of skilled and experienced labour, many concerns are just as reluctant to put off labour as they are to sell machinery for which they hope to find work after an interval. In any case, the Essential Work Order prohibits the dismissal of labour except with the permission of the Ministry of Labour. The augmented use of capacity exchanges will mitigate this problem of temporary unemployment, but it remains imperative that firms should be encouraged to "lend" their temporarily unemployed workpeople to other concerns in the vicinity, thus increasing the number of "man-hours" worked on munition and ancillary contracts.

These are organisational matters. There appears also to be scope for further improvement in the technique of production. Much has been done in the past year to adapt designs to the need for economy in labour, materials and machinery, and to standardise specifications. But concessions in design—the permission to modify specifications—are probably still not being passed on quickly enough to all the producers of supplies and equipment concerned. And it is certain that not enough has yet been done to correct the naturally uneven distribution of efficient managements between different un-

dertakings by the interchange of experts and the pooling of technical knowledge or to establish still closer collaboration in technical matters between workpeople and managements. For example, it frequently happens that an efficiently managed concern discovers a new method of producing a mechanism which saves labour, materials—and machinery. In present conditions, the knowledge, unfortunately, is not always passed on to concerns producing the same type of equipment. A solution to this problem has been found in the adoption of a system, by which the concerns producing a certain mechanism have formed themselves into a group under a leader and readily exchange technical information, besides arranging for the common purchase of raw materials in order to avoid shortages at any one of the factories concerned.

Despite the difficulty of applying these tests of efficiency and especially the third, there is more than a presumption that the resources actually engaged in the war effort are not being utilised as efficiently as they might be. It would, perhaps, be surprising if they were.

Notwithstanding the remarkable results which have been achieved in the face of many difficulties, production, in fact, is not as high as it might be. Every test reveals deficiencies which can be remedied: there are still additional resources to be tapped; these resources could be enlisted into the war effort with greater speed; and the resources and knowledge in use must be employed more efficiently. These are the "ragged edges" which must be clipped and darned if the endeavours and the willingness of the British people are to match, in results, their ability and their need.

Finance and Banking

Treasury Deposits Again

The temporary tightness in the Treasury ways and means position reflected in last week's resort to borrowing from the Bank of England has been remedied this week, partly by the exceptionally heavy inflow of revenue, partly by the resumption of Treasury deposit borrowing. Though there were no maturities of such deposits this week, £15,000,000 of fresh money was borrowed on these terms, £14,500,000 from the clearing and Scottish banks and the balance of £500,000 from an Empire central bank. Judging by the latest Bank return, the Treasury has found it possible to start repaying ways and means advances from the Bank, the item of Government securities showing a decrease of £2,655,000. At the same time, public deposits have risen by £6,620,000. The counterpart of these movements and of a further increase of £8,591,000 in the note circulation is in the main reflected in a reduction of £23,231,000 in bankers' deposits. But since this contraction in bank cash started from the exceptionally high level of £132,081,000, it has left the credit position thoroughly comfortable. The banks have been keen buyers of bills this week, and there has been a more than adequate supply of funds to meet the requirements of the market. The market obtained the somewhat better allotment of 27 per cent at last week's tender for Treasury bills, but has found no difficulty in disposing of the increased supply of bills thus made available. Now that sterling area funds are being increasingly invested, not only in Treasury deposits but in Treasury bills issued through the tap, the market syndicate hopes that it may fare rather better at the weekly tenders than in recent months.

The Far Eastern Exchange Loopholes

The application of the Treasury freezing order to Chinese assets, and in particular to those of the Shanghai International Settlement, has brought to a head the multitudinous problems which had hitherto prevented the conclusion of a payments agreement with China. Under the compulsion of this order, these problems are slowly sorting themselves out. Genuine Chinese interests are being safeguarded by granting the greatest freedom of operation to the official Chungking Government accounts, and for this purpose the machinery of the old Stabilisation Fund operated from Hongkong is proving extremely useful. The claims of Shanghai as a great international commercial and financial centre have unfortunately had to be trodden on very roughly, and reports from that centre suggest that for the time being

business is at a standstill, immobilised not merely by the freezing order, but also by the export ban imposed by the local Japanese controlled customs authorities. The free exchange market in Shanghai has thus disappeared, since it was fed mainly on the American dollar and sterling currencies in which the Shanghai banks can no longer operate freely. It has thus required this upheaval to stop what has undoubtedly been the main loophole through the system of sterling exchange control. Ever since the institution of that control, and in particular since the disappearance of the free sterling market in New York, sterling has been quoted in Shanghai at an appreciable discount on the dollar rate. In recent months, the cross dollar rate in Shanghai has been around \$3.60. Even if Shanghai quotations for sterling and the American dollar survive the freezing orders, they will be largely nominal, and the opportunities which the Shanghai market will provide for uncontrolled and undesirable exchange operations will be negligible.

Hongkong in Sterling Area

One of the important incidental effects of the British Treasury's freezing order on Chinese assets has been to bring the colony of Hongkong within the sterling area. This does not imply that the Hongkong dollar is for the first time definitely linked with sterling. The link was forged in the closing months of 1935 with the demonetisation of silver in China. The admission of the Colony within the sterling area means that the Defence Regulations defining the control of the exchange market henceforth apply to the Colony with the full rigour with which they operate in other parts of the Empire. Until last week Hongkong, in common with Canada, remained outside the area of sterling exchange control, and from the point of view of that control its currency had been treated as a foreign currency, resident holdings of which had to be sold to the Treasury. The exclusion of Hongkong from the strictest application of the control scheme was largely due to the exceptional position of this Colony as a British outpost in the Chinese Republic (to which, of course, the control could not be applied), living almost exclusively on entrepôt trade between the Chinese mainland and the rest of the world and tied by the closest financial links with the great free market of Shanghai. To have attempted, in these circumstances, to apply to Hongkong the full severity of sterling exchange control, would have been to cut the ground beneath the bulk of the Colony's trade, and on the other hand would have done little to stop this gap in the Empire's exchange control scheme,

since most of the commercial and financial activity thus stopped would have automatically been transferred to the Shanghai market. But with Shanghai brought within the scope of the freezing order, much of the reason for the exclusion of Hongkong from the sterling area disappeared. The main effect of the new order is to compel all residents in Hongkong to make a return of their foreign exchange assets to the authorities, a step which previously was incumbent only on residents of British nationality. Foreign exchange business has been restricted to eleven authorised banks which include the principal British, American, Dutch and Chinese institutions.

Thai Credit in Japan

The first significant indications of Thailand's financial submission to Japanese pressure is afforded by the news that a Thai banking syndicate had granted the Japanese, through the Yokohama Specie Bank, a credit of 10,000,000 bahts (baht and tical are synonymous terms for the Thai monetary unit which is quoted in London at 1s. 10½d.). The baht, originally a full weight silver coin, was given a specific gold content in 1928 providing an exchange rate of 11 bahts to the pound. It left gold soon after sterling and has remained quoted in London at around a nominal parity of 1s. 10d. Most of the trade of the country has been financed in terms of sterling, and the recent freezing order applied against Japan immobilised the normal machinery for the financing of trade between Thailand and Japan. The credit is thus an immediate response to the freezing orders. It is no doubt being granted in large measure by the Thai Commercial Bank, a Government controlled institution which is the only domestic bank of any importance. The implications of the grant of this credit are self-evident. The Thai authorities have taken the initiative in circumventing the effect of the Anglo-American freezing orders on their trade with Japan. Moreover, they have set in motion operations which must tend to link the baht with the Japanese yen.

Dollar Loan Payment

Reports from Washington announce the first disbursement of \$100,000,000 on the \$425,000,000 Reconstruction Finance Corporation loan granted to the British Government. This first instalment was paid against the deposit with the Federal Reserve Bank of New York of collateral consisting of securities listed on the New York Stock Exchange having an approximate market value of \$145,000,000. The balance of the loan will be available to the British Treasury as needed to meet accruing commitments, which is expected to be at the rate of about \$100,000,000 a month. The British Treasury for its part is mobilising the collateral needed for future instalments. It has this week made an Order specifying certain dollar securities held by residents in the United Kingdom which are being borrowed from the owners for use as part of the collateral for the RFC loan. Some 20 securities are included. They will be released when no

longer required by the Treasury, which nevertheless has power to dispose of them as though they had been vested in the normal way.

European Assets in the United States

The American Treasury Order freezing Continental European assets is apparently being operated with great severity. The exemptions granted to neutral States such as Sweden, Switzerland and Spain apply only to the assets of the Government and central banks concerned. Nationals of those countries do not benefit by the exemptions granted by the American Treasury and must receive specific permission for every operation involving disposal of their American dollar assets. The severity of the order is enhanced by the exceptionally wide definition which has been given to the term "national." It includes any person or corporate body domiciled in or a subject of the foreign countries concerned. It thus includes, for example, a Swiss residing in the United States or an American citizen residing in Switzerland. The definition is widened to include any corporate body which is either controlled by a foreign country or in which a substantial part of the capital is owned directly or indirectly by such foreign countries. The net is cast further still to include any person acting directly or indirectly for the benefit or on behalf of any nationals of such foreign countries. There is consequently no transaction with the slightest taint of Axis instigation that could not be held up under the Order.

Marine or War Risk?

On August 5th, the Court of Appeal reversed the High Court's judgment delivered by the Lord Chief Justice on July 4th in the case of the Yorkshire Dale Steamship Company, Ltd., *versus* the Minister of War Transport, raising the question of whether a casualty at sea is for insurance purposes a war risk or an ordinary marine peril. The circumstances of the case were reported in the issue of *The Economist* of July 12th. Briefly, a steamer, the *Coxwold*, was requisitioned by the Ministry on the terms of a charter-party under which the charterer took the war risk and the owners the marine risk, and at about 2.45 a.m. on May 17, 1940, she stranded on the Isle of Skye when in convoy from Greenock to Narvik. The Court of Appeal has allowed the Minister's appeal from the decision of the Lord Chief Justice, which affirmed the arbitrator's award holding that the loss was by a war peril. Lord Justice Scott, in his judgment, said that although the *Coxwold* was engaged in a warlike operation, because she was carrying a war cargo for war purposes, yet the contents of her cargo had nothing to do with the unknown and unexpected set of the tide which drove her on to the rock; that the war character of the vessel's adventure was no more than an irrelevant circumstance; and that there was no chain of causation, much less a direct link, between that character and the stranding. The judge indicated that leave to appeal to the House of Lords would be granted.

Investment

Buying for Income

It is always difficult to distinguish between "emotional" and "rational" motives in any well-marked Stock Exchange movement. How far the rise in ordinary share values during the last three or four weeks has been due to optimistic prognostications about the outcome of the war, and how far to a conscious search for a higher income than the 2½ per cent to 3 per cent obtainable on gilt-edged stocks, few dealers would be prepared to say. Certainly, many institutional investors are finding that the factor of increased "weighting" of their average rate of income by purchases of new gilt-edged stocks is presenting formidable problems whenever long-term engagements, contracted on a higher-interest basis, are involved. Banks are relatively fortunate, since the alternative to the gilt-edged rate, in their case, may be, say, Treasury deposit receipts giving 1½ per cent and not merely advances to customers at around 4½ per cent. But life insurance offices, which issued policies in the past based on a higher net rate than anything obtainable to-day, and investment trusts, with debenture and preference shares outstanding on a 4 per cent and 5 per cent

basis, cannot live on patriotism alone. Actually, for some time past, the gap between gilt-edged and industrial yields, which was unduly wide a few months ago, has been steadily closing. A month before the outbreak of war, the yield on 2½ per cent Consols was 3.78 per cent and that on Industrial shares (according to the *Actuaries' Index*) 5.64 per cent, the margin thus being 1.86 per cent. On the eve of Hitler's attack on Denmark and Norway, the respective figures were 3.37 and 5.98, the margin having thus widened to 2.61. Two months later, when Western Europe had fallen before the German onslaught, the margin was as much as 5.48, with the Consols' yield fairly steady at 3.53, while the industrial share yield had risen to the fantastic average of 9.01. Even by the end of last year, the gap had tended to close appreciably, but at 3.21 it was well above anything which would have been considered even approximately normal in peacetime, and at the end-June last it had narrowed only to 2.91. At the end of last month, however, it was no more than 2.43, which is less than at any time since the war became real and earnest. The gilt-edged rate, throughout, has been fairly steady, with a slightly

THE STOCK EXCHANGES

London

Note: All dealings are for cash.

WITH continued Russian resistance and Far Eastern uncertainty in the background, the search for adequate yields continues. Interest was concentrated on equities until Wednesday, and scarcity of stock led to a steady upward price movement which spread through all sections of the market. The gilt edged market opened quiet, but a strong improvement took place in mid-week. The renewed interest in gilt edged issues was due mainly to persistent rumours of a new issue of National War Bonds on less favourable terms than the present.

The gilt edged market was quiet before the week-end, but absence of sellers resulted in prices remaining unchanged, except for 2½ per cent Conversion which lost ½. At the opening on Tuesday, Conversion 3½ per cent Funding, 4 per cent and 2½ per cent all added ½, and 3½ per cent War Loan ½, but business remained slight. Indian issues were weak, the 2½ and 3 per cent loans losing ½ and the 3½ per cent down ½, but later recovered. In mid-week 3½ per cent War Loan gained ½ in brisk trading.

The foreign bond market closed strongly before the holiday, the main feature being the improvement in European issues, while Chilean bonds were also prominent. Week-end developments led to renewed weakness in Japanese issues, the 5½ per cent stock, 1930, losing 3 points and the 6 per cent, 1924, 2½ points on Tuesday, while S. Manchurian and Siamese 4½ per cent fell back a point each. European issues, however, continued in demand, with Turkish 4 per cent and 3½ per cent and Polish 4½ per cent bonds all rising 3 points.

The home rail market closed on a firm note on Friday last, with LNER senior issues finding support, while Southern preferred rose 1½ and deferred ½. On Tuesday, LMS ordinary repeated Friday's rise of ½, GWR and Southern deferred ordinary both adding ½, while "Berwick" 4 per cent 1st preference rose 1 point. Elsewhere, Canadian Pacific ordinary added ½ and the preference issue ¼. South American issues were rather weak before the holiday, but subsequently there was considerable improvement.

The feature of the week has been the wide range of price increases in the industrial market. Brewery issues were prominent. Ind Coope added a further 1s. on Monday, while Courage and Guinness gained 2s. the next day and Charrington 1s. Iron and steel issues were strong, Swan and Hunter gaining 1s. 6d. before the week-end and Richard Thomas preference 2s. 9d. on the dividend announcement. William Cory was steadily in demand. Textiles improved slightly, and shipping shares were a good feature, Union Castle adding 1s. before the week-end and in the current week there were small gains for P. & O. Defd. and Furness Withy. Among motor issues, Morris and Ford rose 1s. on Friday and Leyland ½. In the current week, Raleigh Cycle Holdings fell back against the trend. Stores were a strong feature on Monday, with John Bakers, 1s. 9d., and Harrods, 1s. 6d. up among smaller increases. Tobacco shares also shared in the general improvement, following Friday's gain of

½. Carreras added ½ on Tuesday, while in the miscellaneous section International Nickel, London Brick Birmid Industries and Cable and Wireless were all strong. Hudson's Bay added 2s. 4½d. over the week-end.

Both before and after the holiday, the kaffir market was strong and enjoyed Cape support, Blyvoors being prominent on Tuesday with a rise of 1s. 9d., while gains of ½ were general. Venterspost added 1s. 6d. on Friday, when Johnnies gained ½ and West Wit Areas ½. In the oil market, before the week-end, Burmah, Anglo-Iranian and Lobitos rose ½, while Shell Transport improved ½. On Tuesday, however, there was little business and prices eased. Anglo-Iranian fell ½, and Lobitos ½. The rubber market finished quietly firm before the week-end and business this week remained at a low level, with prices mainly unchanged.

New York

THE prospects of higher taxation and possible price control continued to overshadow business on Wall Street both before and after the week-end. Throughout the past week, price movements have been narrow and trading generally slack with a tendency for fractional losses to predominate. In mid-week caution was still the dominant market sentiment and prices fell back moderately under the leadership of rail and aircraft issues.

B. Laporte Limited.—An offer has been made for 20,350 £1 ordinary shares which are part of the unissued capital. The shares would rank *pari passu* with the existing 304,650 shares as from April 1, 1941. A price of 55s. 6d. per share has been offered, which the directors propose to accept, subject to the assent of existing shareholders at a meeting on August 21st to consider the proposal.

Electrolux Corp. of America.—Net profit for 3 months ended June 30th \$460,506 (\$376,136), after taxation \$697,106 (\$612,246). Net profit after tax for 6 months \$893,422 (\$897,560) equal to 72 cents (72c.) per common share.

Bethlehem Steel Corp.—Net inc. for 2nd quarter \$5,651,000 (\$10,807,000); div. of \$1.50 (\$1.25) per common share (no par value), makes year's dividend to date \$4.50 (\$3.50).

Shorter Comments

Canadian Pacific Railway.—Net earnings June, 1941, \$4,068,000 (\$2,923,000), aggregate gross earnings January 1st to June 30th, \$99,840,000 (\$75,385,000), net earnings \$19,919,000 (\$12,636,000).

Electrolux Corp. of America.—Net profit for 3 months ended June 30th \$460,506 (\$376,136), after taxation \$697,106 (\$612,246). Net profit after tax for 6 months \$893,422 (\$897,560) equal to 72 cents (72c.) per common share.

Bethlehem Steel Corp.—Net inc. for 2nd quarter \$5,651,000 (\$10,807,000); div. of \$1.50 (\$1.25) per common share (no par value), makes year's dividend to date \$4.50 (\$3.50).

Industry and Trade

Committee on Retail Trade

On May 13th Mr Oliver Lyttelton appointed a committee to "examine the present problems of retail trade in goods, other than food, having regard both to the immediate needs of the conduct of the war and to the position after the war and to report." Owing to the many problems involved in the adaptation of the retail trade to war conditions, the decision to appoint a committee was probably sound, though the exclusion from its terms of reference of food shop is difficult to understand. After preliminary consideration, the committee, under the chairmanship of Mr Craig Henderson, K.C., reached the conclusion that there are four main facts which must be faced squarely:—

- The reduction in the volume of new goods available for sale, estimated at about 50 per cent. The full effect of this reduction has not yet been felt owing to the existence of a "cushion" of accumulated stocks, now rapidly shrinking.
- The need for keeping the price level as stable as possible. The Government has recently taken powers in the Goods and Services (Price Control) Bill to exercise a much more drastic control of prices.
- The policy of the Government not to pay compensation for loss of business.
- The diversion of large numbers of workers from retail distribution to the armed forces and to the war industries.

In view of the need for securing the goodwill and collaboration of traders in facing these problems, the committee has decided, before going any further, to ascertain the views of trade associations and other bodies representative of the industry, by means of a questionnaire. The committee holds the view that schemes designed to adapt the retail trade to present conditions may, "almost of necessity, involve the withdrawal, at least temporarily, of a proportion of the existing traders" and "would have to include provision for compensation to those traders who withdraw voluntarily from business." In view of the Government's policy not to provide compensation from the Exchequer, the committee reached the conclusion that it should be possible for compensation to be paid by those who remain in business, "as they would, under the scheme, enjoy an increased share of the available commodities without increase in their overhead standing charges." In principle, this solution of the problem is probably sound—since the alternative of Government compensation is in any case ruled out—but everything will depend on its application in practice.

Waste of Lubricating Oil

A recent statement by Mr Soubry of the Standard Oil Co., to the effect that Great Britain had lost about one-half of her ocean-going tanker tonnage emphasises the need for using every conceivable method for reducing the total quantity of oil to be shipped across the Atlantic. Hitherto the recovery of waste lubricating oil does not appear to have received the attention which it deserves. Though recent statistics are not available, it may be assumed that the total consumption of lubricating oil is somewhere in the region of 600,000 tons per annum. The amount of this which may be recovered as waste oil is difficult to estimate, as at no time in the past has waste oil been efficiently collected, but about a quarter of the consumption might reasonably be expected to be re-used if a national scheme of salvage were adopted. The most difficult problem is the collection of a very large number of small consignments of waste oil. Certain of the large users, such as the motor transport companies and Government services, already possess systems of collection, and in many cases are either themselves working recovery plants or have made arrangements with independent contractors for the treatment of the oil. A certain quantity of lubricating oil is also being recovered by private contractors, and the amount of plant designed specifically for this purpose is increasing very rapidly, so that, apart from any official action, increased oil recovery may be expected within the next year. In contrast to petrol, lubricating oil is not consumed, but the collection of impurities within the oil, particularly carbon, gritty matter and asphaltic matter, produced by the action of air on the oil, and petrol and water, resulting from condensation, make the oil unsuitable for further use until these impurities are removed. Provided suitable

equipment is employed, the impurities present in waste oil are no more difficult to remove, and are somewhat less varied in character, than the impurities present in the crude oil from which the lubricant was originally made, by subjecting the oil to refinery treatment similar to that employed in the original refining of the crude, a finished product is obtainable which is equal in quality to new oil. From the refiners' end, the proposition is simpler than that of making oil from crude, particularly as the quantity of good lubricating oil in waste oil is usually in the region of 85 per cent, whereas the proportion obtainable from crude oil is rarely above 30 per cent. The recovery equipment may be divided into two classes. On the one hand, there is the system specially devised for waste recovery and in which only those refining operations necessary for this class of work are used, and, on the other hand, there is the alternative method of putting the oil through a normal refinery designed for the manufacture of lubricating oil and processing in the manner usually adopted for the treatment of crude oil. These processes may yield equally satisfactory finished products, whilst the former process may to some extent economise by omitting certain stages which are required in normal refineries. The refineries already exist and, if provided with a large enough quantity of oil, they can operate economically on account of their size. While it is impossible to give exact figures, it may not be impossible to save something like 100,000 tons of shipping per annum; some of this saving will be obtained from schemes already afoot, but with the assistance of an officially sponsored campaign it would be considerably increased.

Farm Wages

About two months ago the representatives of the farm workers on the Central Agricultural Wages Board put in a claim for a national minimum wage of 60s a week, a rise of 12s on the present minimum wage. On July 23rd the Board decided to defer the question until November, when, in the opinion of the Appointed Members, the arrangements made as to wages and prices in 1940 will have been worked out in farming costs and returns. With these figures before them in November, they suggested that they would be able to decide what increase in the national minimum wage would be proper and possible. They agreed that some increase may be possible. Their decision, however, has met with strong opposition from the farm workers, and a deputation of the National Union of Agricultural Workers and of the Transport and General Workers Union which met the Minister of Agriculture on July 30th, suggested that if wages were not to be increased forthwith, agricultural workers should be freed from the Restriction on Engagements Order. The Minister reminded the deputation of the reasons given by the Wages Board for their decision, and held out no hope of that decision being reversed or amended. He pointed out, however, that it was open to the Agricultural Wages Committees throughout the country to raise county minimum rates in spite of the decision of the National Wages Board. The deputation was not satisfied with the Minister's reply, and proposes now to approach the Minister of Labour to remove agricultural workers from the scope of the Restriction on Engagements Order.

Tea Quota at 100 Per Cent

For the second time the export quota for the season ending on March, 1942 has been revised. The quota, originally fixed by the International Tea Committee at 90 per cent of the standard tonnages, was raised to 95 per cent on May 26th and to 100 per cent on August 1st, against 92½ per cent for the previous season. This is the first occasion since the inception of the international tea scheme in April, 1933 that the quota has reached 100 per cent. Although reports of a pending increase have been current for some weeks, the actual decision came as a surprise, as it had been semi-officially stated at the middle of July that no change in permissible exports was to be expected and that, in fact, the International Tea Committee was not even contemplating holding a meeting. The new decision may not be unconnected with Japan's latest move in Indo-China and the resulting threat to the chief tea producing countries. Tea is almost exclusively grown in Asia and the only

non-Asiatic production of some promise—that in East Africa—is still in its infancy. Theoretically, a 100 per cent quota should release about 845,000,000 lbs (i.e. 808,428,000 lbs of current season releases and the remainder covering unused export licences carried over from the last season) for export from the three members of the restriction scheme, British India, Ceylon and Dutch East Indies. Another 32,000,000 lbs will come from the East African associate members of the scheme, while outsiders' exports should reach between 100,000,000 and 125,000,000 lbs. A supply of not much less than 1,000,000,000 lbs will be the highest total ever reached and compares with 927,000,000 lbs in each of the last pre-war and first war seasons. Of this quantity, the British Ministry of Food has acquired a total of 503,000,000 lbs under direct agreements with the British and Dutch producing countries. The quantity left for all other consuming areas, therefore, will probably not be much less than 500,000,000 lbs. The countries which still have access to the market consumed only just over 375,000,000 lbs of tea in the last pre-war year. But the demand from a number of countries, with the United States and Australia ranking first, has been very heavy in anticipation of a possible Japanese southward move and has caused a strong rise in tea prices on the Eastern markets. Until recently the International Tea Committee showed no inclination to meet this demand for building up stocks by raising the export quota far beyond the current season's requirements. The latest Japanese move, however, has further intensified the scramble for supplies. It is unlikely, therefore, that market conditions in the producing countries will be altered by the increase in the quota. Neither the British Government nor British consumers, however, will be affected by this scramble, for British supplies are allocated before exports to other countries are released and British buying prices are firmly fixed on a basis arrived at on the average prices for 1936 to 1938, plus certain allowances for war time increases in production costs.

Tin and Rubber Markets

For the past two years prices for tin and rubber have on numerous occasions shown a very strong advance in anticipation of a possible Japanese threat to the chief producing territories in the Far East. As over nine-tenths of the world's rubber and some two-thirds of the world's tin is produced in the Pacific danger area, these reactions appeared not unnatural. With its aggression in Indo-China, Japan has taken virtual possession of the smallest of the Far Eastern tin and rubber producing countries, but at the same time it has taken up a strategical position which can be regarded as a jumping board to any or all of the large Far Eastern rubber and tin producers. Yet, the influence of Japan's southward move on tin and rubber prices has proved slight. In rubber, the total gain of the past fortnight in the London market has not exceeded ½d per lb, raising the price to 1s 1½d, while in New York the net gain amounts to less than one cent, lifting the price to 22.50 cents per lb. In tin, advances to £261 per ton in London and to 55 cents per lb in New York were the first market reaction to the Japanese move, but within less than a week the whole of this gain has been lost, and London prices are back to £256 10s and New York prices to 52.75 cents.

These price movements indicate clearly that both the rubber and tin markets are at present dominated by factors other than the Far Eastern question. In rubber, all imports into the United States and Great Britain, now the only two important buyers, have recently been monopolised in the hands of the respective Governments. These Governments own considerable stocks and control prices, and there is no longer any opportunity for speculators to make use of the present Far Eastern tension. The British tin market is at present influenced by the discontinuation of exports from this country, which is resulting in continuous large offerings by British smelters. As the operations of these smelters are based on Bolivian and Nigerian ore, there is no danger that the British supply position will be directly affected by any Far Eastern development, although, of course, a possible interruption of Far Eastern shipments might induce the British Government to release some tin for the United States' armament programme. Actually, the threat to the Eastern tin industry seems less imminent than it may appear from circulating reports. In Malaya, the industry is well sheltered behind the Singapore defences, and even the Dutch East Indies' tin industry, which is confined to the islands of Banka and Billiton (situated off the east coast of Sumatra), would

only be seriously endangered after a considerable weakening of Singapore. In New York these considerations have had a sobering effect, but, in addition, the United States Office of Production Management has "requested" consumers not to purchase tin for stock until they have used up at least half the reserves accumulated since the middle of 1939. This "request" means a virtual ban on consumers' buying and may well be a step towards the creation of an import monopoly. Meanwhile preparations are being made in Malaya and the Dutch East Indies to export tin and rubber by alternative routes *via* India or Australia if the need arises, while in the United States the recent restrictions on rubber consumption will probably be followed by a similar measure for tin.

Price of Cereals

In order to encourage orderly marketing and storage in stock until next spring, the Ministry of Agriculture has decided to pay a storage charge on millable wheat and on millable and other oats, over and above maximum prices. The following are the prices that will rule during the new cereal season:—

	Millable wheat per cwt.	Milling oats per cwt.	Other oats per cwt.
August, 1941.....			
September.....	14/6	13/9	13/6
October.....			
November.....	14/6	14/	13/9
December.....	14/9	14/3	14/
January, 1942.....	15/	14/6	14/3
February.....	15/3	14/9	14/6
March.....	15/6	15/	14/9
April.....	15/9	15/	14/9
May.....	15/9	15/	14/9
June.....	15/9	15/	14/9
July.....	15/6	14/6	14/6

The price of non-millable wheat will be 13s per cwt throughout the season, but provision is being made which will enable wheat, which can be made millable by treatment, to be sold at the millable wheat price, less a reasonable charge for conditioning. The prices per cwt for other grains will be as follows throughout the season: Rye, 14s 6d; field beans, 14s 6d; feeding barley, 13s 6d; dredge corn, 13s 6d. Seed wheat, oats, and barley, as well as barley sold for malting, will remain free of price control.

The Oil for Germany's War Machine

Germany's campaign in Russia undoubtedly places a heavy strain on her none too plentiful oil resources. While some of the estimates of actual consumption (they range up to the rate of two million tons per month) must be wide of the mark, the quantity required must nevertheless be very considerable. An attempt has been made in the current issue of *Petroleum Press Service* to assess roughly Germany's rate of consumption. On the assumption that the German army operating in Russia consists of 15 armoured divisions, 20 motorised infantry divisions and 150 ordinary infantry divisions, and on the information available concerning their constitution, it is estimated that the number of tanks is approximately 6,300, that of motor vehicles of various kinds, 72,500, and that of motor-cycle combinations, 3,750. The mileage covered per day by each vehicle can only be conjectured, but it has been calculated that the total consumption of these vehicles is at the rate of 104,000 tons per month. An additional 74,000 tons per month is estimated to be needed by the lorries required to supply the fighting forces, put also at 72,500 units. Germany's operational strength in the air is estimated to be 4,000 aircraft, equally divided between two-engine and single-engine units, and their total fuel consumption is given as roughly 60,000 tons per month. An additional 10,000 tons per month is considered to be required by transport services ancillary to the *Luftwaffe*. On this basis, the monthly rate of consumption would be in the neighbourhood of about 250,000 tons, but if allowance is made for other requirements, including those of German naval forces operating in the Baltic, Germany's total oil expenditure in the Russian campaign is probably well over 300,000 tons per month. While these estimates can only be in the nature of very rough approximations, they suggest that, if account is taken of the reduction in Germany's supplies through the bombing of Roumanian oil fields and of Roumanian and German refineries, it may be difficult for the Nazis to stand the strain for any prolonged period.

COMPANY MEETINGS

AMALGAMATED PRESS

VERY SATISFACTORY RESULTS

The annual general meeting of the Amalgamated Press, Limited, was held, on the 6th instant, in London.

Viscount Camrose (the chairman), who presided, said that last year he had said that their problem was entirely one of raw material—namely, paper. While they had not, of course, been able to secure anything approaching their pre-war consumption, they had been able to rely on the allotted ration and were able to take steps to accommodate themselves to that ration. To cite out the supply they had had to resort to extremely stringent measures, such as the reduction in the size of some of their periodicals, the amalgamation of others, and in several cases the suspension of publication for the time being. In addition, they had made many adjustments and economies. The figures presented reflected the result of all those efforts, and the balance-sheet for the year revealed a most satisfactory state of affairs from the shareholders' point of view, allowing always for the critical days in which they were living.

The profit and loss account showed that the profit for the year amounted to £593,555, or almost exactly £90,000 more than for the preceding period. They recommended that £100,000 should be added to the general reserve, bringing that fund up to £1,350,000 and that a dividend of 6 per cent. be declared on the ordinary shares. With the payment on August 23rd next of six months dividend on the preference shares the dividend was brought up to date. They sincerely hoped that they would never have to postpone the payment of any such dividend in future.

ORDINARY DIVIDEND RESTORED

It was a great pleasure to the directors to be able to recommend a distribution on the ordinary shares again. As he had emphasised last year, it was only the abnormal times through which they were then passing and the uncertainty of paper supplies that had compelled them to proceed so cautiously last year in respect of dividends not only on the ordinary shares, but also on the preference shares. They had been very painful decisions, particularly so as they had made sufficient profits to have acted otherwise. Their main care then, as indeed it must always be, was to conserve the assets of the company so as to be strong enough to face any crisis. The balance-sheet now presented showed a much healthier liquid position and justified them in facing the future with confidence.

While the profits for the year must be considered very satisfactory indeed, he thought it only right to say that they had not been helped by any dividends from their two principal subsidiary interests. The Imperial Paper Mills, Limited, in which they held all the ordinary shares and a large proportion of the preference shares, had had an extremely difficult year and had not been able to pay a dividend on its ordinary shares. Equally, too, Kelly's Directories, Limited, had been seriously affected by the war and had had to pass the dividends on both preference and ordinary shares. He could make no prophecy in regard to the former company, as in common with other paper-making companies, it was only working to a small proportion of its normal output. With regard to Kelly's Directories, Limited, the outlook had improved considerably, and next year should show distinctly better results.

RESULTS WELL MAINTAINED

Shareholders would not expect him on the present occasion to enter into any detailed statement concerning their periodicals and other activities. Everything about them must necessarily depend on the progress of the war effort. However, as far as their present financial year had gone—now approaching six months—the results achieved in 1940-41 had been well maintained. It was an extremely risky thing to make any prophecy about the future, and he confined himself to saying that, subject always to the times in which they lived, they had reason to hope that they would do as well this year as last. They would have the advantage this time of the profits of Weldon's, Limited, which was purchased after the close of their last financial period. Weldon's was one of the oldest-established fashion-publishing houses in the country and its journals of practical instruction were in great demand to-day.

The report was unanimously adopted.

BUKIT IJOK (SELANGOR) RUBBER

HIGHER PROFIT

The thirtieth ordinary general meeting of the Bukit Ijok (Selangor) Rubber Company, Limited, was held, on the 1st instant, at 19 Leadenhall Street, London, E.C., Mr H. B. Yuille (chairman of the company) presiding.

The following is the chairman's review of the financial year ended December 31, 1940, circulated with the report and accounts:—

You may remember that for nearly seven months in 1939 we suspended tapping, with the result that the output of rubber during the year only amounted to 169,545 lb. During 1940 the estate was in tapping throughout the whole period and we were able to harvest some 476,000 lb. It is this larger crop, offset to some extent by increased expenditure, which is mainly responsible for our operations showing a higher profit this year, but out of this heavy provision for taxation has to be made.

You will notice that we have transferred the sum of £1,057 from the reserve account to a new account designated "provision for deferred replanting," and I will explain briefly the reason for this alteration. As you may be aware, there is some shortage of labour in the East and also uncertainty as to the position of estate staffs in relation to military service. In these circumstances your directors have decided to hold up the replanting programme. They feel, nevertheless, that it is only prudent to make some provision towards the cost of resuming the programme at some future date.

The recent reports show that the estate is in a satisfactory condition, and the work taken in hand during the year in order to maintain your property included the manuring of almost the whole of the mature area.

It will be observed from the notice convening the general meeting that it is proposed to convert the issued shares of the company into stock. The reason for the change is given in the directors' report, and there is no need for me to go into further details except to remind you that it will only be necessary for the existing share certificates to be sent in to the company if and when a member desires to transfer stock held.

The report and accounts were unanimously adopted.

PATALING RUBBER ESTATES

The twenty-first ordinary general meeting of the Pataling Rubber Estates, Limited, was held, on the 7th instant, in London, Mr H. Eric Miller (the chairman) presiding.

The following is an extract from the chairman's statement which was circulated with the report and accounts:—

Working profits for the year were £121,856, compared with £58,369 in the previous year—more than double; but the former figure is reduced to £65,856 by the provision which has to be made to cover our excess profits tax liability, estimated at £56,000 as against £3,000 for 1939. The increased profit is due to the larger accountable crop, which was nearly 1,270,000 lb. higher than in 1939, and sold for nearly 1½d. per lb. more, while the unit cost was fully ½d. per lb. less as a result of the higher output. The amount before us for disposal to-day is £75,428, and we are asking you to approve the transfer to taxation reserve of £12,000 needed to cover the estimated income tax liability on the profits earned to December last; also the transfer to reserve for cultivation and replacement of £10,000, which will bring that reserve up to £37,182, a useful sum to have in hand to meet present and future rejuvenation commitments; and the transfer to contingencies reserve of £5,000. You will no doubt approve these proposals and our recommendation to pay a final dividend of 7½ per cent., less income tax, making with the interim dividend of 5 per cent. a total of 12½ per cent. for the year (against 12 per cent. for 1939), leaving the carry forward at £25,542.

It may interest you to know that actual results from the experimental area of Kuala Ketil largely planted with Prang Besar material are very satisfactory. The clonal seed areas at six years old yielded at the rate of 900 lb. per acre, and we are told that an outstanding feature of these trees is their rapid bark renewal.

Our 1941 operations should make a good showing, but the incidence of excess profits tax limits your interests in the profits, except that you will, I am sure, share our feeling of satisfaction at being able to make a substantial contribution to the war effort on the successful issue of which all our hopes for the future depend.

The report was unanimously adopted.

OVERSEAS BANK RETURNS

NOTE.—The latest returns of the Bank of Finland appeared in "The Economist" of Dec. 9th, 1939; Norway, of Apr. 13th, 1940; Denmark, of Apr. 27th; Netherlands, of May 11th; Belgium, of May 18th; France, of June 8th; Java, of June 22nd; Latvia, of June 23rd; Estonia, of Oct. 26th; Mellie Iran, of Nov. 23rd; Lithuania, of Nov. 30th; Reichsbank, of Feb. 15th; Egypt, of May 10th; U.S. Federal Reporting Member Banks, of June 7th; International Settlements and Hungary, of July 5th; Australia and Sweden, of July 26th; India, Argentina, Canada, Prague, Switzerland and Turkey, of August 2nd.

The Eastern Fringe

HITLER'S "new order" is generally admitted to be the Nemesis that has overtaken a disordered Europe. While it is obvious that the new system is very much worse even than the anarchy it followed, most people are agreed that there can be no return to the Europe of the twenties and thirties. Hitler's "new order" is a sign and a portent as well as a disaster. People will sacrifice some prosperity for stability; many of the states, when run on the lines of untrammelled sovereignty, were not—and never could be—viable; there is no such thing as "national defence" for a small or an under-industrialised country; and, as a corollary, a large and highly industrialised state will inevitably occupy a predominant position for good or ill. The problem is how to reconcile these realities with the traditional rights and liberties of Europe. The reaction of the nations to the "new order" settles once and for all the query whether Hitler has solved the problem; and, "at sea," the President of the United States and the Prime Minister of this country have squarely faced the need for a solution. They have declared the principles: no territorial changes without the freely expressed wishes of the peoples; the right of the peoples to choose their rulers and the form of their rule; economic collaboration and the enjoyment by all nations, great and small, victor and vanquished, of access to the riches of the earth; and the abandonment of force. It now remains, as stage by stage Nazi tyranny is destroyed, to translate these principles into plans of action.

The solution is most discernible in the west. The nations of the "western fringe" have—with the exception of the Iberian peninsula—the same political traditions, a similar economic framework, world-wide interests and a seafaring tradition. Geographically, they are well-knit and could easily form part of a common defence scheme. The United States, too, is part of the Atlantic world, and could conceivably be interested in some organisation

of their political and economic life. Above all, Britain, as the most powerful industrial nation in this grouping, and thus its power centre, has shown itself capable of combining leadership with respect for national rights.

The problem of Eastern Europe is far more formidable. It seems a long way off to a Britain that made only a very half-hearted attempt to keep its frontiers on the Rhine and treated Czechoslovakia as a distant land "about which we know very little." Democratic statesmanship will continue to depend upon "what Jones will swallow," not only immediately after the war but ten years later, when its terrors are forgotten. Will Jones swallow a frontier on the Vistula, the Bug or the San? The political realist says "No." Certainly, the natural tendency of free countries to apathy in foreign affairs must condition foreign policy; and there are other difficulties—profound differences in social and political structure, enormous geographical obstacles to common defence, different economic orientation. Nevertheless, it was Eastern Europe that finally brought Britain into this war, just as it was South-Eastern Europe that brought it into the last; and it must not be forgotten that three of Britain's specific war aims are already concerned with Eastern Europe: the restoration of Poland, the curbing of German strength, and the encouragement of European—including German—prosperity.

The problem is more formidable in the east than in the west because Russia and not Britain—with or without the United States—is the power centre. Those who are most enamoured with the "inevitability" of Great Power domination see a solution in Russian leadership. But Russia has so far given little evidence that the fate of a state closely associated with her would be anything but absorption—absorption into an ideological framework quite incompatible with Europe's traditional conception of freedom. "Realism" must not be used to gloss over

the fact that the fate of the Baltic States is exactly what Britain is fighting to prevent.

Again, the Russian economy—a centralised planned system of national autarky—is much nearer to *Wehrwirtschaft* than to the type of co-operation between free economies which can perhaps be developed in the west. The difference between Nazi and Soviet planning in trade and production has been the verbal difference between Four Years and Five. Externally, the danger of Russian economic "leadership," unless a radically new economic policy were to be adopted by the Soviets, would be an isolation of Eastern Europe from the markets and resources of the world as effective as their present attachment to German self-sufficiency. The peoples of Eastern Europe have the right to plenty as well as to order; and Russian planning in its present form would leave Eastern Europe, like Germany yesterday and German Europe to-day, in the position of being blockaded by its own policies. Internally, Russian leadership in the agrarian east of Europe would carry with it a programme of collectivisation. It is not that Britain has any interest at all in preserving a system of feudal estates and landless peasantry. But neither can it be British policy to forward enforced collectivisation under autocratic and centralised control. In economics, or in politics, the aim of British policy must be to avoid the facile "either-or" of rival ideologies—and there are working models of a middle way in the land-holding and co-operative farming of Denmark or Croatia before the Teutonic deluge.

The assumption of unlimited Russian leadership is not only incompatible in the long run with Britain's pledges. It is inexpedient now. It throws doubt upon the honesty of British intentions and on the seriousness of Britain's desire to build a better Europe after the war. It raises the question in a number of minds whether, if the issue is between German and Russian domination, the known evil is not preferable. Europe is struggling and hoping, not to exchange tyrannies, but to be free—a fact that was confirmed by the violent reaction in some quarters to the hint of Russian leadership which appeared in the *Times*. The Russians themselves are not so naive. The themes of their propaganda are freedom and self-determination; and at least one broadcast from Moscow has assured the German people that they need have no fear of the bolshevisation of Germany when Hitler goes.

Belief in the "inevitability" of Russian hegemony is a species of inverted Munichism. Isolation is isolation whether Germans or Russians are dominating Eastern Europe, and isolation is a policy which has brought Britain into two major wars, the United States into one and into the toils of another, in the course of thirty years. It is not as though the "either-or" of German or Russian leadership is absolute. From the Baltic to the Balkans runs a separate bloc of Slav peoples, with Turkey to the south and Scandinavia to the north. Can it be established as a common interest of Britain and Russia that this bloc shall be strong, independent and economically prosperous? Britain's interest is obvious and a measure of direct economic contribution in the shape of credits and gifts would bring in ample returns if new, expanding markets

could be set up in Europe's principal distressed area. And Russia? It can at least be said that, while the last two years have thrown the gravest suspicions on Soviet policy, the direction of Soviet diplomacy over the stretch of twenty years from the Civil War to the German Pact is far from discouraging.

After the first phase of diplomatic isolation and "world revolution," Russia made a strong effort to counter Hitlerism by swinging over to the support of collective security and the "popular front." The territorial occupations of the last two years, although they were naked aggression, accompanied by political and economic assimilation, were primarily and cynically strategic in their purpose; and, if they prove anything, it is that Russia greatly gains by having a protective glacis of strong, friendly states. The policy pursued since June 22nd suggests a return to the earlier conception of collective security. The recognition of Czechoslovakia on July 18th, the Russo-Polish Pact of July 30th, and now the reassurances to Ankara that Russia has no designs upon the Straits, respects Turkey's integrity and is prepared to defend it, are signs of a new temper. M. Maisky has voiced his hope of a "firm and solid friendship" between Russia and Poland "when the time comes to build up a new Europe after the war . . . on the principle of the self-determination of nations." More recently, M. Tolstoi spoke to the representatives of the Slav nations gathered together in Moscow in terms of "equal partnership."

The test of Russia's sincerity towards an independent East European bloc will undoubtedly be Finland. Whether Finland would have actively co-operated with Germany if Russia had not first attacked her is certainly open to doubt. Now Finland is officially the enemy of both Russia and Britain. Yet if any state had proved its ability to exist independently as a civilized community and to develop its national economy, it is Finland.

On the ideological front, it should be possible for Britain to urge the Soviets to stabilise their propaganda at least in its popular front form. There is a lie in the heart of a diplomacy which, while professing to accept the integrity, prosperity and independence of its neighbours, is nevertheless engaged upon an underground campaign to sap and split them. The antics of the Communist parties abroad have helped to discredit them. It ought not to be beyond the compass of British diplomacy to urge that support from Moscow should now be withdrawn. Communism will continue, naturally, to be propagated so long as it finds converts. Moscow's fiat can make no difference here. But Britain can fight Communism in Europe—or Nazism or Fascism or any other false gods—by destroying its breeding grounds—poverty, land hunger, unplanned industrialisation, economic nationalism, unemployment. The attitude of those who simply attack the rank and file Communists is as unscientific as those who hope to end malaria by swatting the mosquitos instead of by draining the swamps. The ideological issue is whether Britain can generate a keener faith and create a better system in Europe than any of the totalitarian new orders. If she can, then, neither strategically nor ideologically, has she much to fear.

Social Security

EVEN in wartime propaganda for a better post-war world there is little need to apologise for England. It is a fault in the most-heard and most-read reformers in this country that they seem unable to advocate social improvements without painting the present over-blackly; and it comes a little oddly to hear American journalists putting the seal of their friendly approval upon England's "new" determination to be "democratic" and set society to rights. On Monday next week an important book by Mr Seeborn Rowntree will be published about poverty and progress in York in the last forty years. It will indeed serve as a blue-print for fresh and urgent reforms in the social services; but its first lesson will be the dramatic changes for the better that have taken place in the conditions of the working classes in a single generation.

Twice Mr Rowntree has made a house-to-house social survey of York, one in 1899 and again in 1936. It is almost impossible to make an exact statistical comparison between two single years so far apart. The first was a year of almost full employment in York and the second one of widespread unemployment; and the mode of work and habits of life of the citizens had altered radically between the two dates. But any judgment on the figures must be reserved for a formal review; their precise implication may be debated, but their general meaning not at all. The point that is indisputable is the improvement which such a comparison must show. In 1899, going on for a sixth of the working-class population of York had incomes below a level which left no margin for more than their bare physical needs; in 1936, a year of bad trade, less

than a fourteenth were in this abject state. The real wages of male heads of working-class households, their actual power to buy goods, rose by a third between 1899 and 1936. A quarter of the working-class population in 1936 were living in better houses than the very best working-class houses of 1899; and whereas in the earlier year a tenth of the working-class in York were living with more than two persons to a room, in 1936 the proportion crowded in this way was not one in 25. In 1898-1901 the annual death rate in York was 17.2 per thousand; in 1936-38 it was 11.6 per thousand—and the infant mortality rate had fallen by two-thirds.

York is not unrepresentative. This improvement within a lifetime is solid achievement, and the fact that the standard of living, in real terms, has risen in this period by something approaching a third should be the point of departure for any consideration of the great deal that remains to be done. In 1936 Mr Rowntree adopted a "poverty line" for his survey which was much more generous than the "primary poverty" line he used in 1899—which was bare subsistence level. The line in 1936—43s. 6d. a week for man, wife and three dependent children—allowed sufficient, not only for physical efficiency, but also, within narrow limits, for clothing, heating, lighting, transport, beer, tobacco and recreation. Over a third of the working-class population of York were £1 or more a week above this line, and a seventh were between 10s. and £1 above it. But nearly a third were below it; going on for a fifth had less than 10s. to spare; and one in fifteen was in "primary poverty." These facts personify the measures that have still to be taken to straighten out the front of social advance.

The Causes of Poverty

In a speech a few weeks ago, Mr Rowntree said that he had analysed the causes of the poverty of those who fell below his 1936 line. Three-quarters of it was due to three causes—a third to insufficient wages, between a quarter and two-fifths to unemployment and a seventh to old age; and it is an indication of the part played by social services, which did not exist in 1899, in warding off at least the worst aspects of poverty that four-fifths of the income of the unemployed poor and two-thirds of the income of the aged poor came from unemployment benefit, health benefit, pensions or public assistance. Even when the changed value of money is allowed for, between 25 and 30 times as much money was paid out every week on these services in York in 1936 as was paid out in poor relief there in 1901. It remains a fact, however, that the aid of these payments did not suffice to raise these people above a line which, though much more liberal than the level of "obvious want and squalor" which Mr. Rowntree used in 1899, still unmistakably represents poverty according to the criteria of to-day. It is further true that the largest single class of poor in York in 1936 were neither unemployed nor aged, but simply underpaid; that those who were poor because of insufficient wages received less than a fiftieth of their total incomes in social payments; and that, in all categories of the poor, it was the biggest families with most dependent children who bulked most largely. Over half of the working-class children in York under one year of age are estimated by Mr Rowntree to be in poverty, according to his definition; and nearly half can expect to be in poverty for five years or more.

On Thursday, the Declaration of Principle announced across the Atlantic from Mr Roosevelt and Mr Churchill laid down social security as a first peace aim and the right of all free countries. The strategic and political settlements that will be the subject of the next peace conference may be impossible to define exactly, because the state of the world and the wishes of the peoples after the war are yet untested. But this more domestic peace aim is definite enough—for England at any rate. It is not the war that has made social security necessary or desirable or possible; it is only that the war and its aftermath of reconstruction afford a special chance to take further steps to achieve it. Mr Rowntree's figures

are pre-war figures, but conclusions like his make a practical foundation for war and post-war reforms. When workers fall out of work, through no fault of theirs, they and their families fall into poverty. When they fall ill, are injured or grow old, the same happens. In spite of social insurance and public assistance, which are intended to maintain them in their misfortune, they still find it more than difficult to keep themselves and their families in full health and fitness for any length of time; and their difficulty is in direct proportion to the number of their dependent children.

The Test of Need

To institute a national minimum income per head which would enable every man, woman and child to be maintained above an accepted level of poverty would introduce no radically new principle. It would simply round off a generation of development. The social services are the heirs of the old poor law; insurance against unemployment and sickness were introduced before the last war to eliminate the causes of poverty; and the trade boards which were established to set wages in low-paid industries had a similar purpose. The point is that this attempt to break up and solve the problem of poverty has not yet succeeded. The old poor law lives on in its relic, the local public assistance committee, which still has to fulfil its statutory obligation to relieve destitution. The Assistance Board came into being to fill the gap left when workers were unemployed too long and fell out of insurance benefit. Insurance was a great advance, but it was not enough, and insurance-cum-assistance is not enough. It is not a question of starting again, but of finishing the job; and it is important to appreciate this continuity. The outstanding problems and the data for their solution are equally well known. The basis of insurance against unemployment has been broadened by successive stages until workers with incomes up to £420 a year, as well as agricultural workers, are included; but it is obvious that, as a defence against poverty, it will remain inadequate so long as the unemployment of any appreciable section of the insured tends to last longer than the actuarially determined period of benefit. It is widely understood that health insurance provides neither insurance nor maintenance for dependants; and the need for means to maintain all children is common opinion. More and more, the view is accepted that, whatever the cause of a citizen's poverty, whether it is unemployment, sickness, accident or old age, it should be met by payments to make up his or her income to the level needed to house, clothe and nourish the entire family efficiently.

The trouble is that the "break up" of the poor law has so scattered the administration of the anti-poverty services that this problem of maintenance is never seen as a single problem. The Ministry of Health is responsible for health insurance, public assistance and contributory pensions; the Ministry of Labour for unemployment insurance and, through the Assistance Board, unemployment assistance; the Home Office for workmen's compensation; the Ministry of Pensions for pensions for members of the armed and civil defence forces; and the Customs and Excise department for non-contributory pensions and pensions for blind persons. The public assistance committees of local authorities apply a household means test for allowances; Customs and Excise officials apply a test of personal property and fixed income for pensions; and, for its allowances, the Assistance Board applies a test of personal income, with account of the contributions that might be expected for board and lodging from other members of the household. Whereas the basic needs of men, women and children plainly do not differ appreciably according to the cause of their distress, the payments made for maintenance by these various authorities vary startlingly; they depend in practice, not on actual need, but upon the administrative pigeon-hole into which the applicant may chance to fall.

There is nothing controversial about the remedies for this state of affairs. It is the result, not of deliberate policy, but of historical accident; and it would put no strain on any political faith to "codify" these mainten-

ance services under the control of a single Ministry of Social Security or to administer them, according to a uniform set of principles and a common measure of need, through a single Maintenance (or Assistance) Board. It is true that there are still some people who argue that to remove entirely the "spur of poverty" from economic life by establishing a "national minimum" would fatally enervate the nation's enterprise. But this argument was debated and democratically settled, in principle, long ago. The various agencies that have been described in this article are intended to prevent or cure poverty, and to oppose their reform on this ground is simply to claim, disingenuously, that it is better to have the social services working inefficiently than to make them efficient for their avowed purpose. Nor can there be much patience with an argument which maintains that to set a level below which no family shall fall—say, Mr Rowntree's 43s. 6d. a week for a family of five, adjusted upwards for the rise in prices since 1936—would destroy initiative.

Wartime Urgency

Still less can there be any patience with the easy dictum that wartime is no time for social reforms. In fact, the basic social reforms are forced on by war conditions. It may be true that large-scale revisions, such as the definitive overhaul and extension of health insurance or workmen's compensation, are ruled out by the inescapable preoccupations of total war. But it is also true that the fundamental need on the home front in wartime is the necessity of distributing an inevitably short supply of civilian goods evenly through the population, so that no citizen and no citizen's family need go without a basic ration. The establishment of a "minimum" and the institution of a guarantee that no child, whatever the circumstances of his family, shall go without—these are part and parcel of the wartime problem of distribution. There was a time when Mr Rowntree hesitated to produce the results of his second York survey while the war was on. But, happily, he was over-persuaded on the unassailable ground that certain of his conclusions—the need for a "minimum" and for family allowances—are matters of wartime urgency. The method of applying these recommendations may necessarily be an interim one; but there can only be one directive to the Government on them, and that is "act at once."

There remains the wider task of post-war reconstruction. It is not simply a matter of establishing a "national minimum" and setting up a single Ministry of Social Security; nor even of deciding, where insurance is the method chosen of protection against poverty, that even though it may be expedient to retain an actuarial relationship between normal contributions and normal benefits, it may still be necessary, in order to secure the "family minimum" in every case of unemployment, sickness and disability alike, to subsidise the schemes in special in-

stances. It is not simply that the question must be finally asked whether efficiency and uniformity can be achieved in the social services, while the traditional system of approved societies attempts to reconcile the principles of private business with those of social progress. The test of social services is their results; and the obligation to maintain those in misfortune is only the first aim. The real objective, as distinct from the financial, is to re-employ the workless, to cure the sick and to rehabilitate the injured. Proper treatment and restored health are more important than cash payments; and it is perhaps not too much to hope that the special quality of social reform after the war will be its concentration on these "real" aspects of prevention and cure. A Ministry of Social Security is only one half of the work; the other will be a true Ministry of Health.

The present Ministry of Health is a post-war creation, set up after the last war to replace the Local Government Board; and it might well have become a true Ministry of Health if the scores of reports that poured in from official commissions and committees between 1919 and 1939 had been embodied in its practice. As it is, it has largely remained a Local Government Board, with a notable record in the environmental task of housing betterment. In 1920, the Holman Gregory Committee on Workmen's Compensation and the Parmoor Committee on Industrial Assurance; in 1928, the Royal Commission on Health Insurance; in 1937 and 1939, the Interdepartmental Committee on the Rehabilitation of Persons Injured by Accidents—inquiries like these have made as plain and complete as can be the financial and administrative reforms that are needed for a positive policy of health and welfare. Now a new Commission on Workmen's Compensation has been two years in being; and yet another Interdepartmental Committee has been set up this year to survey the social services.

But there is little need for fresh research and new inquiries. The work has been done. The deficiencies and the solutions are known. What is needed is the action that has been so strangely inhibited hitherto. In part, the obstacle to reform has been stupidity—the stupidity which has refused to see that financial, medical and surgical questions cannot be considered separately without the means and the end being divorced, and failed to understand that health insurance, workmen's compensation and rehabilitation are all aspects of a single problem. In part, the obstacle has been interest—the interest of companies and professional men who have a stake in the present anomalous and inefficient "system." It will be the mission and the responsibility of Sir William Beveridge's Committee to put forward a plan of action that will set a term to this endless procession of solemn pronouncements about facts that are well known and remedies that by now are commonplaces. As peace aims, social security and national health have the uncommon virtue of being as easy to attain as they are important.

The Future Debt Burden I

It is already abundantly clear that the cost of this war, measured in millions of pounds sterling, is higher than that of 1914-18, and people are understandably asking themselves whether its financial legacy will similarly be heavier. In the last war, income tax went up from a sum that now seems childishly small in 1914 to 5s. in the £ at the end of the war and to 6s. in the £ soon after, and though the extremity of the burden was relieved in the post-war years, taxation remained at a level far closer to that of war than of peace. Is this experience likely to be repeated? Can a permanent income tax, if not at 10s. in the £, then at 8s. 6d., be expected?

The higher level of Government expenditure, and consequently of taxation, after the last war was not entirely due to the war—at least not directly. The proportion of the gross national income (at market prices—Mr Clark's estimates) taken by the Government and

spent on different purposes were, very roughly, as follows:—

	National Debt Service	Defence	All Other Expenditure	Total Expenditure
1911-13.....	%	%	%	%
1924	1	3½	3	7½
1929	8½	3	6½	18½
	8	2½	7	17½

There was thus a considerable rise in the spending that was neither preparing for future wars nor paying for those that had been won, and this new expenditure (the bulk of it for social services) cannot be said to be due to the war, except to the extent that it arose out of the quickening of social progress which began in the war years. But the biggest factor in the rise in Government expenditure was the cost of the swollen national debt. Accordingly, a first approximation to the

budgetary problem of the post-war years should be obtainable if the future of the national debt were known. This is a subject in which prophecy is more than usually difficult and dangerous, but since the Chancellor of the Exchequer permitted himself some references to it in his Budget speech, it may be permissible to explore the ground a little farther.

The first point to be realised is, of course, that the net burden of the national debt has not increased since the beginning of the war by the full amount of the Budget deficits. There are two sources of the funds open to the Chancellor of the Exchequer which do not increase the net debt of the State. One is the utilisation of capital assets already belonging to the State, of which the assets of the Exchange Equalisation Account are the most important. Their departure is, of course, an economic loss to the nation of considerable magnitude; but they were bringing in little or no financial income and their sale puts no new financial burden on the Exchequer. The second source is the accruing income of such public funds as the Unemployment Insurance Fund and now the War Damage Commission. These are, in all but form, additional tax revenue. It is true that in both these varieties of cases, Treasury bills are issued. In the first case, to replace the foreign assets of the Exchange Equalisation Account; in the second case, to represent the assets of the Unemployment Fund, etc. The gross total of the national debt is therefore swollen; but that is mere accounting procedure and the net burden on the State is not increased thereby. Thus in the first eighteen months of the war the gross budgetary deficit was £2,756 millions, but the net increase in the national debt was only about £2,097 millions. In the current financial year, the Chancellor estimates a gross deficit of £2,420 millions (excluding all lease-and-lend operations, which are similarly excluded from all the figures in this article). But if the extra-Budgetary receipts of public departments continue at the recent rate, the net increase in the debt will not be more than about £2,250 millions.

These are capital figures and what really matters is the annual interest charge. It is here that the biggest difference between this war and the last is apparent. Sir Kingsley Wood has stated that borrowing is now being done at an average rate of interest of less than 2 per cent. Even if a full 2 per cent is taken for the purpose of calculation, the recurrent cost of the debt incurred in the first eighteen months of war is about £42 millions per annum and that of the debt to be incurred this year (if the Chancellor's estimates of expenditure are not exceeded) about £45 millions. Thus in 2½ years the State will have increased its debt by a capital sum about 60 per cent of the 1914-18 increase; but the interest charge will only be about 30 per cent of that incurred in the last war.

