Co-operation with Germany is furthered by all available means. A special organisation has been created for the purpose, with the participation of all the more important professional associations. In July, discussions were held between various German and Roumanian industrial groups. German interests have now direct control of the entire heavy industry, three of the leading banks and many other enterprises. A number of mixed German-Roumanian companies have been formed, especially for the development of agricultural industries.

Hungary at War

[BY A CORRESPONDENT]

October 21st

THE fog which enveloped Hungary's entry into the war has not lifted. On June 27th, four days after a "non-belligerency" announcement by the Government, a bewildered public was told that, as a retaliation for a raid by "three disguised Russian planes," Hungary had declared war on

Russia. Hungarian troops attacked at once, while the accompanying anti-Communist propaganda was launched. The two main events of the war, so far as Hungary is concerned, have been the summoning of Admiral Horthy to Hitler's headquarters—when, undoubtedly, more troops were demanded—and the replacement of the Hungarian Commander-in-Chief, General Werth. On neither was the Press allowed to say anything except the brief official communiqué. Meanwhile the Press, by now entirely Nazi-communiqué, indulges in abuse of Russia, the Allies and the Atlantic Charter, as well as in boasting of Hungarian unity.

In truth, however, the Hungarian home front is far from united. There is a criss-cross of undercurrents, much un-easiness and heart-searching. Hungary's involvement in the war has brought home, even to some former Government supporters, the dangers of its situation. There are, again, those who think the time ripe for pressing forward new revisionist claims. Other elements feel alarmed at Hungary's growing isolation from its small neighbours. A powerful influence is exercised also by the strong Hungarian community in the United States, now unreservedly on the side of the democracies.

Another source of discontent in the country is the deteriorating economic situation, and especially the growing food shortage. The bringing in of the harvest—which has been a mediocre one, after disastrous crops last year—has relieved an impending bread famine, but bread rationing has had to be maintained and even extended. There is an acute shortage of fats and a dearth of dairy products. Milk supplies have declined by 30-40 per cent. Among consumption goods, kerosene, soap and shoes are the most marked shortages.

The lack of raw materials has resulted in hold-ups in many industries. The textile and clothing industry, normally employing over 200,000 hands, works at one-third capacity. The agricultural situation, too, is deteriorating. After the military call-up a serious labour shortage developed on the land. Despite the rise in agricultural prices, the real income of the farming population declined during 1940 by 15 per cent. The difficulty of collecting taxes from the farmers has been officially admitted. Foreign trade is increasingly monopolised by Germany. A new trade agreement was signed on July 31st, but details were not published.

The de-industrialisation policy previously pressed by Germany has apparently been dropped, in line with Germany's revised economic plan for the *Suedo-Ström*. The new formula for Hungary's economic structure is "agricultural westward, industrial eastward." On the other hand, Clodius, roving salesman of the new order, has expressed Germany's "desire" to participate in Hungary's industrial expansion. There are signs that this desire is being fulfilled.

Inflationary Trends in Egypt

[FROM OUR ALEXANDRIA CORRESPONDENT]

September 15th

SINCE the beginning of the summer, inflation has gathered considerable momentum. Up to that time the steepest rise had been in the price of imported goods, mostly manufactured; local foodstuffs were plentiful and relatively cheap, thus allowing for stable conditions in the labour market. The situation is now reversed, and many local products for domestic consumption are in the forefront of the advance.

The official index of the cost of living, applying to the lower middle-class, has moved as follows:—

	April	May	June	July
1939	130	128	128	128
1940	137	137	138	138
1941	164	165	172	178

For food the figures read thus:—

	April	May	June	July
1939	113	109	109	110
1940	115	114	113	114
1941	135	134	142	150

The above indices do not convey a full picture of the present situation as a fresh sharp rise has occurred recently. Furthermore, food looms very large in the total expenditure of the fellaheen and town labourers, so that appreciable economies on other items are scarcely possible.

The presence of inflationary factors has been discernible for a long time past. The note circulation has steadily expanded from £E20,712,000 on June 30, 1939, to £E42,257,000 on June 30, 1941, with a contra-seasonal advance during the latter month. The expenditure of the British and Imperial forces in Egypt now exceeds the value of the country's exports. Up to a few months ago, however, inflationary factors had been partly counteracted by other influences, of which the chief was the tendency to hoard notes. With the consolidation of the British front in the Middle East, and the outbreak of hostilities between Russia and Germany, a feeling of much greater confidence pervaded the whole country. Actually, the bullish impulse was imparted by the boom in wheat prices that started after April owing to a short crop. The general rise gathered further momentum when the heavy bombardments of Alexandria last June, and the subsequent large-scale exodus of the population, affected production for a while, and disorganised the distribution of consumption goods. Had the new Anglo-Egyptian cotton deal raised the price of this commodity too steeply, the inflationary movement might have got out of hand.

The general improvement in the Middle East has gone hand in hand with a boom in securities which may not have spent itself as yet. In the majority of cases prices both of fixed interest securities and of equities are at a higher level than last winter after the Italian defeats in Albania and Cyrenaica.

The New Cotton Deal

Although the purchase by the British Government of last year's cotton crop at a remunerative price spared Egypt a major economic crisis, no energetic measures were taken during the subsequent months to curtail the acreage under cotton and to encourage wheat growing. The result was not only a short cereals crop, which has necessitated a recourse to imports, but also quite a large cotton crop. The British Government, which is still burdened with a great part of last year's purchases, is prepared to take but half of the new production and only at last season's price. The other half will be taken by the Egyptian Government. Owing, however, to the rise in production costs, and to the strong pressure exerted by Parliament, where landowners are largely represented, the Egyptian Government will pay out an extra two tallaris per kantar (1d. per lb.) on all cotton bought by either of the two Governments. It is proposed to obtain the necessary funds from an increase in the National Defence Tax, and from budget economies. For the financing of the cotton purchases a short-term loan of £E17½ millions will be floated, and should local capitalists fail to subscribe the whole amount, the British Treasury will take up the balance. This time, however, British help is made conditional on the curtailment of cotton acreage to about 25 per cent of the total cultivated area of Egypt. Effective measures will also have to be taken to make the country once again self-sufficient in cereals.

Shorter Notices

"Butterworths' Emergency Legislation Service." (London) Butterworth and Co., 37 Essex Street, W.C.2. New Impression. £10 10s. net.

Messrs. Butterworth and Co. are rendering valuable service by means of their *Emergency Legislation Service*. The *Service* covers all emergency war legislation, arranged in a form suitable for quick reference. It is divided into two sections, one covering Statutes and the other Statutory Rules and Orders. The first section is kept up to date by the issue of supplements, which now number ten. The second is a loose-leaf volume in four binders and containing four parts: a survey of Regulations, Rules and Orders issued in connection with the present emergency; a digest of cases arising under the provisions, showing their effect upon the law and upon previous cases; a note-up on the cumulative system which, issued periodically, shows changes and additions to the material already contained in the *Service*. The fourth part was a cumulative index, but this has now been discontinued. A new index is in preparation which, it is hoped, will facilitate quicker and easier reference. Though the *Service* is primarily designed for the use of the legal profession, it has been found to be of greatest value to commercial concerns, whatever their interests. As a work of reference in which any point can be looked up with the minimum amount of trouble, it would grace the shelves of any library.

German Europe

Capital Markets.—During the first six months of 1941, total capital issues amounted to roughly Rm. 12,000 millions, against Rm. 8,673 millions in the whole of 1938. Approximately 85 per cent of the total were public issues, a percentage which has hardly varied since Hitler came into power. Share issues during the first half of 1941 amounted to Rm. 1,640 millions, an increase of 100 per cent compared with the corresponding period of 1940. The issue of industrial debentures, however, decreased during the same period from Rm. 611 millions to Rm. 128 millions. More than half of the total share issues were used for financing new companies. Prominent among them were the new subsidiaries of the *Reichswerke H. Goering*, the *Kontinentale Oel AG*, and mining and steel works in incorporated territories. The remainder of the share issues were capital increases, used for financing the acquisition of interests in other companies or for adjusting the capital to greatly increased industrial or financial activities.

The decline in the issue of industrial debentures is easily explained by the abnormal financial liquidity of German companies. During the first six months of the war, capital issues were almost exclusively used for financing an actual expansion of industrial capacity. Since the occupation of almost the whole of the Continent, private capital issues are used chiefly for the expansion of financial interest in all parts of Europe.

A characteristic feature of the new share issues was that only a very small part was offered to the investing public, which suggests that they were largely used in the reorganisation of companies. The growing influence of the state in this reorganisation is shown by the fact that the greater part of the shares were issued by the *Reichswerke AG H. Goering*. The percentage of shares dealt in on the German Bourses is very small. At the end of 1939 total share capital amounted to Rm. 20,330 millions, but only Rm. 7,760 millions, or 38.2 per cent of the total, were dealt in on the Berlin Bourse.

It is thus small wonder that the excessive financial liquidity, which has developed since the beginning of the war, has caused a persistent rise in share prices, whose index increased by 57 per cent from August, 1939, to September, 1941. The demand for shares greatly exceeds the supply in spite of the huge public issues of capital. Neither increased taxation nor the dividend and profit stop, after the model of the price and wages stop, have been enough to check the advance of share prices. The casual observer must assume that the general public tries to invest capital in shares as a safeguard against a possible inflation. Yet there are strong indications that the joint stock companies, as distinct from the general investor, have been accumulating shares and paid for them out of their greatly increased liquid reserves. This is certainly true of the banks. The Big Five Banks, for example, increased their investment in shares from Rm. 53 millions at the end of 1939 to Rm. 212 millions at the end of 1940. The president of the Reich-Group Industry, Dr Zangen, has exhorted industrial concerns and companies to refrain from investing their surplus reserves in shares; but it is quite obvious that everybody in Germany, private investors and companies alike, is trying to cash in on the possible profits accruing from increased war work. The general public, however, looks upon the increasing share prices as an indication of substantial war profiteering. The capital adjustments of the undercapitalised companies, now in full swing, have had hardly any influence on share prices. Most of the adjustments were nominal. From July to the beginning of September, 72 companies increased their capital from Rm. 495 millions to Rm. 875 millions by converting reserves into capital. There is no doubt that these adjustments will continue for a long time, but they will not alter the conditions of supply and demand on the capital markets.

The capital market situation has become a controversial subject among the economic administrators in Germany. Some of them who are concerned with the control of agricultural marketing have suggested the abolition of the Bourses, arguing from the analogy of their abolition of the agricultural commodity markets. At the Vienna Bourse a share price stop was introduced after the model of the price stop, but it did not work. At the same time, the financial Press violently opposed any scheme of abolition or marketing. Recently share prices have been falling because the government has ordered an investigation of

the investment portfolios of all companies. Meanwhile, speculative investments acquired recently may be disposed of. The idea is to restrict the purchase of shares by companies. The matter cannot rest there, and there is a demand for greater publicity in annual reports. It is felt that, in the public interest, the investment portfolios of companies should be specified instead of being shown as a total of investments. Lastly, there is the threat of increased taxation, and in the last resort of prohibiting dealing in shares outside the Bourse. The excessive liquidity of the companies is, however, bound to continue, and this root cause can hardly be checked by the usual control measures.

Clothing Cards, 1941-42. The new clothing cards for the third year of the war have been issued. They are valid for the period from September 1, 1941, to December 31, 1942. The total number of points, or coupons, has been reduced to 120, which must last for 16 months. The actual reduction in the monthly average works out at about 40 per cent. The cut has been made after a careful inventory of the available stocks of raw materials. These have decreased, especially those of cotton and wool. The *Wehrmacht* demanded greater supplies, and the number of workers available for the manufacture of civilian textile goods is much smaller. The total ration now may be judged by the fact that a suit requires 80 coupons, or two-thirds of the total coupons for 16 months. This cut, coming after the requisition of substantial stocks in occupied countries, suggests that there has been some check to the expansion of the manufacture of artificial textile fibres. The supply situation in Italy seems also to have deteriorated. On September 30, 1941, sales of textile goods were suspended for a fortnight to enable shops to make an inventory. It is expected that clothing cards will shortly be introduced.

Substitute Motor Fuel. A short time ago Major-General von Schell, the special commissar for motor industry and motor transport, announced that 180,000 motor vehicles, mainly lorries, were running on generator gas in Germany and the German occupied countries. That is almost half the number of lorries on the roads in the Old Reich at the beginning of the war. Von Schell estimated that roughly 648,000 tons of liquid fuel can thus be saved annually. An increasing number of barges and other craft used in inland shipping is also being converted for the use of generator gas. Special credits are granted for fitting Diesel engines with generators. The special commissar aims at saving annually at least one million tons of petrol and fuel oil, or roughly one-seventh of the total oil supplies of Greater Germany in 1938. There are, however, difficulties in the supply of suitable wood for generators. Experiments are being carried out with the use of coal, lignite and peat. No progress has been reported in manufacturing a generator capable of burning any kind of wood. Two leading companies engaged in processing and distributing wood were recently merged with the purpose of centralising the supply of wood for generators through a network of filling stations.

Industry and Banking in the Protectorate. Representatives of the mining section in the Central Industrial Organisation of Bohemia and Moravia reported that coal output in 1940 was 6.5 per cent greater than in 1939. Lignite output increased by 19.4 per cent, and the output of iron ore by 10.4 per cent. It is clear from the annual reports of the leading industrial concerns that during 1940 capacity was fully employed, mainly on war orders transferred from German concerns. The total turnover of the *Poldi Huette AG* increased during the year by 25 per cent. Plant and factories of the concern were fully employed on war orders. The famous *Skoda* works, now a subsidiary of the *Reichswerke AG H. Goering*, report an increase in capital. The *Verein fuer Chemische und Metallurgische Produktion Prague* increased production considerably. All the principal concerns increased their capital expenditure. The total deposits of nine banks increased from Kr. 11,873 millions on December 31, 1939, to Kr. 16,301 millions on March 31, 1941. Advances, on the other hand, decreased from Kr. 9,100 millions to Kr. 7,790 millions. The banks invested a considerable part of their financial resources in German Treasury bills and Treasury bonds. The bill portfolio covering these investments increased from Kr. 1,447 millions to Kr. 5,329 millions.

THE BUSINESS WORLD

Oil in American Defence

THE advantages possessed by the democratic Powers in their command of oil supplies have been greatly exaggerated in popular discussion; but they are none the less real. Given the necessary transport facilities, Britain can obtain an abundance of oil from any of the world's exporters, while America is far and away the largest producer of this essential raw material. The latter's 1940 output of 1,352 million barrels (say 185 million tons) was, indeed, equivalent to 63 per cent of the world total. The importance of oil in war was underlined by the President earlier this year, when he appointed Mr Harold L. Ickes, Secretary of the Interior, to be Federal Petroleum Co-ordinator for Defence; and the lesson was driven home to every citizen when Mr. Ickes proceeded to impose restrictions on the use of motor fuel in the Eastern States. Despite the fact, recorded in a Note in last week's *Economist*, that these restrictions—necessitated by the loan of tankers to Great Britain—have been removed now that some of the borrowed vessels are being returned to their owners, a general realisation of the crucial importance of the petroleum industry remains.

Though not so directly affected by rearmament requirements as, for example, steel, petroleum products proper, as well as certain of the industry's chemical by-products, have been in steadily increasing demand. With the steep rise in general business activity in the United States there has been a marked advance in the demand for industrial fuels and lubricants, while steadily mounting pay-rolls have naturally been reflected—in a country which possesses well over 30 million motor vehicles—in a sharp rise in petrol consumption. Following a remarkable increase in domestic demand for the principal petroleum products in 1940, a further rise of over 10 per cent occurred in the first six months of the current year. As compared with the same period of last year, domestic requirements advanced as follows:—Motor fuel from 279 to 309 million barrels; lubricating oils from 12 to 15 millions; gas oil and distillate fuel oil from 85 to 93 millions, and residual fuel oil from 169 to 188 millions. Despite a sharp reduction in exports, due mainly to the loss of European outlets—total shipments of the principal products fell from 41 to less than 29 million barrels over the year—total demand for all oils thus registered a considerable advance in the period under review. And the pace has shown no sign of slackening since the close of the half-year.

The expansion in demand has naturally been reflected in an upward trend of prices. But Mr Henderson, chief of the Office of Price Administration and Civilian Supply, has taken steps to check any inflationary advance in the price of petroleum products. First came the stabilisation (at the end of July) of Gulf prices for petrol for domestic shipment, a maximum of 6 cents a gallon being laid down for 72-74 octane material; but an increase to 6½ cents is now possible owing to the intervening rise in costs. For the principal grade of Pennsylvanian lubricating oil a ceiling of 33 cents a gallon has been decreed, while restrictions have been placed on increases in the price of crude oil. Finally, filling station prices for petrol have been fixed in 40 eastern cities. These measures, though naturally not very popular in the oil industry, certainly seem wise in the light of British experience; for in the United States prices of petroleum products enter into industrial and transport costs at many points. To hold in check the upward tendency in this important sector will therefore contribute materially to the avoidance of inflation in the economy as a whole.

Hitherto supplies of the majority of bulk products appear to have kept pace fairly well with the increasing demand. According to the A.P.I. statistics, stocks of petrol amounted to 83,343,000 barrels on October 25th, against 80,891,000 barrels on the corresponding date of 1940. Those of gas oil

and distillate fuel oil rose from 48,893,000 to 53,183,000 barrels in the same period. These increases in stocks, however, have hardly done more than keep pace with rising demand, and in some important special varieties stocks are running down. Thus in residual fuel oil there was a marked decline—from 108,475,000 to 95,205,000 barrels—but this was almost entirely confined to California, stocks east of the Rockies having gone down by no more than 1,647,000 barrels. Lubricating oil stocks are also much lower, stocks of viscous neutral in the Pennsylvania and Mid-Continent regions having fallen from 608,000 barrels in August, 1940, to 368,000 barrels in July, 1941. Finally, stocks of crude petroleum have been reduced over the year from the high figure of 262,098,000 to 243,605,000 barrels. A year ago there was a widespread tendency to regard stocks as excessive. And representing, as they do, something like five months' domestic requirements of the principal liquid products, they still appear, in general—though not in some special varieties—adequate for present needs.

But if requirements continue to grow—and in the absence of Government intervention this may be taken for granted—will the oil industry be in a position to deliver the goods? An unqualified answer is not so easily given as might be supposed, for the issue is not dependent upon the petroleum industry alone. Owing to the stringent position in the steel industry, difficulties have lately been encountered by certain oil companies in securing supplies of essential equipment. In the case of plant for the manufacture of highest quality aviation petrol, high priorities have, it is true, been granted. But from both the producing and refining sections there has recently come a chorus of complaints that proper recognition of the industry's great importance has not been manifest in the decisions of the Supply, Priorities and Allocations Board. But on the assumption that there will be no serious lack of steel tubes and other necessary drilling equipment, the position of the producing section of the industry appears reasonably assured. Although the output of crude oil has risen from a daily average of about 3,500,000 barrels in January to a present level of around 4,100,000 barrels, there is still a considerable "shut-in" capacity. This means that an immediate increase in output—up to perhaps 4,600,000 barrels daily—could be secured simply by operating the flowing wells at capacity; and an acceleration of drilling work would ensure a further increase in a few months. Production of high-grade Pennsylvanian crudes, from which the finest lubricating oils are manufactured, cannot be expanded easily at short notice. But there are plentiful supplies of other crudes which, when subjected to modern methods of treatment, yield lubricants of only slightly inferior quality.

In the refining branch, however, the position is much less favourable. The available statistics certainly suggest that the active capacity of the 500-odd refineries in the United States is around 4,600,000 barrels a day, against a present daily throughput of only about 4,100,000 barrels. But such figures may be misleading. The capacity now idle may not be capable of turning out products conforming to stringent present-day specifications, while a refinery, in contrast with a flowing oil well, cannot be operated for 365 days a year. Much of the spare capacity is in inland regions or on the Pacific Coast, and its use would intensify the transport problem. Only a small proportion of it, perhaps equivalent to some 110,000 barrels a day, is in complete plants. That the refineries are, in fact, now working fairly near the practicable limit of their capacity was recently suggested by Mr R. K. Davies, who—though guilty a few months ago of making an unduly alarmist statement of the East Coast supply position—as Mr Ickes' deputy co-ordinator should know the facts of the present situation. New refineries are, of course, always being constructed in the United States, technical

progress in this branch being exceptionally rapid. But it may be necessary to speed up such construction work—and to guarantee the materials for the purpose—if an adequate margin of refining capacity is to be maintained.

In general, therefore, the American oil position is one that requires careful watching, but no alarmism. There is still a margin of capacity over and above present consumption. But the margin is small, the demand is rising—it might rise very rapidly if a vast war of movement were to begin—and additions to refining capacity are likely to be slow. Moreover, rising demand for, and growing dependence on, other varieties of oil, such as fuel oil and residual oils (used in domestic heaters), make it difficult to increase the proportion of crude going into motor and aviation fuels. But there is, of course, one enormous cushion against rising needs. The domestic consumption of motor spirit and lubricating oil, though not much more than half the total output of the American oil industry, is something like seven or eight times the total supplies of German Europe. Mr Ickes's recent attempts to restrict consumption on the Eastern seaboard were ill-conceived and unsuccessful. But private consumption could be reduced if the need arose, and a comparatively small cut would supply the needs of a very large army.

Petroleum cannot, however, be treated as a single homogeneous commodity, and in some of the more specialised branches of the industry the position is by no means so reassuring. There may be a severe shortage of lubricating oil (so often forgotten in oil calculations) in prospect. In the case of 100-octane aviation fuel the need for increased capacity is officially recognised. The capacity of the existing plants for the manufacture of this highest-grade fuel is officially estimated at 40,000 barrels a day, or well over 1,500,000 tons a year. Though this is adequate for the needs of the moment, a rapid increase in requirements must be provided for. Only last month the United States Secretary for War announced plans for almost trebling the Army Air Force to 400,000 flying cadets and enlisted men by the end of next June, and, if possible, to 500,000 after that. The latest OPM schedule calls for an output of some 4,000 aircraft a month by next July—about double the existing

rate of production. To these rapidly growing American requirements for aviation petrol must be added some part of British and Russian needs.

In anticipation of increased home requirements, the Administration placed certain restrictions on the export of aviation fuels as long ago as July, 1940, and later made arrangements for the accumulation of emergency reserves equal to "100 days' requirements of a full war basis." The target figure has naturally never been disclosed, but stocks of all aviation petrols have steadily advanced to a present level of over 7,000,000 barrels. The next step was to withhold from general use all blending agents needed for the manufacture of highest quality aircraft fuels. Finally—and most important of all—plans have been drawn up for trebling existing capacity for the production of 100-octane petrol at a cost of approximately \$150,000,000. Though work has apparently not yet been started on many of these new plants, Mr Ickes has offered front-rank priorities to refiners building new plant or expanding their existing capacity. A daily output of 120,000 barrels of aviation fuel would be sufficient to keep some 66,000 fighter aircraft in the air for one hour a day throughout the year—which suggests that Mr Ickes' aims are none too high. If the necessary basic stocks and blending agents are obtainable at short notice—and this seems to be reasonably certain—it is to be hoped that nothing will be allowed to interfere with the speedy fulfilment of the programme.

It may be literally correct to say—as Mr Sumner Welles said in public last week-end—that "the western hemisphere's petroleum problem has ended" or that "the current requirements of each country in this hemisphere can be met one hundred per cent" and still to feel some anxiety about the future position. However, if remedial action is sufficiently drastic and timely, the American oil industry should be able, given the necessary materials and equipment, to meet all reasonable demands for its products. And in the event of a sudden and unforeseen jump in military needs it would always be possible by a proportionately slight cut in non-essential uses (especially of petrol) to free large quantities of petroleum products.

ments is reflected in the latest Bank return, which shows a drop of £3,191,000 in public deposits, and a corresponding rise of £3,052,000 in bankers' deposits, carrying the latter to the comfortable level of £120,013,000. The feature of the return is its revelation of another rise of £6,622,000 in the note circulation, carrying it to within £51,000 of the £700,000,000 mark. The movement is counter-seasonal, and leaves a mere £30,292,000 of unissued notes in reserve. At this rate another increase in the fiduciary circulation will have to be made before the end of the year. The authorities are going out of their way to prevent this increased circulation from affecting the credit position, and during the week to last Wednesday a further £8,350,000 was added to the Bank's holding of Government securities—thus more than neutralising the contractionist effect of the net withdrawal of notes.

Expenditure Record

The Exchequer return for last week is noteworthy for its revelation of a rate of Government expenditure previously exceeded in one exceptional period only, namely the final nine days of the last financial year, when the customary accounting adjustment brought the apparent figure of expenditure to a level well in excess of the true Exchequer outlay. No such reservations, however, attach to the latest weekly figure which reveals an expenditure for that period of £122,195,429 or equal to an annual rate of over £6,350,000,000. Last week's total was swollen to the extent of £18,484,716 by National Debt charges, but even allowing for this the rate of expenditure revealed is of the magnitude of about £5,400,000,000 per annum, or about £1,450,000,000 in excess of the estimated expenditure for the year (deducting, for purposes of true comparison, the National Debt charge from the budget estimate). The total ordinary expenditure in the first seven months of the current financial year (i.e., in 58.3 per cent of the year) amounts to 64 per cent of the estimate for the twelve months. As the rate of expenditure has been accelerating, it is now a foregone conclusion that the expenditure estimates for the year will again be comfortably exceeded. The tradition of

timid budgeting, so solidly established since the outbreak of the war, is thus in no danger of being broken this year.

Revenue Prospects

The redeeming feature of this budgetary pusillanimity is that by underestimating expenditure, the Chancellor underestimated the likely growth in the monetary national income and, therefore, in the yield of taxation. It is already evident that the estimated revenue of £1,786,360,000 for the year will be appreciably exceeded. Of that total, some 51 per cent had been collected by the end of last week, while at the corresponding period of last year the revenue collected was only 40 per cent of the total amount which was received by the Exchequer for the full year 1940-41. There is every likelihood of the customary acceleration in the flow of revenue being greater in the current year than it was last. The greater part of the £253,000,000 increase in the estimated yield of income tax will be compressed in the final five months of the financial year. The income tax yield to date is already £97,000,000 in excess of what it was at this time last year, and given the normal seasonal spurt in the collection of this tax, it should yield more than the estimated £756,000,000 by the end of next March. The acceleration in question should become particularly evident from now onwards, for schedule E income tax now deducted at source on salaries and wages begins this week to bear the higher rates imposed last April. Wage envelopes handed out at the end of this week will have been the first to reflect the impact of the last change in taxation and to affect the hundreds of thousands of new wage earners brought within the taxpaying class by the last Budget. Similarly, it is at the end of this month that salary earners paid monthly will be first made to feel the additional burden they will henceforth be called upon to bear. It will be interesting to note how far the reduced pay envelopes will find their reflection in a reduced flow of small savings to Government loans. Some immediate reaction seems inevitable. It will be up to the National Savings Campaign to minimise both the severity and duration of its impact. From this point of view, the launching of the Warships Weeks campaign is well timed, for its appeal is aimed as much to the small saver as to the institutional investor whose participation in Government issues is less directly affected by fiscal considerations than that of the individual.

Check on Bank Notes

Acting on instructions from the Ministry of Food, the joint-stock banks have begun to keep a record of the distinctive numbers of bank notes issued at certain of their branches and, in particular, of notes withdrawn by drawings on accounts largely or mainly operated in this manner. The intention is to keep a check on the issue of currency which may serve one or other of the "black markets" in food-stuffs and by following the circulation of such notes to

obtain additional evidence on the location of these markets and on the identity of the persons engaged in them. Most of the black market operations involve payments in notes, though diamonds have also been used for this purpose. The general practice is for the invoice at the authorised price to be paid by cheque in the normal way and for the illegal excess to be settled in cash. The chances of detection are thus minimised and all evidence of the illegal part of the transaction can be eradicated. It is believed that this use of currency in black market operations has reached appreciable dimensions, and that it represents a by no means negligible factor in the unexpectedly severe expansion in the note issue over recent months. It may well be questioned why so obvious a piece of detective work should be as widely publicised as it has been. The answer probably is that more good may be achieved by the deterrent effect of the new precautions than by the actual discovery of some of the black market operators which greater secrecy might have achieved.

Bank Charges

There has recently been evidence of a fairly widespread tendency among the clearing banks to increase the charges made to keep current accounts. This is a matter in which local branch managers are left considerable discretion; but the manner in which that discretion has been used suggests that it has not been altogether devoid of guidance from the centre. There would be ample justification for such guidance in the heavy pressure on bank costs brought about by the war. If the banks are unduly oppressed by increased staff, ARP and other charges it is far preferable that they should recoup themselves by charging more for the services they render than by switching their assets from shorter into longer and comparatively high-yielding Government loans. Recent experience in Eire should, however, have taught the banks to tread warily along this path of increased charges. In Eire, the initiative was boldly taken by the Irish Banks Standing Committee at the end of last August, when a fixed scale of bank charges was announced. This was to be ros. 6d. per half-year for accounts not exceeding 50 transactions, and a further ros. 6d. for each completed 50 transactions up to a maximum fee of 15 guineas. During September hardly a day passed without bringing one or more petitions and resolutions from commercial and public bodies in Eire, each vying with the others in the terms of outraged protestation with which it attacked the proposal. The Minister for Supplies was compelled to take cognisance of this nation-wide clamour and on September 29th, two days before the new scale of charges was due to come into operation, he requested the banks to postpone the increase pending an inquiry by his department into the reasons for the proposal. More than a month has passed, and the findings of this inquiry are still being awaited.

Investment

Recovery Yields

Another month has passed without bringing any development of major importance to the stock market. As was already evident a week ago, fixed interest securities have risen relatively to industrial equities, and, in fact, are up on the month, while ordinary shares show a very slight decline. The rise in the former class has occurred in second and third line securities, and in medium-dated Government securities. The irredeemables are comparatively neglected, while the "shorts" are held back by the conditions explained in *The Economist* of October 25th. The fall in equities is, according to *The Actuaries' Investment Index*, the smallest movement for many months, and it is to be noted that, once again, it fails fully to reflect the reduction in dividend payments, the yield on the total of 159 industrials being lower, although by very little. Among 15 groups of industrials proper, six show rises and eight falls, but the only substantial improvement is in electrical manufacturing, one of the very few sections which enjoys both good current results, and an upward secular trend. The other rises among industrials are in shares which had been for one reason or another out of favour, but it cannot be said that the movements reflect a very definite outlook. It seems reasonable to suppose that the intensity of the struggle in Russia, and the publicity given to the need for

further expansion of output, both here and in the United States, might have impressed upon the investor the probability that the post-war recovery, of which he appeared to be thinking in the early summer, is still a very long way off. He may well have reached this conclusion, but it finds no reflection in prices. The only groups yielding less than 4 per cent are cotton, oil and building materials, the ones giving over 6 per cent are iron and steel, coal, railways and aircraft manufacturing. The position of coal is not very clear, but, otherwise, the first group are recovery industries, and the second those where there is danger of substantial excess capacity once the war regime is ended. The remaining eight groups give yields ranging from 5.54 for breweries—some decline in employment is discounted—to 4.38 for stores and catering. The weighted average of these eight is 4.86, against 5.22 for the whole list, and 4.85 for twenty concerns in the miscellaneous group.

* * *

A New Pattern

It can scarcely be said that such yields are handsome, even when compared with 3 per cent on long-dated Government securities. This is especially so when it is remembered that the end has not yet been seen of the combined effects of EPT at the full rate, and war damage payments, which are due to increase progressively unless the absence of bombing continues long enough to make possible a substantial revision of the basis of contribution. None the less, it is probable that prices will not remain indefinitely as stable as they have been in recent weeks. Apart from military developments, whose long-term effect has usually been slight, there seem three main directions from which fresh movements may be stimulated. The South African vesting of next month, and the Indian operation which is likely to

follow it, are certainly not the last shots in the Treasury's locker in the battle of low interest rates. There may be a further rise of some importance in the general level of all securities for this reason. The forces which have already reduced the margin between the yield on 2½ per cent Consols and industrial equities to less than half the level of a year ago, may carry the movement still further. Finally, there are new developments. A minor instance affecting current earnings is the institution of point rationing for certain foodstuffs, coupled with freedom of choice to buy these rationed goods where one will. As the system is extended, it may have the effect of restoring a more competi-

tive element to retail trading. Much more important is the fact that there is a growing realisation that, if chaos is to be avoided, and the best made of the opportunities which reconstruction will offer, much must be planned in advance. As the general shape of the post-war world emerges from the tug-of-war of divergent opinions regarding aims and methods, varying estimates will inevitably be made of the fortunes of industrial groups. The position of the export industries is a very obvious case in point, and others are not lacking. It is thus possible to look forward to the possibility of both a general movement in values and adjustment between various classes, but both movements are likely to be at a tempo much less than that of the general recovery which has been the main feature of the past fifteen months.

Argentine Bonds and Sterling

The news of a scheme to convert some of the internal loans of Argentina to a lower interest basis has been seized upon by a section of the market as the prelude to possible action with regard to the sterling portion of the debt. Of the £30 millions odd of Argentine Government debt outstanding in London, almost two-thirds are subject to redemption by sinking funds which can be increased at will, so that all questions of anticipating redemption rights by more than a very short period are beside the point, except as concerns the remaining loan, the 5 per cent stock of 1933. It might be attractive to repay this early as it carries the highest rate of interest. It would appear, however, that there is no reason at present to look for any large scale operation. Balance of payments figures for recent years are, evidently, not available, but the following table gives the state of the balance of physical trade for the first eight months of this year and last.

ARGENTINE TRADE Millions of pesos				
	United Kingdom 1940	1941	Total 1940	Trade 1941
Exports to				
Market value	427	520	1,117	969
Imports from				
Tariff value	158	93	775	505
Market	*222	*136	1,091	741
Favourable balance	*205	*184	26	228

* Estimated.

There is, thus, a favourable balance with this country of some £11 millions, which is less than that on the corresponding period of 1940, and, although the world balance on current trade is much better than at that time, it is still modest. The sterling resulting from the trade with this country goes to a special account set up under the trade

agreement and no information is available as to any special restrictions upon its use, although these may exist. But in any case, the net amount available is greatly inferior to the usual pre-war figure. This is only to be expected in view of the difficulties which Argentina experiences as a result of the closing of markets for her cereal produce. These difficulties have been lightened, but not removed, by the agreements of this country to take large quantities of meat and of the U.S.A. to buy wool and hides. It will be surprising if, in these circumstances, any major operation is undertaken, although it is not impossible that such surplus as remains, after meeting the normal sinking fund and interest service on the debt and other necessary payments, will be devoted in part to increasing sinking fund purchases. As to the internal debt conversion, this reflects in all probability the increased control given by a closed economy rather than any positive improvement in the status of the Government as a creditor, for large and increasing funds have to be found to finance purchases of grain and other products for which there is no sale.

The Montreal Dispute

In view of the haste now necessary after the long delay, the Committee for General Purposes of the Stock Exchange, London, has itself taken in hand the matter of securing organised representation for British bondholders of the City of Montreal. The actual machinery so far established is the creation of a sub-committee, including, among others, the chairman and deputy-chairman of the Committee for General Purposes, which is already getting in touch with the larger holders of the bonds in this country, and hopes by this means to establish a working body to handle the matter. This appears to be the first time that the Stock Exchange Committee, as such, has undertaken this kind of task, although it has on at least one occasion made representations to a company that an attempt to force through a scheme of reconstruction could only be followed by official action. There is so far little further information as to the actual position in Montreal. The Quebec Municipal Committee, a body appointed some years ago to deal with cities

whose finances were entangled, is participating in the reconstruction in some way, but the secrecy which has surrounded the whole matter envelops the activities of this body, and it has been impossible to discover whether it is effectively in charge of Montreal's finances. In fact, there is a disgraceful lack of information in this country on every point of importance, and it is a relief to learn that certain influential quarters are already showing interest in the formation of a bondholders' committee which will really represent British interests. There can be little doubt that, in this matter of protecting the rights of bond and shareholders, there is more experience in this country than in America, and if it can be mobilised in wartime for a job which admittedly makes no apparent, direct contribution to the war effort, there is still a good chance that a reasonable scheme can be substituted for that which now holds the field.

Company Notes

Horden Colliery Accounts

Total profits of Horden Collieries were reduced from £413,139 to £395,968 in the year to September 30th last while charges against earnings remained approximately stable. Thus, equity earnings are down from £114,301 to £112,042, representing 7.46 against 7.71 per cent. Tax provision absorbed £160,000 and war damage contribution £15,000, against £190,000 for tax and contingencies in the previous year. The repetition of the 7½ per cent dividend involves a small draft on the carry forward, which is reduced from £79,232 to £78,775. War damage contribution is not mainly provided out of revenue, a further £20,000 being transferred from reserve for contingencies. The balance sheet shows a rise in the total of current assets from £755,551 to £828,642, accompanied by a drop of some £45,000 in the total of fixed assets, which now stand at £2,350,150. The increase in liquid assets is concentrated on a jump in cash holdings from £83,285 to £267,811 and in debtors from £156,182 to £260,660. Stocks are nearly £80,000 lower at

Dividends declared during the year:
No. 62 of 15 per cent., and No. 63 of 12½ per cent. 343,090 11 0
Leaving a balance unappropriated of £390,301 10 0

The available ore reserve has been re-estimated, and is as follows:

	Tons.	Value Dwt.	Width, Inches.
Main Reef	1,093,400	3.5	59.1
Main Reef Leader	3,476,700	4.1	53.2
South Reef	2,577,600	3.9	49.5
Bird Reef	3,416,300	2.8	79.5
Total	10,564,000	3.6	59.0

In addition there are 1,622,600 tons of payable ore valued at 3.9 dwt. per ton contained in shaft and safety pillars not at present available for stoping.

Compared with the previous year, the available reserve shows a decrease of 134,000 tons, the value is 0.1 dwt. lower, and the estimated stoping width 1.1 inch greater.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., No. 4 London-wall-buildings, London, E.C.2.

NEW MODDERFONTEIN GOLD MINING COMPANY, LTD.

(Incorporated in the Union of South Africa.)

Miners' Phthisis—Provision on account of Outstanding Liability as at 31st July, 1940 5,748 8 0
Taxation 555,945 1 9

563,422 2 9
Dividends declared during the year—No. 69 of 20 per cent. and No. 70 of 15 per cent. £726,420 7 6
Leaving a balance unappropriated of 490,000 0 0
£236,420 7 6

The Ore Reserve was re-estimated as at 30th June, 1941, and is as follows:

	AVAILABLE.			UNAVAILABLE.			TOTAL.		
	Tons.	Value Dwt. Per Ton.	Width, Inches.	Tons.	Value Dwt. Per Ton.	Width, Inches.	Tons.	Value Dwt. Per Ton.	Width, Inches.
South Reef and Marker	1,343,900	2.5	46.0	178,400	3.8	44.6	1,522,300	2.6	45.8
N.A. 6 and 7	567,500	2.4	40.8	133,900	5.4	42.4	701,400	3.0	41.1
N.A. 3, 4 and 5	236,300	2.4	41.8	95,900	2.7	44.3	332,200	2.5	42.5
N.A. 1 and 2	2,083,600	2.9	48.8	218,900	3.8	48.5	2,302,500	3.0	48.8
Main Reef Leader	996,000	4.2	50.9	127,200	4.8	60.3	1,123,200	4.3	51.8
Total	5,207,300	3.0	47.1	754,300	4.1	47.3	5,961,600	3.1	47.1

Compared with the previous year's estimate, the total reserve shows a decrease of 958,300 tons, the value and width being lower by 0.2 dwt. per ton and 0.4 inches, respectively.

As the remaining undeveloped areas, in which payable ore can be expected to occur, are steadily declining the time is approaching when the ore reserve will be insufficient to supply the full tonnage for both mills. In these circumstances it has been decided to mine the reef left in the pillar supporting the north mill. This work will be spread over several years. No serious reduction in tonnage is anticipated during the current year.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., 4, London-wall-buildings, E.C.2.

£156,648, while investments are reduced from £246,377 to £109,977. The net change in near liabilities is insignificant, a fall in taxation and contingencies from £376,130 to £296,014 being accompanied by the provision of £33,610 for war damage payments and a rise in creditors from £63,636 to £84,567. General reserve is unchanged at £240,000. The directors state that since the end of February last demand has revived and now exceeds the capacity to supply it, a fact which is indicated by the depletion of stocks and rise in cash and debtors. It is welcome news that the management has arranged for the erection of canteens at each of the company's collieries. There is a reasonable possibility that the maintenance of demand in the current year will provide higher net earnings provided that no acute labour shortage is allowed to develop. The £1 ordinary stock, at 22s. 6d., yields £6 17s. 11d. per cent.

Leach's Argentine Estates

Total profits of Leach's Argentine Estates declined in the year to March 31 from £230,000 to £177,331, mainly on account of the lower price obtainable for the sale of sugar. Depreciation claimed £51,499 against £49,940, other expenses were a trifle higher than in 1939-40, but taxation required only £10,000 against £30,000. None the less, earnings for dividends amounted to only £83,664 against £117,723, permitting the fixed cumulative 6 per cent dividends on preference and ordinary stock to be covered and the balance of £17,692 against £51,796 to be placed to general reserve in accordance with the company's usual practice. Exchange losses were heavy, although lower than in the previous year, amounting to £19,752 against £22,331. The yield of sugar per ton and the tonnage milled by the company both increased, and production reached a new record at 35,250 against 32,054 tons. Consumption in general was also higher, so that the lower selling price, coupled with the relatively stable exchange losses, was the sole cause of the setback. The proportion of earnings drawn from sugar fell from 88 to 78 per cent, due to the higher yield of citrus crops. The company has continued its practice of transferring sums from general to exchange reserve to cover the excess of trading assets over liabilities in Argentina, exchange reserve rising in the current year by £8,500 to £69,000. General reserve, after this deduction and the transfer from current profits, stands at £386,447 against £397,007. The balance-sheet also shows a decline in both creditors, including taxation, and bank overdraft from £239,982 to £190,289 and from £54,213 to £30,796 respectively. Bills payable, £127,611 of which are secured on stocks of sugar, are up from £203,923 to £247,157. Among liquid assets, cash holdings are some £3,000 higher at £28,243, and stocks of sugar and alcohol over £14,000 higher at £177,308. Stores are reduced from £158,425 to £131,072, and debtors from £239,873 to £229,613.

Conditions in the Argentine sugar industry remained substantially unchanged throughout the company's year. The national sugar law remained on the shelf and there was no change in the Convenio agreement. It seems probable, therefore, that the growth in production meant that an even larger proportion of the total crop had to be exported than in the preceding year and that the less satisfactory results are partly to be attributed to this fact. Since the end of the financial year, the hopes of a new Convenio agreement have been realised, and it may be assumed that this will have the effect of bringing production into closer relationship with internal demand. The company has always been favourably placed as compared with many other British concerns operating in Argentina in that it had an assured market for much of its produce. This factor is likely to be of increased importance in the

future, but prosperity is, of course, dependent upon securing a really remunerative price in the local market. The 10s. ordinary shares stand at 7s. 6d., giving a yield of some £8 5s. 7d. per cent, while the £1 6s. per cent participating preference are quoted at 18s. 9d.

Burma Corporation Results

The decline in total profits of Burma Corporation from £1,043,044 to £924,263 in the year to June 30th last is due both to a moderate fall in metal sales from £2,310,911 to £2,228,927 and to a slight rise in operating costs from £1,244,310 to £1,298,234. There was no exchange loss and depreciation absorbed £35,411 against £40,433. Tax liability, provided at the current rate in each year, rose from £489,410 to £495,380. This, however, takes no account of the supplementary provision for 1939-40 transferred from general reserve to meet the subsequent increase in the standard rate of income tax. Thus, the apparent decline in net profits in Indian currency from Rs. 68,12,359 to Rs. 52,46,295 is modified to the extent of Rs. 10,00,000 transferred to taxation reserve in 1940-41. Equity earnings are down from £510,927 to £393,472, narrowly covering the tax-free dividend reduced from 4.86 to 4.16 per cent, but permitting an increase in the carry forward from £63,366 to £75,978.

‡ Free of Indian, Burmese and British income tax.

§ After £41,250 to tax reserve.

As in the previous year, no details of output are available, but the directors state that sales of silver to the Indian Government, and the British Government demand for lead, played a preponderant part in maintaining revenue. Stocks of metals were reduced last year from £145,909 to £82,501, while stores and plant stand at £355,940 against £404,637. The year's expenditure in the smelter division amounts to £56,254 against £62,963. Cash holdings are up from £967,497 to £1,140,108 and investments by some £23,000 to £179,757. Debtors have risen ahead of creditors, while the decline in general reserve from £111,887 to £36,887 through transfer to tax reserve is accompanied by an increase in the latter fund from £888,027 to £1,055,187. Despite higher costs and taxation, and transport difficulties, Burma Corporation remains a prosperous and solid concern. The 13s. 6d. (Rs. 9) ordinary shares at 6s. 3d. ex dividend yield £8 19s. 9d. per cent.

Singer Motors Improved Results

The full accounts of Singer Motors show total profits after tax of £266,793 for the year to July 31st last, against £206,385 for the previous sixteen months. This improvement is an indication that a significant revival of business activity took place last year, and the directors state that it was necessary to make provision for EPT as well as income-tax, whereas no provision for EPT was made in the previous year. Charges against profits are generally higher than in the previous period, maintenance of plant requiring £51,351 against £28,527, and ARP and war damage contribution £30,695 against £14,587 for the former. Since total charges rose only by £33,547, while revenue rose by £60,408, net profits are up from £58,648 to £85,509. The whole of this total is placed to the carry forward, thus converting a debit of £60,242 into a credit of £25,267. The directors have purchased and cancelled £7,113 against £7,720 of debenture stock, and have decided to redeem the remaining 4 per cent Income Notes to a total of £13,314. Unfortunately, the realisation of a creditor carry forward for the

first time since the reorganisation of the company in 1936 is somewhat marred by the inclusion of an unexplained suspense item of £25,349 among floating assets. The company, despite last year's improvement in earnings, is still painfully devoid of reserves, and a long way from making a payment on its ordinary capital. The balance-sheet shows important increases in debtors and creditors from £105,823 to £239,799, and from £80,518 to £233,395 respectively. The decline in stocks from £200,351 to £189,090 is to be accepted with caution, since both figures are based on estimates unsupported by stocktaking—the management being unwilling to interrupt output for this purpose. Cash holdings are substantially higher at £167,130 against £21,907, but additions to fixed plant during the year amounted to only £1,105 against £25,548 in the previous sixteen months. The earnings of the past year represent a considerable rate on the ordinary capital after meeting the preference dividend. If they are maintained, the latter should be met and a payment on the former is possible, although only the most modest equity payments should be made before building up the reserve position. An unfortunate EPT standard must considerably impede the growth of profits. The 5s. ordinary shares stand at 3s. 7½d. and the 8s. 7 per cent preference shares at 6s. 3d.

Peruvian Corporation

It was unfortunate for Peruvian Corporation that the improved results earned in terms of the sol, in the year to June 30th last, should be nullified by exchange movements. In fact, the average value of the sol against sterling declined from 10½d. to 9½d. in the year in question. Thus, while net receipts in Peruvian currency rose from S. 3,272,246 to S. 3,835,993, the improvement in terms of sterling amounted to only £8,680 at £151,841. Since there was an exchange loss of S. 8,040 against a credit item of S. 8,230; since the Perene colonisation loss was some £1,600 higher at £2,642, and since interest on arrears of debenture service was some £7,000 higher at £69,268, the net deficit on the year is up from £200,695 to £214,911. As in each year since the debenture moratorium scheme was initiated in January, 1933, £261,765 has been charged on account to debenture holders, while the actual payment remains at 3 per cent. The transfer of £3,000 for depreciation of Lake steamers which has been appropriated in the four previous years is maintained. Unfortunately, last year's exchange reverse raises the accumulated deficit to the carry forward, which has increased each year since 1931-32, to the considerable total of £1,925,660. Since arrears of the debenture service from 1933 are cumulative under the terms of the moratorium and since there seems little prospect of substantial improvement, at least until the

conclusion of the war, it is difficult to attach any value to the preference and ordinary stock. The most favourable factors in the position, as pointed out by the chairman, Mr Oliver R. H. Bury, in his statement, are the decisions of the Peruvian Government to frustrate German penetration—a decision which included the suppression of the German air service—and, from the economic standpoint, to foster the development of an iron and steel industry through the creation of a Mineral Bank with a capital of S. 50,000,000. The transport of anthracite for smelting would provide valuable freight for the Chimbote Railway, and the contemplated industrialisation could hardly fail to have a revivifying effect on transport receipts generally. The 6 per cent first mortgage debenture stock stands at 34.

Tube Investments Dividend

The reduction in the final dividend of Tube Investments from 13½ to 10 per cent for the year to October 31st, making a total of 20 against 23½ per cent, appears to have been totally unexpected by markets and stockholders alike. The general impression that the rate of payment would be maintained derived partly from the stability of ordinary distributions over the past four years, during which total dividends have remained unchanged at 23½ per cent, while earnings have risen from 27.9 to 35.2 per cent in 1939-40, and partly from Mr Arthur Chamberlain's surmise at the last general meeting that dividend rates would probably be maintained in the future. Since there is every reason to suppose that the necessity for making the reduction could not be foreseen a year ago—despite the advent of heavy bombing two months earlier—the most reasonable explanation is the adoption of a new standard of financial prudence deriving from the combined effect of increased tax and costs. The preliminary statement indicates that income from subsidiaries, which represents the major part of Tube Investments' revenue, is lower than in the previous year, when it declined from £840,860 to £804,368. War contingencies reserve receives £200,000 against nothing a year ago. It remains to be seen what appropriations compare with £150,000 to general reserve and £100,000 to reserve against investments at that time. An important feature of the reduction is the influence which it will exert on the Stewarts and Lloyds' revenue from the £500 liaison deferred shares, on which the gross payment will be reduced by £18,750, or about ¼ per cent on the deferred capital of that company. Market disappointment was reflected in a drop in the price of Tube Investments' £1 ordinary shares from 93s. 3d. to 87s. 6d., at which price they yield £4 11s. 11d. per cent. Stewarts and Lloyds' £1 deferred declined in sympathy from 46s. to 45s. 9d.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

THE tone throughout all sections of the market both before and after the week-end has been distinctly firm, although current uncertainty regarding the situation on the Russian front and in the Far East resulted in a reduced volume of business. In the absence of any marked buying or selling, price movements were slight. The decision of the Argentine Government to convert the internal loans attracted considerable support to the sterling issues in the early part of the current week, while in the industrial market both brewery and textile issues advanced on persistent buying.

Activity in the gilt edged market was slight, but prices were generally well maintained before the week-end, when gains of ¼ and ½ were registered by 4 per cent Victory Bonds and the 2½ per cent Funding, respectively, while 3½ per cent Conversion Loan improved ½. The current week opened with losses of ¼ for 2½ per cent Consols, 3½ per cent Conversion and 3 and 3½ per cent War Loan, while 2½ per cent National War Bonds 1945-47 and 1946-48 both declined ¼. The following day, however, quiet trading

left prices unchanged. Later prices continued firm in an inactive market. Interest in the foreign bond market was centred on Argentine issues, the news of the internal conversion giving rise to reserved support of Sterling issues. Thus, on Monday, 3½ and 4 per cent Conversion both rose 2 points, while 4 per cent "Roca" and 3 per cent "C" Trust repeated the previous Friday's gain of 1 point. The following day witnessed a further advance of 3 points for 4½ per cent Conversion, while the 3½ per cent BA (Prov) loan jumped 3 points on Monday, when Brazilian and Chilean bonds were generally easier. Japanese issues were dull, the 5 per cent loan of 1907 and 5½ per cent, 1930, losing 1 and 1½ points respectively on Monday.

Complete lack of interest accounted for the low turnover in the home rail market, where GW ordinary reversed an earlier gain of ¼ and Southern deferred declined ½ on Monday. The following day GW ordinary suffered a further loss of ¼, while Southern deferred dropped ½, but senior issues remained steady throughout. Apart from a fall of ¼ in Southern preferred prices in midweek were unchanged. In a quiet foreign rail market, San Paulo was prominent, the

ordinary stock gaining one point before and after the week-end. On Tuesday, a general improvement in Argentine rail stocks included gains of one point for BAGS 4 per cent debentures and C. Argentine 4½ per cent preference. Elsewhere Canadian Pacific ordinary gained ¼ on Tuesday.

Quiet conditions in the industrial market were relieved by selective buying of brewery shares and support for textile and shipping issues. In the brewery group, Distillers rose 1s. 9d., and Bass, Benskins and Ind Coope 1s. before the week-end. Further small gains were realised this week, although Distillers reacted on Tuesday. In the aircraft and motor group, Napier was prominent with a rise of 1s. on Tuesday, but Parnall declined on the dividend cut, but in mid-week Tube Investments more than lost an early recovery on announcement of a reduced dividend. A jump of 1s. 6d. in Courtaulds at the close of last week stimulated a general improvement among textile issues, in which Patons and Baldwins improved ½ on Tuesday. Shipping issues were supported before the week-end when Furness Withy gained 9d., but later prices moved irregularly. There was little business in the tobacco group and in the early part

(Continued on page 577)

NORANDA MINES, LIMITED

DIVIDEND NOTICE.

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines, Limited, payable December 15, 1941, to shareholders of record at the close of business, November 20th, 1941.

By Order of the Board.

J. R. BRADFELD, Secretary.

Toronto, October 31st, 1941.

Industry and Trade

Non-Axis Shipping Pool

The adoption, by the American Congress, of the Senate Foreign Relations Committee's recommendation that the Neutrality Act should be amended, not merely to permit the arming of merchant vessels, but to allow them to enter the war zones, would bring an immediate and appreciable improvement in the Allied shipping position. The effect of the amendment, if enacted, would be twofold. First, a good deal of time would be saved if American vessels were to carry supplies direct to this country; secondly, it would be possible to use the ships under Allied and American control more advantageously. Indeed, it is reported from the United States that the removal of the restrictions on the movement of its merchant ships might be followed by the pooling of the Allied and American merchant fleets under an international committee. The constitution of such a pool would facilitate the distribution of vessels for the purposes for which they are best suited. Since America's merchant fleet (excluding lake vessels) totalled some 9 million gross tons before the war, the economies that could be achieved are likely to be considerable. Their significance, however, lies in the fact that they would be immediate. True, the expansion of shipbuilding in the United States is making rapid headway, but, while next year's output may exceed 3½ million gross tons, the gross tonnage launched this year is not expected to exceed one million.

Economy in Food Transport

The success of the Ministry of War Transport's drive to economise transport by the elimination of cross-hauls and by the curtailment of long-distance traffic must depend largely on the enterprise of the Ministries concerned, i.e., the Ministry of Food, the Board of Trade, the Ministry of Works and Buildings and the Supply Departments of the fighting forces. A good deal has already been done to curtail unnecessary movements of goods, but the scope for further economies appears to be quite appreciable. Last week the Ministry of Food issued an Order enabling it to control more closely the transport of food and animal feeding stuffs. By this Order the Minister may prohibit the movement of supplies, determine the method of transport, the route which must be followed, and the time of conveying specific consignments from one part of the country to another. Individual schemes will as a rule be drawn up with the agreement of the food trades concerned, and compulsion will be used only when this is necessary to ensure the compliance of traders. This Order, if efficiently carried out, should result in an improvement in the distribution of food and feeding stuffs as well as in a saving of transport.

Coal Traffic

Cross-hauls and long-distance hauls, which are to be reduced by the Ministry of War Transport's new scheme for economising transport, are characteristic of railway coal traffic. In the last war a belated effort was made to reduce them by an Order compelling customers to draw their supplies from the nearest coalfield, and regulating traffic as far as possible in well-defined directions along the main trunk lines. When that scheme was brought into operation in September, 1917, the prospective saving was estimated at about 700 million ton-miles per annum, or approximately 7 per cent of the ton-mileage of the coal, coke and patent fuel conveyed. Since the scheme subordinated peacetime competitive considerations affecting the distribution of coal to the speeding-up of transport, both producers and consumers welcomed its abandonment after the war. But it undoubtedly secured economies in the use of locomotives and wagons, and contributed to a general improvement in transport. But its revival in the greatly changed conditions of to-day is regarded as improbable. The regional and national control now exercised by the Government over the sale and supply of coal is far more complete and effective than that improvised for the purposes of the Transport of Coal Order of June, 1917.

The quantities, grades, destinations, as well as the prices of coal, are subject to the direction of the Mines Department through its coal supply officers. Moreover, a considerable measure of success has been achieved in the allocation and clearance of wagons through the co-operation of the newly appointed coal traffic inspectors of the Mines Department and of the officers responsible for coal supplies and railway operation, by the grouping of coalfields on a regional basis for purposes of distribution, the organised allocation of wagons to collieries by the Central Wagon Control, the movement of coal in trainloads or in blocks of wagons, the re-grading of domestic coals and other expedients. These measures may have left many faults unremedied; it is even complained that in some directions new difficulties have been created by the extension of Government control. But on the whole they have regard to the suitability of coals to meet the specialised and varying requirements of consumers as well as to railway operational needs, and since last spring they have been very largely responsible for the exceptional freedom of the industry from temporary stoppages due to lack of wagons. The problem of long hauls has been complicated by the fact that the increase in coal consumption since the outbreak of war has been accompanied by a substantial reduction in the volume of coast-wise shipments. To meet these needs a weekly service of special coal trains has been organised from the producing areas of Northumberland and Durham, and the Midlands and South Wales, to the South of England; and in the House of Lords on October 1st, Lord Templemore announced that provision had been made for an additional thirty or more trains per week from the North-east Coast to deal with an expansion in output.