Sir Kingsley Wood's recent Budget speech implied, in many of its passages, a belief that there would not be much further increase in the cost of the war. An attempt is to be made to stabilise the value of money and prevent any further rise in prices; and the rise in expenditure due to expanding physical output of munitions was only put at some £500 millions. Reasons have already been given in *The Economist* for questioning both assumptions—the former for over-optimism, the latter for over-pessimism. But if the Chancellor's estimates are accepted for the purposes of calculation, it is possible to form some idea of the total cost of the war. For example, let it be assumed that this war lasts as long as the last—that is, 4½ years, or for two more financial years after the present one. Let it further be assumed that the deficit rises by £500 millions in each of these subsequent years. Then the net debt incurred over the whole period will be £2,100 millions in the first eighteen months, plus £2,250 millions in 1941-42, plus £2,750 millions in 1942-43, plus £3,250 millions in 1943-44, or say £10,000 millions in all. At 2 per cent the interest charge will be £200 millions per annum. It is hardly necessary to say that these figures are in no way predictions either of the length of the war or of its

cost; they are merely illustrations of the order of magnitude involved. They should be set against the actual figures of the last war—an increase in principal of about £7,000 millions and in annual cost of about £290 millions.

How heavy a burden will £200 millions a year be? There is one very frequently forgotten circumstance which considerably reduces the burden. This is the fact that payments of interest on the national debt are subject to income tax and surtax, while holdings of principal are subject to death duties. When there is a great increase in the National Debt, there is a similar increase in the taxable incomes of the individuals who compose the community. This does not mean, of course, that the real wealth of the community is increased and in computations of the national income, debt interest is usually deducted. But an increase of debt does increase the total of incomes that individuals return for income tax, and it does increase the amount of money that will be brought in by a given rate of income tax.

It is important, however, to realise in exactly what circumstances it does so. If the debt is created by borrowing current savings, or by borrowing created credit, the proposition just set out holds good. But if the debt is created merely to replace other forms of income-producing capital, the case is different. National debt of £1,000 issued to purchase £1,000 worth of American securities leads to no increase in the total of incomes assessed to tax: the interest on the debt merely replaces the dividends on the securities—and may not do so completely. It is important, therefore, to estimate what proportion of the debt to be created during this war falls into each category. In the first eighteen months of the war, just over £1,000 millions was raised by liquidating foreign assets, and £300 millions by drawing on domestic capital. But not all these capital assets were income-producing. Of the foreign assets, £388 millions were the gold and foreign exchange in the Exchange Equalisation Account, which yielded virtually nothing. Of the domestic £300 millions, a large part must represent the depletion of traders' stocks, which again yield nothing. It may be guessed that only about £800 millions of income-producing capital was drawn on in these eighteen months; this is about 40 per cent of the net increase in the debt. For 1941-2, by a similar calculation, it seems probable that rather over a quarter of the net increase in the debt will be of this nature. Over the war as a whole, if the net debt increases by £10,000 millions, probably £3,000 millions will be in replacement of income-producing capital. On this amount, therefore, the net burden on the Budget will be the same as, or even greater than, the rate of interest paid.

In respect of the remaining £7,000 millions, however, the total of taxable incomes will be increased by the full amount of the debt interest paid. What deduction should be made on this score? Much depends, of course, on the post-war scale of taxation, and to some extent the answer to the whole conundrum must be anticipated in order to answer one part of it. But the sum can be worked out in terms of pre-Hitler taxation—that is, income tax at about 5s. in the £, and corresponding levels of surtax and death duties. Some debt holders pay less than the standard rate of income tax, some pay surtax, at varying rates. In the case of companies, only the standard rate of tax is payable, but the individual wealth of their shareholders is indirectly enhanced through the companies' receipts of debt interest. It is obviously impossible to make an exact estimate without knowledge of the post-war distribution of debt holdings. But for the purpose of giving an order of magnitude it may be guessed that, with income tax at 5s. in the £, the effect of taxation would be to reduce a gross rate of interest of 2 per cent to a net rate of 1½ per cent. The net burden of a £10,000 millions debt would therefore be the full 2 per cent on £3,000 millions plus 1½ per cent on £7,000 millions, a total of £147½ millions.

This is not a very large sum. If the level of prices after the war is the same as it was in 1936, when income tax stood at 4s. 9d. and total tax revenue was £750

millions, it will require an all-round increase of nearly one-sixth in the rates of taxation—that is, income tax at about 5s. 6d. in the £. But, of course, it is very unlikely that prices will return to the level of 1936. If they settle down at one-sixth above the 1936 level, the 1936 taxes can be expected to bring in £150 millions more. This would probably not be enough, since a higher level of prices would increase other items of the Government's expenditure. But the problem is clearly soluble, and there is nothing in the way in which the National Debt is now increasing to prevent a return after the

war to approximately the pre-war levels of taxation. This is a gratifying conclusion. Both Right and Left, it would appear, can breathe freely again. The rich man is not going to have all his possessions taken away from him—not by the inevitable aftermath of war borrowing, at least—while the poor man need not fear that there will be nothing left for social services. It is important, however, to remember that the conclusion rests on certain provisos—especially those relating to the level of prices and the rate of interest. These will have to be examined in a second article.

NOTES OF THE WEEK

Atlantic Meeting

Twice in just less than three years a Prime Minister of Britain has flown abroad in search of peace. The first flew east and found his peace, in 1938, at Munich—a poor, evanescent thing, peace by capitulation. Mr Churchill went westward, and there is no surrender in the peace that he and the President of the United States have defined for the whole world. The first premise is resistance to "domination by world conquest" and the destruction of Nazi tyranny. The second is aid to every State and people who are resisting—and the main theme of the discussions at sea between British and American officials and of Lord Beaverbrook's mission to Washington has been the flow of war supplies to the forces of Britain, the United States and Russia. After victory, the real peace can be built upon the Declaration of Principles that the two great democratic leaders laid down: no aggrandisement; no changes in territory or in government except by the will of the peoples freely expressed; equality of economic opportunity for every nation; collaboration between the nations in the establishment of labour standards and social security. They are principles which comprehend everything that all ordinary people long for—freedom from fear and want and liberty to travel the seas without let or hindrance. The Declaration states plainly its belief that, from "realistic as well as spiritual motives," all nations must come to the "abandonment of force." But first the war has to be won. The Atlantic Meeting is not only a milestone because it brings a standard and a hope for a free, peaceful and prosperous world to come; its first object was to tighten the cordon around Hitler's Germany and "the other Governments associated with it"; and its result will be more weapons for freedom and more powerful measures to preserve the world. The President could not speak for Congress as Mr. Churchill could for Parliament. He could make no binding pledge to fight—in any part of the world; or even commit his country to implement these principles. The danger in the Far East was not mentioned by name, and American action there must still wait upon more complex motives than the simple statements of this Declaration. Words will win neither the war nor the peace. But here is a great beginning which, in terms of power, cannot but dismay the dictators, the tools and the jackals and which, in terms of welfare, offers men and women everywhere the outline of their salvation and security.

Pacific Powder Keg

The "powder keg of the Pacific" is waiting for the spark to set it ablaze. That Japan will supply that spark seems almost certain, for the simple reason that Japanese troops are now massed on the Thai frontier in the south and the Russo-Manchurian frontier in the north, and whenever a local Japanese army commander gets near a frontier, he has sooner or later to cross it. It is a temptation which, in the ten years which have elapsed since the real beginning of the "China Incident," Japanese army commanders have never been able to resist. On almost every occasion the Government at Tokyo has had misgivings, and would have been glad to hold its hand. Here, again, the situation is running true to type. Although such warlike preparations as the application of the National Emergency Mobilisation Act have been made, there are signs that Prince Konoye's Cabinet is perturbed by the hornets' nest they have stirred up in the south, and, after a week end of flamboyant troop landings in Indo-China and of

rumours of the full mobilisation of the Japanese Fleet, there has been, if not a lull or even a slackening of tension, at any rate a perceptible pause, as of a man drawing breath. The hesitation is reasonable enough. The Japanese hoped to find Thailand as complacent as the lackeys at Vichy. It must have been with the astonishment of a Goliath that they watched Thai troops mobilise on the Indo-Chinese frontier and listened to the Thai Government declaring its determination to offer unlimited resistance to aggression, to adopt a "scorched earth" policy and—last, fantastic touch—to use poison gas if necessary. There are some 50,000 Japanese troops in Indo-China, probably enough to overwhelm the Thais; but, with Thailand's message of defiance, has come serious doubts whether, if the Thais were attacked, they would fight alone. Mr Eden has stated bluntly that an attack on Thailand would menace the security of Singapore, and the Japanese Ambassador to Washington, Mr Wakasugi, has warned the Japanese people that the United States will meet every new Japanese advance by new counter-measures. At Tokyo the British and American Ambassadors have made a number of joint *démarches*. The step that might finally confirm Japan's hesitations would be an unequivocal statement that in the event of one more act of aggression, the British and Dutch Empires, the United States, Russia and China would act together. But it is still doubtful whether American opinion is readier for shooting in the east than in the west.

Northward Bound?

It is hard to believe that the Japanese Government seriously envisages an attack in the north. Besides the strong and autonomous Far Eastern Red Army, there is a serviceable army attached to Outer Mongolia, trained and partly officered by Russians, and the Japanese experience at Nomonhan in 1937, when the Japanese troops were annihilated by Russia's mechanised divisions, is still an uneasy reminder of the risks involved. There are perhaps 100 submarines in the harbour at Vladivostok, and Soviet bombers would be in range of Japan's overcrowded, wood and paper built industrial towns. Nevertheless, reinforcements have undoubtedly gone north, and the Japanese Press is taking up the question of American supplies reaching Vladivostok. It is difficult to see what steps the Japanese could take to blockade Vladivostok without accepting the risk of war, unless their Navy chiefs still argue that in no circumstances will the American Navy shoot. Naturally, as long as the Americans remain uncommitted to any line of policy, the Japanese have a gamble upon which to bet. Possibly the Konoye Government is less inclined to gamble now than a week ago. There would be more chance of peace in the Pacific if the same hesitations could infect the commanders on the spot.

After Eight Weeks

According to official German claims, the German line in Russia after eight weeks' fighting stretches from Narva and the Baltic coast through Soltsa to Kholm, then from Kholm to Nevel and the Smolensk bulge. South of Smolensk, where the Russians have admitted, the line skirts Roslavl, where fighting continues, passes through Korosten, goes west of Kiev to Byelaya Tserkov and Uman, and in the south runs east of Kishinev to the mouth of the Dniester. These are considerable gains, and, in the course of the fighting in the last fortnight, the Germans have undoubtedly straightened their line; the Russian defences

must be very taut and the Smolensk salient is an ugly bulge into the Russian line. Nevertheless, from the Baltic to the Kiev sector there has been no break through, and the Germans appear for the time being to have halted the drives on Leningrad and Moscow—which may just possibly mean abandoning them for the whole winter, since the bad weather will begin in the northern sectors in another four or five weeks. The weight of Germany's third offensive is directed against the Ukraine, and the Germans claim to have isolated Odessa and to have reached the Black Sea by a drive south from Uman. The Russians report nothing, and it is still too early to judge whether a real break through is taking place. The Germans should be able to make use of combined land and air activities on this front, landing men from the air on the coasts to synchronise with drives southwards by the land armies. The towns thus encircled, Ochakov, Nikolaiev, Kherson, Perekop, could be reduced at leisure, and the peninsula of Crimea seems an obvious target for operations on the model of those in Crete. The defenders of the Ukraine are in an obvious dilemma. If they stand to defend the Black Sea ports, they risk encirclement, and they throw open the Kiev-Kharkov area, from where, if the Germans struck north as well as east, the line might be turned below Smolensk. These are critical moments in the campaign, and they rebuke the facile optimism which is still going its irresponsible way in this country.

The Way to Victory

General Smuts has stated his faith in victory by the air arm without the use of large land forces; and this view is common among the people of this country—and, increasingly, in the speeches of Ministers. Like the view that this is not a physical war at all, but an entirely moral one, in which the right propaganda will just deflate Germany like a balloon overnight, this is the natural view of a belligerent which, until the Germans chose Russia to be an extra foe, was heavily outmanned; and it remains probable that, whatever may happen on the Eastern front, the enemy will have a clear advantage in men in the West. It was reported that, before he left Cairo, General Wavell told a representative of the *New York Times* that, without the aid of American man-power, victory on land was impossible. Actually, in both popular and Ministerial thought, the issue seems to be confused. The land, air and sea arms are spoken of as if they were separate and alternative weapons, while, in fact, the only way in which a decision in the West can be won, by the Allies or by the Germans, is by the striking power generated from a combination of all three—a truth which has always appeared more evident to the German strategists, in spite of their superiority on land, than to their opponents. Those who deduce from the balance of man-power that this country should not attempt to have an offensive army at all are as beside the mark as those who would still pin their entire faith to victory by foot-slogging, in the hope that, by some miraculous means, the superior fighting qualities of the British soldier will by itself suffice to outweigh his inferiority in numbers and weight of metal. It should not be necessary to tell Englishmen, the bombers *par excellence* of this war, that air bombardment is not likely to win wars—any more than artillery bombardment from the ground is. It will be a severe trial for the German people, and a serious restraint on their production, if they are bombed from both West and East in the winter; tentatively but ominously, Berlin has already been between two fires. It is an ill promise for the economy and morale of German Europe that British bombers can now carry out stiff raids well inland by day, like Tuesday's fierce pounce on Cologne and Emden. This is the artillery preparation which will grow in strength and, with British and American output and Russian aid, it should be brought as close as possible to the quality of "drum fire." But Napoleon said that the moral was to the material in warfare as three to one, not three to none; and the striking forces to drive back the shaken enemy and the holding forces to take his territory will be soldiers, and they will come by sea. The respective strengths and weaknesses of the two belligerents mean that the proportions of the respective amalgams they make of land, sea and air forces must differ. Plainly, naval might and power in the air, as well as heavier equipment and armour on land, must be developed and deployed to compensate for Britain's lack of numbers. This is presumably British policy—to build up the most effective ratio of men to material, within each arm and between them, and to work out a strategy according to the size and character of the forces available. All Europe is washed by sea, with the air above; and there will be a score of points

for the "indirect approach" to Germany's heart. But when the final battles come to be decided, no arm will be dispensable. To beat Britain the Germans must have their navy; the British army is needed to beat Germany; and victory will fall to neither side like a ripe plum, unfought for.

The Use of Men

A good many of the general admonitions levelled at the Government about the need for workers to make tanks rather than for soldiers to fight without them are off the target. It can be argued, of course, that there are still far too many people who are neither in the forces nor in the factories; and it is astounding that the Government should only now have decided to take the obviously common-sense and fruitful step of combing-out domestic servants. But, on the general issue of policy, it can be assumed that the Services and the Supply departments are now working to a programme of recruitment and production which recognises the scarcity of men and the necessity of having no bigger army than can be better equipped, armoured and trained—and better supplied with aircraft support—than the enemy's. The faults are rather in detail, and often the details are important. It has, for instance, proved a fantastic mistake to have deprived building and coal-mining of so large a proportion of their heavy labour—and in some respects agriculture may be in the same category. It was not as if there were not a margin to draw upon of men who are neither building houses nor digging coal nor growing food. The quantitative approach of the authorities to the distribution of man-power between fighting and working has been less in error than the qualitative. The trouble is that the principles of reservation upon which the process of recruitment has been based have been hopelessly over-generalised. The principles are, first, that young men are more fitted for military service than older ones; secondly, that certain broad categories of industry are more important than others; thirdly, that skilled men are more important than unskilled; and, fourthly, that brains are more important than brawn. To a point, these principles are obviously sound. But they require constant checking in detail, and two further questions need to be asked: first, whether a particular job (as distinct from a category of work) is indispensable; and, secondly, whether the particular man holding the job can be replaced by another man—or woman. The introduction last spring of a new category of protected industries and protected work was at least a move in these directions; and it was generally believed that the Kennet Committee on the calling up of civil servants was going to ask these questions. But, in its interim report, the Committee merely recommends that the age of reservation should be raised for administrative and executive grades from 25 to 30 and for clerical and analogous grades from 30 to 35; and, although nominally 8,000 more civil servants will be released, the real job of combing-out jobs and job-holders is, in effect, left to the departments—the recommendation that deferment of calling-up should be abolished in 30 months' time is tempered by the proposal that they should be replaced by temporary and special deferments. Obviously, Government service can be war work of the first importance; the war effort is driven and held together by administration. But, equally obviously, it is absurd that, say, scholarly keepers of the public records should be reserved to firewatch in a mostly evacuated Record Office—or, outside the civil service, that a whole host of professional men and office workers should be reserved in dispensable work—while men are taken from the pits to fight. It is a snobbish delusion to suppose that brains (which normally means education or social status) are always more important than brawn; and it is what a man does and not what he is that should count in this matter.

Australia Quickens

The tension in the Far East has fanned the claims of Australia to be represented in an Imperial War Cabinet; it may also lead to the formation of a real War Cabinet in Australia itself. The present Cabinet has asked Mr Menzies to return, as soon as possible, to London, where "decisions of great importance for Empire policy and strategy would inevitably be reached," so that the British War Cabinet might be continuously given first-hand views of the Dominion most directly concerned with Japan's moves. His colleagues consider that Mr Menzies should return to London still in his position as Prime Minister, but that if events necessitate a prolonged stay, he should either be replaced by

another Minister, or else relinquish the Premiership, and accept some special status appropriate to his mission. But whether they envisage him as an Australian Lyttelton posted in London or merely as a Duff Cooper, the Australian Cabinet are surely not wise in insisting that the envoy must be Mr Menzies. There must, or should be, other Australians who can inform the British Government on Australia's views, and if the Commonwealth is to be plunged into a new war near at hand, the proper place for a Prime Minister, especially one of Mr Menzies' calibre, is in his own country. It may be, of course, that they consider a Prime Minister is less easy to override than someone with lesser stature. Mr Menzies himself appears willing in principle to make the journey, but he has called an emergency meeting of Parliament first, for the matter to be discussed with all parties. Mr Curtin, the Labour leader, has agreed to the early summoning of Parliament; he has also conferred with Mr Menzies, after which he issued a statement calling on all Australians to fight or work. There is, as yet, no indication that any moves for a coalition are afoot, but Mr Curtin and Mr Menzies must surely see that claims to be represented in an Imperial War Cabinet come a little oddly from a country which in such a crisis is still politically divided within itself.

The Fire Guard

So far from being intimidated by the attitude of the trade unions over compulsory fire-watching in business premises, Mr Morrison has now decided that the Civil Defence Duties (Compulsory Enrolment) Order is to be applied in all areas in which the Fire Prevention (Business Premises) Order is, or may be, in force. The purpose of the Order is to enable local authorities to carry out their obligation to provide satisfactory fire prevention arrangements for residential areas, including small shops not covered by the Business Premises Order and unoccupied and miscellaneous buildings. It has already been applied in parts of London and elsewhere where the number of volunteers for home fire guarding has been too small for the local authority to make satisfactory arrangements; but since the Business Premises Order has been applied to the whole of the London region, nearly all the industrial areas and most of the big non-industrial towns of the country, fire-watching, either at home or at work, will now be compulsory for a big proportion of the civilian male population—though there are, of course, certain exempted classes. This should strengthen Mr Morrison's hand in the struggle with the trade unions, for they can no longer contend that compulsion in practice only falls on the workers. But, from the point of view of civil defence, the most satisfactory part of Mr Morrison's new measures is the attempt to make the fire watchers—or Fire Guard, to give them their official new title—efficient, whether they are conscripted under the new system or volunteers under the old. The Fire Guard will be an essential part of civil defence, with its own paid officers who will form part of the wardens' service and will be responsible for the training of fire guards individually and in parties, the preparation of duty rotas, the mustering and allocation of fire guards, sleeping and feeding arrangements and so on. What is aimed at is a disciplined and efficient service instead of a collection of frequently, half-trained, half-hearted—and half-asleep—householders.

Hard Labour

Lord Woolton's announcement last week that the meat ration would probably not be increased for the duration of the war was good news, not bad. There are better and more economic uses to which home and imported resources can be put than the feeding of more animals to produce meat. There is, for instance, the pressing need to raise the supply of milk, which threatens to be uncomfortably short in the winter months. The announcement was welcome in yet another way. The Minister of Food went on to say that, if any extra meat became available, it would be reserved for people engaged in heavy work. It is only a fortnight since the Prime Minister told the House of Commons that one of the two most important checks to production was the insufficient diet of heavy workers; and, since war production should be paramount, this statement seemed to establish a case for reducing the ordinary meat ration still further, if it was necessary, in order that sufficient might be made available for war workers. In Germany, there are three grades of rations—for ordinary workers, for heavy workers and for very heavy workers.

It might not be necessary here to adopt these differentiations within the coupon system. The method should be to use the workers' canteens in order to ensure that extra supplies of meat and cheese and other protein foods should reach the workers most in need of them. This, of course, is already being done, and Mr Bevin has made it plain for many months that the function of the canteen is to provide cheaply the food that workpeople need. But, unfortunately, in one sense, there are too many canteens, and, in another sense, there are too few. There are too many because canteens at offices and factories where work is light are treated on a par, in the quantity of supplies, with canteens for heavy workers. There are too few because, in many of the industries which need extra food most, there are few or no canteens. Coal mining is the prime example. There is no doubt that one of the chief difficulties in restoring the output of British coal is the fact that miners, by comparison with their normal diet, are going hungry; and it should be a prior charge on the resources of the industry and the Government to provide feeding centres and more solid food for the workers in the pits.

The Middle East: Diplomacy in Action

Now that Germany's offensive is turning south, with the immediate objective of the Donetz basin and the ultimate aim of securing Russia's Caucasian oil supplies, the importance of stabilising and developing the Middle Eastern front is trebled. Turkey is still paralysed, on the one hand by the German and Bulgarian armies deployed on her Thracian frontier and, on the other, by her fears—assiduously exploited by the Nazis—of what Anglo-Russian collaboration may mean in terms of territorial concessions at her expense. Happily, this week has seen some improvement, for the Germans have received a sharp rebuff in their trade talks in which they tried to bluster the Turks into a virtual monopoly of foreign trade and public works contracts. At the same time, the joint British and Russian guarantee to respect the integrity of Turkey, together with the Straits Convention agreed on at Montreux in 1936, and to go to Turkey's assistance if attacked, has created the best possible impression, especially as verbal assurances given at the same time explained in the most precise way the friendly attitude of the two Governments, and pointed out the extent to which Nazi propaganda had sought to mislead Turkish public opinion. Further east, the position is less promising, for the Iranian Government has chosen to disregard the official representations of Britain and Russia about the activities of German agents, and there is evidence that more German officials are on their way to Teheran. Iran, of course, has unhappy memories of the division of Persia into Russian and British spheres of influence before and during the last war, but the policy of both States has always been perfectly correct towards Shah Riza Pahlavi's Government, whereas German activities most palpably are not. It is in Germany's interests—either by threats or blandishments—to keep Turkey and Iran neutral until such time as the German army decides to invade. It is admittedly a trying situation for the Allies to be held apart by territory which the Germans will not scruple to use as a high road when the day comes.

Decline and Fall at Vichy

The shadows are deepening at Vichy round the muddled, unhappy old man who, flattered into believing himself the sole source of authority in France, has been led and bullied and worried by Darlan further and further into the German entanglement. Now he has seen fit to make this unscrupulous man of Darlan to be Minister of National Defence undoubtedly marks a decisive step downwards in the decline and fall of Vichy. On the home front, it is to be accompanied by a series of measures which will bring the civil life of the community more into line with that of its German masters. The police force will be strengthened, and special commissions will investigate the loyalty of government servants and the activities of "secret societies." So France is to have a Gestapo. Furthermore, all opposition groups and leaders are to be split up or removed, and the Marshal is empowered to impose punishment without trial. So France is to have its concentration camps. And to crown this picture of the "quiet of old men dropping to the worm," the Marshal ended a broadcast to the French people—in the course of which he had chided them for misjudging Darlan, "who

has never ceased to help me with his loyalty and courage"—with the words: "In 1940 I put an end to our rout. To-day I am going to save you from yourself"—but not, apparently, from the Germans. In yet another ministerial reshuffle—the number must be well up to a dozen by now—the more upright members of the Cabinet, such as M. Chevalier, have been dropped. Those who remain are the Anglophobes, a Barthelemy or a Bouthillier, or the supporters of Axis co-operation, a Lucien Romier or a Caziot. This reorganisation at home no doubt foreshadows new measures abroad. Weygand has returned to North Africa. There is no reason to suppose that he is any more friendly than before to the project of surrendering Dakar and Casablanca; but he is now a man under authority—Darlan's authority, and Darlan's plans for the empire are dictated in Wiesbaden and Berlin. Whether the next step is the adherence of France to the Tripartite Pact is still uncertain, but Germany is undoubtedly preparing for some new diplomatic "triumph." In these circumstances, it is essential that Britain and the United States should be at one in their policy *vis-à-vis* Vichy and North Africa, and that being at one should not mean the reduction of their joint policy to the lowest common denominator of the State Department. If the Nazis act in North Africa, they will act quickly. The democracies must be ready to act more quickly still.

Marketing Colonial Produce

In an important debate last week the House of Lords discussed the problem of the disparity between the prices paid to the producers of colonial products and those paid by the consumers. This problem raises issues far too wide to come within the scope of a single debate on colonial policy, and the Lords confined themselves to the effect of low prices on the colonies' material and social development and the question of whether the disparity could be lessened by international—or intercolonial—regulation schemes and by improved marketing arrangements within the colonies themselves. Lord Moyne mentioned the regulation—he appeared to boggle at the word restriction—schemes for rubber, tin, tea, sugar, copper and diamonds, and claimed that they have provided a better standard of life for "those engaged in production without causing difficulties to the consumer." But in the case of tin, copper and diamonds, production is carried on by companies operating on capital provided from outside the colonies concerned. Therefore, higher prices only benefit the colonial communities if they are reflected in higher wages—which is certainly not bound to follow. In the case of rubber, sugar and tea, too, production is frequently carried on by foreign-owned capital, or by European planters whose prosperity, owing to the present system of colonial finance, only indirectly benefits the natives, if at all. Probably, international schemes for controlling the production of native-grown and native-owned crops, even if they were desirable, would be impossible to operate. On the other hand, improved marketing arrangements within the individual colonies are both practicable and desirable. The most obvious example is West African cocoa, the marketing of which, as the Commission appointed to inquire into the growers' hold-up reported in 1938, is extraordinarily inefficient and wasteful. Its recommendations, which were not accepted then, that growers should be organised to sell their cocoa on a co-operative basis, and that the Association thus organised should also be used for improving agricultural methods and grading the cocoa, might be extended in principle to other colonies and other crops. But it should be remembered that colonial poverty will not be overcome by higher export prices alone. As Lord Moyne pointed out in the debate, doubling the value of Nigeria's exports—in 1938 18s. 10d. per head—would provide a very inadequate basis for a rise in social standards. Moreover, the great majority of colonial peoples are still far more dependent on subsistence agriculture and on local sales than on exports. By comparison with export trade there is, to quote Lord Moyne, "unlimited scope for the increase of wealth by internal exchange." Both for agricultural and industrial products, the colonies' best markets may well be found within the colonies themselves.

Damage to Property

The contributions fixed by the War Damage Act in respect of damage to property during the period ending on August 31, 1941 (with the exception of certain categories) are calculated to bring in some £200 millions in five

annual instalment. If the damage during this period exceeds this sum the Exchequer will pay the whole of the excess up to a further £200 millions; after that, the State and the contributor will share the burden equally. Since the period covered by the original Act has now almost run its course, it is interesting to speculate on how much damage has, in fact, been inflicted upon property. In the natural absence of any official data, any estimate must, of course, be purely conjectural. A recent analysis, based on "Rates and Rateable Values in 1938-39," a computation issued by the Ministry of Health, shows that the value of "immovable property" (excluding site values) was roughly as follows:

Greater London	700,000,000
County boroughs	2,000,000,000
Non-county boroughs, urban and rural districts	3,300,000,000
Total	6,000,000,000

It is reported that a company with interests in Greater London has suffered war damage amounting to between 3½ and 3¾ per cent of the total value of its property; and if the experience of the country as a whole has been similar to that of this company the total damage sustained at the rate of 3½ per cent would amount in value to about £210 millions. In actual fact, however, the extent of the air-raid damage in the country as a whole must have been considerably less than this. True, the damage suffered by certain towns such as Coventry, Southampton, and Bristol, has been very severe; but in many other large towns the damage suffered has been insignificant. The rate of damage in London is not applicable to the whole country; and, on the assumption that the total damage sustained was at the rate of, say, 2 per cent in the first two years of the war, the loss, in terms of pre-war values, would only amount to about £120 millions.

Government Borrowing Technique

An interesting change in the technique of Government borrowing was announced towards the end of last week. The issue of 2½ per cent National War Bonds, which have been available on tap, was suspended from August 14th; and "until further notice," Sir Kingsley Wood stated that he would revert to the earlier practice of relying on one market issue. This issue will be that of 3 per cent Savings Bonds, of which some £280,000,000 are now outstanding, against the £433,000,000 total of the National War Bonds, 1946-48, now suspended. These changes do not in any way affect the plans for tapping the small man's savings, and the issue of National Savings Certificates and of 3 per cent Defence Bonds—both of them subject to limitations of individual holdings—will continue unchanged. It is, however, in the issue of National War Bonds and Savings Bonds that the "big money" has in recent months been collected by the Government. One of the reasons for suspending the tap issue of 2½ per cent National War Bonds

Rationing and Price Control

AMERICA'S rearmament programme has now reached the stage where its further unimpeded progress involves the deliberate curtailment of the production of consumers' goods, and where a rapid upward movement in prices can only be avoided by immediate and decisive official intervention. The problem is urgent because, in anticipation of a reduction in the supply of consumers' goods, the demand for durable commodities has increased by leaps and bounds in recent months.

Hitherto the American Government's approach to the problem has been very similar to that of the British Government. It has tended simply to tackle the difficulties as they arose. As in Great Britain, industry has been allowed to minister to the private consumer until a point was reached when the demands of both its defence and civilian sectors could no longer be met in full. Wherever this point has been reached, the American Government has asserted the prior claims of the war industries, though not always in time to prevent hold-ups in production.

The latest instance is steel. Although America's steel makers are operating virtually at capacity—the output of crude steel has recently been at the rate of about 75 million tons per annum—they have been unable to meet all the growing requirements of the defence and civilian sectors of industry. Hence, on August 10th, the Office of Production Management ordered steel producers to give priority to the needs of the war industries, regardless of deliveries already promised to other users under existing contracts. The balance is to be allocated "in accordance with such a programme as the Office of Price Administration and Civilian Supply may determine."

This policy has naturally retarded the application of "bulk rationing"—the allocation of new supplies of materials for different purposes in accordance with a system of priorities—the first step in the control of the distribution of scarce materials. But the consumption of a number of materials—such as steel alloy metals—for civilian purposes has already been restricted, and there are indications that events will soon compel the Government, not merely to curtail the total quantity of materials used for civilian purposes, but also to determine their distribution between the manufacture of motor cars, typewriters, refrigerators and other household goods. Indeed, America will soon have to issue "limitation of supply orders"—which have been familiar to this country since the spring of last year, setting definite limits to the output of different kinds of civilian goods.

The approach to the problem of prices, too, has been similar to Great Britain's. Until recently, all that seemed necessary was to prevent a speculative rise in raw material prices; in this the Government has been fairly successful, though Moody's index of the prices of staple commodities is now 40 per cent higher than a year ago. The need for a comprehensive system of price control seemed remote, for, with a few exceptions, available resources were adequate to meet demand. Despite the growth of industrial activity since the spring of 1940, wholesale prices and the cost of living showed remarkable stability. Thus, between April, 1940, and February, 1941, when the Federal Reserve Board's index of industrial production rose by 27 per cent, the index of wholesale prices calculated by the Bureau of Labour Statistics showed an increase of only 2.5 per cent. Since then, however, the upward movement in wholesale prices has tended to quicken; and on June 17th the official index was 7.6 per cent above the February level. Similarly, the cost of living index compiled by the National Industrial Conference Board showed little variation until last spring; the index for May, for example, showed a rise of only 2.6 per cent from the figure for the corresponding month in 1940. Wage rates appear to have risen faster than the cost of living, for, according to the National Industrial Conference Board, average hourly rates in industry last April were 6.8 per cent higher than a year earlier. But America is now entering a period of scarcity, when sharp

upward movements in prices are inevitable unless timely steps are taken to prevent them.

The British Government has found a practical solution of the scarcity problem by increased taxation, price control *cum* subsidies, and the rationing of individual consumers. America, too, has imposed increased taxation. But the increases sanctioned for the year ended June, 1942, will do little to curb the increase in spendable incomes, still less to reduce them—though the Treasury has now recommended further impositions to the Senate Finance Committee. On August 11th, President Roosevelt issued an Order designed to curtail instalment purchases which account for a large proportion of new purchases of consumers' goods. Under this Order regulations will be issued by the Federal Reserve Board, acting in collaboration with a special committee consisting of the Secretary of the Treasury, the Federal Loan Administrator and the head of the Office of Price Administration and Civilian Supply.

The second defence against inflation is the commodity Price Control Bill now before Congress. In its present form, the Bill empowers the President to fix, either by himself, or by delegation, maximum prices for commodities on the basis of the level of July 29th. But special provision has been made to prevent the President, or his delegate, from fixing maximum prices for agricultural commodities below 110 per cent of "parity" as determined by the Secretary of Agriculture, on the basis of the ratio between the prices of agricultural and industrial goods in the period 1909-14, or below the market prices ruling on July 29th. Public utility charges are not covered by the Bill, and rents are included only within the defence areas.

Moreover, the Bill follows the British precedent in excluding the control of wages and salaries from its scope. The Government appears to have no illusions concerning its probable contribution to the stemming of the advance in prices. On August 5th Mr Leon Henderson, in charge of the Office of Price Administration and Civilian Supply, pointed out that his country was faced with "a most strong and pronounced increase in the cost of living," even if the Bill became law immediately.

Increase in Production

The expansion in America's total industrial activity between June, 1940, and June, 1941, is reflected in the table below. Only part of the rise in the index, however, is due to the increase in the output of the goods of war:—

BUSINESS INDICES (Unadjusted for Seasonal Variations)			
1935-9=100 for industrial production and freight car loading 1923-5=100 for other series			
	June, 1940	May, 1941	June,* 1941
Industrial production (total)	121	153	156
Manufactures (total)	122	157	161
Durable	134	185	192
Non-durable	112	134	135
Minerals	118	128	131
Construction contracts (total)	86	121	130
Residential	76	104	105
All other	93	136	151
Factory employment (total)	103.1	124.8	—
Durable goods	99.8	131.2	—
Non-durable goods	106.2	118.7	—
Factory payrolls (total)	99.5	144.0	—
Durable goods	101.4	163.0	—
Non-durable goods	97.4	122.7	—
Freight car loadings	110	131	136
Department store sales	87	105	98
Department store stocks	64	76	—

* Preliminary.

Further progress was made in July, when the Federal Reserve Board's index of industrial production, adjusted for seasonal variations, was 34 per cent above the level for June and July, 1940. According to a statement made by the Director-General of the Office of Production Management on August 8th, defence production will reach 50 per cent of the maximum planned for at the beginning of 1942 and will be at its peak by the summer or autumn of next year.

THE WORLD OVERSEAS

Economic Changes in Palestine

(By a Correspondent)

July 23rd

FROM the 1940 Statistical Abstract of Palestine, which has just been published, a good picture can be obtained of how Palestine has fared in the second year of war. While agriculture is still the mainstay of Palestine's economy, and the cultivation of oranges and grape-fruit was the principal form of agriculture until the war, important changes have taken place both in agricultural and industrial life to meet the new conditions. The export of citrus fruit has been drastically curtailed; and, at the same time, the production of wheat, of vegetables and of dairy produce has been greatly increased, particularly in the Jewish settlements. At the outbreak of war, more than half the wheat flour, 80 per cent of the butter, 35 per cent of the eggs and 10 per cent of the vegetables consumed in Palestine were imported. Palestine has been made to a much greater extent self-sufficient in food products. The 1940 vegetable crop is estimated at about 150,000 tons. One of the country's greatest assets is its possession of a number of first-rate men of science, who are applying their knowledge to agriculture and industry. The scientists have devised ways for using the unexportable orange crop, partly in the production of alcohol, partly in the extraction of sugar, and partly in a dried and shredded form as a fodder for animals. The Botanical Department of the Hebrew University of Jerusalem has discovered a means of storing seed potatoes which will not only make the country independent of imports of this kind, but should enable it to export potatoes. In the first three months of the present year, the Jewish production of potatoes amounted to 2,000 tons, which compares with 287 tons in the corresponding period of 1940. The change in the position of dairy produce is illustrated by the fact that to-day only 20 per cent, instead of 35 per cent, of the eggs required have to be brought from outside. Another change brought about by the war is the development of Palestine fisheries. Before the war, only a quarter of the fish consumed was caught locally off the coast. But in the last two years Jewish settlers have established a number of fishing villages.

Industrially, the most striking development has been the use of the mineral resources of the Dead Sea. The Palestine Potash Company has been steadily increasing its output; and now its export takes the principal place in foreign trade. Potash, bromide and magnesium, which are extracted in the Dead Sea works, are all required by the British Commonwealth, and it is possible to export to countries in the east. The development of electric power production, which has also steadily increased during the last two years, is an index of growing industrial enterprise. The sale of electricity rose in 1940 to over 100 million kilowatt-hours; and more than half the power sold was used for industrial purposes and irrigation. At the outbreak of war, Palestine local industries were stimulated by the demand of Syria, where the needs of a large army had to be supplied. For a year after the *débâcle* in France commercial intercourse between Palestine and Syria was almost cut off. But the recent occupation of Syria by the British forces will renew the opportunity for exports and imports.

The steel forging and casting and tool-producing trades in Palestine are now employing over 1,000 workmen, and there is every sign of further expansion. It is also worth mentioning that, while the ports of Palestine, Haifa, Jaffa and Tel Aviv have been affected by the reduced foreign trade, some of the workers formed a most valuable unit for the British military authorities in the Middle East. About 2,000 longshoremen and boatmen have been recruited, and the port of Tobruk is almost entirely manned by them. There is a Jewish marine school in which some 400 youths are being trained.

The Government finances are in a favourable position. Total revenue for the fiscal year ended March 31, 1941, was £5,184,000, which exceeds the figure of the preceding year by £830,000, and the estimate by nearly a million pounds. Ordinary expenditure amounted to £5,613,000. This includes charges for defence, and the British Government made a grant-in-aid for this purpose to an amount of £3,300,000; the greater part of this grant was for extraordinary expenses, particularly the building of permanent police posts in all parts of the country. As a result of the British Government grant there was a balance of nearly £1,000,000; and the total surplus of the Palestine Treasury has increased during the past two years by £1,175,000, and now amounts to £4,000,000. The finances of the Government are, therefore, again approaching the position of the years of prosperity when a surplus of £6½ millions was accumulated.

Inevitably, the cost of living is rising. The wholesale price index in 1940 rose by 43 per cent over the level of 1936, and the retail price level by about 30 per cent. But though life in Palestine, as elsewhere, is to be simpler and luxuries are discarded, the constructive energy of the people is not affected, and the development of fresh resources during the war should have a permanently healthy effect on the country's economy.

Higher Agricultural Production in Eire

[FROM OUR DUBLIN CORRESPONDENT]

August 3rd

THE changes that have taken place in Irish agriculture during the last ten years are shown in official figures published in the *Irish Trade Journal*. In 1939-40 the physical volume of agricultural output reached the 1929-30 level for the first time in ten years.

INDEX NUMBERS OF VOLUME OF AGRICULTURAL OUTPUT
(1929-30=100)

	1929-30	1937-8	1938-9	1939-40
Livestock and livestock products	100	89.8	93.5	95.9
Crops and turf	100	123.7	115.4	122.3
Total Output	100	95.2	97.0	100.2

The changes in the manner of disposal of the agricultural output are shown in the following table:—

	Percentage of Value of Total Output 1929-30 1937-8 1938-9 1939-40			
Consumed by persons on farms	27.1	33.6	33.0	32.6
Other home consumption	21.5	31.4	29.2	30.0
Exported	51.4	35.0	37.8	37.4
Total Output	100	100	100	100

The trends disclosed by these figures are a growing concentration on the production of tillage crops and an increasing reliance on the home market. The proportion of Irish agricultural output that is exported has never recovered to its pre-depression level, but it is to be hoped that a further expansion of production and export will take place in the future.

All the available evidence indicates that production has been increased during the current year. The preliminary returns of crops and livestock issued by the Department of Agriculture prove that the tillage drive has been conspicuously successful.

	June, 1940 000 acres	June, 1941 000 acres
Wheat	305	491
Oats	681	778
Barley	132	169
Potatoes	367	437
Turnips	191	159
Mangels	93	97
Sugar beet, cabbage, etc.	94	116
Total root and green crops	705	809

	No. (000)	No. (000)
Cattle	4,023	4,178
Pigs	1,049	781
Sheep	3,070	2,959
Poultry	19,975	17,039

The area under wheat is the largest ever recorded since the beginning of the Irish Agricultural Statistics in 1847. In 1851, the area under wheat in the twenty-six counties now forming Eire was 428,705, after which it decreased yearly until it was stimulated by the compulsory tillage order during the last war. In 1918 it reached 236,882 acres, but rapidly declined after the war, the lowest point being reached in 1931, when it sank to 28,848 acres. No such recession will take place after this war, since the encouragement of wheat growing is part of the Government's long-term agricultural policy.

The Future of Transport

The Reports of the Transport Tribunal, which was appointed in 1938 and completed its proceedings in 1939, have been published. The terms of reference of this Tribunal were to examine the position of public transport, excluding air transport; the causes of the unfavourable position of the railways; and the measures necessary to ensure an efficient system of public transport. The Majority Report recommends the establishment of a National Transport Council to review all trends of transport for five years, at the end of which a final decision could be made about the future working of the railways. The existing board of the Great Southern Railways should be replaced by a smaller board assisted by two expert controllers. Financial resources would be needed for the acquisition of competing road transport concerns, the extension of road services and additional working capital. The Government should guarantee a debenture issue of £1,250,000 at 4 per cent, and additional taxes should be imposed on private motor vehicles, the proceeds of which would be available to make up any deficiencies in the company's fixed interest obligations. A pooling arrangement is proposed for traffic in the Dublin area.

The Minority Report, signed by Dr. Henry Kennedy, Secretary of the Irish Agricultural Organisation Society, which approaches the problem from the standpoint of the consumer of transport services rather than from that of the railway companies, expresses strong disagreement with the proposals to limit the competition of road services and to impose additional taxes on private motor vehicles. Agriculture, the predominant industry in the country, has much to gain from the flexibility of independent transport services. The Great Southern Railways should be owned and operated by the State, the existing proprietors being suitably compensated. Any deficits that arise should be met out of taxation, which can be distributed in a manner calculated to do less harm to economic development than higher transport charges. The Great Northern Railway, the greater part of which is in Northern Ireland, should receive a subsidy. The final decision regarding the future of this railway needs the co-operation of the Dublin and Belfast Governments. Needless to say, the transport problem has been greatly changed by the war, and will need further investigation when normal conditions are restored.

The annual report of the Electricity Supply Board indicates that this great undertaking continues to progress in spite of the difficulties of the times. The gross revenue for the year was £2,082,522, an increase of £124,021 on the previous year, and the sales of electricity at 345,230,808 units were 26,679,152 higher. The average price per unit was 1.44d, compared with 1.84d five years ago, but rising rates may necessitate an upward revision of charges in the near future. Owing to the growth in the consumption of electricity, an increasing proportion of the demand is

supplied by the Dublin coal-generating station, and the Board makes a very strong appeal for economy in the use of current owing to the shortage of coal. If the Shannon had not been hydro-electrically developed, the country would be threatened with a stoppage of the total supply of electric light and power. The experience of the war emphasises the need to complete the development of the Liffey, which is well advanced, and to study the possibilities of other rivers such, for example, as the Erne.

Restricting Consumption in Canada

(FROM OUR OTTAWA CORRESPONDENT)

July 21st

THE past fortnight has witnessed no material change in the general business situation as the data given below about the weekly economic index of the Bureau of Statistics and some of its components reveal:—

Week Ended	Carloadings	Wholesale Prices	Bank Clearings	Weekly Index
July 13, 1940	93.7	81.7	84.9	102.4
June 28, 1941	104.2	90.4	117.0	113.7
July 5, 1941	104.9	90.3	106.8	113.0
July 12, 1941	103.6	90.6	105.3	112.9

There has been the usual summer recession in some lines of manufacturing industry, such as the women's clothing industry, but the great majority of Canadian plants and factories are maintaining a higher scale of operations than in any recent summer. The primary iron and steel plants are hard pressed to meet the unprecedented demands for their output.

The Department of Munitions and Supplies has disclosed that it and its predecessors between June, 1939, and June 30, 1941, had awarded more than 135,000 contracts involving total expenditure of about \$1,931 millions, of which \$1,096 millions were placed on Canadian account and \$815 millions on British account; contracts in connection with land purchases and contracts in connection with the Commonwealth Air Scheme absorbed nearly \$20 millions. There has been an increase in the rate of contract placing which, in the quarter ended June 30th, attained its peak figure with a monthly average of 12,759, compared with 7,093 in the preceding quarter and 4,051 in the same quarter of 1940. The total outlays on new plants, plant extensions and their equipment was up to May 31st \$511.1 millions, of which 35 per cent was on Canadian account, 26 per cent on British and the remaining 35 per cent on joint account. Of the manufacturing capacity of these new plants, 22.7 per cent is being devoted to chemicals and explosives, 22.3 per cent to guns, munitions and carriages, 10.4 per cent to shells, 4.6 per cent and 26.6 per cent to miscellaneous goods.

It has been clear for some time past that for a further expansion of the national war effort there would be required an additional diversion of industrial equipment and labour, now devoted to the production of civilian goods, to the manufacture of war materials; and forecasts have been emanating from Ottawa that the Government is planning an extension of the present system of controls and priorities and also intends to exact sacrifices, by means of severe restrictions on consumption, on a much larger scale than is now demanded from the civilian population. A beginning has been made with petrol and other oil products for the purpose of meeting a threatened shortage occasioned by the withdrawal of oil tankers, which have been conveying oil to Canada for the needs of Britain. The sale and delivery of petroleum and allied products is now banned from 7 p.m. to 7 a.m. on week-days, and completely on Sundays; and the price of oil has been raised a cent a gallon. The object of this increase is to stimulate domestic oil production, which happily has shown a steady rise. The output of the oil-fields in Alberta for the first half of 1941 amounted to 4,784,000 barrels, an increase of 1,204,000 barrels over the figure for the same period of 1940, but domestic production still only furnishes a fraction of Canada's requirements. The public has been asked to curtail the use of private cars by 50 per cent, and it has been warned that if it does not co-operate, a rigid rationing system will be applied.

Sawfly after Grasshopper

The latest reports about the wheat crop of the Prairie provinces describe conditions as satisfactory in Manitoba, south-eastern Saskatchewan, south-western Alberta and the Peace River region, but only fair in west-central and north-east Saskatchewan, and decidedly poor in central and western Saskatchewan and eastern Alberta, where rain is urgently needed to check further deterioration. The grasshopper plague is not serious this year, but considerable damage has been done by another kind of insect pest, the

Letter to the Editor

Member of Parliament

TO THE EDITOR OF THE ECONOMIST.

SIR,—I have only had the opportunity on my return to London this afternoon to read in the issue of my last week's *Economist* your first article under the above title. I venture to suggest, with much respect and in all sincerity, that the extravagant attack which you make upon the dignity and prestige of the House of Commons is wholly unworthy of the high tradition and the quality and character of your great national weekly review. To employ the misguided actions of a single Member of Parliament as a pretext for a savage assault upon the whole *personnel* of the House of Commons is, I submit, not merely a violation of the decencies of responsible journalism, but an ill-considered effort to undermine the whole structure of democratic representative government, which, with all its faults, has borne the stress and strain of 800 years.

What useful, helpful, wholesome purpose does *The Economist* hope to serve in the presentation of a united Parliament fighting for the freedom of humanity and the maintenance of Christian civilisation as if its outstanding features were collective ineptitude with something of an approach to intellectual imbecility? Is this the contribution *The Economist* desires to make to world public opinion on the value of democracy as the form of government for the continuity of which the Allied nations are engaged in bloody conflict?

Members of the House of Commons cannot pretend to reach the exalted intellectual level of *The Economist*, but they can at all events claim the discharge of exacting duties in circumstances where sound judgment, intelligence and self-sacrifice are the essence of public service. The picture drawn by *The Economist* of the process of the selection of candidates is a grossly unfair travesty of the facts. During nearly 21 years in Parliament I have never known an instance in which the adoption of a candidate could be with justice included in the category of nepotism upon which *The Economist* expends so much picturesque invective. Local constituency committees are completely free in their choice of their representatives, and if more efficient and effective procedure can be made operative those who quarrel with the method should produce an alternative.

The Economist has rendered outstanding service to the nation and to the British Commonwealth for nearly a century in clarity of thought and vigour of exposition on economic, social and political affairs, but it renders a poor service in these days of "blood and sweat and tears" in its diatribe upon the competence and capacity of the greatest democratic assembly in the world.—Your obedient servant,

PATRICK HANNON,
M.P. for Birmingham (Moseley).

Carlton Club, S.W. 1.

[Sir Patrick Hannon has plainly not yet had time since his return to London to read this article with care. When he does he will see that, so far from being an attack on the dignity, prestige and tradition of the House of Commons, it was a plea on their behalf; and that, so far from being a criticism of the freedom that has broadened in Parliament for the last 800 years, it was an expression of regret at the way in which it has been narrowed by unworthy heirs in the last ten. So far from ignoring the fact that local constituency committees have free choice of the candidates, the gravamen of the charge made in this article was the irresponsible way in which that freedom has been used, and the pernicious criteria that have been applied to test the worthiness of possible candidates. The fact that there are misgivings in the Conservative Party itself on

saw-fly. In Ontario the drought has been broken by a series of rainfalls which have greatly improved growing crops and pastures, but they arrived too late to be of much benefit to the hay crop and the early grains. Pastures still remain deficient in most districts. The output of cheese for June was satisfactory; it was 25½ million pounds for the whole of Canada, compared with 16½ million pounds in May and 24 million in June, 1940. In Quebec heavy rains have benefited the crops, which, except hay, are well up to the average, and the outlook for the harvest in the maritime provinces and British Columbia is quite satisfactory.

these scores is familiar; and *The Economist's* concern for and belief in free Parliamentary institutions is too well known to need any exposition or defence. This is by no means the first time that *The Economist* has ventured to criticise on these grounds the *personnel* of the Baldwin-Chamberlain Parliaments, who opposed Mr Churchill in the critical pre-war years; and it will probably not be the last.—EDITOR.]

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE BUSINESS WORLD

Aircraft Shares

THOUGH the recent incipient renewal of activity in ordinary shares generally has not entirely by-passed the market for shares in aircraft manufacturing companies, it is still true to say that equities in the industry on which, more than all others, the nation's safety depends, are still priced to give an income yield commonly associated with pre-defaulted foreign bonds. A year ago, the five aircraft manufacturing shares in *The Actuaries' Index* stood at 40.2, to yield no less than 14.6 per cent. By the end of 1940, their price index had risen to 50.1 and their yield had fallen to 11.4 per cent. In the first quarter of this year, they tended to lose ground again, but after declining to 46.3 in February, they were back again last month at a higher level than that of December, 1940, with a price figure of 53.0 and a yield of 10.96 per cent. On the same day, July 29th, the average yield on the 159 ordinary shares in the complete *Actuaries' Index* (which represent a fair cross-section of the whole of British industry) was 5.63 per cent. It is not unfair to say, therefore, that the attitude of investors towards the prospects of the aircraft industry remains a little less than hostile, but more than sceptical.

Such a state of affairs would seem wholly paradoxical if, in this war of 100 per cent EPT and moral dividend limitation, the investor's distrust of war industries *per se* had not become a commonplace. No industry has shown greater expansion since pre-rearmament days than the aircraft industry, and in no other instance has the administrative machinery for "taking the profit out of war" reached so advanced a state of efficiency. Investors feel themselves in an unenviable position, between the respective swords of Jehu and Elisha; for surplus profits, which escape the severe control of contract prices imposed by the accountants of the Ministry, have short shrift from Sir

Kingsley Wood. Nominal rates of dividends are high—that result follows from the sheer volume of production and the fact that, unfavourable as is the industry's EPT standard in relation to contemporary activity, air re-armament started early enough in this country to allow of some increase in earnings before the end of 1937. And, for various reasons, the industry has financed its subsequent needs for increased working capital, for the most part, by means other than the issue of ordinary shares.

Since air re-armament began, indeed, the dividend policy of the leading aircraft concerns has been distinctly conservative. The following table, which shows, for each year from 1935 to the latest date available, the profits, percentage equity earnings and dividends of seven important companies, suggests that current dividend rates are not very much higher than they were in 1935-36, and that they have certainly not increased in the same proportion as total profits. It is true that, in one or two instances, there were bonus share issues before the war, but these represented merely the capitalisation of resources already accumulated and employed in the businesses, and, in one case at least, there had been an earlier writing down of capital in days of depression:—

(a) On capital increased by bonus issue of 3 shares for every 4 held. (b) 7.5 per cent on old capital and 7.5 per cent on new. (c) On capital increased by bonus issues. (d) 10 per cent subject to tax and 20 per cent tax free. (e) Of which 15 per cent paid on capital increased by bonus issue of one in four.

The table shows, clearly enough, that earning power was rapidly growing up to the outbreak of war. If the aggregate profits of the seven companies for accounting periods ending in 1936 be taken as 100, the corresponding figures are 161 for 1937, 189 for 1938 and 231 for 1939. The returns for the first full year of war are still incomplete, but those already published suggest, broadly, that the pace of the advance in profits has appreciably slowed down. In two out of five cases, the rate of dividend was reduced. One would probably not be unduly conservative in assuming that the latest figures represent the highest dividends shareholders are likely to receive during the war, and that the tendency will be, if anything, to "shade" them as the war proceeds.

The unpopularity of aircraft shares, however, is much less a function of any fear of a serious falling off in divisible earnings during the war, than of their virtual collapse when hostilities cease and the Royal Air Force returns to peace-time establishment. With 100 per cent EPT, plus capacity working, the return on particular contracts has become a secondary matter. The industry agreed with rela-

tively good grace to the lower profit percentages allowed by the Air Ministry in 1939, and the extent to which any given company is liable to hand over its profits to the tax-gatherer is to-day of much more immediate moment to shareholders than any question of gross earnings. The table shows that some concerns are decidedly more fortunate than others in their EPT bases. Rolls-Royce, for example, is fairly well placed, Hawker Siddeley moderately well placed, and Parnall, De Havilland and Fairey unfavourably placed. At the beginning of June, indeed, Parnall announced the omission of an interim dividend owing to the incidence of EPT and income-tax.

Even 100 per cent EPT, however, has its silver lining. It is unlikely to necessitate any really severe further cut in aircraft dividends as a whole, and it spares shareholders undue anxiety through the fact that, so long as the war lasts, national reasons will prevent their knowing much about actual working conditions in their industry. They have no longer any but a deferred interest in the volume of production or in profits over the EPT standard, except in so far as the 20 per cent remission of tax, promised by the last Finance Act, will tend to ease the problem of transfer to a much reduced basis of eventual peacetime activity. Even that, however, is of limited importance beside the main problem, which, more than anything else, explains the high yield on aircraft shares to-day. Where will post-war demand come from? And how great will it be? Until those questions are answered, there is no actuarial basis for valuing aircraft shares, however high the income which shareholders receive during the war.

Obviously, any estimate of service requirements in the post-war world, or of the rate at which civil aviation or export trade in British aircraft is likely to develop, must be, from the nature of things, a leap in the dark. A more profitable line of approach for investors, who realise the inevitability of post-war contraction of output, may be to endeavour to ascertain how far, in fact, the companies have actually extended their scope and financial commitments now. That may be a measure of their vulnerability later. The next table has a direct bearing on this question, for it shows, for each of the seven companies included in the preceding table, three indices of "financial extension"—namely the growth since 1938 of the balance-sheet figures of fixed assets, stock-in-trade and capital. The absence of complete figures for 1940 again somewhat detracts from any conclusions which may be drawn, but the general impression given by the returns is moderately reassuring. The companies appear to have financed a considerable increase in current output with a less than proportionate growth in their commitments on the capital side. Between 1938 and 1939, the valuation of the stock-in-trade and work-in-progress of six companies rose by 50 per cent, while between 1938 and 1940 the same figure for four companies showed a rise of 66 per cent. But (comparing 1939 with 1938) the growth, in book values, of fixed assets was only 13 per cent for six companies, and the increase in total issued capital was only 29 per cent for seven companies. Between 1938 and 1940, the respective increases for four and five companies were 19 per cent and 43 per cent. Presumably, devices like the Government shadow factory help to limit the financial hostages which the companies are required to give to fortune. Whatever the reason, however, there is at least *prima facie* evidence that, when the time for post-war "slimming" arrives, the

amount of financial flesh which the industry will have to lose will be appreciably less than proportionate to the cut in physical production.

All in all, while really conservative investors may tend to steer clear of aircraft shares until such times as they can put a firmer value on the unknown quantity in the post-war equation, the more enterprising type of investor may feel that the shares of a selection of the biggest companies, at least, offer a prospect which current prices do not value over-generously. As the final table shows, current Stock Exchange prices are near—and in some cases below—the lowest levels touched between 1935 and 1939.

† Tax free.

It may be reasonable to surmise that, whatever the terms of any eventual Peace Treaty, this country will not revert to an air force of anything like the small dimensions of the 1920's and early 1930's. Commercial aviation has itself great possibilities in the post-war world, which war developments will tend, generally, to hasten. Export trade may be extensive, though highly competitive. Broadly, while some of the smaller firms will have difficulties of their own to meet, the larger concerns may have a reasonable hope of obtaining and maintaining sufficient orders to afford a not unreasonable, if not over-generous, return on their capital, provided they can continue to keep its wartime extension within reasonable bounds.

Finance and Banking

Tighter Credit

The credit situation this week has been influenced mainly by the last minute rush of applications for 2½ per cent National War Bonds. Whether made for the banks' own accounts or for customers, these considerable subscriptions have eaten into the available volume of bank cash and supplies of credit have been correspondingly short throughout the week. On the whole, the banks have been very niggardly buyers of bills from the market, which at last week's tender for Treasury bills obtained a 30 per cent allotment on its quota application. There has consequently been a fairly good demand for money, and the rate for non-clearing bank loans has at no time dipped below 1 per cent.

The need to seek the help of the special buyer has at times appeared imminent, but the necessity for such operations has been removed in each case through fair buying of bills from one or other of the clearing banks. Such help has perhaps been made possible by special transactions between the clearing banks concerned and the Bank of England. The Bank has given some help to the cash position, as is shown by the increase of £6,085,000 in Government securities and of £2,060,000 in other securities shown by the latest Bank return. Despite this assistance, bankers' deposits have fallen by £12,723,000 to the low level of £96,127,000, while the reverse side of the position is shown in a rise of £19,766,000 in public deposits. The expected post-holiday

reflux of currency has not occurred, and the Bank return shows a further £1,153,000 expansion of the circulation over the week to last Wednesday, a movement which reduced the reserve of unissued notes to barely £12,000,000.

Banks and War Bonds

The suspension of the issue of 2½ per cent National War Bonds is of immediate concern to the banks and the discount market. These bonds with their five to seven years life are short enough to be eligible for banking and discount houses' portfolios, and there can be little doubt that a substantial proportion of the £440 millions subscribed to the last series represented the investment of banking funds. The 3 per cent Savings Bonds, whose final maturity date is 1965, are too long to be eligible for banks and discount houses except in small amounts, and while they remain the only available tap issue the flow of banking funds to the Exchequer will be somewhat disturbed. The general expectation is that within the next few weeks the Treasury will launch another issue of stock designed to appeal to the market and that in the meantime there may be greater reliance on Treasury deposit receipts. That reliance should, however, be minimised, first, by the fact that what should prove to be a good revenue period is now beginning, and, secondly, by the heavy subscriptions to the National War Bonds made in the final days of their tap sales. Notice of the suspension of their issue was given almost a week before the tap was turned off, and during this period banks and other institutional investors appear to have applied heavily for the issue. This anticipatory investment of banking funds will be reflected in the August clearing bank returns. It should minimise the dependence on Treasury deposits for a week or so, but it cannot postpone for much longer the need for another short to medium term issue.

Clearing Bank Statements

The expansion of banking credit is no longer interrupted by the customary seasonal influences; in the normal course, some contraction would be expected in July following the inflation of the June 30th figures. But the latest clearing bank statements reveal a further expansion of £44,862,000 in deposits. This movement understates the true expansion in bank credit last month, since cheques in course of collection and other transit items have over the same period fallen by £38,370,000. The outstanding factor in the credit expansion in July has been the rise in the banks' holding of bills, the movement totalling £81,545,000. This increase, occurring over a period when the Treasury bill issue rose by no more than £15,000,000 and when the

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

discount market was none too successful at the weekly tenders, raises some interesting questions—whether, for example, there may not have been some special direct sales of bills to the banks. The other outstanding increase in assets has been in investments which continue their steady expansion. Last month, this amounted to £22,228,000, and there is now only one of the 10 English clearing banks whose advances are not exceeded by their investments. Against these increases, Treasury deposits have fallen by £6,000,000 and advances by £5,789,000.

Doubts About Silver

Mr Morgenthau is reported to have announced this week that "he would raise no objection to the abandonment of the American silver purchase programme." In the immediate pre-war years, this announcement would have knocked the bottom out of the silver market. It has been received with complete indifference by the London market where the spot price for the metal recovered momentarily to 23½d. So much for the insulation of a market in which the turnover has become negligible and which is closely hemmed by the restrictions on the free import and export of the metal. It is not surprising that, after eight inglorious years, the silver purchasing programme should have lost the sympathy of the United States Administration. Its monetary significance was lost many years ago. Its importance in the domestic politics of the country has likewise dwindled. As long as the American Treasury continues to pay a subsidised price for domestic silver, the abandonment of the rest of the purchasing programme would probably raise no single cry of resentment in the United States. The interests of China in the programme have largely disappeared since the Chungking Government have probably shipped most of their reserves of demonetised silver to the United States, and such metal as now makes its way out of the country is in most cases looted silver exported with Japanese connivance and destined ultimately to strengthen Japanese exchange reserves. Mexico is vitally interested in the silver programme, but the disposal of her important production is already being handled through a bilateral Mexican-American agreement and not under the general provisions of the silver purchasing programme. Though the market has ignored Mr Morgenthau's remarks, it should be evident that if the silver programme is abandoned, and if the United States Treasury no longer publishes a price at which it will buy imported metal, the anchor to which the world price of silver has for many years been tied will be removed. The subsequent adjustment of the world price is a phenomenon about which no confident prediction is possible. Much must, in any case, depend on the policy of the American Treasury, which, as the holder of the world's largest stock of the metal, will, whether it likes it or not, be the arbiter of the metal's fate. If it refuses to buy, there may be an appreciable slump in the price. If it attempts to sell, the word "slump" would be quite inadequate to describe the movement in the quotation.

Shanghai Dollar Fluctuations

The rate of the Shanghai dollar has plumbed new depths this week. In terms of sterling it has fallen to 2½d.-3½d. though there has since been a modest recovery to 2½d.-3½d. The market is still in the greatest uncertainty concerning the interpretation of the freezing order on Chinese assets and on those of the International Settlement in particular, but by dint of almost continuous negotiations between the interested parties in Chungking, New York and London, the position is gradually clearing up. There is reason to hope that the new Chinese Currency Stabilisation Board may before many days provide the effective freed dollar and sterling resources of the Chungking Government. The composition of the Board has at last been completed with the appointment, as British representative, of Mr Edmund Leo Hall-Patch, Financial Commissioner in the Far East. That fact was largely responsible for the slight recovery in the Shanghai rate in mid-week.

Instalment Credit in the United States

American concern at the inflationary potential in that country and at explosive material in the defence programme ready to convert that potential into an inflationary conflagration is evident in the moves taken this week to control instalment credit. The Federal Reserve Board has been

authorised by the President to take any lawful steps necessary to bring such control immediately into being. The obvious intention of this move is to curtail the sales of durable consumption goods such as motor cars, refrigerators and vacuum cleaners, which provide the main civilian competition for steel and industrial capacity increasingly required for defence needs. It is estimated that there are about \$5,000,000,000 of instalment finance debts outstanding in the United States and that about half this figure represents amounts owing in respect of motor car purchases. The method of controlling such credit has not yet been announced, but it is clear that the most direct and likely approach to the problem will be a tightening of the facilities for discounting and re-discounting instalment finance paper by the Federal Reserve system. It is also expected that the authorities will issue instructions to member banks

on the question of personal loans. Such instructions will probably be similar to those issued soon after the outbreak of the war to British banks, to discourage any accommodation that was not directly or indirectly linked with the war effort. The need for such preventive anti-inflationary measures in the United States is greater than it was here because of the absence of specific rationing schemes, and the presence of a huge mass of surplus bank cash.

Marine or War Risk—A Correction

The date of the stranding of the *Coxwold* was May 7, 1940, not May 17th, as was stated last week. On May 8, 1940, different provisions came into force which would have affected the question of liability if the casualty had occurred after that date.

Investment

A Hesitant Market

Uncertainty regarding the future of Government loan policy was probably a more potent influence in restraining the volume of business this week than uncertainty as to Russian capacity to stem the drive to Odessa. With obscurity still clouding Japanese intentions toward Thailand and the U.S.S.R. and the foreign bond market goaded to alternate waves of optimism and pessimism, it is small wonder that investors last week were in general content to bide their time and to absorb larger holdings of 2½ per cent National War Bonds 1946/48 before the "tap" was turned off at the close of dealings on Thursday last. The following table indicates the movements in a relatively stagnant gilt edged market in the interval between announcing and carrying through the discontinuation of the second issue of 2½ per cent War Bonds.

GILT-EDGED MOVEMENTS						Change since Aug. 7
	Aug. 7	Aug. 8	Aug. 11	Aug. 12	Aug. 13

F.N. fixed interest index	129.8	130.0	129.9	129.9	129.8	—

The effect of the announcement was to promote interest in the remaining short and medium term issues, coupled with a movement away from 2½ per cent War Bonds 1945/47. Long term and undated issues remained under a cloud, though it is probable that a recovery is by now overdue. Shortage of stock in the industrial sections of the market raised the prices of many industrial equities, among which the brewery group continued to hold a prominent place. Outside the gilt edged market, the prevailing opinion reason for comparative quiescence, the prevailing opinion that a critical phase of the war is about to be reached prevented large scale business from developing.

Turning off the Tap

Sir Kingsley Wood's announcement on August 7th that the issue of 2½ per cent National War Bonds, 1946-48, was to be discontinued as from the close of the dealings on August 14th was received with surprise by the market. The general expectation that a new series of bonds would be issued immediately has proved incorrect, and the Government is, for the present, to revert to the practice of relying on only one tap issue for the absorption of current savings where maximum holdings of Savings Cer-

tificates and 3 per cent Defence Bonds have already been acquired, namely the medium-term 3 per cent Savings Bonds, 1955-65. The winding up of the second issue of 2½ per cent National War Bonds brings the total yield to £433,618,720 at August 12, 1941, whereas the total yield of the first issue, 2½ per cent National War Bonds, 1945-47, amounted to some £444,440,000. Three per cent Savings Bonds, however, in the whole period of their currency of thirty-three weeks, have yielded only £279,824,779. The implications of the decision from the standpoint of general financial policy are discussed in a Note on p. 197 of the current issue. The Treasury decision, in fact, appears to be more important for its method than for its content. There can be little doubt that a new Government issue will be made before long, but it is not clear whether the Treasury will choose to make an offer of the old style or again to make use of the tap. By cutting off the source of short-dated tap issues, an attempt is, however, being made to tickle the investor's appetite for more Government loan by creating a relative scarcity. From the market angle, this means that there is, for the first time, a real market in the second 2½ per cent War Bond issue, as there has been in the first issue since it was discontinued and replaced on slightly less favourable terms at the beginning of the year. In the second place, it means that the would-be investor in tap issues is driven to a rather later maturity date. The decision to increase the maximum currency, but not the maximum individual holding, of 3 per cent Defence Bonds from September 1st next tends in the same direction; to necessitate investment for a longer period, when it may be assumed that, on the whole, long-term holdings at low rates are not in the investors' favour, and thus to whet the appetite for new shorter-dated issues. A minor consideration is that the yield on 3 per cent Savings Bonds, which has so far been relatively neglected, will presumably be raised to a more respectable total. In short, the Treasury appears to have decided to prepare the field for the next issue by subtlety rather than by force. The only question which remains is the date at which the next issue may be expected.

Commonwealth Mining Reorganisation

Far reaching amendments to the original schemes for re-organisation of the De Bernaldes group of Australian mining companies which were approved by meetings of shareholders somewhat hastily convened at the end of December last, have now been put forward as joint recommendations of shareholders' committees and the boards of the companies concerned. The original schemes proposed, in effect, that the British companies should be reduced to two in number which should control the Australian companies amalgamated into one concern. The latest amendments propose that the Australian mining companies shall be acquired by an existing Australian company, Emu Gold Mines, which has recently changed its name to Australian Gold Production. The Australian companies, Comet and Yellowdine, are, however, to be omitted from the re-organisation, and their shares are to be distributed among the shareholders in the British companies interested, the seven British companies being placed in voluntary liquidation. Finally, certain assets of the De Bernaldes family companies

are to be acquired for cash. Thus, under the new scheme, shareholders will hold direct interests in the three Australian companies, Comet Gold Mines, Yellowdine Gold Development and Australian Gold Production. Application is to be made to the stock exchanges in London and Australia for permission to deal in the shares of these three companies. It is clear that the new proposals in no way affect the basic profit-earning capacity of the group. Whether or not the shareholders would ultimately benefit from the change depends upon the character and soundness of future management rather than upon the form in which the enterprise is cast. It cannot be assumed automatically that Treasury approval will be forthcoming for a scheme which will, in effect, transfer the group to Australia, since Treasury sanction was withheld for a similar proposal by Great Boulder Proprietary, another De Bernales company. It is also unclear whether the London Stock Exchange will accede to the request for a resumption of dealing in the shares of the group. On the detail of the latest scheme, it may be suggested that the transfer of assets of the De Bernales family companies to Comet Co. and Australian Gold Production should be placed on the same paper transaction basis proposed in the case of the transfer of shares in Comet and Yellowdine to the British shareholders, unless, of course, there is some adequate reason for the course proposed.

Reactions to Rule 92a

The denial of London Stock Exchange facilities to Messrs Cyril Nicholson and Company, of Sheffield, under Rule 92a, which was discussed on page 178 of *The Economist* last week, has had the reactions, so far, which might have been expected. As Parliament is not sitting, no questions, criticising by implication the policy of "the Throgmorton Street Stock Exchange" can be put, and the most influential voice which has publicly been raised in protest against the Committee's decision has been that of Mr. K. Milliken Smith, chairman of the Birmingham Stock Exchange. In a letter to a daily financial newspaper, Mr. Smith reiterates the well known fact that the Associated Stock Exchanges, operating in large towns and cities in the provinces, were not unanimous in supporting the "non-member jobbing" rule, but were swung round by the action of the four largest. On the London Stock Exchange itself, opinion is determined rather than enthusiastic; for even the appearance of restraint of trade is repugnant to most members. The consensus of view, however, is that the Committee's decision was implicit in the new rule when it was passed, and that the matter had best be squarely fought out once for all. The efficiency of Nicholson's, by far the largest firm of outside jobbers in the country, is recognised ungrudgingly, even in the "House" itself. It is believed that it will continue to transact a widespread business under the new conditions, and may well succeed in devising a technique for extending its own "self-sufficiency" in jobbing to many securities and dealings in respect of which it would normally have drawn on London's facilities. If London's action tended merely to introduce a species of tariff and quota element into national security dealings, it would be deplorable, and the argument that London has acted only in self-defence does not entirely meet this implied criticism. The only ultimately satisfactory reply would be the use of the advantages brought by the new rules as a whole (including those reducing the scales of commission rebates to outside agents) to improve the Stock Exchange's own facilities to its clients—particularly by way of a reduction at the first opportunity in the general level of commissions. The corollary to the "protection" which the Stock Exchange claims for itself is receptiveness to all feasible suggestions for raising the quality and lowering the price of the services which the Stock Exchange alone can provide.

Associated British Picture Deal

The terms on which the sale of approximately half Mrs John Maxwell's holding in Associated British Picture Corporation to Warner Brothers has been concluded appear to be satisfactory from the national as well as from the personal standpoint. Mrs John Maxwell, who formerly held rather more than half of the corporation's £2,000,000 issued ordinary capital, has disposed of only some 2,000,000 5s. ordinary shares, or approximately one-quarter of the total ordinary capital. The transaction will be made against

dollars, which will in consequence form a welcome addition to Treasury holdings, and not against blocked sterling balances. It is stated that the terms of the sale ensure that full freedom of action remains with the corporation. Representative directors are to be appointed to the board by Mrs John Maxwell and Warner Brothers. Associated British Pictures is interested both in production and distribution, owning Associated British Cinemas, Pathé Pictures and British Instructional Films and controlling Union Cinemas. As the corporation occupies a leading position in both branches of the British film industry, it is satisfactory that control will remain in this country. The infusion of an American interest may well serve to improve technique and administration. Last year, no dividend was paid on the ordinary shares of the corporation, which received 20 per cent in 1938-39, business having been severely prejudiced by war conditions. Despite this inevitable setback, market confidence in the future of the concern is indicated by the current price of the 5s. ordinary shares, which now stand at 7s. 7½d.

Company Notes

Courtaulds' Sacrifice

In view of the feeling among many of the 80,000 stockholders in Courtaulds that an early statement should be made about the prospects of negotiations, formal or informal, on the question of compensation for the sale of the American Viscose shares, interest attaches to certain estimates of the probable capital value of Courtaulds' sacrifice which were made this week by *The Financial News*. A survey of American Viscose profits for the last ten years brings out the fact that any reasonable capitalisation of average earning power (say, on the basis of ten times the mean profit of the decade) would give a figure differing hardly at all from the cash proceeds actually received by the British Treasury (\$56 millions against \$54½ millions). The British company, however, may reply that the low level of average earnings was the basic reason for the decision to embark on an extensive programme of new capital expenditure under which, between the end of 1938 and last March, some \$47 millions had been employed in the modernisation of American Viscose. Already in 1940, earnings had risen to a point which would give a capitalised value (on the ten years' purchase basis) of \$72 millions. A capitalisation on similar lines on the written-down balance sheet values of American Viscose gives a figure of \$102 millions, which is raised to \$114 millions if a special reserve (representing past depreciation charged back, as it was in a statement made by the directors of Courtaulds last June. Even the last figure, however, though it is more than twice the amount received by the British Treasury, allows nothing for a number of considerations which, it could be urged, should, in equity, be taken into account in assessing the loss which Courtaulds have suffered. These include goodwill (valued at \$25 millions on the incorporation of American Viscose in 1922), the rapidly growing business and wide potentialities of the making of staple fibre and the loss to Courtaulds of their position in the largest domestic market in the world. All in all, the weight of evidence seems to support the view that the sacrifice rather than the sale price should be the measure of the compensation paid to the British company.

Richard Thomas Progress

As was forecast last year, the Richard Thomas accounts for the year to March 29, 1941, show a further substantial rise in consolidated profits from £3,171,296 to £4,000,172, enabling a payment to be made for the first time since 1937-38 to the company's preference shareholders. No doubt the rise in consolidated earnings would have been even higher but for the difficulty of keeping the Ebbw Vale plant running at full capacity. Tax liability for the group rose from £1,159,704 to £1,671,036, while depreciation, including extraordinary and capital expenditure written off, at £830,382, remains at approximately the previous year's level. Thus, the surplus for dividends is increased from £566,871 to £861,809. Unfortunately for shareholders, the company has to meet an estimated war damage contribution of £200,000. The amount due under agreements and compensation is reduced from £177,500 to £10,000, but a sum

of £363,677 has conservatively been drawn from profits to write down the book values of stocks. Thus, £288,132 is available to meet the requirements of shareholders.

(a) Including amounts written off. (b) After transferring £200,000 from general reserve. (c) Ebbw Vale costs: £337,212 running-in loss and £200,000 being proportion of debenture interests attributable to reconstruction. (d) Commutation of interests due under agreements and compensation. (e) Of amounts due under agreements and compensation. (f) Including £107,492 from contingencies and £179,793 from general reserves. (g) Including £41,118 special credit. (h) War Damage contribution, £200,000; written off stocks, March 29, 1941, £363,677; agreements and compensation, £10,000.

After paying one year's dividend to the Richard Thomas preference shareholders and placing £100,000 to general reserve, the carry forward of the group is raised from £454,759 to £541,480. The carry forward of the parent company is increased from £32,100 to £153,297. Prospects for the current year are obscure, but there is every probability that the payment on preference capital can be maintained. The consolidated balance sheet shows a rise of more than £1,000,000 in stocks to £4,375,881 and debtors are up from £3,145,176 to £4,603,822. The acquisition of £345,000 of National War Bonds has depleted cash holdings by approximately the same amount. Despite a rise in current liabilities from £3,894,092 to £5,593,884, the surplus of current assets is increased from £3,515,491 to £4,381,130. General reserves are up from £947,714 to £1,311,356. The £1 6½ per cent preference shares at 16s. 10½d. ex dividend yield £7 14s. per cent. The 6s. 8d. ordinary shares now stand at 3s. 10½d.

Watney, Combe Reid Earnings

The full accounts of Watney, Combe Reid for the year to June 30th last show, as was to be expected, a moderate fall in gross income from £2,549,290 to £2,391,104. Expenses have been strictly controlled, but, with a rise in the allocation to repairs and depreciation from £230,617 to £250,958, equity earnings are nearly £150,000 lower at £694,934, representing a rate of 28.6 against 32.2 per cent. Deferred stockholders receive a dividend of 15 per cent, the interim payment having been cut by 2 per cent. After transferring £200,000 against £300,000 to property improvement reserve, the carry-forward is rather higher at £328,961 against £311,838.

‡ Including a cash bonus of 3 per cent. in 1939 and 2 per cent. in 1940.

The company's liability for war damage insurance, which is estimated at £275,000, is provided by a draft on property improvement reserve, and £173,000 has been drawn from this fund for current expenditure last year. The balance-sheet total of the reserve now stands at £525,455. The chairman, Colonel Oswald Pearce Serocold, states that sales remained practically constant, an improvement in the second six months having compensated an early setback. The company has, of course, been hampered by the high price of barley and by difficulties in obtaining raw materials; there have also been some labour difficulties; and, generally speaking, it is unlikely that these difficulties will diminish this year. The balance sheet shows no marked change. The total of stocks and stores, beer and casks, etc., is up from £1,062,008 to £1,162,105. Investments, other than trade investments, are down from £1,124,544 to £974,482—market value £1,046,403—while cash holdings have increased from £361,897 to £466,315. General reserve is unchanged at £1,000,000 and the newly-created war damage contribution reserve stands in the balance sheet at £267,333. Despite the difficulties of the past year, which provided a sound argument for reducing the ordinary payment and conserving resources, there is still an ample margin of cover for the deferred stockholder and the position is by no means discouraging. The £1 deferred stock, after the rise of recent weeks, stands at 50s. ex dividend and offers a sound yield of £6 per cent.

Morris Motors Accounts

The setback to the gross profits of Morris Motors in the year to December 31st last from £2,385,568 to £1,951,442, leaves the total still nearly £200,000 above the level for 1938. The decline, as the directors indicate in the report, must be attributed to inability in present conditions to keep plant running to capacity throughout the year. The net profit figure amounts to £1,520,913, against £1,991,947, from which must be deducted a higher tax provision of £774,282 against £628,721, but A.R.P. and special war contingency allocations totalling only £172,537, against £405,611. After meeting preference dividends, the equity surplus is down from £732,615 to £349,094, at which level it fails to cover the total ordinary payment of 17½ per cent., tax free, and there is a consequent draft of £100,000 on dividend equalisation reserve. The payment of the 17½ per cent ordinary dividend, free of tax, against the payment, less tax, of 40 per cent. in 1939, involves an effective cut in the rate of 5 per cent., less tax. In the previous year, £75,000 was credited to dividend equalisation, at which total the fund now stands in the balance-sheet. The carry forward is moderately reduced from £248,450 to £233,794.

* Including other income after charging staff fund allocations. † Dividend equalisation reserve. ‡ Tax free.

The consolidated statement shows a rise in current assets from £8,569,621 to £9,985,868, the most substantial increase being in debtors from £851,443 to £1,723,655. Holdings of Government securities at market price are down from £1,976,510 to £1,267,465, a decline which is partly compensated by cash holdings of £968,162, against £504,176. Stocks and work in progress are up from £3,260,175 to £4,003,769. On the liabilities side of the account, the most striking rise is that in taxation charges from £186,057 to £984,941. Reserves for contingencies are raised from £614,816 to £900,542, and general reserve remains at £3,250,000. The 5s. ordinary stock at 30s. yields £2 18s. 8d. per cent, tax free.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

AFTER a firm close at the week-end, markets opened on a subdued note on Monday under the influence of the news from the Ukraine and continued Japanese tension. There was, however, little selling, and price changes were small and irregular. Uncertainty regarding the future of Government loan policy was responsible for a quiet gilt edged market, investors concentrating on industrial equities, among which breweries, tobacco and shipping issues were favoured. Elsewhere, Argentine rail issues were a good feature, but Far Eastern tin and rubber issues were subdued for military reasons.

The firm tone of the gilt-edged market before the week-end was not maintained in the earlier part of the current week. The decision to terminate the tap issue of the 2½ per cent N.W. Bonds, 1946-48, led to a final bout of buying, but long-term issues lacked support. On Monday 3 per cent Conversion and 2½ per cent N.W. Bonds, 1945-47, eased ¼ and ½ respectively, while the following day 2½ per cent Consols, 3½ per cent Conversion and War Loan, Local Loans and 4 per cent Funding all lost ¼. In midweek, 3 and 5 per cent Conversion each gained ¼. The main feature of the foreign bond market was the alternating waves of optimism and pessimism which raised the 6 per cent Japanese loan of 1924 and the 5½ per cent loan of 1930 by 2 points on Tuesday, various other issues gaining 1 point, after considerable selling both before and after the week-end. Chinese bonds ruled mainly firm, although there was some irregularity in the 5 per cent issue of 1913. In other directions, the Dawes and Young loans lost ground before the week-end, while Poland 4½ per cent 1927 gained a point on Tuesday. Midweek saw a fresh demand for Brazilian bonds and French railways improved fractionally.

The home rail market was dull and small losses predominated among junior stocks. On Monday "Brum" 5 per cent. Redeemable, 1955, rose 2 points and "Berwick" 5 per cent. preference, 1955, 1 point. GWR ordinary dropped ½, and LMS ordinary and Southern deferred ¼. London Transport "C" was a good feature, gaining 1½ points on Monday. The following day many senior issues were weak, but losses did not exceed ½ point. The foreign rail market was cheerful, and improved demand coupled with lack of stock led to good rises in Argentine issues, B.A. Pacific 4 per cent debentures gaining 3 points on Monday. Canadian Pacific ordinary was steadily in demand.

In the industrial market, brewery shares continued to attract considerable demand. Before the week-end, Bass, Charrington and Courage rose 2s., while Watney defd. jumped 4s. on the unexpectedly good dividend. In the early part of the week, further increases took place, but Watney defd. and Courage reacted. Both the motors and aircraft and the heavy industrial group moved irregularly and price movements were generally trifling. Austin, Dennis, Morris and Lucas, among motors, and John Brown, Guest Keen and Richard Thomas preference suffered small losses at the beginning of the week, but BSA and Cammell Laird attracted demand. Many movements were reversed in the course of the week's trading. There was little business in the miscellaneous section, although Turner & Newall and

Murex both improved on Tuesday when International Nickel and Brazilian Traction reversed previous losses of ½. The textile group failed to hold early gains, but the shipping section showed considerable strength, E. & O. Defd. gaining 1s. 1½d. on Tuesday followed by 10½d. the next day. The tobacco leaders gained ground after losses of ½ for Imps and BATS on Monday.

The commodity share markets were overshadowed by the uncertainty of Japanese intentions. Kaffirs suffered numerous losses in the order of ½ which in the early part of the week extended to Johnnies, Grootveit, Sallies and E. Daggas, while Durban Deep and West Wit Areas were ½ down. The threatening political situation in the Far East was responsible for a number of fractional losses in the rubber market. Golden Hope, Straits Rubber and Malayalam lost a few pence each and price movements were generally lower. The oil market closed firmly before the week-end, but on Tuesday, Anglo-Iranian ordinary, VOC and Trinidad Leaseholds eased ½ and the recent upward movement of Canadian and Mexican Eagles was reversed. Later, Anglo-Iranian and "Shell" Transport ordinary and Burmah Oil were all offered in a small way.

New York

BOTH before the last weekend and during the current week, Wall Street continued to be ruled by fears relating to State tax policy and by uncertainty as to the next moves in the war. Before the week-end there was some pressure to realise holdings and, despite occasional resistance, most issues lost up to 1 point. This week, business became extremely slow and price changes were narrower, with fractional losses still predominating. Steel, motor, aircraft and copper issues were all sold and hesitation remained the dominant sentiment. In midweek prices showed a firmer tendency.

The Iron Age estimates steel mill activity at 98.5 per cent. of capacity against 99.5 per cent. in the previous week.

Shorter Comments

International Nickel Company of Canada.—Earnings first half of 1941 \$38,864,808 (\$33,266,636). Net income, before tax and depreciation, \$38,409,671 (\$32,651,907). Tax provision \$15,189,325 (\$9,246,823). To depreciation and other purposes \$5,904,739 (\$5,344,791). Net profit, six months, after tax, \$17,315,607 (\$18,060,293). Earned surplus \$77,518,240, an increase since beginning of year of \$1,770,488.

Celanese Corp. of America.—Gross income year ended June 30, 1941, \$18,434,541 (\$16,041,693), exes. \$3,924,091 (\$3,622,962), total inc. \$14,552,826 (\$12,809,642), dep. (\$2,601,927) (\$2,067,481) debt. int. \$775,449 (\$603,097), amortisation \$237,636 (\$27,258), tax provision \$5,755,788 (\$2,182,898). Net income \$5,182,024 (\$7,868,906).

Industry and Trade

Dwindling Unemployment

The number of persons on the registers of employment exchanges in Great Britain is still dwindling. On July 14th, the total number of registered unemployed was 277,300, against 301,900 on June 16th and 827,300 on July 15th, 1940. The reduction was widespread, for in each of the eleven administrative divisions, the number registered was smaller than in June. The number of persons temporarily stopped, and unemployment among casual labour, showed little change between June and July; the number in the first category declined from 47,700 to 46,000, while that in the second rose slightly from 10,500 to 11,700. The number of wholly unemployed fell from 243,700 in June to 219,600 in July; on July 14th, this category included 102,000 men, against 110,400 on June 16th, and 88,900 women, against 102,200 in the previous month. While there is still scope for a further reduction in the number of registered unemployed, the size of the available labour force officially recorded as unemployed is now small. The bulk of the new recruits to the war stations must now be obtained from unessential and overstaffed occupations. The Ministry of Labour's decision to comb out domestic staffs is, therefore, to be welcomed; but, apart from domestic servants, there are still large numbers of persons who can be withdrawn from their present occupations and absorbed into the war effort.

Clothes Coupons Changes

Further changes in the coupon values of certain garments which became effective on August 12th relate largely to the amount of material needed in their manufacture. Among women's garments the bolero and short cape, originally rated at 2 coupons, developed in the hands of some manufacturers into a very substantial garment, with sleeves and collar, using, in many cases, more material than a cardigan, hitherto rated at 8 coupons. The rating of 2 coupons for a bolero applies now only to the less substantial of these garments, and those which have sleeves and are woollen or leather, are now rated at 5 coupons; those fulfilling only one of these last three conditions are rated at 3 coupons. Woollen cardigans, sweaters, jumpers or jerseys, are now rated according to weight. Such garments, whatever the length of sleeve, weighing 10 oz or more for adults, or 7 ozs or above for children, will take the higher rate of 8 or 5 coupons, which originally applied if the garment had long sleeves. The lower rates of 5 and 3 coupons apply to garments under 10 ozs and 7 ozs respectively. Overcoats and raincoats were previously rated at 16 coupons for men, 15 for women and 11 for children. These garments have now been divided into two classes; those fully lined and either woollen, leather or fur are now rated at 18 coupons for men and women and 11 for children, those partly lined woollen, lined cotton, and others, are rated at 16 for men, 15 for women, and 10 for children. In each case, the revision has been made on a basis of material expended, and, as such, is in complete accord with the underlying principles of clothes rationing. Other new and amended ratings in this group are concerned with various items of women's underwear, sashes and scarves, gloves and mittens. No decision has yet been made regarding workers' protective clothing. Notification has been received classifying certain garments on which there has been some doubt. It is now made clear that the distinction between women's three-quarter length coats and full length coats has no bearing on girls' and children's coats, on which the rating is irrespective of the length of the garment. It is also made clear that the lower rates of coupons apply to garments exempt from purchase tax, whatever the reason, and to no others. Thus, children's garments and footwear containing fur, skin or silk are subject to purchase tax and therefore require coupons as for adults, but miners' protective boots which are free of purchase tax, require 2 coupons.

Although at the introduction of clothes rationing on June 1st, babies' clothes were exempted, it became clear that if mothers were to be in a position to make clothes for their children, babies' clothes must be rationed, so that the

knitting mother was not at a disadvantage compared with the one who bought a ready made layette. By an Order coming into force on August 12th, all baby clothes are rationed, and an expectant mother was entitled, from August 5th, on production of a certificate of pregnancy, to an issue of 50 coupons. In addition to these, the baby, on birth, is to receive an ordinary clothing card. During the current ration period, a proportion of a year's coupons will be issued to each child. The allowance of 50 coupons is somewhat small, presumably to encourage the handing on of used baby clothing. Coupon values vary from one-third of a coupon for such garments as bibs and binders to 6 coupons for a fully lined woollen overcoat. It is not easy, however, to see why napkins of the towelling variety should be rationed (at one coupon) when towels of every other description are exempt.

Retail Trade in June

The retail trade returns for June, published in the *Board of Trade Journal*, show an increase of 0.6 per cent in average daily sales compared with the figure for the corresponding month last year. The value of sales was bigger than a year ago in all the districts with the exception of Suburban London. The figures for Central London, where sales had been below the previous year's level for many months, actually showed an increase of 9.4 per cent in June. The increase in total turnover was caused by an improvement in non-food sales. The course of food and other sales since August last year is shown below:—

	Percentage Changes from Preceding Year	
	Food and Perishables	Other Merchandise
1940 August	+ 5.4	+ 21.0
September	- 11.5	+ 6.7
October	- 5.2	+ 20.9
November	- 0.3	+ 1.3
December	+ 0.8	- 6.7
1941 January	+ 5.8	- 8.8
February	+ 3.5	+ 1.8
March	- 2.1	- 2.1
April	+ 0.9	+ 2.9
May	- 4.3	- 2.4
June	- 3.1	+ 6.8

As the table on page 214 shows, the increase of 6.8 per cent in non-food sales compared with June, 1940, can be ascribed largely to the introduction of clothes rationing at the beginning of the month which prompted a rush to buy. The returns of the wholesale trade in textiles, issued by the Wholesale Textile Association in collaboration with the Bank of England, show a similar spurt. Thus, domestic sales of textiles in June showed an increase of no less than 26 per cent on the figures for the corresponding month last year.

"Barter" in Croydon

Enthusiastic digging for victory and good weather have given many back-garden agriculturalists a harvest well in excess of their own individual requirements. Some part of this excess is absorbed by private trading with friends and neighbours, but absence of transport and access to the usual market facilities were bound to lead to a demand for their own markets. It was left to the enterprise of a department store to fulfill this function for Croydon, where, on August 10th, such a market was opened. Allotment holders and small back-garden growers were invited to exchange their surplus produce at the store for such things as clothes and furniture. It was inevitable that such an enterprise should develop on an exchange basis; but, as such, it is far from being without interest. Conditions of pure barter in a free market obviously did not apply, since there was already a monopoly existing in the person of the department store. Again, barter was ruled out by the floating of a token currency in the shape of the voucher, in terms of ordinary currency, which could be exchanged in other departments of the store. The difficulties, in this complex economic system, of evaluating silk stockings in terms of vegetable marrows could not but prove too great, par-

ticularly when the transactions were governed by the existing price control system. It is in many ways a pity, however, that so many complications were, perforce, introduced into what might otherwise have been a series of exchanges of the classical simplicity, so beloved of writers of economic text-books. Even Marshall had to make heavy calls on his fertile imagination to conjure up illustrations of the simple market, and recourse to the marketing habits of primitive people is not always possible for the hard-working economist. A valuable field of research for the economic anthropologist has therefore been lost but, no doubt the small crop producers of Croydon have been the gainers thereby.

Export of Wool Textiles

Information has now been released, writes a correspondent, concerning the export trade in wool, tops, yarns and piece-goods during the second quarter of the year. There was no notable variation from the volume of shipments during the first quarter. Exports of woollen tissues were about 1,500,000 sq yds higher, but this was offset by a decrease of about 2,000,000 sq yds in worsteds. The returns for the April-June quarter are appended, with corresponding figures for the three preceding quarters:—

	July to Sept., 1940	Oct. to Dec., 1940	Jan. to Mar., 1941	April to June, 1941
	sq. yds.	sq. yds.	sq. yds.	sq. yds.
Woollen Tissues ...	11,418	7,558	8,907	10,472
Worsted Tissues ...	9,197	5,357	6,406	4,457
Total Tissues...	20,615	12,915	15,313	14,929
	lbs.	lbs.	lbs.	lbs.
Worsted Yarns ...	2,162	2,137	2,114	2,224
Woollen Yarns	545	362	296	277
Tops (combed wool)	5,332	4,929	4,278	4,477

No details are disclosed regarding the destination of exports, but it is well known in the trade that the best market for fully-manufactured goods is the United States. Considerable quantities have also been shipped to Canada and to the South American Republics, especially to Argentina.

New System of Cotton Allocation

A new system for allocating supplies of cotton yarn to the various types of demand was introduced on August 11th by the Cotton Control. The existing Preference Directions system which has been operating since February 1940 has been abandoned. In its place, a system has been adopted whereby the delivery of yarn spun from raw cotton, waste or rayon staple fibre will, in future, be licensed only against approved orders. This licence system applies also to yarn produced for their own consumption by spinner manufacturers and spinner doublers. The available raw cotton will be sub-divided into the following sections: (1) Government departments; (2) certain industries outside the cotton industry; (3) essential home services; (4) export and (5) civilian home trade. Approval will be based on certificates issued by Government depart-

ments, organisations appointed for the purpose in the case of certain consuming industries, and the Cotton Control. The great advantage of the new system over the Preference Directions system is that authorisation from the Control at each stage between the placing of a contract and the delivery of the yarn, is cut out. There appears to be some confusion, at present, among traders about how the new arrangement will work, but while the new system is coming into full operation, in order to avoid interruption of work on essential orders, spinners will be licensed to continue deliveries against existing contracts.

Changes in Sugar Supplies

Apart from transport difficulties, Great Britain's sugar supply position is now much better than it was in the last war. In 1913 some two-thirds of imports came from the Continent, while home production was negligible. During the twelve months preceding the present war, more than one-half of total imports were drawn from the Empire and the remainder from other overseas territories, such as Cuba and Java. Moreover, a substantial proportion of requirements was met from domestic supplies. During the first two years of the war, virtually the whole of Great Britain's consumption, curtailed by rationing from about 2,500,000 tons to less than 1,500,000 tons per annum, was satisfied from the Empire and from the domestic crop. The Ministry of Food, together with the Dominion Governments of Canada and New Zealand, acquired the whole exportable surplus of Australia, South Africa, Mauritius, Fiji and the British West Indies of about 1,750,000 tons per season, of which Great Britain received about 1,250,000 tons. Domestic production from beet has requirements will continue to be based on the Empire surplus for the duration of the war, there are indications now that certain changes in policy are under way. It was reported this week that the Ministry of Food had acquired 100,000 tons of Cuban sugar for delivery in September and October next; a similar tonnage of Cuban and San Domingo sugar had been bought for the first time since the outbreak of this war in April last. Although no official explanation for these purchases against dollars has been given, there may be two reasons for them. The first is connected with the international sugar agreement of 1937, which, despite Britain, as the chief free sugar importing country, accepted the obligation not to cut out foreign sugar. Although there can be no question of importing Latin American sugar at the pre-war rate, when Great Britain took up to one quarter of Cuba's exports and up to three-quarters of San Domingo's shipments, limited purchases in those countries may be desirable to retain their goodwill towards the international scheme, which, after the war, may play an important part in meeting the industry's difficulties. The second reason for the sugar purchases in dollar countries may be the need for economising shipping tonnage, since the length of the haul is much shorter from the chief Latin American supplying countries than from most of the Empire exporters, of which Australia and Mauritius are the two most important. In the first 18 months of war foreign exchange considerations were probably more important than shipping considerations in the determination of sugar import policy, but since the passing of the Lease and Lend Act, this position has been reversed.

COMMODITY AND INDUSTRY NEWS

THE American Metals Reserve Company is to buy concentrates containing 20,000 tons of refined tin from the Dutch East Indies. The London tin market for cash was firmer from Tuesday, and Wednesday's closing price was £258 15s.-£259 per ton compared with £256 15s.-£257 per ton a week earlier. Three months was £260 15s.-£261 per ton as against £259 15s.-£260 5s. Pepper prices showed no change on the week, with white Mun-tok still 16d. a lb. and Lampong black 9d. a lb.

Lorries from America.—The Ministry of War Transport announced the purchase of a number of International Harvester chassis from the United States to supply the urgent need for additional road transport in this country. The price

of chassis and cab will be £710, the vehicle will have right-hand drive and will carry up to seven tons. It is intended that these vehicles shall fulfil the demand of those operators of road transport in need of trucks or lorries whose applications for licences to acquire new vehicles have not yet been met. Arrangements for a satisfactory supply of spare parts have been made, and an early delivery of vehicles is expected.

American Cotton Crop Estimate.—The United States Department of Agriculture announce that the indicated yield of the cotton crop for 1941-42, of 10,817,000 bales, is the smallest estimated since the 1935-36 season, when the estimate was 10,638,000 bales. This compares with the estimate at this time

last year of 11,429,000 bales, which gave a final crop of 12,586,000 bales. The condition of the crop on August 1st was estimated at 72 per cent, which is the same as was reported on August 1st last year, and the same also as shown in the final report for last season. The yield per acre is returned at 224.4 lb. compared with 222.3 lb. a year ago, and the final yields of 252.5 lb. and 237.9 lb. respectively for the two previous seasons. Up to the close of business on July 31st, only 2,000 bales of the present crop had been ginned, against the 32,000 bales and the comparable figures of 137,254 bales in 1939 and 157,865 bales in 1938.

(Continued on page 214.)

THE METAL BOX COMPANY

GREAT EXPANSION OF PRODUCTION

PROFITS AFFECTED BY TAXATION

MR F. N. HEPWORTH'S REVIEW

The twentieth annual ordinary general meeting of The Metal Box Company, Limited, was held, on the 14th instant, at the Mnaught Rooms, Great Queen Street, London, W.C.

Mr F. N. Hepworth (chairman of the company) presided.

The secretary (Mr John Cartner) read the notice convening the meeting and the report of the auditors.

The chairman's review, which had been circulated with the report and accounts, and was taken as read, was as follows:—

The delay in the submission of the accounts is due to war conditions. As you are doubtless aware, mails from abroad are very regular at the present time, and there has been considerable delay in getting the returns from our overseas companies.

TRIBUTE TO STAFF AND WORKPEOPLE

Shareholders may be assured that the company's resources have been directed to provide as great a contribution as possible to the national effort. Your management at the head office and in the factories at home and abroad have been unremitting in their endeavours, and they have been supported wholeheartedly by the staffs and workpeople. I wish, therefore, to record in the forefront of this review the board's lively appreciation of the sustained devotion to duty and of the co-operation afforded throughout the company's widespread organisation. Many of our people are serving in his Majesty's Forces, and to them we send our greetings and best wishes.

From the shareholder's point of view the outstanding feature of the year is the incidence of taxation. Our policy has been to avoid inflation of profit, but the great expansion of production has led to a considerable increase in gross earnings. Taxation in its various forms has taken all that increase and much more, so that the shareholder in fact receives less than normal. I hope shareholders will derive real satisfaction from the knowledge that their equipment has proved to be of such value to the country, and that in addition to its production it has contributed very much more to the Exchequer than to them.

DIVIDEND AND BONUS REPEATED

Taking first the profit and loss account, the reduction in trading profit is more than accounted for by the contributions and premiums payable under the War Damage Act, which are not allowable as deductions from profits for tax purposes. The profit available for distribution has fallen from £303,996 to £199,705. This is in common with the experience of most companies, and, as will be seen from the accounts, is attributable to taxation.

The company's practice has always been to provide tax in each year's accounts on the actual profits of the year. In addition, this year we have had to bear the increase of 1s. in the £ imposed on the profits of the previous year by the Finance (No. 2) Act, 1940. The usual interim dividend of 5 per cent. on the ordinary stock was paid on January 1, 1941. Having regard to the conservative policy pursued in the past, your directors consider that it is proper to recommend for the fourth year in succession a repetition of the final ordinary dividend of 10 per cent. and a bonus of 2½ per cent. This leaves a balance of £24,042, which has been added to the amount to be carried forward to next year, making this item £141,446.

STRONG FINANCIAL POSITION

Turning to the consolidated statement, it will be observed that the book value of the fixed assets is slightly reduced. This is accounted for by the fact that depreciation provided has been in excess of capital additions during the year. This reduction is remarkable since output has been greatly increased and is evidence of the adaptability of the company's equipment. The rise in stocks

and debtors indicates a further increase this year in the volume as well as the value of work done.

As against this under current liabilities the item creditors, etc., has risen to £2,329,224, of which about 50 per cent. is provision for taxation. The consolidated statement shows a strong position with reserves of £1,743,437 against our ordinary capital of £1,488,743 and an excess of current assets over current liabilities of £2,162,328. These funds are actively employed in the business. The accounts show that bank overdrafts and bills provide the necessary short term finance.

AIR RAID PRECAUTIONS

During the year further large expenditure has been incurred under this heading and has been written off. Your management has taken every possible care to provide equipment and organisation for the safeguarding of the company's workpeople and of the company's properties which are the means of livelihood of the employees.

Here again, I wish to put on record the board's appreciation of the ready response by our people to the many and exacting calls upon their leisure by various voluntary services. When put to the test of enemy action the spirit shown has been magnificent.

The report and accounts were unanimously adopted.

A final dividend of 10 per cent. (making 15 per cent. for the year), together with a bonus of 2½ per cent., less income-tax, on the ordinary stock was declared.

The retiring directors (Mr C. C. Conway, Mr H. W. Cramer, and Mr F. W. Rankin) were re-elected, and the auditors (Messrs Hodgson, Harris and Co.) were reappointed.

A vote of thanks to the chairman, directors, staff and employees concluded the proceedings.

POWELL DUFFRYN ASSOCIATED COLLIERIES LIMITED THE POWELL DUFFRYN STEAM COAL COMPANY LIMITED WELSH ASSOCIATED COLLIERIES LIMITED

EFFECT OF WAR CONDITIONS

The annual general meeting of Powell Duffryn Associated Collieries, Limited, was held on the 14th instant at the Great Western Royal Hotel, Paddington Station, London, W. Mr Edmund L. Hann, the chairman, presided.

The directors' report and accounts for the year to March 31, 1941, were taken as read.

In the course of a short statement on the general position of the company, circulated with the report, Mr Hann referred to conditions brought about by the war in the coalmining industry, which resulted in numbers of men leaving it for other employment. When demand again increased owing to the needs of the home market, lack of sufficient labour made it impossible to supply the increased requirements. In those difficult circumstances, the company's staff were doing everything possible to increase production to aid the country's war effort.

War conditions, combined with those already mentioned, had had the inevitable effect of increasing costs of production, and this had only been partially offset by the increases in the price of coal permitted by the Government. Trading profits had accordingly been reduced, and after providing for depreciation, deferred repairs and taxation, there was a diminution of some £200,000 in the net amount of profits available for distribution.

The company's plant and machinery are being kept, so far as prevailing conditions permit, in a state of efficiency. As it had not been practicable during the year under review to maintain the same high standard as in normal times, an amount had been set aside towards the cost of repairs and renewals which could not be undertaken until after the war.

The report and accounts were adopted and the dividends proposed were duly declared.

The annual general meetings of the Powell Duffryn Steam Coal Company, Limited, and Welsh Associated Collieries, Limited, were subsequently held; the reports and accounts were adopted and the dividends recommended duly declared.

LONDON ACTIVE SECURITY PRICES AND YIELDS

the British credit to Russia of £10 millions; the preparations for the Moscow Conference—all these are steps on the road through total resistance to total victory; and since the Atlantic talks, the democratic countries are advancing down that road with something resembling a sharp sprint. It is no longer tempting fortune, as it was in the dark days of July and August, 1940, to talk of the goal at the end of the long road of war; indeed, it has become more and more obvious that the race will be run better for a knowledge of the prize which awaits the runners. To the growing demand for peace aims, the Atlantic talks have provided an answer, still set in general terms, but precise enough to meet the aspirations of millions of enslaved men and detailed enough to serve as a basis for further examination and expansion.

The Eight Standards do not go further than a number of speeches made in recent months by the leading statesmen of Britain and America. They include points from Mr Eden's declaration that Germany would be penalised in the military sphere but encouraged in the sphere of economics. They cover aspects of Mr Sumner Welles' call for "four securities," and they provide the economic background for the "four freedoms"—of speech, of worship, from want and from fear—demanded by the President. The advantage of the Eight Standards is their joint promulgation and the bringing together into one document of "certain common principles" accepted by both the leaders of the great democracies.

The general framework which emerges is that of a community of nations, fully self governing and restored to national independence, co-operating, on the one hand, in an economic system designed to free trade, to give access to raw materials, to improve the conditions of labour and the standard of living of the people, and, on the other, in a collective system of defence based upon progressive disarmament. With this there can be no quarrel. It is in aim a type of world order which does fall midway between the anarchy of nationalism—economic and political—and the rigidity of centralised totalitarian planning. Nor should the importance of the rightness of these general principles be underestimated. If the goal is set wrong from the start, no amount of elaboration of the means will put the nations back upon the right path.

Elaboration there must be, however, for there are inconsistencies as well as obscurities in the text. If these are not clarified, there may well be disastrous divergences of interpretation in the hour of victory. The problem of reconciling the vanquished with a new world order will be formidable enough. It will be impossible if the victors themselves are not agreed; the decision to refer the Eight Standards to an Inter-Allied Conference is thus obvious and timely. First, in the political sphere, what have the democratic leaders in mind when they refer, in Point Three, to the restoration of "sovereign rights" and full self-government? Is it to be the 19th-century conception of sovereignty which, in violation of the long tradition of international law, held that the State had no obliga-

tions, political or economic, to its neighbours or to the community of nations to which it belonged, and, in violation of the very idea of law, maintained that the internal affairs of a sovereign State were no concern of its neighbours—even if they included the Gestapo and the concentration camp? Such a conception of sovereignty would be in every sense retrograde and, in any case, incompatible with Points Five and Eight which refer to "the fullest economic collaboration" and to "the establishment of a wider and permanent system of general security," both of which demand considerable modifications of the narrow sense of "sovereignty."

Hitler's new order has now taught the small nations that political—and economic—freedom is only possible within the framework of a wider system of security. The Nazi Reich does offer a wider system, not, it is true, of security now, but possibly of ultimate "security" at a desperately low level, the security of a slave household. The real problem underlying the Eight Standards is therefore whether the two great nations promulgating them have in mind the more general framework of security which their fulfilment demands. They alone have the necessary power—industrial, financial and military—to form the basis of such a framework. Their opening points—renouncing all aim of territorial or other aggrandisement and pledging themselves to respect the desires of the peoples they free—make it clear that they do not intend to use their powers to set up a system of predatory imperialism decked out with democratic camouflage. There is in the history both of the Empire and the Union evidence of their ability to combine leadership and collaboration with the freedom of those they lead. But it would be more satisfactory if the Eight Standards indicated rather more precisely that the active responsibility entailed in creating a genuine new order, free from fear and want, had been squarely faced.

Nor is it enough to face it. Has it been accepted? The memory of the Fourteen Points hangs about the meeting on the battleship like wisps of Atlantic mist. It is true that the President is a more skilful statesman than Woodrow Wilson. It is also true that the Eight Standards are not a unilateral declaration, but an agreed statement issued by both President and Prime Minister. Yet they are—and this must be emphasised—the President's Standards, not those of the United States Government. They do not bind Congress. They do not bind anybody. That is the lesson of the last peace. It is on this issue of responsibility that the "hope of a better future" stands or falls. The new world has to be both led and underwritten. If it is to be a free world, the necessary leadership and material strength can only be supplied by the two great democracies. Are they willing to face the burdens—economic and military—which the task entails? Are they committed in cold realism to the Standards their leaders have proclaimed? If they are not, then, Eight Standards or Fourteen Points, it is all one to an abandoned and disintegrating world.

The Freedom to Trade

FREER trade, like charity, begins at home. So, similarly, does trade restriction. It is true that, in the interwar after 1918, the disparate development of industry and agriculture in different countries during and after the war, and the one-way accumulation of war and post-war indebtedness made it peculiarly difficult for nations to adjust their cost-and-price structures to world movements, without causing social and industrial hardship within their own frontiers—as Britain found when the gold standard was restored by deflationary means, and as New Deal France found in the middle thirties. But, on balance, insulation was deliberately chosen by the nations as their trading policy, rather than forced upon them. When the United States raised its tariff in 1922, it was an isolationist act in the interest of American business, and against the nation's interest as the world's

creditor. The preferential treaties made by Britain at Ottawa and the inclusion of provisions in Britain's later bilateral treaties with other countries for the quantitative limitation of imports were acts of commercial sabotage. The trade policy of Schacht and Funk in Germany was an instrument of Nazi policy. Trade restrictions between 1918 and 1939 may have been more often than not embarked upon, by the new post-war nations and by the old, as *ad hoc* and desperate acts to safeguard national standards against outside strains. But they were retained, developed and rationalised, as a programme of conscious regulation or "planning"; and they were excused on grounds of principle as well as expediency.

By implication, the fourth common principle proclaimed last week by President Roosevelt and Mr Churchill, "in the national policies of their respective

countries," denies this trend towards autarky and exclusion. The statement that "they will endeavour, with due respect for existing obligations, to further enjoyment by all States, great or small, victor or vanquished, of access, on equal terms, to the trade and to the raw materials of the world" can only be read as a repudiation of restrictions upon the quantity of world commerce. In itself, it is not a repudiation of tariffs, which are the instrument of what has been called the "old protectionism." Tariffs are, of course, restrictive of trade, and every approach to freer trade must have their progressive reduction as its spearhead. But, except in this country, there were high and widespread tariffs in world commerce throughout the classical period of freest trading before the last war; and it was only when the United States, practising high protection, became increasingly the owner of the world's debts that quantitative restriction by tariffs became disastrous. It is the "new protectionism" of discriminatory rationing of imports by quotas and exchange allocations that is the new lion in the path of freer trade; for, under these restrictions, no increase in the quantity imported is possible and the destructive consequences to trade are much greater.

Mr. Roosevelt and Mr. Churchill need not appear, on behalf of their countries, as penitents in sackcloth and ashes. It was neither free trade Britain nor even the protectionist United States that embarked after 1918 on a policy of economic autarky followed by a policy of rearmament; and it was this search for self-sufficiency, on behalf of sectional interests or national power, which brought about a general dearth of foreign exchange or international purchasing power, when countries, unable to sell the goods they produced, were unable to buy the materials they needed. Admittedly, the damage done to the world structure of trade and finance by these political policies was increased by the sudden imposition of a tariff in Britain and by the doubling of the United States tariff; and the position of the United States, refusing to take payment from its debtors in goods, was only tenable while American investors had sufficient political confidence to reinvest America's dues in European reconstruction and development. But Britain was the last country to surrender the freedom of trade as the basic principle in its economic relationships with the rest of the world; and (as Professor Condliffe patiently argues in his book), in the years between the Great Depression and the present war, the United States, despite the extremely high level of tariffs from which Mr Cordell Hull started in his policy of reciprocal trade arrangements on the basis of most favoured nation treatment, showed more than any other state the desire "to revive and extend private trading enterprise by assuring equality of trading opportunity."

A Nazi Fable

There is, unfortunately, some danger that the promise "to endeavour to further enjoyment, on equal terms, of access to raw materials" may be taken to endorse, retrospectively, the Nazi legend that the Germans have been debarred from materials in non-German territories. Actually, of course, there has been a "buyers' market" in most raw materials ever since the last war; and raw material producers have been only too anxious to sell, without any discrimination between buyers according to their nationality. There have been agreements to restrict production, it is true. But even these, reprehensible though many of their features have been, arose from inability to sell—at a remunerative price—rather than from unwillingness. The difficulty of the Germans, as buyers of raw materials, was a shortage of foreign exchange with which to buy; and they could have had most of the foreign exchange they wanted during the Hitler period if, instead of converting the copper, lead, rubber and other materials they did import into weapons and munitions of war, they had produced machinery for export and sale abroad. In fact, Germans could buy raw

* "The Reconstruction of World Trade." By J. B. Condliffe. Allen and Unwin. 428 pages. 12s. 6d. A valuable and comprehensive account of the practical issues involved in the determination of future trade policy.

materials everywhere in the same quantities and at the same price as the nationals of any other country.

It must, of course, be admitted that, after 1918, Germany suffered from the effects of the high tariffs erected by its new neighbours and its old customers. These restrictions on sales limited Germany's power to purchase abroad. But this was the common lot of trading nations—and, significantly, it is not the complaint that Nazi apologists, with the most remarkable and ingenious system ever devised for restricting imports in their own country, have made. In the pre-depression and pre-Hitler period, Germany succeeded more than most other countries in restoring the 1913 level of exports. After the last war, one of the most important quasi-monopolies in raw materials, the low-grade iron ores of Alsace-Lorraine, passed from Germany to France; but the German iron and steel industry was not seriously hampered and, long before this war started, it had re-established its predominance in Europe. It is argued by Nazis that practically all the world's jute, over nine-tenths of the world's nickel, three-fifths of the world's rubber and groundnuts and half the world's wool are produced in the British Empire and "controlled" by Britain. But three-fifths of the world's potash and three-tenths of the world's coal (without including the large German output of lignite) are produced in Germany; and other countries have not complained about their lack of access to German potash, German coal and lignite or German zinc and iron ores.

The Democracies' Task

The Atlantic Declaration cannot be a pledge to remove obstacles that have never existed. It is rather a statement, in the most general terms, of the joint and several need of all the nations to re-establish the equality of trading opportunity upon which the prosperity and progress of the world have depended in the past; and, more specifically, it is a repudiation of the considerations of power which have elevated self-sufficiency from being a *saave qui peut* expedient to be a principle of national policy. It is a direct denial of the totalitarian control of trade as an instrument of policy which is practised, even in peacetime, by Germany, Italy and Japan. But more is needed. It is not enough to mark the beam in the enemy's eye; there is the mote in Britain's and America's; and the Declaration will have done little more than state the obvious, with the force of drama and personal authority, if the implications of these economic principles for the policy of this country and the United States are not worked out at once in practical detail.

The difficulties of the two democracies in taking the lead in implementing the freedom to trade will be domestic. The making and administration of their commercial policies are interwoven with the organisation of sectional interests. In this country, agricultural and industrial producers have been given authority, under the latter-day régime of economic feudalism, to control the direction of trade policy; and, both here and in the United States, there are many activities which are maintained in being by the peculiar regulation of foreign trade that has been evolved. It is easier for Britain and the United States to reject the criterion of power in foreign trade than it will be to discard these considerations of interest. But, whatever the obstacles, the end and the means can be plainly seen. It is a fact that the pre-war trend of British policy towards bilateralism and the quantitative limitation of imports is incompatible with the freedom to trade; that the "preferential and trade canalising" agreements made at Ottawa are opposed to the principles pronounced by the Prime Minister and the American President last week; and that the violence which has been done by Britain since 1931 to the spirit of the most-favoured nation clause was, even before the war, a main obstacle to the movement of the United States towards freer trade. It is a fact, too, that in spite of Lease-Lend, the circumstances of the immediately post-war period, when Britain will be very short of dollars, will make wartime exchange control hard to abandon.

Equally, it is true that the possibility of international

co-operation to restore the free movement of capital and goods after the war will depend upon the readiness of the United States "to make tariff concessions that will result in import surpluses consistent with the balance of payments of a great creditor nation." It may well be that America's acceptance of the principle of Lease-Lend, by which goods are to pay for goods, implies that this rubicon has been sighted, if not crossed. But the implications of American leadership go farther still: they have been described as "a general depreciation against the dollar; a greater rise in prices in the United States than elsewhere; an effective lowering in the American tariff; heavy transitional losses in protected industries, particularly in agriculture; and a further displacement of labour in mineral and agricultural industries, and in some older manufacturing industries." It will take more than a form of words to bring about such a change-over.

The belief that nourishes Anglo-American faith in freer trade, despite Anglo-American practices, is that the basis of both wealth and welfare for each and all of the nations is their joint power to produce; and the knowledge that a process by which production is extended in high-cost areas (as wheat in pre-war France) while production in low-cost areas is restricted—which is inevitably the result when the world market is broken up into closed national markets—is a process of impoverishment. It is not mere theorising to say that there is a "virtuous cycle" in the economy of nations by which the investment of capital, the production of goods and the exchange of goods can follow one another in an ascending spiral of prosperity. A situation in which the movement of capital to the parts of the earth where the need—and the return—is greatest and the movement of goods to the places where the demand—and the price—is highest, as well as the movement of labour to the countries where the wage is best, are all three halted is a situation in which world resources are being wasted. There is agreement, even among the supporters of drastic "regulation," about the need for foreign investment to expand world trade, for the "cosmopolitan loan fund" of Bagehot's description "which runs everywhere as it is wanted, and as the rate of interest tempts it"—but which cannot run when there is not a sufficient flow of goods in international commerce to carry the burden of repayment and will not run where there is no political security.

New Deals

The problem of trade is, indeed, a problem of politics. On board the *Augusta*, the pursuit of power in trade was condemned and, by inference, the pressure of interests was rejected. But, in the fifth statement of principle, the third political aim in commerce was explicitly endorsed—the motive of welfare. "They [the United States and Great Britain] desire to bring about the fullest collaboration between all nations in the economic field with the object of securing for all improved labour standards, economic advancement and social security." Here the

key problem of world trade policy is touched. The free movement of goods and capital has implied that each separate nation is ready and able to adjust its domestic policy to its world situation in trade and finance, to adapt its balance of payments, its credit policy, its public expenditure and its costs and prices in order to maintain the exchange rate of its currency stable and to meet its international obligations in world trade and on capital account. This, increasingly, the nations have refused to do, if the process of adjustment would involve deflation, depression and the suspension of New Deals. More and more, nations have come to rely upon domestic policy and the expansion of internal demand for goods and services to maintain employment and income standards, and to abrogate international commitments which, in the short run, have threatened these standards.

This is the fundamental problem which the Atlantic Declaration poses but does not, of course, solve: the problem of combining a New Deal in world trade with New Deals in domestic social and economic policy. It is plainly not insoluble, because the most enlightened domestic policies must depend in the last resort upon a nation's power to produce, which in turn depends, for its full development, upon the processes of international investment and exchange. It is impossible for the nations to hoist themselves into Utopia by their own tails. The solution must rest, as the Declaration says, upon "collaboration," upon the agreement of the nations in council not to impose common policies which will wreck the social structure of individual nations, and upon the agreement of individual nations not to pursue social policies which will place too great a strain upon their strength in trade and which will outstrip their comparative efficiency in production. "The case for domestic regulation in combination with free trade (as one European economist has pointed out) rests essentially upon the extent to which the efficiency of production is stimulated, rather than hampered, by the imposition of minimum standards of wages and labour conditions."

The Declaration, in effect, appears to recognise the fact that, in defence of national welfare, nations will be disposed, and will have the right, to continue policies of internal "reflation." If these policies are pursued within the bounds of agreement between the generality of nations and with full deference to the real aim of raising the production of goods and services, there is no reason why trade between nations should not be freed and flourish, and every chance that the repeated fluctuations in trade, which are the main cause of frightened isolationism, may be abated. The first need is still for the reduction or removal of tariffs and the abolition of other restrictions; but there must be a saving clause for social security. The touchstone for success is collaboration, just as the touchstone for every economic regulation, at home or between the nations, is efficiency in production. And the overriding prerequisite without which all economic devising will be frustrated, is political security and peace.

The Future Debt Burden—II

LAST week's article on the future burden of the National Debt reached a cheerful conclusion. Figures were then given to show that if this war lasts as long as the war of 1914-18, and if the Chancellor of the Exchequer is successful in preventing any further substantial rise in the level of costs, the net increase in the principal of the National Debt is likely to be in the neighbourhood of £10,000 millions. The average rate of interest at present being paid is less than 2 per cent; at this rate the interest payable will be £200 millions a year. But this is a gross figure, reducible by the amount of tax levied on the interest payments. The net burden was estimated at less than £150 millions. If the post-war level of prices is the same as that of 1936, then an all-round increase of one-sixth in the rates of taxation—i.e., an income tax of 5s. 6d. in the £—will be needed.

Alternatively, a post-war price level of 20 to 25 per cent above the 1936 level will automatically solve the problem.