Labour Shortage in Cotton Mills

The unsatisfactory output of yarn is causing concern in the cotton industry, and the Cotton Board and the Cotton Control are now jointly making an organised effort to increase production to the capacity of the running spindles. The Service Departments have larger cloth contracts to place, but considerable difficulty is being experienced by manufacturers in securing adequate supplies of yarn, and negotiations are in abeyance. The shortage of yarn has been accentuated by the growing demand for textiles for Russia. It appears that the difficulties are largely due to the depletion of the industry's labour force. Efforts are being made by the Cotton Board, with the support of the Government, to recruit additional female labour for the nucleus spinning mills. The appeal will be directed particularly to those operatives, estimated at some thousands, who, having been formerly employed at mills now closed down under concentration, did not seek other employment when their factories were stopped. The campaign will be run in close consultation with the trade unions and the Ministry of Labour, and it is understood that the Ministry of Information will make use of various forms of publicity, such as posters and films. Mr George Tomlinson, M.P., Joint Parliamentary Secretary of the Ministry of Labour, regards an increase in the production of cotton yarn as of urgent importance, and his Ministry will co-operate with the Cotton Board in measures to restore the industry's labour force.

British Lumber Camps

The twenty-third report of the Select Committee on National Expenditure (Session 1940-41) which deals with conditions of employment in the production of home-grown timber is a document to bring shame to leisured young women. There are girls working, and working efficiently, in timber camps in Scotland where hot water for washing is not to be had, where the recreation huts contain no facilities for recreation, and where the girls, though in many cases very much farther from their homes than members of the Land Army, get no free passes for their holidays. These camps, set up by the Home Timber Production Department, are largely worked by Dominion labour, consisting mainly of the Newfoundland Forestry Unit and the Military Forestry Units from Canada, Australia and New Zealand. The Select Committee recommends that, in order to expand the employment of women, they should be organised

on the lines of the Women's Land Army, with status and privileges of a similar kind. The men are often on piece-work, and it is suggested that the introduction of piece rates for the girls would be an advantage. The Committee also urges, very rightly, that the improvement both of recreation facilities and of hygienic conditions should be speeded up. It seems a very modest suggestion that each camp should be provided with a stove to heat the water, and that blankets (in the absence of sheets) should be washed "with reasonable frequency." Another aspect of the timber production problem mentioned in the report is the use of waste products. Quantities of slab wood and sawdust, potentially valuable material, are accumulating at the camps, and the problem of its economical disposal has not yet been solved; but "active steps" are being taken to investigate the question. It is not an easy matter to resolve, in view of the shortage of transport and the temporary nature of the output.

White or Brown Bread?

The fortified white loaf is still not generally obtainable and the policy of the Ministry of Food seems to have veered in the direction of a more determined attempt to popularise the wholemeal loaf. This policy is severely criticised by Dr Norman Wright in an article in the August 23 issue of *Chemistry and Industry*. Briefly, Dr Wright's thesis is that the parts of the wheat grain which are included by 85 per cent extraction but are removed from white flour have more food value when converted into milk than when eaten in the wholemeal loaf. Assuming that about six million tons of wheat are milled annually, the raising of the rate of extraction from 75 to 85 per cent would increase the output of flour to 5,100,000 tons. White flour contains roughly 11½ per cent of protein and wholemeal flour at least 12 per cent, but recent researches suggest, though their results are not universally accepted, that the protein of white flour is 89 per cent digestible and that of wholemeal flour only 81 per cent. Both kinds of flour were, until recently, supposed to have the same energy value, but results have been published which suggest that white flour gives 380 calories per 100 grammes and wholemeal only 346, and further, the digestibilities of the energy appears to be 92 per cent and 87 per cent respectively. On the basis of these figures, the gross savings in protein and energy can be tabulated as follows:

GROSS SAVINGS OF PROTEIN AND ENERGY
(000's omitted)

Millions Standard	Flour Produced (tons)	Protein		Calories	
		Total (tons)	Digestible (tons)	Total (millions)	Digestible (millions)
85%	5,100	612	496	18,560	16,150
75%	4,500	547	460	16,380	15,070
Saving	(600)	(65)	(36)	2,180	1,080

Thus if the theory of the difference in digestibility is sound, it means that the apparent economy from intensified extraction is more than halved. Against this economy is to be offset the reduction in milk output which would follow the diversion of 600,000 tons of wheat feed from animal fodder to direct human consumption. There would be a further loss, owing to the reduction in the amount of wheat milled, of over 100,000 tons of bran, and the total of 700,000 tons of wheat feed represents between 300 and 400 million gallons of milk. According to Dr Wright's calculations this would mean a net loss of 18,500 tons of protein and a net gain of 35,000 calories. Moreover he points out that milk protein as vitamins are concerned, he reaches the conclusion that the diversion of wheat feed to direct human consumption would greatly increase the amount of vitamin B₁ in the nation's diet, but this is the vitamin which would be added in "fortifying" white bread. It would, on the other hand, reduce the vitamin B₂ content enormously. The B₂ contribution of wheat directly consumed would be only about one-fifth that of the equivalent amount of milk. A final point in favour of white bread is the difficulty of adding calcium salts to the loaf. As milk is one of the best sources of these, the maintenance of the milk supply would, in Dr Wright's view, render this unnecessary. This argument would be more convincing if the consumption of milk were more evenly spread. As things are, calcium salts are more likely to reach all classes if embodied in bread than in milk. Moreover, Dr Wright does not discuss the possibility that

the shipping space saved on wheat, if extraction were more complete, might be used for alternative feeding stuffs. Still, as a matter of long-term policy, and assuming a steady rate of shipping losses, his thesis has much to recommend it, and this is probably recognised by the Ministry of Food in not insisting upon a more rapid increase in the rate of extraction.

Poultry Prices

The new schedule of prices for poultry, which came into force on November 3rd, is simplified by the omission of distinctions based on the place of origin in the size of turkeys. It is, on the other hand, complicated by more differentiation according to the amount of processing the birds have undergone. The price list is as follows:—

MAXIMUM PRICES OF POULTRY

	Live Birds	Rough- plucked, Undrawn and Untrussed	Drawn and Trussed (including Giblets)	Parts of Drawn Birds other than Giblets	Cooked Birds	Parts of Cooked Birds
	per lb. s. d.	per lb. s. d.	per lb. s. d.	per lb. s. d.	per lb. s. d.	per lb. s. d.
Turkeys:						
First-hand	2 2½	2 6	3 8	...	...	...
Wholesale	2 3½	2 7	3 9½	...	...	...
Retail	2 6	2 10	4 2	4 6½	5 2	5 5
Roasting chickens, Boiling fowls, Domestic ducks & Domestic geese:						
First-hand	1 4	1 6	2 3½	...	...	...
Wholesale	1 5	1 7	2 5	...	...	...
Retail	1 7½	1 10	2 9½	3 0½	3 4	3 6

Poussins, which are defined as young chickens weighing, rough-plucked, undrawn and untrussed, not less than 1 lb. and not more than 1½ lb., are controlled at 3s. per bird first hand, 3s. 2d. wholesale and 3s. 6d. retail, for rough-plucked birds. Cooked birds may be retailed at 3s. 4d. per lb., or 3s. 6d. per lb. for parts of cooked birds. There is also a schedule for kosher poultry, which ranges from 1½d. per lb. dearer than ordinary poultry in the case of rough-plucked turkeys, to 3d. per lb. dearer for parts of drawn chickens and ducks. This new price schedule appears at first sight more complicated than its predecessor, but actually it is approximately the same. Naturally, the loss in weight in the process of drawing varies considerably between individual birds according to their age, sex and condition, but on the average it is fairly represented by the price differential.

Higher Tea Quota

On October 31st the International Tea Committee decided to increase the export quota for the season ending March 31, 1942, from 100 to 110 per cent of the agreed standards. This is the third upward revision since February, whereas the quota has never before been revised more than once in one season. This shows the uncertainty from which the international tea market has been suffering in the past six months. Europe, an area which absorbed between 85 and 100 million lbs. of tea per season before the war, is now cut off from supplies. The Ministry of Food has acquired about 500 million lbs. of tea this season, while before the war the rest of the world never consumed more than 375 million lbs. of tea per season. Reports from the chief consuming countries outside the United Kingdom indicate that consumption there is running at about the peace level; world absorption of tea this season may therefore be estimated at about 875 million lbs. This quantity would have been roughly covered by the original 90 per cent quota, provided that exports from the non-agreement countries, chiefly China and Japan, including Formosa, had remained normal. In recent months, however, two factors have upset all calculations.

FAMOUS SINCE 1795

OTARD'S
COGNAC BRANDY

tions. On the one hand, Japan's exports fell substantially in the summer, and, on the other hand, the continued threat of a Pacific war and its inevitable effect on shipments to North America and Australia have stimulated the accumulation of stocks in the United States, Canada and Australia. The desire of the International Tea Committee to satisfy this demand and prevent soaring prices in the producing countries has been responsible for the three successive quota increases in May, August and October. The new quota permits exports this season from British-India, Ceylon and the Dutch East Indies at a rate of 889,271,000 lb., to which the carry-over of unused licences from the last season at a

rate of 35,260,600 lb. must be added. Total exports from non-agreement countries this season will probably reach about 100 million lb.; on this basis world supplies would reach 1,025 million lb. If the Far Eastern political position remains unchanged, the new releases should have a normalising effect on the market. On the other hand, in the event of an extension of hostilities in the Pacific, accompanied by shipping difficulties, they would have a depressing effect on prices in the producing areas. The Tea Committee is well aware of this risk, but accepted it in order to allow the United States and the British Dominions to secure as much tea as possible before it may be too late.

COMMODITY AND INDUSTRY NEWS

Tin prices were again low in the later part of last week and early this week. Wednesday's price for standard cash was £256-£256 10s. per ton, against £255 10s.-15s. a week ago. This is the highest price quoted since October 3rd. Three months tin was £259 15s.-£260 5s. per ton, compared with £259 10s.-15s. The outstanding commodity market event of the week was the raising of the tea export quota from 100 to 110 per cent. This is discussed in a Note on page 575.

Tin Statistics.—The Tin Research Institute's Statistical Bulletin estimates world production of tin in September at 19,400 long tons, compared with 21,300 tons in August, and 21,800 in September, 1940. Production so far this year amounts to 185,900 tons, against 165,400 tons in the corresponding period last year. United States deliveries totalled 12,715 tons in September, against 13,625 tons in August. For the first nine months of the year deliveries were 119,287 tons, compared with 81,814 tons in the corresponding period of 1940. Consumption in the United Kingdom dropped slightly to 2,079 tons in August, from 2,418 in July; in August, 1940, consumption was 2,322 tons. World stocks of tin, including smelters' stocks and carry-over, decreased by 4,135 tons during September to 46,729 tons at the end of the month, compared with stocks of 52,824 tons at the end of September, 1940.

Cotton and Labour.—Great pressure for the supply of goods continues, and in practically all sections of the industry output does not meet the requirements of customers. To an increasing extent, the Government and Russia are given prior claim upon production; further orders have been placed in heavy materials for the Forces and in miscellaneous fabrics for the essential home services. Every endeavour is being made to send larger quantities of cloth to Russia, and efforts are being made to get more operatives into the mills. There have been rumours that the Controller may consent to a few stopped mills being reopened if the necessary labour can be found, but the object at the moment is to provide running mills with a larger number of workpeople. Fair miscellaneous cloth transactions have been put through for export, these being chiefly for Java, South America, West Africa and the Dominions. Spinners of yarn remain well sold, and most of them, owing to having twelve weeks' order lists, can only sell each week's production as it comes round. A satisfactory feature is that raw cotton supplies are more plentiful than for some time back.

Ex-Services Trucks.—At the outbreak of war the mechanical transport of the armed forces was supplemented by commercial vans and trucks. Now that these can be replaced by vehicles built for the purpose they are to serve, some of the commercial vans are being released from duty with the armed forces. They are now being reconditioned, and will be available for purchase by operators, who

may apply for the necessary certificate from their Regional Transport Commissioners.

Export Control.—The export, except under Board of Trade licence, is prohibited, from November 13th, of a number of electrical goods, gas apparatus and appliances, office machinery and transparent cellulose wrappings, to all destinations, and of card cloth to certain specified destinations. Licences will also be required for the export of sanitary towels, including substitutes, and articles manufactured wholly or mainly of cellulose wadding, but licences for these goods will not normally be granted.

Food Control.—The rationing of certain canned foods is discussed in a Note on page 559. The expected seasonal decline in the supply of milk has begun, and dairymen are required to curtail their total sales by 5 per cent. Non-priority consumers may find their supplies cut by more than 5 per cent, since priority consumers are guaranteed a certain minimum under the Milk Supply Scheme. The first allocation of American unsweetened condensed milk will provide for one tin for each adult consumer. The maximum wholesale price of this condensed milk is 30s. 6d. per case of 48 tins, and the retail price 81d. per tin. The National Vegetable Marketing Company, Limited, is now the sole purchaser of carrots grown on more than one acre of agricultural land, except carrots sold for stock feed or planted after October 1, 1941. The normal allowances to catering establishments for certain rationed foods are increased for canteens providing school meals for children. The control of tomato prices, which was due to end on October 31st, has been extended until December 31st. Prices are raised slightly, varying from 1s. 2d. to 1s. 5d. per lb., according to district. The Ministry of Food has announced the names of certain egg and fruit juice substitutes which have been licensed for sale after November 10th. The release of dried fruits is to be doubled this month to 12 oz. per sugar registration. Maximum prices for leeks were fixed at 5d. per lb. from November 7th. Agreements for the supply of about one million tons of meat from Argentina, Uruguay, New Zealand and Australia have been reached.

Engineering Wages.—Details are not yet available of the reply made on October 29th by the engineering employers to the case for a wage increase presented by the unions. The request of the AEU and the foundry workers for an increase of 4d. an hour, and of the other unions for an increase of 10s. a week, was, however, rejected. It is expected that the unions will now carry their case before the National Arbitration Tribunal, whose decisions are binding upon both parties. The Tribunal is likely also to have the rejected wage claim of the shipbuilding unions brought before it in the near future.

COMPANY MEETING

CHUNGLOON RUBBER ESTATE (1932), LIMITED

The ninth ordinary general meeting of Chungloon Rubber Estate (1932), Limited, was held, on the 30th ultimo, in London, Mr W. E. Martin, J.P. (the chairman), presiding.

The following is the chairman's speech which was circulated with the report and accounts:—

The year under review has been a profitable year for Rubber Companies in so far as a high rate of export release and a good market price are concerned, but with the heavy taxation necessary to carry on the war to victory, the return to shareholders is limited. The profit for the year was £2,536, compared with £3,783 for the

(Continued from page 573)
of the week prices were unchanged. Elsewhere, Gaumont British advanced strongly on persistent buying, but reacted in midweek on profit-taking. Later subdued trading led to small but irregular price movements.

Slight buying coupled with a shortage of stock led to a firm close at the end of last week in the kaffir market. E. Geduld and Geduld both gaining. Conditions at the reopening were rather quieter, but, on Tuesday, Cape buying induced a general improvement in which Central Mining advanced $\frac{1}{2}$, Grootvlei $\frac{1}{2}$ and Western Holdings $\frac{1}{2}$. Far Eastern uncertainties led to dull conditions in the rubber and tin markets, and small declines were general, while on the news of the increase in royalties on Thai mines, Thai Tin fell 2s. 10d. on Tuesday. The oil market closed firmly at the week-end, but this week lack of demand occasioned small losses. Burmah and VOC declining $\frac{1}{2}$ on Monday, while the following day, Burmah, Anglo-Iranian and Shell all lost $\frac{1}{2}$. Later, interest centred on the Eagle issues, while elsewhere, kaffir issues continued to advance.

New York

PENDING decisive developments, sentiment on Wall Street continues to be dominated by current war and labour uncertainties. Trading at the end of last week was restricted, prices moving narrowly and without trend. On Monday, however, the market opened more firmly, and, encouraged by good business results, more active trading led to slight improvements in oil, aircraft, steel and industrial issues. In midweek, after Election day, business continued to improve, and small gains were registered over a wide front.

The Iron Age estimates steel mill activity at 98.0 per cent of capacity, against 94.5 per cent in the previous week.

New York Prices

Total share dealings: Oct. 30, 550,000; Oct. 31, 640,000; Nov. 1, 240,000; Nov. 3, 600,000; Nov. 4, Election Day; Nov. 5, 930,000.

* Two-hour session.

previous year, but £6,596 has had to be reserved for taxation against £1,862 last year. We are pleased, however, to recommend the payment of a dividend of 10 per cent., less tax, the same as last year and in view of the substantial sum payable in respect of taxation, shareholders have the satisfaction of knowing they are doing their bit for the war effort.

A further 32½ acres have been replanted this year with the best budwood or clonal seeds. The release for the year averaged 87 per cent. of the quota and with the present release of 120 per cent., we shall be able to sell all that we can produce. The cash position is sound and we can, I think, look forward to another successful year. The f.o.b. cost this year was 3.00rd. per lb., compared with 3.024d. per lb. last year—a slight reduction, which is very satisfactory in view of generally increased costs.

The report and accounts were unanimously adopted.

Capital Issues

Week ending November 8, 1941
Particulars of Government issues appear on page 573.

Year†	Including Conversions	Excluding Conversions
1941	1,336,075,915	1,282,468,633

them. It is now realised by American administrators that the plans and methods which have hitherto prevailed will not bring results at anything like the speed or on anything like the scale required. The United States is determined to deliver the goods.

In Germany, there may well be no more slack to take in. For a year, labour has been hard to find in Germany; and the two sources which have previously given elasticity to German war production, troops temporarily demobilised and pressed foreigners, can no longer bring about any appreciable expansion. After the former short campaigns of the war, it was always possible to hurry German soldiers back to the factories and the fields. The campaign in Russia has already lasted five months, without an end in sight. The accumulation of war material before the campaign was immense; but the wastage of material has been immense, too; and a vast number of soldiers will never return. There are still prisoners of war and foreign immigrants to work for the Germans; but, if they toil in Germany, they cannot be occupied in the factories of occupied and dependent Europe which are engaged on German account. In materials as well as in labour, the asset represented by the exploitation of German Europe has by now been fully booked, for there are no more stocks of imported raw materials to be seized and used. The productive capacity of German Europe is, of course, enormous. It has been, is, and will remain the strength of Germany that these resources are harnessed to the full by all the methods of rationing, concentration, pooling and rationalisation which the Germans have taught to the world. Over the whole field of war production and supplies, the enemy has still a long lead. In a solemn warning, Lord Beaverbrook has spoken of Hitler's "100,000 guns." But the pace of German war production is probably past its highest, while the output of the Allies is at last gathering its true speed. Always before, in spite of the Allies'

massive resources, the factories of Germany have made the running. Now they can probably go no faster.

It must be very strongly emphasised that to suggest that the German war effort has reached its peak, and that England and America are on the road to surpassing it, is not to say that the end of the war is in sight. The road must be a long one; and it would be truer to say that the real war is only just starting. Hitherto the problem has been to marshal our resources for making weapons. Now the solution is seen and is proceeding. The materials, the tools and the factories are assembled; the bulk of the available labour has been recruited; and the flow of finished supplies is encouragingly large. But, though the work is now in progress, it is still far from being complete. The task of making full use of manpower, and especially women, is very urgent indeed; and the need for improved efficiency at every point of production is more than ever pressing.

Nor will it be enough even to catch up with the enemy in accumulated supplies—and the time for that is still distant, even now. The battle must then be joined; the weapons made, the problem of using them must then be solved. We still stand on the defensive; and in the grand strategy of a war front stretching from the Atlantic life line to battered Russia, on to Japan and China and back again to North Africa and imprisoned Europe, the tremendous difficulty of turning defence into attack, and attack into victory, is plain enough. It will not be possible to cry that "all is over but the shouting" until the Nazi *Wehrmacht* has been, not only matched, but smashed. It is a comfort and an encouragement on the way to know for certain that, with resolution, patience and ingenuity, we are going to beat the Germans in production. But victory will still depend upon our ability to beat them in battle by using the weapons we are making. There is no short cut.

Far Eastern Front

IF the terms proposed by Japan as the agenda of the Washington talks are truthfully reported in a recent number of the *Japan Times and Advertiser*, then Mr Kurusu's mission is condemned to failure before he ever sets foot in the United States. Japan is said to be demanding—against an unspecified *quid pro quo*, possibly an undertaking not to go to war—the cessation of all military and economic aid to Chungking; American non-intervention in the settlement of a Sino-Japanese peace; an end to the military and economic "encirclement" of Japan; no interference in Japan's relations with Manchuria, China, Indo-China, Thailand, the Netherlands Indies and other states, and unequivocal acceptance of the Co-prosperity sphere; official recognition of Manchukuo; the unfreezing of Japanese and Chinese assets; the restoration of the trade treaties and the abolition of all restrictions upon Japanese trade. In other words, Britain and the United States are being pressed under the threat of war to abandon not only their own interests but those of all their friends and allies, in return for a promise of immunity. The Japanese say, in fact, "Get out of our reach and we will promise not to kick you."

It has been made perfectly plain in Washington and London that the time of compromise is at an end. It is Japan, not the democracies, that must make concessions if the risk of war is to be eliminated. But the Japanese insist that retreat is incompatible with saving their Imperial face. Mr Kurusu is not going as a mediator, but to reinforce the statement of Japan's claims. It would therefore be folly to underestimate the risk of general war in the Pacific. Japan's aims have always been incompatible with the fundamental principles and interests of Britain and the United States, and at last it seems that the limit of appeasement has been reached. The question is now one of organising and deploying the strength of the ABCD coalition together with that of Soviet Russia on the new front, "from Siberia to Burma."

The lesson of enemy aggression since 1931 is that there

is only one effective method of meeting it. All the Powers directly or indirectly threatened by aggression must recognise the indivisibility of aggression and organise their defence resources as a common pool—such an approach to the problem of Far Eastern defence was the substance of Dr Quo Tai-chi's recent appeal to the democracies. There are encouraging signs that the indivisibility of Japanese aggression is being more and more generally accepted. Mr Churchill's Mansion House speech, with its warning that "should the United States become involved in war with Japan the British declaration will follow within the hour," vividly illustrates the new inter-dependence. The problem is to close the loopholes, to fortify with a fourfold guarantee every point at which the Japanese aggressor might still hope to strike against an isolated adversary. Mr Churchill's statement is only a first step. To be effective, it should be balanced by a corresponding guarantee from the United States. So long as there remains the faintest hope that Japan, in attacking Thailand *en route* for Singapore, would not have to fight the United States as well, the temptation to attack will remain.

It is, of course, true that the President of the United States cannot, within his constitutional limitations, promise a declaration of war. But, if Congress alone has the right to declare war, it is the President, as Commander-in-Chief, who gives the order to shoot, and it has repeatedly been shown, not least by President Roosevelt, that the shooting need not wait for the declaration. It is both constitutionally and politically practical to suggest that the American Administration should warn the Japanese in the clearest terms that they will be met with American arms wherever they aggress.

Unfortunately, the recent course of American diplomacy has not given a clear warning. True, there is not the slightest evidence of any willingness to retreat from the position taken up. But the willingness to engage in an indefinite series of "negotiations" has given a contrary

impression in Tokyo. And the deplorable announcement that American supplies would go "only" through Archangel, even though later withdrawn, did not convey the impression that the United States is resolutely committed to the maintenance of Russia's rights in the Maritime Provinces. Nor has any specific guarantee been given by Russia's full ally, Britain. It can perhaps be taken for granted that, if the Russians are attacked anywhere, they can count on active British intervention; but the British failure to declare war on Hungary and Roumania is not an encouraging precedent.

There remains the long vital section of the Far Eastern front from Shensi to the borders of Indo-China. It is here that for over four years the Chinese have carried on the fight alone. It is here, too, that the outlines of a system of collective Far Eastern defence are most hazy. The United States is, it is true, making deliveries under Lease-Lend. Mr Churchill's reference at the Guildhall to China's heroic struggle was warm—if negative. The Soviet Government has formally asserted that the Neutrality Pact with Japan in no way modifies the support Russia is giving to Chungking. But all this does not add up to anything much more effective than a dribble of goods along the Burma Road, allocated, not on the basis of China's needs, but on the needs of the western combatants. As for any guarantee to China that intensified Japanese attacks will invoke more vigorous Allied support, there is none.

This grave gap in the Allies' joint defence is all the more serious in that it is on this sector of the front that the next Japanese blow may well fall. It is by no means certain that the Imperial Government is ready at this moment to challenge any of the Pacific Great Powers. The patience of Japan is rather more inexhaustible than Hitler's, nor would it be the first time in Far Eastern history that Japan has declined to challenge a coalition of Great Powers and preferred to wait until its position was stronger. Between the reversal of the Shimonoseki Treaty and the Russo-Japanese war nearly ten years elapsed. But a new offensive on China is another story. The Great Powers have already more or less acquiesced in Japan's aggression there. The Japanese can argue that a new offensive in an old war should not evoke new counter measures. Yet if the China "incident" could be closed, and the main block of Japan's war effort freed from concentration upon the Chinese fronts, the larger task of challenging the Great Powers would be infinitely easier.

There appear to be only two comparatively rapid ways of breaking Free China's resistance—the capture of

Chungking and the cutting of the Burma Road. It is possible that Japan's summer offensives in Hupeh and Honan were designed to open a way along the Upper Yangtse. If so, the recent recapture of Chengchow by the Chinese, and the earlier Japanese failure at Changsha, can only have illustrated the immense difficulties of a frontal attack upon the Chinese capital. The Burma Road is more vulnerable, for at Kunming it runs only 200 miles from the Indo-Chinese frontiers. There are unmistakable signs of Japanese preparations. Mr Yoshizawa is at present in Indo-China as a "Special Ambassador" and while reports of a Japanese demand to station 500,000 troops there are probably exaggerated, Tonkin is coming increasingly under Japanese control; there is great activity on the airfields and rivers and along the railway which, unhappily for the Chinese, runs all the way from Haiphong to Kunming.

An attack launched from Indo-China would not touch Burma, and the Japanese would do their utmost to reassure the British and Americans that the occupation of Yunnan entailed no threat to their vital interests. It would be dismissed as just one more phase in a war which the democracies have been watching as spectators for the last four years. General Chiang Kai-shek has warned Britain and the United States of the dangers of a new Japanese offensive. He has pleaded for aircraft, particularly for fighters, for the defence of the Burma Road. The most vital issue in Far Eastern defence is the clarification of the Powers' attitude to China's resistance.

It is not a question of a declaration of war. Japan, after all, has not yet declared war on China. But it is a question of "non-intervention" on a massive scale. Admittedly the common pool of defence is already drained by the needs of the Atlantic, the Russian, the Middle Eastern, and the Singapore fronts. But has China's claim to any kind of priority been fairly considered? Has the significance of her self-defence been fitted into a coherent picture of Far Eastern defence and the speed and scale of Allied support measured accordingly? There may be bombers and fighters in Australia, the Netherlands Indies and Singapore which at this moment would be contributing more effectively to Far Eastern defence if they were based on Chungking. The amateur strategist cannot answer these questions, but responsible criticism demands that they be asked. Britain, the United States and Russia have painfully learnt the lesson of allocation and priorities in the western battle. It is time to apply the same principles to the Far East.

Canada's War Effort—II

IT was pointed out in the first article, which appeared in *The Economist* last week, that Canada's production of munitions depends to a considerable extent on the ability to buy both raw materials and machinery in the United States. Canada has not availed herself, and is not now availing herself, of the Lend-Lease machinery; all her purchases from the United States are paid for, and the resulting strain on the Canadian balance of payments is one of the most delicate questions with which the Dominion Government has had to contend.

Canada's economy has always looked two ways. On the one hand, the Dominion is in many ways an integral part of a great continental economy. On the other hand, Canada depends absolutely for her living on overseas markets. Regarded as a whole, Canada's balance of payments was strong in most of the pre-war years. But it consisted of two parts; there was a substantial net credit on trade with the United Kingdom and other overseas countries and a substantial net debit on trade with the United States. The two halves could be put together only so long as the net credit earned in the outside world could be used to settle the net debit in the United States—more precisely, so long as pounds sterling could be converted into United States dollars.

The outbreak of war, therefore, posed a problem of considerable difficulty. The deficit with the United States could be expected to grow with the expansion of the munitions industry. But the normal method of acquiring American dollars disappeared; a surplus of sterling could be converted into United States dollars only at the cost of drawing on the painfully inadequate dollar reserves of the United Kingdom. It was this shortage of one particular currency, rather than any general difficulty in balancing the international accounts, that led to the imposition of exchange control in September, 1939, and the Canadian exchange control is correspondingly simple in conception and structure. Its attention is concentrated on the United States dollar; all other currencies are "soft" for Canada.

The difficulties of Canada's exchange policy thus arise from her inability to offset two opposite embarrassments: an ever-increasing shortage of United States dollars, and an ever-increasing surfeit of sterling. The shortage of dollars can be illustrated by the table* on page 586. In 1941, without the special arrangements shortly to be

* Bank of Canada, Statistical Summary, August-September, 1941, pp. 76-7.

described, the net debit would have been considerably larger. The first measures taken were to reduce the Canadian requirement of United States dollars. Increased taxation could be expected to have this effect, given the substantial share of American goods in Canadian civil consumption. But it was reinforced in the course of 1940 by a general War Exchange Tax of 10 per cent levied on all non-British imports, by very heavily progressive taxes on sales of new automobiles, by the prohibition of pleasure travel in the United States and by an embargo on a wide range of imports.

These measures were not, however, in themselves sufficient to solve the problem. As part of the Hyde Park Declaration issued on April 20, 1941, by President Roosevelt and Mr Mackenzie King, two alleviations of the dollar shortage were arranged. First, it was agreed that Canada should supply the United States within the next year with between \$200 million and \$300 million of defence articles of types for which there is already substantial capacity in the Dominion. Secondly, although Canada still does not avail herself of Lend-Lease, the "American component" in goods manufactured in Canada for the United Kingdom (i.e., the raw materials that have to be bought from the United States to make them) was to be supplied on Lend-Lease terms and debited to the United Kingdom. It is probable that the two measures between them will relieve Canada of the necessity of finding somewhere between \$400 millions and \$600 millions a year. For this year and next, with careful administration, the shortage of dollars should not prove a limiting factor in the Canadian war effort.

From September 15th, 1939, to March 31st, 1941, the sterling area—that is, primarily, the United Kingdom—incurred a net deficiency in Canada of \$795 millions. This was met in three ways—\$337 millions was provided by the sale of British assets in Canada, \$208 millions by Canadian accumulation of sterling—that is, by loan to the British Government—and \$250 millions by the sale of gold to Canada. This last item, which occurred in the second half of 1940, aroused some discussion. It arose from the fact that the original British-Canadian agreement had not envisaged payments on the scale to which they rose in the course of 1940; the dimensions of

Canadian production outran the financial provision that had been made for it. Unfortunately, while negotiations were proceeding for a revision of the agreement, a statement of the British Treasury's requirements of dollars for 1941, published by the United States Government, included an item of \$620 millions for gold or United States dollars to be paid to Canada. This was a purely formal figure inserted pending the conclusion of the negotiations, but it occasioned a great deal of comment, some of it acrimonious, both in Great Britain and in the United States. In point of fact, no payments of gold or United States dollars have been made since 1930. The Dominion Government is providing all the Canadian dollars that the United Kingdom Government requires and taking sterling in London in exchange. How large a burden this is, is shown by the fact that \$900 millions is provided in the 1941-42 Dominion budget for British aid, out of total expenditure of \$2,820 millions. The scope for further repatriation of Dominion debt is small, and the bulk of the sterling thus accumulated stands on interest-free deposit at the Bank of England or is employed in the London money market. The future fate of this sterling accumulation is undecided; but Canada will not wish to be less generous than the United States.

The aim of Canadian policy has been to give the United Kingdom the maximum assistance without disturbing Canada's own credit in the United States. This double aim has been very substantially achieved. To the censorious the second half of the policy might seem unduly cautious in time of war; Great Britain herself, they might urge, has scraped the bottom of her American barrel without regard to credit or dignity and undertaken gigantic and ambiguous future liabilities. But the cases are not on all fours. In peace time, dollar reserves—or the ability to borrow in the United States—are little more than a war chest for Great Britain. For Canada, they are her essential working capital, her guarantee of supplies vital for her economic life. The only item that can really come into dispute is the \$250 million sale of gold last year, since it can hardly be supposed that Canada, with her own shortage of American dollars, could actually have put any of this precious commodity at the disposal of the United Kingdom; however much her credit had been exploited, and the most that could possibly be asked would be that she should not put any additional strain on the United Kingdom's own scanty reserves. The gold transaction, as has already been explained, arose because of unexpected circumstances, and it has not been repeated; in all probability, the sum of \$250 millions is less than the "American component" of goods made in Canada for the United Kingdom before the Hyde Park Agreement of April, 1941. There is certainly no reason for anyone in Great Britain to cavil at the Canadian financial contribution to the joint war effort.

Regulation 18B

(By a Correspondent)

LAST week's *Economist* rightly reminded the House of Commons of its duty to see that regulations affecting the liberty of the subject are justly administered; and, in case there are any M.P.s who have not grasped the principles and the administration of Regulation 18B, it may be appropriate to pose and so far as possible answer three questions on its working:—

- (1) What happens to a subject detained under it?
- (2) Has the history of the regulation been inspired by a pure desire to work justice or by a disposition to support the executive?
- (3) Are the powers which the regulation (as judicially interpreted) gives to the executive necessary for the common safety?

When a subject is to be detained, an Order for his detention is signed by the Home Secretary and he is taken to gaol, no grounds being given, except a state-

ment that the Home Secretary has "reasonable cause" to believe him a person of hostile associations. On reaching gaol, he is told about an advisory committee to which he may appeal, and if he decides to make an appeal, his dossier is handed to the Committee by the Home Office. In the early months of the war, Sir John Anderson, then Home Secretary, emphasised that the Committee had been left entirely free in determining its procedure. But the normal routine seems to be that the Committee prepares a brief summary, mostly without reference to persons, places or dates, which is given to the suspect to provide him with a general idea of what the case against him is; and in the course of time he comes in person before the Committee. In preparing for his examination, he is allowed the help of a solicitor, but at the hearing itself he is permitted neither counsel nor solicitor nor witnesses as to fact. He has to answer questions put to him by

members of the Committee based on a dossier which neither he nor his advisers have seen, although, according to the past and present Home Secretaries, the Committee gives him every opportunity to make a statement and helps him to bring out his case. On the strength of his answers, the Committee reports in secret to the Home Secretary; but the report is advice and nothing but advice, since the Home Secretary need not act on it, and would be doing nothing contrary to the law if he threw it into the waste-paper basket.

Whether the Committee has advised release or detention of any particular subject is never disclosed, but global figures are published, and it is known that 100 suspects whose release was recommended by the Committee remain in gaol on the personal decision of the Home Secretary. The central fact is that, in every case, the decision is made by one man and one man only. If the Home Secretary says "keep him in gaol" the suspect is kept. He, and he only, has the right of imprisonment, and for what he does he need give no account and no reasons to the suspect or to his advisers or to Parliament.

That brings us to the second question—the decisions of the courts—for cases of Habeas Corpus have come to court in which a suspect has challenged the right of the Home Secretary to act as he has been acting, and argued that 18B does not in fact give him power to detain without proving that his suspicions are reasonable. It is without proving that his suspicions are reasonable that the judgments of the courts in dealing with these suits that cause grave anxiety and alarm in many who believe that the bench should be independent of the executive, and should administer the law in exactly the same way when they handle a suspect as when they adjudicate in the Commercial Court on a bill of lading.

Regulation 18B in its original form said that the Secretary of State, "if satisfied, with respect to any particular person" that for reasons of security it was necessary to detain him, could make a detention order. But after representations had been made in Parliament, Sir John Anderson agreed to consult with an all-party Committee on amending this and other regulations affecting the liberty of the subject, and the amended Regulation 18B ran "if the Secretary of State has reasonable cause to believe . . . " Has "reasonable cause to believe" "Is satisfied." The suspects say that these phrases mean different things. If a man may take action because he is "satisfied" of so-and-so, then his action cannot be challenged. But if he can act only when he has "reasonable cause to believe," then he may be called upon to prove that he had reasonable cause. "Satisfied" implies nothing but a mental condition. "Reasonable cause" is an objective thing (it is argued) which has nothing to do with the contents of the Home Secretary's mind.

The judges have found against the suspects and apparently, although their judgment did not explicitly take account of this argument, have in effect decided that the two phrases both mean the same thing—that having reasonable cause is the same thing as being satisfied or as thinking that you have reasonable cause. If a man thinks he has reasonable cause for crossing the road in front of a bus, then he has reasonable cause. If the bus driver

thinks he has reasonable cause for driving on, he too has reasonable cause. And the marriage of the two reasonable causes leads to the reasonable death of a reasonable pedestrian by the reasonable action of a reasonable driver. Argument and analogy extended to pages of print and wrapped up in a thousand legal subtleties enabled the judges to do what they finally did: hold that the two phrases are identical and give judgment for the executive against the subject contrary to what a plain man would say was the plain meaning of a plain clause.

That last sentence, 999 times out of a thousand, might be treated as contempt of Court and land the editor of *The Economist* in Brixton gaol with the suspects. But this is the thousandth time; for the sentence is only a paraphrase of what Lord Atkin said, more effectively, in his dissenting judgment. He viewed, he said, with apprehension, judges who are more executive-minded than the executive and he could find no authority for the construction his fellow-judges were putting upon the regulation except Humpty-Dumpty, who claimed that when he used a word the word meant just what he chose it to mean—neither more nor less. The question as between a word and himself was (said that authority) which was to be master—that's all. But the judges, following Humpty-Dumpty, have decided that Mr Morrison shall have complete, unqualified, unchallengeable power to take away your liberty or mine as surely and as safely as Himmler signs away the liberty of any German citizen.

Lastly the third question. Is it necessary for the public safety that this uncontrolled power should not merely exist but be concentrated in the hands of one man? Is that essential to victory? The great difficulty which faces the Home Secretary here is the difficulty of every secret police force, the difficulty of protecting its agents and its sources of information from disclosure. But, if we admit that necessity, we are still very far from accepting the present system. There are alternatives and satisfactory alternatives. There would, for example, be no danger to the State if the power which the judges have bestowed on the Home Secretary were taken from him and given to an impartial tribunal not connected with the police. There would be no danger if the tribunal met *in camera* or in the open according to circumstance. There would be no danger if the suspect could have counsel at his hearing and call witnesses. There would be no danger if the tribunal had the dossier in its possession. There would be no danger if it heard such witnesses for the police as could safely appear and had before it the written evidence of others. There would be no danger to the State if the tribunal were told that it need only be satisfied that there is reasonable cause for belief, and should not ask for the same degree of certainty as is required at the Old Bailey. There would be no danger in publishing the tribunal's findings.

This is an obvious reform, and Mr Morrison as a man of common sense should welcome it—recognising that the terrible power which the judges have given him should not be in the grip of one individual. And least of all should it lie with the man who is at the head of the police.

NOTES OF THE WEEK

A New Session

This week Parliament was prorogued and reopened. In his first speech of the new session, the Prime Minister took as his theme the home front. He spoke of ships, and food and critics. In the four months up to June, 500,000 tons of shipping a month had been lost, and in the four months up to October, only 180,000 tons a month. Now the minimum tonnage of food imports laid down by the Cabinet—to be aimed at, Mr Churchill said, even at the expense of war materials, if heavy losses had persisted—might even be slightly surpassed. "The House may be sure that we shall not err on the side of over-indulgence. I trust we shall not be blamed for stoking up those fires of human energy and human spirit upon which victory in this long struggle

depends." The corn harvest is 50 per cent more than in 1939; this year's crops of potatoes, sugar beet, roots and fodder will be very large; both meat and dairy cattle have been well maintained; and Hitler's plan to starve England, learned from the *obiter dicta* of Hess, has been fended off. Every responsible critic will rejoice with Mr Churchill at this showing; but not all of them perhaps will agree that the import and agricultural policy which the Government has pursued so successfully has been as economical and effective as it might have been. The Prime Minister defended all his Ministers, "united as a corporate body in special faith and loyalty," and declared that no change in their personnel or in the system of Cabinet Government was contemplated. But the critics will still do their duty. Mr Churchill himself again admitted their crucial war-time rôle of vigilance as the

"grand inquest of the nation." Many of them remain unhappy about the powers of the executive under Regulation 18B, which are soon to be debated again. Many, also, agree with the wish of a Select Committee, reported on Wednesday, that the power of the Government to appoint Members to paid offices should be strictly limited, "even in wartime." The need for constant questioning of the planning and performance of production is self-evident; and there are issues outside the main stream of war strategy, issues of civil and economic liberty and social organisation, which must be kept in the forefront of Parliamentary discussion. Sir Percy Harris was right to say on Wednesday that "the Prime Minister has the complete confidence of this country"; but Parliament and the people still claim the right, acclaimed by Mr Churchill himself, "to swear at the Government."

Strikes, Votes and Speeches

American policy continues to be balanced between the needs of foreign and domestic crises. Two more speeches from the President have shown an unchanging firmness of purpose and a growing clarity of language. He has also given proof that he can act as well as talk boldly, when the matter is entirely within his executive discretion, by granting a loan of \$1,000 millions to Soviet Russia; the loan is interest-free and the beginning of repayment is postponed for five years. Unfortunately, the week has also brought proofs of the retarding influences with which the President has to contend. The revision of the Neutrality Act, duly voted in the Senate by a comfortable but not sensational majority, has now returned to the House of Representatives for that body's concurrence in the Senate's extension of the repeal to cover the present prohibition of American shipping in the "combat zones." The House appears to be wavering, and the vote, which may have been taken by the time these lines appear, is expected to be close. The better news from Russia has, as always, acted to diminish the apparent urgency of an intensification of American assistance. But perhaps a stronger influence telling against the President is the recrudescence of acute labour trouble. Many of the Southern Democrats who form the solid core of his majority on foreign affairs are bitterly critical of him for what they regard as his weakness towards the unions, and they may threaten to withhold their votes on the Neutrality Act as a lever to secure more drastic measures against strikes in defence industries. Mr John L. Lewis's demand for the closed shop in the "captive" coal mines has now been rejected by the National Defence Mediation Board, and there is every prospect that the strike will be resumed, unless the President's intervention succeeds where it failed a fortnight ago. It is not correct, as has been stated in the British press, that Mr Lewis's demand is for collective bargaining, which already exist in these mines. His demand is for the closed shop—that is, that the employers should force into the union the small fraction of their workers who are not already members of it. Another dispute of at least equal gravity has arisen through the decision of the railroad brotherhoods to call a strike for December 7th. The quarrel here is over wages, but, as in the miners' case, the workers are striking against the award of a mediation board. These are not the only strikes in progress or in the offing; others affect the aircraft, automobile and telephone industries, and there is evidence of preparations for a deliberate trial of strength between the CIO and the Government. The opinion of the public, as well as of Congress, is strongly against the unions, and the President will require all his powers of persuasion to prevent both sides from having recourse to violent measures.

The "Lull"

The picture of a nation standing idly by is only too easily accepted by anxious Englishmen as they watch the struggle in Russia—and as they remember their own ordeal by bombs a year ago. It is somewhat illusory. The naval and air attacks, for instance, which have sunk 111 German and Italian ships in the Mediterranean are of first-rate importance in the strategy of the war. It cannot have been an aid to Axis plans that Allied submarines and planes have been sinking about a quarter of the ships carrying reinforcements from Italy to Libya. Off Taranto, early this week, ten supply ships and three Italian destroyers were sunk by gunfire and torpedoes; and within a few hours six more merchantmen were sunk and two more ships and two armed merchant cruisers damaged. Ever since

March, Italy's ports and shipping have been steadily hammered, with now and then an outstanding coup. If Admiral Cunningham's hope that "the Mediterranean will soon be cleared of all enemy shipping" were to be realised, the fortunes of war would then indeed be dramatically reversed, and a crucial claw of the aggressor's design would be sheared away. Everywhere that Axis supplies go by water they are now ceaselessly harried—from the air or from under the water—and by no means the least important part of the RAF's growing activity is the daily onslaught on ports and ships along Germany's western and northern supply routes. It was for low-level attacks on shipping that bombs were first added to the great fire-power of the Hurricane fighters, which have lately been diving to plant their bombs with precision on French factories—just as the Germans, too, in their recent small raids at dusk and in the moonlight have been using diving tactics in place of the old attacks from a great height. It would be unwise to rate all this sea and air activity as more than the unending thrust and counter thrust of routine warfare. It does not add up to a new offensive or a second front. Even if the RAF now equals the *Luftwaffe* in size, it needs to be very much larger to have parity on any one front, because the enemy's planes move quickly by land on interior lines, while the RAF must move slowly over thousands of miles of sea. But the activity of the reinforced RAF and of the Navy is bringing in high dividends. On the fringes of German Europe, the enemy's communications are as vital as they are vulnerable, and there is now the strength to attack them north, west and south. Germany's risk in the vastness of the temporary European Reich is that its war supplies may be brought by these attacks below what Mr Dalton has called "the distributional minimum."

Winter War

A touch of uncertainty has crept into German reports of the position on the Eastern front. The weather is undoubtedly very bad, with heavy frost at night, intense cold and midday thaws, which leave the ground a quagmire. The difficulties of supplying the armies under these new conditions are obvious, and it may well be that they are offering almost insuperable obstacles to the mounting of a new offensive. The projected attack on Moscow has petered out into a series of local thrusts which have nowhere penetrated very deeply into the Russian defences. The Russians were able to celebrate the anniversary of the Revolution with the usual mass parade on the Red Square at Moscow, and though the situation, with the Germans within forty miles of the city, remains critical, there seems to be less immediate danger of capture or encirclement. Fighting has flared up again in the north round Leningrad, and in the south has been concentrated in the Crimea. It seems likely that Sevastopol is invested and the Germans claim to have cut off the Kerch peninsula. Their earlier statements that Russian resistance in the Crimea was at an end were, however—like so many similar claims—premature. Sevastopol is preparing to be another Odessa and fighting continues all over the peninsula. So long as the German rear is harassed in this way, the launching of a drive across the Kerch peninsula to take Rostov in the rear is probably out of the question. And an interesting phenomenon on every front is the relatively insignificant role of aircraft. In the north and possibly in the centre, the weather may be the explanation. But in the south, there has been no repetition of the tactics used in Crete. If aircraft dominated the campaigns in the west, the Russian war is the war of the tank.

Two Speeches

The Führer and the supreme leader of Russia have both spoken this week. The circumstances and surroundings were totally different. Stalin spoke in solemn assembly to the Moscow Soviet on the anniversary of the Revolution. Hitler spoke to his party cronies in the beer hall at Munich. As on other occasions, his speech was intimate, abusive, personal and probably more humorous than official translations allow. The Russian leader was presenting an official account of his stewardship. Hitler was letting off steam. Nevertheless the two speeches complement each other. Hitler claimed that the havoc wrought on the Russian forces—he put their losses at over eight millions—is so terrific that "no army can recover from such losses." Stalin pointed to the 30 new divisions which had been created since the beginning of the war as a proof of the vast reserves and the flexibility of Russia's defence. It was not the Russians

that were cracking under the strain, but Germany. Not only was Russia's will to resistance unshakable, but behind Russia stood the united front of Britain and the United States and of the oppressed peoples of Europe who would rise in their anger against Hitler's "new order." Stalin admitted that there was still no second military front and he hoped that one would shortly be established, but Allied supplies and Allied productive capacity were an assurance of final victory. Hitler mocked at possible intervention in the west. "If it pleases the English, be it in Norway, on our German coast, or in the Netherlands, Belgium or France, to start an offensive, we can only say, 'Come on, but you will retire more quickly than you came.'" As for the oppressed peoples, Europe was not oppressed but delivered from the threat of Bolshevism. The poverty and degradation in Russia had taught the soldiers what they had been spared. He, Hitler, was fighting to preserve Europe as the first continent in the world. There was one point of complete agreement between the two leaders. The war is a war of annihilation. The Russians will fight until the last Nazi is destroyed. Hitler's plans include the annexation of Western Russia, the driving of the Slavs eastwards, and the inclusion of Russia's resources in German Europe. It is the old policy of colonial expansion. It is in this form that the Russian campaign will be presented to the "Conference of Europe," should Hitler call his quislings together to declare "peace." In a sense, there is nothing new in either speech. Hitler even brought up Versailles again, and Stalin's references to "oppressed peoples" and "productive capacity" could be repeated from all too many speeches made in France, Britain and the United States since war began. What is new is that the German Army is fighting at full stretch, that a front is holding, that a world coalition is forming, that the indivisibility of aggression is accepted at last. Hitler has said these things before. For the first time, he may be wrong. Others beside Stalin have said these things before. For the first time, they may be right.

No Entry—and No Exit

The Committee set up by the President of the Board of Trade to advise on the reorganisation of retail trade to meet war needs have failed to grasp the nettle. Their task was to suggest ways and means of curtailing the apparatus of retail distribution, in order to bring it into proportion with the limitation of supplies and in order to release the maximum amount of labour for war service—to apply the technique of concentration to shops. Actually, all they have done so far is to recommend a ban on new shopkeepers. When they approached retail traders for their views, the Committee found—not unnaturally—that such a ban was regarded by most of the established shopkeepers as a matter "calling for immediate attention." By an Order dated November 11th it will be illegal, as from January 1st next, to open a new shop or to sell new lines at existing shops (a clause said to be intended to protect small shopkeepers from multiple competition) without a licence issued on behalf of the Board of Trade by local price regulation committees. Thus the ideal of every trade association is realised; shopkeeping becomes a "closed shop." Of course, the fact that vested interests will be well contented does not mean that, in the present wartime circumstances, the new measure is not right and needed. The test of this has still to come. If this first fruit of the Committee's labours is followed by positive steps to cut down the number of existing retail outlets, then the prohibition of new outlets will appear as a logical part of a programme to bring the framework of retail trade into line with the reduction in retail traders' supplies.

By itself, the prohibition is restraint of trade of the worst kind—or, rather, it is only saved from being the worst by the fact that the trade associations themselves will not be the licensing bodies; the representatives of the associations and trade unions will be minorities on the price committees. In theory, however, if it is necessary to reduce the number of shops, it is admittedly reasonable to prevent an increase in their number, as an emergency measure. Even with this justification, the licensing system may prove too rigid. The wartime movement of population means that in some areas, so far from there being too many shops, there are by most criteria too few; and it would be a mistake and an injustice, simply in order to protect the vested interests of existing shops, to prevent retail trading from adjusting

itself, geographically, to wartime conditions, to this extent at least. As it is, even bombed-out traders must apparently not move more than one mile. The reason given by the Committee for the new Order is that newcomers might force existing shopkeepers out of business. The fact is that the root consideration remains financial—which is a reason for pessimism about the prospects of the Committee's work. As it is, labour is drawn from retail trade for national service shop by shop with care to keep each shop active—and, it is hoped, solvent. So long as there is no programme of compensation to cover the case of shops closed down or concentrated, this procedure is not likely to be altered. Retail trade will be swollen out by redundant units. Its labour force will be needlessly and inefficiently large; and the ban on newcomers will, in some ways, merely set a premium on inefficiency.

The Note Circulation

The total of notes in circulation, as recorded in this week's Bank return, now exceeds £700 millions. In the months immediately before the outbreak of war, the circulation fluctuated at and just below £500 millions, so that the increase is of the order of 40 per cent. This magnitude, in itself, is not much more than could have been expected. It is true that the total volume of monetary transactions in the country has not increased by 40 per cent, since the restrictions of wartime have offset the rise in the general level of prices. But there are a number of reasons why the holding of notes should have increased relatively to the total volume of transactions—rising wage payments, the dislocation of normal channels of trade, the disruption of families, even a certain amount of precautionary swelling of cash in view of possible emergencies. What is difficult to explain is why the rise in the circulation continues to be so rapid and so persistent at present, when the rise in prices is very moderate and the restrictions on all forms of trade are becoming progressively more severe. One possible explanation is that it arises precisely out of these restrictions on trade. Wage-earning families, who have no bank accounts, are finding it increasingly hard to spend all of their enhanced incomes. The balance ought, of course, to go to the Savings campaign, but perhaps there are sections of the community who have not yet been effectively solicited. It is, of course, impossible to be certain that this is the explanation of what is, in any case, a puzzling phenomenon. One thing, however, is reasonably certain—there is no immediate threat of inflation in the rise of the circulation. The level of prices depends on the amount of money that is spent, not on the amount that is in existence, still less on the amount that is in existence in one particular form, and the puzzling thing about the note circulation is that its increase is *not* associated with an increase in spending.

Treaty with Iran

Negotiations for the conclusion of a treaty between Great Britain and Russia on the one hand and Iran on the other have so far proceeded slowly and it is good news

Export
and
Import
Banking
on
Sweden

SKANDINAVISKA BANKEN

Child Welfare Committees, to all children born after January 1, 1940. This is to ensure that young children will have an adequate intake of vitamin C—from the fruit juices—and vitamins A and D from the cod-liver oil. Whether that delicate vitamin C, which is so susceptible to ill-treatment, can be effectively preserved in fruit juices is not altogether beyond doubt, but the Ministry of Food has presumably assured itself on this point. In any case, the scheme should cultivate a taste in the young for the fresh fruit itself and a habit in their mothers of giving them the fruits when they are again available.

* * *

Saving Paper

The Ministry of Supply's waste paper campaign began at the wrong end of the stick. It was possibly good publicity for Lord Beaverbrook to appeal for 100,000 tons of waste paper to be turned into cartridge cases on the lines of his "saucepans for Spitfires" appeal of last year. But just as then the housewife's enthusiasm soon turned into indignation when she saw the apparently endless supply of new saucepans on sale in shops, so now the public's willingness to discard letters, magazines, books and records has received a distinct setback by the obviously needless use of new paper that is still going on. The further restrictions on the use of paper that came into force on Wednesday were, therefore, made none too soon. Even so, it will come as a surprise to many people that some of them are still necessary. There have been several previous Control of Paper Orders, as a result of which it was pretty widely believed that Christmas cards would vanish when old stocks were used up, as they probably were last Christmas, and that shoppers' parcels would not be wrapped in paper. Yet a big welcome of cards and calendars has already appeared, and in shops the difficulty is not to get one's parcel wrapped up, but to prevent the assistant from wrapping it up. The snag seems to lie in the loopholes which these earlier Orders allowed. Thus greeting cards could be produced if the weight did not exceed 3-5ths of an ounce, and even this limitation disappeared if the cards were made wholly from waste paper. For a parcel, the loophole lay in the phrase "does not reasonably require any such packing or wrapping for its protection," and the interpretation of an unreasonable parcel was left to the reasonable shopkeeper and customer. By the new restrictions, however, no retailer is to provide any wrapping paper

except for foodstuffs or articles to be delivered. Moreover, the future production of greeting cards is to be completely prohibited; there are additional restrictions on the number and size of posters; the ban on paper handkerchiefs has been extended to cleansing tissues and to the manufacture of paper sachets for permanent waves; there are a host of other restrictions; and in general the use of paper in stock for manufacturing paper articles and the use of paper made from waste paper and straw is now banned. There will probably still be justification for grumbles about the wasteful consumption of paper, especially by Government departments, but the Ministry of Supply is at least making a determined effort to prevent its waste in manufacture, and can consequently intensify its salvage campaign with a clearer conscience.

Shorter Notes

The new Solicitors Act, which received the Royal Assent on Tuesday, provides that every solicitor shall once a year deliver to the Law Society a certificate by a qualified accountant that he has complied with the Solicitors' Account Rules requiring him to keep his clients' moneys in a separate account from his own. Another section provides that rules may be made for the establishment of a compensation fund, out of which the public can be reimbursed for losses suffered through the defalcations of solicitors. Every solicitor will probably be required to pay a sum not exceeding £5, on taking out his annual practising certificate, into the fund. It will be administered at the discretion of the Council of the Law Society, and it is hoped that compensation will be paid in full.

*

The long feud between two of the leading Arab families in Palestine, the Husseinis and the Nashashibis, has recently taken a new turn. Fakhri Nashashibi, a member of the family which is a friend of Britain, whose uncle as Mayor of Jerusalem worked for an understanding between Britain and the Palestinian Arabs, was assassinated in Baghdad last Sunday; and the man arrested in connection with the murder is alleged to have been in communication with Abdul Kadir Husseini, a relative of the ex-Grand Mufti. The ex-Grand Mufti himself, Haj Amin el Husseini, main-spring of the Arab revolt of five years ago, is now an honoured guest in Berlin.

THE WORLD OVERSEAS

China's Needs

(From Our Shanghai Correspondent temporarily in Chungking)

October 7th

THE visits here of another group of British and American financial experts—this time, Sir Otto Niemeyer (British) and Mr Merle Cochrane (American)—were well timed. Free China needs additional foreign credits and supplies to sustain and intensify her defence against Japan. Her leading Government officials have a pretty good idea of what ought to be done along these lines. War expenditure, however, absorbs so colossal a percentage of China's ordinary and extraordinary revenues that only relatively small sums are left over to promote the further economic development that is so urgently required. Moreover, even if the necessary money were provided, China would still lack many of the materials she needs. The Chinese National Government hope that the Niemeyer and Cochrane missions will help them to secure from the democracies both money and supplies.

Dr Wong Wen-hao, Chinese Minister of Economic Affairs, in an exclusive interview with this correspondent, outlined as follows his department's most urgent tasks at present:

(1) The production in Free China of nitro-acid and nitro-cellulose, as well as of other basic materials for the manufacture of explosives, has to be expanded. The present out-

put of these lines is insufficient to meet current military requirements.

(2) Steel production must be increased. During the past two years, Free China has managed to expand very substantially her output of pig-iron, especially in Szechuen province, where numerous new blast furnaces have been established. More of such furnaces are under construction. Yet the expansion of steel output lags far behind that of pig-iron production, and the deficiency has to be remedied by the extension of existing, and the establishment of new, steel plants.

(3) Free China must quickly improve the quality of several of her leading export products, particularly metals. Tin mined in Yunnan is not of an altogether satisfactory quality; new smelting plants must be erected. Free China's wolfram ore is still below current American standards; its quality must be increased by improved ore-dressing, requiring new industrial establishments.