If this conclusion is correct, why, it will be asked, did such a very different set of consequences follow from the last war? There are three main reasons, and examination of them will reveal the provisos upon which the conclusion rests. The first reason is that there was a very substantial rise after the war of 1914-18 in the State's expenditure on items other than the debt and defence. These "other items," mainly social services and economic assistance, more than doubled in proportion to the national income between 1913 and 1929. There are two senses in which this increase in "nation-building" expenditure can be regarded as a consequence of the war. First, the social upheavals and releases of the war period

created a demand for social services that had not existed before. And secondly, the levels to which taxation was pushed during the war showed that it was possible for the State to raise much more revenue than would previously have been thought possible. But both these are indirect connections. The increase in these items was not an inevitable and inescapable consequence of the war. It may be that history will repeat itself in this respect, and that, having discovered once again that the limits of taxable capacity are higher than was thought, the community will choose to go on raising by taxation and spending on social and other services much larger sums than before the war. If so, there will, of course, be no return to pre-war levels of taxation. But this is an entirely different matter from the direct and necessary effects of the war, which are the province of this article.

The high level of taxation after the Armistice of 1918 was by no means entirely due to bigger social service expenditures. The debt service required an extra 7 to 8 per cent of the national income—as much as the whole pre-war Budget. Why was the experience then so different from that forecast for the period after the present war? Part of the answer lies in the fact that much of the debt of the last world war was incurred at price levels considerably higher than that to which the post-war world settled down. Wholesale prices in 1916 were 60 per cent above 1913, in 1917, 105 per cent, in 1918, 135 per cent, and in 1919 (when debt was still being incurred) 145 per cent. But the post-war community which had to bear the burden of this debt had a level of prices (and, therefore, in rough proportion, a national income) only some 50 per cent above the pre-war figure. If this chain of events repeats itself, then the consequences will be the same. The necessity of preventing a continuous rise in the price-level has been fully recognised in this war, both by the public and by the Government—though it is still open to doubt whether the preventive measures have been carried far enough. But it will be even more important to prevent prices from falling when the war is over. The favourable conclusion reached in the previous article depends entirely on the assumption that, even if the wartime rise in prices is not stopped at the present point, the post-war slump is avoided. The figures used in the calculation require both assumptions to be met if they are to be even approximately correct.

Possibly even more important than the price-level in its effect on the future burden of the debt is the rate of interest paid on the debt. The calculations in the previous article were based on the assumption that the average rate would not exceed 2 per cent. For the duration of the war, this is a reasonably safe assumption; the Chancellor of the Exchequer has expressed his confidence that the rate will not go any higher. But the post-war period is rather a different matter. The average of 2 per cent is compounded of two different categories. Roughly half the debt is being incurred by the issue of short-dated paper to the money market at rates slightly in excess of 1 per cent, while the other half is being raised by the issue of medium-term securities to the public at rates ranging from 2½ per cent to 3.175 per cent (on Savings Certificates). Will it be possible, after the war, to maintain this distribution of the debt, and the present rates of interest for each category?

The public's holdings should present no insuperable obstacle. The last eight years of peace provided a convincing demonstration of the possibility of retaining cheap money, even in face of a considerable demand for capital, provided the distractions of an international monetary standard are removed. It is true that the securities being issued in this war are of comparatively short date and it may be thought desirable to convert them into longer-term or even completely funded issues. But if the right moment is chosen, it ought to be possible to do this without paying much more than 3 per cent. There is no reason to anticipate that the cost of this half of the debt will increase in the future.

The future of the other half is more questionable.

There are three main categories of holders of the floating debt. The first is Government departments and Treasury funds: no question of refusing to renew their holdings or to accept a low rate of interest arises in their case. The second is overseas Governments and Central Banks: in their case, too, the difficulties are not insuperable, as their desire is to hold liquid sterling, and they will accept the rate of interest that is current in London. There may, in the future, be cases of unwillingness to hold sterling; but it is unlikely that the rate of interest will have much place in the argument.

There remain the holdings of the money market—that is, in the last analysis, of the banks. The joint stock banks will, no doubt, be very unwilling to see a substantial proportion of their assets permanently invested in loans to the Government at 1 or 1½ per cent. They will urge that it is contrary to their traditions either to lend so much to one borrower or to put out so large a fraction of their resources at so low a rate. These arguments should, however, be resisted. Commercial banking is changing its nature—not only in Great Britain and not only since the outbreak of the war. Traditionally, a bank was an institution which borrowed the savings of the community and lent them at short term to commerce and industry. But nowadays the deposits of the banks represent, not the public's savings, but its current cash. And a long-term tendency has exhibited itself for the demand for bank credit to decline. Industry and commerce, in so far as they are not self-financing, increasingly prefer to raise their finance by methods other than the short-term bank advance. A bank is to an increasing extent becoming an institution which holds the current cash of the public and lends it to the Government. The joint-stock banks are approaching the state from which the Bank of England started: their main liability is the circulating medium of the public and their main asset is a fixed loan to the Treasury. That being so, the time is approaching when a recasting of the traditional structure of interest rates will be necessary. If it is argued that the rate of interest paid by the Treasury to the banks should be increased, because otherwise the banks will not be able to afford the costs that the holding of deposits involves, that amounts to a claim that the State should subsidise the depositor. It would be far more reasonable to require him to pay the cost of the services he enjoys. There may possibly be a case for funding part of the huge mass of floating debt that the banks will hold at the end of the war—that is, for converting it to longer-term paper and avoiding the necessity for renewal two or four times a year. But there is no visible necessity for raising the rate of interest that is payable on it.

If this portion of the debt is not funded, there remains the possibility that it may be found necessary at some time in the future to raise Bank Rate and other money market rates. It is a matter of dispute among the adherents of the doctrine of cheap money whether an increase in money rates is permissible to meet a temporary emergency—such as, for example, might very well arise in the post-armistice period if the public, tired of economy, tried to spend more than its income. Fortunately, the point need not be argued out here, for it would be agreed by both sections of the cheap money school that any increase in money rates, if permissible at all, would be of short duration. There is no reason to suppose that the post-war situation of the money market, on the average, will be very different from that of the years 1932-39, when the Treasury Bill rate was below rather than above 1 per cent.

Examination of the provisos on which the conclusions of the previous article rest thus reveals, not the certainty of keeping the post-war burden of the debt down to a manageable figure, but at least an excellent chance of so doing. The requirements are that prices should be kept down during the war and up after the war, and that the level of interest rates should not, on the average, exceed those of the years 1932-38. These should be the guiding rules of monetary policy in the years to come. If they are followed there is no reason to be frightened of the National Debt.

NOTES OF THE WEEK

The Third German Offensive

The third German offensive is developing all along the tremendous Russian front. In the north, the Russians are holding the Finns both sides of Lake Ladoga, but this defence is obviously drawing men off from the defence of Leningrad. The city is now more directly threatened by the fall of Yamburg, 70 miles distant on the Tallin-Leningrad line and by the fighting round Lake Ilmen where the Germans claim the fall of Novgorod. For the time, there is no change in the Smolensk sector, though there is considerable fighting there; but, to the south, the German advance into the western Ukraine has swept forward almost to the line of the Dnieper. Nikolaiev has fallen; Odessa is surrounded; the Germans have captured their first industrial area round Krivoi Rog, and the great power station at Dnieprostroi is under fire. Marshal Budyonny has succeeded apparently in withdrawing most of his army—with presumably great loss of material—but a very uncomfortable strategic position is developing. Along the whole front there are now three main salients: in the

north towards Leningrad, in the centre beyond Smolensk, in the south forward to the Dnieper. The question is whether the Russians, threatened in between these salients on both flanks, can do anything but withdraw to straighten their line. The fighting at Gomel suggests that the Germans are already bringing pressure to bear at the points which now form Russian salients into the German line. The crucial military question is, given these salients, who will squeeze them out? Can the Russians cut off the Germans at Novgorod by striking northwards from the Kholm area? Can the Smolensk bulge be reduced by a Russian pincer movement from Nevel and Gomel? Can a counter-attack be launched with sufficient strength southwards from Kiev to isolate the advanced German units in the bend of the Dnieper? The likelihood is that the Russians cannot counter-attack on this massive scale, and the danger is that the third German offensive will therefore lead to a considerable move forward. Even so, the Russian line is still intact. The Germans have advanced, but they have not broken through.

The Value of the Ukraine

Roughly one half of Russia's heavy industry is concentrated in the Ukraine, mainly in the Dombas district east of the River Dnieper, stretching from Kharkov to Rostov on the River Don. In 1938, industrial output in the

entire Ukraine showed the following percentages of Russia's total production:

Coal	60.3	Steel	48.0
Iron Ore	60.7	Aluminium	44.0
Manganese Ore	34.0	Engineering	20.0
Pig Iron	60.7	Agricultural Machinery	60.0

It must be noted that the iron and manganese ores are almost exclusively mined west of the River Dnieper at Krivoi-Rog and Nikopol, which are already occupied by German troops. Even so, the output of manganese ore in the Caucasus region still exceeds Russian requirements; and iron ore from the Oka, Kirov, and Ural deposits can replace the loss of Krivoi-Rog. In 1939, Russia's and Europe's largest hydro-electric power station, Dnieprostroi, at the most easterly bend of the River Dnieper, was completed, with a capacity amounting to 560,000 kw, which is some 6 per cent of Russia's total generating capacity. Dnieprodzerzhinsk and Dniepropetrovsk to the north and Zaporozhe to the south of the station are newly built industrial centres which depend on the power of Dnieprostroi; aluminium, ferro-alloys, and rolled steel are the most important products of these centres. Kharkov is noted for one of the biggest of tractor factories, having a daily output of 150 tractors in 1938, and Russia's largest locomotive industry is situated at Voroshilovgrad in the eastern sector of the Dombas district. Kiev, the largest town of the Ukraine, is noted for a variety of all kinds of industries usually concentrated in capital cities. It is also a centre of chemical industries. During 1939 and 1940 industrial development in the new districts in the Ural and Siberia may have reduced slightly the share of Ukrainian industry in Russia's total industrial output. According to the third Five-Year Plan, which will end in 1942, the share of the Ukraine in Russia's heavy industries was intended to fall to nearly 40 per cent; and it must be assumed that the war industry proper, about which no data are available, is less dependent on the Ukraine than the official figures of Russia's total industrial output suggest. There is, however, no doubt that the loss of the Ukraine would considerably reduce Soviet Russia's war production. The Ukraine west of the River Dnieper is mainly an agricultural country, where grain, sugar beet, potatoes, fruit, and oilseeds are the main crops, and the whole of the Ukraine produced roughly one-fifth of Russia's total grain in 1938, two-thirds of its sugar and one-fifth of its sunflower seeds, the leading oilseed of Russia; and flour mills, sugar and canning factories are numerous. The capture of the Ukraine—it should be remembered that the Dnieper has still to be crossed—can have no decisive effect on the war, while Moscow and the régime still stand, and the army and the people still fight. And Russia has other and growing industrial centres. But it is a fact that the agricultural and mineral wealth of the Ukraine cannot be replaced by other districts of Soviet Russia.

Air Front

The Air Ministry has twice announced the number of aircraft engaged in recent night raids on Germany, in order to show the larger forces now employed and the small rate of loss—on those nights. The fact that fleets of 100 and 300 planes have been sent out on occasion is a promise of more intensive—and extensive—attacks to come. But the mere fact that this information about numbers has only been given on these two occasions suggests that these numbers cannot yet be regarded as normal; and the losses that are announced each night probably do represent an appreciable rate of loss in machines and men. This is not surprising. Night defences have improved a great deal in the last few months—as the inhabitants of London and, it seems, of Moscow, know to their benefit—and the air offensive that is gathering momentum from this side of the Channel will not win its mounting successes without considerable casualties. Strategically, it is probable that people in this country devote their attention too exclusively to figures of losses—understandably, because losses were the measure of Germany's only defeat, in the first Battle of Britain, and because of the numerical inferiority in the air under which Britain has hitherto laboured. The test of bombing is its effect, and there is no doubt that, per ton of bombs, the planned attack of

the RAF against the German war economy has been more effective than anything the *Luftwaffe* has done—away from the actual battlefields. Most people in this country, perhaps, will agree with Lord Beaverbrook when, asked if bombing would beat the Germans, he answered that “it did not beat us”; but German morale, as well as German production, will inevitably suffer markedly from the rising weight and numbers of British raids—while Russian bombers come in from the east.

Enemy Supplies

The communications of German Europe are even more vulnerable than those of the advancing German armies in Russia. The blockade of German territories causes strain and difficulties of distribution rather than shortage; and the anxiety of Nazi administrators must be not so much to obtain sufficient supplies as to ensure that they are where they are needed when they are wanted. It is in the attack on transport, therefore, that the British weapons of blockade and bombing work most closely together. The railway system of Germany and still more of German Europe is overburdened, and petrol is a factor limiting distribution by road. There remain the seaways, always an important part of inter-European transport, and it is encouraging that the RAF has recently had so much success in following up its attacks on marshalling yards and refineries by raids on shipping. The Navy, also, has continued its quiet triumphs; and, in the last five weeks, 400,000 tons of Axis shipping have been sunk or captured in the North Sea, the Mediterranean and the Atlantic, while, in the Baltic and Black Seas, the Russians claim to have accounted for another 200,000 tons. This accelerated loss at sea is in contrast to the smaller summer losses of British shipping in the Atlantic, but it is stupid for official publicists to pretend that the comparison is really relevant. The Battle of the Atlantic would still be crucial for Britain if the enemy had not a single merchant ship afloat.

Political Economics

The Government's White Paper on prices, which was put out last month, has certainly succeeded in provoking the views of Labour. It has even caused Mr Bevin to speak his mind on wages policy at last. In a speech at the week-end, he warned trade unions and employers that the Government was determined in its wish to arrest increases in money incomes; he himself had not been in favour of the stabilisation of wages, but now, when the cost of living has been steadied, he has fallen into line. The Transport and General Workers' Union, Mr Bevin's own, is not disposed to abate its claims for more wages; and an article in the Bulletin of the Oxford Institute of Statistics does not agree with the reasons for Mr Bevin's conversion. There is an excess of spendable incomes over the supply of consumers' goods at current prices, and taxation and piecemeal rationing have not closed the gap. But, the article goes on, in a passage that is less remarkable for its clarity than the rest, to peg wages would not prevent prices from rising further; and so the policy of stabilisation is presented, with some disingenuousness, must be said, as an attack on real wages—regardless, incidentally, of the fact that, whatever financial devices are adopted, stabilisation or no stabilisation, real wages must fall in any case, simply because the goods are not there to buy. It is a sheer physical fact that the consumption of the bulk of even the working classes must fall to free resources for war needs. The solution, the article continues very sensibly, is to close the gap by all-round, general rationing, a conclusion which has already been strongly stated by the Transport and General Workers' Union, and which, with appreciable doubts about the complete efficacy in practice of rationing by itself, *The Economist*, too, has endorsed. The problem is essentially one of fair distribution, and successful rationing would solve it. The article does admit that complete rationing may only be an absolutely satisfactory solution in theory; but its ultimate object is apparently to separate the question of wages from the danger of inflation, so that the author can advocate continued bargaining for higher wages, in order that the workers may stake their claim to a larger share in future consumption. This is neither economics nor statistics, but politics. It may be socially desirable for the working-classes to increase their share in the national income, but this is not, and cannot properly be, a part of war economy. It has been plain for

some time that this was the objective of the shrewder trade union leaders, just as the equally opportunist aim of many employers has been to use wartime exigency to import some outside control on the size of their wages bills. The organ of the Amalgamated Engineering Union is frank when, speaking of the White Paper and the discussions between the Government and the Trade Union Congress, it declares that the autonomy of the AEU is “absolute,” and that the union's policy will be decided by it and by nobody else—a declaration of sovereignty which would seem somewhat strange at any time in a democratic country, and is especially so in wartime. But it is a pity when writers in academic bulletins feel themselves constrained to enter into this political scramble for advantage.

Anglo-Soviet Trade

The conclusion of the Anglo-Soviet Alliance has been quickly followed up by the signing last week-end of a trade agreement between the two countries. The details of the new agreement given in the official announcement are scanty. Cash payment and clearing are to be the chief bases of transactions; but the fact that a £10,000,000 credit has been granted by the British Government to the Soviets, which is to be extended after its exhaustion, indicates that British supplies to Russia are expected to exceed supplies in the opposite direction by a substantial margin. This is in complete contrast to the normal exchange of goods between the two countries. The temporary Anglo-Soviet Commercial Agreement of 1934, which is still in force, aimed primarily at bringing about a reduction in the large Russian surplus in its trade with Great Britain. Until the outbreak of this war, Great Britain was, in fact, the only important industrial country which had a large adverse balance in its trade with Russia, and in 1937, the last normal year of Anglo-Russian trade, the British adverse balance of 374 million roubles in this trade was almost as large as Russia's total trade surplus with all countries, namely 387 million roubles. Both the fact that this position is now to be reversed and the conditions of the trade credit—5 years at 3 per cent—indicate that the new arrangement is, not unnaturally in the circumstances, more a political agreement than a trade agreement in the real sense. The last British trade credit to Russia—also £10,000,000, granted in 1936—bore 5½ per cent interest, and its use was confined to the financing of Russian orders for British manufactures. Now Russia needs immediate supplies of war and raw materials, a great part of which can be shipped from the eastern parts of the British Empire to Vladivostok. Great Britain, on the other hand, requires chiefly some Russian bulk products, such as timber and hemp, for which there are hardly any shipping facilities via the west or north and south-west, and for which the eastern route appears far too long. Direct supplies from Russia to the United Kingdom, therefore, will probably remain limited and will be mainly confined to some highly concentrated products, although Russian shipments to the Empire may be larger. The trade between the two countries might be better balanced if agreement were reached about Russian shipments via the east to the United States to be used in the manufacture of supplies for Great Britain, or to be credited there on British account. Despite the empirical nature of the new Anglo-Russian trade agreement, however, its conclusion can have considerable value from the long term view of genuine trade. It may lay the foundation for a large exchange of goods to the mutual interest of both Russia and Great Britain, once normal relations have been restored. After the war, Russia will be a still greater importer of machinery and equipment than in recent years, and the Soviets may then feel inclined to make greater use of British machinery supplies than in the past, when the Soviets used their trade surplus in this country mainly for the purchase of raw materials, for chartering ships, for placing insurances and for similar transactions.

To Blockade or Not?

If proof were still needed to show that appeasement does not pay, it has been provided by the most recent developments in the Far Eastern crisis. A week ago war seemed certain. It looked an impossible feat, even for Japanese agility, to remain balanced on the knife-edge of tension to which the occupation of Indo-China had brought the Far East. That a week has passed without “shooting” has undoubtedly been due to the counter-measures taken

by the democratic Powers, and to the threat that, behind these economic sanctions, lay the ultimate sanction of war. Faced with this front, the Japanese are still hesitating. It is therefore essential that there should be no weakening of the policy that has been adopted, no hint of appeasement or compromise. On the whole, there are few danger signals so far. The rumour that Japan and the Netherlands Indies have revived their trade negotiations appears to be a Japanese *canard*. Individual Japanese business men may be making inquiries, and there has been a limited and carefully controlled amount of direct barter in fulfilment of earlier contracts. In this country, while normal trading has ceased, the Bank of England and the Yokohama Specie Bank have consulted together on the machinery which could be used should the export of some commodity be—by exception—licensed. This apparently does not mean that the embargo is to be weakened at once by a large-scale granting of licences. Its stated intention is simply to create conditions in which, should the needs for supplies from Japan at any point override considerations of economic warfare, goods could in fact be exchanged; and the only danger is that the "disposition to trade" may become stronger than strategic and diplomatic common sense. In the United States similar modifications may be made, for example, if the silk necessary for parachutes cannot be obtained by any other means. Whether the United States is going further to mitigate its blockade by licensing cannot for the time being be ascertained. The step of closing all Pacific bunkering facilities to Japanese ships—a logical rounding off of the embargo—has not been taken. The general impression is that, on Japan's side, there is a good deal of eagerness to restore something like normal trade, while on the side of the democracies, the blockade is being maintained with just sufficient hesitation to give the Japanese grounds for hope. To that extent its execution is faulty. On the military front all is quiet. The direct threat of Thailand and, behind Thailand, of Britain has had some effect. And the announcement from Tokyo that the frontier dispute at Nomanhan, outstanding two years, has been settled by the mixed boundary Commission suggests that the Japanese are for once on the appeasement tack.

The Call to Work

It is now admitted by the Ministry of Labour that the attempt to recruit women for war work by mainly voluntary means is not fulfilling expectations; and it is now intended to make "greater use of compulsory powers" in order to induce women to leave their homes or to transfer from non-essential civilian work in order to serve with the Forces or work in the war factories. The immediate intention is not to introduce conscription, but rather to make more plain to the young women who come within the registered age limits that they must choose one or another of a limited number of definitely war jobs. The necessity for this increased sternness—which is due to the fact that the flow of women into the Services and the war factories is still insufficient to meet the present and prospective need for woman-power—might have been anticipated from the outset. To a point, this sluggishness is the Government's own fault. In the early registrations it was generally stated that young women in paid, full-time work need not necessarily consider transferring to other employment, and the list of occupations that were, in effect, "reserved" was maintained at an inordinate length. Employers were reluctant to lose their staffs; the authorities were reluctant to order the young women to transfer; and the young women themselves had little inducement to make the change. The basic fact about this problem of transfer, whether it concerns women or men, is that, so long as it is left to voluntary means and the ordinary processes of the labour market, some incentive is necessary to persuade workpeople to choose war work rather than civilian employment. The call of patriotism will do a lot, but, more often than not, the material incentive actually works the other way. That is to say, very often men and women can only transfer into war work by moving into less well-paid and less agreeable employment than that in which they are already engaged. This illogical position, in which men and women are left free to choose and at the same time may be better paid and more comfortable in non-essential than in essential work, is made more acute by the working of the Essential Work Orders. These Orders "freeze" the pay and conditions of work in essential employment. Pay and conditions in non-essential work are left free, which means that, as more and more people are

called up or mobilised, and the number of workers available shrinks, they tend to improve, making the "differential" increasingly favourable to the kind of employment which the nation in wartime could well do without. It is on shoals like these that the policy of recruitment by slogans and exhortations runs aground.

Mobilising the Volunteer

One of the most difficult factors in the recruitment of ex-miners for the coal industry is that, by going back to the mines, they are very frequently degraded in pay and conditions of work. In many cases, that is, the only way, in the last resort, in which to induce men and women to enter war work in sufficient numbers, under present conditions, is to introduce compulsion indiscriminately—that is, on some people and not on others—with consequently indiscriminate hardship to those people who are forced to change their jobs. It can reasonably be argued, of course, that the men and women who may be forced to do war work will be, in almost every case, better off anyhow than the men who are conscripted for the fighting forces. But this applies to all civilians, not only to coal-miners and others whose services may be specially needed at any moment. There may be a good, logical case for conscripting the entire man-power and woman-power of the country to do national service; but the method of recruitment for work which has been chosen is by voluntary means; and the real point is that this reliance on volunteering cannot be effective so long as the inducements and incentives impel men and women to stay where they are and not to volunteer. This may not necessarily be an argument for all-round compulsion, but it is, at least, an argument for an attempt to create the conditions which will help volunteering to work. If pay and conditions in essential work are to be controlled or frozen, pay and conditions in non-essential work also must, in effect, be controlled or frozen also, or else men and women simply will not transfer from the one to the other. It is a practical question, arising from the fact that if people are to be left free to choose their jobs, the labour market must be so rigged that they will choose the jobs where they are most wanted. The need to man the Forces and the war factories is greater than ever because of the change in the strategic situation and the marked improvement in the shipping and raw material situation this summer; and the process of recruitment must be made effective. The present unplanned methods involve for many people, not less compulsion and less hardship than conscription would involve, but more indiscriminate compulsion and more indiscriminate hardship.

Costs and Prices

Since the primary function of the Committee of Public Accounts is not to make recommendations but to comment on any apparent irregularities in the Appropriation Accounts, its periodic reports are very limited in scope, and are in addition very much out of date. Nevertheless, the latest report adds some useful details to the broad picture of the administration of the war effort which is so admirably presented by frequent reports from the Select Committee on National Expenditure. For instance, this report takes up the question of iron and steel prices, to which considerable attention had already been paid by previous Public Accounts Committees. The control prices at the beginning of the war were generally those shown in the current price lists of the Iron and Steel Federation, and they have since been increased to cover costs verified by the accountant appointed by the Federation. There was at first no investigation of pre-war or current costs by the Ministry of Supply, though arrangements have since been made for the Ministry to be advised on prices by another accountant, after he has considered the average weighted costs of production ascertained by the Federation's accountant. Moreover, provision has recently been made for the profits of different firms to be examined at quarterly intervals to see that uniform prices based on average costs do not give undue profits to individual firms. A scheme is also being considered under which allowance for increased costs would only be given to firms whose profits would otherwise be unduly reduced. In peacetime, the inclusion of the marginal or sub-marginal producer in determining costs and prices could not be defended. But the principle ought surely not to be

extended to the distributive trades, where the objective should be the minimum distributive facilities consistent with efficiency. The Committee, however, reports that the selling prices fixed by the Ministry of Food cover the costs of unfavourably placed traders and therefore give excess profits to the efficient. This is clearly wrong, although it should be an equally clear principle that the trader who becomes "unfavourably placed" and "inefficient" as a result of the war should not be forced out of business without compensation. The Committee makes no definite statement on whether costs and prices are affected by the practice, followed by the Ministries of Supply and Food, of using the services of trade associations, though it seems to have found no evidence that they are so affected. But it states that the system "raises in an acute form the problem of dual allegiance and every care should be taken to safeguard the public interest."

The Caucasian Front

The German armies have reached the Dnieper. If they can advance to the Caucasus by the autumn, the whole face of the Middle Eastern situation will change. The old scores, the old hopes, the old fears will revive. Britain will be faced with the task of repacifying Iraq and Syria, and will have to deal with a cowed, apprehensive Iran, and an even more cautious Turkey. It can hardly be doubted that, faced with this feeble and disintegrating front, the Germans will attempt a sweep to the south, towards the oil of Iran, to Basra, and the Persian Gulf. In a sense, therefore, both the British and the Germans are now involved in intensive diplomatic preparations for the possible crisis in the autumn. The Nazis are increasing their activities in Turkey and Iran and as far east as Afghanistan, which has its quota of technicians and tourists. There is much talk of Von Papen making way at Ankara for someone with a tougher conception of diplomacy. The counsellor, Kroll, has gone to Berlin to report. British counter-measures labour under the disadvantage, first, of inadequate military backing, and, secondly, of conforming to certain standards of international ethics. If Iran chooses to disregard diplomatic restraints and is not impressed by the amount of force sentations and is not impressed by the amount of force Britain can muster, what is the next step for a law-abiding nation? It is good news that the new direct American bomber ferry service to the Middle East will help to increase the weight Britain can put behind her diplomacy; but the fact remains that the Middle East is proving yet another front on which the nation that plays the gangster game has all the early tricks. It may seem incomprehensible that Turkey and Iran should not see the advantage to themselves of preventing a collapse of Russian resistance. But Russia is very near and very large, and has played an unfortunate part in the earlier history of both countries. Germany's eruption into the Middle East is two hundred years younger than the southward drive of the Russians. Thus the Nazis have a species of "folk memory" to play on in their propaganda, and, as the Turkish Press illustrates from day to day, they are doing so effectively.

The Western Bastion

The stage is set for a German *coup* in the west whenever the High Command decides that such a move would be profitable. In France, the Darlan régime has brought to an end the last lingering belief in the myth of a "neutral" Vichy. In Spain, there is no section in the unhappy clique-ridden country strong enough to stand up to German pressure, if at any point it became severe. Thus, the reason why there has been no western move certainly does not spring from the attitude of Vichy or Madrid. It is a Nazi calculation of interest. The Germans know that, both in Vichy France and Spain, there is much popular discontent which would flare up if the fiction of independence were destroyed. They know, too, that the food situation in both countries would be very add to Germany's supply problems. Portugal is still very useful as a link with the New World, and will remain so unless the Americas are drawn in. Finally, the attitude of General Weygand is still uncertain. Germany's writ runs with reasonable certainty to the rock of Gibraltar. It does not go beyond, and the more the passive resistance of Weygand can be stiffened by Allied encouragement, the less likely are the Germans to risk the hazardous experiment of taking over North Africa in the teeth of the resistance of France's colonial army. Many young Frenchmen have joined the army with the express intention of getting away from France and back into the combat zone. They are not likely

to accept the transformation of Lyautey's heritage into one great Vichy *d'outremer*. Here the attitude of the United States is all important. The French naturally look to America rather than to Britain in this crisis. American diplomacy backed by action could almost certainly win over Weygand—but the time is short.

Priorities for Milk

Registration for milk has taken place this week, and the distribution scheme will come into force on October 1st. As had already been forecast, the scheme guarantees seven pints a week to children under five and to expectant and nursing mothers, and 3½ pints a week to children between the ages of five and seventeen inclusive. This is the old National Milk Scheme extended to all children and adolescents. Invalids, schools and hospitals will also be given priority, and milk will be supplied to undertakings who provide it for their workers and to holders of tea permits; but the quantities, together with the provision to be made for other classes of consumers, have not yet been announced. On the whole, the priorities compare favourably with the amounts allowed this summer to similar consumers in German Europe. In Germany, infants get more, and there is a sensible provision of about 6 pints a week to men in unhealthy occupations; but the priority for children appears to stop at the age of fourteen, and the amount allowed to those aged six to fourteen is slightly less than the provision for children aged five to seventeen in this country. Moreover, it is likely that the rations in force in Germany and German Europe now will not be maintained in the winter. But there can be no cause for congratulation that a situation has arisen in this country in which no liquid milk at all can be guaranteed to consumers outside the priority classes. Until now, official statements have been comfortably reassuring about milk supplies, and as late as July 24th Mr Hudson said in the House of Commons that, "if conditions are very difficult," a possible slight shortage "may slightly affect the adult population in the depth of winter," but that he hoped "any such shortage will be very small." It will soon be apparent whether this statement was justified or consciously misleading.

Emergency Feeding

In view of the coming milk shortage, it is of the utmost importance that effective steps should be taken to prevent any wastage. Now that the public has been warned that it must not expect its normal quantities, private waste and canteen waste—which is notorious—should automatically stop. But a much bigger waste may easily occur after an air raid. It has already happened that farmers or local milk distributors have lost the greater part of their customers in a night when catering establishments have been bombed and large-scale evacuation has taken place. There consequently arises a surplus of milk in one district which should immediately be tapped and sent to other districts. In announcing his post-raid food plans last week-end, Lord Woolton did not state whether measures are ready to deal with such a situation, though it may occur with other foods as well as milk. He was more concerned with the possibility of a food shortage in bombed districts. Thus, he said that emergency food stocks, amounting to several weeks' supply, have been built up in the hundred areas into which the country has been divided for the purpose. Shadow shopping centres have been arranged to replace badly damaged ones; and the provision of meals will be undertaken, first, by the self-contained Queen's Messenger Food Convoys, then by British Restaurants and emergency meal centres. A new, and as yet untried, development is the "food grid"—a series of cooking depôts, to cover 7,400,000 people, established some

miles outside a town, which can produce 6,000 meals in a four-hour period and send them into the town by mobile canteen. We have progressed far beyond the bread and bully beef stage of last September.

Vegetable Marketing

The recently formed National Vegetable Marketing Company will first come before the public eye in its endeavour to ensure an equitable distribution of the onion crop. It will perhaps come as something of a shock to the onion lover to discover that the *per caput* ration of the commercially produced onion crop will be 2 lb in the coming season. The onion season, it is learned, opens, no doubt to the traditional accompaniments of steak, tripe and sage, on September 15th. Unhappily, the season is exceptionally close, the company expecting to have disposed of the entire crop by mid-October. There is no evading the simple fact that 98 per cent of the total onion consumption was imported in pre-war days. That the National Vegetable Marketing Company is going to distribute the crop rationally, instead of permitting unfair competition to do its worst, is highly commendable. Registration with greengrocers will be necessary and the public will thus be brought one stage nearer to the time when the distribution of all vegetables is put on a satisfactory basis. The distribution of carrots will provide more scope for Lord Woolton's interesting enterprise, for the carrot crop is so excellent that there is some risk that 1940-41 may go down to history as the "carrot winter."

War Damage

Ever since the Ministry of Works and Buildings was set up, it has been difficult, in matters of planning, to understand the precise relationship intended between the Ministry, the embryonic Reconstruction Department under Mr Greenwood and the War Damage Commission set up under the War Damage Act. Recently, the position of Lord Reith was made plainer when it was indicated that he was in fact serving in two capacities—on the one hand, as head of his Department and, on the other hand, as the planning member of the Ministers working with Mr Greenwood. Now the position has perhaps been confused again by the publication of a notice by the War Damage Commission, laying down that any person in London, Birmingham, Bristol, Coventry, Hull, Liverpool, Plymouth, Salford, Sheffield, Bootle, Birkenhead, Southampton, Swansea, Wallasey or Gosport, wishing to repair war damage at a cost of more than £1,000, must first inform the Commission, which will then ascertain whether the proposed works will conform with the intentions of local and planning authorities. This notice is issued under Section 7 of the War Damage Act; and, at first sight, seems to fit in with the recent recommendation of the Uthwatt Committee that reconstruction areas should be scheduled in which repairs or rebuilding could not be carried out without permission from planning authorities. Actually, it is specifically stated in the notice that the action of the Commission is not to be confused with any steps which may be taken on the recommendations of the Uthwatt Report; and a distinction appears to be drawn between the immediate exigencies of war-time damage and the recognised need for the planning of physical reconstruction. The distinction, of course, may merely be between repairs, on the one hand, and more comprehensive reconstruction on the other. But the fact remains that the sum of a large number of repairs must be an important act of reconstruction and should come within the direct purview of a single planning authority at once. Any distinction between rebuilding now and rebuilding later on is untenable; and it is of paramount importance that physical reconstruction should be related to a long-term and articulated plan under a single authority from the first possible moment—which should be now.

Vocational Training

A new development in post-primary education has been announced with the statement that State bursaries, tenable at universities and certain technical colleges, will be given to boys and girls who have reached the necessary standard in science subjects. There will be no means test. The object is materialist and limited; it is to meet the present demand for trained men and women for radio work, and in engineering and chemistry. The minimum age will normally be

eighteen years, and it is expected that some of the accepted candidates will be enabled to qualify for a university degree before being required for national service; others will only be given a year's training—though the Board of Education has promised that after the war these cases will be considered for financial assistance to enable them to complete a degree course. Before the war, State bursaries were only given to university students if they intended to become teachers, with the result that many students, who could not otherwise afford a university course, were forced to teach afterwards, whether they had a vocation for it or not. The actual training comes after the course has been completed and the bursaries used. The war has now added strictly vocational bursaries to these pseudo-vocational ones. In addition to this latest development, there are university courses for selected candidates from secondary schools who are suitable for technical branches of the Army; the entry to Dartmouth has been widened by the grant of 30 additional scholarships a year to secondary school boys, and another 30 to preparatory school boys; and the establishment of the Air Training Corps provides pre-entry training for would-be members of the RAF. The ATC, from the point of view of education, is perhaps the most interesting development, because it also caters for adolescents who have left school at an early age and are already in employment. But all schemes show an appreciable advance in the principle, reaffirmed by Mr. Butler last week, that post-primary education should aim at satisfying different tastes and capacities. The principle should be continued after the war, not primarily for vocational purposes, whether pseudo or strict, but simply for the sake of the individual child.

A Grave Loss

On Thursday last week, for the second time in five days, an aircraft of the Transatlantic ferry service crashed, with twenty-two passengers and crew, shortly after taking off from this country. As in the previous accident, the passengers included many American pilots engaged in flying American bombers to this country; and, by an unfortunate coincidence, Mr Arthur Purvis, chairman of the British Supply Council in North America, was also on board. He had come to this country, presumably to consult with Lord Beaverbrook, and had decided to take the first aeroplane back to America when he learned of the latter's sudden visit to Washington. The untimely death of Mr Purvis is a very serious loss indeed to this country, for in his business experience in America, his understanding of American problems and methods and his intimate contacts with American civil servants and men of affairs, he possessed an unrivalled combination of qualities which enabled him to carry out his important task with outstanding success.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since mass raiding began last September:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Total Sept.-Dec., 1940.....	21,669	30,556	52,225
1941:—			
January	1,502	2,012	3,514
February	789	7,068	1,857
March	4,259	4,794	9,053
April	6,065	6,926	12,991
May	5,394	5,181	10,575
June	399	461	860
July	501*	447	948*
Totals to date	40,578	51,445	92,023
* Including missing and believed killed.			

Of those killed in July, 199 were men, 182 were women, 75 were children under 16, and 41 were unclassified.

Sir Paul Latham, who, it was announced in Parliament on July 31st, is to be tried by court-martial for alleged offences against military law, has been appointed Steward and Bailiff of the Manor of Northstead and has therefore resigned his seat in the House of Commons. Captain Ramsay, who has been asked by his local constituency committee to resign, has refused. In his reply he repudiated the committee's statement that he had failed to support the National Government in accordance with his agreement.

Germany's War Finances

DURING the war of 1914-18, Imperial Germany met war costs almost exclusively by borrowing. The first wartime taxes were introduced for the financial year 1916; and, though new taxes were added in 1917 and 1918, total tax revenue remained only a fraction of war expenditure. Total Reich revenue for the five financial years covering the war amounted to Rm. 20,740 millions. But by the end of 1918, total Reich debt had increased to Rm. 153,237 millions, of which Rm. 55,060 millions was made up of short-term Treasury bonds. Revenue only covered the cost of administration and interest payments on debt.

This huge debt was wiped out by inflation. When Hitler came to power, total Reich debt was comparatively small, amounting to Rm. 11,540 millions, of which only 12 per cent was short term. On this favourable foundation, Nazi Germany began re-armament, which in the first instance was financed mainly by undisclosed short-term borrowing, of which the greater part was subsequently converted into Reich loans. It was, however, the declared policy of Nazi Germany to cover re-armament and, eventually, war expenditure, as far as possible, by taxation. During the eight years from April, 1933, to March, 1941, which include nineteen months of actual war, Reich revenue amounted to Rm. 119,200 millions and Reich debt increased by Rm. 78,500 millions to Rm. 90,000 millions.

The Reich also had at its disposal "secret borrowings"—the earnings of administrative institutions, the contributions of social insurance schemes, and the special war contributions of the communes. But these additions, important though they are for assessing actual war expenditure, do not alter the fact that Nazi Germany has been able to finance the war mainly by taxation—though as the economy has become more and more controlled and rationed the problem has plainly become more difficult.

	(Rm. 1,000 millions)			
	Tax Revenue	Administrative Earnings and War contribution of communes*	Borrowing	Total
1937/38	14.0	3.0	2.7	19.7
1938/39	18.2†	4.0	11.1	33.3
1939/40	23.6	4.8	21.2	49.6
1940/41	27.2	5.4	38.0	70.6

* The figures in column 2 are semi-official.

† Reich revenue in 1938/39 includes the capital levy on the Jews.

The first and most important fact emerging from this table is that the share of borrowing in the total yield increased from 13.7 per cent in 1937-38 to 53.8 per cent in 1940-41. If revenue and borrowing increase at the same rate in 1941-42, the share of borrowing would increase to some 65 per cent; and by the end of the financial year 1941-42, total Reich debt would then amount to Rm. 150,000 millions, which would thus be nominally equivalent to the total debt incurred by Imperial Germany during the last war. But the material resources of Greater Germany exceed those of Imperial Germany. The resources of the occupied countries must also be taken into account. The changing ratio between revenue and borrowing only indicates a further reduction in civilian production and consumption in an economy under complete rationing and effective price and wages control.

Some anxiety must have been felt in Germany about the rapid increase of borrowing during 1940-41. Several speeches made recently by State officials and leading bankers emphasised that war expenditure requires a healthy mixture of taxation and borrowing. A year ago, the same officials were confident that the greater part of the costs of the war could be covered by taxation. To-day, the limit of further increases in taxation, in the sense that it impairs the incentive to higher production and greater efficiency, appears to have been reached, and discussion naturally turns on the problem of the limits of State borrowing. It is frequently pointed out that current State borrowing should never exceed the actual reduction in private consumption; and the present problem of war financial policy in Germany is simply the problem of converting the additional purchasing power accruing from war orders into savings at the disposal of the Reich.

The National Income

What was the size of the national income on which Germany's war expenditure was based? There

is no doubt that, after an initial setback, the nominal national income of Germany has been steadily increasing under war conditions; but an estimate of the real national income in 1939 and 1940 is extremely difficult. The official estimate for 1938 amounted to Rm. 79,700 millions for Germany proper, against Rm. 72,600 millions in 1937. The national income of Greater Germany (the Old Reich plus Austria) was estimated at Rm. 88,000 millions in 1938. Meanwhile a number of territories have been incorporated into the Reich, and the total income of these territories is unknown. A very speculative estimate of the total national income of this greater Greater Germany would be Rm. 95,000 millions to Rm. 98,000 millions in 1939 and Rm. 98,000 millions to Rm. 105,000 millions in 1940.

But the pool from which Germany's war effort draws does not stop with German and incorporated territories. During 1939-40, Germany's war economy also made use of the resources of the parts of Czechoslovakia and Poland which were not incorporated; and considerable quantities of raw materials and manufactured articles were requisitioned in the occupied countries. The value of the additions cannot be assessed. The costs of occupation levied in occupied countries must also be taken into account; and, finally, Germany has been running up clearing debts in her foreign trade with occupied and neutral countries. Under these conditions any estimate of "raidable" income must be speculative. Germany has not published any Budget estimates since 1933, and estimates of expenditure on administration which are based on figures for 1932-33 must be hardly less speculative, since quite a different system of political and economic administration has been built up since 1933. The only two sets of figures which are actually known are total Reich revenue and total Reich borrowing, and even here it is not officially stated whether these figures relate only to the Old Reich or to Greater Germany.

A recent official statement claimed that, at the beginning of the financial year 1941-42, roughly two-thirds of the total national output was devoted to public purposes. In 1938, it was stated, Rm. 26,000 millions, or 32.5 per cent of the total national income of the Old Reich, were used for public purposes, leaving Rm. 52,000 millions for total expenditure in the private sector of the economy, that is, for consumption and private capital expenditure; and, according to the same source public expenditure compared with 1938 had doubled by 1940. The figures are somewhat startling. They would indicate that there was no appreciable increase in the national income of the Old Reich from 1938 to 1940. In 1938, compared with 1937, however, the national income increased by 10 per cent.

These official figures make it plain that war production in the Old Reich could only be appreciably increased by cutting-down of civilian consumption and production to some 50 per cent of the level of 1938. But there are also the increments derived from "tribute" and "exploitation" plunder. The industries of the incorporated and annexed territories have added considerable productive capacity and labour resources to the German war economy, additions which cannot be computed in terms of money because of a complete lack of data. The following detailed survey of Reich revenue shows increases during 1939 and 1940 which are the result of increased taxation and additional revenue from incorporated territories. During the second half of the financial year 1940-41, the increase is aided by the employment of several millions of women, foreign workers, and prisoners of war, and by the working of longer hours and the reintroduction of overtime pay.

	REVENUE (in million Rm.)			
	1937/38	1938/39	1939/40	1940/41
Income & property tax	9,823	13,061	16,375	17,700
Excise & Customs	4,142	4,651	5,300	5,400
War surcharge on income tax	...	...	1,100	2,500
Do. on excise	...	...	800	1,600
Total Revenue	13,965	17,712	23,575	27,200
	LEADING TAXES (in detail)			
	1937/38	1938/39	1939/40	1940/41
Wages tax	1,760	2,091	2,645	2,977
Income tax	2,219	3,166	4,347	5,126
Corporation tax	1,553	2,417	3,214	3,476
Turnover tax	2,754	3,357	3,733	3,929

Before the war, successive increases of the rates of taxation played a large part in increasing revenue, and war-time revenue has been markedly raised by the war surcharges, amounting in 1940-41 to Rm.4,100 millions, or 15.1 per cent of the total revenue. The percentage rates of increase in total revenue in each year compared with the previous year were: in 1937-38, 21.5 per cent; in 1938-39, 26.9 per cent; in 1939-40, 33.1 per cent; and in 1940-41, 15.4 per cent. There was a perceptible slowing down in the increase during 1940-41, and total revenue during 1941-42 is expected to reach Rm. 30,000 millions, equivalent to an increase of only 10 per cent over 1940-41.

Mounting Debt

The further increases in war expenditure which will certainly be necessary during the current financial year must thus be mainly covered by borrowing, and there are certain noteworthy tendencies in the actual development of borrowing which were not intended by the Government.

BORROWING

(in Rm. 1,000 millions)

	Total to date	Long term Actual	In % of total	Short term† Actual	In % of total

Mar. 31, 1941	89.65	47.72	53.2	41.93	46.8

† Short term debts include tax certificates, and had increased to Rm. 44,413 millions at the end of April, 1941.

Until March 31, 1938, the actual increase in debt is moderate compared with the extensive rearmament programme, and because of the undisclosed borrowing the share of short-term debt is not abnormal. From March 31, 1938, onwards the increase is spectacular, and on March 31, 1941, total debt was almost equal to the total national income and 3½ times the total revenue of the financial year 1940-41. During the same time the share of short-term debt rose from 14.7 per cent to 46.1 per cent. At the end of the Great War the share of short-term in total debt was only 36 per cent. The credit expansion policy of the early years of the Nazi regime has been revived. But, whereas from 1933 to 1938 the policy was successful, because it brought idle capacity gradually back into operation, to-day there is not that reserve. Confronted with this spectacular increase, the Government hopes that the annexed and occupied productive capacity of Europe will contribute to the consolidation of Germany's internal debt.

It must be assumed that a considerable part of this borrowing has been financed by genuine savings. Complete rationing and effective price and wage control have swelled all kinds of savings. Since the beginning of the war deposits in savings banks have increased by from Rm. 8,000 to 10,000 millions, and during 1940 deposits in credit banks rose by 30 per cent. The civilian sector of the economy contributed the receipts from sold-out stocks as well as the working capital of restricted or closed-down industries; and, unable to replace machinery, industry is accumulating reserves which exceed the actual capital expenditure of the war industry. The pressure of idle capital is clearly visible in the constant rise in share prices on all bourses.

The Economic Danger

As long as the present economic administration remains intact, price and currency inflation in the accepted sense of the word is impossible. The danger arises from the actual destruction of productive capital by overwork without replacement—or *Raubbau*, as it is called in German—and the destruction in battle of war material that cannot this time be replaced by looting or requisitioning in conquered countries. It is true, and should not be forgotten, that the object of Germany's war effort was to make war on the biggest possible scale. Losses in battle are the currency of battle and the price of victory. But, before the attack on the Soviet Union, the actual destruction of productive capacity and war material was extremely small, and requisitioning more than compensated for the actual losses. Now a continued loss of men and material on the eastern front would soon become apparent in Ger-

many's war effort, which would have to be increased more and more from external German-Europe resources, diminishing moreover for the first time by the loss of irreplaceable man-power. The accumulating national debt would then represent nothing but the increasing dead loss of capital, and only the utilisation of the material resources of a defeated Russia could compensate in the long run for the huge losses of a prolonged campaign.

Meanwhile, the occupied countries continue to contribute in their several ways to Germany's war effort. Payments to cover the cost of occupation amount to roughly Rm. 10,000 millions. The excess over actual costs of occupation, which accrues to Reich revenue, was estimated by Secretary of State Reinhardt at Rm. 4,000 millions for the current financial year, and looting must have brought in material to the value of several 1,000 millions of Reichsmarks. The value of seized gold and State property has been estimated at some Rm. 10,000 millions. A continuous flow of goods is secured by Germany's foreign trade with occupied, dependent and neutral countries, in which Germany simply runs up large clearing debits, while the goods of these countries are purchased on very favourable terms by the over-valuation of the Reichsmark in terms of foreign currencies.

The estimates made by Germans of the national income of Germany and of the share of that national income which is represented by public expenditure vary remarkably. The total national income of Greater Germany in 1939 was estimated at roughly Rm. 90,000 millions against Rm. 88,000 millions in 1938. After the incorporation of new territories in 1939 and 1940, there were even indications that the official estimate for 1940 increased the national income well above Rm. 100,000 millions. The rough statement that public expenditure, including municipal expenditure, increased from one-third of the national income in 1938 to two-thirds in 1940 was amended in other statements to 42 per cent in 1938, 53 per cent in 1939 and 70 per cent in 1940. These figures have clearly depended upon the propaganda intention of each particular statement. Sometimes it was Germany's superior financial policy—and ability to make the most of the nation's resources for war purposes—that had to be demonstrated. Sometimes, on the other hand, spectacular increase in borrowing made it necessary to draw attention at the same time to an equally spectacular increase in the national income. The statement that there has been an increase in employment since August, 1939, of some six to eight million women is fantastic, and statements about the total earnings of workers are almost equally unreliable. German estimates of the reduction in civilian consumption have ranged from Rm. 14,000 to 20,000 millions.

The official figures of Reich revenue and of Reich borrowing are inconclusive in themselves. No more can be said than that, roughly, two-thirds of whatever the national income is may possibly be used for the various public services, that is, for administration, war production and actual war costs; and that, in 1939, the share of borrowing in total national expenditure was about 40 per cent, but increased in 1940 to well over 50 per cent. It can hardly be doubted that this share will increase further during 1941. Without the occupation of fresh territories, Germany may be compelled to cut down private consumption still more, perhaps—eventually—to a level comparable to that of 1917, when the standard of living had fallen to one-third of 1913; and, if this happened, the share of public expenditure in the national income would have to be increased from two-thirds to four-fifths. But this danger is hardly "at hand." The third year of the war will prove decisively whether Germany is going to be able to maintain that "healthy" mixture of taxation and borrowing.

Any conclusive comparison of Germany's and Great Britain's war expenditure is fraught with almost insurmountable difficulties. There is no certain ratio between German and British currency values, and production figures, hours of work and data on the actual standards of living in the two countries are not available. What can almost surely be said, however, is that the German war effort is still well ahead in absolute terms of our own, even if the Empire and the United States are included. The proportion which British war expenditure represents of Britain's national income is, however, beginning to rise towards the German level. It will depend on a similar effort on the part of the United States to establish the superiority in absolute output necessary to victory.

THE WORLD OVERSEAS

Finland — Unwilling Foe

(By a Swedish Correspondent)

August 14th

THE irony of history has made democratic Finland an ally of Nazi Germany. Hitler has succeeded in using—for his own purposes—the traditional antagonism of the Finnish people for the Russians, and has thus brought them into the war. But this does not mean that the Finns are more pro-German or less pro-British than before. Some of them well realise that Germany actually forced Finland into the war; and in spite of official declarations that the present hostilities with Russia are a continuation of last year's war, many Finns feel half-hearted towards the new war—in strong contrast to 1939-40 when the whole Finnish nation was united.

This is not the first time that Finland has had German troops on her territory. Those Finns who remember the Germans that came in 1918 cannot have been so eager to accept the Germans this time. A German army was sent to Finland by the Kaiser to assist the Whites in the Finnish civil war of 1918. Afterwards, these Germans stayed in Finland, and Germany forced Finland into a treaty which regarded Finland as a German *Lebensraum*—providing for German directors in Finnish industries, unrestricted immigration from Germany and fixed currency regulations. The Kaiser even appointed a German prince as "King of Finland." It was only the German revolution that liberated Finland from their German "protectors" of 1918.

As a purely democratic country, Finland has, broadly speaking, the same political parties as Britain and other democracies. But she has not had the same party politics. The predominant questions in Finland have been quite different from those of other countries—for example, there is the language problem, the old struggle between the Swedish and the Finnish languages. On questions of social progress and foreign policy, there has been an agreement between all parties such as has seldom been achieved elsewhere.

Only twenty-three years ago, Finland fought a civil war whose wounds have healed remarkably quickly. The Labour movement, which lost the civil war, had again won a leading position in Finnish life, and at the election two years ago, the Social Democratic party obtained 86 of the 200 seats in the Finnish Parliament. The Social Democratic party was in power with the Agrarians for many years—a coalition similar to that in other Scandinavian countries, where the slogan "Workers and Peasants Unite" was accepted in political life. This condition had an overwhelming parliamentary majority behind it.

The Finnish Social Democratic party was modelled on the same lines as the continental parties of the Second International—with a strong ideological background. Their leaders collaborated with the Socialist leaders in power in other Scandinavian countries. It is worth recalling that all the Scandinavian countries still had Socialist Prime Ministers when the wave of reaction and Fascism swept over Europe. The Social Democratic party, which is strongly progressive, has advanced steadily since 1918 and has won over many Communist votes since the Communist party was banned in 1930. The Finnish Agrarian party represents both small and big farmers, and has some 60 seats in the Finnish Parliament.

The great Conservative party in Finland is the so-called Coalition party. It is not socially reactionary but rather progressive. The Finnish Liberals call themselves the Progressive party; they are a small but very influential body, which, after the civil war of 1918, saw as one of its main tasks the reconciliation of the victors and the vanquished. From their ranks came the first President of the Finnish republic—Stahlberg—and many of the most well-known Finnish politicians—Holsti, Cajander, Erkkö and the present President, Ryti. The Progressive party also controls the biggest newspapers of Finland.

Another democratic party is the Swedish party. This party finds its supporters chiefly amongst the farming population of the purely Swedish-speaking districts and also among the old Swedish-speaking intelligentsia and nobility. The language question was for years one of Finland's biggest problems. For 700 years, Finland had belonged to Sweden, and was somewhat feudally ruled by a Swedish-speaking nobility and civil service, who were inclined to look down upon the Finnish language and culture. When Russia took over Finland in 1809, the upper classes remained a Swedish-speaking minority, and because of the electoral regulations for the old States Parliament, the Swedish-speaking minority, controlling the money, the estates and higher education, remained in political control. The language question thus became a social question, and was for many years a hard problem for the new Finnish republic. It faded out, but came into the limelight again after the Russian-Finnish war of 1939-40, when 440,000 Finnish-speaking refugees from the ceded territories settled in territories where the majority of the population were Swedish-speaking farmers. This led to the resignation from the all-party Government of the Swedish leader, Baron von Born.

Poor Soil for Fascists

Democratic Finland is poor soil for anti-democratic parties. The Finnish Communist party lost more and more influence in every election, until it was finally banned in 1930, under pressure from the anti-Labour and Fascist Lapua movement which organised a "march to Helsinki" and literally kidnapped the Communist members from the Parliament building. Soon afterwards, the Lapua movement was also banned, but it rose again under the name "Patriotic People's Movement." This movement was banned, too, but the Supreme Court of Finland decided that the ban was against the constitution. The party has since taken part in the elections, but it rapidly lost support, and its parliamentary representation was reduced from 20 seats to 6. Now, it seems that the Germans intend to back this party. It was the Lapua movement that first took up the slogan of a "Greater Finland," which is not only to comprise Russian Karelia but also big parts of Russian-speaking territories, including *inter alia* the city of Leningrad and Ingermanland. "Greater Finland" comprises also, according to maps circulated in Sweden by Lapua propagandists, Northern Sweden with the iron ore mines and the iron ore railway, and Northern Norway—in fact, everything north of a line from Narvik to Lulea. The Germans are, of course, tempted to use the Finnish Fascists as their shield for conquests, but most Finnish people do not wish to have anything to do with Lapua propaganda or with the German promise to give Finland a "leading position in the North." The Finnish President has declared that Finland does not want this position, although Field Marshal Mannerheim has declared himself in favour of winning Russian territories.

The Finnish parties, as has been said, have a common platform for most big issues. In foreign politics, all parties were agreed upon a declaration made by the last Conservative Government, which was upheld by subsequent Left Wing Governments. This was a declaration for a clear Scandinavian policy—orientation towards the other Scandinavian countries and Scandinavian collaboration. All parties were also agreed on support for the League of Nations. By a coincidence, the first and the last major tasks of the League of Nations were Finnish questions: the League began with the settlement of the Åland Islands problem; and the main subject at its last session was the exclusion of Russia because of the Russian-Finnish war.

Since the war of last year, all parties have united in re-building the country and re-settling the population from the ceded areas. Finland lost by the peace of 1940 about 10 per cent of its entire industry (including its biggest iron-works, one big power station and large pulp factories), 12 to 14 per cent of its agricultural production and 10 per cent of its forests.

Isolation from Britain

Finnish economy is built up for export. Before the outbreak of the European war, Finnish business and industrial circles had gravitated more and more towards Britain, and trade with Germany became gradually smaller. At the outbreak of war, Britain had first place among countries trading with Finland. Britain took the bulk of Finland's timber and pulp, and Finnish shipyards built ships in collaboration with British firms. Some months before the war, a big Finnish trade delegation came to Britain to extend trade relations still further. After the invasion of Norway, Finland was almost completely cut off from trade with Britain. Only three countries remained—Sweden, Russia and Germany. But Sweden and Russia could not provide large markets for Finnish goods, because they exported similar goods themselves. Thus Finland was driven to trade almost exclusively with Germany and German-occupied countries. It was simply a question of life or death.

There was cultural isolation from Britain as well as economic. The Finns have been greatly interested in English culture. Finnish public libraries have always had large English sections, and most books published in Britain have quickly been translated into Finnish. British plays are given in Finnish theatres; English is learnt in Finnish schools; and when the war broke out, Finland was on the verge of introducing English into the training colleges for school teachers. Then, after the invasion of Scandinavia, British newspapers did not arrive, but German papers came regularly. British lecturers could no longer come to Finland—they came from Germany instead. Finally came the German troops, originally intended only to pass to or from occupied Norway, but they stayed in Finland in increasing numbers. The Finns, however, declared that there could be no question of Nazi political infiltration, and they were prepared to resist.

That Finland has now joined Germany in the war against Russia does not in the least mean that the Finns have lost their pro-British feelings. They deplore the breaking of trade connections with Britain; and the fact that Britain is on the other side in the war causes many Finns to regard it half-heartedly. Almost the whole Finnish Press has regretted the breaking off of diplomatic relations with Britain, and everyone declares that this does not alter Finland's democratic traditions.

Portugal's Prosperous Finances

[FROM OUR LISBON CORRESPONDENT]

August 6th

COVERING as they do a full war-time year, Portugal's 1940 accounts also correspond with Dr Costa Leite's first period as Minister of Finance. The figures are eminently satisfactory; no other country in Europe can to-day show so clean a balance sheet. Taking the *conto* at £10, receipts are £25,980,000 and payments £24,240,000. Both totals are well within the Budget estimates for the year. Direct tax receipts continue the steady upward trend of the past five years; indirect tax returns have dropped a little, import dues on general merchandise being £700,000 under the 1939 receipts. Export dues brought £224,000, against £93,500 in the previous year. Expenditure, which is £4,296,000 within the total Budget authorisations, is, as usual, under the actual amount of revenue received. Ordinary and extraordinary accounts are separately listed:—

	Receipts	Expenditure	Surplus or Deficit
Ordinary	£22,150,000	£19,160,000	+ £2,990,000
Extraordinary ...	3,760,000	5,010,000	- 1,250,000
Rearmament and other outlay by the Ministries of War and			

Marine account for increased extraordinary expenditure. Special note is made of the fact that public outlay of a cultural nature, such as the Centennial Celebrations, conservation of ancient monuments, national propaganda, facilities for tourists, and the exhibition, take but 4½ per cent of the year's extraordinary expenses; a proportion which effectively silences certain malicious rumours about governmental squandering.

Dr Salazar's insistence on closing each year with a balance in hand means that by 1940 the total of £21,557,000 had passed through what may best be described as a current account always carrying a varying credit balance. From this account there has on occasion been spent sums up to a total of £13,285,000 to meet varied items of extraordinary expenditure. A substantial balance, the exact amount of which is not published, is in hand. It is a true "reserve," to be drawn on only at need, and its existence has not been built up at the cost of either national development or defence. Its existence, Dr Costa Leite significantly observes, in no way warrants tax reduction. There is no floating debt, and the steady reduction of the public debt continues. War, though it has reduced Portugal's foreign trade, does not affect her productivity; and the basic strength of her finances makes it possible to improve the balance of payments, while her banking system is not only unshaken, but may even be said to be in a position to help the national economic effort in its reaction against present-day difficulties.

Portugal and Japan

Beyond publishing agency cables, the Portuguese Press has said little about Japan's occupation of Indo-China and the very obvious threat of aggressive action against Thailand. Moreover, the greater proportion of the cabled news published concerning Far Eastern affairs emanates from D.N.B. and O.F.I., and both agencies try to put Japanese action in as favourable a light as possible.

Portuguese public opinion, which for a variety of reasons is becoming widely separated from the Press presentment of events, is wholly unfavourable to Japanese action, which is attributed to German influence both in Vichy and at Tokyo. As, however, Portugal's interests in the Far East are to-day of the slightest, the general public shows little concern about the course of events.

Swiss Trade Agreement with Germany

[FROM OUR GENEVA CORRESPONDENT]

August 6th

AFTER long negotiations, Switzerland and Germany have concluded a new trade agreement to replace the one which came to an end on July 15th. The new agreement, which is to remain in force until the end of 1942, though described as a continuation of the previous one, is different in many respects. Its main points are concerned with Switzerland's supplies of coal, iron and petrol and Swiss exports. Germany agrees to supply 200,000 tons of coal a month, most of which is needed for Swiss industry, while a small part will be used for heating purposes. Germany will also supply 20,000 tons of iron, of which 13,500 are intended for the particular use of Switzerland; this means that the remaining 6,500 tons will be manufactured in Switzerland on Germany's behalf. As regards oil, Switzerland depends on countries other than Germany, but the Germans will collaborate with Switzerland in setting up a transport plan to help Switzerland's supplies to reach her. As regards agriculture, Germany will deliver sugar, seeds, alcohol and manure, while Switzerland will send cattle for breeding and slaughtering, fruit and dairy products, and cereals if the harvest permits it.

Switzerland obtains some facilities concerning the granting of *Fahr-Geldscheine*, so that exports will be easier, and exports of watches, which were stopped several months ago, will be resumed. The prepayment of goods ordered from Germany will enable the latter to have more foreign currency at her disposal. There is no substantial change in the present system of transfers, except that a small increase has been agreed in the rate of insurance interest so as to

meet the higher administration costs in Switzerland. Some papers here remark that while Swiss investors lent their money to Germany at 8 to 10 per cent some years ago, they are now content to receive 2 per cent, the alternative being repudiation by their German debtors.

It is stated that the negotiations never left the economic sphere, and that no political pressure of any kind was placed upon the Swiss negotiators. The agreement is officially described as the best which could be hoped for under the present circumstances.

The most delicate point in the negotiations concerned Germany's balance in the Swiss-German clearing system. Switzerland should buy much more from Germany, but she cannot find there all the goods and products she needs. The Swiss authorities are now compelling industrialists to wait three months before cashing what is due to them in the clearing exchange; on the other hand, they will grant them advances, as they deem it better to export without being paid at once than to see unemployment rise, which would occur if Germany reduced her purchases from Switzerland.

Four Million Prisoners

Much concern is felt at the fate which may befall Swiss credits in Germany after the war. It is feared that they will merely be added to the four milliards of francs already frozen there. The *Gazette de Lausanne*, expressing the opinion of financial circles, says that peace is well worth another few hundred million francs. It means that Switzerland is ready to buy peace from Germany at any price. If, by losing one part of her fortune, Switzerland can obtain temporary advantages, she may resume her normal trade after the war. The position of Switzerland is a most difficult one, surrounded as she is by Axis Powers or Axis-controlled countries, which can block her completely whenever they choose to do so. Goebbels said recently that Germany had no intention of attacking Switzerland as all that was needed was the stopping of coal deliveries. The position has been well described by a German politician, who is said to have declared: "Switzerland? It consists of four million prisoners whom we need not feed."

Czechoslovakia and the New Campaign

[BY A CZECH CORRESPONDENT]

August 11th

THE Czech wireless and Press are trying daily to convince the Czechs that the Germans are fighting a crusade against Bolshevism, and that it is not a case of Germans *versus* Slavs. The Nazis feel compelled to explain why the war in the east is proceeding slowly. The *Prager Zeitungsdienst* published an article which states that, even in the last world war, the Russians showed that they were important opponents, particularly in defence, and that the present war has confirmed this experience. The Russian soldier surpasses the French and English in endurance and in scornful death. He is very resourceful in setting up ground defences and fortifications, and he has a good sense of tactics and of dealing with sudden attacks by the enemy. The Czechoslovak reads with satisfaction this praise given by the Germans to their opponents, and deduce from it that German hopes have not been fully realised.

Efforts are being made to recruit Czechs as volunteers against Russia, but appeals issued by Otto Blaha, President of the Union of Czech Veterans, had no response. The aim of his organisation, which has been put up as a rival movement to the persecuted Legionaries Organisation, is "to ensure the future of our nation within the framework of the Reich in discipline and obedience." It is ironical that the pensioned General Blaha should lend himself to this quiescent position, as another General Blaha is to be sent by President Benes from London to Russia in order to command the Czechoslovak Legion there. It will be Blaha against Blaha.

The V campaign has had some success in the Protectorate. The Gestapo arrested a large number of people and confiscated the receiving sets of others. Since the Germans have declared the letter V to be the official sign

of their own victory, the Czechs have added the letters RAF or other signs. Goebbels, cleverly, revels in Vs. The "powder tower" in Prague and many other buildings display red or white flags with a large V. At night a giant V shines over Prague. Railway engines, tramcars, motorcars, shop windows and house windows are all decorated with a V. The "Volksstrasse" is now called "Victoriastrasse," hotels, cinemas and cafés have been renamed "Victoria." The *Vecer* published an editorial on July 18th in which it is said that "V is the expression of the stalwart German will to win and the solemn manifestation of the unshakable belief in German victory." All sixteen post offices of Prague have been ordered to use stamping machines for all letters with the German and Czech inscription, "Victoria! Germany is victorious on all fronts!"

The crusade against the Soviet Union is apparently no obstacle to waging a crusade against the Catholic Church as well. The Nazis have disbanded the Emausz Order in Prague and the Order of the Brothers of Mercy, whose hospital they have seized. The monks are forbidden to wear their habits and are compelled to seek civil occupations. If they do not find any, they will be sent on forced labour to the Reich. Each week brings new kinds of persecutions against the Jews. They are being further rounded up for the labour camps, and when they have completed their compulsory labour, they are handed over to work for the families of mobilised soldiers. In Brno, they are prohibited from entering the public parks.

The food situation has in no way improved. In the fat ration, butter has been completely replaced by artificial fats. Rice is very scarce, and a special decree of the Ministry of Agriculture allows rice only to expectant and nursing mothers and to invalids. Even more rare is real coffee and tea. Coffee is only issued to hospitals and nursing homes by special permission of the district office. At the beginning of the year, tea of a very inferior quality was issued in small rations to certain cafés, but this has now been completely stopped. Farmers are urged to breed snails, which are consumed in great quantities in the restaurants of Prague, Brno and Pilsen. Wednesday and Friday are now meatless days. The Germans are very concerned about the crops, and an article in the *Narodni Politika* of July 20th, written by the Minister of Agriculture, emphasises particularly the danger of fire to crops. A decree of the Price Control Board fixes prices for agricultural machinery and implements at those current on November 1, 1940. Fear of sabotage is also evident in a new order which forbids all inhabitants to go out into the fields between 8 p.m. and 7 a.m. To meet the potato shortage, a decree dated July 19th requires an additional amount of two tons of early potatoes per hectare to be lifted and delivered between July 22nd and August 3rd.

The industrial output is slackening, and repeated appeals have been made to the Czechs to increase their output in the factories. The shortage of certain raw materials has compelled the Nazis to organise collections of scrap iron and other metals. The *Neue Tag* of July 22nd contained a half-page advertisement by the Ministry of Trade, stating that the collections must not be confined to unnecessary articles only, and that the Czechs must show greater willingness and sacrifice.

Turkey Faces the Strain of War

[BY A CORRESPONDENT]

August 11th

THE uncertain political situation in which Turkey finds itself is reflected in the economic sphere. Difficulties have arisen in the negotiating of the economic agreement for which Germany is pressing. This agreement, involving a sum of £T25 millions, was to provide for the exchange of German machinery and spare parts against Turkish tobacco, dry fruit, cereals and a small amount of chromium, copper and manganese. It is, however, understood that earlier engagements reserve these minerals for Britain. Substantial changes which have taken place in Turkey's foreign trade during the last two years make it, in fact, difficult to take up the thread of mutual trade relations where it had been cut off at the outbreak of war. Turkey's total imports dropped from £T149.8 millions in

1938 to £T118.2 millions in 1939 and £T68.9 millions in 1940, and there has been hardly any increase in the first three months of this year. Turkish exports have declined from £T145 millions in 1938 to £T111.4 millions last year, and again there has been only a slight increase during January to March this year. Substantial as this general decline is, the trade with Germany has suffered particularly severely; imports from Germany dropped from £T62.2 millions in 1938, when they reached a peak, to £T9.7 millions last year.

The Germans complain that the activities of the United Kingdom Commercial Corporation have enabled Britain to hold the first place among Turkey's customers. Before the war, it was Greater Germany that supplied more than half of Turkey's imports, while this share is now but 16.7 per cent. Great Britain, which in 1939 supplied 6.2 per cent of Turkey's imports, increased its contribution to more than 20 per cent at the beginning of this year. Similarly, Britain purchased only 3.4 per cent of Turkey's exports before the war, against 28.1 per cent early this year.

Trade with the Balkans

A special feature of Turkey's economic policy in the last few months has been the attempt to strengthen trade relations with the South-eastern European countries: Roumania, Hungary and Bulgaria. Special agreements have been concluded providing for Turkish supplies in exchange for goods from the Balkans, such as Roumanian oil for Turkish cotton. As these Balkan countries have been for some time past under complete German control, their trade, particularly supplies of oil, cannot be maintained without Berlin's consent. It may, therefore, be assumed that the Germans have tried to keep contact with Turkey through the agency of the Balkan States. This policy is being systematically continued. It is as a result of these attempts that, for instance, Roumania's share in Turkey's imports increased from 1.1 per cent before the war to over 17 per cent at the beginning of this year, while Hungary's share rose from 1 to almost 6 per cent. Germany dwells on the argument that Continental Europe participated even last year to the extent of 61 and 68 per cent in Turkey's imports and exports respectively. And since trade with the British Empire along the Basra route and the Baghdad railway has developed favourably, German propaganda tries to stress that the Black Sea and the Danube constitute the "only possible connection of Turkey with reliable trade partners," that is, with Germany. It is Turkish chromium, copper, manganese and cotton that particularly attract Germany's interest.

Shortage of Machinery

There is another side to this question. It is no longer export trade that constitutes Turkey's chief economic problem. Turkey is at present short of goods, and the question of safeguarding imports has become prominent, particularly the import of specialised machinery. Turkey's programme of industrialisation has made progress, and new projects are to be put into operation. For these and for other reasons, foreign machinery and even entire plants are needed. It is true that the industrialisation of Turkey, particularly in its pre-war stages, has been to a large extent carried out by German firms. Theoretically Germany can again supply industrial goods, but in fact they are at present urgently needed at home, and the planned large dockyard at the Golden Horn is to be equipped with British machinery. In fact, during the last few months, Turkey purchased an increasing part of her machinery from Great Britain and the United States, in spite of the difficulties caused largely by the transport shortage.

With an eye on these difficulties, and in order to be better prepared in case of war, the Turkish Government has tried to meet the requirements of the home market by increasing home production, agricultural and industrial, as far as is possible. Comprehensive state control aims at safeguarding supplies to the people and the army out of home production. This means, of course, the organisation of scarcity, as Turkey is not in a position to be self-sufficient. The Turks are, however, making increased efforts to complete their industrialisation and to develop their economy into a kind of war economy, capable of overcoming the primary difficulties arising out of forthcoming events, though not yet of supplying the whole of forthcoming requirements.

Simpler Control in Argentina

[FROM OUR BUENOS AIRES CORRESPONDENT]

June 21st

A DECREE has been made in Argentina which practically abolishes the prior permit system for imports from July 1st, and from that date allows approximately 85 per cent of the country's imports to enter without any limitation whatsoever. In his message accompanying the decree, the Minister of Finance states that, of the remainder, 11 per cent are subject to quantitative limitations of a flexible nature, while 4 per cent are temporarily suspended until Argentina's exchange position improves. The salient features of the decree are as follows:—

Article 1. "As from 1st July next prior import permits shall be suppressed except in special cases and for goods specified by the Ministry of Finance, for which purpose it will issue the necessary regulations after consulting the Exchange Committee."

Article 2. "As from the same date the Exchange Control Bureau ceases to function." (Further clauses of this article allocate the Bureau's remaining functions between the Customs and Income Tax departments and the Central Bank.)

Article 4. "The Exchange Committee will report on import exchange questions to be resolved by the Ministry of Finance, on the procedure referred to in Article 1, and on importers' claims which, under the rulings of the Ministry of Finance, cannot be settled by the Central Bank."

Article 6. "Shipping permits are suppressed except for goods the export of which must be controlled by the Customs departments under special regulations."

The preamble to the decree indicates that the step now taken is part of the gradual elimination of exchange control, and that it is made possible by the saving in foreign exchange caused by the restriction of unessential imports. It also makes clear the superfluity of the existing permit system as regards imports payable in blocked currencies. At the same time, it points out that the limitation of non-essential and luxury imports is still necessary, though subject to a certain elasticity for the time being. Meanwhile, it states, every effort should be made to replace imported by home materials.

Letter to the Editor

Member of Parliament

TO THE EDITOR OF THE ECONOMIST

SIR,—Sir Patrick Hannon's indignation with your article surprises me. I should have thought a fairer criticism of it would be that you were flogging the obvious. I seem to remember that local Conservative committees have been criticised both in the Conservative Press and at Conservative conferences for choosing candidates of wealth and rank in preference to men of ability. Is it improper for a paper to accept Conservatives' own estimates of their own shortcomings and to point out the ill-effect they have already had on Parliament and on our national policy?

Lloyd's.

Yours, etc.,

D. E. W. GIBB.

THE BUSINESS WORLD

Steel Supplies

WHILE steel supplies are by no means the only limiting factor in the production of armaments, in a broad sense they do condition the size of the programmes of the Defence Departments. To ensure adequate supplies of steel, it has been necessary, first, to maintain home production and imports at the highest possible level and to eliminate unnecessary exports; secondly, to adapt the structure of the industry to wartime needs; thirdly, to cut civilian consumption to the bone; and, fourthly, to practise rigorous economy in the use of iron and steel. How far have these tasks been accomplished during the first two years of war?

The task of securing the biggest volume of steel within the limits set by domestic capacity, by available overseas supply and by shipping tonnage has been one of great complexity. Before the war, in the boom year of 1937, the iron and steel industry consumed 13,943,000 tons of mainly low-grade domestic ore and 6,193,000 tons of high-grade imported ore in the production of 8,493,000 tons of pig iron and ferro-alloys, some two-thirds of which were used in the manufacture of steel. In addition, 645,000 tons of pig iron were purchased abroad. In the same year, the industry consumed 7,477,000 tons of scrap in the production of steel; but domestic supplies of scrap had to be supplemented by net imports amounting to 722,000 tons. Again, the output of crude steel in the form of ingots and castings, amounting to 12,984,000 tons in 1937 and involving the consumption of 7,477,000 tons of scrap and of 6,255,000 tons of pig iron, was supplemented by 1,394,000 tons of imported semi-finished and finished steel. In short, in a year of heavy demand, such as 1937, Great Britain had to import, not only a substantial proportion of the bulky raw materials required in the manufacture of crude steel, but also appreciable quantities of semi-finished and finished materials. Moreover, the greater part of the imports of ore and of iron and steel, and a substantial proportion of the scrap purchased abroad, came from countries which are now controlled by Germany. Thus, of the 6,950,000 tons of ore imported in 1937, 5,026,000 tons were derived from Sweden, Norway, Holland, Germany, France, Algeria and Tunisia; of the 2,039,000 tons of imported iron and steel, 1,311,000 tons came from the chief continental producers, while Holland, Belgium, France and Norway contributed 165,000 tons of scrap to the total intake of 951,000 tons.

Although alternative sources of supply of both raw materials and semi-finished and finished steel have been available, the average length of haul is greater, while shipping tonnage is strictly limited. The Steel Control was therefore faced with the need for adjusting the proportion of imports in the different stages of production, from the raw material to the finished product, in order to secure the highest possible yield, in terms of finished materials, and, above all, for expanding the domestic supply of raw materials, that is of ore and scrap. If the United States had enough semi-finished and finished materials to spare, shipping considerations would have favoured the exclusion of pig imports. But, for technical reasons, the industry in this country cannot dispense with substantial quantities of high-grade overseas ore, though the need for importing large tonnages of scrap is less imperative.

The Steel Control, therefore, had to strike a balance. Whether or not it has struck the correct balance is, of course, difficult to judge in the absence of full details. It has certainly managed to maintain the domestic output of crude steel at a fairly high level, in spite of the very considerable technical difficulties involved by the change in the composition of the raw materials at its disposal; and it has managed to secure substantial tonnages of pig iron and of semi-finished and finished materials from abroad. But it is doubtful, to say the least, whether it has gone far enough in substituting domestic for imported scrap.

In view of the heavy home demand for steel, a severe curtailment of exports has been inevitable. So far as the

Dominions are concerned, Canada, Australia and South Africa have all increased their steel-producing capacity in recent years, while India, too, is now in a position to produce substantial tonnages. Like Great Britain, these countries are now compelled to divert their domestic supplies from civilian to war purposes, while Latin American countries will have to rely largely on the United States for their essential needs. Great Britain can no longer afford to export steel, except in limited quantities to assist the war effort in the Empire and other friendly countries. In fact, exports are now well below the level of 1937, when 2,609,000 tons of iron and steel were shipped abroad.

In consequence of the steps taken to maintain home production and imports at a high level, and to cut out unnecessary exports, the total supply of steel available for consumption in this country is now probably bigger than at any time before the war; and stocks of ore, scrap and pig iron are substantial.

The change-over from the production of steel for civilian to war purposes has involved a number of structural changes in the industry, because of the different nature and composition of the finished products required. It has been necessary to adapt existing capacity to new needs and to expand the facilities for the production of alloy steels. Certain production equipment which does not lend itself to adaptation will even have to be closed down for the duration of the war. For example, the curtailment in the output of tinplate has made it difficult to employ all the mills to capacity, even though some of the works are now producing greater quantities of sheet bars, and a committee is now examining the problems of this section of the industry. The process of adaptation is by no means complete. The application of the Essential Works Order to the industry should assist the Steel Control in its effort to make the most efficient use of plant and labour.

Hardly less important than the provision of large quantities of steel and the adaptation of the industry's output to wartime requirements, is the need for an efficient system of allocation to ensure its use for the most essential purposes. Such a system has now been in operation for more than a year, and, while the original plan has had to be modified to some extent, it has served its purpose fairly well. Broadly, the Materials Committee of the Cabinet's Production Executive allocates available supplies to the various Government Departments, which, in turn, distribute their quotas in accordance with their programmes. As a result, the bulk of the available supplies are directed into the production of war goods.

Lastly, since steel supplies set a limit to the size of the armament programme, rigorous economy in its use has become vital. Here, again, a good deal has already been done by changes in specifications, designed to reduce the quantity of steel in many products or to permit the use of materials of inferior quality, by the standardisation of specifications and by the employment, where possible, of alternative materials. For example, the thickness of plates in ARP water tanks has been reduced to yield a saving of 25 per cent, by weight, while part of the huts for the War Office have been made in composition material instead of in corrugated sheeting.

In sum, therefore, the Iron and Steel Control can rightly claim to have achieved a considerable measure of success in the fulfilment of its task. It has succeeded, in the face of great difficulties, in ensuring adequate supplies of steel for the growing armament programmes of the Service Departments. True, it has not been equally successful in the solution of all its problems, and it has not yet been able to strike a perfect balance in the use of the labour, plant, domestic materials and shipping capacity at its disposal. But its record compares very favourably with that of the Mines Department, which has permitted the partial disintegration of the coal-mining industry, almost as a disinterested spectator.

Insurance Accounts

WHILE the spirit of sturdy individualism has stood the British insurance companies in very good stead in almost every respect, its application to their annual accounts is apt to cause some confusion. Apart from the need for setting out all the relevant facts in the accounts, a greater measure of lucidity and uniformity in their presentation is also desirable if the accounts are to be intelligible to all those for whom they are intended. The broad lines on which insurance accounts must be prepared are laid down by the Assurance Companies Act; but its framework leaves a good deal of scope for the exercise of originality. The draft Insurance Undertakings Bill, the work of the Clauson Committee which reported in 1927, would, if brought to the Statute Book, have produced uniformity in some, but not all, of the directions in which it is required. At present, there is such a multiplicity of variations in the treatment of certain items in the accounts that comparisons between the various insurance offices become impossible without the making of more or less arbitrary adjustments, which are calculated to cause irritation to the interests concerned, without any guarantee that in the end an accurate impression is conveyed.

If the plea for greater uniformity merely arose from a desire to compare one company's accounts with those of another, the matter might not possess great significance. The elasticity which the forms of account permit, however, not unnaturally involves the temptation to assist the revenue accounts as far as possible—as no office likes its figures to compare unfavourably with others. In consequence, the public tends to acquire somewhat inaccurate views of the profits made by insurance companies; and such views might form the basis of demands for unjustifiable reductions in rates or of resistance to necessary increases, and thus be inimical to the legitimate interests of the offices themselves. From this point of view alone, therefore, lucidity is a powerful desideratum.

Leaving aside the question of the life, annuity, capital redemption and kindred classes, which are largely self-contained and present special features of their own, the matters on which information is desirable are, first, the underwriting results in the various branches; secondly, net investment income; thirdly, capital gains and losses; fourthly, the strength of the free reserves, that is to say, the surplus of assets over liabilities; and, lastly, the appropriation of profits. These features, incidentally, are all well displayed by the form of financial statements prescribed in the United States in the so-called underwriting, investment and miscellaneous exhibits, one of the great merits of which, bearing on the first and second requirements, is the clear-cut division between the two main sources of profit and loss and the absence of any "loose" items allocated neither to the one nor to the other. There is nothing in British accountancy comparable with the American exhibits, but this is no reason why the formulæ adopted in this country should not be equally lucid. This could be accomplished if, as a matter of general practice, all underwriting charges, but no investment revenue, were included in the departmental accounts, and if the profit and loss account were confined to the joint functions of investment exhibit and appropriation account.

It is here that the varying treatment of certain items of expense is encountered. These items fall under three main headings: first, "expenses not charged to other accounts"; secondly, pensions; and, thirdly, overseas taxation. The first heading comprises a number of charges such as directors' fees, ARP expenditure and certain head office expenses of a general nature, including the cost of administering central departments not concerned with the transaction of any one class of business. These expenses are, nevertheless, a definite element in the cost of conducting insurance business, and there seems no reason why they should not be susceptible of reasonably accurate allocation between underwriting income, on the one hand, and investment income, on the other—the former being a charge against the respective trading accounts, and the latter against interest receipts. If these miscellaneous expenses were properly allocated, there would figure in the profit and loss account only the investment proportion, which would appear as a deduction from gross interest.

Allocations to pension reserves, superannuation funds, widows' funds and the like, coming under the second heading, could readily be dealt with in the same way, for there is no logical reason for treating these charges separately from salaries, since the latter would doubtless require to be higher if pensions were not the rule. The system in use by many offices of allocating sums to pensions reserve from the apparent profits of the year seems to be an anachronism handed down from the days when pensions were conferred by the directors as acts of grace. But nowadays, when pension arrangements are for the most part clearly defined—even if not resting on absolute rights—the cost is analytically inseparable from salary charges. The third group of expenses, that is overseas taxes, are debited by some companies to underwriting and by others to profit and loss. The former procedure—which is that laid down in the draft Insurance Undertakings Bill—seems the most logical, since these levies must be taken into account in order to arrive at the true underwriting profits for the purpose of the accounts as published. British income tax on underwriting profits is in a different category and is uniformly shown in profit and loss.

There is also some divergence (affecting the first and second desiderata) in the treatment of interest earnings on departmental funds in the non-life accounts. The majority of offices do not include such interest in calculating their underwriting profits and, as no allowance is made for this extraneous source of income in computing rates, this would appear to be the correct course. Nevertheless, a case can be made out for the minority practice (which is prescribed in the draft Insurance Undertakings Bill) in the case of certain types of risk where the reserves held against outstanding claims may attain substantial proportions. But some offices include interest, not only on reserves necessarily held against departmental liabilities (a large part of which must be kept in the form of cash), but also on any additional or catastrophe reserves; and, as it would in any case be very difficult to arrive at anything in the nature of a common denominator holding good for all offices, it seems best, for this reason also, to treat all interest earnings as investment income.

COMMERCIAL UNION

ASSURANCE COMPANY, LIMITED

FIRE - LIFE - MARINE - ACCIDENT

Head Office - CORNHILL, E.C.3

TOTAL ASSETS EXCEED £72,000,000

SECURITY

Amid so much that changes the desire for Security of the Person and of Property remains constant.

After 220 years of continuous endeavour to meet this desire by efficient Insurance the "Royal Exchange" is maintaining in every way possible its normal service. All departments of Insurance are represented by the Corporation's policies and the duties of Executor and Trustee are undertaken.

ROYAL EXCHANGE ASSURANCE

Incorporated A.D. 1720

Head Office at the Royal Exchange, London

Head Office temporarily at

KIDBROOKE PARK, FOREST ROW, SUSSEX

The Canada Life in its 94th Year

OUTSTANDING FEATURES of the COMPANY'S REPORT for 1940.

The net new life assurances completed in the year amounted to £7,480,851. Of this, £997,015 was written in the United Kingdom and in Eire. In addition, the sum of £543,519 (£366,461 in the United Kingdom and Eire) was received by way of single premium annuity considerations.

Income from all sources amounted to £7,372,824. Payments to Policyholders and annuitants and sums paid as a result of death claims totalled £5,097,886.

The rate of interest earned on the funds of the Company was £4 1s. 2d. %

The assets at the 31st December, 1940, amounted to £56,626,744.

Special reserves and surplus funds increased to £2,774,228.

In order to establish capital gains and losses and to calculate the surplus of assets over liabilities—the third and fourth desiderata—some uniformity in methods of valuing investments is greatly to be desired. The test of market values of Stock Exchange securities is a severe one, and may not be relevant to life and kindred classes of business, but, in the non-life branches with which this article is mainly concerned, every office of standing must meet this requirement. Mortgages and other property investments are not held to any material extent against non-life liabilities, so that the difficulty of securing uniformity in matters of property valuation is not important. If the offices were to adopt the practice of showing in their accounts the market values of their Stock Exchange securities as well as the book values, instead of masking the market values by revealing book values only, with a certificate to the effect that the investments are fully of the value stated, less this or that reserve taken into account, this would be of considerable value; only then would it be possible to gauge the true financial strength of any insurance institution. The liabilities side of the balance sheet is also important. There are differences, for example, in methods of calculating the reserves for unexpired risks and reserves for outstanding claims. Uniformity here cannot be otherwise than difficult of achievement: there may be reasons, best known to the offices concerned, why the ratios of these reserves to premium income should be higher or lower than the average and, if this is so, insistence on uniformity would serve no useful purpose.

Concerning the fifth requirement—an informative appropriation account—the adoption of the foregoing suggestions would greatly simplify matters, since if all “loose” items were eliminated, the profit and loss account, in addition to the underwriting profits and losses transferred from the individual revenue accounts and the investment items, would normally show only bad debts, debenture interest and dividends. At present, some offices do not carry all their underwriting profits to the profit and loss account, but leave some part to strengthen the additional reserves in the departmental funds. The better course would be to transfer

the full profits and make any allocations to additional reserves from the total sum available for distribution. Secondly, not all offices make full provision for dividends in the current year's accounts; it does not appear greatly to matter which procedure is followed, so long as there is uniformity, and the unappropriated sums carried to the balance sheets do not mean one thing for one office and another thing for another office.

Reference may also be made to the varying treatment of business written through subsidiary companies. Some parent offices treat their subsidiaries purely as investments and include the dividends paid by the subsidiaries in the interest income in the profit and loss accounts. Others combine the business of the subsidiaries with the figures of the parent company in the publication of consolidated accounts; and there can be no doubt that the latter method is in every way preferable. The result of the first method is that there is no effective separation between the investment and underwriting incomes of the subsidiary offices in the accounts of the parent company—and no means of ascertaining how far, if at all, credit has been taken for the goodwill attaching to the business of the subsidiaries, an undesirable practice in any case.

These are some of the main problems with which the student of insurance accounts has to contend; the suggestions for their solution are advanced as a basis for discussion. Reasons have already been adduced urging the importance of accuracy and uniformity, not only for the benefit of shareholders and policyholders, but also in the interests of the companies themselves. The insurance industry has shown an ability to co-operate on many issues; it should not be impossible for the principal offices to agree upon a set of accounting formulae and rules which, by convention, would become binding on all. It is to their skill in avoiding pitfalls, both in the field of underwriting and in that of investment, that the British offices largely owe their success; and it would be a pity if, by, say, excessive Government control, anything were ever done which would take away from the offices that sense of responsibility which is the life blood of the business.

Finance and Banking

Legalising the Fiduciary Issue

To provide the legal authority for maintaining the fiduciary issue at its present level, a new Defence (Finance) Regulation was necessary which has been made this week. In January, 1939, the fiduciary issue was temporarily raised from £230 millions to £400 millions by the large transfer of gold to the Exchange Equalisation Account, and then reduced two months later, by the revaluation of the Bank's gold holding at market price instead of the old statutory price, to £300 millions—the statutory maximum under the Currency and Bank Notes Act, 1928, as amended. Like the two subsequent increases of £50 millions, the increase to £580 millions on the outbreak of war, when the Bank's remaining gold was transferred to the Exchange Account, was authorised by Treasury minute, and, as is known, may not be extended for more than two years from the date on which it was originally made, without Parliamentary sanction. Fresh authority was consequently necessary to continue this increase beyond September 5th. The new Defence Regulation substitutes for this date either September 5, 1943, or the date on which the regulation ceases to be in force, whichever is the earlier. Since the regulation, unless previously revoked, will remain in force until the expiration of the Emergency Powers (Defence) Act, the £580 millions fiduciary issue is in effect regularised for the duration of the war. Any future increase in the issue will, however, be made by the normal machinery laid down by the Currency and Bank Notes Act—that is, by Treasury minute to be laid before Parliament—and not by emergency decree.

Still Tighter Credit

This week's decline in the note circulation—after four months of expansion to successive record levels—suggests that the necessity for any further increase in the fiduciary issue should not now arise until the final weeks of the year. Though the reflux of £2,802,000 is considerably less than in the corresponding week last year, any upward movement contrary to the seasonal trend, which seemed to be

threatened by last week's increase on the holiday peak, no longer seems probable. Notwithstanding the rush of last-minute applications for National War Bonds, which have prolonged the severe immobilisation of funds in public deposits, no steps have been taken to mitigate the resulting credit stringency by any appreciable expansion in the credit base. In contrast with last week, there has been no suggestion of any special bill purchases by the banks in replacement of shorter maturities sold to the authorities. Clearing bank buying has indeed been at a virtual standstill, which is perhaps hardly surprising in view of the call on the banks for £15 millions of Treasury deposits even though no receipts were maturing. The restricted outlet for bills has had the greater tendency to cause stringent credit conditions because the market has had to finance a comparatively generous Treasury bill allotment resulting from the decline in total applications—its own indirect result of the rush to secure National War Bonds before the issue was withdrawn. Altogether, the market has had a far from comfortable week.

China Currency Board in Action

Following the recent appointment of Mr E. L. Hall-Patch as the British representative, the new Chinese Currency Stabilisation Fund to administer the sterling and dollar credits has at last started operations. Its initial intervention was particularly well-timed, having served not only to restore some reality to the Shanghai foreign exchange market, but also to bring about a recovery in the Shanghai dollar. Before the Fund intervened, the market rate for sterling had fallen as low as 2½d. The official rate has been fixed as high as 3½d., though the merchant rate in the market remains in the neighbourhood of 3d. Under present conditions, the fixing of rates above the market level would be calculated to cause a severe drain on the Fund's capital resources in anything like a free exchange market. It goes without saying, therefore, that exchange will not be available at these rates to all comers, but only for certain permitted transactions, which include payment

for *bona fide* imports into China from the United States and the sterling area, personal expenditure, and genuine (as distinct from speculative) contractual obligations. In discriminating between applicants for exchange, the control will be assisted by the recent freezing orders, since each applicant is required to make a separate application. Quite apart from the need for discrimination on political grounds and to conserve resources, a selective policy would have been imposed by the conditions under which the sterling credit was originally granted. It will be recalled that support of the Chinese currency was to be made dependent on suitable arrangements to ensure that the sterling released does not find its way to the free market for conversion into dollars, thus involving the British Treasury in a loss of gold. For the time being, decisions as to the granting of exchange will be made on behalf of the Stabilisation Board by the various British and American banks in the Far East. The fact that the Hongkong and Shanghai Banking Corporation is prominent among these banks is sufficient refutation in itself of the Japanese report that this bank is closing its Far Eastern branches, which has been emphatically denied by the chief manager.

£10 Millions Credit for Russia

Full details have not yet been made known of the £10 millions credit to the U.S.S.R. granted in connection with the new barter agreement. It may be assumed, however, that the present credit will not give rise to any issue of securities similar to the Soviet Government 5½ per cent five-year sterling notes, guaranteed by the British Government and issued in connection with the £10 millions export credit in 1936, of which some £8 millions are held in the money market. On the present occasion, the rate of interest has been fixed at only 3 per cent for an average period of five years. The sum of £10 millions is clearly not intended to set a limit to British supplies to the Soviet on credit, for it is stated that when the present credit is exhausted the two Governments will enter into negotiations for a further amount. No change is expected in the existing sterling-rouble exchange rate, which is based on the rate for free sterling in New York. It is understood that this rate will be used for the computation of accounts in both directions.

Banking and Production

British bankers may find food for reflection in the information contained in the latest Federal Reserve Board Bulletin about the part being played by the Reserve Banks in the American production effort. The co-operation between the Reserve System and the Office of Production Management (the equivalent of the British Ministry of supply) seems to be developing far beyond ordinary banking relations. An official of each of the twelve Reserve Banks and their twenty-four branches has been appointed Defence Contract Officer, with the duty, on the one hand, of co-operating closely with the Defence Contract Service, the branch of the OPM concerned with contracts, and, on the other, of assisting banks and contractors on all financial problems arising out of the defence programme. But more important, the Defence Contract Service has established an office at each of these thirty-six Reserve Banks with a co-ordinator in charge and a manager and technical staff with engineering and industrial experience. The function of these officers and staffs is to help “bring

together primary contractors and sub-contractors and to furnish small and medium-sized local producers with the wide variety of information they need in filling Government orders for defence goods.” Furthermore, the Priorities Division of the OPM is also establishing offices at a number of the Federal Reserve banks and branches to help and advise manufacturers on all “priority” questions. This organization seems thus to be designed to do very much the same work as is being undertaken in this country by the Area Boards and Capacity Clearing Centres of the Production Executive. There is here a wider conception of the function of central banking than has so far gained any hold in this country.

Anglo-Japanese Clearing

Japan was one of the few countries with which this country was unable to conclude a payments agreement, similar to those concluded with most Latin American countries, for the purpose of tightening the exchange control through the establishment of special sterling accounts. During the era of appeasement in relation to Japan, the Treasury did not insist upon the conclusion of such an agreement, and did not carry out its threat made in June, 1940, that compulsory exchange clearing would be imposed on any country which was not prepared to fall in line with the system of special accounts. The blocking of Japanese assets in this country has now created a new situation. It precludes the possibility of paying out of the existing Japanese balances for such exports to Japan as may be authorised. For the purpose of financing the limited trade which the two Governments intend to agree upon, arrangements are being made for the establishment of an Anglo-Japanese clearing account. The proceeds of goods to be imported from Japan under licence will be paid into that account, and these funds can only be used for payments for licensed exports to Japan. Export licences will be granted for approved goods only within the limit of funds available on the clearing account.

Plunder Indices

The figures of the weekly returns of the Netherlands Bank, which continue to be published, constitute a characteristic though by no means complete index showing the progress of the plunder of Holland by Germany. During the week ended June 30, for instance, the note circulation reached a new high level at 1,700 million guilders. The bank's holding of foreign bills increased by 24 million guilders to 308 million guilders. This item consists almost entirely of Reichsmark bills. A year ago it amounted only to 300,000 guilders. During the same week the item of “sundry accounts” increased by 7.7 million guilders to 219 million guilders, against 17 million guilders a year ago. This item, too, represents Reichsmark claims. An increase in the Netherlands Bank's claims against Germany by 31.4 million guilders in a single week gives some idea of the pace of the exploitation of Holland by Germany. Reichsmark claims arise not only from the “favourable” trade balance in relation to Germany, but also from various payments which the Netherlands Bank is compelled to make on German account, such as the payment of interest to Dutch holders of German loans and payment of wages to the families of Dutch workmen working in the Reich; and payment of wages to Dutch workmen engaged in Dutch industries working for Germany.

Investment

Equities for Choice

Although the announcement of the Churchill-Roosevelt meeting at sea and the eight-point declaration did not provide markets with a bull point, last week's close was generally firm. The current week has seen a marked crudescence of buying for post-war recovery, in which even such a war casualty as the retail stores group has shared to the full. Other sections, in particular shipping and textiles, have profited from encouraging company news. The *Financial News* index of industrial shares, which touched 78.0, the highest level since March 18, 1940, at the end of last week has made further moderate progress. While industrial equities undoubtedly held most

of the investor's attention, as representing both a war-time inflation hedge and a prospective share in post-war prosperity, the gilt edged market was firm. The announcement of the Canadian stock requisition provided a background of buying and, on Monday, the overdue recovery in undated funds was initiated by marked support for Old Consols and Local Loans. The home rail market has enjoyed a boom which, although it appears to be founded on optimistic forecasts of Government policy regarding the future of the agreement with the railway companies, is nevertheless backed by the knowledge that the railways are working to capacity. Turnover was not large, but share prices have generally reflected an atmosphere of purposeful confidence.

Canadian Stocks Acquisition

The announcement at the end of last week that, under a new Acquisition Order, five Canadian sterling securities to an outstanding total of £35,467,883 were to be transferred to the Treasury, raises an important point of principle, first brought to public notice when certain Indian Government stocks were "called up" earlier this year. Under the Securities (Restrictions and Returns) (No. 2) Order, 1941, owners of the following securities are required to reduce their holdings at the Bank of England in order that the Treasury, under the Acquisition of Securities (No. 4) Order, 1941, may acquire them on the terms specified:—

	Price per £100 Nominal £ s. d.	
Government of the Dominion of Canada 4 per cent. Registered Stock, 1953-1958 £15,000,000	110 12 11	
Government of the Dominion of Canada 3½ per cent. Registered Stock, 1950-1955 £10,000,000	104 2 5	
Government of the Dominion of Canada 3½ per cent. Registered Stock, 1958-1963 £10,000,000	104 2 5	
Government of the Province of Ontario 4½ per cent. Registered Stock, 1945-1965 £151,170	105 7 6	
Government of the Province of Ontario 4 per cent. Registered Stock, 1947-1952 £316,713	105 2 6	

The terms are based on current market prices, plus allowance for interest during the interval of approximately seven weeks to the due date of payment. Presumably, the object of calling up sterling securities, which earn no dollars, is to enable the Canadian Government to utilise its accumulating sterling balances in London in the extinction of its debts. The two Province of Ontario stocks represent quite a small part of the total. It is incontestable that, in wartime, every investor holds his securities—or, for that matter, his business interests, and his assets generally—at the disposal of the authorities for the successful prosecution of the war. Under the relevant Defence (Finance) Regulation, the authorities can take over securities if they are "of the opinion" that calling up is "expedient . . . for the purpose of strengthening the position of the United Kingdom." The question arises, however, whether the compulsory repayment of securities which, under the terms of the bond on which the money was originally subscribed, have a definite and somewhat distant range of repayment dates, is a precedent which ought to be widely followed. The process of imposing involuntary and premature liquidity on holders who may have arranged their portfolios on a time-table determined by their own contractual engagements (from which they have no power of release) will obviously involve a good deal of hardship if carried to a point at which no holder of a dated sterling stock to-day can feel sure that he will not be a holder of cash to-morrow.

Treasury Borrowing Policy

Further consideration has tended to confirm the market's view that the Treasury's wish in turning off the tap for 2½ per cent National War Bonds is simply to make subscribers go "as long" as possible. In practice, this principle must always be modified to suit particular borrowers who cannot, from the nature of their own engagements, lock up their resources for more than a given time. Insurance companies, for example, have maturing policy liabilities, while banks must maintain a relatively liquid position both immediately and in the medium and long run. On the other hand, the banks have expenses to match their increasing deposits, and may be presumed to be anxious, where possible, to earn more than the 1½ per cent obtainable on Treasury deposit receipts. At present, they are somewhat abnormally liquid; during the past year the ratio to deposits of the four most "liquid" types of assets of the clearing banks has risen from 33% to over 38%. The Treasury may well have assumed that the opportunity for gently propelling them into increased holdings of "longs" should not be missed. The opportunity, of course, is temporary and fleeting, and to maintain for any indefinite period a policy of Treasury financing (other than short-term) by means of tap issues alone, and those exclusively long-term, would not only inflict hardship, but would largely defeat its own purpose. When the medium tap is turned on again, the Treasury may well choose to issue, not a bond with reduced interest, but one with a longer life than its predecessors. Fractional reductions in interest rates

matter little to the Exchequer, with income-tax at its present level, while well-spread maturity dates mean a great deal. A new series of bonds, extending say, to 1950, would not be over long for investors and institutions, who presumably already hold earlier War Bond maturities, but wish to have their capital free within a limited number of years after the end of the war. And it would suit the Treasury very well, since the years around 1950 are not congested with other debt maturities, whereas from 1952 onwards the possibility of converting approximately £2,000,000,000 of 3½ per cent (ex 5 per cent) War Loan to a still lower rate of interest may be occupying the serious attention of the authorities.

Company Notes

Wiggins, Teape Earnings

The full accounts for the Wiggins, Teape group show a rise in gross trading profit for 1940 from £1,385,647 to £1,499,912, and in aggregate profit from £708,319 to £802,518. Since the volume of trade enjoyed by the group was reduced by the raw material shortage which followed the German occupation of Norway, these results appear highly satisfactory. The profits of the parent company are up by more than £80,000 at £594,088. The fall in equity earnings of Wiggins, Teape from £214,119 to £118,079 is due to an increase in liability for income-tax and EPT from £135,150 to £278,819, to the strengthening from profits of reserves against bad debts and to the necessity of providing £33,600 for war damage insurance. In 1940, surplus earnings at a rate of 7.0 against 15.5 per cent provide narrow cover for the ordinary dividend reduced by 1 to 7 per cent, the carry forward being £129 higher at £52,153.

	Years to December 31.		
	1938	1939	1940
<i>Consolidated figures:</i>			
Gross profit on trading	1,134,049	1,385,647	1,499,912
Aggregate profits	523,377	708,319	802,518

Carry forward	52,705	52,024	52,153

* Profits including amount of provision for share of loss in a subsidiary company no longer required: 1938, £1,561; 1939, £21,225.

† Income tax, E.P.T. and N.D.C., income tax equalisation reserve, transfers to reserve against trade investments and against shares in subsidiary company; war damage contribution, 1940, £33,600.

‡ Dividend 8 per cent., cash bonus 2 per cent.

It is satisfactory that both the company's balance-sheet and the consolidated statement show stocks, conservatively valued, in excess of the 1939 holdings, at £358,707, against £317,979, and at £1,618,699, against £1,479,962 respectively. Cash holdings for the group are more than doubled at £733,274, and Government securities are up from £2,500 to £27,771. Total specific reserves are reduced from £170,571 to £155,846, in part through provision of war damage insurance to December 31, 1939, from these funds. The excess of liquid assets over current liabilities is rather higher at £2,208,636, against £2,154,328. There is little doubt that the greatest difficulty for the group last year was scarcity of raw materials, and it is probable that there was a marked expansion in the demand for certain types of product, including photographic base papers for official use. The £1 ordinary stock, at 28s. 9d. ex dividend, yields £4 17s. 4d. per cent.

Bradford Dyers' Preference Payment

The announcement that Bradford Dyers are to pay off five years of preference arrears to December 31, 1937, created an immediate revival of interest in textile issues.

The company's £1 ordinary stock, on which a dividend is, of course, still out of sight, put on 7½d. to 6s. 10½d., while the 5 per cent. cumulative preference stock improved 2s. 1½d. to 15s. 9d. The full accounts for 1940 show profits of £373,857, against £233,556, after depreciation of £160,336 against £142,625. The company's tax liability is not disclosed and the accounts throw no light on the E.P.T. position. After meeting debenture service and allocating £60,000 for war damage insurance, £269,186, against £187,370, is earned for dividends. Since the payment of five years' preference arrears requires £318,655 net, there is a draft on the carry forward, which is reduced from £50,143 to £674. A total of £10,755 from surplus on redemption of debenture stock and profit on sales of investments is transferred directly to capital reserve account, and investments contingency account, raising the funds to £75,619 and £92,294 respectively. A satisfactory feature of the accounts is the improvement in the company's cash position. Cash holdings are up from £152,271 to £390,453, and the total of marketable investments and deposits with building societies at short notice from £139,599 to £362,648. With stock more than £170,000 higher at £621,046, the surplus of liquid assets over current liabilities is raised from £900,239 to £1,272,993. It remains uncertain whether the company will be able to eliminate preference arrears from January 1, 1938, in the current year, since raw material and labour difficulties must be expected to increase. The company should, however, be assured of a prominent position in the supply of the home market.

Hudson's Bay Ten Year Record

The full accounts of Hudson's Bay Company in the year to January 31st last show improved earnings in the trading department and reduced profits in the land department. Total income from trading rose strikingly from £458,155 to £703,520, but, after allocating the usual £150,000 to depreciation and meeting United Kingdom and Canadian taxation of £486,123 against £228,493, the surplus for ordinary dividends is down from £19,769 to £12,804. Thus, the 1 per cent dividend, less tax at 7s. 4½d., is not fully earned, and the carry forward is reduced from £97,227 to £94,299. Owing to a fall in total receipts in the land department from £88,914 to £79,500, the 1½ per cent dividend tax free is also not completely covered by the year's earnings and the carry forward in this case is down from £17,377 to £13,658. The main factors affecting the rise in gross trading income have been the excellent results of large retail stores, the success of the wholesale department's business, and the possibility of, to some extent, transferring the fur trade business from the United Kingdom to the United States. The land department suffered from a decline in the average sale price per acre from £1 11s. 6d. to £1 6s. 7d., and in the number of acres sold from 51,596 to 47,519. The wheat crop in the Prairie Provinces was a record since 1928. The total payment to proprietors of some 3.4 per cent less tax provides a yield of £2 15s. 6d. per cent at the present price of 24s. 6d. ex dividend for the £1 ordinary stock.

The latest accounts include the resolutions to be submitted to the Annual General Court by Mr C. L. Nordon, one of the proprietors, and of the Governor's reply. It is clear that Mr Nordon's complaint that losses of £3,458,084 have been incurred between 1931 and 1940, and that total distributions to proprietors have amounted to £161,994 against total remuneration, plus income tax thereon, to the London and Canada committees of £145,106 can be easily rebutted. The first charge, with its implication of incompetent management, obscures the fact that the board, which took office in 1931 in the depths of the great depression, has succeeded very substantially in pulling the chestnuts out of the fire. Thus, a loss before depreciation of £648,865 in 1930-31 was turned into a profit before depreciation and taxation by 1933-34, which reached a total of £696,177 by 1940-41. The total payment to proprietors was in fact £186,916 gross on trading account, plus £124,611 on land account. Mr Nordon's proposals for reorganisation of the company's management, which in fact amount to a vote of no confidence, appear to be curiously ill-timed. Resolution 2, which contains a plea for more informative accounts, should be taken more seriously than the others. The current accounts do in fact contain a full and important statement of the company's investments and of the

set-up of departments and subsidiaries, and there is no doubt that the accounts would be strengthened if the provision of similar information were made a permanent feature.

W. T. Henley's Accounts

The full accounts of W. T. Henley's Telegraph for 1940 do not add substantially to the information contained in the preliminary statement, discussed in *The Economist* of August 2nd. Total profits, after tax, are down from £415,204 to £400,484; a moderate fall which suggests that the gross figure shows a definite improvement on that of the previous year. Depreciation receives £69,918, against £61,246, leaving equity earnings at £311,566, against £331,353 to provide cover of 27.9 per cent for the total ordinary distribution maintained at 20 per cent. In place of the usual allocation of £100,000 to general reserve, war contingencies reserve receives £50,000, so that, after deduction of a £3,500 bonus to directors authorised at the 1940 general meeting, the carry forward is raised from £380,831 to £382,397. The following table indicates three years' trend of earnings and allocations:—

	Years to December 31.		
	1938	1939	1940
Profit	445,159	415,204	400,484
Expenses, fees and pensions	13,605	13,605	10,000
Depreciation	61,012	61,246	69,918
Preference dividends	9,000	9,000	9,000

Ordinary stock:—

Earnings	361,542	331,353	311,566
Paid	260,000	260,000	260,000
Earnings %	30.8	28.8	27.9
Paid %	20†	20†	20†

Reserve	100,000	100,000	£50,000
Carry forward	411,894	£380,831	382,397

† Including 5 per cent. cash bonus.

‡ After charging £2,416 net loss on sale of trustee securities.

§ War contingencies reserve.

The balance-sheet shows a provision for deferred repairs of £7,400, special depreciation and general reserve remaining at £26,753 and £500,000 respectively. Fixed assets amount to £1,258,815 after additions for the year of £171,433. Liquid assets are depleted by the sale of £93,081 of Government securities, and cash is slightly lower at £132,419, against £150,480. These reductions have helped to finance a rise in stock of £174,992 to £1,071,110. The company's profit position continues to show great stability under war conditions, a fact to be attributed to its satisfactory EPT standard, as well as to the steady demand for its electrical output. The 5s. ordinary stock, at 21s. ex dividend, yields £4 15s. 3d. per cent.

Royal Mail Progress

Royal Mail total profits in 1940 followed the general upward trend of shipping earnings with a rise from £995,005 to £1,102,457. Since taxation and general expenses were rather lower at £338,372, against £356,950, while fleet depreciation absorbed £345,000, against £325,000, the greater part of the increase was passed on to equity earnings, which rose by £98,148 to £378,377. In the absence of a final dividend, the ordinary stockholders receive 5 per cent, as in the three previous years, the rate of cover rising from 11.2 to 18.9 per cent. Of the surplus, £100,000 goes to Fleet Replacement Account, £60,000 is written off investments, and the carry forward is raised from £14,344 to £132,721. No doubt the decision not to raise the ordinary distribution is due largely to the fact that the increase in profits was earned mainly in the first half of 1940, before the entire fleet was absorbed into the Government Liner Requisition Scheme. The balance-sheet shows that the problem of post-war fleet replacement is being taken with due seriousness. The chairman, Lord Essendon, points out in his statement that £1,973,000 has been transferred from available surpluses to Fleet Replacement Account, bringing the total to £3,298,000. Book value of fleet after depreciation is up from £4,601,900 to £4,943,600; the amount at the company's credit under the terms of the Government tonnage replacement agreement stands at £317,825, and loans guaranteed by the Ministry of Finance of Northern Ireland secured against vessels building, are up from £957,000 to £1,143,000. A substantial rise in creditors and taxation from £425,000 to £1,319,000 has been exceeded by a jump in debtors, including amounts owed on Government account, from £718,000

to £2,165,000. Thus, the liquid position is highly satisfactory. The directors have invested £1,450,000 in National War Bonds since the date of the previous accounts, bringing the total of investments to £1,992,637—market value £1,999,378—and cash holdings are up from £395,000 to £522,327. After the rise of recent weeks the £1 ordinary stock, at 21s. 9d., yields £4 11s. 11d. per cent.

* * *

Beechams Pills' Fresh Progress

For the second year in succession, gross income of Beechams Pills to March 31st reached a record level at £1,085,893 against £1,055,615. A rise in tax liability from £469,018 to £695,282 accounts for the fall in equity earnings from £443,847 to £263,986, representing a rate of 32.5 against 46.1 per cent. Special development expenditure of £522,327. After the rise of recent weeks the £1 ordinary sum being transferred back from the free surplus. Thus, the carry forward is raised from £104,593 to £106,031.

Taxation for the group as a whole in the second complete year since the acquisition of Macleans and Eno Proprietaries and the first since the acquisition of County Perfumery, amounted to £1,003,785. The value of the accounts is somewhat impaired by the absence of a consolidated balance sheet. The company's balance sheet shows no important changes. Expenditure of £25,220 has reduced the reserve for cost of merger to £70,609, and bank overdraft has increased from £150,000 to £225,000. The group is fortunate in the absence of its dependence on export markets in Europe. Sales have increased in the Empire and the American continent—and in the home market, where the maintenance of retail prices has no doubt continued to assist sales. Unfortunately, there is still no information regarding the fixing of retailers' margins. The balance sheet still shows goodwill and formulae valued at some £939,000. It remains to be seen whether the coming into force in July, 1942, of the provisions of the Pharmacy and Medicines Act, stipulating declaration of constituents, will fully justify this valuation. The 2s. 6d. deferred shares, at 9s. 6d., yield £7 12s. 3d. per cent.

THE STOCK EXCHANGES

London

Note.—All dealings are for cash.

DESPITE some profit-taking at the close of last week, the undertone throughout remained firm. The requisitioning of Canadian stocks led to some improvement in undated gilt edged issues. Home rail stocks enjoyed a boom, in anticipation of the new agreement. Elsewhere, the tone generally remained firm, while among industrial equities, textile, shipping and brewery issues continued to attract demand.

The gilt-edged market closed quietly at the week-end, 3½ per cent Conversion and 3 per cent N.D. Bonds declining ½, and Local Loans gaining the same amount. The Canadian requisitioning order occasioned some improvement in undated issues on Monday, 2½ per cent Consols and Local loans gaining ½, and 4 per cent Consols ½. Later, the market remained firm with prices rising moderately in response to strengthening demand for irredeemable stocks. In the foreign bond market, Brazilian bonds were supported by sinking fund operations, while Peruvian issues were strong, 6 per cent debenture stock rising 2 points on Tuesday. Chilean bonds were dull on Monday, and Japanese stocks showed intermittent weakness. French railways improved both before and after the week-end.

In the home rail market, optimistic rumours regarding the future of the agreement between the railway companies and the Government promoted a boom which provided one of the brightest features of the week's trading. Among ordinary stocks, Great Western ordinary put on 1½ on Monday followed by 2½ the next day, when Southern pref'd. gained 3½ and Southern def'd. ½. There was also lively trading in the senior issues, "Berwick" 5 per cent preference, 1955, led the market on Tuesday with a gain of 3 points while LNER 4 per cent first preference and LMS 4 per cent preference 1923 and 5 per cent Red. 1955 also enjoyed substantial gains. In midweek, profit taking caused prices to close below their best, LMS ordinary, exceptionally, easing ½.

The recent revival of support for Argentine railways continued to make headway.

Brewery shares continued to attract investors in the industrial market, Mitchells & Butlers, Watney def'd., Benskins, Charrington among others all registered good gains before and after the week-end. On Tuesday, Guinness and Ind. Coope reacted through profit taking. Small gains were general in the motor and aircraft group, although on Tuesday Morris and Hawker Siddeley moved against the trend. The heavy industrial group saw the revival of a speculative demand for coal issues, Bolsover and Wm. Cory improving at the beginning of the week. Richard Thomas preference was in demand, and, despite some irregularity, prices were generally higher. There were few features in the miscellaneous section, Boots and ICI being sold in a small way. The stores section reacted favourably to the interim announcements although Harrods eased after heavy buying at the close of last week. Shipping shares were encouraged by the

Royal Mail accounts and the resumption of preference payments by Bradford Dyers promoted a moderate boom in textile issues. General losses among the leading tobacco issues at the end of last week were reversed.

Turnover was small in the mining and commodity share markets. *Kaffirs* moved irregularly, Blyvoor improving before the week-end and Johnnies, Venterspost and West Wit Areas in early part of the current week when E. Daggas and Springs eased ½. The rubber market showed no response to the increase in the quota, remaining largely under the influence of Far Eastern military developments. Price changes consisted mainly in fractional losses which extended to Rubber Trust, Malayalam and Sendayan. The oil market was uneasy at the prospect of renewed tension in the Middle East, Anglo-Iranian ordinary losing ½ on Monday. "Shell" Transport, however, made good an early loss of ½ and both Trinidad Leaseholds and Attock were in demand.

New York

SENTIMENT remained hesitant on Wall Street before the week-end, with dealers generally awaiting repercussions to the Roosevelt-Churchill Eight Point Declaration. Turnover fell away to an exceptionally low level and there was little revival during the current week. Price changes were narrow and trendless in most sections, although, on Tuesday, there was some steady support for aircraft and rail stocks. Motor issues were out of favour and steel issues barely steady. In midweek, turnover improved and steadier trading raised prices up to 1 point.

The Iron Age estimates steel mill activity at 199.5 per cent of capacity against 98.5 per cent in the previous week.

(Continued on page 250)

Industry and Trade

A Production Crusade

The clogging force known as economic friction is at its most conspicuous in war, when changes in demand and supply conditions are frequent, sudden and unpredictable. To the individual observer, its effects are indistinguishable from those of inefficiency, and for the sake of the effect on foreign propaganda, he is therefore officially encouraged to give the benefit of the doubt when he encounters what appear to be cases of gross misuse of the nation's resources. Yet Britain cannot hope to win the war until its productive capacity is being used to the full, a state of affairs from which, as the National Expenditure Committee has pointed out, it is still somewhat distant. A constructive suggestion which merits examination has recently been put forward in a City firm's circular. It involves no washing of dirty linen in public, but suggests an organised drive, on the lines of the National Savings Campaign, to keep the question of production alive in every district. "At present," the author of the circular pithily remarks, "we are in danger of believing that it is more important for Little Puddlecombe to scrape together enough money to 'buy' a tank than for it to make sufficient effort to produce one (or to achieve whatever its part in war production happens to be or could be). Let us tell the truth about national savings, and abandon the pretence that they are part of the mechanism of production... Let the Government make the public really understand that the one paramount goal is the maximum of war production, which must be achieved at all costs." Recognising that a drive on these lines would be worse than useless until the Government is ready and able to remove impediments to production, the author returns to the demand for a new Ministry, but not a Ministry of the type recently rejected by Mr Churchill in his speech in the Commons. The suggestion is for a small "Ministry of Production Control" to co-ordinate the various supply departments, plan continuously the most systematic use of resources as a whole, and organise and run capacity clearing centres. It should be, for example, in a position to estimate roughly the effect of any new expansion project in terms of the consequent slowing down in other directions. An important function would be the maintenance of direct human contact between industrialists and the various departments, approach to which is at present hampered by a barrage of forms. If this freedom from red tape could be achieved, the proposed Ministry would certainly fulfil a most valuable function. The only question is whether, if formalism, delay and stupidity could thus be eliminated from the workings of Government departments, the establishment of a new one would any longer be necessary. It is doubtful to what extent the shortcomings of Government departments can be neutralised by the addition of new Ministries, but the proposal to give production the same type of publicity that has hitherto been given to savings might be seriously considered.

Further Control of Dock Labour

At the request of the Ministry of Labour and National Service, the National Joint Council for Dock Labour has drawn up a scheme for securing to the port transport industry a regular, sufficient and mobile labour force. In accordance with the scheme, an Essential Work Order has been prepared, which, together with new conditions of employment agreed by the National Joint Council, is to be applied to the Port of London and the principal ports on the Bristol Channel, the Firth of Forth, the Humber, the Tees, the Tyne and the Wear. It will not be applied without further consideration to the ports of Clyde-side and Merseyside, where there are already schemes in operation, under which the Ministry of War Transport is the sole employer. It does not apply in any port unless and until a scheme for that port has been approved by the Minister and is in operation. For the administration of the new arrangement, the National Joint Council is forming a company to be known as the National Dock Labour Corporation, Ltd., to finance, promote and administer schemes and to be responsible for the transfer of dockers from one port to another. It will appoint Local Boards and Port Labour Managers. The local boards will be responsible to it for matters of local policy and general administration, and will co-operate with the regional port directors and

port emergency committees in providing the labour required for the quick turn-round of ships. The port registration committees will continue to register workers and employers, but they will no longer control the arrangements for engaging labour. The local joint committees will continue to be responsible for industrial negotiations. While employed in work under the scheme, dockers will be paid the rate for the job, with piece work as widely as possible. When the job is finished the docker comes automatically into the employment of the corporation and as long as he fills the conditions he will be paid 5s. for each of the eleven half days for which he reports without being given work. He must be prepared to take any suitable work offered and to travel to other ports if necessary. Appeal panels will be provided to deal with appeals against disciplinary action taken by the management. There will be an annual week's holiday with pay of 75s. or 80s. Seven days' notice is required for resignation or discharge except in case of serious misconduct, when there is a right of appeal. Only registered employers will be allowed to engage in port transport and they will only be allowed to employ on it their own permanent men or men allocated to them by the manager. The scheme will be financed by the Corporation with some help from the Exchequer.

Registration of Builders

As a further step towards the closer control of the building industry, the Ministry of Works and Buildings has asked all builders and civil engineering contractors to register with the Ministry. The regulation applies to undertakings in the building and civil engineering industries, as well as to local authorities and public utility undertakings with building or civil engineering departments. Private firms with maintenance departments need not register them, unless these are also engaged on "outside" work. Applications for registration will have to be made by September 1st, while from October 1st no builder or civil engineering contractor will be allowed to carry on business in the absence of registration. The Ministry's decision to call for the registration of firms in the building and civil engineering industries can hardly be questioned. If the control of building activity is to be effective, the Ministry must have full information on the industry's capacity and on its employment.