An all-round increase in industrial production in Free China—considering in the first place military requirements, and in the second place the development of China's natural economic resources—must be achieved, Dr Wong Wen-hao stated. In this field, Free China by no means relies entirely upon foreign assistance. She has a series of important new

industrial ventures well under way. In various provinces, new small and medium-sized electric power plants are in process of construction. New coal mines are being opened up in Szechuen and other provinces. Dockyards in several localities are being expanded and allow the construction and planning of twelve more river steamers; six such new steamers have already been built in Free China. A score of new machine-shops are under construction. Production of alcohol for motor fuel from molasses yielded by Szechuen's ancient sugar industry, which was formerly wasted, is being intensified.

Remarkable results have already been achieved in Free China's industrial development. During the first four years of the Sino-Japanese war, Dr. Wong Wen-hao revealed, the areas now comprising Free China imported from abroad no less than 30,000 tons of industrial machinery, as well as another 140,000 tons from regions now occupied by the Japanese and from Shanghai. Almost all of this machinery has been established and is now in full operation. Free China's industrialisation still compares poorly with that of western countries, yet it has changed the economic structure of many of the country's formerly backward areas to an astonishing extent. It is among the major factors which enabled the Chinese National Government to continue fighting Japan after the loss, about three years ago, of both Hankow and Canton. Outstanding among the new industrial establishments in Free China, now in full capacity operation, are new power plants in six provinces; a series of new cotton mills and 150 machine-shops in Szechuen province; and a combination in three provinces of new manufacturing plants of electric machinery, materials and appliances, whose output includes generators up to 200 kilowatts, as well as transformers.

The Transport Crux

The industrial and general economic development of Free China must go hand in hand with a further improvement in external and internal communications. The crux of Free China's transport problem is still overland traffic in motor trucks. Besides the military trucks operated by the army, there are now running on all Free China's roads approximately 10,000 trucks, of which some 70 per cent are Government-owned and the remainder privately owned. Servicing facilities are not satisfactory. The chief requirements in this field were summarised to this correspondent by Dr. Chang Kia-ngau, Chinese Minister of Communications, as follows: (1) more and better repair stations, as well as technicians, to operate these stations; (2) more trucks and more replacement parts; (3) a better training of the staffs operating the trucks; and (4) more motor fuel and lubricants from abroad. Substantial relief as regards point 2 will result from the early arrival of large numbers of American trucks now on the way to Rangoon. Unsatisfied requirements in the other three points, however, still present great difficulties.

Yet Dr. Chang Kia-ngau insists that remarkable improvements in overland truck transportation have been achieved during the past twelve months, and that there is reason to expect further improvements within the months to come. Relief to truck traffic has been provided partly by an extension in several provinces of river navigation, through dredging and the elimination, by rock-blasting, of rapids in many rivers, as well as by the construction of new steamboats. In Szechuen province, the volume of goods transported by river now approximates that of goods carried by truck. In Kwangsi province, river and canal transportation outdistances highway traffic. Relief to the Burma Road—the all-important foreign trade highroad to and from Free China—is expected from the current construction of railway lines along sections of the route, such as from Lashio (Burma) to the Chinese border, as well as from Kunming westward.

Ghettos in Europe

[BY A POLISH CORRESPONDENT]

November 10th

THE Nazi policy of anti-Semitism now embraces not only the half-million Jews of the Greater Reich, but also about nine million Jews in the rest of German Europe. Persecution and oppression are the fate of all people under Nazi rule, but it is the Jews who suffer most, who have had

the Nuremberg laws applied to them and who have been thrown into ghettos.

The ghettos of the Middle Ages were in some respects a part of the general social and economic structure of society. To a certain extent, all society was then organised in some type of ghetto; the feudal landlords, the artisan and merchant guilds, etc., were all organised behind barriers impassable to any outsider. In such a social order, the Jewish ghetto was not such an abnormality; on the contrary, in many cases, the ghetto implied in some ways the creation of a legal status for the Jewish community, and there existed some possibility of existence and development for the people behind the ghetto walls. The present position is very different. In the last two centuries, Jews all over Europe managed to emancipate themselves and to lead a free economic and social life. The deprivation of all the basic rights of man, coupled with the unbearable economic conditions behind the ghetto walls, will mean the annihilation of large masses of Jews now under Nazi rule.

There are three types of ghettos in Nazi-occupied Europe. First, there are the ghettos of Warsaw, Lodz, Lublin and Cracow, which were created by the General Governor, Dr Frank, in 1939 and were meant for the local population only. Secondly, there is the Lublin Reservation, which is intended, not only for the Jews living there, but also as a reception area for Jewish deportees from the Reich, Austria and the Czech Protectorate. Lastly, there are the newly-created ghettos in Lwow, Wilno, Kaunas, Riga, Minsk, Kiev, Odessa and in other places in the Ukraine and White Russia.

The Warsaw ghetto, which contains about 400,000 Jews, is used by the Nazis as a model for all others. Its establishment was easily carried out, since most of the Jewish population of Warsaw lived in the north-eastern part of the city, and it was only necessary to transfer about 150,000 Jews living in the west and in the centre. But the Jewish districts of Warsaw had always been overcrowded, and there was neither accommodation nor sanitary arrangements for the additional 150,000. The Nazi authorities have, however, ruthlessly carried out their plan; tens of thousands of families were forced to leave their homes; their belongings were confiscated; and they were pushed in behind the ghetto walls. The congestion became intolerable, and many families had to live in one room; no steps were taken to create even the most primitive facilities for the newcomers. It is no wonder that the conditions resulted in the outbreak of epidemics. This, however, was used by the Nazis as an excuse for tightening the ghetto laws; they explained that they were forced to segregate the infected Jews to prevent them from spreading the epidemics outside.

The administration of communal life is left to the Jewish Council of Elders, acting under strict Nazi supervision, who are collectively responsible for the good behaviour of the whole ghetto population. The Council is also responsible for the collection of taxes and contributions, for the execution of all laws and regulations relating to the ghetto inhabitants, for the administration of all welfare institutions—so far as they still exist—and for education—so far as it is permitted by the Nazis. A special unarmed Jewish police helps the Elders to keep order, acting under direct orders of the Gestapo and the military, whose quarters are just outside the ghetto walls. A post office under strict Nazi censorship is the only means of communication with the outside

world; a special Jewish Gazette is published in the Polish language, dealing mainly with official announcements, marriages, obituaries, etc.

Feeding the Ghettoes

Supplies of food and other articles are supplied to the ghetto in stringent rations; the rations for Jews are about a quarter of those for the Germans and about half those for the rest of the non-Jewish population. All commodities produced in the ghetto are strictly controlled by the Nazi authorities, and are in most cases taken away either for the military machine or for distribution outside the ghetto. A special monetary system, with a circulation inside the ghetto only, has been introduced. Prices for all food and raw materials supplied to the ghetto are fixed by the Nazis in such a way that the whole of the ghetto production can hardly cover the cost of the small rations allocated for the population. The German system of clearing and barter is applied to all trade done between the ghetto and the outside world, and as a result the ghetto population never has the chance of producing more than the cost of the small rations. If production increases, the food prices or special taxes are accordingly adjusted by the Nazi authorities, so that the whole ghetto output is absorbed. The population behind the walls can, therefore, never improve its economic position, and the policy of "going slow" is applied by the Jews in every field of industrial and economic activity. This causes unemployment, and any person without full employment is compelled to join the labour gangs for forced labour. The Nazi authorities can always exert pressure on the Council of Elders by threatening to increase the contingent of forced labour.

The number of schools in the ghetto is very small; there are no colleges or universities, and the only technical schools are those for training skilled workers for the engineering industries working for Germany. Every possible step is taken to keep the outside population away from the ghetto, and to prevent any contact between Jews and non-Jews. The Polish Gentile population—especially the working people and the intelligentsia—has, however, shown great sympathy with the sufferings of the Jews, and have shown it in spite of the wild anti-Jewish propaganda. This was clearly seen during the forced migration of Jews from the centre of the city to the ghetto; their non-Jewish neighbours refused the Nazi bribes in the form of Jewish household goods and furniture from the Jewish homes. There also exists underground collaboration between the anti-Nazi inhabitants outside the ghetto walls and the Jews inside. The secret anti-Nazi Press flourishes in the ghetto, and conspiracy can in many cases be more easily carried out inside.

The other ghettos in the General Government are modelled on that at Warsaw. The Lodz ghetto contains about 150,000 people, the Cracow ghetto about 50,000; and Lublin contained until recently about 60,000, but the numbers there have recently increased owing to the large numbers of new deportees from the Reich. The Lublin ghetto, which was originally called the "Reservation," has a complicated problem because of the large numbers of deportees who were sent there from the Reich without means of support. The German Jews always differed in language, culture, habits and education from the Polish Jews living in Lublin, and even under normal conditions there would be difficulties if these groups were suddenly forced to live together.

The newly created ghettos in the occupied territories of Russia are partly under German and partly under Ukrainian supervision. Very little news is as yet available about life there, but it can be expected that the lot of the Russian, Latvian and Lithuanian Jews will not be any better than that of their Polish fellows.

New Zealand's Budget

[FROM OUR CANTERBURY CORRESPONDENT]

THE annual Budget was presented to Parliament on July 16th. No new taxation is to be imposed this year though certain anomalies in income tax are to be removed, particularly in the method of taxing the trading banks. Social security is to cost an additional £NZ2 millions for increased benefits and extended medical services. Loan expenditure on public works of all kinds is slightly reduced, but most of the reduction is offset by increased expenditure from revenue. The estimated expenditure on war is increased heavily, and is to be met from the higher yield of taxation, from surpluses in last year's accounts, and from increased borrowing.

This year's Budget, like last year's, omitted the usual full review of the previous year's transactions and concentrated mainly on the estimates for the current year. In most cases, these estimates are very close to the actual results for last year. The greatest change is in the estimates for war expenditure, which can only be approximate and must be adjusted to meet changing conditions. For war purposes, the Government expects to spend £NZ69.7 millions, which is £NZ42.5 millions more than was spent last year. It is expected that £NZ31 millions of this will be spent overseas and will be met from advances made by the British Government. The remainder will be raised and spent in New Zealand. Surpluses carried forward from the war expenses account and the consolidated fund, together with a proposed transfer of £NZ1.5 millions from consolidated fund revenue, made £NZ7.6 millions available. Special war taxes are expected to yield £NZ19.3 millions and loans of £NZ13 millions in New Zealand and £NZ31 millions in Britain bring the estimated receipts of the war expenses account up to £NZ71 millions. The results for last year and the estimates for the present year are summarised below:—

RECEIPTS AND EXPENDITURE (£NZ million)			
	1940-41	1941-42	Increase
<i>Receipts</i>			
From taxes	61.5	63.7	2.2
Other revenue	11.4	13.3	1.9
Loans	26.0	56.9	30.9
Total	98.9	133.9	35.0
<i>Expenditure</i>			
Consolidated Fund	58.7	58.3	0.4
Social Security Fund	12.6	14.7	2.1
Public works, etc.	21.1	20.6	0.5
Total	92.4	93.6	1.2
Less transfers between accounts	3.2	3.1	0.1
Total ordinary	69.2	69.0	0.2
War expenses account	27.2	69.7	42.5
Total expenditure	96.4	138.7	42.3

Taxation amounted to £NZ37.10s. per head for the total population in 1940-41 and for 1941-42 it is likely to exceed £NZ39 per head.

Last year the net addition to the public debt was £NZ26 millions, of which £NZ15.6 millions was spent on public works, housing, etc., and £NZ10.4 millions for war purposes. But £NZ18.2 millions was raised for war purposes, leaving a surplus of £NZ7.8 millions, which does not appear in the table above. Part of this was used to repay debt and part is available to meet expenditure in the present year. For 1941-42, £NZ12.95 millions is to be raised for public works, housing, etc., and £NZ44 millions for war purposes.

For the social security vote, the estimates are £NZ2.1 millions higher than the expenditure last year. Most of the monetary benefits have increased, and the vote for administration, medical and hospital benefits, etc., has expanded from £NZ1.35 millions to £NZ3.47 millions. It is expected that the yield of the special social security tax will be similar to last year's, but the extra expenditure will be met from balances carried forward and by a larger transfer from the social security fund.

Expenditure on public works last year amounted to £NZ15.6 millions from loan money and £NZ5.5 millions from revenue. For the present year it is estimated that £NZ12.95 millions of loan money will be spent together with £NZ7.66 millions from revenue, a reduction of £NZ500,000 only on last year's expenditure.

AMERICAN SURVEY

Labour Supply and Relations

LIKE Great Britain during the past eighteen months, America is faced with all the difficulties of recruiting and of training the additional labour that is required for the now rapid expansion of the war industries. Unlike Great Britain, America is also faced with a serious problem in labour relations, reflected in frequent threats of stoppages and strikes that are holding up production.

The total supply of America's manpower is larger than the United Kingdom's, roughly in the ratio of their populations, numbering 130 millions in the one and 48 millions in the other country. The proportion of total manpower that is potentially available for employment in the war industries is also probably larger in America, in spite of the high total of labour needed in agriculture, because of the fact that the armed forces, at under two millions, are only about half as large as they are in this country.

It has been estimated that a defence programme involving expenditure at the rate of \$25 to \$30 billions a year at current prices would require a labour force of about 9½ to 11½ millions. In August the annual rate of expenditure was \$13½ billions, but it is expected to rise to the rate of \$20 billions towards the end of the present financial year and to \$30 billions during the year ended June, 1943. Since Great Britain's war expenditure is now at the annual rate of nearly £4,000 millions, or \$16 billions, at the current rate of exchange, which, for the purpose of comparing war expenditures, certainly undervalues the pound, it is still larger than America's. And as the population of the United States is about 2½ times that of the United Kingdom, an annual defence expenditure of \$30 billions would involve a proportionately much smaller drain on its manpower, even if its armed forces were increased to ten millions, which is at present unlikely.

The United States, therefore, should not experience any insuperable difficulty in recruiting for the production front the 11½ million men and women that will probably be needed by 1942-43. Some five million workers are probably already engaged on the defence programme; hence, the additional number required during the next twelve to eighteen months is only about six and a half million. The size of these needs in manpower is seen in better perspective if it is remembered that in July, 1940, at the inception of the defence programme, the Works Progress Administration recorded 9.3 million persons as unemployed. By August this year the WPA unemployment total was down to 5.3 millions; but a large proportion of the four millions who found employment during this period was absorbed in the consumers' goods trades. These trades are now beginning to be affected by the diversion of materials to the defence factories; and according to Mr Leon Henderson, in charge of civilian supplies, "priorities unemployment" may ultimately release two to two and a half millions for war work.

So far as total numbers of war workers are concerned, the present American defence programme is, therefore, easily within the limits of possibility; the real problem is to train the additional millions that will be required. Already reports from America reveal a shortage of skill—manual, supervisory and managerial.

Apart from the need for additional labour, one of the most vexed problems is the loss of time through unsatisfactory labour relations. According to the Bureau of Labor Statistics, the number of man-days lost through strikes between August, 1940 and August, 1941 has been as follows:—

NUMBER OF MAN-DAYS LOST THROUGH STRIKES (In thousands)			
1940—August	706	1941—February	1,128
September	781	March	1,544
October	915	April	7,086
November	740	May	2,250
December	458	June	1,375
1941—January	665	July	1,300

Numerous and costly though these strikes are, the time lost through them represents only a very small proportion indeed of the total man-days worked; but they may cause serious hold-ups in the production of key materials. They do not have their roots mainly in demands for better working conditions and higher pay. Indeed, weekly earnings have increased substantially since the summer of 1940; according to the National Industrial Conference Board, they rose by 23 per cent in manufacturing industries between July, 1940, and the corresponding month this year. Moreover, the rise in the NICB's index of the cost of living has been comparatively small during this period; in real terms, weekly earnings show an increase of 18 per cent. An analysis of the causes of strikes in 1940 and in the first quarter of 1941, based on the Department of Labor's returns, shows the following results:—

Issue	Percentage of Strikes		Percentage of Workers involved	
	1940	Jan.- March, 1941	1940	Jan.- March, 1941
Wages and hours	30.2	28.0	41.0	28.9
Union organisation	49.9	54.3	33.1	53.0
Recognition	10.4	11.8	3.5	17.9
Recognition & other issues	20.4	25.7	8.9	19.1
Closed to Union Shop	11.6	8.0	11.0	7.5
Other	7.5	8.8	9.7	8.5
Union rivalry & jurisdiction	6.3	7.0	4.6	5.1
Other causes	13.6	10.7	21.3	13.0

This analysis shows quite clearly that the main issue in American labour relations is the question of collective bargaining. In 1940, one-half of the strikes, and an even bigger proportion in the first quarter of this year, were ascribed to this cause.

When President Roosevelt first took office, collective bargaining in America was still in its early stages. But his New Deal policy, designed to improve the status and position of the working classes, gave a strong impetus to the development of collective bargaining. Friction between labour and management became inevitable; and the issue was complicated by the rise of the CIO under the leadership of Mr John L. Lewis, with its programme for the creation of industrial unions, which cut right across the principle of the older AF of L and its craft unions of skilled workers. Unfortunately, when the defence programme was initiated in the summer of last year, the majority of the industries affected were then still only partially unionised. Compared with 6,200,000 trade unionists in this country, the combined memberships of the AF of L and the CIO a year ago was still only 7,807,000, the former claiming 4,247,000 and the latter 3,559,000 members. In addition, the Railway Brotherhoods, an independent group of unions, had some 600,000 members. American labour, not unnaturally, is loth to give up the drive for unionisation, simply because of the defence programme. On the contrary, the growing demand for labour puts the unions in a much stronger bargaining position. A comprehensive national organisation, such as the TUC in Great Britain, can take a far-sighted and patriotic view. Two rival federations, competing for the workers' favour, find it much more difficult. The problem is serious, but a solution will have to be found if severe hold-ups in production are to be avoided in future.

There has been no lack of effort on the part of the Administration to secure peaceful settlements of outstanding issues. Indeed, there are no less than six federal agencies created for this purpose, though the scope of four of them is limited. The Maritime Labor Board deals with controversies in shipping, the National Mediation Board in railway and air transport, while the Railroad Adjustment Board mediates in questions concerning the application of existing agreement. The National Labor Relations Board has been set up chiefly to enforce the right to collective bargaining, though it can also assist in preventing strikes over union recognition and unfair labour practices. The Conciliation Service of the Labor Department has been designed to assist in any dispute between labour and management, and in the first seven months of the current year it was able to prevent strikes in 911 disputes involving 548,000 workers.

When the strike epidemic assumed serious proportions early this year, President Roosevelt set up the National Defence Mediation Board on March 19th. The NDMB consists of three independent persons and four each representing labour and management; but it can only mediate in disputes certified to it by the Secretary of Labor who, in turn, has delegated her certifying powers to a committee consisting of the chairman of the Board—at present Mr W. K. Lewis—the legal adviser to the OPM, and the head of the Labor Department's conciliation service. According to a report of the Foreign Policy Association, the NDMB had received 70 cases involving some 800,000 workers by the end of August. Finally, President Roosevelt himself is frequently intervening in disputes, in the present one affecting the "captive" coal mines of iron and steel companies, for example. So far, however, these methods, while often successful, have not been able to stem the strike epidemic.

Rising Production

LABOUR difficulties have not prevented a steady expansion in industrial activity; but without them the pace would have been even faster. The scarcity of certain materials, especially of metals, is becoming more acute, and the stage may soon be reached for a number of materials when, as in this country, the system of priorities will have to be replaced by direct allocation.

The Federal Reserve Board's Index of production continued its ascent in September, but the seasonal adjustment masked the actual increase. Nevertheless, as far as the general public is concerned, the conspicuous fact is the growing scarcity of an increasing number of items of personal and household use, the observable deterioration of quality, and the rise in prices. None of these, however, has reached the stage of causing more than inconvenience.

* Preliminary.

The output of aircraft rose to 1,914 in September, an increase of 60 over the figure for August which contained three more working days. But production in September was still some 300 units behind the schedule prepared a year ago. The production of engines, too, has been speeded up; some 2,700 operational engines more turned out in August, of which about 500 were exported, apart from those in finished aircraft. In addition, some 1,200 smaller

engines for trainers and tanks were completed in August. The total horse-power of engines produced in that month, at 4,500,000, was three times that of August, 1940.

American & British Taxation

THE Chamber of Commerce of the United States has put into circulation some very remarkable calculations purporting to prove that the burden of taxation in the United States is higher than that of the United Kingdom. The fallacies underlying this comparison have already been effectively pointed out in a speech by Mr J. L. Sullivan, Assistant Secretary of the Treasury; but since *The Economist* was used by the Chamber of Commerce as one of its sources, a further brief comment is in order. The Chamber of Commerce gives two comparisons, of which the first is the absolute money burden of total taxation in the two countries. The American figure is given as \$180 per head, the British as \$173. The American figure, which works out at a total of \$23,400 millions, is arrived at only by taking the highest of a range of estimates of State and local taxes. The British figure works out at about £1,980 millions, which is definitely on the low side if it is intended to include (as it should) the full effect of existing national taxes, social service contributions (included in the American figure) and the autonomous revenue of Northern Ireland. The figure would be more correct if it were about \$190 per head. But in any case, this particular comparison is entirely dictated by the rate of exchange that happens to be fixed by the exchange control—and even if it is established that the average American pays more taxes than the average Briton that merely proves how much richer the United States is.

The only fair method of comparison is by expressing tax revenue as a percentage of national income. In this comparison, the Chamber of Commerce performed the statistical *tour de force* of putting the American national income at (in the current financial year) \$90 billions and the British at \$36 billions (£9,000 millions!). So anxious are they to prove that the American burden is higher than the British that they cheerfully accept figures which would make the *per caput* British income more than 10 per cent higher than the American. The source of this figure of £9,000 millions is stated to be an article in *The Economist* of February 1, 1941. There are two things to be observed about the figure. First, it was described at the time as a crude estimate, and any such lay guesses were superseded by the official estimates issued at the time of the Budget speech and fully reported in *The Economist*. Secondly, the figure was printed as an estimate of gross national income. At the time, this was not a very clear concept; but the context of the article should have made it clear that it referred to what, in the more exact terminology developed in *The Economist* of April 12, 1941 (when no less than nine separate definitions of the national income were identified), was called "gross available resources at market prices." As such, the £9,000 millions figure (for the fiscal year 1941-42) was not badly out; the estimate for the last quarter of 1940 derivable from the White Paper is about £8,200 millions.

But the correct figure for comparison with the official American estimates of national income is not the largest of the nine but the smallest, or net national income at factor cost, since that most nearly accords with the American definitions. This figure was at the rate of £5,804 millions (say \$23 billions) in the last quarter of 1940 and may be \$24 billions or slightly more on the average of the current financial year. If the proper total of expenditure is compared with this figure, the tax burden works out at about 36 per cent or well above the American proportion of 25 per cent. In the present state of terminology and estimation, national income figures are very dangerous tools of controversy, to be handled only by the expert. It is a very great pity that, in the anxiety to make a point of domestic political significance, the Chamber of Commerce of the United States should have given the impression that the British taxpayer, after two years of war, is bearing a burden rather less heavy than that which the American taxpayer knows, from his own experience, to be far from intolerable. When the existing Federal taxes have been about doubled, the burden of taxation in the United States will approximate to that now existing in this country. Until then, the British taxpayer should be left to groan without competition.

THE BUSINESS WORLD

British Investment in South America

ALTHOUGH the opening of the Argentine rail season appears to offer nothing but confirmation of the gloomy forebodings entertained by the majority of informed stockholders, interest in investment possibilities in South America has quickened strikingly in recent weeks. This is no doubt due in part to the improvement in the exchange position of certain of the republics, an improvement which, in the case of Brazil, recently permitted the transfer of a dividend on the ordinary stock of Brazilian Traction for the first time since 1938. Moreover, United States and British Government purchases from the South American continent and, in particular, from Argentina, have raised hopes of a general improvement in trade. On the other hand, the accumulation of sterling balances in London, which may result if the scope of recent transactions is greatly extended, again brings to the fore the possibility that the Governments concerned will take the opportunity to redeem the national railways, and other key interests, from foreign control.

The British investor has now, and has had since the first quarter of the nineteenth century, a considerable stake in the South American continent. The record of investment in this field over the last hundred years has not been a wholly felicitous one, but it has none the less played an important part in stimulating the expansion of British trade, and a vital part in financing the development of the former Spanish and Portuguese colonies. Now that the British investor appears to be faced with a choice between prolonged absence of dividends and repurchase at some arbitrary price, it is opportune to ask what Great Britain has put into South America during the past century, what she has got out of it, and what are the current prospects, in the absence of expriative action by the Governments of the various republics. In short, would the British investor be well quit of commitments in Latin America, or is the heyday of development still to come?

From the historical standpoint, it is hardly possible to overestimate the importance of the part played by British capital in the creation and development of the republics which threw off the Spanish yoke around 1820. The original loans, which were floated mainly through the instrumentality of the houses of Baring and Rothschild between 1823 and 1825, were for the twin purposes of arming the republics against reconquest, and of exploiting the mineral resources of Bolivia and Colombia. The boom was short-lived, and default was general by 1826, but it is reliably estimated that between 1815 and 1830 as much as £20,000,000 was subscribed through the London market for investment in Latin America.

By 1830, the British public had thoroughly burnt its fingers in this quarter of the globe, and interest in its possibilities did not reawaken until the railway boom in other more accessible regions had reached an advanced stage. The opening of the new epoch of investment in South America dates from the agreement of Thomas Brassey to start the construction of the Central Argentine Railway in 1864. With the opening up of the continent by the provision of cheaper and more rapid transport in the third quarter of the century, the large-scale exportation of the grain crops of the Argentine and of the coffee of Brazil attracted fresh capital. By 1878, British capital in Argentina alone is estimated to have amounted to £27 millions, or 90 per cent of the total foreign investment in that country. The peak of British lending to South America was reached before 1914. Since that date, a local high level was touched in 1926-27, but the bulk of investment in the inter-war period came from the United States. Thus, British investments are estimated to have risen from \$3,834 millions to \$4,515 millions between 1913 and 1931, while United States investments increased from \$173 millions to \$3,102 millions. The latest estimate for total British holdings gives a figure of £1,090 millions in 1940, against £1,205 millions in 1930. Before the war, roughly one-fifth of all British overseas

investments were still in South America. It is estimated that as much as 80 per cent of the total is in either Government securities or railways. The remainder is employed in companies representing the staple industries of almost every republic. In the main, these companies are registered in the United Kingdom—a practice that stands in contrast to the United States investments, which are largely in companies of local registration.

In many respects, the investment of foreign capital in South America has features that are not found elsewhere. From the standpoint of the republic, British control of, say, Lautaro Nitrate, operating in Chile, Peruvian Corporation or Lobitos, operating in Peru, or Leach's Argentine Estates and Forestal Land in Argentina, provides foreign capital with an unusually direct interest in the development of the countries in question. This is scarcely less so when investment, as in the case of the United States, has been predominantly through the holding of shares in South American ventures. From the standpoint of the British investor, the dependence of each of the republics on the sale in international markets of one or two primary foodstuffs or raw materials has made his investments peculiarly sensitive to the influence of the trade cycle. That is to say, the South American republics benefited excessively from the boom of the late 1920's and suffered proportionately in the slump years. Although the conclusion of the Roca Agreements with Argentina in 1933 and 1936 prevented that

"THE sort of book every big town should produce..."
—Professor C. H. Reilly in *NEWS CHRONICLE*.

"ADDRESSED to the expert, but so written as to be plain sailing for the layman..."—*NOTTINGHAM JOURNAL*.

ORDER FROM ANY BOOKSELLER.

came into operation on November 1st last. The changes were as follows:—

Classes of deposits and banks.	Present Requirements. (Per cent of deposits.)	Previous Requirements.
On net demand deposits.		
Central Reserve City banks	26	22½
Reserve City banks	20	17½
"Country" banks	14	12
On time deposits.		
All member banks	6	5

Member banks' excess reserve balances which stood at \$4,600 millions on October 30th had been reduced to \$3,410 millions by November 6th. The process of mopping

up excess reserves has, however, been hastened by means other than the upward adjustment of reserve requirements. The Federal Reserve Banks' statements show that between October 16th and 23rd last the total member bank reserve deposits had fallen from \$13,321 millions to \$12,749 millions, the whole of this reduction being borne by the amount of excess reserves. Detailed returns will have to be received before the exact causal factor in this movement can be determined, but it is probable that the sudden fall in these reserve deposits prior to the operation of the higher reserve requirements was due to a transfer of credit to non-member deposits. It is certainly not explained by open market operations or by gold movements. Excess reserves reached their peak of \$6,931 millions in November, 1940.

Investment

Overseas Investments

The better news of the past few days has had the usual effect on the stock market, namely a recovery in turn-over, but this is already showing signs of having passed its peak. Actually, Monday and Tuesday of this week were, according to the criterion of the number of bargains marked, the busiest days since mid-September, when industrial equities were at the highest of the year. According to the index of *The Financial News*, this level has been fully attained once more, while fixed-interest stocks have just maintained the advance on their then level. The real interest in the past few days has, however, once more been concentrated upon overseas investments, notably South American bonds and shares of all descriptions, as well as oil and gold-mining favourites. At current levels many of these purchases represent a long-term speculation, but it is to be noted that, with the exception of Argentine railway equities, there has been no substantial loss of value during the temporary halt which followed the previous burst of buying in these sections. No doubt some of the buying was a short-term gamble, but it seems that the search for capital appreciation is now driving the investor further and further afield. Something of the background against which the prospects of South American investments must be viewed is given in an article on page 597, and a development of interest to investors in oil companies is set out in a Note on page 590. Gold mines appear to be in a different category in that their troubles—if they are to come—will begin to emerge after the war. At the moment, all that can be said is that the concentration upon the type of security which has been popular of late appears to reflect a belief that the powers of light will—in the popular phrase—win the peace as well as the war.

Montreal Finances

The full text of the City of Montreal's debt plan has now been made available in this country, but adds little useful information to the story as set out in *The Economist* on November 1st. There are, however, two points of some interest, neither of which is likely to influence favourably the attitude of British bondholders to the scheme. One of these is that "provision is to be made for adequate and effective financial control, details of which are to be arranged by representatives of the City and the Debenture Holders' Committee," that is the committee in Canada. The second is a list of the items in respect of which the debt of \$40½ millions has been, or is to be, incurred from the City's bankers. In round figures, this includes 5 millions for conversion premium and other payments under the suggested scheme, and 8½ millions for the renewal or funding of debt. Of the remainder, the principal items are \$10,340,000 for direct relief, \$6 millions anticipation of revenue re taxes consolidated, and \$10 millions reserve for losses of taxes and other accounts receivable. Montreal was before the war a city of well over a million inhabitants, more than Glasgow or Birmingham. It is out of reason to suggest that it cannot meet such calls upon it without borrowing for an average period of some five years. Alternatively, if it prefers to borrow, it should have no difficulty in raising such a sum as \$26 millions on easy terms to pay off the banks, once there is a reasonable assurance that its finances would be soundly administered in future.

Without that assurance no scheme should be accepted by holders of its debt.

* * *

Protecting the Bondholder

In a time of war controls, it is inevitable that some sections of public opinion should favour intervention from above, and it is presumably this mentality which has suggested that the General Purposes Committee of the Stock Exchange should assume, permanently, the function adopted with regard to the Montreal dispute. Without questioning the great value of their intervention in the circumstances of the moment, it seems highly undesirable that development of the system of protection for the bondholder should lie along these lines. There exists already machinery for this purpose in the Council of Foreign Bondholders, which might well be extended to deal with all overseas bonds. That body works in close co-operation with more than one department of the Government, and it would be ridiculous to duplicate their work. Further, a protest will always be more effective if it comes from the general body of bondholders, based on information supplied by their brokers and the Press. Apart from the fact that it has not been thought necessary to provide machinery for dealing with defaults within the Empire, the principal lacuna in the existing system is the lack of information as to the activities of some borrowers—Montreal is a notorious example. What is required—and here the Committee of the Stock Exchange has an important rôle—is that this information should be made available from the start and that it should be kept up to date. It is not to be supposed that it is wholly the fault of the Committee that no such conditions have been enforced before granting permission to deal. The current assumption, in the past, was that the name of the issuing house was a sufficient guarantee of soundness of the loan. That may have been the case at the moment of lending—although even that was not always true—but with the lapse of time conditions change, and it is clear that, if ever the time returns when there are new issues of this type in London, every effort should be made to strengthen the hand of the Stock Exchange in demanding the regular supply of adequate statistics. A department might then be established to collect, collate and disseminate this information to brokers and others concerned. This department might perhaps best be established by the Stock Exchange Committee, since they would have certain further information which could not be reduced to figures. In any case, there should be a complete pooling of all available facts and improved machinery for their publication.

British Sugar Corporation

The system of subsidising the growth of sugar beet by a payment to manufacturers of beet sugar aroused from the first a good deal of comment, and the fortunes of the British Sugar Corporation have been watched with a great deal of interest. The accounts for the year to March 31st last, held up by a change in procedure as to remuneration, are now presented showing a drop in trading profit from £1,182,143 to £777,164. This fall must be due largely to the fact that, whereas under the old arrangement the

Back to Sanity and Free Trade

"War is teaching us that the whole World is a unit in which the needs of each can be met only by taking into consideration the needs of others."

This sentence from "*Towards a Christian Britain*"—the Manifesto recently issued by the Lord Mayor of Manchester and Mayors of other Lancashire towns—reveals the new spirit abroad in the Land.

For far too long have the British people thought only of their own standards of life. They are now beginning to learn that not only have they had false ideas of values, but that their own standards can be maintained and improved only if the lot of the peoples of other nations improves also. No nation can benefit permanently out of the miseries of others.

Britain raised the standards of life of her own people and of all mankind under Free Trade. Protection reversed that process.

The move back to Free Trade has begun. The Atlantic Charter will be recorded in history as a turning point in the War. It has no value unless it means Free Trade. And it does mean Free Trade.

Mr Sumner Welles, United States Secretary of State, courageously and frankly stated to an audience of the National Foreign Trade Convention in New York, that American tariffs were amongst the most important Causes of the War. He said "the resultant misery, bewilderment and resentment, together with other equally pernicious contributing causes, paved the way for the rise of those very dictatorships which have plunged almost the entire world in war."

Britain, too, made her greatest economic error in abandoning Free Trade. Here, too, repentance is the order of the day. The Rt. Honourable Anthony Eden, Secretary of State for Foreign Affairs, at Manchester, on October 25th, said: "We must recognise that in the past twenty years we have taken a number of wrong turnings in economics and politics alike. To review and consider those mistakes amongst ourselves is essential if we are to shape our future policy aright. These are the problems which are being considered now by the Government."

This statement can mean nothing but a proposal to reconsider the Protectionist Policy.

Our country built up its prosperity and its 45,000,000 population on Free Trade. Under Protection its earnings have fallen. And when the earnings fall it becomes the policy of Government to see that all members of the community get something, however small. The inevitable result is regimentation, a huge bureaucracy, planned industry and the elimination of the small trader and craftsman. Planned industry is evidence of material poverty and poverty of the mind.

In the coming months, vested interests, both of Capital and Labour, will fight for the return of their pre-war privileged positions. In order to do so, some will come forward with proposals for zones of trade influence and for international price rings. But the only cure is complete Free Trade for Britain—regardless of the policies of other nations.

Time marches on. The pendulum swings back. Britain goes forward. A willingness for unselfish reform will fortify the will of men to fight for worthy things.

Support for the Free Trade cause comes in by every post.

Readers of *The Economist* are invited to apply for our Manifesto calling for an immediate declaration of Britain's intention to return to Free Trade.

The Free Trade Legion also seeks men to contest by-elections in the cause of Free Trade and to represent the Legion in all important Centres.

The Free Trade Legion stands for Free Trade, retrenchment and reform, private enterprise, individual responsibility, and sanctity of contract.

President—Major the Hon. L. H. CRIPPS, C.B.E.,

38, Norfolk Street,
Strand, W.C.2.

Treasury found a 4 per cent yield "reasonable," this has now been revised to 3½ per cent. Otherwise the position is not greatly changed. The principle of guaranteeing the minimum is now explicitly recognised, whereas in the past an *ex gratia* payment was made when the *pro rata* subsidy on the product was insufficient. Shareholders will be pleased to learn, however, that the incentive scheme, under which a proportion of all economies, as against March, 1936, may be retained as profit and distributed, is still in force. These sufficed to cover an additional 1 per cent dividend, making 4½ per cent, the same as in the preceding year, and to add some £11,700 to carry forward after providing £80,000 for war damage contribution. The economies should increase yearly, and the figure is of the order of £145,000, compared with £50,000 odd for 1939-40. Charges against the profit shown above are slightly reduced except that net interest payable is up from £5,331 to £87,175. If this were a real increase in costs, it would cut heavily into profits, but it appears to arise in connection with the most striking change in the balance-sheet, namely, an expansion in the holding of raw and refined sugar of over £5,000,000 to £7,807,000 odd. This is financed to the extent of £7,150,000 by advances from the Ministry of Food, and the other liabilities of the Corporation are very substantially reduced. A guarantee has been given against any loss on final realisation of these considerable stocks, and, presumably, this would include permission to charge any interest arising from carrying them. The excess of current assets over liabilities is increased by some £220,000 to approximately £2,000,000. The only other development of interest is the fixing of the EPT liability, which is favourable enough to release £105,000 from taxation reserve for transfer to the reserve against any subsequent fall in the sugar duty which stands, after the transfer, at £180,000. No figures of production are so far available, but it is evidently in excess of rationed requirements. How far the stock of the Corporation has been increased, and what contribution it may have made to recent assistance to Russia, are likely to remain hidden for some time. The outlook for the ordinary shares is conditioned by the extent of economies, and some definition of this term would be welcome. The £1 shares at 18s. 9d. yield some £4 17s. 3d.

Company Notes

Mitchells and Butlers

The full accounts of Mitchells and Butlers for the year to September 30th show a decline in profits after tax—except for an additional liability of £100,000 in 1939-40 due to the rise in the rate of income tax—and depreciation from £599,827 to £540,736. Since results in the current year may well be subject to a further retrospective tax provision, no comparison is possible between adjusted equity earnings of £390,510 in 1939-40 and the £439,898 at present available for 1940-41. The additional provision in the previous year reduced the rate of earnings from 27.0 to 21.5 per cent, while the latest accounts indicate earnings of 28.8 per cent in the current year. Even if further taxation has to be provided retrospectively, it is unlikely that the 21 per cent dividend paid for the last four years will prove to have been under-earned. There would, however, be another reduction in the carry forward, which is already lowered from the adjusted figure of £569,630 to £568,958 by the transfer of £120,000 to war contingencies. In the previous year, property reserve received £100,000.

§ War Contingencies.

The directors state that gross profits increased last year and that the apparent setback is entirely due to higher taxation. This assurance, which implies that total revenue was not restrained by rising costs or by shortage of supplies or labour, is highly satisfactory. The accounts state that some damage to property was suffered from enemy action, and that fixed assets, at £8,685,364 against £8,698,304, are the subject of certain claims under the War Damage Act. As was to be expected, stocks are somewhat depleted, totalling £936,808 against £965,560. Last year's high pressure of business is reflected in a rise in debtors from £168,532 to £269,501 and in creditors, including taxation, from £1,664,650 to £2,502,805. A rise in cash of some £500,000 to £1,491,098 is accompanied by the investment of £145,000 in Government securities, bringing the total to £245,000. The transfer of £200,000 from contingencies—leaving £600,000—to war contingencies brings this fund, after the allocation from current profits and payment of war damage contributions, to £203,108. In the absence of a further steep rise in income tax, there is every reason to expect that net earnings will be approximately maintained this year. The £1 ordinary stock, at 79s. ex dividend, yields £5 6s. 4d. per cent.

Joshua Hoyle Payment

The fact that the final dividend of Joshua Hoyle and Sons is being maintained at 5 per cent, making again 7½ per cent for the year ended September 30th last, is a pointer to conditions in a considerable section of the cotton industry. The company achieved in 1939-40 the largest trading profit, and the best net earnings, for many years. But the chairman pointed out that the bulk of the work represented pre-war orders. He also complained of the small margin on Government contracts, which were already replacing civilian demand, and the difficulties of export. In the past year, there has been a great curtailment of individual demands for non-Government purposes, while export has become still more difficult. The interim statement shows, however, a rise in trading profit from £194,164 to £211,500, after EPT. In this case, the explanation may lie in a settlement of the EPT liability on a basis more favourable than was expected a year ago. But it is probable that a part at least of the improvement is due to the growth of the official demand. This has been accentuated of late by the need to ship textiles to Russia, and there is now a bottleneck in certain sections of the industry caused by shortage of labour. A favourable view of the outlook is evidently held by the investing public, for the 2s. ordinary shares have been steady at 28s. 6d. for some time past, having risen over recent months from half that figure. The yield on the 7½ per cent dividend and the current price is some £6 5s. per cent.

Fine Spinners' Statement

If the Joshua Hoyle accounts helped to encourage the recovery in cotton textile shares, the decision of Fine Cotton Spinners' and Doublers' Association to discontinue interim reports, and defer dividend consideration until the end of the financial year, has had the opposite effect. Yet it should have caused no surprise. In his speech of May last, the chairman made it clear that the profits of 1940-41 had been earned mainly in the first six months, and that the new year would bring a decline. This may actually have been unduly pessimistic, for there is a world boom in cotton textiles, caused by the cutting down of the Lancashire industry, and it is only the full effect of restrictions which is causing a further decline in turnover. This is not wholly effective even yet in the doubling section of the industry, where the care and maintenance scheme comes into operation on December 1st. Until the extent of the economies secured under this is known, the outlook for Fine Spinners must remain problematical. One of the greatest factors in reducing costs is full-time working, and at the moment large sections of the industry have the choice between working part-time and reducing still further the number of looms and spindles at work. It appears that a considerable proportion of employees from telescoped factories either went into other industries or at least left the neighbourhood, with the result that the bottle-neck has shifted from materials to labour. It is not clear how far this labour should be attracted back into cotton, and upon the answer to that question depends, in the short run, the outlook for considerable sections of the industry.

Prices, Tailors Results

Preliminary figures of Prices, Tailors for the year to June 30th last show that this concern has suffered much less from the difficulties of wartime operation than their competitors, Montague Burton, whose results were dealt with in *The Economist* of October 18th, during a period which ended three months earlier. The profit before taxation shows a fall of less than 8 per cent and depreciation and all dividends are approximately maintained. The only important changes are in taxation figures and in the provision of £18,342 for war damage contribution. The profits of the past three years and their allocation are set out in the following table, the amounts of the dividends paid being estimated.

	Years to June 30th.		
	1939	1940	1941
Trading Profit	452,864	542,216	503,611
Taxation	70,000	153,000	230,000
Tax Reserve	120,000	247,000	...
Depreciation	95,322	96,502	95,911
Fees	1,500	1,333	1,250
War Damage	...	...	18,342
Pref. and paid dividends	39,875	35,000	£30,562
Renewals and Contingencies	40,000	...	...
Available for ordinary	86,167	11,581	£127,546
Paid on ordinary	120,000	93,000	£75,626
Carry forward	225,998	142,579	194,499

It will be seen that, while the current provision for tax is some 50 per cent up on the year, nothing is added to tax reserve or to other specific reserves. This interpretation of the gross payment on the ordinary capital to the controlling company, Prices Trust, has been maintained. This can scarcely fail to be the case, since that concern has repeated its 25 per cent dividend, and virtually its sole asset is its holding in the trading company. Since the latter enjoyed very good trade in the year 1937, its EPT base is reasonably good, and it is probable that the large reserve set up a year ago is far from exhausted. Evidently the total appropriation for taxation should be spread over the period in a manner quite different from that adopted in the accounts, and for this reason no attempt has been made to give the usual earnings percentages. The 5s. ordinary shares of the Trust at 18s. ex dividend, yield some £6 19s. per cent.

Central Argentine's Poor Year

The accounts of the Central Argentine Railway for the year to June 30th last do nothing to relieve the gloom created by the figures of BAGS and Western. As in the case of the former, gross receipts are down and, while all sections contributed to the fall, it was maize that was mainly responsible for the drop in goods takings. There is the familiar rise in expenses, due to higher fuel costs. Every other major item shows a fall both in absolute amount and in its proportion to total receipts. The rise in fuel costs was, however, £472,171, or more than one-third of the total interest charges of the company, and it is therefore not surprising to find the amount available heavily down, despite lighter exchange differences.

	Years to June 30th.		
	1939	1940	1941
Passenger receipts	2,302,103	2,176,011	2,089,673
Goods	5,607,457	4,830,667	4,607,107
Total gross	9,421,113	8,404,084	7,927,119
Working expenses	7,174,398	6,856,526	6,974,140
Expense ratio	76.15	81.59	87.98
Exchange loss	962,984	712,662	502,532
Available for interest†	1,316,488	867,159	479,614
Interest charges	1,280,559	1,282,568	*1,277,257
Carry forward	263,963	Dr151,416	Dr797,643

† Including income from investments. ‡ Written off out of General Reserve. *Of which £1,145,966 postponed under scheme of Nov., 1940.

Actually the increase shown in working expenses is due solely to an appropriation of £191,840, against nothing in 1939-40, to renewal funds, and the increase in fuel costs was more than offset by economies in other direct working expenses. Unfortunately, renewals fund still shows a decline of some £260,000 against £330,000 a year before. The first four months of the current year show an improvement in gross receipts of £500,000. Even in 1940-41, cereals accounted for some 47 per cent of the total tonnage of products carried, and the maintenance of this improvement will depend largely upon whether the Argentine Government buys the new season's cereal crops and whether it is possible to transport them to the coast, where storage is now scarce.

THE STOCK EXCHANGES

London

Note: All dealings are for cash only.

The naval successes in the Mediterranean, together with a spate of confident speeches by the leaders of the Allied Governments, provided the impetus to a marked improvement in the markets. Turnover (which included considerable speculative support of South American issues), as well as prices, showed a marked improvement. Some profit-taking on Tuesday was well absorbed, but sufficed to prevent any further advance. An exception to the general revival was the gilt-edged market, which has been affected by the current Warship Weeks, but there was considerable activity in all other sections of the market.

The gilt-edged market finished the previous week on a quiet but firm note, 4 per cent Consols and Funding Loan both advancing ¼, while the 2½ per cent National War Bonds 1946-48 and 1945-7 both improved ¼. Desultory trading on Monday led to losses of ¼ for 3½ per cent War Loan, Local Loans and the 2½ per cent Funding Loan. On the following day prices, apart from an improvement of ¼ in 5 per cent Conversion, remained unchanged, but Wednesday brought a resumption of the decline.

In marked contrast, activity in the foreign bond market was considerable, persistent support for Brazilian issues resulting in numerous and well-spread gains, among which, on the previous Friday the 20 year Funding "A" loan gained 1½, while at the re-opening the 6½ per cent loan of 1927 rose 2 points. Chilean bonds were persistently good,

while the 6 per cent Peruvian Corporation debenture stock jumped 2 points both before and after the week-end. Japanese issues were inactive and eased slightly at the re-opening, but on Tuesday prices were generally steady. Among European issues, French sterling railway bonds were offered after some earlier gains.

The improved tone in the home rail market continued into the earlier part of the current week. Thus, after closing on Friday with rises of ¼ for GW ordinary and Southern preferred, and ½ in Southern deferred, the market witnessed gains of ¼ for LMS and GW ordinary at the re-opening. On Tuesday, LMS ordinary improved ¼, while both Southern deferred and preferred and London Transport "C" stock all gained ¼. Senior issues were firm throughout. But in midweek junior issues suffered from profit-taking.

In the foreign rail market South American issues responded with numerous sharp advances to steady buying in a market short of stock. Senior issues were particularly favoured, the 4 and 5 per cent Central Argentine debenture stocks each rising 3 points before the week-end. Fresh support on Monday occasioned a further all-round advance in which BAGS 5 per cent preference gained 2 points. The following day profit-taking led to a small but general decline, but the undertone remained distinctly firm. Elsewhere, Canadian Pacific ordinary was persistently strong.

Well-spread gains in all sections reflected the better turnover in the industrial market, and, despite slight profit-taking on Tuesday, prices remained generally firm. Among breweries, Watney deferred and Ind Coope rose 1s. before the week-end, while Ind Coope and Guinness gained the same amount on Monday, when H. G. Simonds jumped 2s. After some earlier uncertainty, aircraft and motor issues improved in the earlier part of this week, Triplex, Leyland and Rolls-Royce being prominent with good gains. Heavy industrial issues were dull before the week-end, John Brown losing 1s. 3d., but on Tuesday numerous small improvements were registered. Quiet support throughout led to small gains for shipping issues, although Cunard reacted on Tuesday, when P. and O. deferred gained 9d. In the textile group, British Celanese were outstanding with gains of 1s. 1½d. on the previous Friday and 1s. 6d. at the re-opening, among numerous smaller advances. On Tuesday, however, the decision by Fine Cotton Spinners not to publish an interim statement led to a slight easing of prices. Persistent support for tobacco issues occasioned many good gains both before and after the week-end. Following an earlier gain of ¼, Imps. advanced ¾ on Monday, while the next day Carreras and BAT both improved ¼. In the miscellaneous section, Brazilian Traction enjoyed steady support. Later there were signs that the rise had spent its force, and lower prices accompanied a fall in turnover.

In common with other sections, the

COMPANY MEETING

SOUTH AFRICAN DISTILLERIES AND WINES, LIMITED

INCREASED SALES OF OPERATING COMPANIES

The seventh annual ordinary general meeting of South African Distilleries and Wines, Limited, was held, on the 13th instant, in London, Mr H. R. Mosenthal (the chairman) presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts:—The sales of the operating companies for the year 1940-41 showed an increase of roughly 12 per cent over the preceding year and the gross profit rates have been, generally speaking, well maintained as is shown by the fact that the consolidated net profits, before South African taxation and reserves, have increased by about 7 per cent, which under all the difficult conditions of today you will no doubt consider satisfactory.

TAXATION POSITION

You will have noted a reference in the auditors' report and also in the directors' report to a liability of £61,140 South African currency for South African taxation, which was mainly due to new legislation introduced in South Africa after the close of the operating companies' financial year. This sum must, of course, be provided, but it has not yet been determined whether it can be borne by the operating companies in South Africa or must be borne by our company here. The increase in taxation is heavy and, in addition to increased rates, includes 16 months of South African normal tax, instead of the usual 12, due to the alterations made by the South African Government in their last Budget, but I may perhaps point out that in future only a full year's reserve for taxation will be necessary, and assuming the same figures of net profits, with no increase in the rates of taxation, we should have to provide about £23,000 less in next year's accounts.

Taking first the near future, we must consider ourselves fortunate that we have concentrated in the past on the South African home market, with the result that the prohibition of imports of wines and spirits into the United Kingdom and the shortage of shipping facilities to other markets have not adversely affected

our turnover in fact, for the first four months of the new financial year—i.e., from March, 1941, to June, 1941, inclusive—the sales of the operating companies have increased very substantially. None the less, I hope that ways and means will be found, without detriment to the war effort, of easing the restrictions which prevent Australia and South Africa from taking advantage of the present position and at the same time consolidating the post-war demand for their wines.

TRADING CONDITIONS

The composition of the turnover of the operating companies has, however, been affected by the restriction of shipments of whisky and gin from this country and the cessation of supplies of brandy, wines and vermouth from France, wines from Germany and vermouth from Italy, but there has been more than a counterbalancing increase in the sales of our own South African products of the same type, and it is to be borne in mind that this is enabling us to create future goodwill for our own branded lines. On the other side of the picture, large numbers of the male population have temporarily left the Union and their local consumption has to be made good elsewhere. Secondly, the difficulties of export have increased local competition, and thirdly, it is daily becoming more difficult to obtain all the sundry lines used in the preparation of our products for marketing, such as bottles, capsules, cases, etc., the cost of all of which is rising, whilst at the same time it is difficult and impolitic to adjust our selling prices upward to any degree. Fourthly, wages and salaries have also risen. All this shows that we must not allow the increase in our sales to obscure the higher costs of production and marketing.

As to our post-war prospects, I do beg the Government, when it comes to the economic post-war reconstruction, to utilise the practical experience and knowledge of chambers of commerce, trade associations, labour organisations, etc. Bureaucracy must not be allowed to jettison the fruits of victory which democracy is bringing safely to port for the benefit of the whole world.

In conclusion, I would like to pay tribute to the excellent work the Messrs Ashton have done. To the staff of the operating companies our thanks are also due.

The report was unanimously adopted.

(Continued from page 603.)

kaffir market derived considerable encouragement from the more favourable news and closed strongly before the week-end, when West Wits. advanced $\frac{1}{8}$ and E. Geduld $\frac{1}{4}$. Monday witnessed a decline in turnover, Sub Nigel losing $\frac{1}{8}$, but the following day Libanon, which rose rs. $\frac{1}{2}$ d, led a good recovery. Among other gains, Grootvlei and Geduld both advanced $\frac{1}{8}$, but Blyvoors were out of favour, declining $\frac{1}{8}$ d. There was little interest in the rubber market, quiet conditions leaving prices generally unchanged. The oil market was distinctly firm, although the volume of business was not large. Shell gained $\frac{1}{8}$ before the week-end, when Anglo-Iranian and Burmah both improved $\frac{1}{8}$. Interest in the current week centred on Trinidad issues, particularly Trinidad Petroleum Development, which followed Monday's advance of $\frac{3}{8}$ with a jump of $\frac{1}{2}$ the next day, while Trinidad Leaseholds reflected some slight support.

New York

The generally more favourable war news was offset by the unsettled labour disputes and uncertainties regarding forthcoming taxation on Wall Street before the week-end. Selling, particularly of

utilities and rail issues, for tax purposes, led to some irregularity, but the market closed steady. The tendency at the re-opening to restrict activity in view of the Remembrance Day holiday on Tuesday was strengthened by Mr Churchill's references to Japan, and the holding off of buyers caused a moderate marking down. After the holiday, similar considerations caused moderate offerings, resulting in falls of a point in most prices.

The Iron Age estimates steel mill activity at 97.5 per cent of capacity, against 98.0 per cent in the previous week.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this Journal with this week's issue is invited to fill up the attached:

To The Publisher, Economist Newspaper Ltd.,
Brettenham House, Lancaster Place, W.C.2.

In order to test the value of your publication I should like you to forward it to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

Strikes and Votes

THE Bill to amend the American Neutrality Act out of effective existence was finally adopted by the House of Representatives on Thursday of last week by 212 votes to 194. The margin was small, and it was achieved only after the most strenuous efforts by the Administration. The Speaker descended from his chair to read a special message from the President, and both Mr Roosevelt and Mr Cordell Hull personally appealed by telephone to the numbers of Congressmen. By universal report, the closeness of the vote was due to a revolt by Democratic representatives from the southern states. The revolt was not directed against the President's foreign policy or the Bill before the House—on the contrary, the "solid South" is strongly interventionist in sympathy—but against what is alleged to be the President's weakness in dealing with strikes in defence industries. To vote against the Bill was thought to be the surest way of forcing the President's hand. The demonstration has not, however, sufficed to stop Mr John L. Lewis or the United Mine Workers of America. The postponed strike in the so-called "captive" coal mines owned by the steel industry began on Monday morning, and there has been more evidence since of its spread to other pits than of an approach to a settlement. This chain of events has naturally aroused a crop of puzzled, if not indignant, questions among observers on this side of the Atlantic. If opinion on a measure which, like the amendment of the Neutrality Act, is so obviously an essential part of the President's foreign policy, is so evenly divided that the desertion of a few members who are agitated about an entirely different matter can endanger the whole issue, can the continuance of the policy of aid to the democracies be relied upon? If Congressmen can be so irresponsible as to use the great battle of the world as a mere counter in their campaign against the labour unions, on what is their irresponsibility likely to descend next? And if the work of the "arsenal of democracy" can be interrupted by a strike in one of its most essential links on an issue which nobody can

regard as of real importance, will there ever be an effective arsenal? All those who base their hopes for a speedy issue from our present afflictions on the rising tide of American support are under the necessity of finding answers to questions such as these.

The actions of Congress have never been predictable; nor have they often been explainable in terms of European Parliamentaryism. But one almost infallible rule that can be followed in relating the votes of Congress to the opinions of the American people is to remember that the prescriptions and conventions of the American constitutional system combine to give Congress a strong negative bias—to give it an almost Irish consistency in being agin' the Government. There is, for example, the natural rivalry between the executive and the legislature, which is visible even in England, where they stand in the closest mutual dependence, and greatly enhanced in America where neither dominates the other. This has the result of making it much easier for the opposition party in Congress to maintain its discipline than for the party that supports the Administration. A Democratic President can count on having virtually all the Republican votes against him, but he cannot count on having all the Democratic votes on his side, since there will always be some of his nominal supporters who will use their votes as weapons to secure from him what they want. Another tendency of elected representatives all over the world is to be more afraid of outraging some cohesive minority in their constituencies than of earning merit that would be spread wide but thin. This tendency, too, is carried further in America than elsewhere. The lack of clearly defined differences of principle between the two major parties inevitably makes elections turn on a collection of smaller points. The system of holding primary elections, in which the Representative has to secure the renomination of his party before he can become a candidate in the real election, has much the same effect; in a primary campaign, the Representative cannot plead his general party loyalty to excuse his action

on individual issues. When, therefore, an issue is before Congress, on which one view is held by a minority of the electors, but held by them fiercely, resentfully and single-mindedly, while the other view is held by the majority, but with much less organised enthusiasm, the Congressman will conclude that more votes will be swayed against him if he votes with the majority than with the minority.