Assistance to Collieries

The coal-mining industry is adjusting itself to the exceptional conditions due to the loss of the export trade with greater rapidity than many had expected. When authorising the Coal Mines (War Levy) Scheme in December last, providing for the collection of a levy up to 6d. per ton for the assistance of colliery undertakings temporarily impoverished by war conditions, the Mines Department expressed the view that the cost of the proposals then under consideration would not exceed 4d. per ton, which on the inland and export disposals of the industry in the December quarter of 1940 represented an annual expenditure at the rate of approximately £3 millions. In that period, Durham and South Wales were the only important coalfields operating at a loss; in other districts, the credit balances were appreciably higher than in the June quarter of 1939. It was probably partly for this reason that in the form in which it was first applied the scheme provided for a levy of only 3d. per ton, against the authorised maximum of 6d. per ton, and compensation at the rate of 2s. 6d. per ton instead of at 3s. 6d. on the relative deficiency between the volume of current sales and those in the corresponding period of 1939. The course of events in recent months has been more favourable to the financial position of the industry than was expected twelve months ago. The more recent ascertainties have shown substantial decreases in compensation receipts, and it is understood that the Central Council has decided to reduce the levy to 1½d. per ton in respect of the September quarter. The larger increases in coal prices authorised by the Mines Department in the exporting than in the inland coalfields have probably contributed most to the improvement in the financial position, but another factor stressed by the chairman of the great South Wales coal combine of Powell Duffryn Associated Collieries, Ltd., has been the concentration of production

mainly at mines supplying qualities of coal for which markets remained available to the industry. It is understood that the Central Council is contemplating other modifications of the War Emergency Assistance Scheme, but that these are being opposed by some of the districts. The apparent delay in the authorisation by the Mines Department of price increases in the English (other than Bristol and Somerset) and Scottish coalfields to meet the cost of the guaranteed wage from the first pay week in June, and of the war wage advance of 4d. per shift from July 1st, is also being attributed to the favourable results of the latest joint audits.

Petrol Rationing in America

The long-threatened rationing of petrol in the eastern industrialised states of America is now an accomplished fact. The local shortage which necessitates this unprecedented step arose from the transfer to the service of Great Britain of 50 American tankers formerly used to transport oil from the Gulf Coast to the eastern seaboard. It is due, that is to say, not to a nation-wide lack of oil in this, the world's most important producing country, but to inadequate transport facilities. The measures adopted by the Government to counter the pending oil shortage are reminiscent of those taken in this country in the allocation of scarce supplies. First came an appeal to motorists in the eastern states to conserve petrol by cutting out unnecessary motoring, by avoiding "racing" the engine, by using low gear as little as possible, and so forth. When this method of approach failed to produce any decisive results, the Petroleum Co-ordinator, Mr Harold Ickes, decreed that filling stations in the area in question must cease to sell petrol between the hours of 7 p.m. and 7 a.m. But, so far from curtailing consumption, this measure was actually followed by a large increase in purchases due, no doubt, to the accumulation of private hoards against the anticipated introduction of a more rigid rationing scheme. This week's decision to reduce deliveries to filling stations by 10 per cent was therefore inevitable. It is estimated that the reduction for "non-essential" purposes (however this ambiguous phrase may be defined) will amount to as much as 20 per cent, since there is no intention of cutting supplies to vehicles used for "essential" purposes. Even so, it is questionable whether the Administration has been drastic enough; for the transfer of 50 tankers has already reduced the available transport facilities by about one-fifth, and the surrender of additional vessels to Britain in the near future appears to be inevitable. In the end, Mr Ickes will doubtless have to go the whole hog and introduce a comprehensive rationing scheme on British lines.

American Tin Control

Steps have now been taken in the United States to bring the tin trade under effective Government control. On August 15th the Office of Price Administration and Civilian Supply fixed the country's maximum price for tin at 52 cents per lb., which is slightly below the average market price of recent months, but 2 cents above the basis at which the Metal Reserve Company was buying its tin for the United States war reserve; from its recent transactions it appears, however, that that limit has been unofficially raised by 3 to 4 cents per lb. Concurrently with the introduction of the maximum price, the tin market of the New York Commodity Exchange has taken preparatory steps to discontinue futures trading, current dealings being confined to the liquidation of open contracts. Although no import monopoly has been set up, the fixing of the maximum price has given the Metal Reserve Company a virtual monopoly. Consequently, the only move still possible to strengthen Government control of tin is the introduction of restrictions on consumption, which may not be long delayed. In addition to regulating its market for metallic tin, the United States has taken steps to supplement its ore supply for the Texas City smelter of the Tin Processing Corporation, which is now being constructed by Messrs Ford, Bacon and Davis, Inc., at a cost of \$3,500,000, and which will probably be ready to start operations at the beginning of next year. In addition to the five years' agreement with Bolivia providing for an annual supply of 18,000 tons of metallic tin in concentrates, the Metal Reserve Company (which will take over the whole output of the new smelter) concluded an arrangement with producers in the Dutch East Indies last week, which covers the supply of 20,000 tons of tin in Banka and Billiton ore.

Shipments are to start at once and are to be speeded up as much as possible. This agreement has two advantages. It shortens the time within which the Dutch East Indies tin reaches the United States—and in view of the Pacific tension this time factor is significant—and it will help to overcome technical difficulties at the new smelter arising from the problem of treating Bolivian ore without the admixture of a richer mineral. Of particular interest are the facts that the Arnheim smelter in Holland used to treat its Bolivian ore together with Billiton ore and that the company which controlled the Arnheim smelter has been selected by the United States Government to manage the new Texas City smelter on its behalf. Consequently, there is all likelihood that initial technical difficulties at Texas City will rapidly be overcome. As far as is known, the smelter's initial capacity will be 30,000 tons per year and not 18,000 tons as first reported.

Farm Wages

While the claim of the representatives of the farm workers on the Central Agricultural Wages Board for an increase of 12s. to 60s. per week in the national minimum wage has been adjourned until November, some dozen county wages committees, consisting of representatives of farmers, farm workers, and of the Ministry of Agriculture, have already raised minimum wages in their districts well above the national minimum of 48s. per week. Since local agreements are the result of negotiations between farmers and farmworkers in the districts concerned, they do not involve the consent of the Government. Nor, presumably, can local wage increases be passed on to consumers in the form of higher prices. The inference seems to be that the prices of agricultural products have been fixed at a level which enables the farmers in the more prosperous districts to absorb these local advances. But the series of district wage increases already granted may make it difficult for the Government to refuse an advance in the national minimum next November.

Rise in Sheep Prices

The Ministry of Agriculture has decided to increase the price of sheep and lambs sold by farmers by 1d. per lb. for the six months ending April, 1942. This will raise the farmer's average return for the season ending June, 1942, to 1s. 4d. per lb., against 1s. 3½d. in 1940-41. True, the increase is a small one; but in principle it is difficult to justify. Ostensibly, it is designed to induce arable farmers to maintain their sheep flocks in the interests of the fertility of the soil. But it would seem that the prices of cereals have already been fixed at a level which is high enough to induce arable farmers to maintain their sheep flocks without an additional gratification.

Bovine Panel Patients

Compulsory health insurance has not yet been mooted to the animal world, but what may prove the thin end of the wedge is to be inserted shortly. The National Veterinary Medical Association has evolved a voluntary scheme, designed chiefly to deal with contagious abortion (which not only is a cause of serious economic loss to farmers, but sometimes infects human beings with undulant fever), mastitis and sterility. The National Farmers' Union and the Ministry of Agriculture are co-operating in the scheme. The Ministry takes no responsibility, but is making available certain facilities and supplying free vaccine and drugs at reduced cost. It has also agreed that veterinary surgeons doing panel work for farmers shall be employed by the Ministry on part-time inspection of dairy herds for mastitis and abortion. The scheme, applicable at first only to dairy herds, may later be extended to sheep and pigs. The insurance premium will cover, in addition to treatment, four routine visits a year, and extra charges for specially expensive drugs will be kept at a low level. It is very much to be hoped that the scheme will prove so successful as to give rise to a demand for its extension, for the principle is excellent. At present the smaller farmers shy of any increase in their expenses, are giving it a chilly reception, but when their more prosperous neighbours have proved its value they may come to recognise it as a sound investment. From the public point of view, anything which improves the condition of dairy herds is of first class importance, for the milk situation this winter is a subject on which the public rightly feels profound uneasiness.

COMPANY MEETINGS

WATNEY COMBE REID AND COMPANY, LIMITED

COL. O. P. SEROCOLD'S REVIEW

The annual general meeting of Watney Combe Reid and Company, Limited, was held, on the 19th instant, at the Windsor Castle Restaurant, S.W. 1, the chairman, Colonel O. P. Serochild, C.M.G., presiding.

His statement, which had been circulated with the report and accounts and was taken as read, was as follows: Our sales, which showed a decline in the first six months of our financial year, improved during the second half, so that on the whole period they are nearly level.

When we take into account the losses in licensed houses which we have experienced, and the shift of population, I hope that you will consider the result satisfactory, as the board does.

Being subject to a licence for brewing materials, we, in company with other brewers, have been confronted with many difficulties. The cost of barley has been very high indeed, and there seems to be little relaxation in sight at the present time. However, as the Government has expressed its desire that there shall be an adequate supply of beer forthcoming, we may perhaps feel a trifle optimistic as to an improvement in the access to materials required.

THE LABOUR PROBLEM

I will now say a word on labour. At this time last year I told you that 50 members of our staff and 300 of our workmen were serving with the forces. These numbers have now increased to 112 staff and 509 workmen. This depletion in labour, which is common to all brewing and malting concerns, had naturally brought its repercussions.

Although we have been able more or less to replace our men numerically and to some extent by the substitution of women, we find that an untrained personnel, with the best will in the world, does not maintain the former standard of work. In more than one department of the company's breweries there have been occasions when there has been delay, with the inevitable result that the rest of the machine is slowed down.

As more and more of our men are combed out the more difficult becomes the situation, since we are faced at the present time with an unprecedented demand for beer, which it is difficult to meet.

Our ARP organisation at each of the three breweries has continued to be elaborated, and I may say that without it there would have been more serious losses than those which have actually been incurred. The shareholders' thanks are due to all those who have so willingly responded to the calls made upon them, and especially to those who succeeded in extricating a number of horses on two occasions.

A prearranged mutual assistance pact exists under which we have been able to provide help to other London brewers from time to time when required. I would like to record our thanks to the whole of our staff and employees for their arduous work and co-operation during these trying times. I would also like to pay a tribute to all those tenants of our licensed houses who have stuck to their posts in spite of the damage inflicted on them.

PROFIT AND DIVIDENDS

The chairman, in the course of his speech, said that the profit on trading account at £2,056,000 was only £11,000 below last year. He considered that was a good result when taking into account the vast increase in the cost of materials, of which their malt alone cost £164,000 more.

The final profit was £822,350 and the directors proposed the usual 2 per cent. dividend on the preferred ordinary stock and a final dividend of 11 per cent. on the deferred ordinary. They had reduced the interim dividend from 6 per cent. to 4 per cent. in view of the considerable reduction in the first six months' profit. However, the profits of the second half-year had been better than they had anticipated. They had been able, therefore, to fix the final dividend at 11 per cent., making 15 per cent. for the year, the same as in the previous year, though they regretted that it would not be possible to repeat the bonus dividend of 2 per cent.

The report and accounts were unanimously adopted.

ANGLO-CEYLON AND GENERAL ESTATES COMPANY, LIMITED

SIR EDWARD ROSLING'S STATEMENT

The annual general meeting of The Anglo-Ceylon and General Estates Company, Limited, was held, on the 19th instant, in London, Sir Edward Rosling (the chairman and managing director) presiding.

The following are extracts from the statement by the Chairman, which had been circulated with the report and accounts and was taken as read:—The results for the past year's working may be considered satisfactory, the profit for the year—before allowing for taxation—being £143,150, as compared with £114,960 last year. This is by far the highest made by the company for some years.

As explained in the report, however, there has been an increase in taxation at home, in Ceylon and Mauritius, part of which is retrospective. Added to this there are complications arising out of the taxation in Ceylon and Mauritius, and the computations of the company's liability for taxes have yet to be agreed. In view of this, the directors decided to set aside £95,000 for taxation purposes, as against £50,000 last year, and from the balance to recommend a final dividend of 4 per cent., free of tax. Up to now our dividends have been declared less tax, but we think it simpler under present conditions to propose tax-free dividends. The counterfoil of the dividend warrant will give particulars of the gross amount represented allowing for Dominion income-tax relief.

TEA, CACAO AND RUBBER

In Ceylon the tea crop, amounting to 4,325,474 lb., shows an increase on the previous year of some 167,000 lb., and the price also shows an improvement of rather over 1½d. per lb.

Cacao again gave the large crop of 10,313 cwt., our Kondesalle estate giving 7½ cwt. per acre. Prices, however, were lower, only realising 28s. 9d. per cwt., as compared with 32s. 9d. in the previous year. Owing, however, to the size of the crop a small profit was secured. Our direct interest in rubber is very small; the crop secured amounted to 226,420 lb., netting an average price of 9.37d. per lb.

LABOUR UNREST

In my speech last year I referred to a certain amount of unrest among the labourers in Ceylon. This, I am sorry to say, recently became worse and for the first time two of our estates were affected. Unfortunately, on one of the estates I referred to, our manager was attacked by some of the labourers and he subsequently died. The perpetrators have been arrested and now await trial. The rest of the labour force on this estate has been dismissed and the estate remains closed for the present.

On the other estate a strike developed, but after a week the labour force returned to work and we understand everything is now proceeding smoothly. In neither case can any blame whatsoever be attached to the managers concerned. The reports from all the other estates continue to be satisfactory.

RECORD SUGAR CROP IN MAURITIUS

As to Mauritius, the sugar crop was a record one for the company; 41,708 tons of sugar were obtained, which compares with our previous highest make of 38,098 tons in 1939. All the crop was acquired by the British Government.

The progressive increases in crops and profits are largely the result of the board's policy of consolidation and reorganisation over the past few years and are very gratifying features.

In regard to the prospects for the current season, it is too early to give more than a very general indication. The Government has taken less of our tea—namely, 68 per cent., as against 85 per cent., leaving the balance to be realised on the local market. So far, the prices obtained locally have been quite satisfactory, but it is impossible to make any reliable forecast as to the future. Our crop is estimated at 4,200,000 lb. Cacao prices continue at a very low level, and to make matters worse, it has for months been impossible to obtain freight for shipment to this country.

Rubber remains at a satisfactory level, and there is no apparent reason for any appreciable fall in the price in the near future. Sugar promises to give another good crop and the Government are again taking over all our sugar.

The report and accounts were adopted.

INSURANCE NOTES

Norwich Union Societies.—The fall in new assurances written by the "Norwich Union Life" compares favourably with other offices, bearing in mind the Society's important interests in France and Belgium, where sums assured were only £99,482, against £811,206. These Continental interests have materially affected the premium and interest income; no interest on investments in enemy-occupied territories which was not received by the society before the occupation has been brought into the accounts. War claims amount to about £100,000, but in spite of these the total claims were well below the mortality expected by the ordinary tables:—

due at December 31st last, and the report reveals a strong position. Liabilities were valued under life contracts at 2½ per cent, using the A 1924-29 table, and under annuity contracts at 3 per cent. Stock Exchange securities stand at or below market prices, with the exception of securities in enemy-occupied territory, which have been brought in at the rates of exchange and prices ruling on December 31, 1939; liabilities in those countries are approximately equal to the corresponding assets, the total in each case being about £2,000,000. The surplus disclosed by the valuation is £5,174,554, after paying £396,731 in interim bonuses during the quinquennium. As a precautionary measure the entire surplus is being carried forward undistributed, and the directors are of opinion that much more than sufficient provision has thus been made to meet all war contingencies, and that the assets are in the aggregate fully of the value stated in the balance-sheet. Interim bonuses are being maintained in respect of premiums for the four years 1936-39 inclusive.

Middle Eastern Defence

FOR the third time in six months, British troops have—uninvited—crossed the frontiers of a Middle Eastern state. In May, it was Iraq, where the hostile Government of Rashid Ali was engaged in overturning the constitution, violating the nation's treaty obligations with Britain, and securing the active support of Germany. In June, it was Syria, where the Mandatory Power—Britain's ex-ally—was betraying its trust to the Nazis. Now it is Iran, a sovereign state with a legal Government and no treaty obligations to Britain, but like the other two states, menaced by Nazi activities and apparently incapable of taking by itself the strong measures necessary to restore the situation. As in Iraq and Syria, the British forces are meeting resistance. As in Iraq and Syria, Germany is appealing to the "moral conscience of an outraged world." There is, however, one big difference. The British action in Iran has been undertaken in company with another Great Power. The move was preceded by several joint diplomatic *démarches* on the part of Britain and Soviet Russia; and, when all these warnings had been either disregarded or answered in an unsatisfactory manner, British and Soviet armies jointly crossed the frontiers of Iran, the Russians in the north southwards towards Tabriz, the British from the Persian Gulf and Iraq to the oilfields and beyond.

There are obvious and solid reasons for this move. In the grand strategy of the war, the possession of the Iranian oilfields, with their annual output of 10 million tons, and annual refining capacity of over 14 million tons, is a major factor. It is not that Britain is anywhere near dependent upon these supplies. They are essential for the easy fuelling of the British forces in the Middle East, but other, though admittedly remoter, supplies are open to General Wavell and the British Navy. The position is fully discussed in a Note on page 262. The crucial factor is rather the advan-

tage the possession of such supplies would confer upon Germany's armies.

Again, there is the question of Russia's strategic necessity to remain in contact with the supply routes of the world—a need which has been underlined by the rapid advance of the German armies up the Gulf of Finland and the slow advance of winter on the northern trade routes to Archangel and Murmansk. With the Straits closed by Germany, and Vladivostok held open only by the doubtful courtesy of the Japanese—and the doubtful determination of the United States—Bushire, Basra and Bandar Shahpur are Russia's remaining outlets to the free world. There are obvious difficulties in overland carriage in the Middle East, but when account has been taken of them, the Persian Gulf could become a Red Sea where American supplies are concerned and the direct American ferry service might be extended. By the same token, Iran is the only land linking Britain to the last remaining landfront in Europe. Supplies must reach Russia throughout this crucial autumn and winter, and the railway from Bandar Shahpur to the Caspian, together with the roads from Bushire or Basra to Tabriz and the Russian frontier—via Baghdad or Teheran—can become the chief arteries pumping war materials and reinforcements into the bloodstream of Russian resistance.

Yet, in spite of these overwhelming strategic advantages, it is certain that British and Russian troops would not have moved across the frontiers of Iran in the dawn of August 25th if the Germans had not seen fit to draw the whole Middle East, and with it Iran, into the net of war. It has long been clear that Germany was bound at some point to turn east, for the simple reason that the road to world conquest runs both east and west. Only the timing was a matter of conjecture. The attack on Russia might have preceded the attack on Britain. The

Caucasus might have been opened from the south via Turkey and Iraq and Iran or from the north. As it is, Hitler is proceeding by the northern route via the Ukraine, and one reason why he has chosen this route is that the Balkan campaigns, coming on top of Italy's supreme idiocy in Greece, gave the British time to clear the ground in Iraq before Rashid Ali could prepare it for the Germans.

Similar preparations have long been on foot in Iran. The technique is as old as the Nazi régime—tourists, trade missions, key technicians and engineers, on the one hand, bribes, corrupt politicians, the exasperation of local rivalries, and the encouragement of nationalist ambitions, on the other. Iran was being prepared to repeat the story of Hungary, of Roumania and of Bulgaria. The British treaty in the case of Turkey and Egypt, and British intervention in the case of Syria and Iraq, have prevented these countries from succumbing to the same misfortunes. It must be said, too, that the truculent and unfriendly attitude of the Iranian Government has fully confirmed the conviction that their independence was in jeopardy. In spite of the scrupulously non-political administration of the British oil interests—which provide the Shah's Government with the bulk of its revenue—relations have frequently been strained; and, since the rise of Hitler, Iran has in a number of ways given preference to Germany and attempted to use the Nazis as a foil to the Russians and the British. Like others—including Von Papen in Germany itself—who have tried to use the Nazis, the Iranians have ended by being used themselves.

While the case for the entry of the Allied troops is obvious and overwhelming, much will depend upon the way in which the new policy is carried out. The first essential is speed and strength. The states of the Middle East have on the whole preferred a Britain that acts with resolution to one that holds back in hesitation from steps that are in its obvious strategic interests. The knowledge that Britain is both ready and able to act increases their sense of security, and it is extremely likely that the Turks' reaction will depend upon the vigour with which the Iranian campaign is conducted. With the Germans at their front door, the Turkish Government has naturally disapproved the Allied action. If Britain or Russia bungles the operation, then Turkish disapproval will be reinforced by the conviction that Allied incompetence will only encourage Germany to try conclusions with the Turks themselves. Vigorous and effective action, on the other hand, would reinforce their eastern frontier and give the Germans less encouragement to seek the road to Batum across the uplands of Anatolia. For the time, Turkey's attitude continues to be one of strict neutrality. It should be added that Iran itself is concerned with the strength of the Allied operation. The more firmly Britain and Russia are entrenched, the less inclined will Germany be to convert Iran into a vast battlefield by launching a counter-invasion.

The armies of Britain and Russia have entered a sovereign state uninvited, and the state is offering resistance. This fact cannot and should not be glossed over. It is a grim necessity of war, but it is a very disagreeable one; and everything must be done to ensure that the policy of the Allies towards Iran both during and after the campaign should give rise to no suspicion of hidden motives or duplicity. The record of both Powers with regard to Iran, if not black, is at least off-white; and the

Iranians will not have forgotten the virtual partition of their country before the last war or Lord Curzon's attempts to secure British hegemony there after it. It is true that, in the twenty years that have intervened, it is Germany and not the Allies that has been the small-state swallower. But Germany has been at its cannibalisms in more distant areas, whereas Iranians with long memories may still feel about Russia and Britain as Jonah felt in Nineveh about the whale.

It is, therefore, good news that the political independence and integrity of Iran have been specifically recognised by the two Allies, and the limited aims of the occupation officially communicated to all the Middle Eastern Governments. It is perhaps even better news that, as in the case of Syria, wheat and other foodstuffs are being brought in the wake of the troops to repair the ravages that a war economy with a German bias has wrought among the Iranian people. There must be no flirting with unconstitutional governments, however friendly disposed, and no opportunity must be missed to underline the provisional nature of the occupation. It is in the ultimate interests of both Russia and Britain that a strong independent Iranian State should exist. It is largely because such a state does not exist that the present action has become necessary. Allied policy in the post-war period should, therefore, be directed towards the creation of this strength and independence.

The strength of a state, however, does not only depend on its nationalist will to live, the one element fully provided by Reza Shah's Government. It depends, too, upon its economic connections with the outside world, and on its political relations with its neighbours. Just as the "new order" is designed to deprive Europe of independence by subordinating a satellite fringe of primary producers to the central point of German industrial power, so, too, do the trade relations envisaged by Germany for the Middle East entail the obstructing of local development and the exploitation of the area for Germany's

economic system. Again, one of the entry points of Nazi disintegration in Europe has been nationalist rivalries—the case of Hungary and Roumania is the most obvious example. So, too, in the Middle East, Nazi propaganda has fanned the flames of Great Persian imperialism in order to exacerbate Iran's relations with Iraq, Saudi Arabia and Gulf Sultanates.

Without greatly wishing it, Britain and, to a lesser extent, Russia will find themselves with a deciding voice when, at the end of the struggle, the future of the Middle East comes up for decision. It is essential that, from these first days of occupation, they should work on, and if possible agree on, progressive lines of approach to a fair and lasting settlement. The problem is essentially the same as that of Europe—to provide a framework of economic and military security within which States can work out their national destinies. To be strong and to be independent are no longer synonymous, if independence entails no relations or bad relations with neighbouring countries. Britain and Russia alone have the resources and the power to forward economic development, to encourage political understanding and to provide a background of security in the Middle East as a whole. And the best justification they can give for their present policy—apart from the overwhelmingly strong strategic justification—is that they will leave Iran—and Syria and Iraq—better fitted for the "strenuous conditions of modern life."

Wartime and Peacetime Farming

THEY will endeavour, with due respect to existing obligations, to further enjoyment by all States, great or small, victor or vanquished, on equal terms, to the trade and to the raw materials of the world." It is natural that *The Economist*, which was founded almost exactly 98 years ago as an "agricultural, free trade journal," should have found a peculiar satisfaction in this statement in the Atlantic Charter; and perhaps more natural still that the implications of this pledge for British agricultural policy should be canvassed in these pages. The danger in wartime, in all aspects of economic life, is that the policy dictated by strategic necessity may come to be regarded as the proper policy for peacetime; and this danger is especially great in agriculture, where war and peace aims are very different.

In wartime and peacetime alike, what is needed in agriculture is a consumers' policy, with safeguards for producers. But there agreement, very largely, ends. In peacetime, the object should be to maintain healthy and efficient farming without substantially increasing the cost of the people's food or harmfully disturbing the foreign trade on which the country's wealth depends. It may be reasonable to use methods that produce less food per acre than other methods might, if to do so is more profitable to the farmer and less expensive to the consumer. But, in wartime, the consumer can no longer pick and choose among the produce of the whole earth as well as of this country. And the object of policy is simply to produce as much food for human consumption as possible, in order to save shipping space and foreign exchange. It is a policy which, if it was to be extended to the post-war years, protected by tariffs, subsidies and quotas in place of the German blockade, would deprive the people of this country of precisely that equality of opportunity and access which the Atlantic Charter has promised to every nation.

At present, concern must necessarily be with the exigencies of wartime. Even the confident preparations of the National Farmers' Union itself, which has just invited applications from men, "even if they are not immediately available because they are now serving with the Forces or holding temporary appointments for the duration of the war," for vacancies in the "Parliamentary, Publicity, Organisation, Statistics and Economics" branches of their activities, do not mean that the end of the war is really in sight. But they may be the shadow of coming events; and it so happens that the question of post-war agricultural policy has recently been brought right into the foreground by the announcement of milk rationing.

More Milk?

An article under the title of "Food and Farming" in *The Economist* of August 2nd has attracted official notice. The argument of the article was that still more might be done to keep the supply of liquid milk for human consumption in line with the increased wartime demand. Its starting point was the fact that, while consumption has gone up by 120 million gallons, or 8 per cent, output, because of scarce feeding-stuffs and labour and transport difficulties, threatens to be down in the winter by appreciably over 10 per cent. It is a question, not so much of securing a large increase in milk output, because the process of re-seeding pasture after ploughing-up is not generally practicable during the war, when the object is to obtain the most rapid increase possible in the total output of human food. It is rather a question of preventing any fall in milk yields and of increasing milk production wherever possible. The conclusion was that "while the war lasts, the Ministry of Agriculture will have to aim at higher milk production, even if it must temporarily be at the expense of beef production." The limiting factor is, of course, feeding stuffs, and dairy herds have already first claim on the supply of imported feeds. The point is the allocation of home-produced feeding-stuffs; and the suggestion of the article

was, not that milk or beef must be chosen, but that somewhat more feed could, and should, be provided for dairy herds and less for beef cattle.

This conclusion was reinforced by reference to the long-term requirements of British agriculture. The trend of milk consumption has been steadily upwards. Milk, unlike cereals and meat, has a naturally protected market in this country, and is an essential element in the establishment of higher standards of nutrition. Before the war, the consumption of milk had risen so considerably, in relation to its output in this country, that it was only just possible to keep pace with the demand for liquid supplies in the winter months. Thus, it was argued that "in the long run, the prosperity of British agriculture may well depend on its being able to give the public milk, rather than on any insistence on protection to keep out cheap meat from the Argentine or cheap grain from the United States and the Dominions."

"Balanced" Agriculture

Some exception to this argument has been taken by the Ministry of Agriculture; and, in support of the Ministry's views, a memorandum has been sent to this office by Mr L. F. Easterbrook, the well-known agricultural writer, which is printed as a letter on page 266. This memorandum is only partially concerned with the immediate question of increasing milk output or arresting the present threatened decline in milk yields. Its main thesis is the case for a "balanced" agriculture, in reply to the implications drawn in *The Economist's* article about long-term policy. On the immediate issue, Mr Easterbrook contends that the shortage of milk in the coming months has possibly been exaggerated. He maintains that the chief reason for a shortage is the wartime increase in consumption, and not any fall in output because of inadequate supplies of feeding-stuffs for dairy herds; and he suggests that the public could manage with a return to pre-war consumption. In reply, it may be hazarded, on other information, that it will be surprising if supplies of liquid milk between next November and April next year are more than nine-tenths of last winter's supplies, when the season was a poor one on account of the weather; and Mr Easterbrook himself admits that it would be "tragic" if the demand for more milk were not satisfied as fully as possible.

Actually, Mr Easterbrook's chief point is rather that "milk production cannot be isolated from other agricultural activities." "Milk production involves, generally speaking, the use of the plough to get the best results; the plough enables the stored-up fertility from the grazing stock to be cashed in the form of corn, sugar and other crops, and gives us continually renewed pasture that can carry more stock and produce more milk." The argument is the familiar one that milk and beef are "complementary," because artificial fertilisers cannot be a substitute for organic manure. "We need the beef cattle to tread the straw, to make the dung, to grow the arable crops for feeding the dairy cows." This is the point which is perhaps most in controversy in discussions about farming at the present time. The function of organic manure in the production of arable crops, according to the only scientific evidence available, can be simply stated. First, it is to provide minerals which are derived from the food which the animals eat; this can equally well be done by the use of artificial fertilisers containing the necessary minerals. Secondly, its function is to furnish what is called "humus"; this can be described as the ability of the soil to hold water, which is given by the texture provided by the straw used to absorb the manure. It is hard to accept unquestioningly the view that organic manure is indispensable for the maintenance of this humus content. It is probably fair to say that, on something like 95 per cent of the soil of Great Britain, humus

can perfectly well be maintained by judicious crop rotation, wise cultivations and green manuring, with only a moderate admixture of animal manures. During the last twenty-five years, crop yields have been kept up and even increased in Germany, Holland and Denmark, without recourse to the folding of sheep or the maintenance of large beef herds. In England, in the Holland division of Lincolnshire, the most highly arable country in England, huge crops of wheat, potatoes and sugar beet have been produced over a considerable period without any exceptional numbers of sheep or cattle. It may, of course, be argued that these are especially good soils; but the point is that there has been no deterioration in yields—and it has been largely done by the use of fertilisers. Admittedly, in the remaining 5 per cent of British agricultural land, such as the light sandy soil of East Anglia or the thin soils over chalk in Southern England, it is not possible to get the same results; but special cases do not make sound generalisations or sound policy. Moreover, the statement that beef cattle are needed to provide manure for growing crops overlooks that crops are needed to feed the beef cattle in the first place.

Mr Easterbrook's argument that at least the present ratio of beef cattle to dairy herds is necessary for the sake of the dairy herds themselves does not end with this question of manuring. His second point is that the mixed grazing of cows and bullocks is necessary in order that the bullocks may eat up the coarser grasses and leave the finer pastures for the dairy herds. Actually, it is probably the case that a mixture of cows and sheep or cows and pigs, or even cows and hens, would be at least as good a grazing unit. Indeed, it is probable that, in all the aspects of mixed grazing, young dairy stock could probably do all that store cattle can; and while the manure produced by cows is admittedly poorer in minerals than that produced by fattening animals, if supplemented by straw it produces just as good humus. In Denmark, with the aid of liquid manure tanks, cows are efficiently and profitably combined with arable land. The argument that, without beef herds, straw is wasted insufficiently recognises the fact that it is not an economic proposition to keep steers simply to eat oat straw, because roots and kale must also be grown in order to make up a diet. Moreover, at the present time, hundreds of farmers are thankfully selling straw at £4 a ton for making paper instead of using it to make into manure.

These are technical considerations used to reinforce what is at bottom an argument that must be decided on economic grounds; and, to say the least, it is doubtful whether a sufficiently good case can be built up on these traditional foundations to rebut the short-term, wartime need for more milk, even at the expense of beef—or to deny that, in the long run, the future of a wealthy and efficient British agriculture depends upon milk, rather than upon the production of cereals or meat. The argument for "balance" is an old one. The basis of Mr Easterbrook's memorandum is that, in the nature of farming, there is a fixed ratio between dairy herds and beef herds, and between grass land and arable. This view would commit this country to the maintenance of something like its present beef population regardless of other considerations; and it would also commit the Government to a post-war policy based upon the high protection of cereals and meat with quantitative restrictions upon cheaper imports from foreign countries. It is on these grounds that *The Economist* is more than sceptical.

No sensible critic has ever argued that in wartime British agriculture should confine its attention to the production of milk. Mr Easterbrook would agree that the aim of wartime farming is to produce as much food as possible; and bread, oatmeal, potatoes, sugar, beef and beer are all needed. The problem is how to make the best use of available resources to get the most rapid increase in the total output of human food, in spite of the scarcity of labour and fertilisers. It has unquestionably been the right policy to plough up for arable uses as much land as can profitably be turned to the production of food. Plainly, the production of crops for direct human consumption makes the best use of the land,

though labour and fertilisers are severely limiting factors; and, by contrast to the grassland farming of peacetime, it is necessary to grow potatoes instead of turnips, cabbage instead of kale, wheat instead of grass. The question at issue here really concerns the best employment of whatever food can be produced for animals. The fundamental fact, both in wartime and in peacetime, is that the cow is many times more economical as a converter of feeding stuffs into human food than the bullock. Of the foods produced indirectly for human consumption milk comes easily first in worth, and is not replaceable, in its liquid form, from abroad; and the contention of *The Economist* is that a first charge upon feeding stuffs should be to maintain sufficiently high milk yields to satisfy the increased demands for liquid milk, even if this entails some further cutting down in the number of beef cattle; and only those other animals should be maintained which can be adequately fed from unproductive land, such as hill sheep, or from the by-products of human food—which, at the worst, might still enable something like three-quarters of the present beef cattle and sheep to be kept.

Milk has, of course, already been given precedence. Five or six million tons of feeding-stuffs that used to be imported no longer come in and what imports there are go entirely to dairy herds; the numbers of pigs and poultry have been drastically cut down; and the standard of feeding has been lowered. But the tendency is still for farmers, in the meat tradition of Britain, to grow more oats and barley, rather than wheat, and more roots rather than potatoes—and then to feed these to beef cattle rather than to dairy cows. It seems a reasonable suggestion that there should be some reduction in the numbers of beef cattle in certain areas and on certain types of farms: first, in order to permit the production of more wheat and potatoes for human use; secondly, in order to free oats for urban horses and cake for dairy cattle; and thirdly, in order to free hay for dairy farms. And the object of such a policy would definitely be a limited one—to stop the threatened decline in milk yields.

The Future

But it would do more than this. It would pave the way for a policy of increasing milk production after the war, and serve as the basis for a farming policy which would fit in equally with the needs of the nation and with the obligations accepted by the Prime Minister on its behalf at the Atlantic Meeting. It is undeniable that, on balance, the leaders of British farming, who have most influence, prefer beef to dairy farming, which is more exacting and requires more equipment; and the argument that there is an infrangible cycle of fertility renewed out of its own products by a semi-automatic process is attractive and traditional, as well as useful. But there is no doubt that to maintain meat farming on a large scale would entail high protection; and, on the technical side, there seems to be no scientific proof that, more often than not, artificial fertilisers will not serve as well as dung.

It is certain that, in peacetime, it will be no advantage even for national defence to have agricultural protection which will diminish shipping resources and lessen the good will of overseas food suppliers, inside as well as outside the Empire. It hardly appears disputable that the future for healthy British farming lies in the increased production of milk, eggs, fruit and vegetables, which are necessary to the health of the nation and enjoy natural advantages in British markets; and the most that the cereal grower and grazier can rightfully expect from an economical policy is a system of price insurance which will mitigate the effects of sharp falls in prices and leave them to make headway by their efficiency in production and the quality of their produce. The trouble is, of course, that, in wartime, farmers are in the position of munition makers, and have to be induced to produce crops which in peacetime will not pay them. But this is no ground for envisaging an artificial and costly system of protection to make these crops pay in peacetime; and the different aims of wartime and peacetime farming must be squarely and frankly recognised.

Commonwealth Dilemma

MR MACKENZIE KING, the Prime Minister of the Dominion of Canada, is in England, because his country wanted him to come. Mr Menzies, the Prime Minister of the Commonwealth of Australia, is not in England, because the Australian Labour Party does not want him to come. Mr Mackenzie King has no illusions about the importance or purpose of his visit. He was pressed to make it by Canadian public opinion, which seemed to feel that Canada would lose some of its prestige as the senior Dominion if its Prime Minister ignored the clear wish of the British Government for personal consultation; and he stated, on his arrival, that he came to emphasise the determination of Canada to be at the side of the British people to the end. In his opinion, there exists to-day "the most perfect continuous conference of Cabinets that any group of nations could possibly have"; there is the most perfect understanding between himself and the High Commissioner in London; the Canadian Government receives the fullest information from Mr MacDonald at Ottawa; and relations between the two Governments are closer than they have ever been. There is no need for an Imperial War Cabinet or for methods of closer consultation. Mr Menzies, on the other hand, thinks that Australia should be directly represented in the British War Cabinet, so that the Dominion's voice can be directly heard in the place where major decisions are inevitably made; and there can be no doubt that his opinion is endorsed by most Australians.

The reason for this divergence of opinion on the merits and drawbacks of the present system of collaboration lies in the very different effects which the course of the war has had upon each Dominion. Australia and New Zealand—which subscribes to Australia's views about Imperial representation, though less clamorously—have suffered heavily in Greece and Crete, and are constantly in the fighting in other parts of the Near East. Australia, in addition, is now directly threatened by Japan. Strategic decisions taken by the British Cabinet have thus cost Australia and New Zealand many lives and may at any moment cost them more. Canadian troops, on the other hand, have not yet been in action. South African troops have played an important part in the East African campaign. But that campaign was successful, so South Africa has apparently decided with Canada that the present system of Imperial consultation is adequate. Moreover, owing to the peculiar position of General Smuts, who, as both Prime Minister and the officer commanding the Union's Defence forces, combines a political and military authority wielded by no other Empire statesman, no strategic decisions affecting South African troops are taken which could possibly be said to override the views of the South African Government.

It is quite true that neither Mr Menzies nor Mr Fraser complains that his Government was not consulted before the Anzacs were moved to Greece; in fact, both emphasised that there had been the fullest consultation. In theory, there was not the slightest reason why, if they had wanted, they should not have withheld their consent, just as, in theory, their countries—and the other Dominions—came into the war by their own choice and nobody else's. But, in practice, all the Dominions, except perhaps Canada, were bound by Britain's decision then, just as to-morrow Australia will be bound to follow any vital decision taken by the British Government with regard to Japan. As Mr Hughes, the Commonwealth Navy Minister, said last week, Australia needs naval strength in the Pacific which is only obtainable from Britain. Britain is responsible for the defence of Malaya and Singapore, which, in Mr Menzies' words, are vitally important outposts in the defence of Australia.

But, in spite of the close strategic and economic interdependence of the Empire, which must weigh heavily whenever an "independent" decision is taken, Imperial consultation is, or should be, something more than a polite fiction. For the Empire's maximum war potential

can only be mobilised if there is some means of concerting the war efforts of each part and deciding on the best disposal, for the common—not the individual—weal, of its men and resources. From the very beginning of the war, therefore, steps have been taken to strengthen the machinery of consultation. It was announced when Mr Eden was made Dominions Secretary, that he would have special access to the War Cabinet, and the favour has been extended to Lord Cranborne. Later, the status of the High Commissioners in the Dominions was improved by appointing ex-Cabinet Ministers as vacancies occurred; thus, Mr MacDonald went to Ottawa, Lord Harlech to South Africa, and Sir Ronald Cross to Australia. Nor has the new tendency been confined to representation from the centre outwards. A military mission from New Zealand visited Australia in the spring to discuss closer co-operation in defence measures in the Pacific, and their two Governments have agreed to establish "a permanent consultative committee" of Cabinet Ministers "for regular consultation on matters of common interest."

Consultation has also been strengthened by flying visits to England from Dominion Premiers, who, during their stay, attend the British War Cabinet as honorary members. Mr Menzies was in London when the decision to move the Anzacs to Greece was taken; Mr Fraser has just completed a two-months' stay; Mr Mackenzie King is the latest arrival. Yet, welcome though these visitors are, their presence cannot really affect Imperial decisions. At the moment, it would certainly be useful for the British Government to have Mr Menzies on tap in order to hear a first-hand account of the measures Australia could take if war broke out with Japan. But the decision would be a London—or a London-cum-Washington—decision; and whatever part Mr Menzies played in it, he would still have to refer back to his own Government before Australia could be committed.

It is possible that the Australian Government contemplated giving executive powers to Mr Menzies such as have been given by the British Government to Mr Oliver Lyttelton in Cairo. But there are two differences here. The first is that Mr Lyttelton has no power to decide questions of high policy—and presumably it would be primarily for such questions that an Australian Lyttelton would be appointed. The second is that Mr Lyttelton is a member of a National Government. He is responsible to Parliament, and so would his Australian counterpart be; but there is a big difference between responsibility to a Parliament which is solidly behind an all-party Government, and responsibility to a Parliament which is divided, almost equally, for and against the Government. It is quite true that the Australian Labour party is wholeheartedly in favour of the defeat of Hitlerism, and there is no evidence that Mr Curtin differs from Mr Menzies in his attitude towards Japan. Nevertheless, Australian Labour sees no reason why it should abandon party politics, and its numerical strength in the Commonwealth Parliament is such that it could make the position of an overseas Minister of State quite untenable. In none of the Dominions would the political situation allow an envoy to London to have a higher status than that of Mr Duff Cooper, whose mission to Singapore is simply to examine and report.

The suggestion has been made, and Mr Churchill has welcomed it, that an Imperial War Conference should be held, at which the Prime Ministers and other representatives of all the Dominions should consult, together with the British Government, on all aspects of the Empire's war effort. Such a conference could have very useful results, particularly on the economic front. Not only would it enable the different representatives to compare and co-ordinate their countries' programmes; it would also be possible to set a highest common standard which each would then have as its goal. The American Administration has been "electrified" by Lord Beaverbrook's expectations. It might not be a bad thing if the

minions were occasionally electrified by being told at the Empire expects of them.

But an Imperial Conference, as every Imperial Conference has found, could have no far-reaching results. No binding decisions could be taken. Even if the minion Premiers were heads of National Governments, they would not be given mandates to commit their counsels to a policy decided at an Imperial Conference. This is the weakness of the Delhi Conference, which in theory had the excellent object of co-ordinating the super-programmes of all Empire countries east of Suez, but whose recommendations were not binding on any of the participants.

Another suggested solution is that the present British War Cabinet should be enlarged into an Imperial War Cabinet by the inclusion of representatives of the Dominions. The body set up would be both representative and binding, but the question—who is to do the representing?—immediately arises. Is it the proper function of a Dominion Prime Minister to be in his own country directing its war effort? The Australian Labour party says yes—though from ulterior motives—and most people will agree. But if another Minister is appointed as representative, he would in effect be superior to his own Prime Minister who would have to carry out the decisions of the Imperial Cabinet. This would obviously lead to an impossible political situation.

Still another suggestion is that Mr Churchill should pour the Dominions in his search for "strong men" to compose his Cabinet. The area in which talent may be found has already been enlarged by the practice of appointing Ministers from outside Parliament, and the inclusion of the Dominions in the area would simply be an extension of the present system. But if in his search Mr Churchill's eye happened to light on Mr Menzies,

who would thereupon be co-opted, the Imperial problem would be no nearer solution. Mr Menzies would doubtless be happy; so would his people, who could be confident that Australia's troubles would be given full tongue; and so would Australian Labour, because Mr Menzies could no longer be Prime Minister. But though Australia would thus be represented, it would still not be bound by anything Mr Menzies might agree to as a member of the British War Cabinet. Consultation through the Dominions Office and the High Commissioner would have to go on as before. And the other Dominions would be completely unaffected.

This problem of enabling the Dominions to participate in Imperial decisions and at the same time to keep their separate legal identities with their own independent legislatures is not new. It is inherent in the nature of the Commonwealth, though the issue was shunned in the Statute of Westminster. In normal times, it remains dormant; and the rare occasions on which a Government stirs it may be taken as a sign that the Dominion concerned is not altogether happy about the decisions being made at the centre. That is why it seems at the moment a peculiarly Australian problem; if the fortunes of war placed Canada in the position of the Pacific Dominions, it would not be merely to be in the fashion that the Canadian people would pack their Prime Minister off to London. But it would be a pity if Australia's struggles to find a solution were to obscure what should be the only object of Dominion concern no less than of the United Kingdom. If all the peoples of the Empire are determined to make the maximum war effort of which they are capable, there will be no need for constitution making. It is the only joint decision which their representatives need make; but it is a decision by which they must be jointly and severally bound.

NOTES OF THE WEEK

The Atlantic Charter

The magnificent sweep of Mr Churchill's oratory on Sunday night included the whole world with its hopes and ambitions in the compass of a single broadcast. For the United States, he had gratitude, but also a word of warning, the warning that Hitler has never abandoned the strategy of "one by one," and that the fundamental reason why the United States was not at war was because Hitler wished to finish with Britain first. For the Japanese, Mr Churchill also had a warning, a warning that aggression unlimited in the Far East "had got to stop." For the Russians, there was admiration for their terrific defence and a specific pledge that "we shall strive to our utmost to overcome all difficulties" to bring them the aid they need. For the oppressed peoples of Europe, among whom there runs to-day a ferment of sabotage, unrest and underground activity, there was the promise that by the Atlantic Charter both Britain and the United States are pledged . . . to the final destruction of the Nazi tyranny. In all this, there was little new, except Mr Churchill's untroubled art of marshalling the facts and presenting them on an heroic scale. What was new was the precision given by the Prime Minister to Mr. Eden's earlier statement of Britain's aims vis-à-vis Germany. This policy—which is included in Points 4 and 5 and Point 8 of the Atlantic Charter—is briefly to punish Germany in the military sphere and restore her economically. The reading of Mr Churchill and Mr Roosevelt of Point 8 is that the recurrence of war can be prevented only "by effectively disarming the guilty nations while remaining suitably protected ourselves," and that this time of unilateral disarmament will last on into "any period we can foresee." This interpretation, coupled with the lack of all reference to international institutions, almost suggests that the ineffectual career of the League has driven the two democratic leaders back into a dangerously negative frame of mind. International institutions failed between the wars because there was no power behind them and because they were superimposed upon economic anarchy. It would be folly after this war to supply the force and to remedy the anarchy, but to abandon the institutions. Unilateral disarmament is inevitable in the first hours of victory by the mere fact of

one side having won the war. It is not, and cannot be, a permanent condition of security. Yet, in a world in which wars will recur—just as burglary and arson will recur within the national community—police power there must be. It is the task of the democracies not to rest content with a balance of power tipped overwhelmingly in their favour. Their aim must be an organised society of nations, in which institutions match the force behind them and all are underpinned by the creation of a sound economic community.

They Call It Peace

Mr Churchill's broadcast at the week-end perhaps put into the background a timely speech by Mr Herbert Morrison in South Wales. His starting point was that "once again a number of people have begun indulging in day-dreams of victory coming by itself." Mr Morrison examined the reasons for these daydreams. "Continued Russian resistance (he said) in staving off the German assault means that we shall be given a few more months in which to make a great effort before the launch of German attacks in the spring; and that is the most optimistic forecast." "Do not let us be carried away (he urged) into the romantic belief that the war will be won for us in American factories." "Have we yet made headway (he asked) in reducing Germany's tremendous lead over us in equipment for mechanised war? I doubt it." These words were opportune because two kinds of peace talk have come to enervate the war effort. There are the daydreams spoken of by Mr Morrison and shared by great numbers of people in all walks of life, day-dreams which still ignore the fact that "all the time we are facing the most deadly military power in history, and the process of defeating it has hardly yet even begun." And there are more dangerous folk, those who write in newspapers, in pamphlets or in books on military strategy about the folly of prolonging total war to an exhausting conclusion, those who argue as if it were possible, now or in a few months' time, to make a peace with the Germans that will make the world safe from aggression, that will restore its liberties and that will establish all over the earth the freedoms

laid down by Mr Roosevelt and Mr Churchill in the Atlantic Charter. There are those who argue in this way because, quite explicitly, they are afraid of the growing power either of the United States or of Soviet Russia; and attacks have been made upon Britain's Allies in at least one weekly newspaper, which would seem at least to tempt the fate which befell the *Daily Worker*. These small knots of peace talkers are men with axes to grind, with warped visions and with no conception of the destinies that hang upon the decision of the British people to see this thing through to an end. In numbers, they are very few indeed and in influence not very strong, but their writings, whether they appear in newspapers with a great tradition of integrity or whether they crop up in books by scholars and experts, are insidious forays against the nation's war policy, if not conscious attempts to make use of the natural questioning of ordinary men and women about the precise way in which this war will be brought to an end.

After the War

Lord Baldwin once said that "another war in the west would mean the end of civilisation," and very few remember that he added, "as we know it." For various disingenuous, twisted and interested reasons, people here and there are beginning to return to this theme. The best known of all clerical journalists has just sounded a characteristically gloomy note in a pamphlet which begins with the promise that "there will be no recovery of health in the present century," though "a return to the Dark Ages may be averted." "We must face the fact (the pamphlet goes on) that the country is rapidly bleeding to death . . . the goose that laid the golden eggs for the tax collector and the ducks that laid the silver eggs have both had their necks wrung . . . John Bull will be a fraudulent bankrupt." The learned cleric appeals to his readers to "cease to listen to those who prophesy a good time coming after the war." He speaks of "disgraceful ruin." The writer of these words is presumably an intelligent man, and it can only be assumed that it is with deliberation that he paints this quite unjustified picture of "an unparalleled disaster" arising, he cynically claims, from the fact that "many believed that war was forced upon us" and from the further fact that the Labour party believed that war would mean "a greater supply of material comforts for their own clients." It is, of course, easy to point out that there are Defence Regulations which, if necessary, would amply cover this kind of irresponsible writing, and to point out that it is a remarkable tribute to the flexible freedom of this democratic country, even in war-time, that these things can be written with very little fear of the consequences.

The more important point is that these dire prognostications about the aftermath of the war have no foundation. A war causes loss of life and property; the community loses wealth that could have been produced by the capital equipment that is destroyed. But a country lives and bases its standard of life, not mainly on the accumulation of wealth in the past, but on what it can currently produce; and the only way in which a war can brand the post-war generation with permanent poverty is by its rendering the community very much less able to create wealth when it is over than they were when it began. This did not happen after the last war. In 1924, the net output per worker in the United Kingdom—and, therefore, his consumption—was higher than it had been in 1913, although working hours had been reduced by 1/10; and the same was true of the other belligerent countries, even of Germany, whose post-war troubles were caused far more by the inflation than by the war itself. There is no reason to suppose that there will be any difference this time. The physical destruction of capital equipment, factories and ships, though considerable, has been much less than most people feared, and so far much less than the devastation which was caused in Northern France during the last war. There will be some loss of income from the foreign assets which have to be disposed of to pay for wartime imports, but the total income of the United Kingdom from overseas investments is no more than 1/25th of the total national income. There is the danger that export markets will be lost while the war is on; and there is the possibility that this time, as last time, there may be widespread unemployment after the war. But wise policy, on the part of export industries as well as the Government, can minimise both of these dangers. The second danger does not follow automatically

and inevitably from the effect of war, but from the inability of governments to organise the transition from war to peace. There is no reason why the re-mobilisation of British industry should not be carried through without the consequences of economic and financial bungling that were evident in the twenties after the last war. Britain's power to produce will remain after this war sufficiently high to sustain the standards of material civilisation which are the anxious concern of the gloomy prophets. They need have no fear, except of the widespread resentment that will be caused by their attempts to spread alarm and despondency and to set one section of the community against another.

The Opposition in France

Marshal Pétain's decision to transform Unoccupied France into a police state on the Fascist model has caused a sharp rise in the temperature of resistance. It is as though the creation of totalitarian police powers had of itself created the need for them. The opposition that has come out into the open is worth analysing. On the one hand is the attempt of 100 deputies to form themselves into an opposition, a sort of parliamentary group operating without a parliament. These deputies are mainly men of the Centre of the Herriot stamp, and their opposition may be called the backward-looking type, for they seem to be seeking to preserve in France the nucleus for a return to the parliamentary government of the Third Republic. The other opposition, more numerous, far more violent, perhaps more fully organised, is forward-looking in the sense, not of progress, but of no return to France's old institutions. These are the Communists, to whom the Russian war and the resistance of the Russian people have given an enormous advantage. The sensational shooting by a young Communist, Colette, of Laval, Déat and Duvry, at a parade of anti-Bolshevist "volunteers" on the point of leaving for the Russian front, is only a symptom of an underground ferment which runs the length and breadth of France. It is France's tragedy to lie at the moment between only three alternatives, the prolongation of the

semi-Fascist, Pétainist, clerical rule of the *bienpensants*, the return to a discredited parliamentary régime, or a plunge into Communist revolution. If events were left to their own momentum, the third alternative is the most likely. Only if Britain and America can evolve some genuinely creative answer to the internal and international problems of the European community is a fourth alternative—with order and freedom combined—conceivable. No nation is so spiritually disintegrated as the French. No people are in greater need of genuine leadership. Have the democracies any realisation of the fact that they alone can supply it? If so, now, and not the crowded hours of victory and armistice, is the time to work for a solution.

Critical Days

After a particularly dangerous crisis, the fury of the third Gerran offensive seems to be slackening a little. True, the line has been pushed further east along the entire front, Novgorod has fallen in the north, Gomel in the centre and the Germans claim the capture of Dnepropetrovsk in the south. But the situation is a little more stabilised than at the height of the offensive, when Marshal Voroshilov issued a "defend or die" order of the day to Leningrad, and the drive of General von Bock's armies beyond Gomel threatened to separate Marshal Timoshenko's army from Marshal Budyonny's, and to turn the right wing of the Russian armies in the Eastern Ukraine. A smashing counter attack by General Koniev appears to have steadied the fighting round Gomel, and rain is helping the defenders of Leningrad. Nevertheless, the position remains critical. It is impossible to estimate the relative losses on each side, both in men and materials, but they have been fantastically heavy. The Russians have compiled the following table of losses:

	GERMAN	SOVIET
Men	Over 2,000,000 killed, wounded and prisoner	Killed... 150,000 Wounded 440,000 Missing... 110,000
Tanks	8,000	700,000
Guns	10,000	5,500
Planes	7,200	7,500

They cannot, of course, be accepted without severe reservations, though the ratio is a possible one as between attacking armies and armies retreating fairly intact. The figures underline the fact that, while Germany's problem is probably man-power, Russia's problem is supply. The tanks, guns and planes lost represent an inordinate drain upon what is still a very young industrial system. If any line is to be held west or east of Moscow, the losses must be made good by the Allies. Nor is there any real reason to suppose that the coming of winter will give the Russians their needed respite. The Finnish campaign was fought out in the dark months of a sub-arctic winter, and it would be crass stupidity if the democracies were to delay their aid to Russia on the grounds that General Winter will now do their job for them. Far too many people are already doing the job for the democracies for them to add to the weary list.

Back from America

At a Press conference this week on the state of production, Lord Beaverbrook mingled praise for what has been achieved with criticism of what is still left undone. The output of tanks has reached a fresh record and "we are doing very well in guns and explosives." But, he added, "I am not at all satisfied with what is being turned out by the supply industries . . . At present we are in the unhappy state of having more troops than weapons." Like Mr Morrison in his speech last Sunday, Lord Beaverbrook emphasised the immense task still ahead—and he deprecated any tendency to rely on Russia to win the war or on America to produce the weapons. In any case, records in production should be a matter of course in the present phase of the war effort. While the Minister of Supply paid a tribute to the quantity and quality of the weapons produced in the United States, he also disclosed the fact that that country's growing requirements of raw materials had rendered it necessary to curtail its exports of certain commodities to Great Britain, and to abandon shipments of iron and steel scrap. Fortunately, as was pointed out in an article on steel supplies on page 235 of *The Economist* of August 23rd, the need for importing large tonnages of steel scrap is not indispensable for

the maintenance of crude steel output in this country at a satisfactory level. There is probably sufficient scrap in this country to enable the Steel Control to make good the loss of American material, and stocks at furnaces are quite substantial. Nevertheless, if the flow of domestic scrap to the furnaces is to be increased to the requisite rate within a few months, drastic steps will have to be taken immediately, without regard to pre-war practices and conventions, to ensure the necessary additional supplies.

The Common Effort

Although the loss of American scrap and other materials can probably be made up from domestic sources, it is not mere cavilling to ask whether the supplies which the United States is now not going to export will, in fact, be more usefully employed in that country for the joint war effort than they could be here. The figures given by the President last week of the production of various weapons, while very much above those which had been bandied about by some critics, were still small; and there is more than a little evidence to show that the production of non-essential goods—and the use of vital materials in their manufacture—is still running at levels which, in the circumstances, are remarkably high. The leading fact about the United States, industrially as well as strategically, is that the country is not at war; and a not unimportant cause of the shortage of key materials is their continued heavy use outside the defence industries—a fact which is America's own business and no one else's. But a decisive factor in the distribution of resources from the common Anglo-American-Russian pool should be the question of where they will be best used against aggression. There is little doubt, for instance, that at the moment, the destination of finished goods of war should almost always be the Russian front—or China. War production in the States is held up, *inter alia*, by the controversy between the people who want rationing, those (in Wall Street) who want deflation and cut wages and those "super-inflationist" New Dealers who believe that there is no problem and that the civilian and defence sectors can both be given all they want; and, until it reaches a more rapid rate, and supplies to civilian production are more rigorously limited, there is some ground for wondering whether the materials which the United States has been exporting could not still be more effectively used in this country—or in Russia.

America Hangs Fire

The dismay with which the British people received the news of the passing by only one vote of the bill to extend the time of the United States Army draft is apparently shared by important sections of the American public. The suspicion has arisen that the United States is still trying to play at peace in a world at war, that "all aid short of war" means just that and not a preliminary to "shooting," that the real issue has not for a moment been squarely faced, so that it is still possible to talk of utterly defeating Hitlerism in one breath and of avoiding European Wars in the next. In their exasperation at this humiliating and irresponsible situation, some American critics are turning on the President and laying the blame on him for the manifest insufficiencies of the United States. The criticisms cover two different spheres: on the one hand, that the war effort is being hopelessly mismanaged and the tools of war simply are not coming off the lines; on the other, that the President's political leadership has lacked "high seriousness" and has failed to rouse the necessary sense of responsibility in the American electorate. Of the two charges, there is more substance in the first. Even the keenest admirers of the New Deal admit that the experiment has been somewhat vitiated by the vague and empirical planning and inadequate administration upon which it is based. The same errors have crept into the development of America's war industry. There is much overlapping of function and responsibility owing to the President's custom of setting up a new *ad hoc* body for new aspects of the work without adequate definition of what each body's purpose is to be. There is insufficient delegation of work and authority. There is a dangerous bottleneck at the very top, on the President's desk. But the shortcomings are not all those of the Administration. Like British industry in similar conditions, American industry, after thriving on monopoly and restriction, is creaking in every joint in the effort to work a vast programme of expansion. The business men with drive and

vision have not been found. There is even the suspicion that they are not there at all. And the President, who has relied on getting their support and enthusiasm, and is somewhat committed to working with them, is thrown back on his own resources. As for the other charge, defective leadership, here surely it is Congress and, behind Congress, the Constitution, that are to blame. Congress is obstructing the President. That is what the Founding Fathers designed Congress to do. The tentativeness, the hesitations and withdrawals, the tendency to underground methods which observers have criticised in the President are forced on him by the fact that his actions can at a crucial point be checkmated by Congress. The President is like a man advancing to his goal across a quagmire. It is not surprising that he does not go forward with a bold, unheeding stride.

More Appeasement?

Mr Churchill's reference to the Japanese in his recent broadcast in which, after outlining their career of aggression in China and Indo-China and their threat to Thailand and Singapore, he said, "It is certain that this has got to stop," and immediately capped this by saying, "every effort will be made to secure a peaceful settlement," is perhaps typical of the rather confused situation in the Far East. On the one hand, the freezing of Japanese assets still places an almost complete embargo on Japan's foreign trade outside the yen bloc; Imperial reinforcements are steadily arriving at Singapore; the United States is to send a military mission to Chungking; and the Administration has announced its adherence to the 1937 Declaration, which called for a full recognition of the rights of other nations in the Far East. On the other hand, an uneasy impression has been created by the steps taken to create machinery for a resumption of Anglo-Japanese trade; and negotiations are on foot between Japan and the United States to reach a settlement—nobody knows what kind of settlement—which Mr Churchill has pledged this country to support. Now what, in these circumstances, can a peaceful settlement in the Far East mean? One thing only—that Japan abandons its threat to Russia in the north, to Thailand in the south, and puts an end to the "China incident." Does anyone suppose that this is the agenda of the unofficial talks between Admiral Nomura and Mr Cordell Hull? If this is not the agenda, then there are bound to be shrewd suspicions that Japan is attempting to secure a relaxation of the blockade by a temporary—guarantee to push no further, which is almost equivalent to saying, "What will you give me if I don't give you another kick in the pants?" Again, the possibility that the Japanese are trying to barter their willingness to allow the United States to supply Russia through Vladivostok in return for modifications in the American licensing system, points to this same kind of appeasement, since the United States has a perfect right to use Vladivostok unmolested and without Japanese permission. The truth is that the embargo is something which ought to have been imposed in 1937, and there is nothing, short of closing the China incident, that Japan can do now to deserve it less. It is not the Japanese that should be demanding concessions under threat of further action. It is Britain and America, and, unhappily, the uncertainty whether either of the two democracies is really ready for further action is the surest guarantee that Japan's aggressions will go on.

An Imperial Nuisance

The Australian Labour party is an extremely irritating body. It refuses to allow Mr Menzies to visit London because it considers that he has important work to do in his own country, "implementing the prospectus of an unlimited war effort, which Labour wishes to accelerate as speedily as possible." This would seem to imply that the party has a high opinion of the value of Mr Menzies to Australia. Actually, it is trying to use the proposal of a London visit to jockey the Australian Government out of office. When Mr Menzies heard its decision, he immediately proposed the formation of a National Government, composed of an equal number of Government and Opposition members. This proposal has often been made before, but this time Mr Menzies went so far as to offer to resign the Premiership and serve under Mr Curtin or any other leader chosen by some agreed method. This was the most generous offer that Mr Menzies could have made. But it has been refused by Federal Labour, which says that the offer is an indication of Mr Menzies' inability to give

Australia a stable Government, and that he ought to resign—which Mr Menzies has naturally refused to do. The Labour party opposes an all-party Government, because "it would stifle honest, patriotic criticism," without which a successful war effort would be impossible; and it believes that the people would be more satisfied if the war effort were directed by a Labour Government, which would expect similar critical co-operation from those now in office. This assumption of popularity is amazing in view of the present balance of parties which still gives the Government parties a majority of one; but it seems that Mr Curtin is relying on alleged dissension between Mr Menzies and some of his nominal supporters in the Country Party. It does not follow, however, that these dissidents would be willing to support Mr Curtin, still less that he would gain more support than Mr Menzies from the Australian people, who must be heartily sick of such an exhibition of party politics at such a time.

Army Posting

The important report of the Beveridge Committee on the use of skilled men in the Services was not published until this issue of *The Economist* was actually going to press; and it will be discussed in a leading article next week. It has become a truism to say that the wide gap between Britain's available man-power and Germany's can only be narrowed by the most skilful distribution of men—between factories and the Forces, and, in the Forces themselves, between the specialised units and the other arms. The Commons' Select Committee, in its 22nd report, was mainly concerned with the latter. It recommends that the medical examination of recruits should be made more thorough, both from the physical and psychological standpoints, and that a preliminary intelligence test should be imposed before a man is posted to one of the Services. If practicable, a scheme should be devised by which recruits for the Army should, after their medical examination, be sent to central depots instead of direct to a unit. Here they would be sorted out and further tested for vocational and other aptitudes, and at the depots for the less intelligent they would be separated into the possibles and the impossibles, the latter being rapidly discharged. The Committee also recommends that the impossibles already in the Army—and they are by no means few—should be eliminated; that the existing members of specialised units should be carefully scrutinised; and that the capabilities and qualities of youth should be better utilised. The discharge of Army misfits is an obvious step, especially as many of them, living under normal conditions at home, could do useful civilian work. The other two recommendations would be more difficult to carry out, but are none the less essential. Except in Abyssinia, the offensive in this war has depended on the tank; it follows, therefore, that the Royal Armoured Corps should be the most highly trained and efficient of all the Army units. It has been said that its members—at least, those composing the tank crews—should have the temperament of Spitfire pilots; whether this is true or not, they should certainly not include any misfits. Unfortunately, even if these recommendations of the Select Committee are accepted by the Army Council,

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

it still does not follow that they will be acted upon. Putting them into effect will still depend upon individual commanding officers, and the capacity of some of these to ignore or render ineffectual Army instructions seems unlimited.

Checks on Output

Another report of the Select Committee deals with the most effective use of manpower in industry. Assuming that the average output per worker is considerably lower than it could be, it discusses the various factors which might impede it—long hours of work, wages, management, discipline, welfare and lack of incentives. Most of these have now been discussed *ad nauseam*. It is accepted that long hours of work reduce output, and that workers will work better if they are properly fed and housed, if their journey to and from work is made as easy as possible, and if they work under favourable conditions of light and heat. The remedy here lies almost entirely in the hands of the Government, and the Select Committee urges the departments concerned—the Ministry of Labour, the Ministry of War Transport, and the Ministry of Food—to take a greater responsibility in the matter. But the effect of management on output has received less publicity. Complaints of inefficiency have certainly been made very frequently, but quite apart from this the relations between managements and workers, especially now, when large numbers of new and inexperienced workers are being drafted into industry, must also be considered, when determining whether a management is good or bad. The allegation made at a shop stewards' conference last week-end, "that three-quarters of those in charge of the engineering industry were incapable of organising it properly, and were inefficient," must be a gross exaggeration; but there are individual cases of clear inefficiency, which, added to border-line cases and to the wrong handling of workers discussed by the Committee, lead to an aggregate loss of output that is by no means small. There are also occasions when the trade unions themselves are to blame; for instance, there is the case of the district delegate in a ship-repairing industry who the Committee found was preventing his union's members from working overtime without his permission. Neither one section of industry nor another can at the moment afford to grumble about mores elsewhere.

Iranian Oil

Had the Nazis been given time to establish themselves in Iran, they would have been in a position to launch an attack against the Caucasian oilfields, upon which the Soviet forces rely for the bulk of their supplies. They might, moreover, have been able to do great damage to the Iranian oil wells and refining facilities which provide much of the petroleum products needed by the British forces in the Middle East. The oil installations are safely in British hands. The significance of the Anglo-Russian move may be appreciated when it is pointed out that Iran, with an annual production of over 10 million tons, ranks fourth in the list of world oil producers. The oil industry in Iran is the product of British capital and enterprise, the sole operating concern being the Anglo-Iranian Oil Company. The output comes from the Masjid-i-Sulaiman and Haft Kel districts of southern Iran, though these are by no means the only areas known to be oil-bearing. A small part of the crude oil production is exported as such, but the bulk is refined in the enormous plant situated on the island of Abadan, at the head of the Persian Gulf; this is some 150 miles from the producing fields, with which it is connected by a system of pipe-lines. In peacetime, Iranian oil products found their way, not only to the markets of Africa and Asia, but also to the United Kingdom and other parts of Europe. In view of the extreme length of the journey, now that the Mediterranean is more or less closed, it is unlikely that much oil has come to this country from Iran during the past twelve months. But it is one of the natural sources of supply for the British military, naval and air forces in the Middle East; and although its place could probably have been taken by Iraq, and possibly by other sources of supply in case of necessity, the loss of Iranian oil would have been a grave inconvenience to Britain. It would, moreover, have hit a number of British investors, whose relief is suggested by this week's rise in the company's shares.

Licensed Dealing

Control of food distribution is being extended slowly but steadily. The Food (Restriction on Dealings) Order made by the Minister of Food on August 20th will go a long way to provide the authorities with an effective sanction for use against black market dealers. The purpose of the Order is to extend the list of foodstuffs for the sale of which both retailers and wholesalers must secure licences, to cover in the case of retailers some sixty foods. Among the wholesalers, grocery and provision dealers are the class most affected, but the list also includes a number of the greengrocer's wares such as tomatoes, onions, apples and—hollow mockery—bananas and bitter oranges. The Ministry of Food provides illuminating indications of the type of offence for which licences will be revoked—and it is emphasised that revocation will definitely take place and will generally affect all foods for which the dealer is licensed. The offences which Lord Woolton is anxious to prohibit add up to those time-honoured devices for market manipulation, forestalling and regrating, illicit slaughtering and the offer of excessive prices, coupled with falsification of accounts to conceal the subsequent sale price. The dates at which trading without licence will become an offence are to be announced separately for each group of foods affected. It is to be hoped that the application of this admirable Order will be swift and without compunction.

Shorter Notes

The *Economist* has received from the salvage department of the Ministry of Supply a letter for publication in order to draw the attention of its readers to the urgent need for salvaging waste paper of every type. The letter reveals that since the war the waste paper already recovered would fill a string of lorries stretching from London to Glasgow. The *Economist* fully subscribes to the admirable exhortations expressed in the letter which, since its own supplies of paper are so scanty, it is not able to publish in full. But it finds it a little curious that it should have received no less than nineteen copies of the letter, each in a separate envelope. Eight were postmarked 7.15 p.m., August 25th; four 12.45 p.m. and one 1.15 p.m., August 26th; and the remainder 2.45 p.m. of the same day. Both letters and envelopes will, of course, give a good send-off to The *Economist's* share in the Ministry's "great Salvage Drive."

Within a fortnight of assuming supreme direction of France's national defence, Admiral Darlan has made sweeping changes in the North African Command. General Weygand retains his position as Delegate General of North Africa and General Noguès as Resident-General of Morocco, but General Huntziger is to become Commander-in-Chief and General Juin is to succeed Noguès. The Commands at Tunis and Algiers are also reorganised. This seems a partial strengthening of Darlan's position since the new men depend on him. Nevertheless, not one of them is known as an out-and-out German collaborator.

In view of the virtual termination of hostilities in East Africa, the War Office has announced that an East African Military Command directly under the War Office will be created, to enable the Commander-in-Chief, Middle East, to devote his whole attention to more active theatres of war. Lieut.-General Sir Alan Cunningham, who commanded the East African forces, is transferred to a Command in the Middle East; and the General Officer Commanding-in-Chief of the new Command is Lieut.-General Sir William Platt.

The Jamaican Legislature has rejected the Colonial Office's proposal for a new Constitution and has adopted an amendment in favour of full representative government.

A Central Council for Works and Building has been appointed to advise the Ministry in its direction and control of the building and contracting industries. Its members have been chosen by Lord Reith to represent the industry as a whole, including the manufacturers of raw materials and finished articles; they are apparently not delegates of the sectional interests concerned.

THE WORLD OVERSEAS

Polish-Soviet Relations

(By a Correspondent)

August 19th

THE first positive results of the Polish-Soviet Agreement are now apparent. A Polish Military Mission, under General Szysko-Bohusz, ex-commander of the Polish Expeditionary Force to Norway, has arrived in Moscow, and a few days after his arrival a special convention, defining the status of the Polish forces to be raised in Russia, was signed. (Four to six divisions are to be set up in the immediate future.) General Anders, who had been interned as a prisoner of war since 1939, has been appointed Commander-in-Chief of the Polish Army on Soviet soil. A Polish Ambassador is soon to go to Moscow, and in the meantime a *chargé d'affaires* is keeping in touch with the Soviet Government. Immediately on the resumption of diplomatic relations, several hundred thousands of Polish prisoners of war and political prisoners regained their freedom, and some prominent Polish politicians, released from internment, have since arrived in this country. Two of them, M. Grabski and General Januszajtis, will join General Sikorski's Government, from which three Ministers recently resigned.

Very significant are the repercussions of the Polish-Soviet Pact on Soviet propaganda. Soviet transmitters send out several Polish bulletins daily and address the Polish people with vigorous appeals to resist the common foe. Workers of Moscow's factories appeal directly to the working youth of Warsaw's factories, calling on them to sabotage or to slow down production. Such unusual terms as "the great immortal Polish nation," which some time ago was preposterously blamed as a nation of *pans* (landlords), and "our heroic Polish brethren" occur frequently; and not even the most suspicious listener is able to detect the faintest trace of Communist propaganda in these bulletins.

Polish delegates played a prominent part at the Conference of Slav Nations held in Moscow. Their foremost spokesmen were the well-known leader of the National Democrats, Januszajtis, and the prominent writer and sympathiser of Communism, Wasilewska. They seemed to symbolise an unusual reconciliation of the two extremely opposed factions of Polish society which, under Polish rule before 1939, as well as under the Soviet regime after 1939, had been separated from each other by prison bars. Hitler has achieved the miracle of uniting the jailor and prisoner in a common purpose.

The Conference of the Slav Nations was organised by the Soviets in order to obliterate any unpleasant memories which might have lingered in the mind of the Poles. The old Czarist monarchy used pan-Slavism as a smoke-screen for its expansionist policy, and the paternal gestures of the Czars towards the Slavonic race contrasted sharply with the oppression of Poland by Russia. The last great Russian-inspired Pan-Slav Conference, held in Prague in 1910, was strongly opposed by Polish patriots, who at that time refused to join the Czechs and Southern Slavs in a demonstration of racial solidarity. Only Dmowski, the leader of the National Democrats, who stood for collaboration with the Russian dynasty, took part in it. At the recent Moscow conference, Soviet representatives disowned the pan-Slavist tradition, and gave solemn assurances that, in calling the conference, they had no other ambition than to unite the Slav nations for the common struggle against the danger of their extermination by the Germans.

It would, however, be futile to pretend that the change in Polish-Soviet relations has been welcome in all Polish quarters. Three Polish Ministers have resigned from General Sikorski's Government because of their disagreement with his policy, and the treaty itself has met with bitter criticism in some of the Polish papers published in Great Britain.

Opposition to the Pact

The reasons for this opposition are manifold. First of all, there is the ambiguity about the Polish-Soviet frontiers; and the remark of the Soviet official *Izvestia* that the Polish-Soviet frontier of 1939 should not be regarded as immutable did little to allay the anxiety of some Poles. On the other hand, the Soviets have agreed to transfer former Polish subjects, now serving with the Red Army, to the Polish forces, which logically implies an indirect recognition of the 1939 frontiers. There is, also, resentment at grievances recently suffered at Soviet hands, an emotional factor which, however justified in itself, has unfortunately obscured for some Poles the picture of the new relationship of forces in Europe. And there is, last but not least, the inertia of an inveterate political controversy which is partly contributing to the present dissension. The dispute between anti-Russians and anti-Germans swayed Polish political life for about half a century. In 1914-18, the Left Wing was predominantly anti-Russian, the Right Wing anti-German. The adherents of Pilsudski were, at that time, closely associated with the Left. It is interesting to note that the Left Wing (the influential Peasant Party and the Socialists) have now endorsed General Sikorski's policy, in spite of their anti-Russian traditions. The main opposition comes from the Pilsudskists; two of the departed Ministers, M. Zaleski and General Sosnkowski, belong to that group. (General Sosnkowski was Minister of War during the Polish-Soviet conflict in 1920.) The nationalist Right Wing has split over the treaty; in spite of the strongly anti-German and pro-Russian tradition of the Right, some of its members, like the ex-Minister, Seyda, oppose the treaty, whereas others, like the Minister of Information, M. Stronski, General Januszajtis and the intellectual spokesman of the movement—former Polish Minister of Education—M. Grabski, have unreservedly endorsed it. General Sikorski himself was brought up in and associated with the anti-Russian school of Polish political thought. It testifies to his political courage and flexibility of mind that he was able to discard an obsolete political notion and to adopt a new line such as has been called for by the new alignment of European forces. His critics have no prospect of success, since the Neither-with-Germany-nor-with-Russia-Blind-Alley, into which they have driven themselves, condemns them beforehand to political passivity; though it must be said that some statements in the British Press, such as the *Times* article about Russia's hegemony in Eastern Europe, have played into their hands by hurting Polish national ambitions and arousing misgivings about Britain's attitude in the future settlement of Polish-Soviet relations.

Most important, however, is the response with which the Russo-Polish Pact has been met in Poland itself. The attitude of the Polish population towards the new war in their country was clear from the beginning. The Poles made up their mind from the first day of the outbreak of Russo-German hostilities that their chief enemy was not Russia, but Hitler. The Russian-Polish conflict was, however, a great obstacle to full collaboration, and before the negotiations for the pact were completed the official declaration of the Soviet authorities, assuring the freedom and independence of Poland, favourably influenced the attitude of the Polish people towards the campaign. Immediately after Stalin's call for a guerrilla war against the advancing Nazi forces, groups of partisans were formed all over the country. Polish partisans are operating in the forests of Central Poland, and also nearer the front in the forest of Bielowieza and in the Pripiet marshes. Their activities are concentrated mainly on communications and on the stores of fuel and foodstuffs built up by the German authorities behind the lines. The large quantities of abandoned war material, ammunition

and guns are sufficient to equip the guerilla campaigners with the necessary weapons, and the number of well-armed men now runs into tens of thousands. The Soviet forces are watching carefully the activities of the guerilla partisans and are doing their best to help them by sending supplies by air and dropping instructors by parachute.

An American Farmer Asks

[FROM OUR WASHINGTON CORRESPONDENT]

August 11th

FOR the past few months, members of the Soil Conservation Service have kept track of the questions asked them by the farmers with whom they are in contact. Since the SCS staff numbers about 12,000, distributed over the major agricultural areas, the questions may be taken as indications of what has recently troubled the minds of farmers; unlike the questions in the public opinion polls these are not questions asked of farmers, but questions asked by farmers.

A high percentage of the questions concern the changes in the agricultural situation and the farm programmes resulting from the shift in the American economy toward an economy of total war. For instance:—

We understand that the prices of certain farm commodities guaranteed by the Government are a minimum floor. If products get out of line (for example, if corn goes up out of proportion to hog prices) will action be taken to fix a ceiling? Will a ceiling be fixed if they all go too high in proportion to other goods?

Is there a current shortage of farm equipment? Is one in prospect? What steps are being taken to recognise agricultural needs in establishing priorities for aluminium, steel, rubber, gasoline, etc.?

What is being done by the Government with the surplus stores of cotton and tobacco now piling up? What effect is national defence going to have on these surplus commodities?

At the present time, it seems that farmers are using mechanised practices in agriculture because of the labour shortage. Because of the adjustments due to mechanisation, what will happen to labour after the emergency? Should we advocate increased use of mechanised methods in agricultural production?

A second series of questions indicates sectional and occupational rivalries brought out by changes under the defence programme:—

Is it true that ten States have 90 per cent of defence contracts? If so, why?

How much aluminium and rubber are available, without importing, in comparison to the amount required?

Critics of strikes say that strikes are settled in favour of labour because management is willing to give in because if it doesn't pay in wages it pays in excess profits tax. Is this true? Why pay labour \$1 to \$1.50 an hour when farmers' income is little higher and soldiers get \$21 a month?

How can strikes and drafts be reconciled, that is, a situation in which ploughboys are drafted at \$21 a month while well-paid workers strike?

The strike situation is frequently linked with the activities of fifth columnists:—

What part have subversive or un-American elements played in the defence efforts of the United States and, in particular, in labour leadership and strikes?

The query—What is the United States policy on the shipment of food products to Axis-occupied countries?—is paralleled by anxiety about trade development within the hemisphere:—

Will it be possible to increase trade with South America or to maintain the present volume? What products are now being exchanged and how much of each? If our trade with South America develops, will it mean a sacrifice on the part of the American farmer?

The political and military situation in Latin America is as interesting as the economic:—

Do any South American countries have dictatorial governments now? How many observe the principles of the Bill of Rights and employ democratic processes? How many are pro-Axis and how many pro-United States?

Are we forcing hemispheric solidarity on Latin American countries?

What is being done by the United States to offset Nazi propaganda in South American newspapers?

What steps are Central and South American nations taking for military defence?

England has said that her war aims are to create a new moral order of freedom for all nations. Is this America's aim, and, if so, can we achieve it by merely defending the Western Hemisphere?

As to Germany:—

What is the comparison between our industrial capacity and Germany's?

If the Germans can conquer the Near East, North Africa and Suez, will this give them all the soil they need?

How important is our export trade? What percentage of our national income does it represent? Is it worth fighting a war about?

Why couldn't the United States trade with Germany if the Nazis defeat England?

Questions about the operation of the Lease and Lend Act, about the economic activities of Britain and the Dominions, and about the period just after the war take the following forms:—

What percentage of the aeroplanes we are building for Great Britain actually reach her? What types of aeroplanes are being sent to her and in what numbers? What percentage is being "ferried" and what percentage is being sent in ships, and in whose ships?

How could a total defeat of Great Britain affect the standard of living; hours, wages and working conditions of the average labourer or office workers; military and naval requirements and their cost; and permanent peace?

Are colonies giving all-out support to Britain? What are they doing, how much are they spending, and are they giving or selling goods to Britain?

Why did Canada buy 300,000 bales of cotton from Brazil when the United States has a huge surplus for sale?

Why is England still using part of her merchant marine for shipping non-war materials to the colonies and other nations?

What are the facts on British shipping losses?

If it is impossible for Germany to bring England to terms by an all-out air attack, how can air superiority on England's part, if achieved, ever bring Germany to surrender? Or does England plan an eventual land attack on the Continent? If so, could it succeed without an American expeditionary force?

After the war is over what methods of cushioning the enormous debt payments for defence are likely to be employed? Will we see another depression that will make our previous depression of the early 30's seem mild by comparison?

Labour Troubles in Canada

[FROM OUR OTTAWA CORRESPONDENT]

August 5th

THE Government's policy of trying to anchor wages to the cost of living by adding a cost-of-living bonus to wages has not prevented considerable labour troubles arising from demands for higher wages. There has been a "ca' canny" movement in the coalfields of Cape Breton in Nova Scotia, which has seriously diminished the output of coal, and there have been strikes in munitions plants in Toronto and Hamilton. The industrial outbreak which has had the most serious consequences occurred at Arvida in Quebec, where the Aluminium Co. of Canada operates the largest single war industry in Canada. On July 24th,

Income Tax for Palestine

[FROM OUR JERUSALEM CORRESPONDENT]

July 15th.

AN income tax will be introduced in Palestine on September 1, 1941. The help of an adviser, well acquainted with conditions in India, which are not unlike the conditions here, has been enlisted for drafting a law which will make the introduction as simple as possible technically. The taxfree exemption limit has been fixed at rather a high level, £P400 for a married man, £P300 for a bachelor with dependants, and £P250 for a bachelor without dependants. The tax is levied at a compound rate, beginning with 50 mils (one shilling) for every pound in the first chargeable £P400 and rising to 300 mils for every chargeable pound above £P3,500. A married man with an annual income of £P500 will have to pay £P5, while on an income of £P5,000, £P890 will have to be paid.

As the law is to come into force on September 1st, only seven-twelfths of the full amount will be levied during the current fiscal year. The most reliable estimates put the number of taxpayers under existing conditions at about 7,000 out of a total population of about a million and a half, and the yield for a full year at about £P250,000. This last figure would compare with a budget total of about £P8½ millions in the fiscal year 1940-41. Mr Strathie, the income tax adviser, explained that the high exemption limit and the few and limited personal allowances were intended to avoid "a vast amount of unremunerative clerical work."

It would have been very difficult, too, to build up a department out of nothing to deal with large numbers of possible assesseees. From wage-earners the tax will be deducted at the source, though not very many will be affected; the adviser, judging by his Indian experiences, believes that even somewhat difficult cases, such as money-lenders, can be dealt with satisfactorily. The reductions allowed follow the usual lines and do not call for special mention. The tax upon the chargeable income of a company is to be a uniform 10 per cent.

As the war is steadily drawing nearer Palestine, the necessity for war risks insurance has become even more pressing, and a few weeks ago a draft ordinance for that purpose was gazetted. It is to be supposed that the actual ordinance will contain the same provisions; these are compulsory insurance for goods with a minimum value of £P1,500 and voluntary insurance for goods of a value less than that amount. The insurance is to cover war risks (excluding losses due to invasion and consequent seizure) on goods owned in the course of business and situated in Palestine. The schedule lists not less than 44 types of commodities, including livestock, timber, bricks, metals and ores, machinery of diverse kind, paintings and sculptures, philatelic collections, old books and mineral oils. The rates have not yet been fixed.

During 1941, orders placed by the military authorities have increased, and reliable estimates state that the value during the first four months of 1941 equals the total value of orders given during the year 1940. As far as can be judged, May has been even better than the preceding months. The types of industries working for the armed forces have increased, and whereas in 1940 the bulk of the orders were for canned food, this year the metal industries are receiving a fair proportion of the total of orders. A new development in industry is due to the difficulty of providing raw materials; the Government departments concerned make many establishments work against fixed compensation, while they themselves provide the necessary raw materials.

trouble came to a head; some 300 men employed in the plant took forcible possession of it and retained control for three days until troops arrived from Quebec. But, meanwhile, 5,000 workers actually in the plant and 4,000 more engaged in the construction of a huge extension to it had been thrown out of work. The most serious consequences of the trouble was that the aluminium in the enormous pots, in which the final process of purification takes place, had been allowed to cool and harden; and the laborious work of chiselling it out gradually may mean a loss of two or three weeks' production, which, since there is already a grave shortage of aluminium products, will hamper the aeroplane industry. Mr Howe, the Minister of Munitions, alleges that saboteurs were at work, but officials of the local labour unions maintain that the strike had its sole origin in the failure of the company to concede a just demand for better wages. The King Ministry is being severely criticised for its failure to send in troops as soon as it learnt that the plant had been seized by the workers; and its lagardness is attributed to fear of rousing antagonism in Quebec by employing military force to suppress French Canadian workers.

Supplies to Britain

The war orders continue to keep industrial activity at a record level, but some papers have been pointing out that the shipments of goods to Great Britain are falling below the scale expected. Both Mr Mackenzie King and Mr Ilsey, the Minister of Finance, stated in Parliament that Canada planned to furnish Great Britain during the fiscal year, 1941-42, with munitions, raw materials and foodstuffs of an estimated value of \$1,500,000,000, but the trade figures for the first quarter of the current fiscal year ended June 30th show that the exports of Canadian domestic goods to Britain in that period had only a total value of \$190½ millions. It is pointed out that if the scale of exports to Britain does not increase during the remaining three-quarters of the fiscal year, Canada will only be furnishing Great Britain with a little more than one-half of the supplies to which she committed herself. However, a spokesman of the Government has explained that lack of shipping facilities has delayed the shipment of large quantities of goods, and that a number of factories, which are destined to make a large contribution to the volume of munitions and armaments shipped to Britain, will not come into full production until late in the summer. It is consequently predicted that in the remaining three-quarters of the fiscal year there will be a very large increase of exports to Britain and that Canada's commitments will be adequately fulfilled.

The Bureau of Statistics' survey of economic conditions in June gave the index of the physical volume of business at 135.3, compared with 132.0 in May, and the index for industrial production at 149.3, compared with 143.4 in May. In recent weeks there has been no material change in the business situation and given below are data about the weekly economic index of the Bureau of Statistics and its major components:

Week Ending	Carloadings	Wholesale Prices	Bank Clearings	Weekly Index
July 27, 1940	92.6	82.0	81.9	102.2
July 12, 1941	103.6	90.6	105.3	112.9
July 19, 1941	104.6	91.2	99.7	112.2
July 26, 1941	107.0	91.1	103.8	113.5

Employment continues to expand, and the Bureau's employment index for May 1st, at 145.5, was 27 per cent above the figure for the same date of 1940. The problem of securing adequate manpower for both the fighting forces and the industrial machine is now demanding serious attention. The national registration taken in 1940 disclosed that, during 1941, after making allowance for men already enlisted, about 91,000 young men who reached the age of 21 during the year would be available. But it has also been estimated that, during the year, the fighting forces would need 132,000 recruits and the war industries 200,000 additional pairs of hands. It is therefore clear that women will have to be drafted into industry in increasing numbers; and there will have to be evolved at Ottawa some coherent and effective policy about the allocation of manpower.

Proof of the expansion of Canada's steel industry under the stimulus of the demands of war is furnished by its output for the second quarter of 1941, which attained the record figure of 593,953 tons, an increase of 7 per cent over the previous record figure for the first quarter and of 20 per cent over the figure for the same quarter of 1940.

Letter to the Editor

Milk and Beef

TO THE EDITOR OF THE ECONOMIST

SIR,—The belief that farming can be reduced to factory terms dies hard. The well-known story of the business magnate who bought a sheep farm in Australia and, on reading in his paper that wool prices had fallen while mutton prices had hardened, cabled to his manager: "Stop shearing, start lambing," may be fabulous; but it is true in spirit of a certain kind of mind. Farming concerns the soil, and the soil is not a factory. Liberties can be taken with it in reason, but the point is soon reached when Nature asserts herself above economics and man can go against Nature only at the risk of unbalancing the true economy of food production.

Milk is a good example. There is little doubt that milk production could be increased, even at the present low rate of imports of feeding-stuffs. But we are not contemplating a war-time diet of milk alone, and so there are human competitors as well for the products of arable land, for we need bread, oatmeal, potatoes, sugar—and even a certain amount of beef and beer. We are not robots, and there is not much doubt that the damage done to morale if meat were entirely to disappear would outweigh not only the consequent saving in shipping space, but also the gain to public health by pushing milk consumption to fresh records in every month of the year.

Some reduction in our beef cattle population is a war-time necessity that is accepted and has already taken place. But milk and beef are also more complementary in our present system of self-contained mixed farming than many people realise. It is generally recognised that artificial fertilisers, however valuable, should be a supplement to, and not a substitute for, organic manure. We need the beef cattle to tread the straw to make the dung to grow the arable crops for feeding the dairy cows. If it be suggested that dairy cows should do this treading, the answer is that the dairy cows do not exist on the farms where large quantities of this straw are produced, nor the buildings for housing and milking them. If we abolished the beef cattle we should be committing a crime against economy that would be shocking enough in peace time, but under present conditions would be suicidal lunacy. For the straw would be wasted and the soil cheated of that increased power to produce that is all important.

We are producing our beef cattle with little or no resort to imported oil cake. That is reserved for dairy cattle. Other stock must be content with the leavings from the milch cow's plate. Hay, oat-straw, silage and home-grown roots and fodder crops form the basis of their diet, together with grazing. Moreover, the dairy cow must be pampered to some extent. She cannot be used to eat off the rough grass that is to be found on so many farms, and on a large number of fields coarse grass is a recurring enemy to the finer pasture needed to produce our milk.

There is an obstinate belief that milk and the plough are enemies. In fact, they are essential partners, even in peacetime. In the summer of 1939, the writer made a point of asking the Agricultural Organisers in some fifteen counties the following question: "If most of the permanent pasture in your county were ploughed up, re-sown with a modern grass mixture and brought into some system of ley farming, with crops and grass alternating, by how much would the stock-carrying capacity of the county be increased?" There was not one who did not say it could at least be doubled, and at least half thought that trebling would be nearer the mark. It will be seen, therefore, that the plough, even in peacetime, is the surest way of increasing milk production, especially since it would increase it by raising the output on farms fitted to produce milk rather than by bringing more dairy cattle to the cold, wet land, unfitted for milk production at all, or the dry soils where pasture is obtained with difficulty, or the hill districts from which milk cannot readily be transported. But there cannot be a sudden and wholesale ploughing up of all permanent pasture. It will be noted, also, that periodical use of the plough is part of this system of management that is suitable for the greater part of our grassland. For the plough enables

the stored-up fertility from the grazing stock to be cashed in the form of corn, sugar beet and other crops, and, with very little exception, gives us continually renewed pasture that is able to carry more stock, and produce more milk, than pasture left down indefinitely. But unless this ploughing up and re-seeding is to be impossibly expensive, making the milk expensive too, corn must be grown for a year or two in between the re-seedings. In a large number of cases, even in dairying districts, beef cattle offer the best means of turning this straw to good account, either by eating it or turning it into manure for the land; in the main arable districts beef cattle are essential in this respect.

Mixed grazings is sound economy, for sheep and bullocks tend to eat different kinds of grasses, the sheep preferring short varieties, the bullocks the longer grasses they can get their tongues round.

Milk production, therefore, cannot be isolated and divorced from other agricultural activities, except under a system of deliberately neglecting and misusing the land and aiming at a target far short of maximum production per acre. Milk production that is both intensive and cheap involves, generally speaking, the use of the plough to get the best results; the plough means some corn growing, and, in a large number of cases, the bullock is a partner in both grass and corn production. It has been suggested that beef should give way to milk on an even larger scale than is now occurring, because of the anticipated shortage of milk this coming winter. The danger of a winter milk shortage may well be exaggerated. That there will be a shortage is certain, but it may not be greater than last winter, and is more likely to arise from increased consumption than from decreased production, unless the weather is exceptionally unkind. Milk consumption during the war has risen by 120 million gallons a year, beating all records. Last winter, which was a bad one from the point of view of weather conditions for milk production, we scraped through without any serious shortage. With open weather and farmers becoming more skilled in producing and feeding home-grown rations, it is even conceivable that we may produce more milk this winter than last, especially in view of the much greater amount of silage likely to be made.

In addition, the scale of rationed feeding-stuffs announced for next winter provides an ample supplement to the fodder grown on the farm, and, being based on milk sales, has evidently been designed to give every encouragement to maximum output. By comparison, the beef animal must be content with the products of his owner's land. There are to be no coupons for the fattening bullock.

The very fact that so much more milk is being drunk means that the nation's health would be able to stand something in the nature of pre-war milk consumption for a month or two without suffering harm, although this is not to say that every effort must not be made to meet the demand to the full. It would be tragic if the growing milk habit, which is one of the best things that has come out of the war, were checked by inability to meet the demand.

But surely it would be alarmist procedure to begin a wholesale slaughtering of our beef cattle simply because it may, or may not, be temporarily impossible to meet a record demand at the height of the greatest struggle for our existence we have known, especially when steps are being taken to see that those who need milk most will receive adequate supplies. Nor is it by any means certain that getting rid of our beef cattle would be followed automatically by a big increase in milk production. The cow has very much the first call on available supplies of feeding-stuffs, and the suggestion that milk production is declining because beef cattle are getting supplies that ought to go to dairy cattle is far from the truth.

There is also this consideration. We are making heavy demands upon our soil. We are straining for high production of certain crops, and in the opinion of many we are already pushing the reserves of fertility in much of our soil to the limit. We have had to sacrifice large numbers of our pigs and poultry, potent agents for manuring the land. Our flocks of sheep have also had to be reduced, and a culling of beef cattle is in progress. To deprive the soil still further of the means of maintaining its health is surely not only bad farming and bad economy but also bad hygienics.

West Sussex.

THE BUSINESS WORLD

Insurance under the Nazis

THE present masters of Germany have always seen in insurance a powerful adjunct to their ambitions of world domination. Long before the outbreak of war, an increasingly close control was being exercised over the activities of German companies, for it was early realised that they provided excellent media for the accumulation of capital to feed the war machine; between 1933 and 1939 the proportion of Treasury bonds and Reich loans to their total investments increased from 8.8 per cent to 32.9 per cent. Profits were heavily taxed, both through official taxation and the numerous "contributions" to party funds and the like. The authorities also did what they could, in the atmosphere of economic autarky for which Germany was herself so much responsible, to foster the development of overseas connections, in order to provide much-needed foreign exchange for the purchase of raw materials; it is estimated that in 1937 the gross income from foreign transactions was some £16 millions, the major part of which was provided by the reinsurance companies. On the outbreak of war, many of the markets formerly exploited by German offices were closed, but fresh opportunities for profit were opened up as one European country after another was overrun; and these opportunities were enhanced by the enforced withdrawal of the British companies, with their long-established connections, especially in Western Europe and in Scandinavia.

The organisation of insurance in the occupied territories, to serve the purposes of the new order, has been put in hand with characteristic Nazi thoroughness. There is evidence of systematic efforts to penetrate markets, of the centralisation of reinsurance, of rating control and limitation of dividends—all measures aiming at German financial hegemony. It cannot be doubted that these activities are directed from one centre; it is known, for example, that the planting of agencies of German offices in the occupied areas is subject to the jurisdiction of the *Reichsgruppe Versicherung*. But the extent to which the screw is applied, naturally varies considerably from one country to another, and depends on how far the aggressors are still hoping to induce the people to "collaborate" in the establishment of Nazi ascendancy, as an alternative to compliance extracted under conditions of complete subjection.

At one extreme there is the *Gouvernement Général* Poland, now apparently regarded by the Germans as finally incorporated in the Reich. Here it is decreed that, while the local offices formerly operating may be permitted to continue, the transfer of insurances from one office to another is forbidden and the existing premium must not be altered; contravention is punishable by fines or imprisonment or, in flagrant cases, even by penal servitude. By contrast, in Denmark, where resistance to the occupation was negligible, the local supervisory authorities have, it seems, been permitted to carry on without much interference, and even to make their own arrangements for the liquidation or transfer to Danish insurers of the numerous portfolios of British companies.

The most important areas lying between these two extremes of policy are France, Holland and Belgium, where German offices have respectively opened some seventeen, twenty and sixteen new agencies. In France, an agreement is understood to have been entered into between German and Italian companies, whereby the former acquire two-thirds and the latter one-third of the British portfolios; and the premiums on fire insurances have been increased by 30 per cent, British insurers being blamed for the previously inadequate level of rates. From Holland, it is reported that, apart from the requisitioning of the business of British companies, 50 per cent of the whole of Dutch major and medium fire business must be given to German companies; policy is being directed at reducing the

number of Dutch companies and bringing others under German control. In Belgium, the *Nordstern*, one of the largest German companies, has apparently taken over most of the business previously finding its way to the British offices. Direct German control is suggested by a report from Norway that dividends have been restricted to between 5 per cent and 8 per cent.

In the sphere of reinsurance, the German plan of centralisation is sufficiently evident from the establishment, in March this year, of a *Vereinigung zur Deckung von Grossrisiken*, or "corporation for covering major risks." This is a kind of cartel regulating reinsurance in the whole of Europe, to be administered by the Munich Reinsurance Company, with the support of Italian and Swiss reinsurers. It is explained that the new cartel is intended to replace the activities of Lloyd's on the Continent; each country will first try to absorb its own risks and, where this is not possible, the cartel will arrange for their distribution on a quota system. The power over rates, and in consequence over requisitionable funds and taxable profits, which such a reinsurance monopoly gives, needs no elaboration.

This is sufficient to illustrate Nazi policy in the countries they have overrun. How far is it possible to assess the loss which British insurance has suffered through the temporary closure of the European markets? The paucity of published information makes it difficult to consider this question in any detail. Certainly there have been no untoward reactions on the financial position of the offices, for most of them have already written-off, or established reserves against, their assets in the occupied territories, without noticeable embarrassment; indeed, it seems likely that, in certain areas, the assets held were less than the corresponding liabilities—this appears from the accounts of some companies, and is suggested also by the information that, in France, the German offices, in taking over the British portfolios, have found it "appropriate" to enlist the support of the French banks. The loss of premium income, except in one or two instances, is small against a background of world-wide activity; in fact, a study of the accounts of British companies discloses that many have more than made good any loss of premiums through expansion in other directions. A fair proportion has doubtless been secured of the business in countries outside Europe formerly going to German and Italian companies; and much of the reinsurance on world-wide British portfolios which was previously placed with Continental offices has been assimilated without outside assistance by reciprocal arrangements among direct-writing offices.

Whatever the dimensions of the loss in premiums from European sources experienced in the aggregate by British companies and Lloyd's—and the vital factor is, of course, profit rather than premiums—the loss is unlikely to prove more than temporary, for the goodwill British insurance has enjoyed on the Continent is likely to be enhanced after the war. In the chaotic conditions which the Germans will leave behind them, British capital and experience will have their part to play in the process of reconstruction, when, in the terms of the Roosevelt-Churchill Declaration, it is hoped to bring about "the fullest collaboration between all nations in the economic field, with the object of securing for all improved labour standards, economic advancement and social security."

In the meanwhile, there have been developments in German internal insurance which are not without interest as an illustration of some of the difficulties with which the Nazis have to contend at home. It seems that they have found it necessary to bestow on their war-weary people lavish promises of reorganisation of social insurances, embracing life assurance and pensions, sickness and unemployment insurance; the changes are not, however, to

ALLIANCE

ASSURANCE COMPANY, LTD.
OF BARTHOLOMEW LANE, LONDON, E.C.2

Established 1824

ASSETS EXCEED £35,000,000

INSURANCES OF ALL KINDS

LIFE (with and without Profits)—Estate Duty Policies—Family Protection—Children's Deferred Assurances and Educational Endowments—Annuities.

FIRE — MARINE — BURGLARY & THEFT
Accidents of all kinds — Motor Vehicles

become effective until after the war. The proposed measures in some directions involve merging State or party insurance schemes with the business of the companies, and have not unnaturally evoked protests, which have been met by assurances from responsible State officials that there is no

intention of nationalising private insurance. It may thus be inferred that the familiar Nazi technique of using soft words to prospective victims still has its uses in the domestic field, even though it may be approaching the end of its tether in the realm of international relations.

Finance and Banking

End-Month Stringency

The discount market was again hard put to it in the first part of this week to find the accommodation requisite for its day-to-day needs. There were three factors at work in making for this stringency of credit. The aftermath of the last minute rush for National War Bonds was still evident in a considerable running down of bank cash and in a corresponding accumulation and sterilisation of funds in Government accounts at the Bank of England. It will not be possible until next week's monthly debt return to gauge the immediate impact of these subscriptions to War Bonds on the credit position, for only with the help of this return will it be possible to see how far the substantial applications to War Bonds were in fact financed by the recall of Treasury deposits. In so far as this has occurred—whether in respect of the banks' own subscriptions or of those for clients—the net effect on the credit position must have been nil. The second factor making for tighter credit conditions was the monthly making up in which most banks have been engaged this week. This has made them even more diffident buyers of bills than they otherwise would have been. To cap it all, the market found itself rewarded with the embarrassingly generous allotment of 57 per cent of its quota application at last week's Treasury bill tender. The greater part of these bills were admittedly taken up in the latter part of the week, by which time credit conditions had become more normal, but none the less the market would for once have wished to have encountered somewhat greater competition at the tender. In the first part of the week, conditions in the money market became decidedly difficult. Help was given to the market by a little special buying on Tuesday. In addition, one or other of the clearing banks always seemed to be ready to help with loans when the position got really difficult, and it was suggested in the market that such help was made possible by official purchases of short bills from these banks, thus indicating a return to the technique of open market help applied in the first half of 1940.

Return to Normal

At no time does the total of available credit appear to have fallen short of the aggregate requirements of the market. Where the shoe may have pinched rather more painfully was in what is becoming known as the "black market" for bills, that is, among houses on the fringe of the market and not members of the syndicate, which apply for considerable amounts of Treasury bills on the confident expectation of being able to sell them after the minimum interval. These institutions may have been seriously inconvenienced by the generous allotment they obtained on Friday of last week and, it should be noted, they have not the same facilities for obtaining official assistance, and even clearing bank assistance, as the recognised members of the market. By Thursday the position had virtually returned to normal. The banks' making up was by then almost complete, and these institutions had returned to the market as ready buyers of bills. Their resources had moreover been replenished by the sudden deceleration of subscriptions to Government issues, by larger Government disbursements and by the fact that during the past week they were not called upon to make Treasury deposit payments. These various influences had already been at work by Wednesday, as may be seen from the latest Bank return. This shows a rise of £23,056,000 in bankers' deposits and an accompanying fall of £20,754,000 in public deposits. The former have now recovered to the more normal level of £125,666,000. The money position is also being eased by a gradual reflow of currency from circulation, the latest return showing a return of £672,000 for the week. Although the tenders for £1,000,000 Northern Ireland three months' bills took place on Tuesday when the stringency

of credit was at its height, the rate at which they were allotted was the very fine one of £1 os. 4.67d. per cent.

Iranian Exchange

The Anglo-Russian entry into Iran is not being accompanied by the customary financial trappings of belligerency. Iran is not to share the fate of enemy and enemy-occupied territories, or even of Japan, in having its sterling assets frozen. Iranian nationals are to have complete freedom—within the framework of sterling exchange control, of course—to operate their sterling accounts and deal with their sterling securities. The developments of the past few days have caused a suspension of normal communications between Iran and this country, and all financial transactions between them are in temporary abeyance. It should be added that the practical effect of such suspension on foreign exchange operations between the two countries has been very slight, because no appreciable market in rials—the Iranian monetary unit—has existed in London since the outbreak of war. The rial was, until March 1932, a gold standard currency with a gold content of .07322 grammes of fine gold. In that month, the obligation to pay out gold was suspended, and the quotation of the currency tended to follow that of sterling. In March, 1936, a definite link with sterling was forged, establishing a middle rate of 80.24 rials to the pound. After the outbreak of the war and the depreciation of sterling, that link was severed, and in December, 1939, the rial was tied to the American dollar at the rate of 17.11 to the dollar. There is exchange control in Iran, and only authorised banks are allowed to sell foreign exchange. The official market in which sterling is now quoted at around 68.50 rials to the £, is extremely nominal, and operations are restricted to the comparatively few import and export transactions invoiced in local currency. There is a much more active unofficial "bazaar" market in which the rate of exchange has recently been quoted at around 300 rials to the £.

Remittances from Australia

Certain restrictions have recently come into force on the use of Post Office money orders for effecting remittances from Australia to this country. The purposes for which such method of remitting funds may be used have been more rigidly defined and exclude a number of operations, among them being the payment of premiums on insurance policies issued by British companies. The announcement has led to some difficulty, since a fair number of such money orders were in transit to this country when the new regulations were announced and have not been honoured on this side. It should not be assumed, however, that these regulations imply that the Australian authorities have been compelled, by a deterioration in the sterling reserve position, to exercise greater severity in allowing remittances from Australia to London. It is true that the London funds of Australian banks have been falling somewhat recently, but this is a seasonal movement which will be corrected with the inception of the next wool season. It must be realised that a form of exchange control has been in operation in Australia quite independently of the general scheme of sterling control affecting the whole of the sterling area. Under this control, certain types of personal remittances to the United Kingdom have been barred. The object of the new restrictions placed on money order remittances has been to bring these payments into line with other forms of payments. The Post Office organisation is in most countries the least "exchange conscious" of any branches of the financial machine. In this country, it will be recalled, the Post Office organisation, in 1919, innocently continued to sell dollar remittances to the United States at the pegged rate of 4.76 for some time after the open market rate had been allowed to break away

from the peg and was quoted down to \$4 to the £—thus giving opportunities for extremely profitable arbitrage on the part of some wideawake operators. At a much later date, the Australian Post Office took an astonishingly long time to learn of the break in the exchange rates which suddenly carried the Australian pound to a discount of some 20 per cent on sterling and for some days went on remitting at around par, within the limits allowed to them. The latest restrictions on money order remittances from Australia merely indicate that the same "slowness off the mark" has again been at work.

Anglo-Soviet Clearing

Although full details of the financial agreement with the USSR have not yet been published, the general outlines of the scheme are becoming known. The clearing will be operated in sterling through a centralised account, which the Bank of England has opened in the name of the Gosbank. As a number of the commodities which the Empire will be delivering to the USSR would, but for these shipments, have been sent to the United States and thus swollen Britain's dollar resources (tin and rubber are cases in point), it is reasonable to assume that some provision should have been made in the agreement for partial payment for deliveries to the USSR either in dollars or in gold. There should be no difficulty for Russia in complying with this, as it holds fairly substantial dollar resources and has an annual gold production of between 5,000,000 and 6,000,000 ounces. As the new sterling clearing account will centralise the whole of the payments between the two countries,

other than those for which stipulation of dollar or gold payments may have been made, it is also reasonable to assume that it will handle the maturity of the Soviet 5½ per cent five year notes under the £10,000,000 five-year credit granted in 1936. Such notes will soon begin to mature, and it is probable that the funds required for their repayment will be made available through the general Anglo-Soviet clearing and will thus rank in common with the rest of such payments for the new £10,000,000 credit.

Standard Bank of South Africa

The accounts of the Standard Bank for the year to March 31st last show the effect of war economy in the Union. Deposits are up by £17 millions to £87,897,000, owing, as the chairman, Lord Selborne, said in his address to the shareholders, to the volume of money put into circulation by the Government's war expenditure. This increase in deposits has not been reflected in advances, which, with bills discounted, are down by £3 millions, and has been allowed to build up the bank's cash holdings by £13 millions while £7 millions went into the purchase of investments. The same banking trends are therefore apparent as in other parts of the British Empire; the lack of demand for accommodation, owing to the incursions of the Union Government into industry, is intensified by the crop purchases undertaken by the British Government. The bank has therefore done well to show only a small decline in profits, from £563,860 to £561,837. The dividend for the year is maintained at 12 per cent and the bonus at 2 per cent.

Investment

Stagnation Once More

After a month of steadily rising prices, equities suffered a reverse during the past week. The movement is associated with the renewed progress of Germany in Russia, but this, in fact, produced no selling; only the habitual drying up of demand. In consequence, quotations, as measured by the index of *The Financial News*, have lost the ground they gained in the preceding eight days. The tone is, however, definitely firm and a slight revival in business has been encouraged by the entry into Iran, and by the Prime Minister's Sunday broadcast. The former affected principally oil shares of the Anglo-Iranian-Shell-Burmah group, which have shown a marked rally. The latter was responsible for a sustained improvement in Japanese bonds, which seems to argue a belief that the Eastern partner of the axis will listen to American arguments, at least so long as there is no decisive action on the Russian front. Throughout the week, there has been little or no change in gilt-edged stocks, beyond a very minor reaction at the opening, but there is little sign that the closing of the tap for National War Bonds has, as yet, had any effect on the demand for issues available through the market. Equities have recently touched their best since pre-war days, and the reaction from this new peak has been slight. It is difficult to speak of the future of the general level of these securities, except that, in so far as fixed interest securities rise, they should drag the whole body of ordinary shares after them. A moderately good case can, however, be made for the continued appreciation of a number of the lesser-known equities. The slowness of these to catch up on the rise of the leaders is explained by the fact that few people are prepared to risk having to wait for some time to avoid a sale on an unreceptive market. This is an argument against putting all, or even most, of one's exiguous supply of eggs into this particular basket. It is not an adequate reason for not taking a reasonable mixture of such shares, and brokers are still making recommendations along these lines. The supply is not as large as it was, and it will not be surprising if, apart from more speculative ventures, these continue to be the firmest section of the market. That the more risky type of venture still has attractions, is shown by a sudden rally in home railway ordinary stocks on unsubstantiated rumours of an impending statement about the new agreement. The future of this particular type of investment is so closely associated with political issues, and, leaving this on one side, the intentions of the authorities as to the reorganisation of transport in general are still so fluid, that any venture into the field can only be described as a speculation.

Building Society Policy

Two recent articles on building society policy in wartime (which appeared in *The Economist* of May 31st and June 7th) did not spare criticism, but it is encouraging that they have been received with ready understanding by certain leaders of the movement. A correspondent has recalled an address which he gave before a building society audience nearly three years ago, after the Munich crisis. Even that brief experience of crisis exposed weaknesses in the structure of the movement, which had sprung from typical peacetime malpractices. These are familiar enough—unqualified promises to repay shares on demand; trading on bank overdraft (frequently covered up in the annual report); and the competitive scramble of certain societies after "bad" money. The decade before the war was a golden period for societies whose principles of financial construction were "façade first; foundations last," and loose financial practice has, in all too many instances, met its nemesis in chronic inability to meet commitments. In the process, it has frequently been the small genuine building society investor who has suffered when weak societies became frozen; the large "bad money" share investor has usually managed to flee with his funds well in advance of any overt signs of financial stringency. Most of these points are sadly acknowledged in building society circles to-day, but it needed some courage to say them three years ago. The question remains, how can their consequences be mitigated now and avoided after the war? The current problem of the movement is to build up and preserve its liquidity. In terms of the individual society, the impact of that problem is governed almost entirely by its pre-war financial policy. The balance sheet of one leading society, which has been kindly furnished for our inspection, shows liquid assets amounting to 14 per cent of total assets; of these liquid assets, cash and Post Office Savings Bank deposits account for about two-fifths of the total and investments for the remainder. The detailed portfolio of investments shows that they consist of loans to local authorities (frequently terminable at six months' notice) or of fairly short-dated gilt-edged and municipal stocks. It is no accident that this society has not been compelled to introduce a rota rule for withdrawals, and that withdrawals in prospect for the ensuing six months (of which notice had been given on June 30th under the society's rules) were covered well over twenty times by available liquid assets, and could have been largely paid off from the surplus of new investments and mortgage repayments over the corresponding outgoings during the month of June. Such a financial position is a legacy of good man-

agement in peacetime, and it may be wondered how many societies could show a comparable record. The answer is not known, but it can be suggested that the Building Societies' Association might consider whether they could present the information which reaches them from the member societies in a composite form for the assistance of building society investors. It is understood that a monthly return is made by societies to the Association, showing their liquid position, receipts and payments on investment and mortgage account, withdrawals of which notice has been given covering six months ahead, and the withdrawal policy in force. The financial part of this information might surely be presented in aggregate form each month. At present, facts about the movement as a whole can only be obtained from the Registrar's annual returns, which appear many months after the year has closed. There seems little reason why the Association of Building Societies (now fully representative of the movement) should be any less willing than, say, the clearing banks to issue monthly statements. The regular issue of such statistics would provide facts by which building society policy could be appraised and adjusted. If they had been available in the past, some of the peacetime excesses of competition might have been curbed more promptly. If they are made available in future, they will assist the direction of building society policy towards the fullest contribution to post-war reconstruction.

Inter-Exchange Communications

In *The Economist* of February 22nd, attention was drawn to a demand which had been made by the Post Office for the surrender by London brokers of all, or nearly all, the private lines and teleprinters used to maintain rapid communication with the principal provincial exchanges. Although action was considered imminent at that time, the matter has been allowed to stand over for six months and is only now raised as one of urgency. As was argued in February, the criterion which must be applied in deciding what lines are to be retained is that of the national interest in maintaining an efficient, nationwide market, at least in Government securities. In the none too active days immediately prior to the war, the number of channels of communication was just short of one hundred, of which several served four or five provincial centres. The fall in turnover and voluntary restriction of operations by certain firms have caused almost half of these to be abandoned, while a few have gone out of use because Post Office engineers had more pressing work than the maintenance of brokers' circuits. According to the London brokers principally concerned, virtually no further reduction is possible without seriously impairing the facilities offered for dealing in gilt-edged securities, business in which accounts, in their view, for more than half the value of the total inter-exchange transactions. Some allowance must be made for the fact that they have to defend their position as well as they can, but a study of such details as are available suggests that the margin is not large. The matter is one which concerns the Treasury and the investor, who deals through the leading provincial markets, at least as much as the couple of dozen London brokers and the similar number of their confrères throughout the country, who enjoy these facilities. But it is the London broker who is being called upon to put up the defence. Very properly, the London committee has decided to invite representatives from the Associated exchanges directly affected to meet a sub-committee of their own members to prepare a joint statement. This is one of the fruits of the new co-operation of the whole profession of stockbroking, and if, as seems probable, they show themselves willing to subordinate personal to national interests, their views should carry weight. To deprive provincial markets of facilities would be a retrograde step only justified after every effort had been made to reduce the demands of the departments to the minimum consistent with efficiency and after due contribution had been levied on other users of these facilities in industry and finance, some of whom have not, so far, been approached.

Richard Thomas Future

The annual meeting of Richard Thomas showed that feelings still run high among shareholders. This is not unnatural, since they are debarred from all influence in the operation of the concern and any return on their money,

sunk in a venture which, at the time of its inception, was both bold and well conceived. It cannot be said, however, that either Sir William Firth, the former chairman and managing director, or Mr Barnabas Russell, who claims to represent 3,000 shareholders, was well advised in insisting that a dividend should have been paid on the ordinary capital. The latter talked of earnings of 18 per cent for the year just ended. But these are earnings before providing for depreciation of stocks, and the net figure is less than half that rate. Even so, a payment might have been possible had the outlook been good instead of extremely obscure. In normal times, half the production of tinplate, to the manufacture of which the company is very largely committed, goes overseas. At the moment, the prospect of any considerable volume of exports being permitted is slight, and the industry is faced with a drastic programme of concentration. Recommendations for effecting this are to be made by an independent committee, recently appointed. It may be that, in the national interest, the best method would be to concentrate a large part of the production of tinplate at Ebbw Vale, where a highly specialised plant has been constructed for that purpose, and to leave the older, and possibly more adaptable plants, to do less specialised work. But it is impossible, without detailed study, to say that this is the ideal solution, and equally uncertain that it will be the course recommended. Even if this course were adopted, it is by no means certain that it would greatly benefit the shareholder, for there would be the question of compensation to the less fortunate firms to be considered. The outlook is indeed the reverse of cheerful, and the dissident shareholders will have to find a stouter stick if their attempt to scourge the board is to succeed. Had Sir William so wished, it is possible he might have found this in the composition of the board, which, despite several changes, still seems to represent financial control and other elements in the heavy industries, rather than a team whose first object is the interest of the equity holders. But although this matter was mentioned, the only serious charge was that of dual allegiance, a practice which is far-reaching and deserves more ventilation than it has so far received, although there is some sign of a reduction in its prevalence in this industry.

Company Notes

Ford Motor Profits

The full accounts of Ford Motor Company for 1940 show a rise in gross profits, less directors' fees and a loss of £3,799 suffered by the Near East branch, from £2,744,417 to £2,776,594. The setback to net profits, which has turned earnings for ordinary shares of £605,787 into a deficit of £37,321, is due mainly to the jump in tax provision from £1,110,000 to £1,655,000. The company is also required to provide £102,500 against nil for war damage contribution. Total allocation for depreciation, at £851,559 against £845,222, includes provision for repairs which cannot be undertaken during the war. That the company is able to maintain the 6 per cent dividend and to allocate £100,000, against nil, to contingencies, without reducing the carry forward by more than £82,321 to £961,716 is due to the inclusion of a surplus of £325,000 on the company's guarantee in respect of indebtedness of

† A.R.P.: 1938, £2,241; 1939, £50,000; 1940, £15,000.
* Includes £20,000 reserve against Spanish company not now required in 1939 and £325,000 surplus on Guarantee premiums previously held in suspense in 1940.

The directors indicate that export trade was severely curtailed last year, but that the supply of tractors for the Ministry of Agriculture formed an important section of activity in the home market. The company's balance-sheet position remains strong, as the chairman, Lord Perry, points out in his statement, liquid assets, exceeding current liabilities by some £5,250,000, against some £4,585,000 in 1939. A decline in cash holdings from £2,935,774 to £2,416,222 helped to finance a rise in stocks from £1,899,176 to £3,008,090 and purchases of Government securities amounting to £103,547. The total of reserves and undistributed profit is up from £4,826,837 to £4,936,586 and that of trade creditors from £946,000 to £1,141,808. The company is fortunate in having been supplied with materials by Ford Motor Company, Dearborn, U.S.A., last year. In the absence of a further fortuitous credit, it seems that the directors will have to draw on reserves to maintain the 6 per cent dividend for the current year. The fact that at 20s. 9d. ex dividend the ordinary shares of £1 yield £5 15s. 8d. suggests some doubts as to future earnings.

Union Cold Storage

No strict comparison is possible between profits of Union Cold Storage at £975,970 for 1939, shown before tax on dividends, and profits for 1940 at £628,252 after all taxation. That the year's trading results were wholly satisfactory is indicated by the rise in the rate of equity earnings from 10.7 to 11.5 per cent after placing the usual £125,000 to depreciation and meeting preference service. The 10 per cent dividend, paid throughout the last decade, is maintained and the carry forward raised from £235,650 to £243,348. A footnote to the accounts states that net profits of subsidiaries were only transferred in part to the parent company, part being retained to reduce the cost of certain investments. In the absence of a consolidated profit and loss account and a consolidated balance sheet, and in view of the extreme reticence of the Union Cold Storage accounts, the stockholder must content himself with this somewhat cryptic statement. The need for fuller information is the more urgent since shareholdings in subsidiary companies now amount to £9,433,088, out of a balance-sheet total of £18,308,856. The depreciation reserve, increased by the annual provision from profits and by a surplus on insurance claims of £300,550, is lowered by the transfer of £332,488 in reduction of assets. The total of the fund, in consequence, amounts to £1,705,128 against £1,612,066. The group pursues a trade which is vital to the country's war effort, and there is reason to believe that capacity was stretched to the limit last year. Both creditors and debtors are substantially higher and stocks are up from £293,000 to £453,000. Cash holdings are some £25,000 lower at

£350,896. The decline in the value of ships, at cost less depreciation, from £2,696,000 to £1,317,000 provides an indication that enemy action took a serious toll of the company's resources last year. The ordinary stock is privately held. The £1 10 per cent cumulative preference stock, at 25s., yields £8 per cent.