This is the position in America at present. The isolationists are a minority, but they are an organised and noisy minority. They can shower Congressmen with telegrams, they can organise petitions and threaten the implacable opposition of a substantial body of voters. In the ranks of the interventionist majority, there are few as determined as this. Most of them are hesitant, reluctant, yielding to the logic of events, but not enthusiastic over the prospect of bloodshed. It is a position very similar to that which arose a decade ago over Prohibition. Long after it was apparent that Prohibition could not be enforced, and that a majority of the public desired its repeal, Congress could not be induced to move because of the threatened vengeance of the Anti-Saloon League. And the solution will come in the same way, when the majority become as angry and as insistent as the minority. There are signs that that time is coming. But it has not arrived yet, and until it does Congress will lie far to the rear of the views of the majority. Until that time comes, American policy will continue to present the disjointed appearance it does now, and the development of events will ignore Congress as much as possible. Wherever the President can act within the powers conferred on him by existing statutes, or within his discretion as Commander-in-Chief, he will act, and the front line of American policy will move steadily forwards. But it will leave behind it, far in the rear, isolated pockets of outdated legislation. When these become too much of a hindrance, they will have to be reduced by pitched battles such as that which was fought out last week—and the pitched battles may not always be victories. But it would be a mistake to question the strength and determination of the front line merely because these beleaguered legal garrisons still hold out in the rear—as serious a mistake as to deny the gravity of the German threat to the Caucasus because Sevastopol still holds out.

The place of labour in the structure of national policy is also markedly different in America from anything within British experience. A strike is a strike the world over, and the harm that will be done to the programme of munitions production by a stoppage of the supply of coal to the steel furnaces will be no less in the United States than it would be anywhere else. But the analogy should not be pushed very much further. In this country, if, in the middle of a proclaimed national emergency, a strike were called by the Mineworkers' Federation, led by the outstanding Labour leader of the day, that would be considered to be fairly conclusive evidence of national disunity and a grave handicap to the Government in the conduct, not merely of industrial affairs, but of foreign policy as well. But in America, in spite of the great growth in unionisation in the past decade, there is still no cohesive labour movement, representing and expressing the outlook of the wage-earners on public affairs in general. The labour movement is still a minority movement, even among the wage-earners, and there is still a very sharp distinction—and often a cleavage—of interests between the paid officials of the unions and the workers they claim to represent. This is shown by nothing so clearly as by the enormous salaries that the union officials vote themselves; there is surely something suspicious about a labour "leader" who draws a salary of more than ten times the average earnings of those he leads. Some unions live off the workers rather than for them. There is the example of the Glaziers' Union in Chicago, which charges an "entrance fee" of \$1500 before it will allow a man to work, or of the Hodcarriers' Union which, until this summer, had not held an election of its officers for 27 years. Mr Thurman Arnold, Assistant Attorney-General of the United States, has given many examples of unions which have acquired just enough power to be able to paralyse an industry and which use it to make

money for their officers out of employers, workers and public alike.

Most of the worst examples of labour racketeering are in the American Federation of Labour. The CIO unions are, on the whole, more honest, more genuine and more sincerely representative of the workers they lead. The United Mine Workers of America, which has called the present strike, is perhaps the nearest approach there is in America to the industrial union as it is understood in this country. Nevertheless, some of its actions are very strange. The Union has an agreement with the "free" mines (i.e., those not owned by steel companies) which includes the two principles of the "closed shop" and the "check-off"—that is, the compulsory deduction of union dues by the employer. For many weeks this summer, the miners of at least one county in Pennsylvania were on strike against both the employers and the union, because of an arbitrary increase in the subscriptions deducted, to which their consent had been neither asked nor granted. It is precisely this principle of the "closed shop" and the "check off" for which the present strikes in the "captured" mines have been called. Ninety-five per cent of the workers are already in the union, which already enjoys the full benefits of being the sole representative in collective bargaining. This is the issue for which Mr Lewis has been willing to hamstring the munitions programme, defy the Government and convulse the nation. Clearly action of this sort is not the action of a responsible organisation of the workers, proud of its place in the structure of a democratic nation, as a strike by a similarly large British union would be. It would be a mistake to treat it as indicative of anything but a determination on the part of a sectional interest to take advantage of the opportunity of a seller's market for labour.

As it is, Mr Lewis's actions are gravely embarrassing his colleagues of the CIO, now meeting in convention at Detroit. They have affirmed their solidarity with the miners—they could hardly do anything else. But they have offered a rebuke to Mr Lewis, whose isolationist views are well known, by emphatically endorsing a resolution of support for Mr Roosevelt's foreign policy. The CIO President, Mr Philip Murray (who is also Vice-President of the United Mine Workers), resigned from the National Defence Mediation Board when it found against the miners; but he is full of suggestions for rebuilding a system of mediation. There is good reason for a conciliatory attitude on Labour's part, for the temper of Congress and the public is aroused, and anti-strike legislation is in the air. The anti-labour fire-eaters are probably as dangerous as Mr Lewis; for, if one thing would be calculated to rally the wage-earners behind the labour chiefs, it would be an attempt to outlaw strikes. There is a great deal of wild talk about the Army taking over the mines. It is true that similar measures have succeeded elsewhere—but only where there was a large body of men prepared to work if they could get protection against the union pickets. Wherever there is a genuine strike, which does not depend on violence, armed force will be powerless. Coal cannot be mined with bayonets. With extremists to right and left of him, Mr Roosevelt's task is not enviable.

The Congressional vote and the coal strike, put together, do not present a pretty picture. They show the seamy side of democracy, the struggle of leadership against inertia, the power of the obstructive minority. These defects have been revealed more clearly than usual in America in the past few weeks. But it should never be forgotten—least of all by Englishmen—that they are the defects of democracy the world over. The countervailing strength of democracy is the power of an informed and independent public opinion. It is worth all the delays and the irritations of the democratic process if they are the means of enlisting behind the cause the dynamic momentum of the determination and enterprise of millions of free individuals, each making up his mind for himself. The British democracy did not shake off its sloth until the mass of citizens took a hand in determining policy. There is every indication that the same hour of decision is approaching, slowly but certainly, in America.

Concentration of Industry

NEARLY nine months have passed since the Government's industrial concentration policy was announced on March 4th by Mr Oliver Lyttelton, then President of the Board of Trade. Broadly, the object of the scheme was, not to bring about a further curtailment in production for the home market, but to concentrate into the smallest number of plants the output of some of the factory trades supplying that market, so as to release the greatest possible quantity of manpower, machinery and factory space. The process of concentration was initiated purely as a temporary expedient, designed to economise resources; indeed, the Government has undertaken to "take all measures open to them" to assist in reopening the closed factories after the war. The scope of the scheme was limited in that it was originally intended to be applied in the main only to certain industries manufacturing consumers' goods—the majority of those covered by the Limitation of Supplies Order—and to some of those, such as cotton and wool textiles, footwear and paper, affected by the rationing of raw materials. Since the process is now said to have been substantially completed, the time has come for assessing the results achieved.

In view of the comparatively small section of manufacturing industry covered by concentration—the number of insured persons aged 16 to 64 in the trades affected was about 1,000,000 in July, 1939—the volume of manpower, plant and factory space that could be transferred to the production of the goods of war could not be too spectacular. Nevertheless, hopes ran high, for as Mr Lyttelton said in announcing the scheme, the trades concerned were "the main sources of factory-trained labour for munitions."

In fact, however, by the time the policy of concentration was announced, the industries concerned had already lost a substantial proportion of their labour force, as a result of the call-up of men for the forces and of the imposition of quotas of production and raw material restrictions. For example, the number of workers in the industries subject to the Limitation of Supplies (Miscellaneous) Order had declined from 555,000 in June, 1940, when the Order was issued, to 460,000 in April, 1941, when concentration was introduced; since then the total labour force in those industries has been reduced to some 400,000. But these figures do not tell the whole story. Many individual firms are partly or wholly engaged on war work. The numbers producing controlled goods for the civilian market are estimated at 300,000 in June, 1940, 166,000 in April, 1941, and about 100,000 after concentration. The number of factories in these industries was originally about 4,000; of these, 1,400, employing less than 20 persons, were considered too small for the application of concentration, 950 have been closed, 1,000 are to continue in operation, while 650 are on Government work or not covered by the scheme for some other reason. Of the factories over the minimum size, rather less than two-fifths will thus continue to be engaged wholly or mainly for the civilian trade. In the industries affected by concentration (excluding wool textiles), the number of workers already released, or likely to be released (though not always as a result of concentration alone), has been officially estimated at 149,000 or about one-fifth of their labour force in April, 1941.

The scope of the concentration policy has thus proved to be smaller than was generally believed at its inception; but within that limited scope the policy has been carried out with a fair measure of success, though the results vary from industry to industry. The process is virtually complete in the industries covered by the Limitation of Supplies (Miscellaneous) Order, and it has reached an advanced stage in some of the trades affected by the rationing of raw materials. In the latter group, concen-

tration is complete in cotton spinning and weaving and nearly complete in the footwear trade. Less progress, however, appears to have been made in the paper and wool textile trades. But while concentration has undoubtedly released resources which would otherwise have been wasted by operating factories considerably below capacity, it is not yet possible to ascertain its effect on costs of production. In normal circumstances, the concentration of production into fewer factories, ensuring operation at capacity, should have been followed by a reduction in costs per unit; but this tendency has been offset, to some extent, by the withdrawal of many of the younger and more efficient workers, and by the necessity of paying compensation to the closed factories.

As interesting as the results so far achieved by the concentration scheme are the methods adopted. The basic method was to make it clear that the nucleus firm would be in an advantageous position and to leave it to would-be nucleus firms to make such arrangements for absorbing the production of other firms as would enable them to operate at capacity. On the whole, this plan was successful; in the majority of industries, the response was such that the Board of Trade did not have to use its compulsory powers on a large scale. Since firms refusing to collaborate were faced with the probability of losing their labour and factories, or of having their raw material supplies cut off, this is scarcely surprising. In the larger industries, voluntary schemes predominate; thus 80 per cent of the pottery industry and 70 per cent of the hosiery trade were covered by voluntary schemes. In the case of industries consisting of a large number of small units, such as the jewellery, toy and sports goods trades, or of a small number of large but scattered units, the principle of self-selection of nucleus firms was more difficult to apply. But the Government has used its powers sparingly, perhaps too sparingly.

The methods actually adopted for the purpose of securing concentration of production vary from industry to industry. As was argued in *The Economist* when the policy was first announced, the guiding principle should be to devise the schemes in such a way that a reversion to the *status quo*, or at least to normally competitive conditions, could be easily assured once the emergency had passed and the very different circumstances of peacetime had been restored. From this point of view, the most satisfactory methods would be the more obviously loose and temporary, such as an agency arrangement—by which the nucleus firm undertakes the production as the agent of the closed-down firms, selling the output to them at cost price for disposal through their accustomed channels—or a pooling scheme, whereby a number of firms join together to operate the nucleus plant. The least satisfactory method would be the permanent acquisition of closed-down plants by nucleus firms. In between the most satisfactory and the least satisfactory methods would be the different varieties of scheme based on a transfer between firms of production quotas. If the consideration paid for the transfer of quotas is of the nature of a share in profits, the scheme approximates to the more elastic and more desirable pooling schemes. If the consideration is a fixed sum, it turns the closed-down firm into a *rentier* and comes close to a permanent merger.

Judged by these tests, the schemes that have been adopted are, on the whole, not unsuccessful. Schemes by which the nucleus firm manufactures at cost for its closed partner who continues to sell the products is the most common form of arrangement. There are, however, examples both of permanent mergers and of inelastic compensation arrangements (for example, in the pottery trades). In some sections of the cotton-spinning industry, a full-blown scheme of a levy imposed on active spindles (irrespective of profits) and a fixed compensation payment for inactive spindles has been adopted—a method un-

desirable in principle, but possibly justified in an industry where the need for concentration will not disappear at the end of the war. On the whole, however, it can be said that the Board of Trade has successfully used its influence in favour of the right sort of scheme.

One general criticism that has been urged against the methods followed has been that the fullest economy of resources could be achieved only by treating each industry as a unit and imposing a central scheme. Logically, the argument is correct; but an attempt to apply it would have met with the dilemma that either the schemes must be worked out by impartial controllers from outside—a process that would involve both delay and dispute—or else they would inevitably fall into the hands of the trade associations. In all the circumstances, it is difficult not to accept the argument that to have treated industries as units would only doubtfully have increased the effectiveness of the policy, while it would certainly have strengthened the tendencies towards cartelisation and monopoly. As it is, the Board of Trade successfully set its face against giving the trade associations any governing place in the execution of the policy. In one or two cases—pottery is one—they are being used as the channels through which compensation is paid. In only very few—some parts of the iron and steel trades are significant instances—do the trade associations have any greater powers. This is a very great gain.

Nevertheless, even a brief examination of the results of concentration suggests that, while it may have been designed as a temporary measure, it will inevitably have permanent results in altering the structure of industry. Even if the various schemes adopted had all

been of the loosest variety, many groups of firms would probably find it advantageous to remain combined after the war. But many of the schemes actually adopted are of a nature that will render the process of unscrambling difficult. And in some industries there are indications that the larger firms tend permanently to absorb the smaller. For example, the Lancashire Cotton Corporation is still purchasing additional mills. The tendency towards amalgamation is not necessarily undesirable—in fact it is a continuation of the pre-war trend—so long as it does not result in a permanent restraint of trade. The longer the war lasts, the greater this danger will become, and the more difficult it will be for owners of closed-down firms to re-establish themselves. It is obvious that some unfortunate results must be expected to remain from a policy that could never be regarded as anything but a painful necessity. The Board of Trade should continue the good work they have started, to rescue as much as possible of the peacetime structure of British industry.

In sum, the Lyttelton scheme has brought a substantial measure of rationalisation to the consumers' goods industries. And, provided the Government takes good care to prevent the creation of monopolies, wartime concentration may pave the way towards greater efficiency. But the success achieved in a comparatively small sector of industry throws into relief the Government's failure to deal adequately with the related problems of the distributive and service industries whose labour force greatly exceeds that of the trades affected by the original concentration scheme. It emphasises the need for an early extension of concentration to these and all the other industries which have suffered a decline in the volume of business.

Ostland

IN the last five months, the Germans have occupied the Baltic States, Bessarabia, the Polish Ukraine, White Russia and most of the Russian Ukraine. While the battle rages on inconclusively to the east, the vast task of organising these new conquests cannot await the outcome of the war.

The appointment of Dr Rosenberg to be Minister of Occupied Eastern Territory marks a new stage in the political organisation of Germany's eastern conquests. Before the outbreak of war, it seemed that the Nazis were encouraging dissident national groups with the bribe of independent statehood to work for the disintegration of the U.S.S.R. Ukrainian Nationalists, Lithuanian Activists and Estonian Fascists all hoped—and had some grounds for hoping—that their support of the Nazis would be rewarded by independence and power. The first weeks of the eastern campaign did not disillusion them. The Ukrainian Nationalist *Bandera*, which the Nazis had formed and encouraged from Berlin, assisted in the re-occupation of the Polish Ukraine. The Lithuanian Activists staged an internal insurrection to time with the German invasion, and Kaunas was actually handed over by the Activists to the advancing German armies; but once the occupation was completed, the Germans unceremoniously dropped the Nationalists who had assisted their entry. Their nationalism was too genuine, and the Nazis feared insubordination and local discontent when these men discovered—as discover they must—that they had simply changed one type of occupation for another. Thus all semblance of conciliation was abandoned within a few weeks of the occupation. In the place of national governments, German Reich commissioners were appointed, all picked from among the oldest, most trusted and most anti-Communist members of the Nazi Party. All the north-eastern territories, including Polish and Soviet White Russia and the Baltic States, were grouped together as the *Ostland* and placed under the governorship of Gauleiter Lohse. Other "General Commissioners" work under him, at Kaunas, Riga and Tallinn, and General Commissioner Kube controls Polish and Soviet White Russia from Minsk.

In the south, the hopes of the Ukrainian Separatists were dashed by a German decision, taken soon after the occupation, to transfer the Polish Ukraine to the mercies of Dr Frank and the Government General of Poland. All that is left of the Ukrainians' high hopes to-day is a series of minor political and economic privileges whose purpose is, however, not to raise the Ukrainians so much as to debase still further the status of the Poles and the Jews. The rest of the Ukraine is still under direct military administration. So, too, is the Smolensk area. And "military administration" fades off without any clearly defined frontiers into the actual fighting zone.

All these separate administrations, which have worked from the first in the closest collaboration with Dr Rosenberg's "Eastern Section" in Berlin, have now been grouped together under his control as "Eastern Territories." His appointment marks the end of all opportunist, nationalist flirtations. German policy in the *Ostland* is returning to the secular policy of *Innere Kolonisation*, the policy of Bismarck and the Kaiser when they attempted to people the Polish fringes of Prussia and Silesia, the avowed *Lebensraum* policy of *Mein Kampf*, and of Dr Rosenberg himself. In Bismarck's day, only German-occupied Poland was in question. To-day, in the words of an official German spokesman, "Economic and geopolitical conditions in the East make it necessary to draw the limits of the eastern space rather further afield than is generally done."

If colonisation is the ultimate objective, the first problem is to rescue something from the wreck of war. In the chaos which has followed the passage of the armies and the withdrawal of the highly centralised, highly autocratic Russian administration, some kind of economic and social reorganisation is probably far more pressing than the problem of political control. The Germans face formidable difficulties. In no territory occupied so far have they had to deal with so much destruction. It is always much easier for a completely state-run community to impose huge sacrifices upon the people. The destruction has not been individual and sporadic, but planned as comprehensively as any previous

schemes of construction—for example, the system of time bombs in Kiev was linked to the electric light system of the city. The unequal incidence of sabotage in agriculture and in industry is due not only to the inherently more destructible nature of machinery but also to the fact that it is in crops and livestock that the peasant comes nearest to private ownership and is therefore least eager for patriotic destruction. Wherever the Germans advanced suddenly and rapidly, in Polish Ukraine, in White Russia or in the lands between the Dniester and the Dnieper, they succeeded in salvaging most of the harvest. They were assisted too by the fact that in these western districts they attacked while the crops were still standing. In Eastern Ukraine and in much of the Smolensk area, the harvest was already in and the grain had gone east. The most serious side of sabotage in agriculture follows from the fact that Russian farming is very heavily mechanised. It is hard to say how many of Russia's 7,000 tractor stations the Germans have captured intact—a percentage possibly in the areas of rapid occupation, but, whenever the Soviet authorities were given time, there can be no doubt that the tractor stations were destroyed.

In industry, destruction and evacuation have also followed a consistent plan. The Germans are left with the unexploited raw materials, with very heavy fixed plant that cannot be destroyed and apparently very little else. Even though some new machines can, perhaps, be brought in, the problem of fuel remains very formidable. All occupied Russia is for the time being cut off from its Caucasian oil supplies. The Germans are getting a little oil from Galicia, a few thousand tons from Romney, and perhaps 200,000 tons of shale oil from Estonia—an amount quite inadequate to balance the vast new agricultural and industrial commitments Germany has assumed.

If this sum of agricultural and industrial wreckage is added up, all the Germans can hope to secure this year is some grain—probably not so much as the Russians exported to Germany last year—the flax and hemp crops, and oilseeds. Coal and iron ore are available, if they can be mined, but Germany is not in great need of either, and the iron is 2,000 miles from the nearest smelting works. There is manganese, but the Russians supplied the Germans very fully in previous years. As for next year, everything depends upon the degree of reorganisation possible. It is not likely to be high. Nevertheless, the Germans' power of restoring a country devastated by war and sabotage should not be underestimated. Behind the front line, a whole army of men are occupied on immediate reconstruction. There are the Army Economic Troops who make the inventory of captured foodstuffs, raw materials and machinery. Behind them, the *Technische Nothilfe*, many hundred thousands strong, a corps of engineers and skilled workers, repairs water works, power stations, gas works, plants and factories. Parallel with, and complementary to, their activities is the work of the Todt organisation, which may well number half a million men; its work is the building of roads and railways, aerodromes, factories, housing. Behind them again are the millions of navvies in the Labour Corps and among the prisoners of war. The difficulty in Russia is that all these men, who in the west were available by July 1940 for reconstruction, are still involved in the military campaign. In northern France, particularly in Alsace, it was possible to organise the autumn sowing by throwing in the paramilitary labour battalions—for example, light tanks were used for tractors; in Russia, the vast front diverts a high percentage of men and materials to the feeding of the war machine and there is no trace of slackening appetite.

Germany's hopes of any kind of restoration must therefore depend to a very great extent on securing the co-operation of the Russian population. It is too early to say how well they are succeeding, but their task has probably been made politically easier by the emigration eastwards of the urban and rural bureaucracy and by the most efficient and presumably most politically intelligent workers. At the same time, the managerial problem has been enormously increased. The Germans could perhaps secure a considerable measure of support if they were

completely to undo the collective basis of Russian agriculture, particularly in the Baltic States and East Poland, where collectivisation is not two years old. Unfortunately for the Germans, popularity and output are incompatible. The whole working structure of agriculture and industry could just conceivably be transformed into individualism if the individualist were there. But there are no "kulaks"; there are no small industrialists. The whole bureaucratic framework has emigrated, and there is no local wood for new scaffolding. The Germans have brought in German and foreign overseers to take the place of the old Soviet administration. Collective farms remain the same though they are called "communal farmsteads." State farms remain as "national farmsteads." The peasants are being bribed with taxfree private strips of land and high prices in marks for their goods. But they have not been given control of the land.

It is not only a question of the lack of "entrepreneurs." The lands of the Ukraine and White Russia are not suited to small scale intensive mixed farming. If the Germans "gave" the peasants the land in a Balkan sense of 2-5 hectare holdings, the result would be, not merely no surplus for Germany, but not even subsistence for the Russians. It is the old problem of 1918. At that time, the German General Staff would have found it very convenient to rally the peasants to the support of the independent Ukrainian *Rada* by giving them the land. But they found that only on the big estates were there any agricultural surpluses, or any hopes of future excess production. So, although they grouped the landowners in some communal fancy dress as a Union of Cornraisers (*Khliboroby*), the landowners kept the land, the peasants remained hostile and the whole experiment broke down. The normal type of Ukrainian agriculture is the "grain factory," and grain factories are incompatible with peasant ownership in any form the peasant can recognise as such.

This paradox does not hold good of industry. The Germans, within the constraining limits of further war and indefinite occupation, are more free to experiment as they will. It is too early to say what type of organisation they have in mind. Heavy industry will presumably be state controlled. In September a special company was formed, the *Bergbau- und Huettenengesellschaft-Ost*, under the direction of Pleiger, the managing director of the *Hermann Goering Werke*. The *Werke* are, of course, the parent trust, and the new company's working programme will be dovetailed into the Four Year Plan. It is rumoured that private industry will be encouraged to migrate or to open up new enterprises. At the Koenigsberg Fair in October, Dr Funk spoke of the *Ostland* as being united at last with its natural market, Europe, and examples of Russia's riches—iron from Krivoi-Rog, shale oil from Estonia—were on view. However, none of this can be regarded as much more than shadow play until the war is won or, at the very least, a front stabilised. There are no machines; the railways groan under military traffic; the roads are quagmires; the towns are gutted. To keep stirring even a faint pulse of economic life is all that the Germans can hope for this year or perhaps next. "Collaboration" did not get under way in France until February, 1941, and there there were thousands of industrialists, large and small, with whom to work. Russia must, by every count, entail a slower schedule.

In all this political and economic reorganisation, embryonic as it is, clouded with the fog of war, improvising here, defeated there, baffled by a thousand hair-raising material and psychological problems, in all this, a consistent plan emerges none the less. It is the plan of the *Ostland*, of *Innere Kolonisation*, of a vast area of the East where the Germans can expand as the land owners and industrialists ruling a new race of serfs. The vision is not fantastic. It has been the fate of the vast, inarticulate mass of Slavs to live under many foreign masters and to serve under many autocratic régimes. The great query does not lie in the Ukraine, for all the appalling difficulties the Germans face. It is at the Moscow front and will be answered only by victory or defeat.

Parliament and Placemen

IN time of war the authority of the Government is necessarily complete. It is perhaps for this very reason that, after two years, Parliament should show itself as determined as it has recently been to restate the supremacy of Parliament and the constitutional subordination of the Executive. The opposition to Regulation 18B is a straw in the wind; and last week's report of the Select Committee appointed early last March to enquire into the troublesome question of offices or places of profit under the Crown puts the issue in the long perspective of Parliamentary history. The occasion of its appointment was, it will be remembered, the House of Commons Disqualification (Temporary Provisions) Bill, which was passed on the occasion of Mr Malcolm MacDonald's appointment as High Commissioner in Canada to enable him and other officials to retain their seats in Parliament.

At the time of the debates on the Bill, the two main criticisms expressed in Parliament were, first, that it would disfranchise constituencies and, secondly, that it would increase the power of the Executive. In its report, the Select Committee shows that one or both of these arguments have been behind most of the resolutions, statutes and decisions in individual cases since the seventeenth century, when the question of office holding first engaged the serious attention of the House of Commons. For instance, in 1606 a select committee considered the cases of certain ambassadors and certain holders of offices in Ireland. In the latter case, the Members were declared to have forfeited their seats because their patents were granted for life, whereas the ambassadors were allowed to retain their membership of Parliament, because at that time an embassy was regarded as a temporary mission. Over three hundred years later, therefore, Sir Stafford Cripps was not disqualified from membership when he became ambassador to Moscow. It is true that in the reign of James I, the House of Commons was mainly concerned with its own rights and its own wants, rather than with its duties towards its constituencies. But, as the Select Committee points out, the principle that a Member's duties include duties to his constituents is a modern corollary of the older and wider principle that certain offices are incompatible with membership of the House of Commons.

After the Restoration, Parliament regarded the holding of offices under the Crown from a different angle. The emphasis now lay, not so much on the fact that they were offices—and therefore possibly incompatible with membership—but on the fact that they were under the Crown—and therefore incompatible with the growing power and independence of Parliament. Because of this shift in emphasis, legislation was felt to be more appropriate; and by a provision in the Act of Settlement, all office holders were excluded from membership. Obviously, if this had been the Commons' final say, Cabinet government as England knows it would have been impossible. But in their earlier attempts at legislation and in their resolution of 1680, they had left a loophole for Ministers to remain Members of the House, and in the Succession to the Crown Act of 1705 (re-enacted in 1707) the compromise was made law. This statute provided that any person accepting a new office or place of profit under the Crown—that is, one created after October 25, 1705—should be disqualified, and also that any Member accepting an office of profit should have to seek re-election—which remained in force until the Re-election of Ministers Acts of 1919 and 1926. Thus, although an Ambassador to Moscow is exempt under the first provision, an Ambassador to Washington—as the Attorney-General pointed out in the debate on the MacDonald Bill—is probably not, because there was no such person in the reign of Queen Anne; and the modern office of High Commissioner is quite clearly a disqualification.

These three principles—incompatibility of certain

offices with membership; the need to control the influence of the Executive in Parliament by limiting the number of office-holders in the House; and the need to have some Ministers in the House in order to ensure the control of the Executive by Parliament—have been followed by the Select Committee in its recommendations. It recommends that a Bill should be introduced disqualifying all office-holders, except such as are excepted in the Bill itself, while the enforcement of the law and the consideration of new or doubtful cases would be left to machinery set up by the House. The exceptions would cover—in view of the third principle—holders of ministerial offices, but—in view of the second principle—the Committee would limit the number sitting in the House of Commons in peacetime to 60, about 10 per cent of the total membership and 3 more than the number permitted before the outbreak of war. It sees, however, a danger that the purpose of this limitation would be defeated if the modern tendency to appoint Parliamentary Private Secretaries were extended. Just as under the Tudors and early Stuarts, the privy councillors as Members of Parliament were the chief link between the Crown and Commons, so to-day the PPS is the eyes and ears of his Minister in the House. Since, however, he is appointed by the Minister personally, he cannot be disqualified by reason of his holding office under the Crown—in any case, as the Committee points out, his function depends upon his membership. But it agrees with the view that the existence of the PPSs increases the voting strength and influence of the Government in the House, and it recommends, therefore, that by resolution or some other non-legislative means their number should be limited.

The next recommendation of the Select Committee deals with the non-Ministerial offices which should be exempt from disqualification. These include officers and men of the armed forces not on active service; Lords Lieutenant, except for the counties in which they hold office; High Sheriffs and Recorders with a similar stipulation; JPs, Commissioners of Assize and chairmen and deputy-chairmen of quarter sessions, other than London quarter sessions; Gentlemen-at-Arms; Regius Professors, heads of colleges, the Provost of Eton and other academic offices; the first Church Estates Commissioner and unpaid members of the Forestry Commission and the Charity Commission (it is worth noting, incidentally, that the War Damage Act excludes a Member of Parliament from serving on the War Damage Commission); the legal representatives of the late Mr G. E. B. Eyre, who hold the office of King's Printer in trust for Eyre and Spottiswoode Limited; and finally—it is a relief in view of the present holder of the office—the Lord Warden of the Cinque Ports.

The Select Committee then gives a list of the persons who, it considers, should be expressly disqualified, even though they may be technically outside the disqualification provision. The exclusion of judges is obvious, and other judicial offices, such as the chairman and deputy-chairman of London quarter-sessions, are also specifically excluded from Parliament by statute. But there are other judicial or semi-judicial offices, about which the position is not so clear but which the Committee considers should disqualify. These include the Recorder of London, one of the chief criminal judges in England; the Common Serjeant; the Judge of Appeal of the Isle of Man; and all stipendiary magistrates. The exclusion of civil servants is as clear as the exclusion of judges, but, having regard to both law and practice, the Committee thinks that a definite pronouncement should be made that ambassadors are now disqualified, because their office is no longer a temporary mission—and is therefore incompatible with membership—and because they have to carry out the policy and directions of the Government. The same con-

siderations apply to High Commissioners. The Committee would preserve, however, the Parliamentary fiction of applying for the stewardship of the Chiltern Hundreds and the Manor of Northstead to enable a Member to resign his seat. But there is one body of people on whom the Select Committee finds itself unable to express any opinion concerning their disqualification, and that is the clergy. Thus, unless Parliament itself alters the present position, nonconformist clergy and ministers of other churches may continue to sit—and vote against Sunday theatres—while clergy of the Church of England and the Roman Catholic Church are disqualified by statute.

In the second part of its report, the Select Committee deals with office-holding in the present state of war. The general position has been greatly altered by a series of statutes—the Emergency Powers (Defence) Act; the Regional Commissioners Act, which exempts Regional Commissioners and Deputy Regional Commissioners from disqualification; the Ministers of the Crown (Emergency Appointments) Act, which removes the restriction on the number of Ministers sitting in the House; the House of Commons (Service in His Majesty's Forces) Act, which allows Members to go on active service; and the House of Commons Disqualification (Temporary Provisions) Act. By all this legislation, the three principles underlying the law and practice of disqualification have gone by the board. The Committee recognises that this is largely unavoidable; nevertheless, it is concerned to point out one or two dangers in the present position. For instance, it points out that the Act repealing the limit on the number of Ministers is only restricted in duration by the fact that it applies to Ministers appointed for the prosecution of any war in which His Majesty may be engaged. Thus, it could still be in force if, say, this country were technically at war with San Marino long

after the war with Germany was at an end. The Committee, therefore, recommends that the Act should be amended so as to limit its duration to the present war. It also makes certain recommendations regarding the Disqualification (Temporary Provisions) Act: that the certificate of the First Lord of the Treasury that the appointment of a Member to a certain office is in the public interest should be altered to state that it is also in the public interest that the Member should retain his membership of Parliament; that there should be some limit on the number of certificates granted in a year and some limit on the period for which exemption from disqualification is granted; and that a certificate should be communicated to the Speaker, who would inform the House and thereby give it more publicity.

These wartime recommendations are, however, by their nature of less interest and importance than the main body of the Select Committee's report. The value of this lies both in the clarity with which the present confusing position is expounded and, particularly in these days, in its restatement of the subordination of the Executive to Parliament. If the proposals are adopted, a mass of legal and conventional anomalies will have been swept away, the rights of that "odious and objectionable person"—the common informer—to recover penalties in respect of disqualified office-holders rescinded, and the disqualification for office-holders made as clear as it is for minors, lunatics, aliens, felons, bankrupts and peers of the realm. This alone would be no mean achievement. But far more important is the Select Committee's support of the three principles which in effect affirm the supremacy of Parliament and the people it represents. If its recommendations are in many ways a compromise, that is fully in accordance with the grand compromise—the Constitution itself.

NOTES OF THE WEEK

The African Front

Not only the embattled "second frontiers" but the British public in general have received the news of the Libyan offensive with relief and interest. Now there is a "second front" there where, by every military calculation, it can only effectively be; where the British can strike across a land frontier against an enemy who shares with them the disadvantage of exposed maritime lines of communication. The newly-constituted Eighth Army launched its first attack on November 18th, repeating the manoeuvre of Sidi Barrani. Mechanised units crossed the frontier well behind Sollum and Halfaya and on the first day advanced fifty miles into Libya to the south of Sidi Omar. The real fighting will begin when the columns swing to the sea to establish contact with Tobruk. Axis strength is estimated at three armoured divisions and supporting troops, and there is no doubt that the struggle will be stiff. Nevertheless, the wholesale sinkings of Axis ships in recent weeks must have influenced the enemy's supply position and in spite of Britain's expanding commitments in Iran, the British Army that is attacking to-day is far stronger than the one commanded by Gen. Wavell during the abortive British attack of the early summer. It is disturbing that, at this juncture, the situation in French North Africa should appear to be more unsettled. It is, of course, an obvious moment for Germany to bring pressure to bear on Vichy to put an end to General Weygand's relative independence. The General, backed by American support and American supplies, has been able to prevent so far the enfeebling of his command to the Nazis, and there are some American observers who believe that the arrival of British columns on the frontiers of Tunisia would have a powerful effect on the General. There is little the British Government can do to influence the decision of Vichy. But the position is very different in Washington. Vichy values American recognition. North Africa depends upon

American supplies. The continuation of both must be made conditional upon good conduct.

The Mood of Parliament

It illustrates the present mood of Parliament that both Mr Morrison and Mr Shinwell are under fire, the Home Secretary because of the power he wields to detain suspects in defence of national security and the Labour front-bencher because his criticism of the Government has turned to unremitting censure. The situation has the appearance of paradox. The country is overwhelmingly united in support of the war, and Mr Churchill has commanding backing in Parliament and outside. But Parliament is more than ever wary in protection of individual rights, especially those of Members; and the Government is more than ever sensitive to criticism. The House of Commons is to debate Regulation 18B again, and many Members are anxious to restrain the use of arbitrary detention by the Executive either by replacing the Committee which now advises Mr Morrison in these cases by an impartial tribunal or, as some propose, by restoring to suspects their normal right of appeal to the courts. Lord Ponsonby's indictment in the House of Lords, on behalf of the peace-seeking Duke of Bedford, of the "Gestapo methods" of the Home Secretary probably went further than most non-pacifist critics of Mr Morrison would go; and the astonishing personal attack launched in the Commons last week against Mr Shinwell probably exaggerated—both by its measured violence and by the large proportion it took of Mr Alexander's time in replying to the debate—the Government's resentment of Mr Shinwell's strictures. But the wariness of Members and the sensitiveness of Ministers are very real. To the observer, it appears that although concern by Members for the rights of dissentient opinions and by Ministers for the exigencies of wartime administration are both part and parcel of what Mr Churchill himself last week called "the full

practice and freedom of Parliamentary institutions," both sides could quite certainly do with a dose of common sense, Ministers restraining their resentment and Members their more extravagant suspicions.

Members and Ministers

Parliament gave Mr Morrison the powers he is using under Regulation 18B, after careful scrutiny of their details, because they believed them to be necessary. Equally, they can now take them away or amend them if they feel that, in fact, they have been abused. But members should ask of themselves whether their present critical attitude is not really due to the assumption, which is not as yet soundly based, that the emergency against which 18B was devised has now passed away. They should remind themselves that, as Lord Simon pointed out on Tuesday, the Duke of Bedford, for all his "irresponsible and pestilential" views, is still at large and free to speak. Mr Morrison must have the means to do his job, which is to defend the realm from within; and there is no evidence that opinions, as distinct from subversive action or connections dangerous to the State, are being restrained or prosecuted. Parliament must, of course, decide, but it must decide sensibly. Similarly with Ministers and Mr Shinwell. Mr Shinwell is an able Member and was once an able Minister. During the war his criticisms have often been pertinent and timely. Now, however, his manner, which has always, because of its bitter and personal brilliance, been better suited to the hustings than to Parliament and the wartime platform, has begun to outweigh his master. The more critical Mr Shinwell becomes. He no longer criticises in any helpful sense; he just opposes. He is violent, and therefore disappointingly ineffective; and he is apparently not ready to harness his great abilities to any but the highest offices of State. But Mr Shinwell is not wholly to blame by any means. It is because Ministers have in the past been so slow to move and so reluctant to accept advice that the more restless of the critics have allowed themselves to be goaded into ill-temper and ineffectiveness. The critics start on the firmest of ground: they were elected to scrutinise the work of the Executive, to state grievances, to criticise faults, to make suggestions and "to bother about everything that the people are bothering about," as one Member put it the other day. It is only when they and their Ministerial targets both sacrifice sense to sensibility that the present state of mutual suspicion arises.

Fighting North and South

The lull in the Moscow centre continues, while the Germans publish heartrending accounts of the weather and the cold and the thaws and the mud. On the extremes of the front, the situation is changing. In the south, the Germans report the capture of Kerch; in the extreme north, there is evidence of a new drive against the Murmansk railway. The capture of Kerch—which the Russians do not yet admit—is an essential preliminary to an air and sea attack upon the Caucasus. But there are other preliminaries, equally essential. With Sevastopol unreduced in the rear, naval manoeuvres in the Black Sea would be very hazardous. With big pockets of serious resistance still holding out and general guerilla fighting continuing in the peninsula, the marshalling of the necessary fleet of troop carriers, gliders and support planes would be almost impossible. The attack on Crete followed the "pacification" of Greece and an intensive construction of new airfields. Under existing conditions in the Crimea, such preparations would appear to be out of the question, even supposing that, with the immense drain of the front, the labour force were available. As winter settles on the other fronts, the Germans may very well concentrate more and more of their resources on a Caucasian campaign—in the celebrated map displayed in Prague in 1939 only the Ukraine and the Caucasus are scheduled for conquest by 1941—but the Russians should have some weeks yet to strengthen their defences south of Rostov. The new activity in the Karelian sector may be partly a propaganda move to rally the Finns to greater efforts—Terboven's visit to the northern front probably had the same purpose, both for the Finns and the rather discouraged Germans—but there is an obvious

strategic objective in cutting off the Soroka-Archangel railway line which links Murmansk with Central Russia. It is very doubtful whether Archangel can be kept ice free and the northern supply route—the shortest Anglo-American route—depends upon keeping Murmansk and the stretch of railway between Murmansk and Soroka clear of the enemy. So far, neither Finns nor Germans have made much progress in the Salla-Kandalaksha sector, but the season is beginning in which the Finns scored such signal victories in 1939. Murmansk is thus a crucial sector and it is encouraging that here at least the RAF can render direct assistance.

Russia's Resources

In an article on page 616, the question of Germany's gains from the occupation of European Russia is fully discussed. But more important than the gains of the Germans are the losses of the Russians. By any estimate they have, of course, been terrific; the loss of the industrial area of the Ukraine alone deprives Russia for the time being of nearly 60 per cent of its industrial capacity. However, there is good reason to believe that the Russians have done more than at first seemed possible to build up their industrial second line. The movement of industry to the east, begun under the first Plans, has been carried much further under the Third Five-Year Plan which comes to an end in 1942. Under this Plan the Urals—together with Kuznetsk Khazakstan and Karaganda—are scheduled to produce a third of

the Union's pig-iron, steel and rolled metal next year. The greater part of Russia's smelted copper will come from enormous plants set up at Revda near Sverdlovsk and in the neighbourhood of Orsk. Nickel is produced at Ufa and new plants are nearing completion at Khalilovo. Kamensk has a big aluminium factory and Perm is the centre of a growing chemicals industry. The real shortages occur in such categories as specialised steels, machinery and machine tools. Here, however, the Government's carefully devised and drastically executed plan of evacuation and emigration is doing much to make good the deficiencies. The scene witnessed by Sir Walter Monkton of trucks and trains loaded with tools, machinery, the bricks of the factory, the workers, their families and their household effects all moving eastwards can, it appears, be seen on any east-going road and railway. The evacuation of industrial Lenin-grad—which is said to have begun as early as 1938—has been carried on even with the Germans in the suburbs; and in every area so far occupied by the Germans, almost the entire movable plant was evacuated before the arrival of the enemy. Very optimistic estimates even suggest that by 1942, Russia's industrial capacity—not necessarily its output—will not fall far short of the total Union capacity in 1941. There remains one serious difficulty—oil. The oil resources of the Urals are not very fully developed. The oil from the Ishimbaevo fields is refined at Ufa and Syzran and another refinery is under construction at Perm—for the time, the Perm oil goes to Saratov-on-Volga for refining; but this capacity falls very far short of what is necessary to maintain the Russian armies and Russian industry. The oil of the Caucasus and the sea route from Baku to Astrakhan must be preserved at all cost.

Ring in the New

The expected changes in the Cabinet are apparently not to happen. The Prime Minister went out of his way last week to inform his critics in the Commons that he did not intend to alter his Ministers. Instead, there has been a wholesale reshuffle in the High Command of the Army. Even more than the last drastic changes in the high places of the RAF, this has come as a surprise to the public. The alterations began with the recent appointment of General Sir James Marshall-Cornwall to be GOC Western Command and the "relinquishment" by Admiral Sir Roger Keyes of his leadership of the Commandos. Now General Sir John Dill, Chief of the Imperial General Staff, becomes Governor-designate of Bombay; General Sir Alan Brooke, Commander-in-Chief Home Forces, becomes CIGS; Major-General Nye, Director of Staff Duties, becomes Vice CIGS; Lieutenant-General Sir Henry Royds Pownall, Vice CIGS, proceeds to a special "secret" appointment. Lieutenant-General B. C. T. Paget, GOC South-Eastern Command, becomes Commander-in-Chief Home Forces; and Lieutenant-General B. L. Montgomery takes over as GOC South-Eastern Command. It cannot be disguised that the Army has been the most criticised, in general and in detail, of all the Services; and there is certainly much to be said for changes which, on the whole, bring younger commanders to the fore. The new Vice-CIGS, who has risen from the ranks, is only 45; and Sir John Dill, who is replaced by a man two years younger, had reached the retiring age of 60. Captain Margesson has made it plain that only in exceptional circumstances will any officers be retained above the age-limits laid down. On the other hand, age—especially when it is a matter of a year or two—is of much less consequence in high command than in the field and operational posts which are at present being very properly purged of the old and unelastic. Sir John Dill is still officially described as an "outstanding strategist" of "compelling personality." Major-General Nye is the only really young commander in the new appointments; but none of the others who have been reshuffled, apart of course from the indomitable Admiral Keyes, is yet 55. Lay opinion can make no judgment in these matters; the powers-that-be know best, or ought to. Perhaps the public is somewhat disillusioned; it is used to the military heroes of yesteryear, the Ironsides and the Gamelins, becoming the failures and the discards of to-day. Army commanders are always the best until they are removed, swans until they are recognised as geese. But even the most sceptical will admit that, from their records, there is rather more chance than usual this time that the newly promoted commanders are in fact what the usual chorus of welcome has proclaimed them to be, men who have emerged now because they have stood the test of modern mechanical warfare. They are known to have up-to-date views about tanks and air co-operation. It is always the losing side in Test matches that makes most changes in the team; and the generals of the German army, young or old, do not change because they win their battles. The time is approaching for the Allies to make use of the weapons they are now making; and these appointments may be regarded as the first stage in the new phase of more active fighting.

No Wavering at Washington

In an atmosphere of frenzied patriotism, the Japanese Diet has authorised an extraordinary military expenditure of 3,800,000,000 yen, and has approved stringent new taxation without a qualm. What interruptions there were appeared to represent the impatience of the members with the Government's hesitations in placing the country on "a full war footing." If it was the purpose of General Tojo to work up an atmosphere of crisis in order to secure the safe passage of the new economic measures, he has succeeded admirably; but the effect of the wild talk and general irresponsibility upon the conversations in Washington must be deplorable from the Japanese standpoint—that is to say, deplorable if they really hoped to reach some kind of settlement by negotiation. Mr Kurusu has arrived, and he and Admiral Nomura have seen the President, but, given the statements made to the Diet by the Japanese Prime Minister and Foreign Minister, it is impossible to see what possible basis for agreement there can be. General Tojo laid down a three point programme—non-interference of other Powers in the China "incident," an end not only to the "military threat" to Japan but to the economic blockade and all restrictions on free trading, and no extension of the European war to East Asia. Washington's answer to these points

can follow only one line—that the Japanese have it in their own power to accomplish this programme. No other Powers will "intervene" in China, provided Japanese intervention is brought to an end. There will be no restrictive military or economic action against Japan, provided Indo-China is evacuated and the military threat to the South Seas is removed. There will be no extension of the European war to the Far East, provided Japan breaks off its "entangling alliance" with the Axis. There are happy signs that the President is taking a firm line. His first talks with Mr Kurusu have coincided with the release of very interesting details about the extent and nature of American help to the Chinese. American repair equipment and lorries are being used for widening and improving the Burma Road; 300 United States pilots are to assist in the development of the Free Chinese Air Force; regular shiploads of armaments and supplies are promised for the coming winter. Britain, too, is showing a firm front of which the arrival of Canadian reinforcements at Hongkong is welcome evidence. Japan can have peace—yes, but at a price. And at long last the democracies seem to have realised that not they, but the Japanese, must pay the price.

Good Neighbours

The United States and Mexican Governments are to be congratulated on a statesmanlike settlement of their outstanding difficulties. Not only is the oil dispute apparently closed, but other problems which have long been points of friction in the relations of the two countries are satisfactorily resolved. Mexico is to pay \$40 millions in full settlement of the general claims of American citizens in Mexico—this figure includes the long-disputed agrarian claims; the two Governments announce their intention to negotiate a reciprocal trade agreement; the United States will assist the stabilisation of the peso, buy up newly-mined Mexican silver and make loans for the building of highways. The most important point of friction—the oil dispute—is not settled outright, but the importance of the terms of the

agreement lies in the fact that both parties have discovered an agreed basis for a settlement. It is no longer a question of a lease or the length of a lease or of rights to the sub-soil. The issue is the comparatively straightforward one of compensation. The Mexican Government have agreed to make a cash deposit of \$9 millions pending the final determination of the sum of compensation by two experts, one designated by each of the Governments concerned. The new agreement proves that, given political good will on both sides, economic problems and interests need not stand in the way of a general settlement. President Roosevelt and President Camacho have proved their good will. It is to be hoped that the same mutual accommodation can now be shown between Mexico and Great Britain.

Shipping and the Neutrality Act

On Monday the revision of the Neutrality Act acquired legal sanction. The amendment, which enables American merchantmen to be armed, and removes all geographical restrictions on their movement, is a decisive step towards that full collaboration between Great Britain and the United States which is necessary to secure their joint communications, to enable them to utilise their combined resources to the best advantage, and to concentrate their striking power in the theatres of war. The American Government had already gone a long way in this direction. On the one hand, it has sold and leased merchant ships to Great Britain, and it has begun the biggest shipbuilding programme the world has ever seen. On the other hand, at a critical moment last year, it put 50 destroyers at the disposal of Great Britain, following up this step towards naval collaboration. The latest step, marked by the revision of the Neutrality Act, should lead to an appreciable improvement in the shipping position of the Allies. True, America has no reserve of unemployed ships. But the carrying capacity of the existing fleets of the Allies and the United States will be increased in that the freedom of movement of the American vessels will eliminate delays, and make possible the operation of their fleets as a single unit, and, consequently, the use of individual ships to the best advantage. Secondly, since American merchant ships are now permitted to sail into war zones, President Roosevelt can presumably provide them with an escort of fighting vessels, thus improving the safety of communications. Apart from these immediate consequences, however, the amendment of the Act will ensure that the huge tonnage of vessels that will be launched from American shipyards next year will, in fact, be employed. As Colonel Knox, the Navy Secretary, pointed out on November 14th, Britain is suffering from a shortage of men available for service at sea, and the United States is the only country that can provide crews for the huge number of merchantmen now being built there.

Conflict and Compensation

Both Sir Richard Acland and Mr Hammersley made striking speeches in the Commons' debate on the Address. The two speeches were very different in intention, Sir Richard calling for a new order and a new ethic and Mr Hammersley merely for a new policy. But both speakers made the same central point—that many crucial wartime problems cannot be solved until “they are taken out of the realm of profit and loss.” Ambitiously, Sir Richard Acland, who appeared as a convert and a crusader and impressed the House, would remove the difficulty by “substituting the motive of service for the motive of individual gain”; more pragmatically, Mr Hammersley would remove it by applying the principles of compulsion and compensation fully in wartime organisation. The point is important. There is a legitimate, and often inescapable, conflict between the national and individual interest which holds up the war effort. Sir Richard, whose somewhat ill-defined solutions do much more credit to his heart than to his head, nevertheless put the problem very clearly, showing incidentally that losses, not profits, are the obstacle:—

It is in our [the nation's] interest to postpone every postponable repair; it is in the interest of the owners to get every repair done and have it charged to E.P.T. . . . It is in our interest to share trade secrets; it is in the owners' interests to preserve them. It is in our interest to concentrate output in every factory on one or two products; it is in their interests

to keep the factory flexible by making as many different products as possible. . . . It is in our interest that women should replace men; it is in the interests of the future to hang on to the men. . . . It is in our interest that half-used machines should be sent to factories where they would be fully used. . . . It is in our interest that skilled workers when work falls off should be sent to other factories; it is in the firms' interests to hang on to the machines and the workers. It is in our interest that every productive resource should be pressed into service; it is in the owners' interests to wonder whether there will not be surplus capacity after the war.

Sir Richard Acland looks forward yearningly to “a Britain without property owners” to resolve this dilemma. Mr Hammersley is more immediately hopeful. His theme in the debate was the concentration of industry. In the Government's policy, for instance, small firms employing twenty or fewer workers are excluded, so that they shall not be smothered by the large concerns; that is their interest. Their supplies are restricted; that is the nation's interest. But they keep their personnel, thus defeating the purpose of concentration, which is to release manpower; “owing to the fact that his goods are in short supply and there is a great demand for them, he can get a margin which enables him to pay wages which do not allow his labour to be attracted elsewhere.” In one non-essential industry, Mr Hammersley estimated, 55 per cent of the personnel had been released by the limitation of supplies, by concentration and by the competition of war work, whereas the industry's total maximum wartime production could be done by 20 per cent, instead of the 45 per cent left. The discrepancy is due to the retention of separate businesses because “to close down a man's business without compensation is clearly a gross injustice.” But his business must be closed down to speed the war effort. The labour force in the distributive trades which, before the war, was nearer three than two millions, cannot be combed for national service unless shops are shut. True, there is a steady attrition by bankruptcy; but the real solution, as *The Economist* has consistently urged, is compensation: a share now for every closed-down business in the financial rewards of the industry; and after the war a payment to start again. It is the proper rôle of finance to help on the war effort, not to hold it back.

£3 a Week

A minimum wage of £3 a week for farm workers has been approved by the Central Agricultural Wages Board, and will cost an extra £15-£20 millions a year. The knowledge that this extra burden will fall upon the Exchequer or the consumer has made farmers and landowners very anxious to give the workers their due; and 32 out of 47 county committees had reported in favour of the further increase. It now remains to face the implications, which the Commons certainly did not do in their debate on Wednesday. Mr Hudson's dismissal of the doctrine of cheap food as an old error was economically fantastic; his contention that the community ought willingly to mulct itself, in subsidies and high prices, to maintain a swollen, costly and artificial farming was just playing politics. Like every other industry, agriculture must stand on its own feet. The minimum farm wage has been raised by half in the last few years and by a quarter in the last few months; and the post-war costs of British agriculture will be altered accordingly. Farming can only pay these higher wages, economically and without artificial and costly stimulation, if it can increase its output per man correspondingly, that is, become a more efficient industry; and in any event the higher the wage the smaller the agriculture than any given policy can support. Milk, fruit, vegetables, pigs and eggs, with modern machinery and methods, yield more per worker and can pay higher wages than the production of beef or store cattle. In 1938-39, according to Sir Daniel Hall, thirty per cent of subsidies (including derating) which amounted to about £200 a year to all holdings over 50 acres went to wheat and sugar; 11 per cent went to beef; and other counties had large exportable surpluses of all three, wheat, sugar and beef. Milk, vegetables and eggs saw little of the subsidies. After the war this will not do. Only if there is a price policy, based on long-term contracts between the Government and the farmers, which deliberately favours these high value foods, while simply guaranteeing a minimum for wheat and beef, will British farming have a chance to pay these wages out of its own pocket.

Salvage and Saving

The most exasperating things about salvage campaigns are the muddle and illogicality that usually characterise them. These are also the factors which most threatened their success. The fact that the making of Christmas cards was not banned until last week, when the shops were already full of them, provided bitter fun for the cynical. The pains already being taken by many shoppers and shopkeepers to find ways round the new and belated prohibition on wrapping parcels fit in badly with the drive to save paper. So, too, does the fact that football clubs still sport programmes for their matches, attenuated it is true but quite unnecessary, when loudspeakers and blackboards could announce the teams just as well. The 30,000 programmes for the Lord Mayor's Show which are said to have been printed, scrapped and replaced by 30,000 more were a minor scandal when paper is so scarce; and the Warships Weeks which are going on up and down the country are producing the same sort of stupidity. The fact that a suburban borough in the London area has this week issued a 48-page programme, in addition to a 4-page coloured cover, for its Warship Week is not exceptional. This particular programme is an interesting document; of its 48 pages, the equivalent of six pages is devoted to the week's ceremonies and special entertainments and the equivalent of about 4½ pages to patriotic messages; the rest consists of advertisements either urging readers to spend more money or reminding them, for good-will reasons, that such and such a firm is still extant. Even though large sums of money were presumably paid by advertisers to swell the week's savings figures, as well as to cover the cost of the week's celebrations, the production is a shocking waste of paper. The organisers of these savings weeks seem to have only a slender notion of what they are really intended to do. Thinking only in terms of money subscribed, they entirely overlook the fact that the real reason for collecting the money is to prevent people from consuming commodities or employing labour by spending it. It is an entirely topsy-turvy process to rob Lord Beaverbrook of paper in order to swell Lord Kindersley's figures of money savings. Presumably there must be some wastage, because there must be some publicity by posters and leaflets; but the whole *fiesta* atmosphere of these “weeks” is wrong when people save with one hand and indulge in carnival spending with the other. The proper economic aim is not even to buy warships—which is only a convenient and imaginative symbol—for the naval building programme will not be affected; it is simply and solely to cut down spending and consumption.

Uneasiness in Turkey

A little stir of uneasiness has passed over the surprisingly smooth surface of Turkish politics. The news that the Ministers both of Defence and Communications had resigned raised a question in the public mind which the linking of their resignations with the sinking last June—with heavy loss of life—of the Turkish steamer *Refah*, only partially satisfied. If a trial of strength lies before Turkey, troops and roads are of the essence of her resistance. Close on the resignations came the news that the Prime Minister, M. Saydam, is to take a month's holiday—not in itself an extraordinary step, considering the unremitting nature of his work, but it revived the earlier uneasiness. At the same time, the external situation seems to have taken on a new and ominous colour. M. Zhanev, President of the Foreign Affairs Committee in the Bulgarian Sobranie, made reference in a speech to Bulgaria's unsettled frontiers with Turkey and the dangers created by the presence just beyond Turkey's frontiers of powerful British and Russian armies. His remarks are a reminder to Turkey of the rôle the Bulgarians are reserved for, should the German Black Sea offensive carry the German armies into the Caucasus. With three coasts occupied, the German General Staff would hardly tolerate the independence of the fourth under the control of an ally of Britain. Bulgaria has not been made to fight in Russia. There can only be one reason for the delay—that its tasks lie on other fronts. What of the “unsettled frontier” with Turkey?

* * *

The Need for Nurseries

The Minister of Labour has appealed for a million more married women to work in the war factories. Mr Bevin has recognised that they cannot be persuaded to enlist unless adequate provision is made for the care of their

children in their absence; but it has been left to various correspondents of the *Times* to point out how slowly this provision is being developed. There are still only 163 wartime day nurseries, with accommodation for scarcely 6,000 children, a number which appears particularly inadequate in the light of the fact that, before the war, there were 170,000 children in nurseries and nursery schools. The main trouble is that it appears to be nobody's job to see that this accommodation is provided. The Ministry of Health is responsible, and the Board of Education and the Ministry of Labour have fingers in the pie. The result is confusion and lack of initiative. Logically and practically, the system should be administered by the education authorities, who alone have the appropriate experience and already administer other related schemes. If the responsibility were thus focused, some local education authorities at least might be expected to come forward with schemes showing drive and ingenuity, and these would serve as models for the others. Even with this reform in general organisation, there would, however, remain certain difficulties. The difficulty of finding suitable premises is probably not insuperable. Schools and other public buildings could sometimes spare suitable accommodation; empty houses could be commandeered; owners of large houses who are still living in them might often be induced to lend suites of rooms, even if from no higher motive than to escape having evacuees billeted on them. To find suitable staff is not so easy. To do the positive educational work which can be done by the peacetime nursery school as by no other agency is out of the question; but one trained head, with suitable, if inexperienced, people under her, could keep many of the children every bit as well and happy as they could be in their own homes. Those “grannies and great aunts” who are prepared to respond to Mr Bevin's appeal to help with the children in their own homes would greatly multiply their usefulness if they would go instead as nursery school helpers. Elder sisters who have just left school often have a natural aptitude for managing small children, and might at the same time receive some training which would start them on the road to a useful profession—though they could not and should not be expected to give their services free. In addition to the indispensable day nurseries, it is highly desirable that there should be residential nurseries for those who need them and are willing to use them.