Two Brewery Results

Brewery shareholders are suffering a very varied experience with regard to the results of 1940-41, in so far as dividends are concerned, but, in most cases, published profits are lower, even after credit has been taken for the higher rate of income tax. The full accounts of *Barclay Perkins* show a fall in trading profits of some £30,000 to £321,592, while other revenue is little changed. As the tax provision is more than doubled at £67,500, and other costs show a modest fall, the net figure is £165,444, the lowest for a very long time, and comparing with £225,908 for 1939-40. After covering the preference dividend, the earnings for ordinary are reduced from 10.8 to 6.4 per cent. As in the case of *Wainey Combe*, the interim was cut, but the final is maintained, making a total distribution of 3½ per cent and carry forward is £25,548 against £76,405 a year ago. It appears from the chairman's speech that one of the main causes of lower earnings before tax was interruption of output by enemy action. Certain damage has been sustained, but this is only reflected in the balance sheet in a footnote to that effect. A more encouraging result is that of *Arthur Guinness and Son*, who, after maintaining their interim, repeat the final and increase the cash bonus from 3 to 4 per cent, making a total distribution of 26 against 25 per cent. The preliminary figure, after tax and slightly increased depreciation, of £1,281,348 appears to compare with £1,485,243. So far as can be judged at this stage, this means that earnings for ordinary were little changed at rather over 30 per cent. The increase in distribution is at the expense of a reduction in the transfer to contingencies from £275,000 to £200,000 and a draft on the carry forward—virtually unchanged a year ago—of £20,000. The ordinary shares of *Barclay Perkins*, at 15s. 6d. ex dividend, yield £4 10s. 4d. per cent, and the units of *Guinness*, at 83s., some £6 7s. 6d. per cent.

Richard Thomas Addendum

In view of the strong interest aroused by the non-payment of a dividend on Richard Thomas ordinary capital, the reason for which is explained above, it is perhaps desirable to make even more explicit the details of the table contained in *The Economist* of August 16th. Advantage is taken of this opportunity to adjust the rates of ordinary earnings then given.

	Years to End March		
	1939	1940	1941
Surplus.....	271,781	566,871	861,809
Special charges.....	(a) 537,212	(b) 177,500	(c) 573,677
Paid on Pref.....	Nil	Nil	101,411
Available.....	Dr. 265,431	389,371	186,721
Preference earned %.....	Nil	10.0	10.0
Ordinary earned %.....	Nil	7.6	5.5

(a) Costs of running-in Ebbw Vale £337,212, proportion of debenture interest attributable to reconstruction £200,000.

(b) Commutation of agreements.

(c) War Damage contribution £200,000, written off stocks £363,677, agreements and compensation £10,000.

The surplus is in each year the amount available, after normal charges, for the share capital of Richard Thomas, consisting of some £3,120,000 6½ per cent non-cumulative preference, with rights to participate up to a total of 10 figures represent the gross amount available before providing for special charges arising out of the war situation. For the most part, these are not the less obligatory for being exceptional. In fact, the only one which can reasonably be questioned is that for writing down the value of stocks at March 29th last. There will be those who hold that, although these stocks are at present unsaleable, their cash value when sold is likely to be above current valuation rather than below it. But this is a risk which a prudent board ought not to take and, consequently, it has been assumed that this is also a necessary charge against profits before determining the amount available for the ordinary shareholder. If this were excluded, the yield would rise to 20.5 per cent.

August 30, 1941

London

Note: all dealings are for cash

NEWS of continued German pressure in Russia, together with some profit-taking, led to a general decline in prices in all sections of the market before the week-end, but the undertone remained firm. Although sentiment was improved by news of the Allied entry into Iran, most sections, apart from a revival of interest in leading oil issues, remained quiet. Renewed rumours, now denied, of impending agreement gave rise to fresh buying of home rail issues. Elsewhere, the volume of business remained small, and among industrial issues price movements were slight and irregular.

In the gilt-edged market before the week-end, undated issues suffered some losses, 2½ per cent Consols declining ½, while 3½ per cent Conversion and War Loan, Victory Bonds and Local Loans were all down ½. The market opened quietly steady on Monday, and in the early part of the week, apart from a gain of ½ in Local Loans and losses of the same amount in 3½ per cent Conversion and 2½ per cent N.D. Bonds on Tuesday, prices were mainly unchanged. No improvement took place in midweek apart from a gain of ½ for Old 2½ per cent National War Bonds. After closing quietly before the week-end, the chief feature of the foreign bond market was the strong recovery of Japanese issues in the early part of the current week. Brazilian bonds and the San Paulo Coffee Loan were also supported. In other directions, Mexican issues returned to favour and there was moderate buying of Greek and Egyptian bonds.

In the home rail market, profit-taking before the week-end led to a general decline in prices, but, on Tuesday, rumours of an impending Government statement led to a jump in the prices of junior stocks. GWR ordinary rose 2 points, while LMS ordinary gained ½ and Southern deferred ½ point. Among senior issues, "Berwick" 4 per cent 1st and 2nd preference issues improved 1½ and 1½ points respectively. Prices reacted in midweek, Great Western and LMS ordinary both losing ½ point. The foreign rail market was dull, the chief feature being the weakness of Argentine issues on the Government's claim for wage arrears.

Profit-taking and lack of buyers in the industrial market before the week-end gave rise to a general decline in prices in all sections. Among brewery issues, losses of 1s. were common, but Distillers improved against the trend. The motors and aircraft group moved irregularly. Heavy industrials were weak, BSA, John Brown and Richard Thomas preference, among others, suffering moderate losses. Electrical equipment shares lacked support, while both shipping and textile issues, after general declines at the close of the week, continued to lose ground this week. Apart from Imps, tobacco shares failed to recover losses of ½ incurred before the week-end, while elsewhere Cable and Wireless preference and ordinary fell back on balance.

Before the week-end general uncertainty overshadowed the mining and rubber markets, and losses of ½ were general among kaffirs. On Monday, the news from Iran provided the impetus for

THE ECONOMIST

THE STOCK EXCHANGES

a general advance, during which Blyvoors gained 2s., Western Reefs 1s. 3d. and Venterspost 1s., among many other small gains. Later, however, Sub Nigel fell back. The oil market was depressed before the week-end, but on Monday developments in the Middle East stimulated buying. Led by a rise of ½ in Anglo-Iranian ordinary, Shell Transport and Burmah rose ½ and ½ respectively, and on the following day the upward movement spread throughout the market. Both before and after the week-end business was at a low level in the rubber market, and there were few price changes.

New York

APART from some slight selling, business on Wall Street before the week-end was at a low ebb, and prices generally remained unchanged. The news from Iran was well received but caution continued to be the dominant market sentiment at the opening of the current week, and conditions remained dull, with the majority of issues unchanged. A short revival on Tuesday resulted in gains up to a point in steel, motor and rail issues. In midweek, the modest revival continued and markets closed firm.

The Iron Age estimates steel mill capacity at 97 per cent of capacity, the same as the revised percentage for the previous week.

Industry and Trade

The Miners' Attendance Bonus

There has been considerable friction in the coal-mining industry over the administration of the attendance bonus of 1s. per shift. The provisional agreement of May 22nd between the Mining Association and the Mineworkers' Federation, providing for this wage increase in addition to that automatically secured under the cost-of-living sliding scale, came into operation at the beginning of June, simultaneously with the guaranteed week under the Essential Work Order; while the immediate occasion for it was the miners' application for a national minimum wage of £4 a week, it was negotiated by the Joint Standing Consultative Committee on the understanding, stressed by the President of the Board of Trade in the House of Commons on May 28th, that "it was of vital importance that any increase which was given should operate to increase and stimulate production." The expedient suggested by the owners to achieve this purpose, and provisionally accepted by the miners' representatives on the committee, was to make the weekly payment of the bonus conditional on regular attendance. The only exception originally admitted was disablement by accident at the mine, and it was provided that in such a case the miners would be paid the bonus in respect of the shifts they had actually worked. From the very outset, however, the Executive Council of the Mineworkers' Federation resented these stringent conditions. The owners have made many concessions in their desire to meet the objections of the miners' leaders. On June 6th they agreed that absence due to sickness, treatment during working hours in a hospital or clinic from the after-effects of an accident, trade union business, attendance at meetings of public authorities, Civil Defence services, and cases of hardship affecting the aged and infirm, should not involve disqualification. When these failed to satisfy the Executive Council, further exemptions and assurances of the sympathetic administration of the scheme by colliery managements were given at a meeting of the Joint Consultative Committee on July 3rd, when Mr Ebby Edwards, the general secretary of the Council, described the decisions as representing "the greatest victory for common sense displayed by both sides that I have ever known," while Mr Lawther, its president, added that "practically every aspect of non-attendance due to legitimate reasons has been accepted by the owners."

Despite the concessions made by the owners and their approval by leading officials of the Mineworkers' Federation, the Executive Council remained unappeased, and on August 5th it deprived its representatives on the Joint Committee of any power of further negotiation on points of detail by demanding the abolition of all conditions, and suggesting instead the setting up of local machinery "to deal with any person who may impede production by his conduct"—a step that was approved by the annual conference of the Federation held at Ayr during the month. At the meetings of the Joint Consultative Committee on August 7th and 21st, the owners' representatives informed the miners' leaders that they were not necessarily wedded to the method of dealing with voluntary absenteeism laid down in the bonus scheme, and that they would be willing to abandon it in favour of any alternative method suggested by the workmen which would be equally effective as an incentive to regularity of attendance. Apparently, no acceptable alternative has been forthcoming. The procedure for dealing with absenteeism under the Essential Work Order is considered too cumbersome and inconclusive, and civil action too unsuitable, for the special problem which the bonus system was intended to solve, and further consideration of the dispute has been deferred till September 4th. Hopes are strong that in the meantime a basis of agree-

ment will be found. There are indications that the irritation of the miners and their leaders is subsiding. In districts where the local Pit Joint Production Committees are functioning most efficiently, little or no difficulty is experienced in the removal of the grievances; and in some coalfields the rate of absenteeism has been reduced by nearly 50 per cent since the bonus scheme and the guaranteed week have been in operation. As the extra 1s. per shift has been financed on the authority of the Mines Department by a 10d. per ton increase in the price of coal, the Government is also likely to bring pressure to bear in favour of a prompt settlement.

The Shopping Problem

The increasing importance which attaches to the question of woman power is raising the problem of shopping difficulties from an inconvenience to a serious clog on production. The difficulty of obtaining supplies to feed their families is not only an important cause of absenteeism and bad time-keeping among women war workers, it is actually in many cases a discouragement to volunteering. Replies to a questionnaire circulated among the employees of a Middlesex firm showed that 92 per cent of the women questioned spent a considerable time in queues, and 96 per cent found the stores sold out of the things they wanted. More might be done to improve this by the placing of orders in advance, to be collected after they have been made up. Unfortunately, owing to shortage of staff, such orders are often not ready when called for, and this discredits the system, as does also the conviction not altogether unfounded, that the only way to secure a share of unrationed goods is to be present in person as soon as possible after their arrival in the shop. The crux of the matter is that the shops, which exist to serve the public, can now only do so by altering fundamentally their established customs. In view of the severe difficulties under which they labour, they cannot be expected to do this without Government guidance. Substantial changes in their hours of opening will be necessary in some districts, but hard thinking will be needed to solve the staffing problems arising therefrom. One excellent suggestion is that in districts where the shopping problem is rendered acute by the presence of large war factories, these might co-operate with the shops by supplying clerical and even sales help. As the sale of unrationed goods on works premises offers one of the best contributions to a solution of the problem, and at the same time one most likely to be opposed by the trade, mutual concessions along these lines might be very fruitful. Here, too, the Government should give a lead. One compulsory step which only the Government can take is that of limiting the number of shops with which a family can register. At present the greedy can spread their registration very widely in order to secure more than their share of unrationed goods. In doing so they waste a great deal of other people's time, and add considerably to the congestion in those shops upon which they inflict their custom. The objection to compelling individuals to register at or shop for all groceries is becoming less as the variety of unrationed goods diminishes, and could be largely removed by a revised wholesale distribution of these commodities. Compulsory registration for fruit and vegetables would prevent a great deal of unfairness, and reduce queues, but an attempt to prohibit queues without removing their cause seems futile.

Mutual Assistance

Some of the Regional Boards of the Production Executive are beginning to take a more enlightened view of the

COMPANY MEETINGS

STANDARD BANK OF SOUTH AFRICA, LIMITED

SATISFACTORY RESULTS IN DIFFICULT CONDITIONS

THE EARL OF SELBORNE'S ADDRESS

BROADENING OF SOUTH AFRICAN TRADE

The one hundred and twenty-eighth ordinary meeting of the Standard Bank of South Africa, Limited, was held, on 27th instant, in London, the Rt. Hon. the Earl of Selborne, K.G. (the chairman), presiding.

The following is the address by the chairman, circulated with the report and accounts:—

Turning to the balance sheet as at March 31st last, which shows the record total of nearly £107,000,000, I will refer briefly to the principal features in comparison with the accounts for the previous year.

On the liabilities side notes in circulation have fallen by £354,000. This decrease is due to the fact that the notes of the Southern Rhodesia Currency Board, for which we act as agents in London, were put into circulation as from March 1, 1940. From that date the right to issue notes in Southern Rhodesia was vested in the currency board alone, although notes issued by the commercial banks remain legal tender for two years thereafter.

It may be mentioned that during the period under review Nyasaland joined the Southern Rhodesia Currency Board.

Deposit, current and other accounts show a further large rise of £17,000,000, principally in the funds held on current account. The major portion of the increase is due to the volume of money put into circulation by the Union Government on account of expenditure for war purposes.

On the assets side, cash in hand and at call and short notice shows an increase of £13,000,000, and investments are higher by £7,000,000. Bills discounted and advances to customers show a decline of £3,000,000, which may be attributed mainly to the abundance of funds in South Africa consequent on the disbursement of large sums by the Union Government for supplies required for their war effort and by the British Government in the purchase of the South African 1940-41 wool clip.

RESULT OF YEAR'S OPERATIONS

The balance of profit for the year, after making a suitable appropriation to contingencies account, was £561,837, which, with the amount of £157,932 brought forward, left for disposal the sum of £719,769. The interim dividend paid in January absorbed £125,000, and after appropriating £75,000 to writing down bank premises, there is available a balance of £519,769.

It is recommended that £150,000 be allocated to the officers' pension fund, that a final dividend of 7s. per share be paid, together with a bonus of 2s. per share, making a total of 14 per cent. for the year, and that £144,769 be carried forward.

Having regard to the extraordinary difficult conditions that prevailed during the year, I think the results shown will be regarded as satisfactory.

POSITION IN UNION OF SOUTH AFRICA

In the Union of South Africa commerce and industry adapted themselves smoothly to war conditions, and business on the whole remained remarkably steady. Important contributory factors were the success which attended the quest for new markets and the fairly steady arrival of material from overseas.

Fresh production records were established by the gold-mining industry, on which the basic financial stability of the Union mainly rests, and the amounts disbursed in wages and stores purchased, as well as in taxation and dividends, reached new high levels; in addition, the technical skill and resources of the industry have played a most important part in the enlargement of the Union's war effort.

The production of other minerals and metals also reflected an upward trend.

The flow of Government orders for wartime requirements gave full employment to a large number of factories and stimulated the development of new industries for the production of munitions and articles previously imported. Every effort has been made to encourage industrial activity and with this end in view steps have been taken by the Government to foster potential markets in other African territories.

Positive indications of the broadening of trade and industry are to be found in the figures of imports and exports for the year 1940. As compared with the figures for the previous year the value of imports rose by nearly £14,000,000 (15 per cent.), and the value of exports, excluding gold and wool, were higher by £7,000,000 (27 per cent.). While this increase was due to some extent to the advance in prices it is the fact that more was due to an advance in volume.

The healthy economic condition of the Union was exemplified in the figures given by the Minister of Finance when introducing the Budget for the current year. In place of the deficit of £6,500,000 anticipated by the budget for 1940-41 it was estimated that actual receipts and expenditure would result in a surplus.

The farming industry was faced with serious marketing difficulties during the year. By agreement with His Majesty's Government of the United Kingdom, however, provision was made for the clearance of the wool clip and of the exportable surplus of other important products. Seeing that the arrangement with the British Government regarding the wool clip is to remain in force for the duration of the war and for a season thereafter, and, as the clearance of the main portions of most other crops and products by export or in the local market should not be impossible, the immediate outlook cannot be regarded as unfavourable.

While it would be unwise to attempt to forecast the future, I may say that very careful attention is being directed towards the maintenance of the financial stability of the Union and the prospect of its ability to carry the burdens imposed by the continuation of the war may be viewed with steady confidence.

SOUTHERN RHODESIA

In Southern Rhodesia the year under review, which marked the Golden Jubilee of the Colony, witnessed an appreciable improvement in many important sections of business. The maintenance of economic activity is still founded upon the gold mining industry, but the base metals and tobacco industries have increased in importance owing to wartime demands. The establishment of the Empire Air Training Schools in the Colony has helped to develop trading activity, and further expansion is foreshadowed as the result of the agreement with the Government of Australia, which provides for the entry of tobacco, chrome ore, and asbestos, into Australia in return for favoured treatment for the import into Southern Rhodesia of wheat, butter, agricultural machinery, clothing, and other manufactured goods.

In Northern Rhodesia the production of copper, which continues to be the most important factor, has expanded considerably since the outbreak of the war. It may be assumed that further progress will be made in the current year.

In Nyasaland general business conditions improved as the result of the satisfactory clearance of the tobacco and tea crops. As the outlook for these two products is not unfavourable there should be no diminution in general trading activity.

SOUTH-WEST AFRICA

In South West Africa business conditions on the whole were fairly favourable, but there may be some recession owing to the restriction of mining activity and to the adverse effect on the farming industry of a poor rainfall in a number of districts.

As regards the East African Territories Kenya Colony received a considerable stimulus from the presence of the army massed within its borders. In the other territories the benefit was less marked, although they were able in part to contribute their quota to supplying the needs of the temporarily augmented population. Notwithstanding shipping difficulties exports were well maintained. The ability of the various countries of the Empire to supply East Africa with goods previously purchased in markets now closed has been most marked.

RICHARD THOMAS AND COMPANY, LIMITED

CONSERVATIVE DIVIDEND POLICY

The ordinary general meeting of Richard Thomas and Company, Limited, was held, on the 22nd instant, in London.

Mr E. H. Lever (the chairman), in the course of his speech, said: You will notice in the profit and loss account of the company a special provision of £236,081 for writing down book values of stocks at March 29, 1941. A new agreement has been reached between the Iron and Steel Federation and the Revenue authorities as to the basis of valuation of stocks for tax purposes, and the items referred to are the adjustments necessary to bring our valuation into line with the new basis. The provision of these amounts has involved little material strain on this year's net profits, inasmuch as they are for the most part compensated by a corresponding adjustment of the amount of tax payable. By the nature of the case the items are non-recurring.

UNISSUED BALANCE OF DEBENTURE STOCK

A further amount of £237,833 of the 4½ per cent. prior lien debenture stock has been redeemed. Of this stock there still remains £1,052,590 unissued; not all of this unissued balance is available to the company; the amount at our disposal is £864,803. It not being clear to what extent and when it would be necessary to issue further debenture stock, negotiations were commenced about a year ago with the bankers concerned with a view to defining the position. The outcome of the negotiations has been that the company retains the right to call up to this total of £864,803 at any time and from time to time, until August 1, 1942, on the understanding that any stock not issued by that date will be cancelled.

Your directors take the view that the need for conserving our financial resources is just as acute to-day as formerly, particularly as the immediate outlook on the tinplate side of our business is very obscure, and it is our bounden duty to do all in our power to ensure that the company will be able to ride out any storms which it may encounter. After giving full weight to these considerations, your directors felt justified in declaring a full year's dividend of 6½ per cent. on the preference shares.

With regard to the ordinary capital, the position is somewhat different, and, after taking into consideration all the arguments on both sides, we decided that we could not yet recommend the resumption of dividends on this class of share capital. In any case, any immediate hardship caused by the non-receipt of a dividend is compensated by the enhanced value of the equity.

It is obviously difficult to make any reliable forecast, but there are factors operating in the tinplate and sheet industries, quite outside our control, which, unless events take a more favourable turn at an early date, will almost certainly result in a lower turnover and a lower rate of profit for the current year.

CONCENTRATION OF PRODUCTION

Until the committee of inquiry has finished its work and action has been taken as a result of its findings, it is clearly impossible to forecast the effect upon our own business, and this is an added reason for maintaining a prudent policy with regard to dividends.

Since the last annual meeting agreement has been reached with Sir William Firth as to the amount of compensation legally due to him for loss of office. This amount has now been paid and an appropriate discharge given in return. It was no part of this settlement—indeed, it could not be expected—that Sir William should modify his views concerning his personal position, nor is it to be implied that he, in any way, forgoes his right of criticism as a shareholder in the company; indeed, as the person mainly responsible for the creation of the plant at Ebbw Vale upon which the prosperity of the company must, to a large extent depend, it is only natural that he should watch its future development with a critical eye.

In a circular issued to shareholders in October last, I indicated in general terms the policy of your board concerning the development of the company's business. The keystone of this policy is to derive the utmost possible benefit from the modern plant at Ebbw Vale and to do this with as little capital expenditure and with as little dislocation in other directions as possible.

The report was adopted on a poll.

WIGGINS TEAPE AND CO. (1919), LIMITED

MR F. L. T. BARLOW'S SPEECH

The annual general meeting of Wiggins Teape and Co. (1919) Limited, was held, on the 22nd instant, in London. Mr F. L. T. Barlow presided, and, in the course of his speech said:

The year 1940, especially the latter half, has been most difficult for the paper industry. As you doubtless know, a high proportion of the raw material of the industry consisted of wood-pulp, imported largely from Scandinavia, and esparto grass, imported from the North Coast of Africa. The German invasion of Denmark and Norway sealed the Baltic, while the entry of Italy into the war and the defeat of France practically ended the importation of esparto. As for the alternative source of supply of wood-pulp from the North American continent, you can understand the effect that the battle of the Atlantic has had in reducing importation of such supplies as could be acquired.

The result of this drastic curtailment of raw material supplies necessitated the rationing of paper by the Ministry of Supply. Paper Control, with the inevitable result of a reduction in production. As a consequence, some of the machines in the mill owned by our group of companies have had to be shut.

As explained in the directors' report, the internal reserves have been substantially increased during the year in order to write down the valuations of our paper stocks and to strengthen our general reserves for bad debts. In addition to this, we have had to provide for War Damage Insurance. All these provisions your directors consider it prudent to make, but unfortunately they are no allowable deductions for taxation purposes. Such provisions have therefore, to be made out of taxed profits. This explains why with only a moderate expansion in the profits for the year 1940, the items of taxation bear so heavily compared with the year 1939.

Your directors recommend a reduction in the final dividend on the ordinary stock from 5 per cent. to 4 per cent., making the dividend for the year 1940 7 per cent., against 8 per cent. for the year 1939.

The report and accounts were unanimously adopted.

MORRIS MOTORS LIMITED

ANNUAL GENERAL MEETING

The fifteenth ordinary annual general meeting was held on the 22nd instant, at the Works Club House, Cowley, Oxford.

The Right Hon. Viscount Nuffield, G.B.E., F.R.S., M.A., D.C.L., LL.D., (chairman) presided, supported by the vice-chairman, Mr W. M. W. Thomas, and the managing directors, Mr H. A. Ryder, Mr H. Seaward and Mr J. Shaw.

The adoption of the report and accounts, and the payment of dividends were proposed, seconded, and carried unanimously.

The retiring directors, Mr A. E. Keen, Mr C. Kimber, Mr H. Landstad, Mr H. C. R. Mullens, Mr V. Riley, Mr E. C. Ruffle, Mr T. C. Skinner, Mr S. G. K. Smallbone and Mr B. G. Williams, were re-elected; and the auditors, Messrs Thornton & Thornton, were re-appointed.

The proceedings then terminated with a vote of thanks to the chairman.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brettenham House, Lancaster Place, W.C.2.

BEECHAMS PILLS, LIMITED

CONSIDERABLE EXPANSION

The annual general meeting of Beechams Pills, Limited, was held, on the 28th instant, in London.

Mr Philip E. Hill (the chairman) said: For the ninth successive year our trading profits show an increase. The profit for the year amounts to £1,085,893, which is comparable with £1,055,615 for the preceding year. This figure is arrived at after providing in the accounts of two of the subsidiary companies £97,758 for the redemption of redeemable preference shares (you will appreciate that this cost the company, including tax, some £195,000). In addition, we have increased our reserves and carry-forwards in the accounts of subsidiary companies. Moreover, we have not raised our selling prices since the outbreak of war, although our costs of production and overheads during the year under review have increased by nearly £350,000 as compared with 1939.

The company's normal trade, both at home and overseas, without accounting for Government contracts, shows considerable expansion.

(Continued from page 274)

tasks. For example, the exchange of information on a multitude of practical problems is being encouraged, while one of the Boards now publishes regular bulletins containing a wealth of interesting information which are sent to practically every firm in its area. Firms with machinery to spare, as well as those in need of tools, are listed in great detail in the bulletin, and this practice has already been of considerable assistance in reducing the volume of idle capacity. There are also many useful notes on technical and labour problems which should assist production. It is to be hoped that the publication of these bulletins by the other Boards will be encouraged and that the practice will shortly become general.

Reduction in Textile Sales

The month of June witnessed a sharp increase in sales of goods affected by the clothes rationing scheme which came into force on June 1st. Thus, the index of the value of wholesale trade in textiles, calculated by the Wholesale Textile Association in collaboration with the Bank of England, was 26 per cent higher last June than in the corresponding month last year. The retail returns for June, published in the *Board of Trade Journal*, show a similar tendency. The average daily value of sales of piece-goods was 88.3 per cent higher than a year earlier; the turnover in boots and shoes was up 14.9 per cent. There can be little doubt that the introduction of rationing has been responsible for the marked spurt in buying. It will be interesting to see whether the increase in sales was maintained in July. While the retail trade figures for that month are not yet available, the index of wholesale trade in textiles registered a fall of 38 per cent compared with June, and was actually 8 per cent below the level of the corresponding month last year.

Improvement in Coffee Position

Since the breakdown of the Brazilian coffee restriction scheme in 1928, the international coffee market has been suffering from a permanent malaise caused by excessive supplies. Never, however, did the future of the coffee trade look as black as twelve months ago, when, after the collapse of France, the Continental market, which absorbed about 11 million bags (of 60 kilos each) per season, equivalent

Our report and accounts indicate that our contribution to the national exchequer for the year is estimated to amount to over £1,000,000. Since we last met, Parliament has passed the Pharmacy and Medicines Act, 1941, one of the results of which will be the abolition of the Medicine Stamp Duty, as and from September 2nd next, which, as far as this company is concerned, amounted last year to £166,000. Generally, it is hoped that the new Act will improve the status of proprietary articles and patent medicines. The directors have decided that the full benefit of the savings effected as a result of the passing of this Act shall be given to the public.

It is no easier to forecast the future to-day than it was a year ago, but it is necessary to issue a word of warning and that is—if costs of production continue to increase, we shall ultimately be bound to raise selling prices. Whatever the future may have in store for us, we can be more than ever satisfied that our widespread developments have established our business on a sound basis.

The report was unanimously adopted.

to nearly 45 per cent of world deliveries, was closed. Last October the United States Government came to the assistance of the 14 Latin-American coffee-producing countries by concluding a scheme which provided for an annual import into the United States of 15,900,000 bags of coffee for a three-years' period beginning October 1, 1940. This quantity appreciably exceeded the imports of the United States in the three last pre-war seasons, when they averaged only 12,992,000 bags. But as the scheme contained a clause under which the import quota could be increased or decreased by 5 per cent, producers feared that they might not be allowed to make use of their full quota. This fear proved groundless, for last May the Pan-American Coffee Board raised the quota by the maximum of 5 per cent owing to the expansion in demand. This increase in the increased consumption and hoarding. This increase in the quota coincided with a very poor Latin-American crop. In Brazil, the latest estimate for the 1941-42 crop is as low as 12,700,000 bags, against 20,850,000 bags a year ago, which was also a bad crop year. In the smaller coffee-producing countries about 9,000,000 bags have been harvested, against 10,000,000 bags in the previous season. While the total quantity of coffee available in all Latin-American countries, at 21,700,000 bags, still exceeds the United States' import quota by a wide margin, the Governments of the producing countries, especially in Brazil, are making determined and not unsuccessful efforts to eliminate the surplus. In Brazil a scheme has been prepared by which 35 per cent of the total crop has to be delivered to the National Coffee Department before any coffee can be shipped abroad. Of the remainder, only 30 per cent can be shipped immediately, while a further 35 per cent is retained until a firm demand exists. Fine coffee is excluded from the scheme. It is likely that the 35 per cent "sacrifice quota," which is 10 per cent higher than last year, will reduce the country's supplies slightly below its American import quota, which is 9,300,000 bags and will probably again be raised by 5 per cent in the year beginning October 1st next. Moreover, it is reported that coffee will be amongst the products to be stored, with Allied and United States assistance, in order to supply the European market after the war. As Brazil's coffee surplus in the interior—there is but a small surplus in the other producing countries—does not cover much more than one year's requirements of the European Continent, the outlook of the coffee market appears not unfavourable, and it is not surprising that the New York price for Rio coffee type 7, which opened this year at 5½ cents per lb. has now risen to 9½ cents.

COMMODITY AND INDUSTRY NEWS

The tin market has been quiet. Standard cash was £256 5s.-£256 15s. a ton on Wednesday, compared with £256 15s.-£257 a week before. Three months tin was £259 15s.-£260 a ton compared with £259 18s.-£260.

Food News.—The Ministry of Food has issued a maximum price list for pickles and sauces. After September the manufacture of these products may only be carried out under licence. Maximum prices for honey have also been fixed, ranging from 1s. 9d. per lb. for imported honey to 4s. for home-produced heather

honey sold in ½-lb. containers. Wild blackberries are to be subject to a maximum price of 5½d. per lb.

Cotton Market Position.—There has been increased activity in piece goods as cloth merchants have now received their quotas for the rest of the year. Most of the buying has been for South America, especially the Argentine, for the United States, and for the Dominions, in particular Canada and South Africa. Government contracts have been placed in fine strong cloths and there has been buying of essential goods for the home services.

Spinners have for the most part been refusing to sell on any terms and are expected soon to apply to the Controller for an increase in margins. It is officially announced that after the end of this month previous preference direction certificates will not be valid and fresh application may be made for the use of yarn for all cloth contracts.

Purchase of Egyptian Cotton Crop.—The Egyptian Government has decided to raise the purchase price of the next crop by 2 per cantar. The entire inc-

GOVERNMENT RETURNS

For the week ended August 23, 1941, total ordinary revenue was £30,067,000, against ordinary expenditure of £74,804,000 and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,169,853,000 against £892,351,000 for the corresponding period a year ago.

(a) 1937, average January to August; figures for September-December not comparable owing to revised method of counting adopted in September, 1937. (b) From January, 1940, includes former Southern and South Eastern divisions. (c) Includes Southern division before January, 1940. (d) From September, 1939, Glimsby and Lincoln included in North Midlands instead of N.E. England. (e) Ordinary and Self-balancing revenue and expenditure. Annual figures are totals for financial year, beginning in year shown. Monthly figures are cumulative. (f) Average of weekly figures. (g) Annual figures for 1929 and 1932 do not include District Bank.

COMMODITY AND INDUSTRY NEWS—continued from page 277

crease is to be borne by Egypt. The British Government, which is purchasing half the crop, will pay the same price as before: \$14.25 per cantar for Ashmouni and \$15.25 for Giza No. 7. The Egyptian Government will finance its purchase by raising the supplementary National Defence Tax from 1 per cent of income tax to 10 per cent, and by a loan of £17,500,000. In the meantime Great Britain is to provide temporary credit.

A Rabbit Policy.—The Ministries of Agriculture and Food are anxious to encourage the breeding of rabbits on a commercial scale. To the announcement that members of rabbit clubs owning not more than four breeding does would be provided with bran, on condition that they disposed of some of the meat to the common pool, is now added a promise of rations for commercial growers. Rabbit keepers who breed rabbits for sale and keep eight or more breeding does will be allowed 28 lb. of bran per quarter for each four breeding does. These will only be provided where the owner has access to ample supplies of greenstuffs, including wild plants. If these measures prove adequate to encourage rabbit breeding they will not only help the food situation but will contribute to export trade, since there is an urgent demand for rabbit fur for export.

Clothing Concessions.—Several minor changes in the clothes rationing regulations have been announced. Employers of agricultural workers who customarily provide protective clothing for their workers may now do so without coupons and free of quota. Women without uniforms who are becoming students or joining the nursing or probationary staff of secondary training colleges, nursery schools and day or residential nurseries may purchase rationed goods free of coupon, on a certificate signed by an officer of the institution and countersigned by the Secretary of the National Council for Maternity and Child Welfare. The Directorate of Civilian Clothing is adding to the list of clothes which may be supplied to makers-up free of quota and temporarily free of coupons, a range of Scotch tweeds at about 7s. 9d. per yard. These must be made up into suits or overcoats within a prescribed price range. Provision is made for sale of damaged goods at half coupon rate or coupon free.

citizens of their right to "life, liberty and the pursuit of happiness," that violates the first of President Roosevelt's four fundamental freedoms—that of worship and of speech—is recognised to be abusing its authority. The Minorities Treaties of the last peace settlement recognised this. They went farther. They attempted to put the implementation of the rights of minorities under the control, not of the sovereign state, but of a supra-national organisation. They recognised, in a word, that law is indivisible and that the rights of man, as well as the rights of states, are the concern of the community of nations.

In this perspective, it can be maintained that the first Jew thrown into a concentration camp without trial was the Nazis' first act of aggression against Europe as a whole—against humanity and against the world. It would, therefore, have been fitting if the new Charter had gone farther than the Minorities Treaties. The world between the wars has seen that, not minorities only, but even majorities need safeguarding in their rights. A "majorities treaty" for Europe, or, to use the older phrase, a declaration that the rights of man are the concern of the international community, would state one of the necessary limitations upon the undefined "full sovereignty" that the Charter guarantees to each independent nation. Such a clause would at the same time place a salutary limit to the right of peoples to choose their own government. It should not be possible for a people to choose a Hitler any more than it is considered lawful for a man to commit suicide—or murder.

The limitation of sovereignty by law is equally important in the international relations of the state; and here, it must be confessed, the Atlantic Charter does not go very far. There is in Point 8 a reference to a "more permanent system of security." But no inkling is given of what that system is, except that it is apparently to be underpinned by the maintenance of unilateral disarmament. This will not do. Unilateral disarmament there must, and will, be. But if nothing more than a revised version of the balance of power is envisaged, this means, quite simply, that the combined efforts of constructive Anglo-American statesmanship in the last century are to be abandoned. It is true that the League experiment did not fulfil the warm hopes it roused, but that is no reason for swinging to the opposite extreme. The League failed because there was no will and no power behind its sanctions. Now there is to be power, and perhaps more will, but no League. One League experiment has failed, it is true; but history is strewn with the wrecks of power systems. There can be no lasting solution of Europe's anarchy on the basis of unilateral disarmament alone.

While it is true that the foundation of any interna-

tional security system must be Anglo-American power, that power must be put, not only behind the preservation of peace, but also behind the upholding of international law. For this, institutions such as the Hague Court must be preserved, and their scope extended; and, since the law is the common interest of the European community, the goal for a progressive settlement should be to associate all the nations with the work of its maintenance. There are thus three essential stages in the creation of an "International police force"—the unilateral armament of Britain, America and Russia at the armistice; the expansion within this nucleus of the rôle already played by the Allied armies—French, Poles Czechs; and, finally, the association with it of units from the former aggressor nations. The system will not work if this last step towards international co-operation is abandoned.

The failure of the Atlantic Charter to indicate any of the limitations imposed upon political sovereignty by the universal nature of law is the more conspicuous since the limitations imposed on it by practical considerations of economic and military necessity are fully recognised. If the state exists for the good of its people, its functions should not include those which, if exercised on a purely national basis, impede, the development of a national community. In the twentieth century, economics and defence have clearly entered a phase in which their national organisation is an obstacle to peace and progress. The money spent on national defence by such nations as Roumania, Hungary or Holland has proved to be sheer waste; their security demands a broader system. Similarly, autarky, even when practised by so large a unit as Germany, condemns people to falling standards of living.

The Atlantic Charter does look very explicitly for a co-operative economic system and—less explicitly—for a general system of defence. But, in the political sphere, on which ultimately all will depend, the question is left wide open. Possibly the tacit assumption is that Anglo-American leadership in itself will solve the problem. It is true that there will be no solution at all—political, economic or military—unless the basis is Anglo-American collaboration. It must be said, however, that such a hegemony would be quite intolerable if it were not immediately consecrated to the maintenance, through appropriate institutions of a system of international equity and law, and that so far at least there is no guarantee that the combined strength of Britain and the United States will in fact be mobilised for the creation of a genuinely new order. The lack of such a guarantee is an omission which the Atlantic Charter could not, of its nature, make good. But it is one that must be made good if the Charter is to have real significance.

Arms and the Men

THE urgent need, on both sides of the battle, is for trained manpower. In Germany, there are signs that, during the last few months, all the remaining classes liable to military service, that is all men in Germany (including annexations) between the ages of 18 and 45, have been called up. Very many have been called up for service in the labour corps, and in the Todt organisation, because the need for repairs and reconstruction is especially heavy on the eastern front. Regular sappers and railway regiments advance with the fighting troops to build and restore bridges and railways; the labour corps follows to carry out temporary repairs to roads; and the road builders of the Todt organisation come after with the most modern road building machinery. These corps must number more than a million men. There is a very large demand for supply columns, and for troops to occupy the conquered territories.

This heavy recruiting has made the shortage of labour for war work very pressing. As in the case of France in 1939-40, it is possible that Germany is, temporarily, over-mobilised—after months of intense output have

built up war stocks. At the beginning of this year, there was a drive to re-employ old age pensioners. In March, Hitler made a special appeal to women; and in April the labour exchanges began to interview the married women who were still unemployed. The use of foreign workers was increased. Newly created Croatia was persuaded to export 50,000 workers; and, a few weeks ago, Italy promised to increase the number of Italian workers sent to Germany by some 100,000. When the harvest began, civil servants were called upon to do harvest work at week-ends. The employment of domestic servants, who number perhaps a million and a quarter, now needs a special permit; and households must release all their servants except one if the labour exchange orders it. The number of girls on compulsory service is to be increased to 300,000, and the length of service is to be prolonged from six to twelve months.

In this country, too, the labour problem has reached something like a crisis. Last week, the Beveridge Committee endorsed the need of all three Services for more skilled men to maintain their machines and instruments. At the week-end, it was once more announced by the

Ministry of Labour that drastic measures were intended to induce women to enter the forces or war factories. There are signs that a progressive reduction in the ages of reservation is intended in coming months. The Trades Union Congress met in Edinburgh on Monday with the knowledge that their attitude must powerfully affect the course of the war effort.

It is a strange anomaly that the view persists widely here that the war can be won without fighting men. In 1939, the belief was that the French army and the British blockade would suffice; and, in 1941, the argument is that the Russian army, backed by British bombing, can win the war. The flow of American supplies, but not of American soldiers, is misinterpreted to mean that the war in the west can be decisively ended by *matériel* alone. Actually, the perspective was rightly drawn by Mr Churchill when he asked the Americans to "give us the tools," but then added "we will finish the job."

It is, of course, quite certain that any attempt to build up a British army comparable in numbers to the Germans must be disastrous, for the force would inevitably be vastly inferior in both size and equipment. The balance of population has been heavily in favour of Germany ever since the defection of France; and the forces and the war factories are competitors for manpower. But events in Norway, France, Greece and Crete have underlined the need for fighting men as well as for fighting equipment. The preventive action taken in Iraq, Syria and Iran and the defence of Egypt has shown the value of the British army. True, the resistance of Russia has brought an army of millions into the scales on the Allied side, furnished a footing against the enemy and bitten into his weight of numbers. But the Russian war has not made land action by Britain in Europe unnecessary; it has made it possible.

Wehrmacht and Manpower

Actually, it confuses the issue to speak of the army as a separate problem. In the British triangle of forces, the longest sides must be in the air and on the sea, where the ratio of *matériel* to men is greatest; but the land base is indispensable, for action all over the world battlefield, as well as for defence against invasion at home. It is a confusion, too, to speak of the choice between men to fight and men to make fighting equipment. On both sides of the front in Russia, it is the men who maintain machines and communications in action who have probably played the most crucial rôle; and it is with this extension of the industry into the ranks of the armed forces that the interim report of the Beveridge Committee is concerned.

There has never been the same dichotomy in Germany, a conscript country, between industry and the forces. The practice under conscription was always to recruit skilled labour to the more complicated branches, to the artillery or navy, and now to tanks and the air force; occupational skill was always used in the army where mechanical skill was needed for handling weapons or equipment. This has been carried a step further by the Nazis. The army itself includes vast mobile workshops (for the artillery, for tanks and for the air force) as sections of the fighting army, manned by skilled workers. The ordnance factories and the requisitioned factories for aeroplanes, tanks and other highly complicated equipment work in collaboration with the fighting forces. Submarine crews, whose craft are being repaired or overhauled, work side by side with civilian workers in the repair depot; and similar arrangements have been made in civilian aeroplane and tank repair shops.

The distribution of labour between industry and the forces in Germany has been flexible—which was easy while fighting was confined to very short periods. During the lulls in the winter of 1939-40 and the autumn and winter of 1940-41, large-scale leave was given to soldiers, who mostly went straight back to the factories where they had been working before being called up. This made possible the calling up of other classes, including skilled workers, for training. Soldiers on leave thus replaced the new recruits; and more men were trained in the forces without withdrawing more men from industry.

This interchange was made practicable by the system of general registration and the collaboration between the military authorities and the labour exchanges which were both instituted in Germany in 1935.

Industry and the three arms make up a single war machine; and the question to be answered by the Beveridge Committee was whether the efficiency of this country's *Wehrmacht* is likely to be impaired for lack of uniformed craftsmen. The danger is "that the machines on which the lives of fighting men and the safety of the country depend may have to be entrusted to hands insufficiently skilled under inadequate supervision"; and the Committee's answer is plain enough. The inquiries have gone into little detail yet, and the findings are provisional. But, in spite of a "notable economy [in the Services] in the use of skilled men, secured by a high degree of dilution, and extensive and well-designed arrangements for training"—and for remustering suitable men for technical work—"a further substantial withdrawal of skilled men from the engineering and allied trades is required." The subject of the investigation is the Services; but this message is for industry. It is true that the war is a war of production; and that, as the Minister of Information said on Tuesday, this country must look first to its factories, its mines, its ships, its docks and its farms. But production is a means to an end. Modern warfare is industry in action; the end is not simply safety against attack, but success in battle; and the test of production is the efficiency of the armed forces in the field. The need for more skilled men in the Services "should be met (the Committee advises) by a corresponding extension of dilution in civilian industry"; and the Committee's comment that "so long as men of military age are used on work within the capacity of women or older men, the Government will not escape criticism for waste of manpower" is plainly as applicable to industry as it is to the Services.

This is a challenge to the Ministry of Labour and to the engineering and allied industries—as well as to the Trades Union Congress. "The main obstacles to dilution in civilian employment (the Committee points out) do not arise in the Services. They have not the same temptation as private employers to use skilled men where less skilled men would suffice; and there are no demarcation or wage difficulties to prevent men in uniform from being used to the best of their capacity." There is the clear implication that these obstacles are still influential in civilian industry—and the authority in these matters of Sir William Beveridge and Mr J. C. Little, who was president of the Amalgamated Engineering Union from 1933 to 1939, is unquestionable. The fact is that dilution, the economy of skill by replacing skilled by less skilled workers, and, especially, the substitution of women for men, is now the cardinal issue in labour policy, not simply because more skilled men are wanted by the Services, but more especially because more weapons and equipment are urgently needed from the factories themselves—at a time when the competing claims on manpower are reaching a peak.

Economy of Skill and Numbers

In other words, the bottleneck in labour supply that has not been unpredicted seems now to be in sight. It was realised from the outset in this war that skill would be scarce; and the schedule of reserved occupations was devised to prevent essential war workers from being called up and, with periodical revisions, to preserve a balance between recruitment and production. It was not equally realised that, in the test, actual numbers would be short as well, or that there might also be a shortage of heavy workers, coal miners and builders' labourers; and it is only lately that an attempt has been made to reserve men on the basis of their actual jobs rather than their "qualifications." Production programmes were set low; non-essential employment was maintained too high; and those who called for the extensive transfer and training of workers and, like Sir William Beveridge himself, for the utmost economy of skill were

regarded as needlessly anxious. Nor is the explanation that the fall of France could not have been foreseen a sufficient excuse—any more than the appearance of Russia as an ally now, or of the United States as a universal provider, is a sufficient excuse—for this reluctance to see that total war requires total effort.

In the event, those who have called, in season and out, before Dunkirk and after, for the recruitment and training on the largest possible scale of a new industrial army are justified. Mr Churchill's call in the first month of 1940 for a million more women war workers was shrewd and statesmanlike. It is true that men were not needed in the forces to man and maintain machines until the machines were made, or workers in the factories to make the machines until the factories were built or brought into war production—though both fighting men and factory workers can be given preliminary training. War policy is a process of constant adaptation to new needs as they arise; and the urgent call for workers and Service technicians now does not in itself mean that there have been omissions in the past. In fact, however, the goal has consistently been set too near. The needs of the war programme have until lately been satisfied because the programme has been too small; and it is presumably the "war supply budget for 1941," which was presented to the War Cabinet by Mr Churchill on March 31st this year, that has brought the Services and industry face to face at last with the full measure of their tasks—and of the nation's capacity. The encouraging fact that the country is much stronger and much better armed at the beginning of the third year of war than it was a year ago is a matter of history; the need for more arms is immediate. It is no answer to the contention that more transfer, more training, more dilution and more women are required to say that dilution and the recruitment of women have already gone a very long way. It is true that trade unions have made large concessions in their regulations, and that employers are in many cases working with strange and mixed staffs. The point is that, unless this process of changing the composition of the labour force, in order to make the maximum saving of skill and the maximum use of every available hand, can be extended and accelerated, the industrial and strategic programmes cannot be fulfilled. The short-term needs of the Services for craftsmen and women, and the rate at which war industry must take in fresh labour, have been plainly indicated in recent weeks; and it is the necessary duty of the Ministry of Labour to find the men and women and of the Services and industry to absorb them. The need for more dilution is a challenge to industry's ability to rationalise its processes; and

Milk Rationing

LORD WOOLTON has now given his estimates of the amount of liquid milk that will be available for consumers outside the priority classes during the coming winter. "Two adults will probably get four pints of liquid milk a week." It is not quite clear whether, in making this estimate, the Minister was assuming that the priority classes will or will not take up their full ration. But, since a ration of 2 pints a week per adult, 3½ pints for older children and 7 pints for children under 5 would mean an available supply which would be short by 10 per cent of peacetime consumption—which is the actual anticipated drop in milk yields—it is reasonable to infer that Lord Woolton was counting on the whole of the priority ration being taken up. Two pints per adult will be a minimum.

Since liquid milk consumption has gone up by 14 per cent since the war, the scale of rations will mean a considerable cut in the consumption of some households. Insofar as the increased wartime consumption is due to the extension of cheap milk schemes, the cut will not, of course, be felt, as those covered by the schemes are to be guaranteed their full supplies. But it is probable that

a *non possumus* answer would be to admit defeat.

It is the technique of the comb-out that is still in question. There are practical difficulties that arise from the maladministration of the industrial recruitment campaign. In industrial areas where the need is greatest, the labour exchanges themselves, for instance, are serious bottlenecks because they are too understaffed to conduct all the registrations for which they are responsible. Working conditions for women, and especially for those with household responsibilities, are far from uniformly satisfactory. There are very many cases in which, because of the difficulty of migration or travelling, it is better to take the work to the workers rather than *vice versa*. There is parental opposition to the recruitment of young women.

Efficiency and Fairness

But, underlying all this, there are more basic points of principle. Apart from men of military age, the method is still exhortation; and, as Mr Thomas Balogh argues in the current issue of *The Banker*, the trouble is that the voluntary principle does not work efficiently in wartime because the ordinary incentives to effort, profits, prices and wages, do not operate effectively to supply the war economy. It is not necessarily in the interest of employers or workers to enter the war effort; they are not compensated for losses that may fall upon them because of war conditions; they struggle against war policies in self-preservation; and in wages, instead of changes taking place which would reflect the relative wartime urgency of different jobs, there has been an all-round rise, weighted only by the different bargaining power of different unions. If voluntary means are to be relied on, full mobilisation can only be carried through by furnishing suitable incentives for wage-earners and managers to throw their energies exclusively into war production and by the "negative" compulsion of so restricting work that is not war work that, in practice, there will be little choice—a method which, by the limitation of supplies and the concentration of industries, has furnished a flow of recruits, but not a sufficient stream.

If, on the other hand, positive compulsion is applied in the industrial field, it must be comprehensive and fair. The target is known, in precise numbers, and the task is to strike it at the appointed date, by whatever means. At present, compulsion is employed here and there as patch-work to fill in dangerous gaps—to force ex-coal miners out of better-paid work, to coerce unemployed women and, to a point, by the Essential Work Order. The power—and the obligation—was laid upon the Government by statute, in May, 1940, to make use of all persons and all property to win the war; and there is no citizen who can in justice claim exemption from the call to arms.

part at least is due to the more extensive eating of porridge and cereals in lieu of other vanishing breakfast staples, and to the general tendency to seek a substitute for other foods that are in short supply. Part, too, is undoubtedly due to a shortage of condensed milk. This shortage, according to the Minister of Food, will be rectified by home production this summer and by imports from the United States, and he estimates that available supplies of condensed milk this winter will be equivalent to a further three pints of liquid milk weekly for every family.

Unfortunately, these estimates are complicated by the fact that the consumption of both liquid and condensed milk is very uneven as between one household and another. The Oxford Agricultural Economics Research Institute has re-examined its earlier survey (described in *The Economist* of August 2nd, page 128) and found that 197 households out of 623 were not taking up their full ration; the assumption made by the researchers that the adults who did not consume the equivalent of their present full ration in 1938 is somewhat unrealistic, because it ignores the fact that, under rationing and in the present

circumstances of food restriction, people who never thought of drinking milk, or consuming any other rationed food before, will now tend to draw their rations in full. The survey goes so far as to estimate, on rather speculative grounds, therefore, that 1 to 1½ pints a week will be available from the "deficient" households, which the dairyman will be able to distribute as a supplementary ration to those whose consumption will be reduced by the rationing scheme. In this event, of course, heavy milk drinkers would fare best if they were registered in poor districts where there were many "deficient" households. In any case, the distribution of any milk surplus will obviously cause heartburning between one district and another.

A more serious drawback, however, is that no provision has been made for rationing condensed milk. Even on the most favourable assumptions about the supplies of liquid milk that will be available both for basic and supplementary rations, it must be concluded that many rich households will find their consumption cut down. The danger is that condensed milk will be bought up by these households as an insurance. An attempt could, of course, be made to prevent this engrossing by only releasing supplies gradually; and it is an added reason for preventing any "superfluous" consumption of condensed milk that it has to be imported. But experience of the measures which fed rather than frustrated the run on tobacco has shown that this would probably only aggra-

vate the trouble. The point is that condensed milk is the food of poor households, and it would be deplorable if it were to be snatched from their grasp.

But the precise method of rationing condensed milk is peculiarly difficult to determine. To ration it by itself, without relation to liquid milk, would not take into account individual preferences, which in the choice between liquid and condensed milk are very strong—both ways. The Oxford survey suggests, on the basis of its rather small sample of households, that 35 per cent of the households which were not consuming their full ration of liquid milk actually consumed more than 3 pints of condensed milk—Lord Woolton's estimate of the supply of condensed milk that will be available. All in all, it would seem fairer and more expedient to ration condensed with liquid milk, and then allow the dairyman to distribute both in different proportions to different households according to his supplies and the requirements of his customers—after the liquid requirements of the priority classes have been met. The difficulty in doing this is that, at present, condensed and powdered milk is supplied by grocers, and it would be necessary, to work this rationing scheme, to transfer the trade to the dairy retailers. The Ministry of Food would inevitably receive many complaints, and not without some justification. But these complaints would be nothing compared with the storm that would much more justifiably be raised if there were not after all enough condensed milk to go round.

NOTES OF THE WEEK

Into the Third Year

As the war enters its third year the general improvement in the Allies' position is being widely—and rightly—underlined. When all chances of maintaining a footing in Europe seemed to be irremediably lost, the creation of a Russian front has given the Allies a defensive position of almost inexhaustible depth. When all the armies of Europe had been destroyed, the Russian millions came in to restore the balance in the battlefield. In the New World, cash-and-carry has given way to lease-and-lend, and the balance in the factory can be restored by the United States. A tide, if not the tide, in the Battle of the Atlantic has turned. On the home front, the people of Britain have been tried in the fire of heavy bombing and have not flinched; and the long-neglected work of transforming Britain from a peacetime to a wartime economy is under way. All this is pure gain. Whereas a year ago the problem was how not to lose the war, it may fairly be said to-day that the question is: how are the Allies to win it? Nevertheless, there are still skeletons in the national cupboard and, unhappily, they are the same skeletons. What brought down Europe in the course of the first years? The policy of "one by one." France and Britain were not ready to help Poland. The neutral fringe clung to their neutrality. Britain's dilatory industrial and military mobilisation was too late to reinforce France; and France was too feeble and divided to help herself. The Balkans were divided against each other. No front could be established to save the Greeks. Is the same story to be repeated with Russia? Russia's millions will only be Hitler's doom if they can be nourished and supported to the utmost by Britain and America. They can only be a war-winning asset if the industrial liability they represent is freely and promptly met. Their mighty resistance calls, not for less effort and output from the Allies, but for very much more. It is once again a question of industrial mobilisation—both in this country and in the United States.

The success of "one by one" is itself only a symptom of deeper dangers—on the one hand, an emotional failure, on the other, a failure of intelligence and will. Future historians, looking back on these first two years of war, will surely record as one of its most astonishing characteristics the basic irresponsibility of public opinion in the democracies. With their world going up in flames about them, the people are still using their sand, not to extinguish the fire, but to bury their heads. The least respite, the least lightening of the horizon, and, hey presto, the war is already won. Thus, when the fighting moves, temporarily,

from the Channel to Smolensk, the emotional urgency behind the democratic war effort wanes. The failure of intelligence applies to leadership rather than to the masses. It is quite simply that, after two years of war, the economic, social and administrative implications of total war are still not fully grasped; and this lack of realisation, coupled with the general public's readiness to slip into apathy and complacency, is the main reason why the policy of "one by one" has so far been effective. The democracies seem incapable of profiting by lulls; as they enter the third year there is little sign that they are yet mending their ways decisively.

The Drive in the North

After their great surge forward a week ago, the German armies are once again halted save in the northern sector. Here it seems that the real battle for Leningrad is opening. The Russian attempt to cut off the advancing forces by a counter-attack in the Velikiye Lugi area has apparently been frustrated. The fighting has been very fierce in this sector, but the town is still in German hands. Farther north, the Germans claim to be within fifteen miles of Leningrad—at Krasnove Selo. However, these units may only represent a mechanised advance guard which, as so often before in the Russian campaign, may be cut off by a swift Russian counter-attack. Nevertheless, the people of Leningrad can hear the guns, and German air activity has increased considerably in the Leningrad sector. A grim struggle for the city itself is obviously the next phase in the north. In the centre the Germans are held, and after the dangerous advance beyond Gomel, which at one point seemed likely to threaten Marshal Budyonny's flank, Marshal Timoshenko's counter-attacks, coupled, it appears, with dirty weather, have stayed the German offensive for the time being. The danger is that all these Russian counter-attacks, which are very costly, may at no point have stabilised the front sufficiently to enable the Russian General Staff to launch a full-blown counter-offensive. A series of counter-attacks, while it can and does pinch out advance points in the German wedge, does so at the cost of weakening the Russian line above and below the wedge. The Germans can profit by this to launch their next drive at the weakened spot in the enemy's defences. Thus the attack on Gomel was launched in a sector from which troops had probably been withdrawn northwards to counter-attack in the battle of Smolensk. In the south, the Dnieper line stands. Marshal Budyonny, by a series

of daring and well-concerted raids across the river, has so far prevented the Germans from massing sufficient troops to storm the river and create bridgeheads on the farther bank. It has been suggested that the destruction of the great dam at Dnieproges will assist the Germans by lowering the level of the Dnieper above the dam. The question of the water level is, however, irrelevant. Rivers are obstacles only if they are integrated into a workable defence system. Unfortunately for the Russians, the west bank of their rivers is usually higher than the right—which gives the Germans the advantage of the higher ground. The significance of destroying the dam is above all symbolic; it typifies the readiness of the Russians to sacrifice everything in their defence.

Failure of a Crusade

Hitler's crusade against Bolshevism is making heavy weather. In France, the first official gathering of the "anti-Bolshevist" volunteers nearly cost one of Germany's arch-quislings his life. And Colette, the man who shot at, but apparently did not kill, Laval, turns out to be not a Communist, but a would-be de Gaulliste of no particular political leanings, and is thus a symbolical figure of France's general disgust. The Spanish volunteers are reported to be deserting in a disorderly straggle across Europe. Certainly some thousands have already returned to Spain. The Roumanians are in a state of growing revolt over the sacrifice of their men before Odessa; they claim that in this battle Roumanian units have simply been used to wear down the Russian defences, and that the Germans have shown an incredible callousness towards their losses. The Hungarians are doing better and took part in the capture of Nikolaiev. Nevertheless, even here, there are reports of some unwillingness to raise more battalions for the eastern front. It is in the north that the Germans are facing the most serious revolt—at an awkward time, with the battle for Leningrad developing. The Finns joined in the war quite simply because they wanted back their old frontiers. It is probable that they stopped fighting in 1940 because the Germans guaranteed a restoration. Now, after over two months of fighting, during which the Finns have been severely mauled and have received such inadequate German support that they have had—notably at Salla—to stiffen German resistance, the old frontiers have been virtually recaptured and Viipuri has fallen to the Finns. There is thus no point in fighting on, and the problem for the Finns is whether, on the one hand, the Russians will concede the reconquered frontiers, and whether, on the other, the Germans will let the Finns abandon the fight. Unofficial feelers have apparently already been put out to Moscow, very probably with American backing; and the Russians' sudden retreat down the Karelian isthmus suggests that they may be ready to contribute something to the pre-conditions of peace. The German reaction is harder to assess, but a number of practical considerations suggest that the Finns may get their way. A people cannot be coerced into fighting, and the Finns are the least amenable people in the world to coercion. But the Germans are not trained for arctic fighting. If Leningrad falls, the fate of Karelia, Murmansk and Archangel is not vital. The Germans may prefer to cut their losses for the winter and transfer their units south, leaving the Finns behind their ice-bound ports. The withdrawal could be represented as a typical example of German disinterestedness and generosity. If the Finns do extract themselves from the fighting, it will be a lasting monument to Stalin's folly in launching the Russo-Finnish war. To-day the Finns might otherwise have been fighting with the Russians to expel the Germans.

News from The East

It used to be said of the old Turkey that the people were always surprised when the winter came. Times have changed, and now it is apparently regarded by the British Foreign Office as quite a normal procedure for vital news about Britain's own life-and-death struggle to be made known to the Turks while it is still an official secret here. The information given last week by the British Ambassador in Ankara to the Turkish President that British and Allied shipping losses in all waters in July were the lowest monthly total since the war began, except for two months before the collapse of France, is only the latest of a series of such "invisible exports." Once it was the American

President who told the world the ratio between British losses and British shipbuilding capacity; another time it was a Canadian who revealed facts about British tanker losses. But this Turkish episode is peculiar, because it was in July that the Admiralty solemnly announced that it was no longer in the interests of national security to publish shipping losses regularly. It was suspected by many people then that this meant that only low losses would be published—though not even the most captious sceptics forecast that they would be put out in Ankara instead of London; and this figure for July, which must be between 135,372 tons (the total for April, 1940, the higher of the two lowest monthly totals of the war) and 164,626 (the total for November, 1939, the third lowest monthly total of the war) is most encouragingly low. It cannot, of course, be assumed that the German blockade has therefore been finally broken. The increased numbers of escort vessels in service, their success in the long summer days and the "insulation" of a large tract of Atlantic waters by the presence of American patrols have struck a serious blow against the submarine campaign; and the combined efforts of the Navy and the RAF have removed or pinned down the surface raiders that did so much damage earlier in the year. But, if it is true that Hitler's policy in grand strategy is "one by one," it is equally true that his policy in operations is "one thing at a time." In the air, the hard knocks given in German Europe by the RAF have not yet forced the enemy to do battle on a big scale in the west while the eastern front is active; and, at sea, there has been work for German forces in Russian waters. It is not many months since the Germans had something like 200 submarines in commission (more than the 169 estimated at the peak of the submarine campaign in the last war) with perhaps 100 operating against shipping at the same time; and there is little doubt that there will be a renewal of more intense activities in coming months. But it does seem probable, as the number of convoy escorts grows, that the worst will not happen; and, meanwhile, if the Turkish report, confirmed by Sir Archibald Sinclair on Wednesday, that in recent weeks imports have been coming in at the rate of 850,000 tons weekly, 60 per cent of the high rate of 1937, the situation is immeasurably better than might have been expected.

Settlement in Iran