Religious Education

An amendment to the debate on the Address in the Lower House last Tuesday moved “ . . . that greater recognition should be given to the essential value of religious education in our schools . . . ” The debate which followed covered suggestions that in elementary and secondary schools daily religious instruction should be made compulsory, as should daily corporate worship; that the limitation on the hours in which religious teaching may be given should be removed; and that school inspectors should undertake examination of religious knowledge. Admittedly, from the standpoint of those with definite religious beliefs, the present state of religious teaching in state-aided schools is unsatisfactory. This is particularly true since at present religious teaching is reduced to a minimum, often ineptly offered, and generally robbed of any feature capable of distinguishing it from literary-historical discussion. But there is very grave doubt whether any of the suggestions made in the course of the debate, except the removal of restriction on the hours in which religion may be taught, will prove of any advantage to those parents who wish their children to be given in school the opportunity of assimilating a vital and positive religion. There can be little doubt that the present ineffectiveness of religious

ESTABLISHED 1810

education is due primarily to the necessity, since the Education Act of 1870, of reducing the teaching of divinity to a common denominator of piety and scriptural examination. The Cowper-Temple clause forbids the teaching of religious formulae, of a particular dogma, of theology which alone can interpret and inspire. The solution certainly does not lie in forcing denominational teaching on the unwilling. It may well lie in the suggestion that the time set apart for religious teaching should be used for instruction by local priests and ministers of religion of those children whose parents are agreeable. The provision of Clause 13 of the Education Act, 1936, that children may be withdrawn from school to receive this instruction outside school buildings, places too high a premium on inertia to be effective. The one essential of true religion is the elimination of the present insipid mixture and its replacement by competent, positive instruction according to taste.

Location of Industry

The Land Utilisation Committee appointed by Lord Reith in consultation with the Minister of Agriculture is tackling a difficult job. Its terms of reference are the consideration of guiding principles to govern post-war location of industry, building development and reconstruction. The collaboration of the Minister of Agriculture is designed to ensure that post-war building shall not trench upon the territorial requirements of post-war agriculture—whatever they may be estimated to be. The recommendations of the committee are intended to guide the projected Central Planning Authority. Until it is evident what forms of industry will flourish in post-war Britain, it is difficult to plan the location of factories, the more so since surplus capacity after the current expansion is likely to be the outstanding problem in many industries. The demands of agriculture are equally uncertain. Moreover, the "economic" location of industry, in the strict sense, takes little account of the demands of rural preservation, and the "uneconomic" location of industry would need some form of Government subsidy if its products were to be competitive. Town planning, in the economic and not the architectural sense, also hinges on industrial location. For the present, there is no doubt much that can be said on the technical building side; but in the main the committee will be faced with a wide gulf between the admirable abstract principles

that can be laid down and any precise proposals that can be put forward with any confidence that they are practicable.

Shorter Notes

The following table gives the number of civilian casualties in air raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Casualties
Total Sept. Dec., 1940.....	21,669	30,556	52,225
1941:—			
January.....	1,550	2,021	3,571
February.....	793	1,068	1,861
March.....	4,298	4,794	9,092
April.....	6,131	6,900	13,031
May.....	5,520	5,207	10,727
June.....	406	461	867
July.....	501	447	948
August.....	169	136	305
September.....	217	269	486
October.....	262	361	623
Totals to date.....	41,516	52,220	93,736

Of those killed in October, 136 were men, 92 were women, and 34 were children under 16.

Senator Arthur Meighen's return to the leadership of the Canadian Conservative party seems to promise stronger opposition to Mr Mackenzie King's Government. It is true that in accepting the position Senator Meighen denounced party government in wartime, but he is hardly likely to persuade Mr Mackenzie King to form a National Government after stating that the present Administration uses "unmanly and unworthy methods of cajolery, subterfuge, and the social thumbscrew" to mobilise manpower. Senator Meighen himself urges "compulsory selective service over the whole field of the war," but Mr Mackenzie King, in a statement in Parliament last week, declared that he would never introduce full military conscription without first consulting the people.

In a written Parliamentary answer this week, Mr Morrison stated that since the outbreak of war 1,766 persons have been detained under Regulation 18B, and the number still detained is 671.

THE WORLD OVERSEAS

Vichy's Internal Policy—I

(By a Correspondent)

November 11th

WHEN the Third Republic collapsed, the whole political structure of the French nation was wiped out almost overnight; and as this was a sudden breakdown, under the impact of the German war machine, there was nothing, no set of new political ideas, no framework of new institutions, ready to fill the vacuum left by the disappearing republic. The mystical call to repentance issued by the Marshal in those days might have appealed for a time to the masses of bewildered Frenchmen who blocked the roads in their panic-stricken rush to the south. Mysticism, however, could not replace politics for long, and soon the Marshal and his followers had to set out in search of some new constitutional ideas and political institutions.

The original slogan coined by Vichy was the revival of the *ancien régime*: back to agriculture, back to the medieval principle of provincialism, back to a decentralised administration. The source of France's disaster was traced to the unfortunate ideals proclaimed over the ruins of the Bastille. A hundred and fifty years of France's history had to be obliterated by one stroke. But so archaic was this scheme, so crazy was the attempt to unearth France's past and to bury her present and future instead, that the men of Vichy were soon compelled to drop it. The scheme had, it is true, been taken up by the monarchists of *L'Action Française*, but it met with the bitter opposition of Déat,

Doriot, Deloncle, etc., who thought that for the Vichy regime the only chance of survival lay in a radical social demagoguery which the dictators of Germany and Italy had so successfully applied in their countries. They feared lest the Marshal's outmoded conservatism should place upon the regime an anti-popular stamp. Moreover, some monarchists, more far-sighted than Maurras's disciples of *L'Action Française*, refused to compromise their cause by associating it with Vichy's defeatism.

This first adventure in the search for a new constitutional principle revealed a major weakness in the regime. The ruling cliques, cut off from the bulk of the French nation, have been divided by the conflicting tendencies of a social and political conservatism on the one hand and a French imitation of Fascism and National Socialism on the other. The spokesmen of the first tendency are, besides the Marshal, the Under-Secretary for Industrial Production, M. Lehideux (a member of the Renault family), and the prominent representative of the metal industries, M. Pucheu, now Minister of the Interior. Behind them stand circles of French industrialists who have tenaciously clung to Business-as-Usual—business with the invader. Their conception of "collaboration" has, on the whole, been confined to the economic sphere, and they have shown some reluctance towards definite commitments in political and military matters. They have, however, been unable to give

the regime the measure of stability which can be derived only from popular backing.

The French variety of Fascism or National Socialism is still represented by several rival leaders. Most of them are in Paris and enjoy there the presence of their sources of inspiration. There is Doriot with his Dr Goebbels—Marion—whom Darlan has put in charge of the Information and Propaganda Department. There is the leader of the *Croix de Feu*, de la Rocque, whose political activity has lost much of its original impetus. There is Deloncle, whose Social Revolutionary Movement has specialised in spying, murder and setting fire to synagogues; his followers were responsible for the murder of the Socialist ex-Minister of the Interior, Marx Dormoy. There is Déat, whose *Rassemblement National Populaire* has recently parted with Deloncle's organisation, "in spite of unanimity in matters of foreign policy, owing to the difference in views on internal affairs." There are a dozen or so of *de minorum gentium* on the Olympus of the National Revolution. They all have in common their eagerness to carry collaboration into the spheres of foreign policy and military action. They accuse Vichy of being incapable of defending the French Empire against Great Britain, and claim a "common Franco-German defence of North Africa." They also demand a wholehearted participation in the anti-Bolshevik crusade, blaming Pétain's Government for what they consider a lukewarm attitude towards the anti-Communist Legion. (Significantly, Maurras and his monarchist disciples openly refuse to recruit for the Legion). Coupled with this, there is the demagogic scurrilous propaganda against plutocracy and the demand to purge the Vichy regime of the friends of big business. Yet none of these self-styled Leaders has succeeded in stirring any mass movement for the National Revolution. The only serious attempt was made by Déat, who propounded the need to create the *Parti-Unique* on the German or Italian pattern. But the *Parti-Unique* was no less of a failure than the abortive restoration of the *ancien régime*. Vichy rejected Déat's scheme, and the endeavour to fuse the numerous Fascist groups into one has resulted in even more schisms among them. Fascism and National Socialism grew into mightier popular movements, thanks to the exaltation of a hysterical nationalism and to the promise of national aggrandisement they carried with them. The promise to perpetuate France's prostration within the framework of Hitler's new order could hardly favour their French imitators. If Danton's saying that a revolution cannot be carried abroad at the bayonet's point is true, then it is even truer that National Socialism cannot thrive in a country into which it has been brought on the caterpillars of foreign tanks.

Reviving Verdun

Pétain's reply to Déat's *Parti-Unique* was the *Légion Française des Combattants* which exists in unoccupied France and North Africa only. True to his favourite method of exploiting the glory of 1914-18 in order to veil the capitulation of 1940-41, Pétain turned for support to his old subordinates, the combatants of the last war. Their old independent associations have been banned, and in their place the *Légion Française* has been set up, which the members of the former associations have been forced to join. The Legion's task has been officially defined as that of "informing the Government of the legitimate aspirations of the French Commonwealth and of the intrigues waged against the doctrine of the National Revolution, or against the practical application of its principles." The rôle assigned to the Legion has thus been made clear; the memories of Verdun have been evoked to make the ex-combatant serve as a spy against his "disloyal" countrymen. The spying system has spread all over the country; every street, and, in big towns, every block of flats, have been placed under the care of a trusted Legionary. But only a small minority of the combatants have agreed to do the job, and the Vichy press has constantly had to report de Gaulle plots, the discovery of free masonic conspiracies and Communist cells within the Legion, and the dissolution or purge of whole sections. The auxiliary police rôle which the Legion has assumed has made it more difficult for it to play the part of a political propagandist body which was expected of it, and the supporters of Déat's *Parti-Unique* were quick to point out the failure of the *Légion Française*.

Another striking admission of failure came from a most unexpected quarter. In the summer of 1941, Admiral Darlan approached the leader of the Radicals, M. Chichery, with the proposal to resuscitate his party. A similar offer

was made by the Vice-Premier, M. Paul Faure, the former leader of the pacifist section of the Socialist party. The old party system, which was blamed for the defeat and for all the disasters that had befallen France, and which was indignantly buried in the summer of 1940, was to be called back to life a year later at the request of Vichy. It is true that it was to be revived in an emasculated form—"sans Herriot" and "sans Blum"—so as to "agree with the spirit of the new epoch," that is, with the Pétain-Darlan dictatorship. But M. Chichery declined the offer right away. M. Paul Faure made a tour of the provinces to see what could be done; he found that he could persuade no more than 500 former members of the SFIO to accept the proposal. The whole scheme had to be thrown overboard; and Darlan has thus learned that though it may be easy for a conqueror to keep a puppet government in a conquered country, it is somewhat more difficult for such a government to set up a puppet society with sham parties and sham organisations to fill the political vacuum around it.

Eire's Balance of Payments

[FROM OUR DUBLIN CORRESPONDENT]

October 27th

THE official estimate of the Irish balance of payments in 1940, which has been published in the *Irish Trade Journal*, throws much light on the economic changes caused by the war. Compared with the previous year, visible exports increased from £26,892,000 to £32,966,000, and visible imports from £43,415,000 to £46,790,000. The physical volume of both exports and imports materially declined, but there was no change in the terms of trade as the prices of imports and exports rose by the same amount. The passive balance of trade fell from £16,523,000 in 1939 to £13,824,000 in 1940. The estimated total of invisible exports on current account fell from £20,993,000 to £18,757,000, and that of invisible imports from £8,017,000 to £7,807,000, the active balance on invisible account falling from £12,976,000 to £10,950,000. The total of all current items on the export side rose from £47,875,000 to £51,723,000, and on the import side from £51,432,597 to £54,597,000. The total current balance was passive to the extent of £2,874,000.

Among the invisible exports, the revenue from port receipts from foreign shipping fell from £250,000 in 1939 to £165,000. This decline reflects the consequences of the blockade, and may be expected to be even greater this year. The income from investments and profits abroad rose from £12,700,000 to £13,200,000. On the other side of the account, remittances to foreign owners of Irish investments fell from £7,000,000 to £6,900,000, leaving a net inward balance in 1940 of £6,300,000. Emigrants' remittances from the United States declined from £2,226,000 to £1,428,000. This serious reduction, which may be expected to continue, as emigration to the States practically ended in 1929, is partially offset by an increase in the remittances from Great Britain from £600,000 to £700,000. In view of the magnitude of emigration to Great Britain in recent years, this estimate appears rather low, and the amount will certainly be greater this year. Receipts from American tourist expenditure have sunk to nothing. No estimate is given of other tourist expenditure, but it may be assumed that the severe travel restrictions have practically abolished this item from both sides of the account.

It is a sad reminder of the disturbed age in which we live to find that pensions are still being paid by the British Government to Irish residents who fought in the last war. This source of revenue, which is in its nature wasting, sank from £1,240,000 in 1939 to £1,190,000 in 1940. Payments by the British Government, other than those made through the Department of Pensions, rose from £1,129,000 to £1,350,000. As against these receipts, an annual payment of £250,000 was made to the British Government under the post-Treaty financial agreement. "Other known current items" declined drastically from £2,168,000 to £356,000. This great reduction was caused, it may be assumed, almost entirely by the interruption of the Hospital Sweepstakes' foreign receipts.

The estimates of capital items show exports of £10,568,000, compared with £10,339,000 in the previous year, and imports of £12,822,000, compared with £9,851,000. These

German Europe

Grossraum Economy.—A continental *Grossraum* economy dominated and "steered" by Germany, or the economic unification of all European countries, is Nazi Germany's war aim. This European *Grossraum* is ultimately to be extended into Africa and into the European part of the Soviet Union, which a short time ago was termed a *Grossraum* in itself. The *Wehrwirtschaft* experts of the German High Command, and the theorists of the Four Year Plan Bureau, have made it clear that the *Grossraum*, whose geographical limits may be changed according to changes in the situation, must ensure economic self-sufficiency for war purposes.

Grossraum, or Greater Territory, is the extension of *Lebensraum*, or living space. Before the war, Germany incorporated Austria and Czechoslovakia, and at the same time penetrated the south-eastern countries of Europe by unilateral trade and clearing agreements. The first phase of the war added Poland to Germany's *Lebensraum*. The second phase, which ended with the collapse of France, was the first step to a *Grossraum*, and the New Order, conceived long ago as the framework of the continent under German direction, appeared. Its main features are a central clearing system for all trading and financial transactions, and agricultural and industrial collaboration for war purposes now. The total population of Germany and German occupied or dependent countries, including the neutral countries, numbers roughly 370 millions, or 60 per cent of the total population of Europe.

Until quite recently, German economic penetration of the continent proceeded rapidly and on a large scale. The heavy industries of Poland, Czechoslovakia and Alsace-Lorraine have been incorporated in German State or private concerns. The acquisition of industries in south eastern countries and in Norway, Belgium, and Holland by German concerns is very extensive. Subsidiaries of German banks acquired considerable interests in foreign banks and industries. The central clearing system is generally accepted by the subject countries, making the Continent a Reichsmark area. Industrial collaboration with western countries and agricultural collaboration with south eastern countries is well advanced. The characteristic institution is the German controlled all-continental concern, such as the Continental Oil Company or the European Re-insurance Cartel. Either there is direct collaboration between individual German and foreign firms, or collective agreements are made between whole industrial sections, such as the agreement between the German and French, or the German and Belgian textile industries, or between German and Norwegian cellulose manufacturers.

German war economy has no doubt benefited greatly by this collaboration. But the economic possibilities of the process are limited, not only by the supply of raw materials and manpower, but also by the different traditions of economic organisation in the occupied and dependent countries. Recently the German authorities put a stop to the acquisition of industries in south eastern countries by private concerns; and the all-continental concern owned and controlled by Germans is no longer regarded as the ideal solution for a *Grossraum* economy. German State and private concerns are not able to supply the necessary equipment, plant and machinery for the reorganisation of these hastily acquired foreign industries; and the German methods of economic control, that is, the rationing and allocation of raw materials and the control of prices and wages, have to be imposed on systems of economic organisation very different from the German—compulsory economic organisation and marketing systems, which have been decreed in occupied countries after the German model, are not working as the Germans expected.

Nazi economists are therefore calling for what they call realism, which means a temporary stop both to direct economic expansion and to their experiments in economic organisation. Germany still needs the resources of the continent, of course, for its war economy, and it is claimed that the more effective method needed is what is called the *Grossraum* cartel. In Germany itself, the cartel has proved to be an admirable instrument for State control. There are 2,200 internal and 255 international cartels registered in Germany; there are cartels in the continental coal, steel and chemical industries, which are already more than mere quota arrangements, and rather work as central planning institutions for Europe. The argument is that a comprehensive network of European cartels under German

control would be more effective and more flexible than a total reorganisation of the occupied countries, which could not possibly be achieved in a short time. The motor car agreement between Germany, Italy and France (see *The Economist* of May 17, 1941, page 659), is looked upon as a model for the future *Grossraum*-cartel. Nazi economists are convinced that the economic unification of the Continent is an historical process. They have discovered that cartels in Germany laid the foundations for the present highly developed economic organisation; and they believe that European cartels will do the same work for the continent.

Forestry.—Continental Europe has been divided into two forestry *Grossräume*: the North Sea and Baltic countries; and the Danube, Adriatic and Mediterranean countries. The German timber marketing system is to be introduced into all countries. The northern countries will fix their inland consumption, and will be allocated export quotas. Transport is being planned with a view to reducing unnecessary shipments. In the south of Europe, organisation will be different. There central marketing will be organised by a German company, and in each country will be established a mixed company after the model of the German-Rumanian Forestry and Timber Company, whose board of directors is composed of an equal number of Germans and Rumanians.

National Income.—The latest estimate of the national income of Greater Germany (that is, the Old Reich, Austria, the Sudetenland and the incorporated, as distinct from occupied, territories), is as follows:

	(Rm. 1,000 millions)		
	Old Reich	(1) Greater Germany	(2) Greater Germany
1938	80	88	...
1939	85	...	94 to 95
1940	...	...	100

(1) Old Reich, Austria, and Sudetenland. (2) Incorporated Polish and French territories included.

These figures published by the German press suggest that gross national income increased during 1940 compared with 1939 by roughly 6 per cent. The national income of the Old Reich increased by 6.3 per cent in 1939. From December, 1940, to January, 1941, the wholesale price index advanced by 3.5 per cent. It is suggested that total production in Germany rose slightly during 1940. War production must thus have increased considerably.

European Price Policy.—The price stop which Germany introduced in 1936 prohibited an increase of prices above the level of October 16, 1936. From a mere stop the German price system developed into a method of price calculation with minute regulations for each industry. With each new German conquest, the system of price-stops was extended into other countries. Similar prohibitions are now in force in Norway, Finland, Holland, Belgium, France, Slovakia, Hungary and Croatia. Italy, on the other hand, introduced a slightly different price-stop in 1937. In Denmark, an early attempt at a price-stop after the German model was soon abandoned, and replaced by a system that makes increases possible if a rise in the cost of production can be proved. In 1939, Sweden introduced a system of standard prices which may not be changed without special Government permission. In Switzerland, there is no general price control; if the situation makes it necessary, prices of single commodities or groups of commodities are placed under control.

Dr Todt.—The man combining the greatest number of offices in Germany is Dr Todt. He has advanced slowly but steadily from being architect of the *Autobahnen* to being Special Commissar for the building industry and Minister of Munitions and Armaments, and finally to being Inspector-General of Waterworks, Power Plants and Inland Waterways. He is the man who was responsible for constructing the West Wall. For that purpose he formed the Todt Organisation, composed of conscript labour. Building, road construction and civil engineering are now controlled by one man, who, at the same time, supervises the building of fortifications along the Atlantic coast, and the construction of supply roads in Russia.

THE BUSINESS WORLD

Australian Banking Control

TWO recent developments reveal a distinct movement towards much increased Government control of banking in the Commonwealth of Australia. They are the proposed regulations for the licensing and control of private banks and the transparently political appointment to the Board of the Commonwealth Bank made by the new Labour administration. Control of the trading banks is in accordance with one of the oldest planks in the Australian Labour party platform. The initiative for the particular development now taking place does not, however, lie with the new Labour Government; it goes back to an agreement reached with the trading banks at the time of the introduction of Mr Fadden's last budget, in September of this year. That agreement, made between the trading banks and the Commonwealth Bank, arose out of the fear that a secondary inflation of bank credit might be caused by the trading banks allowing their loan facilities and other assets to expand quite independently of the basis of cash determined by the authorities through the policy of the Commonwealth Bank. The argument advanced at the time by the Labour party, then in opposition, was that the trading banks might be tempted into such undesirable expansion by the search for profits. In the preamble to the agreement, the trading banks denied all intention to make excess profits arising from war conditions. They agreed as a wartime measure not to make new advances or increase existing facilities, except in accordance with the policy laid down from time to time by the Commonwealth Bank, and undertook to obtain the specific permission of that bank before purchasing or subscribing to Government or other gilt-edged loans. The trading banks further agreed to deposit with the Commonwealth Bank all surplus investible funds, the understanding being that such deposits would be for periods of six months; that they would be renewed as they matured unless, in the opinion of the Commonwealth Bank, the funds in question were required by the trading banks for their legitimate business; that the rate of interest was to be low, and fixed from time to time by the Commonwealth Bank. The trading banks finally undertook to issue accounts and balance-sheets according to specified forms, to grant the Auditor-General full access to their books, and in general to satisfy the Commonwealth Bank that no excess profits were in fact being earned.

The Fadden Government was given no opportunity of implementing the agreement. When the new Labour Government took the matter in hand, it did so through its Treasurer, Mr J. B. Chifley, whose advocacy of the nationalisation of the trading banks had been given unmistakable expression in the minute of dissent which he attached to the report of the Australian Banking Commission. Mr Chifley announced in the course of his recent budget speech that the Government had decided to implement certain recommendations of the Banking Commission in order to bring the operations of the trading banks under effective control. Accordingly the trading banks are to be licensed, and the regulation will provide that licences are granted only to institutions which deposit their surplus resources, as defined by the Commonwealth Bank, with that institution, and which publish their accounts in accordance with the directions of the Commonwealth Treasurer. Mr Chifley also announced at the same time that facilities to private manufacturers engaged in war production, wherever such loans were guaranteed by the Commonwealth Government, would in future be provided by the Commonwealth Bank. As implemented under the direction of Mr Chifley, the avowed apostle of nationalisation, the agreement with the trading banks and the findings of the Banking Commission are taking on a character of which the originals were largely innocent.

It cannot be suggested that the experience and policy of the Australian trading banks since the outbreak of the war have provided any justification either for fears of "secondary

inflation" being engineered through them, or for the punitive measures now contemplated against them. The expansion of bank credit in the Commonwealth has been surprisingly modest. In September, 1939, the total deposits of the nine trading banks amounted to £A315 millions. By last June they had risen to £A369 millions, an expansion of 17 per cent, or very much less than the corresponding movements in the United Kingdom. This expansion in bank credit has been built up largely on the basis of increased holdings of Treasury bills and longer-term Government securities. The Treasury bills, on which the prevailing rate is 1½ per cent, rose between September, 1939, and June, 1941, from £A19 millions to £A44 millions, while the investments moved from £A22 millions to £A61 millions. The average yield on the additional investments made by the banks since the beginning of the war probably falls under 3 per cent. The last Government issue was made on a two-decker basis, a long-term issue being offered at 3½ per cent and a medium-term, on which the banks would certainly concentrate their applications, on a 2½ per cent basis. The trading banks' advances have remained comparatively stable, the latest total of £A283 millions comparing with £A294 millions on the outbreak of the war. This, the most remunerative of their assets, may be severely cut into by the proposals compulsorily to transfer from the trading banks to the Commonwealth Bank all Government guaranteed advances to manufacturers engaged on war work. Such activity must become increasingly representative of the industrial life of the Commonwealth, and it needs only increased readiness on the Government's part to grant Government guarantees for armament loans for the transfer to the Commonwealth Bank of a considerable part of the genuine industrial and commercial banking business now handled by the trading banks.

Nor does the trend of banking profits since the outbreak of the war provide any factual basis for the fears that the profit motive has tempted the trading banks into excessive credit expansion, or for the impressive and detailed counter-measures which are being applied to prevent any such development. The balance-sheet figures show that in Australia the trading banks have been reasonably successful in maintaining the level of their normal banking business, and have not been driven excessively into the market for Government securities. They remain primarily trading banks, and are in no danger of becoming gilt-edged investment trusts. Any expansion in their income since the outbreak of the war has been more than offset by higher costs, and particularly by the outlay on salaries, and the trend of declared profits has, as in this country, been slightly downward.

The appointment of Mr William C. Taylor, a solicitor long associated with the Australian Labour party, to a seat on the Commonwealth Bank board, appears superficially to be in line with the recommendations of the Banking Commission. The report of the Commission suggested that members of the board should be selected for "capacity and diversity of experience and contact," and not as representatives of special interests, such as industry and agriculture. This gives the Government of the day a considerable measure of latitude in its selection of directors, and it is evident that the Curtin administration is not allowing grass to grow under its feet in beginning the task of changing the character of the board. The task must, however, take some years to complete, since there are at present seven directors other than the governor and the Secretary to the Treasury, and they are elected for seven years, one retiring each year, and being eligible for reappointment. But there can be no mistaking the significance of this first appointment of the new Government. The *Gleichschaltung* of the Commonwealth Bank is clearly under way. With Mr Chifley in the Treasurer's office, the Australian trading banks must, for their part, expect a much sterner assault on their independence and business than they have yet had to with-

stand. There has long been room for a clearer segregation of banking functions than has in the past been evident in the Commonwealth. On the one hand, the central bank has engaged in highly competitive, commercial and industrial banking, and, on the other, private banks have at times taken an unjustifiable lead in such matters as exchange rate policy, which should be strictly the province of the central bank

or the Government. But there appears to be little prospect of that segregation being effected by reciprocal action on the part of the Commonwealth and the trading banks. It is all too likely to be a one-way movement of encroachment by the Commonwealth Bank on the legitimate sphere of activity of the trading banks. It would be better to face the issue of nationalisation than to bring it in by the back door.

Dollar Assets and Commitments

THE evidence given by American Treasury officials on the recent \$6 billions Lend-Lease appropriation, of which detailed reports have recently reached this country, sheds fresh light on the dollar assets and commitments of the United Kingdom. It brings the essential data up to as recent a date as September 1st last. The position of British dollar assets on that date compared with that at the outbreak of the war was as follows:

	(in million dollars)	Sept. 1 1941	Outbreak of War
Marketable securities.....	950	227	
Gold	2,038	151	
Official dollar balances	50	54	
Private dollar balances	545	310	
Direct and misc. investments	900	785	
Total	4,483	1,527	

As was to be expected, the heaviest drain had been that on gold and marketable securities. The amount of private balances remaining at the beginning of September was not "available" since it represented the minimum required for the financing of trade between the two countries, and a large part of the "direct and miscellaneous" investments must be regarded as unliquid, except to the extent that RFC loans can be secured on them. The "available" amount is certainly considerably less than, and perhaps less than half of, the total of \$1,527 millions.

The report also throws considerable light on the vexed question of Great Britain's—or, more accurately, the sterling area's—continuing requirements of dollars, now that the main flow of munitions (in the widest sense of the word) is obtained on Lend-Lease terms. In the six months from September 1, 1941, to February 28, 1942, the sterling area will require \$500 millions for payments on contracts entered into before the passage of the Lend-Lease Act, and \$535 millions for current needs. The composition of this total and the methods by which the requirements are expected to be met are shown in the next column.

These figures illustrate the continued shortage of dollars. It is true that the current earnings of dollars, at \$885 millions, are larger than the current requirements—that is, requirements other than for the liquidation of past contracts—of \$535 millions. But, in addition to the \$500 millions to be paid off in these six months on pre-Lend-Lease con-

DOLLAR REQUIREMENTS AND EARNINGS, SEPTEMBER, 1941—FEBRUARY, 1942.

Requirements	\$ million	Earnings	\$ million
Pre-Lend-Lease contracts	500	Sales of merchandise to U.S. by U.K.	60
Payments to U.S. for shipping interest, film remittances, etc.	85	Sales of merchandise to U.S. by rest of sterling area	310
Payments to U.S. from rest of sterling area (i.e., other than U.K.)	280	Sales of gold	290
Payments to areas outside the U.S. requiring gold or dollars (mainly S. America)	60	Shipping, interest and other services	225
Goods or services for U.K., urgent or ineligible for Lend-Lease	110	Total of above	885
	1,035	Draft on dollar assets	150
			1,035

tracts, there will remain a further \$430 millions, most of which will presumably fall into the next half-year. Since a substantial fraction of the remaining liquid assets will have to be realised before the end of February, and, in all probability, a further portion in the next period, it is clear that the margin is very small, and that the prospect of an alleviation of the dollar shortage is still remote.

It is interesting to note that the details of British dollar commitments include some provision for dollar or gold payments to countries outside the United States. The amount so due in the six months to the end of next February is \$60 millions, and is stated to be payable largely to South America. This indicates that there is some provision in the Special Account and other payments agreements with the South American countries for occasional settlement of the balances due to them through payments in gold or American dollars.

There can be no question that the publication of these figures assists understanding of the British exchange position both in this country and in the United States. It may be against the tradition of British official secrecy, but it is difficult to see what real harm is done. On the contrary, the only way of convincing the American public of the real nature of British difficulties is to prove them arithmetically, as is here done. It is a pity that the figures have to reach the public through the somewhat hole-in-the-corner method of the publication by a Congressional Committee of evidence given to it some weeks earlier by representatives of the American Treasury. The full value of the figures would be realised if they were openly and regularly published as a White Paper.

Finance and Banking

Big Treasury Deposit Payments

The position in the money market during the week has been dominated by the heavy Treasury deposit payments of the banks. While there were no maturities of such deposits, new payments were called for to the extent of £50 millions. But the time the clearing banks had effected these substantial transfers to the Treasury and had financed the appreciably heavier flow of public subscriptions to Government loans they found themselves left with very little appetite for purchases of bills from the market. The syndicate, fortunately in the circumstances, received an allotment no greater than 27 per cent in its applications for Treasury bills on Friday of last week, and the absence of ready buyers of bills from the discount market has, therefore, led to no great expansion in the demand for short loan accommodation. At all times the supply of credit has been about sufficient to meet requirements. The drain on bank cash is shown in the Bank return, in a fall of £18,896,000 to £120,048,000 in bankers' deposits. The Treasury has utilised the bulk of the receipts indicated

by this decline in repaying indebtedness to the Bank, and Government securities have fallen by £13,346,000 over the week. Thus the increase in public deposits amounts to £2,257,000 only and leaves this item at the comparatively low level of £10,618,000. The note issue maintains its persistent upward trend, the rise in the past week amounting to £2,661,000, carrying the total of notes in circulation to £706,697,000 and reducing the unissued notes in reserve to £23,544,000.

Rise in the Circulation

The search for convincing explanations of the rise in the note circulation continues to exercise many minds. It will probably be found that the increased use of cash as against cheques in commercial operations accounts for a substantial part of the recent abnormal expansion. The use of notes in "black market" transactions has already been mentioned

in these notes. The responsibility of this particular factor for the total expansion of recent months is probably of a quite minor character. More important is the use of notes in dealings by traders who are prompted by the ros. in the income tax to hide their turnover from the inspection of the taxation authorities. That is a field where useful co-operation between the banking and inland revenue authorities might yield appreciable results. Of more normal character is that part of the increased circulation which is due to the curtailment of banking facilities. The closing of many branches, the less frequent opening of many sub-branches in country districts, to say nothing of the general shortening of banking hours, have meant greatly restricted facilities for depositing cash with the banks. As a result many farmers and traders in rural localities are forced to hold far more cash than was their wont. The restrictions of travel facilities, and, in particular, the increasingly severe rationing of petrol, have the same effect, inducing many people living far from the nearest bank offices to bank their cash at far longer intervals than was their custom in normal times. Another factor in the increased demand for cash has been the transfer of population from the salary to the wage earning classes. Many clerks who were paid by monthly cheques are now munition workers receiving weekly cash wages. These contributory explanations of the steep expansion of the note circulation are not equally welcome; but they all emphasise the absence of any urgent inflationary implication in the movement

Notes and Deposits

In order to view the movements in the circulation in their true perspective they should, moreover, be compared with the concurrent expansion in bank deposits. Three series may be used for such comparison, first, the clearing bank deposits, secondly, the active circulation of the Bank of England, thirdly, the circulation, including coins, estimated by the Bank of England to be in the hands of the public, i.e., after deduction of notes held by the banks. The following table shows the percentage changes in these three series since the beginning of the war, over the year to the end of October and over the last six months of that period. The figure of the total circulation in the hands of the public for the end of October has had to be estimated, but given the available evidence, that can be done with a reasonable measure of accuracy.

	Clearing Bank Deposits	Percentage Increases	B. of E. Circulation	Net Circulation
End Aug., 1939, to end Oct., 1941	41.3	31.0	40.8	
Year to end Oct., 1941	19.1	17.2	18.8	
Six mths. to end Oct., 1941	12.1	11.2	13.3	

It will be seen that the expansion in the circulation since the beginning of the war and over the past year has not quite kept pace with the rise in bank deposits. It is only over the past six months that the circulation in the hands of the public has shown any indication of outstriking the

expansion in deposits—and then only by a very small margin.

Bank Credit and Government Borrowing

The Chancellor of the Exchequer was asked in the House this week what steps were taken to ensure that conversion by the banks of Treasury deposits into National War Bonds did no more than represent the investment of genuine savings deposited with them. Sir Kingsley Wood in his reply stated that "the money out of which the banks lend to the Government is, broadly speaking, derived from deposits made by customers in the ordinary course of their business, and there is no question of banks creating credit for the purpose of lending money to the Government." The Chancellor in his answer strayed quite unnecessarily on to dangerous general ground. If bank credit has not been created by direct Government borrowing from the banks since the outbreak of the war, one would like to know by what miraculous process bank deposits have, since September, 1939, risen by some £930 millions, especially as bank advances have, over this period, fallen by about £150 millions. The Chancellor was "speaking broadly"; he may have cause to welcome that modest qualification to a very sweeping statement.

Royal Bank of Scotland Profits

The report of the Royal Bank of Scotland covering the financial year to the second Saturday in October provides the best indication so far available of the general trend of banking profits over the past year. In this respect it confirms all the previous indications that there has been an appreciable falling off as compared with the previous year. The net profits, after providing for taxation and bad and doubtful debts, amounted to £491,522, a drop of £65,837 on those for 1939-40. The explanation—apart from the heavier burden of taxation—is not far to seek. The most remunerative type of asset, loans and advances, has fallen by £2,170,037, while it is in Treasury deposit receipts and investments that the expansion in the balance-sheet figures derives its main stimulus. These items are up by £4,000,000 and £5,498,310 respectively. Deposits have risen over the year by £6,915,856 and the note circulation by £807,146. But given the comparatively high rates still paid on deposits in Scotland, it is evident that with the redistribution in assets which has occurred over the past year, a considerable proportion of the bank's resources are now employed on an extremely narrow margin of profit. Expenses, for their part, have tended to rise. In this combination of factors there will be found ample explanation of the drop in the published profit figure. The distribution policy has fortunately been exceptionally conservative in the past, and it is thus found possible to repeat the 17 per cent dividend, while still allocating £130,272 to reserves, premises and pension funds.

Investment

Treasury Intervention

The last few days have brought signs that the investor is inclined to abandon new favourites for old, and there has been some recession in overseas investments, with a modest recovery in first-class industrial equities and the Funds. The explanations advanced for this change are a string of rather favourable company reports and such events as the Chancellor's statement concerning the Viscose arbitration. The operative factor is, however, likely to be the consideration that prices in both sections have been either unchanged or subject only to minor fluctuations without any real trend for a matter of weeks, or in some cases months. So far as Government securities are concerned, the attached table, showing some of the peaks and depressions of the past year, is instructive. In the ten months ended mid-September, there was a steady upward trend, affecting

	Mid-Nov. 1940	Aug. 22, 1941	Sept. 12, 1941	Sept. 22, 1941	Oct. 1941	Nov. 1941
Consol 2½%	75½	81½	82½	82	82½	82½
Local 3%	88½	95½	95½	95*	95½	95½

5% 1944-64	107½	107½	107½	107½	105½*	105½

* Ex-dividend.

all maturities. In the ten weeks since then, there has been little definite direction in such movements as have occurred. The explanation lies in the fact that the institutions are not in the market—their investments going into tap issues—while the general public is still seeking its fortune elsewhere. It is possible that the process of consolidating the advance in gilt-edged, by reducing the yields on all other types of investment, has not yet reached the point where it will start another rise in the premier securities, even without the assistance of the institutions. It is also probable that the volume of real saving by individuals and companies, apart from that portion invested in the tap issues, is falling, but it seems likely that some move will be made before long to provide the small stimulus needed to put the circle of falling yields into operation once more. The action of the Treasury in offering to buy lodged American securities, and in taking up the internal Argentine loans, may help a little. The permission to public utilities to convert to a lower basis will also work in the same direction, and the three together will involve a considerable sum, for although public issues of utilities covered by the permission are few, they have substantial amounts of debentures available for conversion.

* * *

“Motes” and “Mites”

The Economist strongly favours salvaging paper before it is used rather than after, and no one will deny that members of the Stock Exchange can make their contribution to that end. Brokers and jobbers would, however, be more than human if, when forbidden the free distribution of lists, they did not contrast the reduction in size and number of their own product with the growth in the number of forms, often of unnecessary dimensions and almost always on paper of good quality, which they are called upon to compile for the assistance of the authorities. Apparently, there is no ban on distribution provided a payment is demanded. But, unless the payment were made large, it would probably not greatly reduce the total output, whereas it would entail additional accounting which would be costly of labour—the shortest commodity on the Exchange—as well as of paper. It seems a great pity that, in a matter where no possible harm could have been done by prior consultation, the committee should have been left in ignorance of official intentions and that the order should have been put into force without notice or explanation. The two types of publication principally affected appear to be lists of closing prices and lists of stocks on offer. The latter are essential to anything like an active market in the Funds and all other trustee, or near trustee, securities, while the former are needed for the compilation of accurate closing prices, disseminated throughout the country by the press and other agencies. After some talk of “mites” and of “motes,” jobbers have carried on with publication, until they are given further instructions, feeling, doubtless, that the letter of the law can always be complied with, but wishing to know what the authorities really intend. On this point, it is difficult to escape the conclusion that there has been insufficient study of the machinery with which it is proposed to tamper. The proper solution can only be reached after consultation.

* * *

Pledged Dollar Stocks

It will be recalled that, following the agreement for a loan of \$425 millions from the American Reconstruction Finance Corporation to this country, the Treasury, early in August, gave notice that all holdings of a short list of some 22 American securities must be placed at their disposal for use as collateral security. Holders of these were given to understand that, in the normal course of events, their securities would be returned to them, but that they had no actual right to claim the release at any time and that the Treasury could dispose of the holdings if it so wished. This had, of course, the effect of freezing these investments. It has now been announced that owners of all but five of the list may sell them to the Treasury at any time, while holders of the remainder, consisting of four types of share in W. R. Grace and Co. and of Virginian Corporation 5 per cent collateral trust notes, Series “M,” may dispose of them abroad, subject to the consent of the RFC. This permission apparently applies only to the restricted list of 22 securities. Presumably, the much larger lists, which provided part of the remaining cover for the loan, were either holdings already vested, but not sold, or

trade investments in the U.S.A. of British industrial or commercial concerns. The nominal value of the holdings which the Treasury is prepared to buy amounts to some \$46½ millions, plus some 727,000 shares of no par value and some others. The step thus constitutes a considerable measure of unfreezing, for which some holders will be duly grateful. Whether the present is a good time for the sale of most American investments is a matter of some doubt, but holders should bear in mind that they have no absolute right to the return of their stock. The Treasury has to find, in addition to the half-yearly interest payments of \$6,375,000, a sinking fund appropriation of \$7,500,000 per annum, starting from October 1st last, and a reserve account of not less than \$6,375,000. As was pointed out on page 509 of *The Economist* of October 25th, the annual earnings of the British insurance companies come within measurable distance of covering the whole service. The Treasury may wish to provide a larger reserve or even to expedite repayment of the loan, but the main reasons for the step are to afford relief to would-be sellers and stimulate demand for other securities.

* * *

Rhodesian Copper Prospects

Apparently the investing public has miscalculated the demand for copper by the war industries of this country, in the same way, but to a less extent, as it originally miscalculated the demand for oil. The first of the full accounts of the Rhodesian group for 1940-41, those of Roan Antelope, show, as was suggested, a rise in costs of almost £150,000, but this is only one-third of the total fall in net profit before tax, the remainder being due to a decline of some 9 per cent to just over £3,000,000 in copper sales account. Unless the generally accepted statement that the price paid by the Government is virtually unchanged on the year is misleading, this can only mean substantially smaller sales, and since stocks show a modest reduction, a slightly larger decline in output. Actually taxation, although very heavy—it still absorbs 63 per cent of net profit—is down on the year from £800,000 to £730,000, of which the provision for NDC is only £43,500, against £73,000. The tax provision includes £118,000 in respect of the rise in the rate of tax levied on the profits of 1939-40, and only covers tax on those of the year just ended at the current rate of 10s. in the £, less Dominion Income Tax Relief. After maintaining the appropriation of £100,000 to reserve, and paying the dividend of 10 per cent, against 20 per cent, there is a draft of some £27,000 on the carry forward, against one of almost £53,000 a year before. Capital expenditure during the year was less than £200,000, mainly on housing, and a third reverberatory furnace. There is a comparatively small increase in total liquid assets, and a negligible decline in their excess over current liabilities to just under £800,000. Since the mine is at the height of its capacity, there is no reason to suppose that its small sales are exceptional, and it will probably prove a favourable specimen of the companies operating in the area. The accounts cover a year during much of which industrial output for war purposes was only slowly getting under way. It may be doubted, however, whether recent additions to our effort have been in a direction which particularly favours copper producers. Presumably a time will come when this demand will increase. Meanwhile, shareholders have the consolation that, had sales been markedly higher, a large part of the increase would have gone in EPT, and that, as things are, their wasting asset is being used up more slowly than they expected. The price of the 5s. shares, at 14s. 4½d. ex dividend, giving a yield of a mere £3 9s. 7d., suggests that investors are not too depressed as to the outlook.

Company Notes

Cunard Dividends

Since the announcement last September that *Cunard White Star* was to redeem from reserves the company's debt to the Treasury to a total of £7,950,000, markets have been optimistic regarding the possibility of payments on ordinary capital. Consequently, the decision of the *White Star* board to declare in the current year a 5 per cent dividend, less tax, the first since its formation in 1934, is hardly a surprise. The payment requires £500,000 gross, which does not unduly strain the accumulated carry-forward of £1,414,351. The payment is to be partially passed on to

the general investor through the decision of *Cunard Steam Ship*, which owns 62 per cent of the *White Star* capital, to pay off two years' arrears on 5 per cent cumulative first preference capital. The payment, which is less tax at 10s., requires £150,000 gross and will bring payments up to June 30, 1933, leaving gross arrears on this class of £712,500 to end December next. Arrears on the 6 per cent preference issue, which are cumulative since June 30, 1931, will amount to £690,000 and the end of the current year. Clearly, ordinary stockholders in *Cunard Steamship* have a considerable distance still to go before they can expect to receive a dividend, but a start has now been made. After the announcement, the £1 ordinary stock changed hands at 15s. 4½d., the 5 per cent preference stock at 111 and the 6 per cent preference stock at 108.

* * *

Bass, Ratcliff and Gretton

Like those of the majority of breweries, the accounts of Bass, Ratcliff for the year September 30th last show a rise in gross income, from £1,503,980 to £1,574,417, and a moderate decline in earnings after tax. Since depreciation absorbs only £66,312 against £78,346, while rents, rates and taxes are less than £80,000 higher at £640,217, the decline in equity earnings amounts to only some £9,000 to £525,059. With the tax free ordinary dividend maintained at 20 per cent, to which it was reduced from 25 per cent in the previous year, the company is able to transfer £50,000 to reserve for contingencies as before and to raise the carry forward from £844,852 to £872,784. The tax free cover is down from 23.9 to 23.4 per cent, equivalent to a rise from 41.5 to 46.8 per cent.

	Years ended September 30th.		
	1939	1940	1941
Total income.....	1,545,450	1,503,980	1,574,417
Depreciation	76,986	78,346	66,312
Rents, rates and taxes	445,086	562,649	640,217
Renewals, fees, etc.	93,755	72,822	89,877
Debenture interest	190,089	187,590	184,951
Prof. dividends	68,000	68,000	68,000
Ordinary stock : †			
Earned	611,531	534,573	525,060
Paid	558,910	447,128	447,128
Earned %	29.9	23.9	23.4
Paid %	25	20	20
Reserves	50,000	50,000	50,000
Carry forward.....	807,407	844,852	872,784
† Tax free. ‡ After deducting £28,551 for depreciation of investments.			

The balance sheet shows a fall in stock from £635,619 to £490,880, which indicates that shortage of supplies rather than any failure in demand has set the limit to gross revenue. This decline and the reduction in cash from £775,059 to £688,455 provides for the rise in Government securities from £836,814 to £1,086,814. Increases in creditors and debtors are both moderate, while general and property reserves are unchanged at £1,000,000 and £200,000 respectively. The company's War Damage Contribution has not yet been written off out of profits and, consequently, appears on the assets side of the account to a total of £88,940. The report emphasises the stability of the leading breweries. The £1 ordinary stock, at 138s., yields £2 19s. 3d. per cent, tax free.

* * *

Anglo-Iranian Results

The Anglo-Iranian preliminary statement for 1940 shows a slight fall in net profits from £2,986,358 to £2,841,909, for which higher taxation is no doubt mainly responsible. Thus, it is probable that income before tax is somewhere near the previous year's level of £7,722,778, to which it declined from £10,583,985 in 1938. Extra depreciation requires £625,000 against £571,250, and there is a consequent fall in equity earnings from £1,343,874 to £1,145,675, representing 6.4 against 7.7 per cent. The ordinary stockholders again receive 5 per cent, to which the customary 20 per cent payment was reduced in 1939, and the whole of the surplus goes to raise the carry forward from £962,551 to £1,101,350. As far as can be judged from the preliminary figures, the severe blow to revenue sustained by the considerable rise in refining costs and the inter-

ruption of normal communications in the first year of the war was not accentuated in 1940, Anglo-Iranian being scarcely involved in the European losses which so seriously affected the Shell group. That relatively satisfactory results were obtained last year must be attributed largely to the political acumen which prevented a German coup in the Middle East. The market was encouraged by the statement, and the £1 ordinary stock rose by 2s. 6d. to 43s. 1½d., at which price it yields £2 6s. 11d. per cent.

* * *

Anglo-Dutch Accounts

Accounts of Anglo-Dutch in 1940 show a rise in total income for the third year running from £387,580 to £394,410. Increases in total tax provision from £155,700 to £164,000 and in general charges from £14,657 to £18,023 are responsible for a small fall in earnings for ordinary dividend from £179,776 to £177,815. Thus, the 6 per cent dividend is earned only to the extent of 5.9 per cent and the carry forward is reduced from £57,253 to £55,068. Cash profits of the wholly owned Dutch subsidiary and associated companies were converted at Fl. 7.53, the average exchange rate for 1940, while current assets and liabilities were converted at Fl. 7.60, the rate ruling at the date of the balance-sheet. Owing to its failure to arrive from Java, the customary consolidated statement is not included in the accounts. The report shows that the rubber crop rose last year from 11,934,358 to 15,425,012 lb. There was, however, a severe fall in the coffee crop from 25,264 to 13,328 cwt and the tea crop was some 1,200,000 lbs lower at 12,168,238 lbs. The large increase in rubber sales at rising prices far outweighed the effects of smaller tea and coffee crops and gross profits of the operating company increased by some 20 per cent. This was, however, more than offset by a rise from Fl. 524,000 to Fl. 1,579,000 in taxes, including in the last year Fl. 150,000 War Profits Tax. In consequence, the net profit is lower, despite smaller depreciation, and the small rise in Anglo-Dutch income is due to appreciation of the florin. The Anglo-Dutch balance-sheet shows a reduction in the total of investments at or under cost—other than in subsidiary companies—from £496,151 to £364,714, having a market value of £358,582. Cash and debtors are both higher at £283,196 against £227,573 and at £28,863 against £4,750 respectively. On the liabilities side of the account, creditors including taxation are reduced by more than half from £114,535 to £55,069, while exchange suspense account stands at £118,749 against £122,986. General reserve is unchanged at £375,000. The general development and replanting policy appears to be going forward satisfactorily. The £1 ordinary stock, 17s. 1½d., yields £7 os. 2d. per cent.

* * *

Malayalam Report

Gross revenue of Malayalam rose in the year to March 31st from £716,401 to £770,653, an improvement which outstripped the increase from £398,057 to £439,380 in general production costs and net expenditure on fixed assets. Total tax provision rose from £147,000 to £185,000, while other charges against profits remained approximately stable. Thus, equity earnings declined from £154,735 to £129,237, representing a reduction in the rate only from 13.6 to 13.3 per cent. Stockholders receive 10 per cent as usual, less income tax at 9s. 3d. No doubt investors will be gratified by the chairman's announcement that the directors intend to use the dividend equalisation reserve, increased by the current allocation of £10,000 to £70,000, when occasion demands. General reserve receives £15,000 against £20,000, bringing the fund to a total of £160,000, and the carry forward is raised from £100,075 to £101,916. The balance sheet shows a rise in net liquid assets from over £457,000 to nearly £477,000. On the liabilities side, creditors, including taxation, are up from £117,482 to £222,200. Among assets, the increase in cash and investments from £582,028 to £666,649 includes a jump in British Government securities, etc., from £70,572 to £299,425. Stocks are up from £114,888 to £221,688, while debtors have declined from

FREE TRADE LEGION

With reference to the advertisement of the above which appeared in *The Economist* on November 15th, the advertisers wish to state that the address given was incorrect. The correct address is 38, Bedford Street, W.C.2

£109,330 to £34,701. The chairman, Mr H. J. Welch, states that the fall in the average yield of tea per acre from 543 to 540 lbs. is due to a cut in the internal Indian export quota. The rubber crop, however, increased from 6,321,786 to 6,343,132 lbs., and it appears that the whole crop was exportable as against 66½ per cent, subject to internal cuts, in the previous year. Both tea and rubber estates suffered damage last year, the former from a drought and the latter from a cyclonic storm. In the current year, crop prospects appear satisfactory, and it is estimated that the whole rubber crop, reduced by some 4 per cent owing to the storm, will again be exportable. The £1 ordinary stock, at 28s. 3d., yields £7 1s. 7d. per cent.

AEC Dividend

The preliminary statement of AEC announces the maintenance of the total tax-free ordinary dividend at 7½ per cent for the year to September 30th last. Thus, the effective rate less tax is raised approximately from 13 to 15 per cent. Net profits of £132,500 compare with £196,500 in the previous year, a figure which, however, included £7,852 profit on sale of investments. Thus, the amount available for equity payments was £188,648 in 1939-40, representing a tax-free rate of 12.6 per cent. On the assumption that last year's net profit figure contains no fortuitous credit from disposal of securities, the current dividend is covered by tax-free earnings of 8.8 per cent, leaving £20,000 for transfer to general reserve, which received £82,000 in the previous year, or for addition to the carry forward. It is probable that the accounts will show a relatively stable figure of gross earnings, which rose from £451,200 to £717,799 in the previous year, leaving higher taxation to account for the drop of between £50,000 and £60,000 in probable equity earnings. The £1 ordinary stock, at 51s. 9d., yields £2 19s. 1d. per cent, tax free.

Joshua Hoyle Prospects

The full accounts of Joshua Hoyle for the year to September 30 last show that the rise in profits from £194,164 to £211,580, before income-tax but after EPT, is largely to be attributed to the special circumstances resulting from concentration in the textile industry. Thus, the outlook appears rather less favourable than was suggested by the preliminary statement discussed in *The Economist* of November 15th. Ability to meet the War Damage contribution of £22,992 and to repeat the transfer of £50,000 to depreciation without reducing equity earnings by more than £1,868 to £71,544—representing a rise in the rate from 16.9 to 19.5 per cent—is due largely to the clearance of stocks from mills which have been closed down. Moreover, income tax last year, as in 1939-40, claimed no more than £30,000, since, as the chairman, Mr H. A. Enright, points out in his statement, it has been possible up to the present to offset losses incurred in previous years. In future, income-tax liability must rise substantially. For the present, however, the company is able to repeat the 7½ per cent ordinary dividend, the transfer of £25,000 to general reserve, raising this fund to £85,000 in the balance sheet and the transfer of £10,000 to benevolent fund, while increasing the carry forward from £58,731 to £67,749. The balance-sheet shows no striking change. EPT provision accounts mainly for the rise in creditors, including taxation, from £515,567 to £633,599. Stocks are nearly £40,000 lower at £476,921 and debtors are down from £371,186 to £324,055. These changes are compensated by a rise in cash from £463,778 to £556,850 and in investments from £105,419 to £281,822. Shareholders must look for some reduction in earnings in the current year, though satisfaction may be drawn from the fact that such mills as remain in production have been declared nucleus plants. The 2s. shares at 28s. 6d. ex dividend yield £6 per cent.

Joseph Lucas Profits

Joseph Lucas is in the fortunate position of possessing a relatively favourable EPT standard and, consequently, disclosed profits for the year to August 7th last, struck after taxation and other charges, are reduced only from £299,317 to £286,703. With provisions for fees and staff funds unchanged, there is a decline in equity earnings from £273,835 to £262,259, which provides a rate of 26.7 against 24.0 per cent. After paying the usual 15 per cent dividend, the company is able to repeat the previous year's transfer of £100,000 to general reserve, bringing the total of this

fund to £1,000,000, and to raise the carry forward from £65,986 to £81,200. Clearly a company specialising in the production of electrical accessories for use in motor vehicles will have been producing to capacity last year. The balance sheet shows a shortage of working capital already evident in the case of certain aircraft companies called upon to expand rapidly. Thus, cash is down from £179,246 to £9,025 and British Government securities from £95,870 to £28,495. The chairman, Sir Peter F. Bennett, points out in his speech that, since the date of the accounts, an accumulated sum of £150,000 has been invested in Government securities in the course of Birmingham's Warship Week. None the less, the balance sheet shows that a bank overdraft of £546,726 was incurred last year, while a footnote to the accounts states that the overdraft of a subsidiary has been guaranteed up to £5,000. The rise in stocks from £1,158,108 to £1,642,258 and in debtors from £1,844,851 to £3,101,601 indicates that the cash shortage is due solely to existing production conditions. Creditors, including tax and subsidiary companies, are up from £2,292,747 to £3,461,623. There is a decline in fixed assets indicating that new works, which the chairman says are well distributed, have been erected at the public expense and remain public property. The £1 ordinary shares, at 61s. 10½d., ex dividend, offer a conservative yield of £4 16s. 11d. per cent, indicating market confidence that the company will be able to maintain dividend rates for a substantial period of years.

Kaffir Results

The report of *Luipaards Vlei* shows that the mine had another excellent year. Percentage of payability in development was again high at 65.5 per cent, and tonnage milled increased by 290,000 tons to 946,000. The plant, which has a capacity of 85,000 tons per month, is to be still further expanded to 100,000 tons a month. Future prospects are excellent. The *Consolidated Main Reef* report shows that development on the South Reef continues to open up good payable values, but on the other reefs development has been generally poor or irregular. The mine is going through a difficult phase, and ore reserves show a further decline which represents, however, four years' supply to the mill. Profit on trading continued to decline, and it may be difficult to maintain dividends for long at the present rate. The main development of *Modderfontein East* has reached the boundaries of the property, except to the north and east. The report discloses that, to the north, development results have again been poor, while to the east payable ground continues to be opened up. The available ore reserves show a substantial increase and are about five years ahead of the mill. The future of the mine will become more and more dependent on development to the north and east, and prospects appear to be unfavourable. The following table gives the latest results for the three developed mines:—

Reports to	Ore Reserves	Payability	Dividend 1940-41	Dividend 1939-40
June 30th	000's tons	dwt.		
Luipaards Vlei ...	3,294	4.8	11d.	1/-
Cons. Main Reef ...	10,564	3.6	27½%	30%
Modder East ...	7,200	3.8	37½%	40%

Outstanding among developing mines, *Blyvooruitzicht* has recently been so consistently a market favourite that the report is rather an anti-climax. The Carbon Leader was intersected in No. 1 shaft at 4,685 feet and development on the 5th level gave 82.5 dwts. over a width of 16.6 inches for a total of 205 feet sampled. Development on the 3rd and 4th levels should soon be started. A mill with a capacity of 8,000 tons a month should be in commission early next year to crush development rock, whose profit will supplement working capital to carry on development. The present abnormally high value of the 10s. ordinary shares at 30s. cannot continue indefinitely. The *Libanon* report shows all work was at No. 1 shaft, and that intersections were made at the 5th, 6th, 7th, 8th and 9th levels. The rate of development was retarded owing to the broken ground and the water fissures, which had to be cemented off. Work will now be concentrated on the 6th, 9th and 12th levels. Of the footage sampled, 1,005 feet, or 26.3 per cent, was payable, averaging 4.8 dwts. over 42 inches. The results of development in *Libanon* have been rather disappointing and compare unfavourably with its neighbour, *Venterspost*.

London

Note: all dealings are for cash

The firm tone at the end of last week reflected the markets' satisfaction at the revision of the Neutrality Act, but sentiment at the reopening was rather subdued owing to Far Eastern developments and the American labour crisis. The general tone was firm and the uncertainty found expression in lower turnover rather than in adverse price movements. On Tuesday, however, conditions improved with considerable activity in the industrial market, where stock was in short supply.

A slight revival of activity in the gilt-edged market before the week-end led to gains of ¼ for 2½ per cent Consols, 3½ per cent War Loan and Local Loans, while 3½ per cent Conversion advanced ¼. In more subdued conditions, 3½ per cent War Loan and Conversion Loan both improved ¼ on Monday, when 2½ per cent National War Bonds 1945/47 advanced the same amount. The following day 3½ per cent War Loan eased ¼, but 4 per cent Funding Loan and Victory Bonds each gained ¼, 3 per cent National Defence Bonds improving ¼. In midweek slight selling was sufficient to depress prices. Quiet conditions ruled in the foreign bond market throughout. Japanese issues, after some improvement, fell back in the early part of the current week, the 5½ per cent loan of 1930 and the 6 per cent loan of 1924 losing 2½ and 1½ points respectively in midweek. Among Chinese bonds the 4½ per cent loan of 1898 advanced 1½ points and the Boxer loan 1 point on Monday. Interest in South American issues was slight. Among Argentine issues the "Roca" loan fell a point on Monday, when Brazilian bonds were generally easier, but later the market, apart from Japanese issues, was steady.

In a quiet but firm home rail market, most issues were unchanged immediately before and after the week-end, although Berwick 5 per cent pref. gained ¼ on Friday. In common with other sections, interest revived on Tuesday, moderate buying raising Southern pref. 1 point and GW ordinary ½ point. Quiet support for senior issues was reflected in numerous small gains. Moderate buying in midweek raised GW ordinary 1½ points among other gains. Good traffic receipts encouraged mild support for Argentine rail issues in the foreign rail market before the week-end, but prices in the early part of the current week were slightly easier. BAGS and BA Western ordinary both declined ¼ on Monday, while the following day Central Argentine issues were weak, the 4 and 5 per cent debentures each losing a point. In contrast Canadian Pacific issues were persistently strong.

Steady buying coupled with a marked shortage of stock resulted in many strong advances in the industrial market. Demand was well spread, but interest centred mainly on brewery issues. Gains of 1s. were general. Distillers, Bass and Ind Coope all improving that amount on Tuesday, when Charrington was prominent with an advance of 1s. 6d. Steady support for aircraft and motor issues, among which Rolls-Royce, and Raleigh Cycle Holdings were prominent, led to numerous rises. The iron and steel group was quiet, but prices were generally firm with small gains for Swan Hunter, Richard Thomas pref. and ordinary, and Hawthorn Leslie. Shipping shares attracted some demand and most issues improved. Coast Lines were outstanding with persistent gains, while both Cunard

THE STOCK EXCHANGES

and Royal Mail advanced. In an otherwise quiet textile group, Courtaulds rose 2s. on Tuesday following the Chancellor's statement on the Viscose settlement. On Tuesday, renewed buying of tobacco shares resulted in gains of ¼ for Imps, and ½ for BAT and Godfrey Phillips. Stores issues were in demand on Monday when Harrods and Barkers each improved 1s., while among miscellaneous issues Emmies, United Molasses and Beechams defd. were all in demand. Prices continued to advance in midweek on steady buying, with brewery issues outstanding.

After closing quietly at the week-end, Cape buying occasioned a general advance in the *kaffir* market in the early part of current week. Dividend paying shares were especially in demand, Sub Nigel repeating Monday's gain of ¼ the following day when E. Geduld gained ¼, Geduld ½ and Crown Mines ¼. In midweek, Cape selling reversed the trend, Libanon falling 1s. 6d. among other smaller losses. Turnover in the rubber market was small, but prices in the early part of the week were steady. Despite a general decline of interest in the oil market, prices before Tuesday were generally firm. Anglo-Iranian on the preliminary statement and VOC each gained ½ before the week-end, while at the reopening Attock, Lobitos and Ultramar all improved ½. On Tuesday, however, prices turned easier, and Anglo-Iranian and Burmah both declined ½, while Trinidad Petroleum Development lost ½. In midweek Shell advanced ½, and later demand improved strongly.

New York

APART from some earlier hesitation, the actual revision of the Neutrality Act had little marked effect on Wall Street before the week-end. Major interest in the current week centred on the coal strike, but despite the general uncertainty sellers held off in the hope of prompt action by Congress. Far Eastern developments restrained any speculative element, and cautious dealing in a generally dull market led to narrow and irregular price movements. The impending holiday strengthened the tendency to wait and see in midweek, and conditions continued dull.

The *Iron Age* estimates steel mill activity at 97.5 per cent of capacity, the same as in the previous week.

BY TENDER

East Worcestershire Waterworks Company.—Offer for sale of £40,000 4 per cent Preference Stock at a minimum price of £100 per £100 Stock. Last day for tenders December 1, 1941. Total revenue years ended June 30, 1939, £36,840; 1940, £42,020; 1941, £48,035.

Shorter Comments

Lake View and Star.—Bullion proceeds and sundry revenue £1,343,992 (£1,381,646) for year ended June 30, 1941, net profit £465,293 (£551,666). Depn. £41,407 (£45,960), spec. devpt. nil (£40,552), taxation £230,000 (£220,000), divs. £197,750 (£210,000), carry fwd. £6,086 (£19,950).

General Cinema Finance.—This company has filed particulars of a debenture, charged on the company's property and undertaking, dated October 27th, to secure all moneys due to the National Provincial Bank.

Young Accumulator.—The merger between Crompton Parkinson, the above company and the latter's subsidiary, Assoc. Elec. Vehicle Mfrs., has now been ratified by a requisite majority and becomes absolute.

Industry and Trade

Statement on Production

The recommendations on labour problems made by the Select Committee on National Expenditure in their twenty-first report of the 1940-41 session, have drawn replies from all the Supply Departments; and these have been combined in a "Statement Relating to Production" issued last week by the Committee as its twenty-fifth report. The statement not only comments upon the thirty-two recommendations of the Committee's twenty-first report, but also deals with problems of labour and production not covered by that report. The replies reveal the difficulties still to be overcome in the quest for higher production, as well as showing that a good deal has been, and is being, done to carry the Committee's recommendations into effect. One of the principal recommendations of the Committee related to the need for the assumption, by the Supply Departments, of a greater measure of direct responsibility for ensuring that labour and materials are used to the best advantage. While the need for achieving this end is fully admitted in the official answer, the Statement rightly emphasises that the primary responsibility for the efficient use of labour and materials by contractors must necessarily rest with their managements. At the same time, the reply recognises that the Supply Departments themselves can do a good deal in preventing waste by the extension of the "fixed price" contract, and, where "cost plus" contracts have to be let, by the investigation of costs and the disallowance of excessive charges. Another important point made by the Committee was that factories and plant should be employed for as many of the twenty-four hours as possible. But the extent to which this is possible depends on the available supply of labour. The Supply Departments are, in fact, impressing upon firms, whose products are urgently required, the need for organising double and even treble shifts wherever practicable. And an increasing number of plants are understood to be operated all round the clock. But the fact that many are not so employed emphasises the need for speeding up the inflow of munition workers. There are many other problems concerning labour relations, management and wages, which are being currently tackled by the Supply Departments. Every effort is also stated to be made to improve the transport of workers to and from their places of work, to provide incentives for bigger production and to secure better feeding conditions. The Government is obviously alive to the need for improvement under the various headings of the Committee's recommendations. What is needed is a decided increase in the speed with which improvement is brought about.

* * *

Speeding Up Inland Transport

The growing intensity of the war effort on the home front is tending to increase the strain on inland transport facilities, especially during the winter when movements are inevitably slowed down by the lengthening of the night and when the demand for coal shows a seasonal increase. According to estimates made by the Ministry of War Transport, coal traffic alone will be heavier than last winter by about a quarter of a million tons a week. Substantial increases are also expected in other freight traffic and in the number of workers to be conveyed to and from the war factories. To meet the increasing demand for transport at least 100,000 more wagons and lorries will be required. But as these additional facilities cannot be put at the disposal of the transport industries this winter, the only solution lies in an increase in the utilisation of existing equipment and in a further drive to economise transport. In order to secure an increase in carrying capacity by the better utilisation of existing railway wagons and lorries, the Ministry of War Transport has launched a campaign designed to speed up the turn round of wagons and lorries. It appears that wagons are frequently still left idle for days because more loads are forwarded at one time than the consignee can discharge. An investigation carried out in the second quarter of this year showed that the average number of wagons standing idle under inward load for more than 48 hours was then nearly 60,000. Such a wastage of capacity is inexcusable, but in its attempt to reduce it, the Ministry of War Transport must rely on the close collaboration of traders.

Post-War Export Planning

In an address to the Institute of Export some time ago Mr R. Huntley-Davidson made a vigorous plea for a revision of the British attitude to export trade, in order that this country may be ready to meet the extremely difficult conditions which are to be expected in international commerce after the war. He pointed out that the industrialisation of other countries is likely to be accelerated, that scientific and industrial knowledge will tend to be more rapidly internationalised, and that the movement towards collective action in trade and industry will continue and expand. Britain cannot therefore hope to secure an adequate share in international trade by the old methods. Mr Huntley-Davidson claimed that "a serious volume of export trade cannot be built upon the economics of home trade. . . . To participate effectively in international trade we shall have to concentrate on the economics of production and distribution most suitable for export trade." To do this will require a considerable measure of State control, unless each industry undertakes the necessary co-operative planning for itself—the only way, in Mr Huntley-Davidson's opinion, by which the dangers of economic totalitarianism can be avoided. When Mr Huntley-Davidson attempts to demonstrate the importance of export trade, however, he appears to fall into a fallacy which recalls Adam Smith's predecessors. "From the angle of national economy, so long as the sale of exports secures in hard currencies more than the hard currencies used in the acquiring of the raw material content of such sales, does not that surplus represent a gain to an industry's or a nation's economic power of survival?" The answer is that it does, but not necessarily as great a gain as might have accrued from the use of the same amount of resources in production for home use or for some other form of export. Arguing from this fallacious premise that any export which brings into the country a net import of cash is a desirable export, Mr Huntley-Davidson reaches this conclusion: "Provided that export production and distribution costs are based on maximum efficiencies, conforming to export requirements, is it not sound economics to distribute over our home trade, and even over certain classes of exports, the cost of lowering prices of other exports to overseas competitive levels, by means of levies or similar expedients?" This dangerous doctrine of subsidised dumping on the Nazi model should not, however, be allowed to obscure the value of a reasoned plea for a more far-sighted attitude on the part of individual industries towards the international market.

* * *

Coupons for Overalls

When the most exclusive women's shops in the West End of London begin to advertise bib and brace overalls free of coupons, it is clearly time for the Board of Trade to take action. The Board itself foreshadowed at the outset of the scheme that steps would be necessary to see that coupon-free overalls were only obtained by *bonâ fide* workers, and it has now issued an Order to implement this promise. At the same time as well-to-do women were saving coupons by wearing dungarees, those women workers for whom men's overalls free of coupons were unsuitable have been giving up as many as seven coupons to obtain the type of overall appropriate to their work. Both these injustices are to be remedied by the abolition of coupon-free overalls and the application of a low coupon rating to all types of industrial overalls. To qualify for this low rating, the garment must be unlined and made of plain or twill weave cotton material in plain single colour. A boiler suit conforming to these requirements will in future require four coupons; bib and brace overalls, wrapover coats and overall long coats take three coupons; overall trousers, overall jackets and aprons will need two coupons. After the end of January, 1942, these low ratings will only apply to garments made of utility cloth No. 311. More coupons will be required for garments made from other materials.

Fuels for Producer-Gas Vehicles

In the application of producer-gas (a mixture of gases derived from the combustion of solid fuel in a suitable generator) to road transport, Great Britain is far behind

Europe; there are only a few hundred such vehicles in this country, compared with some 150,000 in German Europe. This is not surprising, in view of the relative inefficiency of this method of propulsion compared with the petrol engine and the fact that adequate supplies of liquid fuel have hitherto been available for essential purposes. Nevertheless, for certain transport services in time of war, the producer-gas unit, despite its technical inferiority, has a definite part to play in economising imported motor fuel; and this is reason enough why its use should be encouraged, wherever feasible. But an important question, naturally, is whether sufficient supplies of home-produced solid fuel are available to make an appreciable extension possible. Actually, many fuels may be used in gas generators, including coal, coke, wood, charcoal and peat—though even the Germans have not yet succeeded in designing an apparatus capable of operating efficiently on any one of these fuels at present. Because authoritative information regarding supplies of suitable fuels is not available in this country—after two years of war—the Secretary for Mines has invited the Henley Committee (which last year considered low-temperature carbonisation processes) to study the problem. The Committee were asked to estimate the quantity of solid fuels that could be made available at present, and to report on any measures required to increase supplies if necessary. Its findings will be awaited with interest; for they will fix the limits within which a change-over to producer-gas propulsion would be physically possible. Official encouragement is at present confined to the promise that home-produced solid fuels for gas generators will be duty-free for five years. Further assistance might be necessary if the wider use of producer-gas equipment is to be made a commercial proposition.

* * *

Scrap Shortage in America

The American iron and steel industry, which has been operating virtually at capacity for many months, is beginning to be affected by a shortage of scrap. Indeed, the latest cables suggest that the production of ingots is already hampered by inadequate scrap supplies. No doubt there are ways and means of increasing supplies in the United States and there is still considerable scope for a curtailment of steel consumption for unessential purposes. But it is probable that exports of scrap and pig-iron to Great Britain will be further curtailed and that the British iron and steel industry will have to rely increasingly on its own resources. There are indications that the rate of collecting scrap has tended to increase and that stocks are substantial. But unless vigorous measures are taken now to ensure a steady expansion in the flow of scrap to the steel mills, a shortage may develop next year. For example, the machinery for the collection of railings is far too cumbersome; if additional powers are required to secure a speed-up in this collection, they should be taken forthwith. A shortage of scrap must be prevented at all costs if the increase in the output of munitions is to be maintained.

* * *

Malaya's Tin Export Duty

The establishment of a large tin smelter in the United States has led to a controversy about Malaya's tin export tax. This duty was introduced at a rate of 40 per cent *ad valorem* in 1903 and amounts now to \$30 per picul of tin ore exported from Malayan mines to smelters outside the British Empire. The duty at this rate is prohibitive; it was never intended to produce revenue, but was introduced to ensure the monopoly of tin smelters in the Straits Settlements and the United Kingdom. In the past ten years, the extension of the Banka (Dutch East Indies) refining capacity as well as the establishment of modern Chinese, Dutch (Arnhem) and Belgian (Antwerp) tin refineries has greatly reduced British predominance in tin smelting, although for the present most of the new refineries are cut off from their ore supplies. Hitherto, all new tin refineries were erected by important mining interests. In the case of the new American refinery, however, the position is different. That country is the most important tin consumer but does not produce tin ore. The United States Government agency (the Metal Reserve Corporation) has concluded agreements for the supply of ore with Bolivia and the Dutch East Indies, but many of the Malayan mines are understood to be anxious to participate in the supply of ore to the smelter in the United States. As a result, the Tin Producers' Association has sent a resolution to the Colonial Secretary this week asking for the repeal of the tax in order to give tin mining companies freedom of action. In con-

sidering the maintenance or repeal of the tax the Government must consider both immediate and long-term implications. For the duration of the war, the Texas City smelter is of great strategic importance to the Allies, especially if war breaks out in the Pacific. Any British ore required by the smelter during the war should, therefore, be made available to America. After the war, conditions may be very different. Past experience has shown that tin smelting costs in the United States are higher than elsewhere, so that the continuation of operations in that country after the war may involve the introduction of an import duty on refined tin. Such a duty would hit smelters outside the United States and may endanger the Liverpool tin-smelting industry. An indefinite suspension or permanent repeal of the Malayan export tax should, therefore, be made subject to satisfactory arrangements between the British and United States Governments, securing the maintenance of duty-free imports of refined tin into the United States. The Tin Producers' Association in its resolution this week pointed out that the duty in its present form represents a discrimination against non-British buyers and thus is contrary to the principles of the Atlantic Charter. This fact cannot be denied. But the introduction of an import duty on refined tin aimed against non-United States refineries would be a similar infringement.

* * *

Antimony Supplies

The growing tension in the Pacific, especially the possibility of an early Japanese offensive against the Burma Road, has brought the problem of antimony supplies to the fore. Antimony is an essential war material, and, as a hardener of lead, it is extensively used for the production of munitions, battery plates and other vital products. In the ten years preceding the Sino-Japanese war, China supplied over two-thirds of the world's total output of antimony, chiefly from the Hunan province. The recent successful Chinese counter-stroke at Changsha has cleared the Chinese antimony area from Japanese troops, but this achievement would be of little value if communications were cut further south. Fortunately, the dislocation of the Chinese antimony industry since 1937 has led to substantial changes in the world's antimony industry which have tended to reduce the dependence of the democracies on Chinese supplies. Last year, China exported only 5,493 metric tons of antimony in metal and concentrates against 16,348 tons in 1936 and well over 20,000 tons in good years. This decline has been more than offset by the expansion in production, with American financial aid, in Mexico and Bolivia. In 1940, Mexico supplied no less than 11,286 tons of antimony against 6,719 tons in 1936. Simultaneously, Bolivia raised its output from 6,040 tons to 10,813 tons. In 1941, both countries have taken steps to expand their output still further, and recent reports indicate that at least 25,000 tons will be available from the two countries this year. Virtually the whole of this supply is available to the United States. Countries other than Mexico, Bolivia and China produced between 12,500 and 15,000 metric tons of antimony last year. Of this total nearly 4,000 tons came from Yugoslavia, 1,000 tons from Czechoslovakia, 1,000 tons from Peru, about 1,250 tons from the British Empire (chiefly from Canada and Australia), 800 tons from Italy, 850 tons from French North Africa and 500 tons from the United States. These figures indicate that supplies available to the democracies will remain something like four times as large as Axis supplies, even if China's exports were entirely cut off. Last year, the United States consumed about 15,000 tons of imported antimony, but since then consumption has greatly increased. Simultaneously Great Britain has lost its Balkan supplies and will probably require United States' assistance to make good the deficiency. Despite the increased supplies from Mexico and Bolivia, therefore, the interruption of Chinese shipments would constitute an important loss to the anti-Axis front, although it would not endanger their great superiority in supplies, which are comparatively limited in Axis countries.

During the year they had had further securities, standing in their books at £39,985, requisitioned outright by H.M. Treasury. The Treasury had also required them to place at their disposal certain securities to be used as part collateral for the loan of \$425 million from the Reconstruction Finance Corporation to this country. The terms gave the owners no right to sell them if, and when, they desired to do so, but, on the other hand, the British Government, or the Reconstruction Finance Corporation, were, in effect, to have an option to sell them at any time without reference to the owners, when the owners would receive only the proceeds of the sale. The directors felt that, as the securities were borrowed by the Government in the interest of the nation as a whole, in equity the company, and the other owners, should be indemnified against any loss if the securities were sold by, or on behalf of, the British Government at a price below the market price ruling at the date of the Treasury Order. By a supplementary Order announced only two days ago, the

THE rise in tin prices was maintained, and on Thursday of last week standard cash was as high as £258 10s.-£259 per ton, the highest price quoted for three months. On Wednesday standard cash was quoted at £257 5s.-10s. per ton, the same as the week before. Three months tin was £260 5s. 10s. per ton against £260 10s.-15s. Prices of cotton cloth have risen slightly; for example, 36-inch shirtings, 75 yds., 19 x 19, 32's and 40's, have risen by 3d. to 40s. 6d.

Import and Export Control.—From November 13th, the Board of Trade required applicants for licences to import goods from China to undertake to pay for these imports through a bank in China approved by the Exchange Control authorities, and to pay within a specified period. The Export of Goods (Control) (No. 39) Order, which comes into force on December 1st, consolidates the previous export control Orders. Licences will in future be required for the export, to all destinations, of caps and sprinkler tops wholly or mainly of metal; to certain specified destinations of manufactures wholly or mainly of wool (other than carpets and floor rugs) not previously controlled. A Board of Trade Order, making 670 additions to the "Black List" of traders in neutral countries with whom it is unlawful to have dealings, came into force on November 19th.

Woolen Goods Exports.—The export of woven tissues and blankets containing more than 15 per cent by weight of wool, is prohibited from November 21st, except under Board of Trade licence. An open general licence has been issued to cover exports to certain countries. Export rations for certain countries will later be allotted to exporters. Exporters will be required to make a return of their exports during a specified period. A committee representative of the trade is to be consulted by the Board of Trade in determining the amounts to be licensed. Goods licensed for export before rations are announced will count against the ration.

Utility Clothing.—The Board of Trade has made the Limitation of Supplies (Cloth and Apparel) (No. 4) Order, which consolidates and extends the provisions relating to the cloths and knitwear on special quota. The existing cloth and knitwear schedules in the three previous

Treasury were now prepared to take over at once and to pay a just price for many of the securities borrowed, and he congratulated them on the decision.

The report was unanimously adopted.

The twenty-ninth ordinary general meeting of Leach's Argentine Estates, Limited, was held, on the 14th instant, in London, Baron F. A. d'Erlanger, the vice-chairman of the company, presiding.

The following is an extract from the review of the vice-chairman on the year's operations, which was circulated with the report: The profit on trading at £177,293 is less than last year's figure by £52,668; £9,220 was paid in May last in respect of the year's interest on the 5 per cent. Funding Certificates and £15,000 as an interim dividend of 3 per cent. on 6 per cent. Cumulative Preference stock. The directors now recommend the payment of the balance of 3 per cent. on the Preference stock and that there be set aside £5,972 to the Funding Certificates Redemption Fund and that the remaining balance of £30,000 be applied to the payment of the 6 per cent. non-cumulative dividend on the Ordinary stock.

As regards future prospects, owing to the loss of sugar in Tucuman, we took steps towards the end of our crop whereby the output originally aimed at was slightly increased. Given normal markets, we should be justified in looking forward with confidence to the results of the current year.

The report and accounts were unanimously adopted and, the formal business having been transacted, a vote of thanks to the chairman, directors and staff terminated the proceedings.

For the week ended Nov. 15, 1941, total ordinary revenue was £38,279,000, against ordinary expenditure of £79,028,000, and issues to sinking funds of £155,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,858,422,000 against £1,554,525,000 for the corresponding period a year ago.

Shorter Comments

(Continued from page 635)

Socony-Vacuum Oil Company (\$000s).—Operating income for 1940 \$87,988 (\$84,089), deprec., etc., \$52,364 (\$46,212), net operating income \$27,944 (\$32,142), other income \$19,129 (\$12,126), taxes \$7,680 (\$5,735), net income \$36,409 (\$34,453), equal to \$1.17 (\$1.10) per share. Div. for year \$15.603 (same) equal to 50 cts. (same) per share, contingency res. \$75,000 (nil), surplus \$71,626 (\$125,820).

Argentine Bond Purchase and Conversion.—Full instructions have been issued by the Treasury to British holders of the Argentine internal loans which have already been lodged with, and are now

to be transferred to, the Treasury against payment in sterling. There are thirteen loans to be transferred at payment stated to be not less than the market value on November 18, 1941. The Argentine Government will shortly decree conversion of 1,450,000,000 pesos (about \$85,000,000) of National Mortgage Bonds.

Tanganyika Concessions.—Inclusion of £47,000 unrequited tax reserve raises year's profit to £25,660 (Dr. £24,722), which has been put to reserve.

Pennsylvania Water & Power Co. (\$000s).—9 months ended September 30th: Gross rev. \$5,140 (\$5,089), operating exes. incl. taxes \$3,297 (\$2,923), fixed charges \$531 (\$589). Net income \$1,581 (\$1,576), paid for Pref. divs.

\$80 (same), common divs. \$1,289 (same), surplus \$211 (\$206).

American Viscose (\$000s).—Nine months' net earnings \$5,466 (\$6,198). Third quarter net earnings \$2,099 (\$2,130) after tax provision \$1,446 (\$468).

Argentine Navigation Co., Mihanovich, Ltd.—Arg. P. \$000s. Gross earnings for September \$4,022 (\$2,525). Aggregate gross earnings January 1st to September 30th, \$31,762 (\$27,370).

Mount Lyell Mining & Railway Co. Net profit year ended September 30th £169,318 (£183,095), after charging prospecting and development £32,95 (£28,489), depreciation £63,018 (£64,446) and taxation £54,996 (£50,018).

the farm labourer and the farmer are to get more money, it must come from somewhere, and the source must be the community at large, whether as taxpayers or as consumers. The dimensions of the cost that the community will have to pay to realise the farmers' dream are very rarely realised. Sir Daniel Hall has estimated that in 1938-39 agriculture was costing the community over 100 millions a year in subsidies, remission of taxation, and prices above the world level. Since then the wages bill has been increased by between £30 and £40 millions a year. The policy of higher prices and guaranteed markets is also very costly; it was calculated in *The Economist* in January, 1939, that the peacetime cost of applying it, even with prices and quantities far lower than those now contemplated, might well be over £30 millions a year. In short, the cost of doing what the farmers want could not be very much short of £200 millions a year.

This is an enormous figure. The question immediately arises whether it is not altogether too large to be considered as a permanent burden for peacetime. However the money is raised, it must be regarded as an addition to the cost that the nation pays for its food. There is some risk of the basic fact being forgotten that the fundamental purpose of the agricultural industry is not to provide farmers and farm labourers with a living but to provide the people with food. Certainly there has been no slackening during the war, but rather an intensification, of the determination to improve the nutrition of the nation, and no twisting of logic can pretend that an increase of something like 10 per cent in the nation's food bill is a step in that direction.

Small but Prosperous

But, in any case, whether the limit is set at £100 millions or £150 millions or £200 millions, there must be a limit somewhere. At some point the agricultural interest will have to realise the choice that is before them between a *prosperous* agriculture and a *large* agriculture. Whatever the sum of money that the public will find, it can either be used to secure high wages and high prices for a limited volume of production or less wages and high prices for a larger volume of production. The higher the cost of maintaining a thousand men on the land, the fewer thousands can be maintained for a given cost. Some excuse might be needed for harping on this very simple arithmetic if it were not so frequently ignored, or left to be evaded by some (undisclosed) magic of "greater efficiency." Greater efficiency is, of course, to be desired—indeed, to be demanded if subsidies are to be provided on this scale. But however great the efficiency of cultivation, it will still be true that the higher the costs of production (whether through higher wages or higher profits) the smaller the industry that can be maintained for a given price. This being so, the only answer that the community can make to the new agricultural policy that is being asked for, is this: If higher wages, fixed prices, assured markets and increased returns are provided by the State, they must be accompanied by a severe limitation of the volume of agricultural output. Indeed, if they are to be provided on the present scale, it may be necessary to reduce the size of British agriculture below its pre-war level. A prosperous agriculture in this country must be a small agriculture. If it is to be large, prosperity cannot be guaranteed.

Of these two alternatives, there is little doubt that the small, prosperous agriculture is to be preferred. The community's money, however much it may turn out to be, can better be spent on improving the lot of those—or some of them—who already draw their living from the land than on increasing their numbers. There are two main reasons for this choice. First, the history of material progress is one of the movement of workers away from the land and into urban pursuits. Even with maximum efficiency, the productivity of one man-day's work in agriculture is less than that of one man-day's work in industry or in other non-agricultural occupations. The chief reason for the high standard of living in Great Britain is to be found in the low proportion of the total labour force engaged in the relatively unproductive

calling of agriculture. To attempt to raise this proportion by artificial means would be a retrograde step. Secondly, a greater total production of food inevitably, with a stable population, means lower imports (any increase in consumption is, of course, out of the question, if the cost of the community's existing food is to be increased by some £200 millions. The American Government has already invited British assistance in freeing the channels of international trade. Apart altogether from the serious repercussions on British export trade, it would cause the most serious objections, not merely in the United States, but in the Dominions, too, if Great Britain were to start the new era by a deliberate choice of restriction and autarky.

Against these two arguments, the only reason that can be advanced for a larger domestic production of food, in peacetime, is the need for security in war. But it is a very poor argument. It is quite true that, for the second time in a generation, the British people are short of food. But it has also been shown for the second time in a generation that sea-power can keep the ocean routes open. Security can be much more cheaply and effectively obtained by a reserve of shipping and by stocks of food than by any practicable, permanent increase in the output of British agriculture. Moreover, there are dangers in the familiar argument. It has been conclusively demonstrated that the supreme bottleneck in the British war effort is neither food nor shipping but manpower, and there is nothing more wasteful of manpower than to grow food at home. The greatest advantage that Britain has over Germany lies in the fact that it takes 162 men in Germany to provide food for 1,000 consumers, and only 98 in this country. Britain would be not stronger but weaker for war if, in peacetime, she grew more of her food at home, and it is very questionable whether the ploughing-up campaign has not already been driven too far and imposed an unnecessarily large burden on the supply of man-power.

Cheap Food

The apparent willingness of the British public to pay more for its food than it is compelled to is not an economic decision; however the details of its application are arranged, it will reduce the standard of living below what it might otherwise be. But the incidence of the burden will, of course, be very different according to the methods adopted for raising the money. Broadly speaking, the money can be taken from the taxpayer or the consumer; and, again speaking broadly, the method of taking it from the taxpayer means that the reductions in the standard of living can be arranged to fall on luxuries, while taking it from the consumer inevitably means a lower consumption of food. It was on this subject that Mr Hudson uttered some remarks which must have taken the Commons' breath away, since there is no other way of explaining the absence of immediate protest. He congratulated the representatives of the Trade Unions on their abandonment of the cry of cheap food.

It was the cry of cheap food which depressed agricultural wages and kept them depressed. Cheap food . . . meant sweated labour, and, above all, sweated land in the primary producing countries overseas, and it was, incidentally, also responsible . . . for much of the curtailment of our export trade, and much of the consequent unemployment.

One is astonished only at Mr Hudson's moderation in not pursuing his argument to the logical conclusion that the more the people of England pay for their food the better off they will be. How is it possible, in this year of grace, for a responsible Minister to use such language? How is it possible for him to forget that, even in peacetime, the diet of half the people of this country could be improved with advantage to their health, or that at least one-fifth—and much more than one-fifth of the children—are definitely under-nourished? How is it possible for the Conservative Party to pretend that it is interested in the welfare of the people if it permits its leaders to talk nonsense like this?

The argument for cheap food is not only, and not

mainly, one of equity; it rests on the fundamental economics of Great Britain's place in the world. The only natural advantages that this country ever possessed were plentiful coal, a native spirit of enterprise and a position at the cross-roads of the world. The first is now of dwindling importance; the second is being choked by the monopolistic economics and the growing rigidities of the social structure; only the third remains, and the ability of a crowded and poorly dowered island to retain almost the highest standard of living in the world rests on the skill with which the nation takes advantage of its place in the world. This is not, of course, new doctrine; it has been the very foundation of British wealth and greatness for a century past, and still is. The Englishman's ability and willingness to get his food and his raw materials cheaper than any of his competitors have given him a headstart in competition—it is the only advantage that

remains. Whatever amendments and modifications are made to the old uncontrolled structure of Free Trade and *laissez-faire*—and many will have to be made—this basic principle must remain untouched. There must be no interference with cheap food or cheap materials. That way ruin lies. It is only because the nation is wealthy that subsidies to agriculture can be contemplated. It follows that their burden must fall entirely on the nation's margin of luxury, and not at all on the price of food, which is at once a necessary of life and, through its effect on industrial wages, a basic constituent of the cost of production. The cost of assistance to agriculture must come out of the ordinary Budget, and be raised, in the ordinary way, by taxation adjusted to the capacity to pay. The community has a right to choose in which ways it will dispense its bounty. And its ruling must be that food comes before farmers.

African Front

THE battle for Libya has entered its second phase. The first began with the opening of the offensive at dawn on November 18th. British columns swept across the frontier below Sidi Omar, advanced far into enemy territory, swung to the sea, and presumably attempted an immediate junction with the defenders of Tobruk. The fact that this encircling movement trapped the bulk of General Rommel's mechanised forces in a rough triangle between the sea, the Egyptian frontier and the line of the British advance suggests that the attack came only just in time to forestall an Axis attempt to invade Egypt.

The second phase opened with the attempt of the British—by a sortie from Tobruk and by a further advance from the south-east—to close the line behind the trapped Axis armies. The Germans' counter-efforts to force their way through the gap between the raised ground of the Gebel el Aqaba and the outer perimeter of Tobruk's defences brought the opposing forces to a standing battle round Sidi Rezegh. Here a struggle has developed unique in military history. On the open desert, the tanks manoeuvre for position like ships at sea, and the two terrifying armadas first remained locked in a gigantic struggle for over five days, the line of battle swaying backwards and forwards through Sidi Rezegh. Then, after a pause for regrouping and reinforcements, the battle has been joined again. Its outcome is still in doubt. Meanwhile, a column of New Zealanders, after capturing Bardia and Gambut, is advancing in the rear of Rommel's armies, and another British column has driven south, to Jalo and Aujila, only one hundred miles from the Gulf of Sirte.

The success of the opening phase is all the more remarkable in that to most observers—including General Rommel—it can have seemed only a matter of time before the blow would fall. To anyone, save the most inveterate "western frontier," Libya was the obvious scene for the longed-for British offensive. Only in Libya did German and British armies face each other across a land frontier. Only in Libya were the problems of supply facing the two armies of equal complexity. The only problem was whether Britain's new commitments in the Middle East had made such a claim on the Army of the Nile that the offensive could not be mounted.

The immediate objective of the campaign is, naturally, the clearing of Libya. If Great Britain were in control at the frontiers of Tunisia, the Allied defence line would stretch from the waist of the Mediterranean to Murmansk and Singapore. The acquisition of Benghazi and Tripoli as naval air bases would greatly increase Britain's striking power against Italy. In the air, the scope of the devastating bombing attacks of recent weeks, during which the southern Italian supply ports have been battered ruthlessly, could be extended to new and more distant military and industrial targets. The more nearly Italy is reduced to impotence, the greater charge it becomes upon Berlin

and the more wavering will be its support in the event of German reverses on other fronts.

The naval advantage of controlling Tripoli is obvious enough. It is a fully equipped base and it would provide the Navy with a centre for operations much nearer the dangerous straits between Sicily and Tunis. The exploitation of such an advantage to ensure a complete opening of the Mediterranean for the conveying of British supplies to the Caucasian battlefield would, however, depend upon the situation in Tunis. Bizerta is the key to the Straits—the "pistol pointed at the heart of Italy"—and if, under new pressure, the French were to permit the Nazis to "protect" Tunis against the advancing British, the shipping position in the Mediterranean might for a time become still more hazardous, even if the whole Libyan coastline were in British hands.

[Reproduced by permission of the "News Chronicle"]

The problem of Libya thus cannot be divorced from the problem of North Africa as a whole. The conquest of Libya would place Great Britain in a position to take a direct hand in the political and strategic game which is being played out in the French North African dependencies. Once strongly ensconced on the Tunisian frontier, Great Britain would be able to strengthen the faltering hands of Vichy, or, if necessary, take over the cards. Any British action in French North Africa is of course impossible until the common land frontier is established—and it would be very foolish to count any unhatched chickens. But if it can be established, these territories, from Dakar to Tunis, should prove one of the decisive fronts of the war. "Hemisphere defence" has carried the United States to Iceland, to Newfoundland, to the Caribbean, to Dutch Guiana, to joint bases in Brazil; but hemisphere defence may well be to the next phase in American policy what Cash-and-Carry was to Lend-Lease. If fighting overseas comes to be seen and to be accepted as a necessary

part of the task of defeating Hitlerism, the entry point for American intervention is geographically and strategically obvious—in the great westward hump of Africa opposite the Caribbean. From this point of view, the fighting in Libya is the first stage in a vast campaign stretching out in time and space and turning on control of the sea coasts of French Africa.

Germany's increased pressure on Vichy shows that the Nazi leaders are alive to Libya's significance in the general perspective of the war. Pétain abandoned General Weygand almost in the hour of the launching of the British attack. The diplomatic offensive in Berlin, Paris and Vichy for effective control in North Africa can be likened to a race run with the armies of General Auchinleck. Who will reach the frontiers of Tunisia first, the Allies by crushing the resistance of Rommel's army or the Nazis and their quislings by thrusting from office France's loyal colonial civil servants and officers? It is possible, of course, that Pétain, by throwing General Weygand overboard, is only lightening the sledge, not changing its direction. The Germans are reported to have made other demands than for Weygand's dismissal: for the use of the French Mediterranean bases and for the conveying by the French fleet of Axis soldiers. It has been a custom at Vichy to combine a certain amount of concession with some measure of resistance, and it is suggested in some quarters that neither General Juin nor General Barreau, who are to divide the military command of French North Africa between them, nor the Secretariat which is to take Weygand's place, is likely to surrender lightly all the positions of control to the Nazis

—and there is fairly general agreement that, so far, Nazi penetration in North Africa has been on a limited scale.

It requires a great deal of optimism, however, to rely on this interpretation. The melancholy history of French collaboration has proved the folly of any policy of half agreement. Even if the Nazis do not advance three steps at a time, one step at least is conceded and each time the ground of independence upon which Vichy stands is lessened by so much. A year of collaboration has increased the Nazis' stranglehold and given a growing number of Frenchmen a vested interest in it. The prisoners of war are still in Germany and in the background there is the new technique of mass execution. From North Africa are arriving reports of widespread changes in the staffing of France's colonial army and administration. This can mean one thing only. Weygand is to be followed out of office by Weygand's men. The officials who take their place will be the creatures of Darlan.

The probability of a wholesale deterioration in the integrity and independence of French North Africa does not affect the immediate issue of the campaign in Libya. It only increases the urgency of a speedy British success. If Vichy and the North African administration are still wavering, a resounding German defeat might restore to them a little of the courage they so sadly lack. If they have sold the pass, it is essential that a powerful British army should be within striking distance of Bizerta before the Germans have time to exploit Vichy's surrender. Even more than in Syria, speed and decision are the key to victory.

Women's Pay

WOMEN are scarce. In the last war, nearly 1,700,000 women entered industry from domestic service, household duties and idleness. In this war, the need is even greater. Twenty-one months ago, Mr Churchill called for another million women in war industry, and only a few days ago Mr Bevin appealed for a million more wives to do war work. Inside industry, there has been a large transfer of women from civilian work; and, if the women's auxiliary services are included, it may be that more than a million women have already entered war employment from outside. The task now is to call up the reserves; and this will not be done in sufficient time or on a sufficient scale unless their pay and conditions of work are made economically attractive.

Numerically, women have been at a discount in this country for a generation; they outnumber men, and the jobs traditionally open to them are narrowly restricted. In wartime, they are at premium as workers; and, for efficient mobilisation, no less than for the sake of fairness, it is necessary for this fact to be registered in the structure of wages. In peacetime, outside the narrow range of specifically women's jobs, such as domestic service and nursing, all ill-paid, women tended to be employed in commerce and industry because they could be induced to work for lower pay than men; because of their restricted openings, the supply of women workers always tended to exceed the demand. In wartime, the boot is on the other foot; women must be mobilised for industry because there is a shortage of men. Whereas, formerly, many women competed for relatively few jobs in a range of occupations limited by tradition, prejudice, training and aptitude, the demand for their services now threatens to outrun the supply. In consequence, it is expedient as well as right that women should gain on the roundabouts of warwork what was denied them on the swings of competitive employment in the past.

This is not a simple exercise in social justice, but a problem in industrial economics. The point is that the war has changed the standing of women in the labour market. "Equal pay for equal work" is obviously a right principle—in peace or war. It is always a target to be striven for. If wages could be decided solely on moral

grounds, there would be no more to be said, for the old argument that women should be paid less than men because "they have no families to keep" is completely fallacious. Women very often do have dependants; men often do not; and, in any case, wages are not fixed by family circumstances or the number of a worker's dependants. Nor, however, are they fixed by moral considerations. By and large, they are fixed by supply and demand. If the price of labour is fixed at a level higher than would bring the demand for workers and the supply of them in the market into balance, there will be unemployment; and, in peacetime, the demand for women workers in gainful occupations was artificially restricted by custom and convention, and women's chief work, which is still in the home, was not paid at all. The economic reasons why women's wages tend to be lower than men's are plain enough.

This does not mean, however, that, even in peacetime, the inferiority of women's rewards is unchangeable. The demand for women's work is not an immutable economic fact, but rather a social phenomenon quite capable of being changed. The position of women can be improved in normal times, not simply by raising their wages all round—which, other circumstances being unaltered, would only throw a proportion of them out of work—but by altering the outlook which dictates that women should be employed only in a certain limited range of occupations. The path of the reformer in peacetime is clear. It is to increase the demand for women's services by removing the existing arbitrary restrictions on their employment, as, for instance, the ban, which runs through the professions and enters into commerce and industry, on the employment of married women; and to spread the supply by establishing the desirability, from the woman's point of view as well as that of society, of bringing women into occupations which they have not previously thought of entering.

The immediate point is that, temporarily at any rate, the war has done the reformers' work for them. The demand for women workers has been increased; and the number of occupations into which they are eagerly admitted is growing. But in spite of the greatly increased

number of women coming forward, there is still a shortage; and the problem is to secure a sufficient supply. It is necessary as well as desirable that the altered bargaining power of women in the labour market should be allowed to have its effect.

In industry, the issue needs no thrashing out. It was thrashed out twenty-five years ago. Mr Lloyd George laid down the principle in the last war that "if women turn out the same quantity of work as men, they should receive the same pay." It is a principle that cannot be gainsaid. Minimum wages were then fixed for women war workers; fully skilled women were to be paid men's time rates; men's piece rates were to be paid to women workers; and the low wages in the traditional women's occupations were to be levelled up towards the wages being paid to women replacing men in men's jobs. There was evasion by employers, it is true. But women's wages in industry, which averaged no more than 10s. or 12s. a week in 1913, were trebled in five years. These principles have been stated again this time. What is needed is to apply them fully and effectively. Once more, there is a wide gap between the wages of women in women's jobs and the wages of women replacing men. For the trade unions, "equal pay for equal work" is mainly the means of safeguarding the pay and conditions of men replaced by women. In the general run of women's jobs in factories or, for instance, in the Post Office, wages seem to range between 45s. and 50s. a week. In engineering, women over 21 start at 43s. a week, and can rise with overtime to 60s. London bus conductresses, replacing men, start at 73s. 10d. and can rise to 90s. The fact that women engineers in training are paid 4s. a week more than when they start on production work is a stupid anomaly. In the cotton industry, an established women's trade, wages are too low to attract married women back to work.

In general, therefore, the right and proper policy in wartime is to allow women's pay to find the level set by the importance of women's work to the war effort. To a considerable extent "equal pay for equal work" is a practical proposition. There are, however, special problems. The supply of unmarried women is being used up, and the need now is for wives and mothers, with their peculiar responsibilities. It was argued in the last war, by employers, that women should be paid less than men, even at the same work, because they produced less, and because they raised expenses by requiring special supervision and facilities. Married women with family ties need time for shopping and other duties; and special provision has to be made for the care of their children. This is not an argument either against their employment or for their being paid inadequately. They must be employed because the war effort needs them. There is no alternative, and they will not come forward unless they are to be in a position to discharge their domestic and financial responsibilities.

It is too little realised, in fact, that the women have the whip-hand. The problem is simply to make war-work

sufficiently attractive. The effect of income tax upon the earnings of married women illustrates how recruits are, in fact, being held back. It is wholly irrational that a married woman in war work, if her husband's income reaches the full income tax level, should therefore receive as net income only half the income received by an unmarried woman doing the same job. Both are equally needed; and there is a very strong case—in peacetime as well as in wartime—for the separate assessment of the earned income of husband and wife. If the women are wanted to win the war, they must be given the same net inducement (after taxes and family expenses) as men. It can, of course, be argued that they could all be conscripted. There is indeed a case, on the ground of equality between the sexes, that women should be conscripted for the services as men of military age are. But men in industry are not conscripted, and it would be unfair if women were compelled to do their war work on less favourable terms than men, because of discrepancies which are the fossilised remains of an older attitude and a different state of affairs.

The war will not end the problem. After the last war, one of the major changes was the expansion of women's work and the improvement of women's status. There is little doubt that this will be the case again. The old fears remain; the dread that women will take or keep men's jobs and cause unemployment is frequently voiced. But no man of sense can subscribe to the view that the fewer workers a nation has, the better off it will be. Even if it were not the case that the working population of this country will fall in numbers in the coming generations, it would still be desirable to raise to a maximum the brains and hands available to do the nation's work. The standard of living and of leisure must increasingly be based upon the work of women as well as men in the production of goods and services; and the nation's need for women workers is more than a wartime phase.

The long-term solution, for the sake of the women and the community alike, can be simply stated. It is, first, that in the professions—in teaching and the Civil Service, for instance—there should be no discrimination between men and women, because in these occupations it is as individuals with set personal qualifications and capacities that they are employed. It is, secondly, that, in industry, every effort should be made to reduce the disparity between men's and women's earnings. In the lower ranks of industry, it is perhaps as "hands" rather than as individuals with set qualifications that workers are employed, and it cannot be denied that, in many occupations, though by no means in all, a man's hands can do more than a woman's. This fact will always impede complete equality of wages; but the effort should be to get rid of all disparities that are founded on less solid bases. The war has given the community the chance to start again on a fairer and more efficient foundation; and over a great part of paid employment, there is little doubt that the only obstacles to "equal pay for equal work" are the prejudices which have hitherto compelled women to seek their living only through a narrow funnel of ill-paid jobs.

NOTES OF THE WEEK

The Spirit of the People

The debate on the Address ranged far and wide, the most bizarre contribution perhaps being a meticulous recital of the history of the "bona fide traveller." But some very clear themes stood out, and one was a sense of frustration—not of defeatism, for the notes of resolution and confidence were very marked, but rather of questioning. Sir Richard Acland voiced it when he claimed that conflicts of economic interest, many of them quite natural and inevitable as things are, were holding up the war effort. Sir George Schuster voiced it when he recorded the remark that, at a meeting of twelve industrial magnates in his constituency, "there was not a man sitting round this table who has not a feeling of grievance against the Government, a feeling that he has been messed about and that his desire for help has been frustrated." Sir Roger Keyes voiced it when he spoke of

"the strength of the negative power which controls the war-making machine in Whitehall." Mr Griffiths voiced it when he told the story of the old Welsh miner who said "I can see that we must all pull together to destroy Hitler, but after that—what?" Serving members voiced it when they indignantly attacked the disparity between high pay in industry and meagre allowances in the forces. It is a peculiarity of the House—and of the country—that almost complete unanimity about the war is combined with serious doubt about the efficiency of administration, widespread uneasiness about the inequality of war sacrifices and general questioning about the post-war world. This is not opposition. It is democracy; and it is to be hoped that the Prime Minister, even at this flood time of more active warfare, will find time to hear these murmurings. They are the stuff of which the country's resistance and determination are made; and they

should be echoed in every Government department until plain answers and remedies are found. This is the only way to win the war—and the peace.

Reward for Service

There is no doubt that the last word has not yet been said on the pay and allowances of soldiers. When everything has been said about the free board and lodging that serving men and women receive, it still cries out for notice that it is possible for young boys to earn more in civilian war work than men in the Services, and more, too, than skilled miners and farm labourers. High earnings, for boys or adults, are very much more rare than rumour says, and often they are only earned by long, laborious overtime. In individual instances, they are merely evidence of an abnormal, and perhaps temporary, demand for a particular product or class of labour. Moreover, it is not the purpose of war to level out all the hills and valleys in remuneration which made gainful employment so unequal before the war. The trouble is that the absence of a wages policy and of any special restraint upon other excess incomes, except profits, has probably accentuated the differences; and the current comb-out of civilian employment for the last drop of manpower for the forces means that these differences are set more than ever in relief. Even though differences in consumption, as distinct from income, are limited by restrictions and rationing, it is still economically, as well as morally, expedient that there should be a wages policy; and serving men cannot be expected to wait patiently for action while their dependants go shorter than other families and their savings run out as others' savings mount. It may be that there is some reluctance to raise allowances to their wives because the wives are now wanted to work; but this should be no bar to higher allowances for soldiers' children. Indeed, if the vagaries and unfairnesses of wartime remuneration are to be restrained, as they should be, there is everything to be said for family allowances all round to ensure that, while adults do not "profiteer," children do not suffer.

ABCP Front in Washington

The dangers inherent in any attempt to reach a settlement with an aggressive Power are obvious—that some other weaker country's interests may be sacrificed and that, in making concessions, the aggressor is probably only buying time and manoeuvring for position. Both dangers have obviously been in President Roosevelt's mind throughout the protracted negotiations with Japan, for they are present in an acute form. The weaker Power is obviously China. The Japanese insist that the "China incident" must be isolated from a general settlement of the Pacific problem. China is no concern of the other Powers, and their attempts to assist China—by loans, by the despatch of war supplies, by holding open the Burma Road—are unwarrantable interference in matters "internal" to East Asia. The other danger—that concessions made now are only interim measures—is borne out by Japanese history; on at least two occasions the nation has accepted terms, consolidated its position and struck again. Thus the problem facing President Roosevelt and the British, Australian and Dutch Ambassadors, whom he called into conference in Washington during the past week, has been whether there was any contribution they on their side could make to lowering the temperature in the Far East. At one point it must have seemed that there was, for rumours circulated of a suggested 90-day "truce" and even of some return to more normal trade conditions. But a sharp protest from Mr Hu Shih, the Chinese Ambassador, appears to have put the talk of "concessions" into its right perspective. In the long run it is obvious that the great industrial Powers of the Western world could do much to assist in creating healthy economic and political relations between China and Japan, in expanding Japan's internal and external market, in encouraging a rising standard of living among Japan's depressed masses, in assisting Japan's transition from war to peace economy. But the move from war to peace must come first, otherwise any concessions and assistance would merely render more easy the waging of war and the consolidation of conquest. In other words, the concessions were all up to Japan. Would the Japanese evacuate China? Would they withdraw from Indo-China? Would they scale down their war expenditure? Would they accept the role of friend and collaborator in China's nascent industrial development? These are the questions Mr Kurusu had

to meet, and the breakdown of the Washington talks is proof that he could not provide the answers. Now, unless Japan stages a sudden *volte face*, the period of diplomatic exchanges is at an end.

The Moscow Offensive

After a lull during which the Germans confined themselves to local action round Moscow, testing out the strength of the defences, a new attack has been launched with redoubled fury, its main weight falling on the sectors to the north and south of the city. Advancing from Kalinin and Volokolamsk, the Germans claim to be beyond Klin, while in the south they appear at last to have penetrated the defences in the Tula area. At the same time, a heavy battering is going on in the Mozhaisk sector where the Germans seem to be exploring the Russian line for a point of entry. The Russian communiqués recognise the danger, but the tone of headquarters, press, and wireless is far more confident than in the great crisis of October. During the lull, the defences have been strengthened, fresh troops have been brought in and more material brought up. It is, of course, exceedingly foolish to characterise the new German offensive as "a last desperate effort" in which Hitler is "staking all" on a final "gamble." Almost every offensive the Germans have launched so far has been a "desperate gamble," yet they have reached the gates of Moscow. Nevertheless, the Russians' picture of Germany as "a dangerous animal, a wounded and bleeding animal who hopes to find in Moscow warm winter quarters" is probably nearer the truth than the Germans find comfortable. They claim that the new offensive is designed to encircle the city. So far the circle is barely one-third complete, but a break through beyond Tula would interfere dangerously with Moscow's supply lines to the south and east. Yet, as Leningrad has shown, almost complete encirclement would not necessarily ease the Germans' embarrassment with regard to winter quarters. Nor is it at all certain that they can maintain the present offensive with sufficient force to carry them to the east of the city. In the Donetsk sector, Russian counter-attacks round Vorishilovgrad have driven the Germans back, and it may be necessary to draw off some troops from Moscow to reinforce the German position. In the extreme south, the struggle for Rostov is raging in the streets of the city, but the line of the Don still holds.

Dead Hand?

The regret of Sir Roger Keyes that it has not been possible to bite deeper and more often into the enemy's extended coast-line by amphibious strokes is shared by everyone; and his complaints about the negative and procrastinating approach of official committees will find a flock of echoes. The unmistakable suggestion that the Prime Minister himself is hobbled by his permanent advisers would be profoundly disturbing, if it could possibly be taken as true. It is Mr Churchill's duty—and, by universal belief, his character—to lead. If it were a fact that the chiefs of staff and their supporting network of inter-departmental committees had prevented Sir Roger Keyes, as Director of Combined Operations in charge of commandos, ships and naval personnel, from "altering the whole course of the war" since July, 1940 by seaborne raids, despite the Prime Minister's backing, it would show a fatal conflict at the centre. It would be sound cause for alarm and despondency; and it would be a heavy indictment of Mr Churchill and his colleagues, who are alone responsible for the conduct of the war. Sir Roger should have addressed the charges he made in the Commons on Tuesday to the War Cabinet, and not to the chiefs of staff or that "section of the war machine whom I had criticised earlier in the war"—which, by cross reference, would actually appear to be the Admiralty. By associating Mr Churchill with his frustrated keenness to act, Sir Roger said too much or too little. The fact that a greater spirit of daring and initiative may well be needed among high officials and officers ought not to obscure the fact that Sir Roger may well have been wrong; and the last word in this discussion, now it has been started, should come from the Prime Minister—for his own sake as well as his advisers'.

Regulation 18b

On Wednesday, the Government refused to amend Regulation 18b to bring it into line with Lord Atkin's dissenting judgment in *Rex v. Liversidge*. The most telling of the arguments brought forward by the supporters of the

amendment is that the wording of the original regulation was changed, from "if the Home Secretary is satisfied" to "has reasonable cause to believe," at the instance of Parliament itself. Sir John Anderson, however, denied that this change meant that the Home Secretary's action in detaining persons could be challenged in a court of law. Both he and Mr Morrison declared that the change was an attempt to find additional safeguards within the procedure contemplated—reference to an advisory committee with the Home Secretary's decision as final; it was a direction to him to be doubly careful, but that was all. It is certainly strange that Parliament has never awakened to the difference in wording before Lord Atkin pointed it out, although cases have come to the courts before that of Mr Liversidge. There is the further point that although the House of Commons in November, 1939, and November, 1941, was anxious to restrain the Home Secretary, in May, 1940, it was anxious lest his powers were not strong enough. Members' vigilance for the liberty of the subject is very naturally inclined to vary with the fortunes of the hour, but the Home Secretary's vigilance for the safety of the State must be unwavering and unceasing day and night. It is on this ground that the Government made its stand. The emergency is still there; consequently the emergency powers must be there too, and the normal checks on the Executive must yield. One of the best of the checks is the obligation that lies on the Executive to disclose—to dis-oblige to an independent body, whether the legislature or the judiciary, the reasons for its actions. If the Home Secretary's advisory committee for Regulation 18b were replaced by a court of law or an independent tribunal, that is, a tribunal whose judgment the Home Secretary would have to accept, he might find himself called upon to disclose more evidence than would be justified by the principle of the safety of the State and evidence that might defeat the activities of the Secret Service. Whether, in detaining persons under Regulation 18b, any individual injustice has been done, no one—not even Mr Morrison—can tell. But if the House of Commons had less than reasonable cause to believe that injustice was being done, it could make his position quite untenable.

Total War

This week, a variety of speakers in both Houses of Parliament have done very little service to ATS recruiting. There was too much heavily male talk about glamour, mirrors and lipstick—all of which, admittedly, have their importance—and too little realisation of the imperative necessity which lies upon the Government and the women to cke out the nation's man-power. Lord Trenchard seized the opportunity on Tuesday to restate the case, which has been fully argued within the higher command of the ATS itself, for the policy of complete segregation which the need to free every available man for fighting has made it necessary to discard. By implication, he vastly exaggerated the moral and other perils of the mixed work that is being organised in the Anti-Aircraft Command, where the immediate need to release men for overseas service is greatest—and thereby did a notable ill-turn to the call for recruits. He said nothing about the dangers which the women of this country would share if too few men were freed to win the war. It is, of course, true that cooks, orderlies and clerks can usually be organised in quite separate units, and, indeed, they are so organised. It is equally true that great numbers of additional men could be released, as Lord Trenchard argued, if women were to take over the Army's accounts and records; there should be no able-bodied men left needlessly in offices. But, if Lord Trenchard believes that this would remove the need for women to do other non-domestic and non-clerical work for the Army, he is oddly unaware of the nation's lack of numbers—and of the resentment that is very properly aroused in many women by the doctrine that, women's place being in the home, their only openings outside should be to scrub, to work, to sew and to type. The need to free the gunners and drivers for all the fronts remains; and the policy of AA Command which is aimed at releasing one man for active service for every woman recruited and trained is an outstanding contribution to the war effort. Lord Trenchard's remarks did no justice to this constructive programme or, in the strictures on "mixed discipline," to the able and conscientious work of women officers who, although the operational duties of their troops are necessarily and rightly under the command of men, are in fact responsible for their discipline and their welfare.

To run the ATS according to a male military pattern, as was attempted earlier in several ways, would, of course, be fatuous—though uniforms and the military trimmings have far more attraction for women than the pundits allow. But the service is an essential and integral part of the Army, and it cannot be run as either a nunnery or a girls' school.

American Labour

The strike in the "captive" coal mines was called off at the end of last week. The United Mine Workers then decided to accept the President's suggestion, which they had previously declined, that the issue of the "closed shop" should go to arbitration. The arbitrators, who were promptly appointed, are Mr John L. Lewis himself, Mr Fairless, president of the U.S. Steel Corporation, the largest of the owners involved, and Dr John R. Steelman, of the Department of Labour. The decision will obviously be Dr Steelman's and if, as some observers expect, it is in favour of the closed shop, Mr Lewis will have won the substance, even if he has yielded in form to Mr Roosevelt's insistence that there must be no strikes against defence work. Whether the "labour crisis" is over remains to be seen. The next hurdle is the railway strike threatened for next week—another labour rejection of an arbitration award. This particular issue may well be compromised, since the railway brotherhoods do not seem to be in a very belligerent mood, and the attitude of public and Congress alike is still menacing. But it is difficult to believe that, with a strong demand for labour, two rival federations competing for the workers' favour, and the absence from either one of them of a sense of responsibility for the public good, there can be an undisturbed period of industrial peace.

The First Five Years

This week's two-day conference in Berlin has carried through the renewal of the Anti-Comintern Pact by its original signatories and provided a number of satellite powers with an opportunity of adhering to it. The pact was originally signed on November 25, 1936, between Germany and Japan for a period of five years. Later signatories included Italy and Spain and, in the spring of this year, various Balkan puppet governments. Delegates to Berlin included plenipotentiaries of all previous signatories and of such marginal supporters of the Axis as Denmark and Finland. Twelve countries in all were represented. It would certainly be a false estimate to write off the function as window-dressing, although this aspect of the discussions was by no means absent. In a sense it is true that the Berlin Conference was a face-saving substitute for the Congress of Vienna, which Hitler is generally believed to have planned for this autumn to mark the end of the Russian campaign and the proclamation of peace in Europe. A more serious explanation of the willingness of the German Government to waste even two days on the despised conference method lies in the necessity of preserving Japanese solidarity with the Axis. It was no accident that Japan and not Italy was the foundation partner of the pact. For

whether it was in fact directed primarily against Russia, primarily against the British Empire or equally against both, full Japanese co-operation is still as essential as Ribbentrop knew it to be in 1936. In the last five years, official anti-comintern policy has taken strange forms, each of the original signatories concluding agreements with the USSR. But pragmatic justification has been afforded by the fact that these overtures have assisted Germany to overrun Eastern Europe and Japan to subjugate a sufficient area of China to make an attack elsewhere a strategic possibility. The fifth anniversary finds German troops at the gates of Moscow. Yet it also finds the risk of Japanese defection unusually great. Japan is still not finally committed and she has recently been willing to carry on discussions with the United States in Washington. Reaffirmation of her anti-comintern vows before many European witnesses is, consequently, a matter of vital concern to Germany, more vital for the present than the ratification of the New Order.

Defence of Dutch Guiana

The importance of the transfer of a contingent of United States troops to assist Netherlands forces in the defence of Dutch Guiana is more prospective than actual. The presence in the colony of vitally important bauxite mines, whose significance for the United States' import needs is discussed in an article on page 651, is in itself sufficient reason for ensuring the presence of an adequate garrison. And it is fully in line with the declared policy of the American republics that the garrison should be provided by the United States, rather than by the re-drafting of Dutch troops at present required for service in the Netherlands East Indies. Both the intervention of the United States and the co-operation of the Brazilian Government, which is to exercise military vigilance on the frontier, demonstrates a determination to defend the American hemisphere as a whole—a policy agreed by the Havana Convention. The practical necessity for improving the defences of Dutch Guiana is to be found in the recent deterioration in Vichy's resistance to German demands, coupled with the geographical situation of Dutch and French Guiana. French Guiana, which borders the Dutch colony on the east, is not very far from Dakar. If Hitler, or a subservient Vichy, were in control of it, it might well serve as the spring-board of a Nazi invasion of the New World. Whether or not it would be advisable at the present juncture to forestall Nazi aspirations by the entry of United States forces into French Guiana, and possibly by the acquisition of Martinique and Guadeloupe, it would clearly be criminal negligence to leave Dutch Guiana inadequately protected. The New World cannot afford to lose the output of the bauxite mines at Surinam, whether by seizure or by sabotage; nor can it afford to allow Germany to acquire a bridgehead in South America, however remote the time may be when Hitler could attempt to exploit it. Thus the future of the French colonies in the New World turns on United States estimation of the *bona fides* of the Vichy Government. If Vichy is just another puppet government, there can be no justification for allowing the independence of its possessions across the Atlantic to bring the Nazi menace to the doorstep of the American continent.

The Second Savings Year

The second year of the War Savings Campaign ended on November 22nd. Complete figures are not yet available owing to the time lag in collecting them, but the total up to November 18th (that is, with four days missing) was £600,395,406, compared with £463,883,446 to the same date in the first year. Lord Kindersley's target figure of £620,000,000 will probably be reached when the full returns are in. This is a creditable result. But perhaps of greater significance than the twelve months' total is the fact that the latest weekly figures have shown a persistent declining tendency. The reason is not very far to seek. Deduction of income-tax at source, at the new standard rate and with the reduced personal allowances, has begun for weekly wage-earners and will begin this week for monthly salaries. Its full effect can be expected to be spread over fifteen weeks, as the usual office or factory savings scheme has a life of that period and it is only when a new period begins that taxpayers will revise their rate of savings. At the same time, it is evident from a number of signs that there is plenty of money about. Black markets are probably small in extent, but grey markets flourish exceedingly and every avenue that is open to expenditure is being very freely

explored. In Germany, where little reliance has hitherto been placed on savings, the same problem of a great head of dammed-up purchasing power pressing against the restrictions on civilian consumption has recently led to the institution of the so-called "iron savings" scheme, of which some details are given in the "German Europe" section on page 654. In this country, the position appears to be that, while there is a substantial proportion of the national income that is neither required for necessities nor finds its way back to the Exchequer in taxes or loans, the yield of the Savings Movement is tending to decline. This would suggest that there are still sections of the community who have not been reached by Lord Kindersley's movement. Perhaps the only way to reach them will be by compulsory savings.

Restraint of Trade

The reduction in the number of firms or shops which war economy makes desirable is regarded in various ways. In the context of war policy, it is a means of freeing manpower for war work; the trouble is that, outside the limited range of "concentrated" industries, it is left to haphazard bankruptcy to bring about the reduction. To some economists it is a chance, as in the case of retail trade, to increase efficiency by getting rid of "redundant" units which the "imperfect competition" under which they normally operate does not provide. To many trade associations, on the other hand, it is simply a stepping stone to corporative organisation and monopoly, and the registration of builders, like the licensing of shops, is a first step. The aim of the building associations, for instance, is to achieve a "qualitative" control of building, by which they mean that the trade should be limited to firms of "standing." This can be just as dangerous as "quantitative" control. The purpose, it is said, is simply to ensure high standards of construction and business conduct—which ought, in any case of course, to be done by a disinterested authority, and not by the trade associations in any way; but the incidental consequences could hardly fail to be organised price-fixing and something very like a "closed shop" in building. There is nothing that the Government's reconstructors should look at more warily than the tendency of necessary wartime measure to lead towards monopoly and the restraint of trade.

The Balance in Spain

The offensive in Libya and the new German pressure on France may well end the diplomatic lull which the Russian war brought to Western Europe. The Spanish attitude to Germany's military plans does not appear to have altered materially. The old split remains, with the Falange representing the extremist, modernising, "New European" attitude, and with the Caudillo and the Army, supported by all the more responsible elements, taking a cautious view both of Spain's internal stability and the likelihood of a total German victory. It was significant, for example, that neither General Franco nor the army leaders were present when the eighth anniversary of the Falange was celebrated with the usual fireworks against Freemasonry and pluto-democracy on October 29th. The relative strength of the two tendencies varies, of course, with Germany's fortunes of war, since the irresponsible Suñer has identified himself and his party completely with a German victory and a German New Order. But the grim facts of Spain's internal position—facts which Suñer waves away with extravagant plans for "Ibero-American solidarity" and for the development by Spain of "the imposing left shoulder of beheaded Africa"—tell all in favour of the moderate statesmen. There were 8,000 cases of typhus last winter, of which over a thousand were fatal, and the Director-General of Health has warned the country that the epidemic is still rampant. It has proved impossible to increase the very small bread ration in spite of large imports of American grain. The shortages have bred a fever of hoarding, profiteering and speculation which the Government since November 1st has been trying to counter by the extreme measure of the death penalty. Since 1939, exports have fallen by 589,994 tons, imports by only 3,821 and the exchange problem, aggravated by wartime conditions, is insoluble. The weakness in the Caudillo's position is the extent to which Spain must depend economically upon German Europe. German technicians are active in all branches of reconstruction, Germany is the main export market—which includes the export of workers. The Cau-

dillo's strength lies where it always lay, in continued British resistance, in the growing American war effort, and now, by a paradox, in the Russian armies which Spain's "Blue Division" is fighting in the field.

The Colonies in Parliament

The fifth day's debate on the Address was given up to the discussion of colonial affairs. Because of the occasion, the discussion was on very broad lines, but most speakers concentrated on economic problems and urged the speeding up of the new policy epitomised in the Colonial Development and Welfare Act. The speakers, however, hardly touched on the main economic problem of the colonies—how to raise their standard of living. They were mainly concerned with the conditions of life, which is a different matter. It is with these that most of the recent official action has been taken—the appointment of labour advisers; labour legislation and now the establishment of a Labour Advisory Committee at the Colonial Office; Sir Frank Stockdale's welfare schemes in the West Indies, and so on. But social services of this sort are no substitute for a higher standard of living, and the third stage of colonial policy, which, as Lord Hailey said recently, we have now reached, should include far more than the expansion of the social services. It should be, in his words, "of a positive and constructive character"; development must march along with welfare. Lord Hailey's fourth stage, the extension of self-government, was hardly discussed in the debate, except by Mr Creech who was drawn into it by Mr Noel-Baker, who drew attention to the dangerous situation which has arisen from the amalgamation of Europeans in the two Rhodesias for the amalgamation of the two territories and Nyasaland. Unfortunately Mr George Hall, in his reply, made no mention of the matter, although it is known that the Prime Minister of Southern Rhodesia is working hard to force amalgamation on the British Government. An early statement that the Government has no intention of handing over the three million natives of Northern Rhodesia and Nyasaland to a Government whose native policy is based on sharp discrimina-

tion is clearly called for; and it would be to prevent matters like these from going by default that a standing Parliamentary committee on colonial affairs would be particularly desirable. There must be no Munich in the colonial empire.

Shorter Notes

Last week's reports of a settlement of all the outstanding difficulties between the United States and Mexico have proved incorrect or possibly premature. The oil companies refused the terms proposed by the Mexican Government and Mr W. Farish, president of the Standard Oil Company of New Jersey, has issued a statement on behalf of all the oil companies condemning the proposed oil agreement as "vague and ambiguous." All through the Mexican oil dispute it has been difficult to be clear about the points at issue, and the obscurity remains. On the surface, the oil companies appear to be rejecting a proposal that their claims should be arbitrated between the two Governments. The real position may be, however, that part of their claims—specifically, the claim for compensation for the loss of subsoil rights—is excluded from the arbitration. One thing that is reasonably clear, however, is that the Mexican Government has succeeded in driving a wedge between the United States Government and the oil companies, and there is talk of action by the former to coerce the companies.

Within a week of each other, four important personalities of the *Luftwaffe* have met their death, two air aces, Von Werra and Moelders, and two highly placed administrative officers, General Wilburg and Udet, the Quartermaster General of the *Luftwaffe*. As all these men, with the exception of Von Werra, were killed in accidents, the outside world is permitting itself the luxury of a "revolt" inside the German Air Force. No doubt the Germans interpreted the loss within one fortnight this summer of four trans-Atlantic bombers as a "revolt" in the Atlantic Ferry Service.

THE WORLD OVERSEAS

American Bauxite Supplies

(By a Correspondent)

November 25th

THE United States and Dutch Governments have arranged that, for the duration "of the present danger," United States troops will be sent to Surinam (Dutch Guiana) to co-operate with the local Dutch forces in the protection of the bauxite mines. The Brazilian Government will contribute to the defence of the Guiana bauxite deposits by exercising an especial measure of military vigilance in its northern frontier zone and by sending a mission to Paramaribo, the capital of Surinam. This is the first occasion on which the United States Government has taken steps to secure its raw material supplies from a foreign source by military protection.

This action is a clear proof of the importance the United States has attained as a source of supply of bauxite for the United States aluminium industry. The United States itself is one of the most important bauxite-producing countries in the world; in 1940 the mines in Arkansas, Alabama and Georgia produced the record total of 445,958 metric tons, against 381,331 tons a year previously. This year, an increase of no less than 50 per cent in the country's bauxite output is expected, and investigations made by the United States Bureau of Mines indicated that even this year's output could be multiplied if required. Nevertheless, the Office of Production Management decided last summer that, while United States bauxite mines should be fully equipped to meet any possible emergency, imports should be maintained at a high rate as long as possible in order to conserve domestic reserves.

Among the foreign bauxite sources of the United States, Surinam is predominant. In 1940, when the record total of 629,552 tons of bauxite (against the previous record of 520,179 tons in 1939) were imported into the United States, Dutch Guiana supplied no less than 585,993 tons, or 93 per cent of all imports. Of the remainder, 29,929 tons came from British Guiana and 13,630 tons from the Dutch East Indies. This year, United States requirements will be much larger than in 1940. The country's total bauxite consumption in 1941 can be taken at 1,400,000 metric tons, against 958,695 tons last year. Of this huge quantity United States mines may supply 660,000 tons, while at least 740,000 tons will have to be imported.

The MERCANTILE BANK of INDIA LIMITED

Head Office: 15, Gracechurch St., London, E.C.3

FIXED DEPOSIT ACCOUNTS

Rates will be quoted on application

There is every likelihood that Surinam will be able to meet the increased requirements. Last year, Surinam produced 615,434 metric tons, compared with 511,619 tons and 377,213 tons, respectively, in the two preceding years. Since then, production has been greatly expanded. The *Surinaamsche Bauxite Maatschappij* started a new bauxite crushing and drying plant at Paranam in February, 1941; its ore basis is a newly developed and rich deposit at Topibo in the Para Creek district. The new plant has a production capacity of 150 tons of dried bauxite an hour, while the company's old plant at Moengo on the Cottica River, which has so far supplied the bulk of the Surinam bauxite and which is still in operation, has an hourly capacity of only 100 tons. In addition to the expansion of this company, the *N.V. Billiton Maatschappij*, which interrupted its bauxite mining operations in Surinam in 1940, in order to concentrate on its work in the Dutch East Indies, re-entered the field early in 1941, and started the construction of a crushing and drying plant on the Surinam River near Paranam in February last. Whether this plant has already come into operation is not yet known, but it is safely assumed that Surinam will produce 800,000 metric tons of bauxite this year and will increase the output to over 1,000,000 metric tons in 1942. As the Surinam bauxite reserves are so extensive that their probable total has not yet been established, the rapid increase in production since the outbreak of war will not cause any technical difficulties.

Additional Supplies

While Surinam will still be able to supply the bulk of the United States' bauxite imports, the U.S. aluminium industry has a direct interest in the opening of additional American bauxite resources, especially as the country's aluminium output is still far from its scheduled peak and ever-increasing bauxite supplies will be needed within the next few years. The only important American bauxite deposits so far developed outside the United States and Surinam are situated in British Guiana. The latter territory, in which the production of bauxite started in 1914 (Surinam in 1922) produced less bauxite than Surinam between 1927 and the outbreak of this war. Last year, however, both the expansion and rate of production in British Guiana reached an unprecedented level, and 700,000 metric tons, against 483,653 metric tons and 382,409 metric tons, respectively, in the two preceding years, were produced. The Demerara Bauxite Company, Ltd., a subsidiary of the Aluminium Company of Canada, continued to account for the bulk of the output from its extensive Demerara River deposits, which stretch over long distances on both sides of the river. Moreover, an investigation into new bauxite deposits in the districts of Essequibo and north-west Guiana was completed by this company last year and will probably lead to the opening up of new mines. Meanwhile, the Berbice Company, Ltd., started the construction of a new bauxite crushing and drying plant early this year to utilise the ore from a new rich 4,000-acre concession near the Demerara River. British Guiana also, therefore, has every prospect of bringing its output to within reach of 1,000,000 tons a year before the end of 1942. As has been shown, British Guiana has so far supplied only a very small percentage of the United States' bauxite imports. Almost the whole of its output is shipped to Canada and to a minor extent to Great Britain. As, however, the Canadian aluminium industry has concluded huge aluminium supply contracts with the United States Government early this year, the United States is directly interested in the protection of the British Guiana deposits, even if the British colony continues to supply only limited quantities of bauxite to the United States direct. In this connection, it is not unlikely that the American forces in Dutch Guiana will collaborate closely with the British forces and administration in British Guiana, although so far no official statement has been made.

While the development of the bauxite output of the two Guianas since the outbreak of war has given the United States cause for satisfaction, the expectations of its aluminium industry in the opening up of the huge bauxite deposits on the plateau of Pocos de Caldes in Minas Geraes (Brazil) has proved a disappointment. In 1940, the Reynolds Metals Company, the new United States aluminium producer, concluded an agreement for the first 100,000 metric tons of Brazilian bauxite on a f.o.b. Santos basis. The bulk of the ore has since piled up at Santos, but shipment has become economically impossible, as the freight rate between Santos and United States ports has increased from \$5 to \$15 per ton since the conclusion of

the contract. The freight alone is thus more than twice as high as the domestic bauxite price in the United States. As United States aluminium prices are now 25 per cent lower than at the outbreak of war, and may be reduced still further through the intervention of the Office of Price Administration and Civilian Supply, there is little likelihood that they will rise to a level at which shipments of bauxite from Brazil to the United States will become a commercial proposition.

Vichy's Internal Policy—II

[BY A CORRESPONDENT]

November 11th

AN article in last week's *Economist* described the fiasco which has attended the Vichy Government's attempts to find a new constitutional principle. Official policy towards the trade unions shows a similar record of failure. Soon after the armistice the *Confédération Générale de Travail* held a congress at Toulouse, where its leaders tried to save their organisations by adopting a compromising attitude towards Vichy. This was of no avail. In September, 1940, the CGT was banned. In November, an accord was reached between the CGT and the Christian trade unions to "lay the foundations of a new French syndicalism." This last attempt to save the movement was also brought to nothing by Vichy. But to ban trade unionism was not enough; the cadres of the movement, with their social tradition, which has not yet lost all its vitality, might become a danger to the regime were they left intact. Vichy set out to demoralise them, and has scored some success, though only of a negative kind. There had been no lack of Left Wing defeatists among the CGT whose services Pétain could enlist. There had also been a strong, deeply rooted bias against parliamentary democracy and politics, instilled into French trade unionism by Sorel's ideology. Both these factors, defeatism and syndicalist prejudices, have played into the hands of Vichy. The number of trade union leaders who have agreed to be the tools of the Marshal and his cliques has been comparatively high. It is enough to mention Belin, an old prominent disciple of Sorel; Dumoulin, the former popular leader of the workers in the north; Gitton, the former Communist vice-president of the CGT; and Delmas, once the Radical spokesman of the Teachers' Union. But, like the Fascist leaders, these Left Wing henchmen of Pétain are engaged in a fierce struggle for the leadership. Some of them went so far as to turn the remnants of their trade unions into recruiting offices of labour for Germany; yet, again like their Fascist counterparts, they too have proved themselves incapable of winning any popular support. This can be illustrated by the fact that the membership of the Metalworkers' Union in Paris, which some time ago amounted to 200,000, has now fallen to 1,500.

The most recent development is the *Charte du Travail*. Under it, monopoly trade unions under State control will be set up. The *Charte* provides for separate unions of employers, employees and technicians, as well as for mixed committees endowed with arbitration powers, but supervised by governmental officials. Unions and mixed committees alike are to be organised on a local, regional and national scale. The activity of the unions is to be strictly confined to the limits of their respective trades. No organisational link between unions of different trades—no *confédération générale*—will be allowed; this should prevent them from becoming involved in politics. No free independent unions will be permitted. It is not yet clear whether it will be compulsory for employees to join the new unions, as has been the case with the *Arbeitsfront* and with their more immediate model, the Italian corporations. In view of the hostile attitude of the working classes, the reform can hardly lead to anything but the growth of a new bureaucratic apparatus, without any real mass support at its base.

Strengthening the Police

The regime has so far relied in its internal policy on two factors—besides the external pressure of the ubiquitous invader—on its military and police force and on the authority of the Marshal. The lower the latter declines—and it can hardly be rescued by such melodramatic gestures as the Marshal's rumoured offer to hand himself over as a hostage to the Germans—the more scope is being given to

the terror of the military and police apparatus. One of the first measures taken by Darlan, on the assumption of his present office, was to advance 3,000 million francs for the modernisation of the police. France, which was short of tanks in the war against the external enemy, has now endowed its police with tanks and highly mobile equipment to keep down its own people. Multiple types of special courts to deal with political offences have been busily at work throughout the country. But the police itself, inherited from the Third Republic and therefore "infected with the spirit of liberalism," has frequently proved unfit for its new tasks. (Even the Riom Court, whose members had been carefully chosen to try the "war culprits," and refused to comply with all the orders issued to them, and Pétain himself had consequently to assume the rôle of a self-appointed Supreme Judge.) Hence the overhauls, transfers and purges to which the administration—along with the municipalities—has been ceaselessly subjected. To this should be added the daily heresy-hunting from which nobody can feel immune; one of its latest objects is none other than Pétain's former Minister of the Interior, M. Peyrouton, unmasked as a freemason.

The opposition to the regime has been as widespread as it has been politically amorphous. The catastrophe of June, 1940, has broken the backbone of the old political parties. None of them—either on the Right or on the Left—has emerged from the wreckage of the Third Republic with a clear record, unstained by defeatism or treachery. Such parts of the old movements as have remained morally and politically sound can only be rallied very slowly, unless they are stimulated by some definite German reverses on the battlefield. The only exception is the Communists, whose activities have received momentum recently; not because their war record has been any better than that of the other movements—it has rather been even worse—but because the outbreak of the Russo-German hostilities gave them a new political purpose—the preservation of the USSR has always been their *suprema lex*—and restored much of the coherence of their cadres. They have toned down their specific Communist propaganda, and of their own accord have declared their unconditional support for General de Gaulle, regardless of his well-known royalist outlook. This, in itself, may be taken as a proof of the ever-growing popularity of the de Gaulle movement. In fact, this movement has become the only rallying ground for all those forces which, without distinction of class or political creed, work for the restoration of French independence.

Swiss-German Economic Relations

[FROM OUR GENEVA CORRESPONDENT]

October 14th

THE news that, as a result of the recent German-Swiss trade treaty, Britain would no longer grant navicerts for goods intended for Switzerland caused much surprise and comment here, but as Britain is still said to be ready to facilitate the transport of foodstuffs to Switzerland, it is felt that some Anglo-Swiss arrangement is not excluded. The British measure mainly concerns raw materials and manufactured goods, of which Switzerland is now so short that there is no danger of these being re-exported.

It is estimated in Britain that Swiss industry is now completely under German control, and that Swiss factories are all working for Germany. This is not exactly the case. It is clear that Switzerland, as a democracy, had morally defeated at the same time as France. Alone and isolated, Switzerland could not hold out very long against an attack so that, for the time being, she could not avoid abiding by some of the German claims. Politically she is free, but economically she is under the Reich's influence; and it is rather surprising that, in the circumstances, she has succeeded in maintaining a great part of her overseas trade. Germany was always Switzerland's chief purveyor, especially in regard to raw materials; and this is the position to-day, with the difference that the Nazis not only charge a very high price for their deliveries, but also choose the Swiss goods and products they want in exchange. Thus Germany is supposed to deliver some 18,000 tons of iron and 20,000 tons of coal a month, while she is to get in exchange Swiss cattle, milk, butter, cheese and fruit. This

explains why the monthly ration of butter in Switzerland is 8 ounces, that of cheese 9½ ounces and that of milk about one pint a day.

On the other hand, Switzerland refused to issue a German loan here or make direct loans to Germany; but as all imports are prepaid, and as these advances will not be repaid through the clearing for some months, Swiss industrialists are thus lending to Germany funds which at the end of this year will be well over 1,000 million francs.

Some factories in the machine, metal and watchmaking industries are carrying out German orders—mostly peace-time products—and use for that purpose raw materials supplied by Germany. Many other factories occupied in peace work are receiving raw materials from various sources and selling their goods to all countries. In fact, the Federal Government is taking the greatest care that raw materials from Allied countries should not go to the Axis partners, while materials supplied by the Axis are not allowed to go to Allied countries. The same control is applied to imported foodstuffs and other articles, which cannot be re-exported.

The worst evil menacing the country is the rise in unemployment following the closing down of factories as a result of the lack of raw materials. Moreover, the Government fears that this situation, coupled with a rise of about 30 per cent in the cost of living, may lead to labour unrest; and it is therefore considering starting public and other works and finding employment for the greatest possible number of workers. All national resources are being fully utilised. Scrap metals are collected, and the few metal deposits exploited to the utmost. Work is to be resumed in the Delemont (Jura) iron mines, while it is in full progress in the Gonzen (St. Gallen) and Chemin (Valais) mines, which are daily yielding a few tons of iron ore; as that ore cannot be melted here, it is sent to Germany, which in return supplies cast iron. Work is also in full swing in the Canton Valais anthracite mines of Ferden and Chandoline; this coal is rather poor; nevertheless, it is helping industry to some extent. Every effort is being made to produce substitutes, and last September the Lausanne Samples Fair was a striking example of all that is being done to keep industry at work. Another remarkable instance of Swiss effort was the recent show at Geneva and Zurich of women's dresses made of Swiss textiles, either of real or artificial wool, cotton and silk, and of embroidery; the Swiss Chamber of Textiles, which organised the display, proved that Swiss industry is not only capable of creating a Swiss fashion and entirely supplying it, but also of supplying textile fashions in other countries, as is shown by the important orders received from America.

Switzerland is thus doing her best to adapt herself to present conditions. Her position is a most delicate one; economic difficulties and possible unrest would be a boon for German designs on the country; and it is hoped that Britain will give her as much help as possible to save her from being thrown into the hands of the Axis.

German Europe

Steering Purchasing Power.—For some time the German public has shown uneasiness about financial developments. There has been a continued rise in revenue, but a considerable increase in borrowing has overshadowed it, and there has been a rumour that new taxes are contemplated. Some people expected a tax on capital, others a war surcharge on all property taxes; and the mass of the people feared the requisitioning of savings.

The method of the war surcharges previously imposed on income tax and excise duties had the desired result of producing more revenue; but it discriminated against certain sections of the population. Private employers, for example, paid 50 per cent surcharge on income tax, while joint-stock companies paid no surcharge on corporation tax. Workers whose weekly earnings were increased by overtime work discovered that a considerable part of the increase was taxed away.

In offices, the deduction of taxes and various levies from wages became extremely cumbersome; a wages clerk had to struggle with eight regular deductions; that is, wages tax, war surcharge, civic tax, defence tax (imposed on men who were not conscripted), three different contributions to social insurances and the contributions to the Labour Front and to the "Winter Help." A number of stamp duties made a great deal of work in the district offices of the Treasury. Some reform was obviously needed. The first step was to simplify the deductions from wages. Wages tax and war surcharge are now one item—which arouses the suspicion among workers that the increased tax will be maintained after the war. The defence tax has been suspended.

The second step, taken at the end of August, was a war surcharge of 25 per cent on corporation tax, and private employers may now apply for a reduction in the war surcharge on income tax—a maximum of 10 per cent of the profits may be freed from the additional charge. The Government was forced, probably under some pressure, to meet the wishes of private employers thus far. The increase in the corporation tax, which is the second largest item in total revenue, has made possible the repeal of a number of stamp duties.

The latest new measure is called the "steering" of purchasing power. There is, first, a kind of deferred wages, called "iron savings," applicable only to wage and salary earners; a worker who undertakes to save regularly a fixed part of his wages may deduct this from his wages for purposes of tax (the amount deducted being limited to Rm. 6 a week) and the sum is credited to him in a special savings account. Withdrawals from these special savings will not be allowed until 12 months after the end of the war. Once "iron saving" has begun it becomes compulsory. It is clear from this innovation that savings were unsatisfactory during 1941. No statistics about savings deposits have been published since January, 1941, when it was stated that, from September, 1939, to December, 1941, total savings deposits increased from Rm. 19,800 millions to Rm. 27,400 millions, or by 38.5 per cent.

The object of "iron savings" is to "steer" the excess purchasing power resulting from increased wages into savings, and employers have been given a chance to do the same with company revenues. Any employer may pay into the Treasury depreciation accounts or reserves, which cannot be used during the war, and at the end of the war these sums will be paid back to the firms, the amount in this case being limited to half the declared depreciation accounts of the financial year 1940-41. After the war, replacements financed by these refunded amounts will be tax free. This is designed to relieve the pressure of excessive wartime liquidity on the capital markets.

As it is, the pressure of excess purchasing power has made a direct increase in taxation necessary. The war surcharge on cigarettes and tobacco has been raised from 20 per cent to 50 per cent of the retail price, the war duty on brandy by Rm. 1 per litre and that on champagne by Rm. 1.50. There is no increase on the price of beer. It is expected that the consumption of tobacco and brandy will fall accordingly. Drinks and tobacco are almost the only goods not directly rationed in Germany, and scarcities have led to long queues. Official statistics put the consumption of cigarettes at 62,400 millions in 1939 and 74,800 millions in 1940, but nearly half of the increase is

accounted for by the incorporation of new territories, and the forces are said to consume nearly 40 per cent of the total.

The latest revenue returns show the following trends:—
(Rm. 1,000 millions)

	April/Sept., 1940	April/Sept., 1941	Increase in %
Total revenue.....	13.2	15.8	19.7
Income tax.....	5.4	6.7	24.1
Corporation tax.....	1.8	2.4	33.3
Turnover tax.....	1.9	2.1	10.5

The three taxes shown in this table account for roughly 70 per cent. of total revenue. The yield from the "Profit-Stop" has proved to be extremely small—roughly 0.4 per cent. of the total. A total revenue of Rm. 32,000 millions is expected for the financial year 1941-42, against Rm. 27,200 millions in 1940-41, an increase of 17.6 per cent. Revenue plus the war contributions of the communes plus the charges levied on the occupied countries are expected to total Rm. 45,000 millions, and if borrowing went on at the present rate the total available for public expenditure would amount to Rm. 90,000, so that revenue, borrowing and foreign tribute would exceed four-fifths of the gross national income of Greater Germany.

*

Employment.—The latest statistics published by the Ministry of Labour suggest that, between January and September, 1941, 700,000 additional women were brought into employment, against only 300,000 between September, 1939, and December, 1940. The number of foreign workers increased from 1,560,000 in December, 1940, to 1,700,000 in September, 1941. No exact figure of employed prisoners of war is given, but in January, 1941, it was stated that the number of employed prisoners of war had reached one million. In July, 1941, 437,000 men and 174,000 women were working as labour conscripts. There is no doubt that the total number of workers employed in Germany has fallen since the beginning of the year, when an increasing number of men were called up in preparation for the war against the Soviet Union, which has involved large-scale mobilisation. New prisoners of war are mainly employed in the zones of occupation.

The labour turnover is still large. During the first six months of this year, five million workers changed their employment or were set to fresh work under the direction of the labour exchanges. The fact that, at the end of each month from January to July, 1941, 1,500,000 jobs were registered as vacant at the exchanges does not mean that there was a shortage of 1,500,000 workers. The actual figure is much smaller. Women workers now account for some 40 per cent of the total workers, excluding prisoners of war. The total number of unemployed at the end of September, 1941, was 10,000.

An interesting step is the prolongation of compulsory labour service for girls from 6 to 12 months. During an additional six months of labour service, the girls will be employed in administration for the forces, in the Civil Service, in hospitals and as helpers for children evacuated from danger areas. The total number of girls now serving is roughly 300,000.

*

Synthetic Oil.—The Dutch paper, *De Economist*, has published the following figures about annual synthetic oil production in Greater Germany:

(1,000 metric tons)			
Hydrogenation.....	2,100	Benzol.....	500
Other synthetic processes.....	1,300	Alcohol.....	500
Coal tar distillation....	700	Regenerated lubricating oil.....	100
Total.....			5,200

These figures may be near the actual output. It is rather surprising that they should have been published in a German-controlled paper. On the basis of them, the total output of synthetic and natural oil in German Europe would be nearly 14 million tons, compared with the more conservative estimate of some 12 million tons.

THE BUSINESS WORLD

War Transport

GREAT BRITAIN entered the war with an inland transport system that was not only capacious in relation to peacetime needs, but also flexible, in that rail, road, coastwise shipping and canals often provide alternative facilities. But just as the effective carrying capacity of sea transport was reduced by the reintroduction of the convoy system, the need to avoid normal sea lanes, delays in port through the concentration of traffic on the western ports, sinkings, and the transfer of ships to the fighting services, domestic transport has been hampered by the blackout, by the graphical redistribution of the density of movement, by the damage caused to roads and railways by bombing, by the danger to coastwise shipping from air raids and mines, and by the transfer of carrying capacity to the fighting services. In fact, inland transport, like shipping, became one of the tightest of the ruling bottlenecks. But while ocean-going shipping was pooled soon after the outbreak of war, and utilised in accordance with a schedule of priorities, the need for adopting a similar policy for inland transport was not recognised at first. This was largely because, unlike ship-transport, inland transport is not a homogenous commodity; it consists of four different facilities which, in normal times, compete with each other. But competition between independent shipping companies differs in no fundamental sense from competition between rail and road. The scarcity of transport last winter should have been sufficient to prove that inland transport, like shipping, was one industry—with four branches, that carrying capacity, like shipping space, should be pooled and rationed in accordance with the national interest. Since then, the Ministries of Transport and Shipping have been merged into the Ministry of War Transport under a new Minister, Lord Leathers. The time has come for an examination of the progress that has been made this year with the organisation of the supply of and demand for transport.

An efficient system of allocation and rationing was impossible until the supply of transport had been sufficiently organised. And before the supply of carrying capacity could be pooled, it was necessary, as a first step, to secure a greater measure of central control over the four separate transport systems. Substantial progress has, in fact, been made towards this first objective. Government control over the railways was tightened on August 9th, when Sir Alan Anderson was appointed Controller of Railways and chairman of the Railway Executive Committee, which consists of the general managers of the main-line railways and of the chairman of the LPTB. The selection of Sir Alan Anderson as chief executive officer of the railway system is of special significance, since his interests had previously been mainly in shipping. Secondly, the revised agreement between the railways and the Government, which was announced on August 28th, substituted a fixed payment to the railway companies for the sliding scale of the previous agreement. This change for the first time made it a matter of financial indifference to the railways if traffic which might have come to them was diverted to other means of transport. The Ministry of War Transport is therefore at last in a position to utilise the railways irrespective of the financial consideration. Even before the conclusion of the new agreement, last May, the Ministry was instrumental in the formation of the central wagon control, by which all wagons are pooled; this scheme enables the Government, not only to distribute railway traffic to the best advantage, but also to avoid delays and eliminate bottlenecks by means of a continuous record of the movement and location of all wagons.

A good deal of headway has also been made towards the fuller utilisation of the canal system. As a result of a special investigation carried out by the late Mr Frank Pick, the Ministry of War Transport, on September 19th, announced its decision to set up a Central Canal Committee, which is under the chairmanship of Colonel J. J. Llewellyn, Parliamentary Secretary to the Ministry of War Transport, to advise on questions of policy affecting inland waterways, and to co-ordinate the work of the six regional canal

committees. The main functions of these committees, which are composed, apart from canal members, of representatives of other forms of transport and of Government departments, are to organise the effective operation of the canals and the efficient working of craft; to survey traffic possibilities and to make sure that traffic conveniently water-borne is allocated to the canals; to minimise empty running; to arrange, if necessary, for the pooling of barges; to investigate unreasonable delays; and to ensure adequate maintenance and dredging of waterways. The improvement in the utilisation of the canals is revealed by the fact that they are now carrying 15 per cent more coal—their principal freight—than a year ago.

Coastwise shipping had already been effectively organised before the Ministry of War Transport was set up; liners were requisitioned in October, 1940. Carrying capacity has been severely reduced by the transfer of vessels to the Admiralty and by air raids and mines. Owing to the reduction in the intensity of air raids after the spring, it has been possible to increase the volume of traffic carried.

Progress towards cohesive organisation and closer Government control has been slowest in the case of road transport, mainly because the very large number of independent units in the industry made it administratively the most difficult to fit into a scheme of war transport. Before the war, some 148,000 lorries were operated by no fewer than 61,000 A and B licence holders and 365,000 vehicles by 178,000 C licence holders. Moreover, the carrying capacity of road transport was allowed to shrink far too rapidly early in the war, when many thousands of vehicles were requisitioned by the fighting forces. The Road Haulage Consultative Committee, consisting of representatives of A and B licence holders, with an official chairman and secretary, which was set up in August, 1940, for the purpose of facilitating "discussion between the Ministry and the road haulage industry," was devoid of executive power and, though useful, did little to organise the industry. But the need for making better use of road transport was recognised during the intense air raids and the shortage of carrying capacity last winter; and in January the Ministry of Transport took the first step towards direct control by introducing a scheme of hiring vehicles from operators for the carriage of Government traffic. But this scheme never grew to full stature, and in July the Minister of War Transport decided to set up another committee—the Road Haulage (Operations) Advisory Committee—to advise him on the "operation and development of the Government's road haulage scheme." After somewhat protracted negotiations, the Ministry was able to announce an important extension of the scheme on October 20th.

The new road haulage scheme is designed to provide the Ministry of War Transport with a fleet of some 4,100 lorries (of which 1,600 are already chartered for the movement of meat) and to enable it to "arrange through one channel at least a considerable part of the long-distance road movement of Government traffic or other national requirements." The vehicles are to be hired at rates which include a standing payment per week with an additional allowance on a mileage basis. The number of lorries will not be increased unless experience justifies it; but arrangements have been made whereby traffic that cannot be handled by the Ministry's vehicles will be allocated to the road haulage industry. To this end, the Ministry will set up an area organisation—there will be six divisions, which will be sub-divided, as a first step, into fourteen areas—which is to control the operation of the fleet at its disposal and to act as a clearing house for traffic. Parallel to this, the road haulage industry itself will set up an organisation to allocate the traffic passed to it by the Ministry. This scheme, which is voluntary, gives the Ministry a greater measure of control over road transport, while interfering as little as possible with the "individuality of operators." The scheme is a considerable improvement on the original plan; but it is still only a beginning.

On the whole, therefore, considerable progress has been made during the past year, and especially since the formation of the Ministry of War Transport under Lord Leathers last May, in organising the four carrying facilities and in fitting them into a scheme of war transport. Moreover, some £6,000,000 is being spent on the expansion of railway facilities, while a campaign was launched last month to increase carrying capacity by speeding up the turn-round of wagons and lorries.

Most of the measures that have been taken, however, have been concerned with the supply of transport, which is well on the way to an effective co-ordination. One of the chief problems still remaining is a functional and administrative division of transport into long-distance and local traffic. Much less has been done on the side of controlling and directing the demand for transport. The machinery of allocation was set up as long ago as last March by the constitution of the Central Transport Committee. The functions of this committee, which is composed of representatives of the Supply and Service Ministries and of the four branches of transport, are, first, to estimate the volume, nature and distribution of traffic in advance; secondly, to allocate it among the four carrying facilities without regard to any pre-war conventions or financial considerations; and, thirdly, to economise transport. Until recently, the committee's terms of reference represented an ideal whose realisation seemed a long way off. During the past few months, however, a serious attempt has been made to translate them into practice. Traffic is now estimated and allocated some months ahead in accordance with a system of priorities. Towards the end of October, Lord Leathers announced that a drive was to be made to eliminate cross-hauls, and to curtail long-distance traffic whenever alternative goods can be secured from nearer sources of supply. This represents the first important step towards the reorganisation of the demand for transport. Moreover, travelling facilities on the railways have been reduced appreciably; the average frequency of main line services is now about 25 per cent less than before the war, while a further reduction in long-distance trains, in restaurant and sleeping cars was announced on Wednesday.

Despite the very considerable achievements made this year in the organisation of the supply of transport, which

will undoubtedly enable a heavier load to be carried this winter than last, the rationing of carrying capacity has not yet been carried very far. Indeed, inland transport is still far from being as efficiently managed for war conditions as ocean transport. True, the problem of inland transport is more complex than that of shipping, where the supply could be organised by requisitioning, and the demand by agreement between the Ministries concerned. But the difference is merely one of degree; fundamentally, the two problems are similar. Many of the seemingly insuperable obstacles in the way of pooling and allocating domestic carrying capacity are found, upon examination, to rest on the inability to cast off pre-war conceptions of transport. Once rail, road, coastwise shipping and canals are regarded as so much more or less interchangeable carrying capacity—as they now are—the remaining difficulties are mainly administrative; again, there is no reason why it should be assumed that the public, which willingly accepted the rationing of the essentials of life, would object to a severe curtailment of unnecessary movement both of persons and of goods, or to the loss of its peacetime right to choose by what means its goods should be carried. A good deal, then, remains to be done before transport can be said to be organised for war. The demand for carrying facilities must be treated like the demand for other scarce commodities. This task is the Government's rather than the Ministry of War Transport's. But the supply must be organised by the Ministry to maximise carrying power with the existing equipment. This inevitably involves a limitation of the consumer's choice of the means by which he or his goods are to be conveyed; and, by hypothesis, it involves the allocation of transport by clearing offices which combine the railway station, the haulier's, the coastal shipowner's and the canal operator's office.

While the rationing of the demand for transport is essentially a wartime expedient, the pooling of its supply may permanently alter the organisation of Great Britain's communications to the benefit of the public. It has, in fact, many features that could be retained with advantage. In particular, it may pave the way towards a state of affairs when the guiding principle of the whole transport industry will be to do the nation's carrying at the lowest real cost to the community, rather than to ensure the financial independence of each branch and of every firm inside each branch.

Diamond Shares

THE current revival of Stock Exchange interest in diamond company shares, as in oil shares, is a recognition that the depressing effects on earning power of the events of the earlier part of the war—particularly the sealing up of the European market—had been over-discounted. Diamonds, the text-book example of value as a scarcity function, rank under modern conditions among industry's indispensable raw materials, but for really handsome profit returns the trade is still dependent on the "luxury" demand for jewels. The outbreak of war cut off both kinds of market inside the area ringed by the British blockade, and worse was to come when the German conquest of the Low Countries deprived the industry of irreplaceable skilled cutters, of whom only a handful escaped to carry on their trade in the free area.

Recent company reports, however, have shown that wartime limitations on the industry's scope are by no means incompatible with a reasonable rate of profit, which has so far been high enough to enable the industry's largest undertaking to meet its preferential dividends and may even suffice for future equity payments. It is this possibility that explains the recrudescence of semi (and rather more than semi) speculative stock market interest.

De Beers Consolidated Mines last paid a dividend on its deferred shares in respect of the year 1937. The company's capital has a higher gearing than the proportions of its £2,000,000 of preference to £3,181,973 of deferred shares would suggest, for the preference shares are entitled to a cumulative annual dividend of 40 per cent. In recent periods of depression, arrears of preference dividend have tended to accumulate, and have formed a fairly heavy first charge on the fruits of returning prosperity. In the two years 1936 and 1937, for example, the company paid out as much as £5,200,000 in preference dividends. During the ten years to 1940, the deferred shares received only a single payment.

Through all the difficulties of the last three years, however, the company has been able to avoid the piling up of any substantial amount of new preference dividend arrears, and the declaration of a full twelve months' dividend, earlier this year, brought payments to June 30th last. A final half-

year's declaration is expected in the near future, and the question which chiefly concerns the market is whether surplus earnings will be sufficient to induce the directors to resume dividends on the deferred shares.

Some light is thrown on this problem by the following table, which analyses the receipts, expenses and dividends of De Beers for 1929-30 (the last year of outstanding prosperity) and for every year from 1937 to 1940:—

DE BEERS: RECEIPTS, EXPENSES AND DIVIDENDS
(Amounts in £'000)

	Year to June 30, 1939	Years to December 31			
		1937	1938	1939	1940
Receipts:					
On Diamond Account	3,263	2,537	656	1,065	1,534
Int. & Divs. on Investments	503	844	954	754	484
Realized Profits on Investments	18	85	2	6	38
Total (Including other Revenue)	3,798	3,479	1,623	1,825	2,057
Expenses:					
Mining	1,430	821	805	755	452
General	229	69	80	116	126
Interest on Leased Co.'s Capital	96	96	96	96	131
Income Tax	303	220	8	55	150
Total	1,974	1,215	993	1,026	844
Earned for Dividend	1,824	2,264	630	799	1,213
Paid on 40% Cum. Pref.	800	2,000(a)	400	800	800(b)
Earned for Deferred (%)	37.6	9.2(c)	Nil	Nil	Nil
Paid on Deferred (%)	Nil	30	Nil	Nil	Nil

* Including Net Farming and Railway Accounts, and Debenture Service of £147,000 in 1930, and Nil since 1935. (a) 2½ years' arrears. (b) Payment of further £800,000 last May, brought all payments up to date, to first half of 1941. (c) Equivalent to 54.1%, allowing single year's preference dividend.

Although the major part of the company's receipts is "on diamond account," interest and dividends on investments (the nature of which is indicated below) make an extremely important subsidiary contribution. Indeed, the company is able to meet its expenditure on charges account, on dormant mines, on leased companies' interest, etc., out of revenue from investments in other than diamond mining and diamond dealing companies. Net cost of production on

diamonds, therefore, is merely actual mining expenditure, which is very low in relation to the value of the product. Between 1938 and 1940, revenue from interest and dividends was nearly halved, but, even so, it was almost as high in 1940 as in 1930, although receipts on diamond account were only half as great. A second factor of inestimable value for shareholders is the reduction made during the past decade in expenses, which in 1940 were only about two-fifths as high as in 1930. Thus, earnings available for dividend have been steadily increasing since the depressed pre-war year, 1938, and were last year only approximately £600,000 lower than in 1930, although total receipts were over £1,700,000 lower.

The figures in the table epitomise the changes of a decade which, structurally, has been by far the most important in the history of the industry. At the end of the disturbed period caused by the development of new diamond fields in the early 'thirties, the ascendancy of De Beers was re-established, but the company's finances have been considerably depleted by the buying up of new production. The apparatus of control, however, had been made watertight, and the Producers' Association allocating quotas and the Diamond Trading Company acting as its counterpart on the distribution side. The Diamond Corporation, whose capital is entirely held by De Beers and affiliated producers, contracts for the purchase of all important production outside South Africa.

De Beers itself, in addition to its own properties, has control of Consolidated Diamond Mines of South-West Africa. In normal times, this is a particularly important interest because of that company's low production costs, which contrast with the high costs of other controlled mines like Premier and New Jagersfontein, where operations have for some time been suspended. In brief, De Beers, as leader in a tightly organised industry, is interested directly in some of the most profitable production in South Africa, and indirectly in important and rapidly developing production outside that area, particularly in West Africa. Actually, as the next table shows, De Beers' outside interests, on a conservative balance sheet valuation, stand at a figure more than twice as great as those of the company's own properties.

DE BEERS: ASSETS, DECEMBER 31, 1940

	(£'000)

Finance and Banking

November Making-Up

The clearing banks have been engaged in their end-November making-up this week, and conditions in the money market have been patchy. At no time, however, has the available volume of credit been inadequate for the needs of the market, though borrowers have had to search for their accommodation with rather greater assiduity than is now customary. The banks have had their position eased by the fall from £50,000,000 to £15,000,000 in the payments of Treasury deposits expected from them this week. As may be seen from the Bank of England return, however, it is not from the deposit banks, but from the Bank of England, that the Exchequer has during the past week derived the bulk of the resources required to finance the current deficit. Government securities have risen by £19,805,000, indicating heavy ways and means borrowing. Public deposits, for their part, have been kept at an exceptionally low level, falling by £829,000 to £9,790,000 over the week to last Wednesday. Bankers' deposits have thus felt almost the full impact of the expansion in bank cash, and are up by £16,381,000 to £136,429,000. The

The last £1,000,000 of the balance of the purchase price for the Diamond Corporation holding has now been written off out of the De Beers balance sheet, which, financially, is immensely strong, with reserves and carry forward of £5,783,000 against a share capital of £5,182,000 with no debentures. The company, clearly, is well equipped to withstand recurrent periods of depression, but its own prosperity remains bound up with the diamond trade. In wartime, an important part of the industry's bread and butter must come from the demand for industrial stones, extensively used in machine tools for munitions. Demand from Britain, the Empire, America and Russia has naturally increased, but prices have not been raised since the war. In this direction, De Beers is reaping the reward of its foresight in taking a substantial holding, during the depression of the early '30's, in the Société Minière du Beceka in the Congo, whose deposits, the richest in carat content in the world, are mainly suitable only for industrial purposes.

The stones which pay producers best, however, are neither industrial diamonds nor even the large "gems" which to-day are in relatively good demand in the United States. The most important section of the industry in peacetime depends on the mining, cutting and sale of the smaller stones displayed in jewellers' shops. To-day, though the necessary diamonds are available, they cannot be cut by the skeleton labour force available in South Africa, England and the United States. Thus, even if a further increase in prices occurs, the industry's profits, for the war's duration, will be limited, less by lack of demand than by inability to produce ample supplies in saleable form.

For shareholders, therefore, the prospects may favour a moderate rise in divisible earnings without justifying anything remotely resembling a share boom on the Stock Exchange. For the fairly conservative investor, the £2 10s. preference shares of De Beers, which at £12½ yield 7.9 per cent, have a certain interest. The dividend appears to be well covered by current earnings, and in the past preference shareholders have always received their dividends sooner or later. The appeal of the £2 10s. deferred shares, which stand at £10½, is mainly speculative. If net earnings returned to the 1937 level (which was nearly twice that of 1940) they would represent something over 50 per cent on the deferred shares. It may, however, be questioned whether, in the most favourable wartime circumstances, the board would be ready to pay out much more than the 30 per cent distributed for 1937. Investors who desire to participate directly in any further improvement in the industry's fortunes may find a less speculative equity in the ordinary stock of Consolidated African Selection Trust. This company, which owns low cost properties in West Africa, has a negligible preference capital, which, in the year to June 30, 1940, took less than £20,000 out of total earnings of £276,000. Profits fell off markedly in 1939, but showed a considerable recovery last year. On the last payment of 10 per cent, tax free, the 5s. units of ordinary stock, at 17s. 3d., yield 2.9 per cent, tax free. The accounts for the year to June 30th last are due to be published in the near future.

The True Circulation

The current Statistical Summary of the Bank of England brings up to date the data required to arrive at an estimate of the true circulation of notes and coins in the hands of the public. The essential information, showing

changes since the outbreak of the war, over the twelve months to last October and over the latter half of that period, is given in the following table:

In Million £'s							
Average of	B. of E. Notes	Scottish & Irish Notes	Coin	Total Out- standing	B. of E. Reserve	Held by Banks	Net Circ.
Aug., 1939.....	551	46	80	677	32	162	483
Oct., 1940.....	631	58	89	778	33	175	570
April, 1941.....	641	60	93	794	22	173	599
Oct., 1941.....	731	69	95	895	46	184	665

The main features brought out by the above table are the acceleration in the expansion of the circulation over the six months to October and the fact that the circulation of coin and the holding of cash by the commercial banks have increased much more slowly than the total circulation in the hands of the public. In the 26 months of the war, the net circulation has increased at the average rate of 17.5 per cent per annum; over the twelve months October, 1940, to October, 1941, the rate of increase was 16.6 per cent per annum, and over the six months to October, 1941, it was 22.2 per cent per annum. The amount of coin outstanding has hardly altered over the last six months of this period. The commercial banks' holdings of till money have risen by a mere 5 per cent over the twelve months to October. The relative stability of the coin circulation and of the banks' till money suggests very strongly that special factors unconnected with the normal expansion in the demand for currency have played some part in the recent increase in the circulation. The use of notes for hoarding purposes, for black market dealings and for tax evasion in commercial operations would all rank in this category.

Indian Capital Repatriation

The reaccumulation of Indian sterling resources, after the encroachment of last February's vesting order, is making spectacular progress. By November 7 last the sterling balances and securities of the Reserve Bank of India had risen to £174,000,000, as compared with £130,000,000 a year previously, and this despite the fact that over the intervening twelve months £90,000,000 of Government sterling debt has been repatriated. The Government of India is losing no reasonable opportunities of utilising this steadily increasing reserve of liquid sterling to repay sterling debt. At the end of this year between £3,000,000 and £4,000,000 will be utilised to pay off stockholders of the Assam Bengal and the Bombay Baroda railways, whose contracts will then terminate following the notice given twelve months ago by the Government of India. Similar notice to terminate contracts has recently been given in respect of the Bengal and North-Western Railway and the Rohilkund and Kumaon Railway companies. This will take effect at the end of 1942 and the purchase price payable by the Government for these two undertakings will be in the neighbourhood of £12,000,000. The bulk of the capital invested in these railways is held in the United Kingdom. Such operations do little more than nibble at the edges of the current expansion in India's sterling reserves, and the stage must clearly be in course of preparation for a more ambitious programme of sterling debt repayment.

United States and Mexican Silver

Whatever doubts there may be about the precise nature of the agreements reached last week between the United States and Mexico, there appears to be no lack of clarity in the arrangements made for the stabilisation of the Mexican peso, and for continued American purchases of newly-mined Mexican silver. The stabilisation agreement earmarks \$40,000,000 of the US Stabilisation Fund for use in stabilising the dollar exchange value of the peso. Since the beginning of this year the Mexican peso has been held steady at a rate of about 20.50 cents in New York, as compared with the previous nominal parity of 27.75 cents from which it began to decline in 1938. The intention is to keep the rate stable at the new *de facto* parity. That task should be considerably facilitated as a result of the parallel agreement by which the US Treasury undertakes to purchase from the Mexican Treasury up to 6,000,000 ounces of newly mined silver monthly. The agreement has been made on a month-to-month basis, and the price to be paid by the United States will be determined daily by the Secretary to the Treasury. The latter provision amounts to no more than stating that the price paid for the silver will be the official buying price for imported metal, which is, indeed, liable to modification without notice, but which, in fact, has remained

stable at 35 cents an ounce since July, 1939. The proposed maximum scale of purchases should absorb some 85 per cent of Mexico's current output of silver, and provide Mexico with some \$250 millions a year. The implications of this agreement for the silver market are considerable, and its impact would have been more apparent but for the insulation and isolation of the sterling price of silver which are bound to obtain given the present restrictions on the import and export of the metal. The undertaking by the US Treasury to purchase the bulk of the silver mined by the largest producers in the world provides an implied guarantee of the maintenance of the US silver buying programme which, for what it is worth, has been welcomed by the markets in London and Bombay.

Irish Banks' Returns

The returns for the banks operating in Eire for the September quarter, published by the Currency Commission, are as follows:—

(£000)					
	Sept. Quarter, 1940	June Quarter, 1941	September Quarter, 1941		
			In Eire	Else where	Total
Liabilities:					
Capital reserves, etc.	17,572	17,599	10,379	7,236	17,616
Notes in circulation	11,599	15,421	5,282	8,649	13,931
Current deposit and other accounts	170,963	181,139	134,325	52,199	186,524
Other liabilities	6,196	7,182	5,769	1,749	7,518
Total	206,331	219,341	155,755	69,835	225,590
Assets:					
Cash & Balances with London Agents and other Banks	26,174	28,599	9,074	18,642	27,717
Money at call and short notice	9,799	12,514	...	12,433	12,434
Bills	5,367	4,930	4,205	555	4,761
Loans and advances	73,436	68,445	45,324	22,161	67,485
Investments: (a) Government	72,549	85,582	6,713	86,432	93,145
(b) Others	10,264	10,100	4,155	5,890	10,045
Other assets	8,739	9,171	5,207	4,796	10,003
Total	206,331	219,341	74,679	150,911	225,590
Excess of Assets outside Eire over Liabilities outside Eire	66,300	76,847	...	...	81,076

The same trends that have been apparent since the outbreak of war continue. The increase of deposits and the diminution of loans and advances are signs that money is being kept idle for lack of profitable investment outlets in Eire; for many firms the replenishment of imported stocks has proved impossible and unusually large resources are therefore accumulating in the banks. All the bills, both in Eire and elsewhere, are in respect of private transactions, no Government bills being held. The slight reduction in liquid assets has been caused by the purchase of Government securities, the average yield on which is far from satisfactory from the standpoint of the banks' profits. The increase in the banks' net sterling assets, which reflects the reduction of imports resulting from the war, is not regarded with universal satisfaction in Eire as there is a fear that the pound may suffer further depreciation. Eire is not in the position to use these accumulations of sterling to redeem outstanding external loans for the simple reason that no such loans exist.

Repatriating Argentine Debt

The domestic debt conversion operation recently announced in Argentina is being made the occasion for a substantial repatriation of Argentine debt held in this country. The peso loans in question are held to an appreciable extent by British institutions—mainly insurance companies—and have already been registered with the Bank of England in accordance with the Defence Regulations. The bondholders, offered the option of conversion or repayment in cash, are bound, under the Defence Regulations, to accept the latter. In order to facilitate the completion of the necessary arrangements, the Treasury have recently vested these securities, requiring that they be delivered to the Bank of England or to the Buenos Aires office of the Bank of London and South America, and announcing that payment for them is to be made in sterling at prices ranging between £5 17s. 9d. and £5 19s. per 100 pesos. The Treasury will thus come into possession of the pesos when the bonds in question are repaid and will utilise those pesos as an offset against the sterling which Argentina is accumulating here on its Special Account. There can be no doubt that over recent months the balance of payments between Argentina and the sterling area has turned appreciably in favour of the former and the coming operations will thus prove a useful means of helping to restore the equilibrium.

Investment

Re-investment in Equities

Four weeks ago, it was possible to draw attention to a rather sharp rise in medium-dated Government stocks, with an accompanying appreciation in second and third line fixed interest securities, and to suggest the possibility that any further rise in equities in the immediate future would owe a good deal to the upward pull of lower interest rates. Since then, however, a considerable change has occurred in the direction of price movements. The investor has gone first after frankly speculative overseas investments, and more recently into industrial leaders at home, while fixed interest stocks have been relatively neglected, and the Funds themselves have fluctuated very mildly and virtually without trend. Owing to seasonal influences, such as the anticipation of reinvestment of the dividend on Old War Loan, November normally witnesses a fairly marked rise in fixed interest stocks. This year, the tendency should have been accentuated by the impending payment on vested South African stocks, as well as other influences mentioned last week, but the rise has been negligible. To explain the lack of resilience by the savings drive will not suffice, for last year, when the improvement was well up to standard, over £300 millions was lent to the Government in various forms, and the contribution outside the floating debt was very substantial. Such information as is available suggests that a rather higher percentage of money seeking investment is going into equities than was the case, say, a year ago, but it is commonly stated that the absolute amount involved is not really large. It is possible that an increasing proportion of the money which would normally go into the Funds is being retained in more liquid form. Moreover, more people are talking of buying equities as an inflation hedge than at any time since the imposition of EPT at 100 per cent.

Test for Cheap Money

A continuance of the movement of money seeking investment into equities is only justified if four conditions are granted. These are that the Treasury has no effective means of forcing up the price of Government securities; that it has no further rod in pickle for the equity holder; that it will—freely or under pressure—relax the rigours of EPT, and the system of controls within a short time after the cessation of hostilities; and that the rise in commodity prices will continue. Granted these conditions—or rather a belief in their existence by an influential body of investors—there is at least a possibility that the classic experience of a switch from fixed into variable dividend securities will occur years rather than months before the improvement in equity earnings materialises. Indeed, once the investor is convinced that a very considerable rise in prices is inevitable, it will be difficult to find sufficiently potent expedients under conditions one and two, provided he is assured of the eventual operation of condition three. The failure of the Government to prevent the rise in wages, and in particular the granting of a new minimum wage for agricultural labour, is certainly making an impression. The speech of Mr Hudson was particularly unfortunate in this respect, and its effects have been only partially offset by the assurances of the Secretary of the Department of Overseas Trade. It is true that gilt-edged stocks actually improved in value during the last two years of the Great War, when the controls were rudimentary compared with those now in existence. But it is also the case that the knowledge of the public with regard to the effect of rising prices was then at least equally incomplete, and that the great rise in commodity prices came later. There is a possibility, if no more, that we are at a point where the cheap money policy will cease to be fully effective even under the favourable conditions of a closed capital market.

Harland and Wolff Introduction

The decision to permit dealings in the 5,200,000 "A" shares of £1 in Harland & Wolff is an event of some importance. The shares were issued in part satisfaction of debts under the reconstruction scheme of 1937, and holdings were "blocked" for the time being. The shares passed to financial institutions, which would not normally hold such securities, and the present boom in shipbuilding is

doubtless considered a favourable opportunity for exchanging into something more suitable. The shares actually rank as non-cumulative preference up to 4 per cent, with a right to participation up to a total of 6 per cent. They are a first charge on distributable profits, and have ranking after them £1,796,082 of "B" capital, which constitutes the real equity. For the two years 1939 and 1940, 6 per cent was paid on the "A," and 4 per cent and 6 per cent respectively on the "B." The latter had risen during the year from 10s. to 17s. 6d., and improved a further ninepence on the news of the placement. The original price of offer was 17s. 1½d., plus stamp and fee, which would amount to about 22s. 6d. on a hundred shares. The amount to be placed in the first instance is not known, but is said to be large, while it is likely that, provided market conditions continue favourable, holders of three-quarters of the whole amount are at present considering a sale. Too much importance ought not to be attached to the rise of a shilling in the price of the "B" shares as an indication of the ultimate value of the "A." It is rather more to the point that the latter received an independent valuation of 17s. some time prior to the introduction—that is to say, a valuation reached on the basis that there was no market for them. The rise in shares of shipbuilding companies is, of course, a reflection of the wartime boom, but a continuance of prosperous conditions after the war will depend upon a number of factors whose relative weight is not easily assessed. Air transport is likely to make inroads into passenger and mail traffic, but against this it may, perhaps, be assumed that there will be some increase in international trade over the very low level of the immediate pre-war years. Whether this country will increase, or even retain, its share in the new building which peace will call for is uncertain. Against this, the immediate prospect is for a maintenance of the 6 per cent dividend which would give a yield of £7 per cent at the present price.

Company Notes

B.A. Pacific Higher Earnings

The Buenos Ayres and Pacific accounts for the year ended June 30th last make, on the whole, a rather better showing than any of the other major lines. Thanks to a recovery in wheat traffic, and further development of the carriage of petrol and potatoes, total gross traffics are higher on the year. Increased fuel costs and a larger charge for track maintenance have raised expenses, after repeating the allocation of £250,000 to deferred renewals, while the exchange loss is again increased. These rises are, however, in part offset by smaller depreciation of currency floating assets and the net amount available for interest payments is slightly higher. Even so, it fails to cover even half the amount due for interest and the debit balance is further increased. The principal items for the past three years are set out in the following table:—

	Years ended June 30th,		
	1939	1940	1941
Goods traffic	4,609,435	4,458,944	4,726,258
Total gross traffics	6,563,161	6,233,643	6,594,100
Working expenses	4,952,629	4,776,476	5,168,456
Expense ratio	75.46	76.62	78.38
Exchange differences ..	706,589	643,672	664,538
Depreciation of currency assets	88,626	108,393	39,282
Interest earned	131,931	149,778	149,725
Available for interest ..	947,248	854,880	871,549
Interest charged	1,773,570	1,808,587	1,838,041

Carry forward..... Dr.6,531,985 Dr.7,485,692 Dr.8,452,184

Considerable economies were achieved by the use of diesel cars, but there are growing difficulties in oil supplies, and the company is increasing its use of wood to relieve the coal shortage. In general, the picture presented by the report and the chairman's address is one of a modest improvement in strictly internal trade, relieved to a considerable extent by a good external demand for meat and dairy products. There is, however, a danger that shortage of plate will restrict the canning industry. As to the more

distant future, road transport is regarded as an ever-growing menace, and the chairman is not able to make any forecast of results for the current year.

Consolidated Gold Fields

The reports of *New Consolidated Gold Fields* and *Consolidated Gold Fields* for the year to June 30 last make more encouraging reading than those of the previous year despite a further fall in the profit of the former company from £739,218 to £723,501. A continued appreciation of investments during the past year has provided an unrealised profit and permits the provision of only £100,000 for depreciation against the exceptionally large sum of £1,370,000 in 1939-40—of which £1,000,000 was drawn from reserve. Thus, a net decline in accumulated earnings of £720,993 is converted into an addition of £218,739, which compares with £248,634 earned in 1938-39. Since the ordinary dividend is raised from 8½ to 10 per cent, of which only 9.5 per cent is provided by current earnings, the carry forward is reduced from £162,625 to £152,141. *Consolidated Gold Fields* distributes its entire revenue of £353,824, against £345,210, in dividends, ordinary shares receiving 10 per cent as before, less tax at 6s. 11d., so that the carry forward is unchanged at £9,673, whereas last year it was substantially reduced.

	Years ended June 30th,		
	1939	1940	1941
<i>New Consol. Gold Fields</i> :—

Carry forward	39,602	9,673	9,673

† Liability for South African taxation only. * Same for both companies, except in 1940, when 8½ per cent. on ordinary was paid by New Consolidated.

It is probable that the rise in working costs reported by many of the gold mining subsidiaries played a considerable part in causing the further fall in the income of *New Consolidated*, which the profits on the sale of holdings were not able completely to offset. The further decline in the balance-sheet valuation of investments at or under cost from £6,608,183 to £6,477,508, coupled with the rise in British Government securities from £639,370 to £806,900 and the directors' assurance of market appreciation, indicates the sale of a considerable volume of mining and oil producing securities. It is to be noted that, while full provision was made for an unrealised loss existing at June 30, 1940, no credit has been taken for appreciation since then, which a year ago was already some £2,000,000. Thus, the fact that the reserve remains at half that figure is no indication of the true position. Possibly the board are doubtful as to the maintenance of existing values. Cash holdings have increased from £1,087,773 to £1,455,372, thus offsetting a decline in debtors from £448,148 to £314,707 and a rise in creditors from £816,789 to £1,029,512. The *Consolidated Gold Fields* £1 ordinary shares, at 45s. 7½d. ex dividend, yield £4 7s. 8d. per cent.

Anglo-Iranian Report

The full accounts of Anglo-Iranian for 1940 depart from the company's established practice in that they show total income after royalty to the Iranian Government, as well as after depreciation and administrative expenses. Consequently, the latest figure of £5,826,191 compares with £4,951,964 in 1939, instead of with the previously disclosed figure of £7,722,778 before payment of the royalty of £2,770,814. Since it is generally understood that a new agreement between the company and the Government of Iran was arrived at after the end of the previous accounting year, according to which royalty payments in respect of the years 1938-41 should be based on the payment for 1937,

there is every reason to suppose that last year's payment was substantially above that disclosed for 1938. Indeed, it was estimated in *The Economist*, August 31, 1940, that a retrospective payment of £1,000,000 would be due in respect of the years 1938 and 1939, and that, for each of the two following years, total royalty could hardly fall below £4,000,000. In any case, it is clear that gross income must have recovered substantially last year, since royalty charges and a rise in taxation of over £1,000,000 to £2,975,156 have been met with, as was estimated in a note on the preliminary statement in *The Economist*, November 22, 1941, a decline in equity earnings only from 7.6 to 6.4 per cent. The following table analyses income and allocations over the past three years :—

	Years ending December 31st,		
	1938	1939	1940
Total income	10,583,985	7,722,778	15,826,191
Royalty	3,307,479	2,770,814	†
Taxation	1,157,029	1,955,605	2,975,156
Extra depreciation	602,602	571,250	625,000
Fees	10,000	19,000	9,126
Prof. dividends (gross)	1,071,234	1,071,234	1,071,234
Ordinary stock :—			
Earned (gross)	4,435,611	1,313,874	1,115,675

Carry forward	625,552	962,551	1,101,351

† After royalty payable to Iranian Government.
‡ Not disclosed.

The balance-sheet shows a decline in refinery and tank installations of £804,313 to £6,857,745, due, as is pointed out in the statement of the chairman, Sir William Fraser, to the minimisation of new construction during the war. Stocks have fallen from £2,427,567 to £1,696,773, while both creditors, including taxation, and debtors rose substantially, the former by £5,151,587 to £16,178,626, and the latter by £1,642,631 to £5,747,652. All these changes provide a hint that sales were considerably higher last year. Sir William Fraser points out that it is impossible to ascertain the position regarding investments in enemy-occupied territory, and that, in consequence, substantial additions have been made to reserves. Despite this, investments in and advances to subsidiary companies are valued at £20,816,926, against £20,174,971. Holdings of British Government securities are up from £1,837,596 to £3,590,387, and of cash from £4,264,633 to £4,646,213. The report suggests that ordinary stockholders are again likely to receive 5 per cent, but no more in the current year. More distant prospects are governed by the future of the royalty agreement, as well as by the progress of the war. The £1 ordinary stock, at 47s. 6d., ex dividend, yields £2 2s. 1d. per cent.

Odeon Theatres

The full accounts of Odeon Theatres for the year to June 21st last show a rise in total profits from £477,493 to £647,315. This suggests that the income of the circuit was not appreciably affected by the widespread bombing of the winter of 1940-41. The failure to make a payment on ordinary capital for the second year in succession is due partly to the rise in tax provision from £150,000 to £325,000 and partly to the necessity of allocating £65,000 for war damage contribution and £14,470 against £12,334 for ARP. Thus, equity earnings are down from £92,495 to £22,231 and, in the absence of any transfer to reserve, which received £50,000 in the previous year, or of any reduction in outstanding preliminary expenses, which were written down by £36,000, the carry forward is raised from £74,661 to £96,892. The management is clearly wise to conserve this sum for the present. The improvement in receipts since the early months of the current year suggests that, in the absence of further sustained bombing, revenue may again rise substantially in the current year and may even outstrip rising charges. The balance sheet shows a further deterioration in the company's liquid position, the deficit in current liquid assets rising from some £342,000 to some £593,000. Here the most important factors are the jump in creditors from £387,163 to £701,503, while debtors have risen only from £118,338 to £213,875 and the increase in reserve for taxation and war damage contribution from £71,545 to £354,724. Cash holdings are up from £118,393

THERAPEUTIC RESEARCH CORPORATION OF GREAT BRITAIN LIMITED

1. The purpose of this announcement is to inform the Medical, Dental, Veterinary, Chemical and Pharmaceutical Professions that a group of the leading manufacturers of medicinal products in this country has formed an organization for the more effective prosecution of research in their industry.

2. This organization will be known as the

THERAPEUTIC RESEARCH CORPORATION OF GREAT BRITAIN LTD.

(subsequently referred to as the T.R.C.) and a private limited liability company with an authorized capital of £500,000 has been registered accordingly. There will be no public issue of capital.

3. The principal objects of the T.R.C. are :—

(a) To provide for the co-ordination and extension of research in matters of common interest with a view to accelerating the discovery of new substances for the service of therapeutic and preventive medicine ; to ensure proper collaboration with medical, dental and veterinary practitioners in the introduction of new medicinal substances and to assist in the advancement of the art of medicine by the subsidization of research on a broader and more rational basis than has so far been possible in the British Pharmaceutical Industry.

(b) To provide for the pooling of manufacturing facilities, where desirable.

(c) To enable the industry to co-operate more effectively in national planning by presenting to the Government through its appropriate medical, dental, veterinary, scientific and technical organizations the pooled knowledge and facilities acquired by the constituent companies in the field of therapeutic research.

4. The constituent founder Companies of the T.R.C. are :—

BOOTS PURE DRUG COMPANY LTD.
THE BRITISH DRUG HOUSES LTD.
GLAXO LABORATORIES LTD.

MAY & BAKER LTD.
THE WELLCOME FOUNDATION LTD.

They will subscribe the capital of the Corporation as and when required in equal amounts.

5. The Board of the Corporation will consist of the Chairmen or Managing Directors of the constituent Companies.

The registered offices (pro tem.) of the Corporation are at :—
183, EUSTON ROAD, LONDON, N.W.1. (Telephone : EUSton 4477)

All communications should be addressed to the Secretary.

to £357,632. Against this there is a modest reduction in mortgages and secured loan, while an additional £245,000 net has been devoted to financing subsidiaries. The total of fixed assets is some £30,000 higher at £3,997,764. The 5s. ordinary shares now stand at 7s. 6d.

Rhoanglo Dividend

The preliminary statement of *Rhodesian Anglo-American* for the year to June 30th last announces a final payment of 3½ per cent less tax at approximately 6s. 3d., making a total of 6½ per cent against 9½ per cent in the previous year. Net profits, after debenture service and general expenses, but before income or directors' additional remuneration, amount to £391,000 against £520,000. Last week's announcement of a final *Rhokana* dividend of 15 per cent, making 30 against 40 per cent for the year, made inevitable a further reduction in the *Rhoanglo* dividend. Since *Rhodesian Anglo-American* owns 54 per cent of the capital of *Rhokana Corporation*, one of the most sub-

stantial Rhodesian producers, and is interested through this holding in *Mufulira*, its revenue is necessarily reduced by the passing of the *Mufulira* dividend and the 10 per cent cut in the *Rhokana* payment. In fact, it appears that the failure of *Mufulira* to make any payment in 1940-41 against 11½ per cent in the previous year, which represented some 7.2 per cent on the *Rhokana* ordinary capital, was the main influence responsible for the cut in the *Rhokana* and so in the *Rhoanglo* dividend. In the absence of the accounts of the two operating companies, it is impossible to say whether the setback is due more to the weight of Imperial taxation or, as with *Roan Antelope*, to unexpectedly low copper sales. In the case of *Rhoanglo*, as a purely holding company, there is no liability for I.T. Consequently, it is probable that the current dividend is narrowly covered by equity earnings and involves no draft on the previous year's carry forward of £333,846, which had been reduced from £332,079 since 1937-38. The *Rhoanglo* 10s. ordinary shares were unchanged on the announcement at 15s., at which they yield £4 10s. 5d. per cent. The *Rhokana* £1 ordinary shares stand at 160s.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

The initial successes of the Imperial forces in Libya were received with considerable satisfaction in the markets, and the tone before the week-end was distinctly firm. Early in the current week, lack of fresh decisive developments and the renewed threat to Moscow induced rather quieter conditions. With most stock in short supply, however, prices in the industrial market continued to advance strongly, but interest in gilt-edged issues market remained at a low ebb.

Activity in the gilt-edged market was slight both before and immediately after the week-end, and prices generally were unaltered. On Tuesday, some small declines occurred in dull trading. Local Loans and 3 and 4 per cent Funding all losing ½, while 3 per cent War Loan declined ½. Five per cent Conversion, however, improved ½. Later gilt-edged issues remained unchanged, while demand for India loans brought higher prices. In a rather more active foreign bond market, Brazilian bonds enjoyed mild support in the earlier part of the current week, although Chilean issues were out of favour. Japanese issues were bought before and after the week-end, the 5½ per cent loan, 1930, gaining 3 points on Monday. The next day most issues fell on profit taking, but the rise was resumed in midweek. Chinese bonds were persistently strong, the 5 per cent loans of 1912 and 1913 gaining 2½ and 1½ points respectively on Monday. The following day the 1913 loan advanced a further point, when the Boxer loan rose the same amount. Three and a half per cent Egyptian preference advanced a point, on Monday, on the Libyan developments. Elsewhere, prices were mainly unchanged.

While the volume of business in the home rail market declined at the week-end, the upward trend of prices was resumed at the reopening. On the previous Friday, GW ordinary rose ½, Southern defd. ½ and Southern prefd. ½, while LMS ordinary improved ½. On Monday, LMS ordinary and Southern defd. both gained ½, and London Transport "C" stock, ½, but the following day most junior issues fell back. Thus, GW ordinary and Southern prefd. lost ½, LMS ordinary ½ and Southern defd. ½. Senior issues, however, generally remained steady. Lack of support in midweek led to minor declines in some of the junior issues. After closing quietly before the week-end, a slightly easier tendency developed, in the early part of the current week,

among South American rail issues. Central Argentine was out of favour, 6 per cent "C" preference falling a point on Monday, while later small losses predominated. Elsewhere, Canadian Pacific ordinary lacked support before and after the week-end, but the preference stock gained ¼ on Monday and the previous Friday.

The industrial market continued to monopolise attention, and with stock in short supply, prices, despite some profit-taking, generally advanced. Numerous gains of 1s. reflected a strong demand for brewery issues, Meux, Barclay Perkins, and Guinness all rising this amount on Monday. Quiet but persistent support for aircraft and motor issues occasioned numerous small gains, among which Rolls-Royce, De Havilland and Joseph Lucas were prominent. Iron and steel issues were firm, Harland & Wolff "B" ordinary gaining 1s. and Hawthorn Leslie 9d. on Monday. The following day interest centred on the marketing of Harland & Wolff "A" ordinary shares, whose price remained unchanged at 17s. 1½d. throughout the day, although the "B" issue eased 3d. Among shipping issues Cunard was sold in a small way. In the textile group, Patons & Baldwins improved ½ on Monday when Courtaulds reacted. Later, prices were mainly steady. Considerable support for stores issues resulted in many good gains, among which Harrods, J. Barker and Maples all advanced 1s. before the week-end, while Great Universal Stores rose the same amount on Tuesday on the doubling of the interim dividend. Tobacco issues were in demand, Carreras advancing ½, and Gallaher ½, on Monday. The next day BAT gained ½, and Gallaher ½, while Imps and Godfrey Phillips both improved ½. Among miscellaneous issues, Boots, Dunlop and Lever & Unilever were all in demand. Reduced activity in midweek was associated with some weakness, but there were a number of rises, and the undertone remained firm.

The kaffir market closed firmly at the end of last week, West Wit Areas and Daggafontein gaining ½ among other small improvements. Prices continued to rise on Monday, but the undertone was weaker, and, the following day, turnover was much reduced. Cape buying raised Crown Mines by ½ and Geduld by ½, but most changes were against holders. The small turnover in the rubber market had little effect on prices. On Monday, tea issues were strong, Deundi advancing 9d. and Empire of India, 6d. Leading issues in the oil

market were prominent before the week-end with good advances, Burmah rising ½, Anglo-Iranian ½, and "Shell" Transport ½. At the reopening, the same issues all advanced ½ in a firm market, and despite a slightly easier tendency the next day, Anglo-Iranian and Burmah both improved the same amount. Canadian and Mexican Eagles were also in demand. Later the rise in teas continued briskly, but in oils and rubbers the rate of advance slackened, while Kaffirs were quietly steady.

New York

WHILE the cessation of the coal strike has given rise to some satisfaction on Wall Street, the labour situation in general continues to exert a depressing influence on dealing. This was more than sufficient to offset the news of the British offensive in Libya, and markets continued cautious and narrow. Selling for tax purposes was well in evidence throughout the earlier part of the current week, while on Tuesday prices eased over a wide front pending Congressional action on price control legislation. These factors continued to operate in midweek, causing further slight declines.

Cotton Trade Labour

The labour situation in the Lancashire cotton industry is becoming more serious than ever. The problem is most acute in the spinning branch and for some time the limited yarn production has resulted in a scarcity of supplies. The execution of Government contracts is now being affected and some method of securing more operatives will have to be found if the war effort is not to be injured. Since the concentration of production scheme began to operate it is estimated that about 8,000 operatives have been lost to the industry. Some of these have gone into munition works and others into the Forces, but a considerable number of married women are now staying at home. This development has been partly due to the higher wages now earned by the husbands. For several weeks there has been a drive to induce these former workpeople to return to the mills but the success achieved has been very limited. On Monday the Cotton Board is holding a special conference in Manchester of employers, trades union officials, managers of labour exchanges and representatives of the Control to discuss the position. Another effort will be made to obtain the necessary labour on a voluntary basis, and if that fails, an attempt will be made to get operatives who have gone into other jobs to come back to the mills. Yarn output is now being affected by sickness due to weather conditions. Another cause of absenteeism is that when men in the Forces come home on leave the women in the households take several days' holiday. A solution of this problem will not be easy to find, but it is a matter of national importance and the reduction in the output of cotton goods is having serious consequences. It has been suggested in some quarters that longer hours should be worked in the mills, but this is the wrong time of the year for such an innovation; when it was tried on a previous occasion, production began to fall off after a short time.

* * *

Standardisation of Electrical Equipment

One of the most important forms of economy is that obtained by standardisation. An important step in this direction is embodied in the Control of Machine Tools (Electrical Equipment) (No. 1) Order, 1941. The flow of production of machine tools has hitherto been hampered by the special specifications required by particular users and by the widely varying conditions imposed by local electricity supply authorities. The Order therefore provides: (1) that all such electrical equipment manufactured in the United Kingdom after January 1st, 1942, shall comply with British standard specifications; (2) that indicating instruments shall not be fitted unless they are essential to the efficient operation of the tool; (3) that electricity supply authorities shall not refuse to supply electricity to users requiring to start, direct-to-line on a 3-phase system, a motor of capacity not exceeding 5 h.p., or requiring to use on such a system a squirrel cage motor of a capacity not exceeding 30 h.p.; (4) that no person shall, by virtue of any contract, be entitled to demand delivery of electrical equipment produced by a specified maker or of a specified brand, or to require the equipment to be subjected to any test other than is necessary to establish compliance with British standard specifications. Tests required by the machine tool makers are exempted from this provision. These regulations should remove wasteful friction, especially when reinforced by the new area organisation set up by the Director of Industrial Electrical Equipment. The primary purpose of this organisation is to give advice and assistance to war factories in matters of damage to electrical equipment by enemy action. Each defence area has its electrical adviser, with a number of electrical engineers available as his assistants. Not the least valuable feature of this organisation will be a survey of the electrical repair capacity and of the stocks of electrical equipment which could be called upon in an emergency. As it may be assumed that the results of this survey will be available for use in other emergencies than those caused by direct enemy action, it should mark a decided step towards the more advantageous use of tools.

Copper in America

Last summer, this year's American copper consumption was estimated at 1,800,000 short tons; but since supplies (inclusive of 600,000 tons of imported copper) were then expected to reach only 1,600,000-1,650,000 tons, the Office of Production Management introduced a priorities system

on August 6th. It has since become apparent that the official estimate of supplies had erred on the side of optimism, and that they would amount to about 1,500,000 tons, including 500,000 tons from abroad. In order to ensure supplies for essential purposes, the Government has decided to curtail civilian consumption still further, to encourage domestic production by subsidising high-cost mines, and to stimulate output in countries exporting to America by an increase in prices. One of the measures taken to economise domestic consumption is the prohibition of non-essential building. Subsidies to domestic high-cost producers will be on a "cost plus" basis; in some cases this may put the price up to 16 cents per lb., or one-third above the official price of 12 cents per lb. Lastly, the American Metal Reserve Company's buying price for imported copper—mainly from Chile, Mexico and Peru—has been raised to 11.25 cents per lb., f.a.s. New York, compared with 10.0 cents per lb. last summer. While the steps taken to increase supplies are likely to become effective early next year, it is probable that, before long, the growing defence requirements will involve a further curtailment of civilian consumption.

Malaya's Duty on Tin Ore Exports

On page 637 of the *Economist* of last week, reference was made to a resolution sent to the Colonial Secretary by the Tin Producers' Association, calling for the repeal of the Malayan tax on exports of tin ore to non-Empire countries. It was stated that, while the export tax was a discrimination against non-British buyers and, hence, contrary to the principles of the Atlantic Charter, the imposition of an import duty on refined tin by America after the war would be a similar infringement and would prejudice the tin-smelting industry in other countries. It is as well to make explicit what was implied in last week's note—namely, that by the 1938 trade agreement between the United Kingdom and the United States, refined tin enters America duty-free. The retention of this clause in future revisions of the trade agreement is an essential part of the very strong case for the repeal of the Malayan Duty.

* * *

West African Cocoa

In the colonial debate, the Under-Secretary of State tried to clear up some of the mystery that has surrounded the Government's West African cocoa transactions. Last year's cut in the West African grower's price, together with the increase in the wholesale price in Britain, implied that some Government department was making a profit; nor was suspicion dispelled by the ambiguous statements made by Lord Moyne. Mr George Hall's statement last week should, however, clear the Cocoa Board of the charge of profiteering. He explained that the Ministry of Food, which bought the crop in the first war year, made a loss on its transactions. The Cocoa Board, which then took over the business, naturally expected an even bigger loss in 1940-41, because of the disappearance of the European market in the meantime. Actually, however, owing to a bigger market in America and the availability of shipping, most of the 1940-41 crop was sold, and, after writing off the loss during 1939-40 and taking into consideration the cocoa in store, the Board has a surplus of about £1,300,000. It does not appear, however, that this profit will immediately be handed back to the growers or spent for their benefit. The sum will be held in reserve in case a shortage of shipping prevents sales from covering the increased buying price in the current year. Thus, although the Cocoa Board is not profiteering, it can hardly claim to be generous in its price policy. Nor are the African growers, who resented bitterly the fact that they were not consulted over last year's price reduction, likely to be convinced by the pious hope that eventually they will receive any profits that are made by the Board, on which, incidentally, they are not represented—although their old antagonists, the West African buying firms, are. And what still remains obscure is the position of the Ministry of Food. This department buys from the Cocoa Board and sells to the wholesalers at an increased price, and it was recently announced in Parliament that, as a result of the £10 per ton increase in its selling price, it made a profit of about £382,000 from October, 1940—June, 1941. It has been suggested that this profit is being used to subsidise other British foodstuffs. Surely this is unfair so long as the grower is receiving less than his pre-war price—itsself a depression price. The sums involved would not matter a farthing to the British taxpayer; but they would make a great deal of difference to the African.

COMPANY MEETINGS

OTTOMAN BANK

REVIEW OF PAST YEAR'S OPERATIONS

MAINTENANCE OF LIQUIDITY

FACTORS AFFECTING DIVIDEND DECISION

GOOD RESULTS OF BRANCHES

SIR HERBERT LAWRENCE'S ADDRESS

The annual general meeting of the shareholders of the Ottoman Bank was held on the 26th instant at Winchester House, Old Broad Street, London, E.C.

General the Hon. Sir Herbert A. Lawrence, G.C.B., presided. Mr W. Stewart McKim (secretary to the London Committee) having read the notice convening the meeting.

The chairman said: Ladies and Gentlemen, I am informed that the requisite number of shareholders with the necessary shareholding are present or represented in accordance with the requirements of the statutes of the bank. The report and accounts have been circulated among you, and I presume that it will be your pleasure that they be taken as read.

This meeting has been convened much later in the year than has been our past custom, the reason for which is, of course, the great delay in communication with Turkey and the Near and Middle East generally. I do not propose, in the present circumstances, to make my usual somewhat detailed survey of the conditions in the various countries where the bank is established, but will confine my remarks to some comments on the accounts and a mention of the chief events affecting our operations.

THE ACCOUNTS

The accounts, which are now before you, and which I shall later ask you to approve, indicate the continuance of the policy of maintaining liquidity required by world conditions.

Of the total assets of the bank at the 31st December, 1940, which are shown in the balance sheet as £28,749,583, it is satisfactory to note that only a small proportion is represented by assets in occupied territory. As an instance, I can quote the cash in hand and at bankers and the money at call and notice, which amount together to over nine million pounds. Less than 10 per cent. of this sum represents funds held by branches in territory now occupied by the Axis Powers. Moreover, according to the returns we have received, this position has not been achieved by any reduction of the liquidity position in those countries, and any cash there was of course held by these branches in the ordinary course of business as a counterpart to their liabilities to depositors.

RESULT OF YEAR'S WORKING

The profit and loss account, after covering all charges and expenses and providing for all known bad and doubtful debts, shows an available balance for the year of £64,165 15s. 7d. This figure represents only profits which have been transferred, or are readily transferable, into sterling.

The non-transferable earnings, which are not included in the above result, represent as they did last year, an appreciable amount and, added to previous accumulations, constitute a useful addition to our reserves against any contingencies which may arise in the future.

DIVIDEND DECISION

As stated in the report, the Committee do not recommend the payment of a dividend this year, but propose instead that the profits, which, including the amount brought forward from 1939, total £109,284 1s. 11d., be carried forward to the current year.

This proposal is necessary because of the impossibility of ascertaining the value of assets in France (and now, of course, in Greece also). So far as exchange risk is concerned, the situation is favourable, since our franc assets do not exceed our liabilities

in that currency. Moreover, provisions have been made in the past which afford considerable protection against such losses as may eventually arise.

The only other feature in the accounts to which I need refer is the continued increase in the deposits, the current accounts creditor having grown by a further two million pounds to the figure of £20,448,963, which can be taken, I think, as reflecting the continued confidence of the public in those countries where we are established.

SATISFACTORY BUSINESS IN TURKEY

Turkey has remained outside the sphere of hostilities, and the economic situation there in 1940 was very satisfactory. There were two periods of difficulty, in June and November, arising from the extension of the war to the Mediterranean, but these only served to emphasise the solidarity of the banking system of Turkey. External trade was naturally affected by the international situation, but, as imports decreased more than the exports, there was a favourable balance of trade of forty-two and a half millions of Turkish pounds as against nine million two hundred thousand in 1939 and an unfavourable balance of four million eight hundred thousand Turkish pounds in 1938.

Crops were good and prices maintained, in spite of the prohibition, imposed in September, 1940, of the export of many agricultural products. The working results of our branches in Turkey, although less than those of the previous year, remained satisfactory, but have not been transferred. Our relations with the Turkish Government, the High Administrative Departments and the banks continue cordial and confident.

PROSPERITY IN EGYPT

In Egypt 1940 was a period of prosperity. Money flowed into the country as a result of the purchase of the cotton crop by the British Government and the expenditure of the British Military Authorities. The demand for credit facilities was heavy, as, in order to purchase abroad, importers had to make large use of bankers' credits. Moreover, goods took a long time to arrive. Again, export bills, which formerly reached their destination and were accepted in a few days, now took months to arrive. Our branches took their share in this business and their results were very satisfactory.

IRAQ AND IRAN

Events in the Mediterranean resulted in a reopening of the transit trade of Iraq, goods passing through for Palestine, Transjordan, Syria, Egypt and Turkey. The date crop was abundant. The cotton crop was all sold to Japan, and cattle and sheep, no longer being sent to Syria, found a new market in Palestine.

In Iran, our branches, though foreign exchange business remained strictly controlled, made good profits, but those profits cannot be transferred into sterling. However, in both Iraq and Iran, events of 1940 have now receded into the background in view of the military operations of 1941, which have changed the whole situation in those two countries.

PALESTINE AND CYPRUS

In Palestine the position of the citrus industry remained serious owing to the lack of shipping and, with a view to keeping the industry alive, an arrangement was made between the Govern-

ment and the banks under which a Government guarantee was given covering the bulk of advances, on a restricted scale, to carefully chosen borrowers. Documentary credit business increased for the same reason as in Egypt. Prices rose steadily and the presence of British Forces contributed to the prosperity of local commerce.

In the first part of 1940 Cyprus enjoyed prosperity, but the entry of Italy into the war, with its consequent shipping difficulties, caused a big falling off in trade. The Government assisted by purchasing caroubs, raisins and wine at fixed prices, but no such help was possible to the citrus industry, which suffered severely. The potato crop was disposed of to the troops in Egypt and Palestine. Our branches had a successful year, but the effects of the falling off in trade will be felt in 1941.

AFFILIATED BANKS

As regards our affiliated banks, the Banque Franco-Serbe in Yugoslavia, the British-French Discount Bank in Greece and the Bank of Roumania in Roumania, are now in occupied territory, although they were not so in the period under review, but we have of course no reports from them of their position.

The recent occupation of Syria by British and Free French troops has led to an active resumption of relations between London and the Banque de Syrie et du Liban, but I have as yet no details available of the working of that bank in 1940.

With regard to your Committee, we have, of course, been out of communication with our Paris colleagues since I last addressed you, but we trust all is well with them. They cannot exercise their functions outside France, but that being so, we are informed that no objection will be raised in this country to the re-election which I shall mention in a moment.

THE LATE SIR JOHN HEWETT

In September, 1941, the General Committee suffered a grievous loss in the death of Sir John P. Hewett, G.C.S.I., K.B.E., C.I.E., who had been one of their number since 1913. I should like here to pay tribute to the many qualities which made him not only a successful administrator, but also the sincerely admired friend of all those who came into contact with him.

The Members of the Committee who have to retire under the statutes are Le Baron Hottinguer, le Comte Pillet-Will and myself, all of whom are eligible for re-election.

TRIBUTE TO MANAGEMENT AND STAFF

As regards the management and staff of the bank, I will only say that they continued to render loyal service, overcoming by their increasing efforts the depletion of their ranks and the various other difficulties of wartime banking. To all those members of the staff who are serving in the various forces you will, I am sure, join with me in sending our best wishes.

I now beg to move, ladies and gentlemen: "That the report and accounts now read be received and adopted." Before I put this resolution I shall be happy to answer any questions.

Mr A. G. A. Jamieson seconded the resolution and it was carried unanimously, no questions being asked.

The chairman next proposed the re-election of the retiring directors, Monsieur Le Baron Hottinguer, General The Hon. Sir Herbert A. Lawrence and Monsieur Le Comte F. Pillet-Will.

This was seconded by Mr A. C. Gladstone and unanimously approved.

Mr Gordon L. Jacobs proposed a cordial vote of thanks to the chairman, directors, management and staff for their services during the past year, and this was seconded by Mr A. Bradbery and unanimously accorded.

A brief acknowledgment by the chairman concluded the proceedings.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes.

In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever.

Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brettenham House, Lancaster Place, London, W.C.2.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

EFFECT OF RISING COSTS ON THE INDUSTRY

The annual general meeting of shareholders of Johannesburg Consolidated Investment Company, Limited, was held on the 25th instant in Johannesburg. Mr. G. H. Beatty, who presided, said: The position disclosed in the directors' report and accounts is satisfactory. The strong financial position of the company is fully maintained. The liabilities amount to £1,611,074, which, deducted from the total book value of the assets of £9,157,970, leaves a surplus of assets over liabilities of £7,546,896.

The net profit amounted to £530,689, which with the balance of £95,207 brought forward made available an amount of £625,896. £395,000 was declared in dividend, leaving a balance of £230,896 to be carried forward.

WORKING COSTS

Working costs have increased as a result of the abnormal conditions prevailing, and it is feared that the increase will continue. Working costs per ton milled during the third quarter of this year were 21s. 2d., while the figures for the corresponding quarters of the two previous years were 20s. 6d. in 1940 and 19s. 3d. in 1939. A material increase in working costs is a serious matter not only for the industry but also for the country. The increase of 1s. 11d. per ton has not only correspondingly reduced the profit which can be made from each ton of ore milled, but has raised the pay limit by .23 of a pennyweight and thereby decreased the tonnage payable.

It was the increase in tonnage which became payable because of the lowering of the pay limit which gave rise to the prosperity of the post gold standard years. It was this increase in payable tonnage which enabled the industry to expand production until it is now distributing in costs nearly double what it was distributing in 1932, but with a rising pay limit the whole process will be reversed. The fall in the pay limit which took place during the post gold standard years resulted from an increase in the gold price arising from world conditions out of this country's control. Any rise in the pay limit which results from an increase in working costs is to some extent within the country's control and to that extent should be strenuously resisted. With the tremendous effect which the falling pay limit has upon the whole well-being of the country fresh in our minds, it is possible to realise the contrary effect which a rise in the pay limit must have and the vital necessity of doing everything to prevent it. Some increase in working costs is unavoidable in war time, but it is still within the power of the Government to offset much of it. The ill effects of a vicious spiral of rising costs are nowhere greater than in a country such as this, whose wealth is so largely based on the possession of marginal gold ore. Nowhere, as the experience of the past seven years has proved, does a descending spiral benefit a country more generously.

TAXATION AND FUTURE OPERATIONS

The only change in direct taxation of the gold mines, which incidentally was a severe increase, was the imposition of a further 5 per cent. tax on working profits which brought the special contribution to 16 per cent. on working profits. It may be instructive to look ahead and estimate what effect such heavy taxation will have on the future scale of operations. With taxation at the present level the time must be near, if not already reached, when the consulting engineers will be unable to recommend the spending of any capital on developing new mines, which if the country is not to suffer must be ready to replace the old ones. The average recovery of the Witwatersrand mines is just over 4 pennyweights per ton, and in the new areas of the West Rand it costs about three million pounds to bring a mine to production on a scale of one million tons per annum. It has been calculated that such a mine, with taxation and costs at present levels, cannot be financed economically unless recovery of at least 5.8 pennyweights per ton can be expected. As this recovery is of a category of which only two examples are on the Witwatersrand it can be seen that the present scale of taxation must almost entirely prohibit the development of new properties.

The report and accounts were unanimously adopted.

ANGLO-DUTCH PLANTATIONS OF JAVA, LIMITED

MR W. H. DAUKES'S REVIEW

The thirty-first ordinary general meeting of the Anglo-Dutch Plantations of Java, Limited, was held, on the 25th instant, in London, Mr W. H. Daukes (chairman and managing director) presiding.

The chairman, in the course of his address, said: The net revenue received from the Java company amounted in 1940 to £377,009, compared with £371,569, and in emphasising the heavy figures of taxation, I do not wish for one moment to convey the impression that we are cavilling at the amount, but these figures have to be borne in mind when making comparison of one year with another.

Turning to the revenue account in our London balance-sheet, the balance left over amounts to £322,314 12s. 2d.; £57,253 6s. 4d. was brought forward from last account, leaving a total amount to be dealt with of £379,567 18s. 6d. An interim dividend of 2 per cent. was paid on February 21st last, and as soon as the directors realised that there would be a considerable delay in the presentation of the accounts, they declared a second interim dividend of 4 per cent., payable on August 8th, intimating at the same time that this would take the place of the usual final dividend.

Provision for national defence contribution to the amount of £19,500 has been made in the revenue account, an amount of £25,512 was deducted for income-tax from the first interim dividend and £60,000 from the final dividend of 4 per cent.; these, with the further amount reserved in the appropriation account, make a total of £230,012, in addition to the £19,500 national defence contribution.

TEA

As far as the Netherlands East Indies is concerned, the year 1940 was not a satisfactory one for the tea producer. In 1940 our planted area was 26,952 acres, all of which was in bearing with the exception of some 67 acres. The total manufactured crop was 12,168,238 lb., which included 408,015 lb. of bought leaf, the actual estate production being the equivalent of 437 lb. per acre. The higher cash cost in terms of sterling at 8.16d. per pound, compared with 6.60d. in the previous year, was due partly to the smaller crop but mainly to the fall in sterling exchange from 8.35 guilders to the £, the average exchange rate for the year 1939, to 7.53 for the year 1940. The selling price also showed a small decrease from 10.17d. to 10.01d. per pound. As a consequence of these various factors, the gross profit at F.943,192 showed a substantial decrease from that of the previous year of F.1,509,000. As regards the prospects for the current year, these are distinctly brighter.

RUBBER

Rubber throughout 1940 was a favourable market, the London price for standard smoked sheet varying little from about 1s. per pound throughout the year, the highest price being the June average of 1s. 1½d. and the lowest April average of 11½d. The quota releases were on a steadily ascending scale. From 75 per cent. for the last quarter of 1939, the quota was raised to 80 per cent. for the first half-year of 1940, 85 per cent. for the third quarter, and 90 per cent. for the last quarter of that year.

Our total planted area in 1940 amounted to 39,618 acres, of which 14,235 were not in bearing. Our standard production was 19,571,733 lb., and the local exportable percentage average 77½ per cent. Our standard yield per acre in bearing was 771 lb., and the year's production amounted to 15,425,012 lb., a yield of 608 lb. per acre. Notwithstanding the fall in the value of sterling, the cost price at 3.44d. per pound, was only fractionally higher than that for 1939 at 3.39d., the smallness of the increase being entirely due to the very much larger crop. On the other hand, selling price showed an advance of over 1d. per pound at 9.02d. per pound net compared with 7.95d. In viewing the selling price in comparison with the London price figure, the heavy incidence of export tax, freight and insurance must be borne in mind.

The profit for the year was a very satisfactory one, the gross profit increasing from F.1,700,000 to F.2,800,000. As regards the prospects for the current year, all conditions seem to indicate an excellent result.

The report and accounts were unanimously adopted.

KALIDJEROEK RUBBER COMPANY, LIMITED

HIGH INCIDENCE OF TAXATION

MR VERNON WETHERED'S SPEECH

The thirty-first ordinary annual general meeting of Kalidjeroek Rubber Co., Ltd., was held on the 25th instant at 58 Mark Lane, E.C., Mr. Vernon Wethered (the chairman) presiding.

The chairman, in the course of his speech, said: From the profit and loss account you will have observed that proceeds from rubber, cinchona and coffee amounted to £54,078, which, after adding sundry receipts, interest and discount—£765—makes our gross revenue £54,843. Expenditure in Java was £26,994, and London expenses and provision for depreciation of buildings and machinery required £1,892, thus making the total expenditure of £28,886. In addition, it was necessary to reserve £16,400 for taxation in the East, and a further sum of £2,000 for taxation in the United Kingdom. Thus from the gross profit of £25,957 taxation at home and abroad takes no less than £18,400. I would here mention that were taxation in the East less onerous it would make little difference to the final results, as what was not taken in taxation in Java would have been payable to the Exchequer here, our Standard for E.P.T. having been fixed at £7,696.

PROVISION FOR MAXIMUM ASSESSMENT

These reserves for taxation make full provision for the maximum assessment we are likely to receive. However, it is possible that the full amount would not be required. In my address last year I mentioned with regard to cinchona, which also is a controlled commodity, that our standard production assessment had been increased and made retrospective to 1937. Part of the deliveries of cinchona bark made by us during the past two years were in respect of the years 1937 to 1939. Consequently the revenue from these retrospective deliveries does not properly belong to our last financial year and we intend to reopen our accounts for taxation purposes for some years back. This will involve an increase in our income tax liability for those years, but as the rate of tax then was lower and as there was no EPT for those years, on balance there will be a considerable saving.

Despite the excellent crops of rubber and cinchona, harvested at low cost, the directors find themselves unable to maintain the dividend of 8 per cent., less tax, paid on the ordinary stock account 1939-40. We are recommending that 8 per cent., less tax, be paid on the preference stock and 7½ per cent., less tax, on the ordinary stock. This slightly reduced dividend affects individual stockholders very little, as when 10s. is deducted for income tax it means that the total sum received by the stockholders is reduced by only £225. Nevertheless, I think you will agree that the stockholders are not getting the return that should be expected from their valuable and cheap working properties.

LIQUID ASSETS

The accounts are drawn up in the usual clear manner and call for little comment. I would, however, point out that, after providing for the dividend we recommend paying, liquid assets exceeded all ascertained liabilities by £21,500, or, say, the equivalent of £5 10s. per planted acre. This might be considered a reasonable margin in normal times, but when we visualise the possibilities of the post-war period, when stocks of rubber in America and elsewhere accumulated for war purposes may have to be liquidated, it would appear to be wise to build up reserves against such an eventuality. Unfortunately, the present high incidence of taxation does not permit this, if we continue to pay reasonable returns to the stockholders.

This brings me to another important matter which will have to be allowed for in the accounts of the coming years, that is, the replanting of our oldest rubber. Of the 2,044 acres planted, no less than 1,364 acres are at least 20 years old. Part of it exceeds 30 years of age, and is thus past its economic life. These older gardens will have gradually to be replaced by trees of high yielding stock, and provision will require to be made for the cost of this work and bringing the gardens to maturity.

The report and accounts were unanimously adopted.

MALAYALAM PLANTATIONS, LIMITED

The twentieth ordinary general meeting of Malayalam Plantations, Limited, was held, on 26th instant, in London, Mr H. J. Welch (the chairman) presiding.

The following are extracts from the chairman's address circulated with the report and accounts:—During the year the company produced nearly 3,000 tons of rubber and over 5,000 tons of tea—both war necessities—it provided £205,000 in British and Indian taxation, and 25 of our European staff out of a total of 59 have volunteered or have been requisitioned for H.M. Forces.

Our total profits for the year amounted to £336,049. After providing for the year's dividends totalling 10 per cent., we propose to add £15,000 to the general reserve and £10,000 to dividend equalisation reserve.

The surplus of liquid assets amounts to £476,630, or £11 13s per planted acre. The net cost of the planted tea, rubber and cardamom areas, including the buildings, machinery and equipment, now stands in the balance-sheet at the record low figure of £32 13s per acre.

In the current year we estimate to produce over 11,000,000 lbs. of tea and about 6,000,000 lbs. of rubber, of which we anticipate over 9,000,000 lbs. of tea and the whole of the rubber crop will be exportable. Most of the exportable tea up to December 31st this year has been sold to the Ministry of Food at a reasonably remunerative price.

The report was unanimously adopted.

CRAIGIELEA RUBBER PLANTATIONS, LIMITED

The meeting of Craigielea Rubber Plantations, Limited, was held, on the 21st instant, in London. Major W. M. Sime, O.B.E., J.P., chairman of the company, presided. The chairman's review of the year's operations, circulated with the report, stated: Our profit at £59,742 compared with £45,418 last year. Last year we had to set aside £24,000 for taxation, but this year we have to find no less a sum than £41,000.

Your directors regret that the net profits will not permit them to recommend the payment of a dividend equivalent to that paid last year; £3,000 has been set aside as provision for deferred replanting. Owing to a shortage of labour we have considered it necessary to limit our replanting programme.

The item "Interest and Dividend" in the profit and loss account includes a dividend of 7½ per cent. on our investment in Middleton Plantations, Limited, in respect of the year ended March 31, 1940. I mentioned last year that the Excess Profits Tax falls heavily on young developing companies like Middleton. Owing to the heavy provision of taxation which it was necessary to make for the year ended March 31, 1941, the directors of that company have only been able to recommend in respect of that year a dividend of 5 per cent.

The report and accounts were unanimously adopted and the proposals for the conversion of the issued shares of the company into stock were approved.

ROAN ANTELOPE COPPER MINES, LIMITED

The fourteenth annual general meeting of Roan Antelope Copper Mines, Limited, was held on 26th instant, in London. Mr A. Chester Beatty, the chairman, presided.

The following are extracts from the statement by the chairman which was circulated to the stockholders with the report and accounts for the year ended June 30, 1941, and was taken as read: After transferring £200,000 to replacement reserve, the profit, before providing for taxation, is £1,158,506 compared with £1,623,243 in the previous year. The amount required to meet the company's liabilities for taxation is £730,000, equivalent to approximately 63 per cent. of our net profit.

In the accounts to June 30, 1940, we set aside the full amount of our tax liability calculated at 8s. 6d. in the £, which was the standard rate of tax in force at that time. The Budget of April last increased the rate of tax to 10s. in the £. Under the Income Tax Acts this is the rate applicable to our profits for the year

to June 30, 1940, and therefore we have had to provide in the present accounts an additional £118,000 to meet that liability.

After transferring £100,000 to general reserve and providing for the interim and final dividends for the year, there remains a balance of £174,819 to be carried forward, as against £202,075 in the previous year. Expenditure on capital account during the year was £197,890. This was mainly on European and native housing, and a third reverberatory furnace.

During the year the company contributed £5,000 to the Governor of Northern Rhodesia's "Speed the Planes" Fund. It has also paid to the Treasury the sum of £300,000 as a loan without interest, and £190,000 as an advance against taxation liability both here and in Northern Rhodesia.

The report and accounts were adopted.

LAKE VIEW AND STAR, LIMITED

MR D. CHRISTOPHERSON'S STATEMENT

The thirty-first ordinary general meeting of Lake View and Star, Limited, was held, on 25th instant, in London, Mr D. Christopherson, C.B.E., the chairman, presiding.

The following are extracts from the statement by the chairman which was circulated to the shareholders with the report and accounts for the year ended June 30, 1941, and was taken as read:—

The net profit for the year under review was £465,293, which compares with £551,606, the net profit in the previous year, after allowing for development expenses written off in the appropriation account. The reduction of £86,313 is mainly due to higher wages granted by the Western Australian Arbitration Court and the rise in the price of stores due to the war, also to the lower net value received for gold due to the full effect of the Commonwealth Gold Excise Tax having operated throughout the year.

After providing £230,000 for British and Australian taxation and £41,407 for depreciation of plant and machinery, there remains a balance of £193,886, to which is added £19,950 brought forward from last year, making a total available balance of £213,836.

Two dividends of 12½ per cent. have been paid during the year, and the directors recommend the payment of a final dividend of 25 per cent., less tax, making the total distribution 50 per cent. for the year.

Taking into consideration the rise in costs and the difficulties under which operations are carried on owing to the shortage of skilled labour, the result must be considered very satisfactory.

The ore reserve position is again one of great strength. During the year, although we extracted 689,577 tons, reserves were further increased by 276,000 tons, and now amount to a total of 4,130,700 tons, averaging 5.17 dwts per ton.

At the Chaffers plant 690,694 tons, averaging 5.09 dwts., were treated with an extraction of 89.7 per cent., both grade and tonnage showing a slight reduction on last year's figures.

Costs for the year amounted to 22/10.45 shillings sterling, or an increase of 2/7.21d over the previous year. Higher wages and increasing cost of all materials account for part of this, and though every effort has been, and is being, made to offset such increases by mechanical assistance and improvements, and simplifications in transport and treatment of ore where possible, there is, of course, a limit to what can be done, and a further increase during the present year must be expected.

The new Chaffers retreatment plant commenced operations in October, 1940, and by June 30, 1941, has treated 552,874 tons for a recovery of 8,854 fine ounces of gold. Values here are expected to improve in the future, as the lowest grade material lies in that part of the dump now being worked. This plant has proved a complete success and more than justifies Mr Thorn's original estimates.

The call to the armed forces and to new equipment concerns has taken many of our skilled underground men, and while new men are being trained to take their places there has naturally been a falling off in certain directions in the amount of work that can be undertaken. In this connection we have just received the following from Mr Thorn:—

"Labour conditions becoming more serious and we are compelled train new men who have little knowledge of mining. Labour

PARNALL AIRCRAFT, LIMITED

BURDEN OF E.P.T.

The sixth annual general meeting of the Parnall Aircraft, Limited, was held, on the 28th instant, Sir Louis R. Vaughan, K.C.B., K.B.E., D.S.O. (the chairman), presiding.

The chairman, in the course of his statement, said: An examination of the balance-sheet will show the continued expansion that has been made during the past twelve months.

The profit and loss account shows that the net profit on trading amounts to £95,315, which figure has been arrived at after estimating the Excess Profits Tax commitments of the company in accordance with the Finance Acts.

As you will see from the report, the directors have recommended the payment of a dividend of 5 per cent. for the year. The directors made an announcement through the Press in May last stating that, in spite of increased turnover and earnings for the first six months of the company's financial year, they were unable to recommend the payment of an interim dividend owing to the incidence of Excess Profits Tax and income-tax. I must again reiterate how hardly present taxation bears on a company placed financially as your company is, especially in view of the demands for production made upon it.

We have had a very difficult year of intensive work and a great task has been achieved in the planning and dispersal of our production. This has imposed very heavy and exacting work on your executives and staff. It has been found advisable to form an executive committee who advise on the managerial direction of the company.

Captain Thompson agreed to become chairman of this committee (and also deputy-chairman of the company), and Mr Healy, our former general manager, has followed him as managing director.

You will appreciate that it is very difficult to foresee the future under existing circumstances. It is not, however, over-optimistic to assume that facilities such as ours will be rapidly absorbed in supplying the civil requirements which will have to be met when this conflict ceases.

The report and accounts were adopted.

MODDERFONTEIN EAST, LIMITED

BURDEN OF TAXATION

Mr W. M. Frames, who, presided at the annual meeting of Modderfontein East, Limited, held in Johannesburg on 20th instant, moved the adoption of the report and accounts.

Commenting on the accounts, the chairman said that the total profit last year was £933,791, of which dividend had absorbed £349,952.

The amount provided for taxation of £435,343 showed an increase of £123,292 compared with the previous year's figure. That increase was due to the higher taxable profit and also to variations in the rate of the special contribution which had been 11 per cent. for the first six months and 16 per cent. for the second six months of the year, as against 9 per cent. provided for the second six months of the previous year.

Provision had also to be made for an additional special contribution of 2 per cent. for the second half of 1939-40 which had been imposed retrospectively after the close of that financial year. There had been an increase of £16,890 in the payment in respect of the lease consideration which had amounted to £130,649.

During the year, the chairman added, developments had been advanced by 40,116 feet. Payable ore developed had shown a small increase compared with the previous year's figure, but the average value had been lower by 0.2 dwts. per ton.

New tonnage had been developed, mainly in the eastern section to the dip of Number 1 shaft, where prospects continued to be favourable. In the northern section exposures, had been poor except for a small extension of payable ore in the vicinity of the eleventh level. In the remainder of the mine shareholders were informed that internal development had continued to expose a considerable tonnage of payable ore.

Capital expenditure during the year had amounted to £14,414.

situation on woodland not good and at present time we are burning Collie coal at Chaffers and Ivanhoe winding plants. Everything at mine and plant operating smoothly."

I am sure you will desire to be associated with the board in extending to Mr Thorn and his staff our high appreciation of the success attained in all departments during the past year.

The report and accounts were unanimously adopted.

NOURSE MINES, LIMITED

SATISFACTORY RESULTS

Mr W. M. Frames presided at the annual general meeting of Nourse Mines, Limited, in Johannesburg, on the 21st instant.

Moving the adoption of the report and accounts the chairman said that the total profit had been £422,116 and dividends had absorbed £176,324.

The amount provided for taxation at £194,152 showed an increase of £71,014 over the previous year.

That was due to variations in the rate of special contribution and to the higher taxable profit earned during the year under review. It also included additional taxation for the year 1939/40 which had been imposed retrospectively after the close of the last financial year.

Net expenditure on capital account amounted to £28,637, the principal items being in connection with additional equipment at the reduction plant, additional compound accommodation, hoisting equipment at No. 3D Incline and the installation of a high-pressure electric cable system with transformers on the 37th level to meet increasing requirements of No. 3D incline and southern section.

Development accomplished during the year totalled 29,066 feet, an increase of 3,108 feet compared with the previous year's figure.

Main development in future would be confined to the area south of Goch Dyke. The ore reserve tonnage which could be developed in that area depended entirely on the rate of sinking of No. 3D Incline. Given normal conditions it was anticipated that two new levels each year could be opened up which with the present percentage of payability could hardly be sufficient to maintain the ore reserve tonnage.

Ore reserve at present, however, was in a satisfactory position and it was expected that with probable small additions in older areas there would be no serious falling-off in tonnage in the near future.

The percentage payability for the year at 57.3 had been slightly higher than for the previous year, the average value being 272 inch pennyweight compared with 258 inch pennyweight for 1939/40. Payable ore developed during the year totalled 682,300 tons of an average value of 4.3 pennyweight ton.

Number 3D Incline had been sunk 723 feet during the year to a point 212 feet below the 44th level and the cutting of a station on the 44th level had been commenced.

A second winding engine at that shaft would be put into commission before the end of the current year.

Principal additions to the reduction plant comprise four Brown tanks, four rotary filters, and new classification plant. The tanks and filter units had been put into commission early in June and residue value had shown immediate improvement, the figure for June being 0.217 pennyweight as against an average for the year of 0.257 pennyweight.

The new classification scheme had been put into commission on September 29th last and residue values averaged 0.181 pennyweight for the last two months.

Available ore reserve as re-estimated at June 30, 1941, totalled 3,912,600 tons of an average value of 4.3 pennyweight over an estimated stoping width of 48 inches. Compared with the position on June 30, 1940, the available reserve was 338,700 tons less and the average value of 0.1 pennyweight lower, the stoping width being unaltered.

The company continued to give full support to the national war effort. Production of gold had been well maintained and as many employees as possible had been released for military service. The company had also undertaken its share in the production of munitions.

The report and accounts were adopted.

Various additions had been made to the reduction plant to permit of increased tonnage being treated and 16 rooms had been added at Number 1 compound to bring accommodation up to requirements.

The available ore reserve as re-estimated at June 30, 1941, had totalled 7,197,600 tons of an average value of 3.8 dwts over a stopping width of 42.5 inches.

The available reserve showed an increase of 350,900 tons compared with the previous year's figure, the average value and width being lower by 0.1 dwts and 0.1 inch respectively.

The company was contributing to the national war effort by every means in its power. As many as possible of the European employees were being released for full-time military service. In addition the company had undertaken, successfully and efficiently, an important share in the production of munitions.

The report and accounts were then adopted.

BLYVOORUITZICHT GOLD MINING COMPANY, LIMITED

ENCOURAGING DEVELOPMENT RESULTS

Doctor Hans Pirow presided at the annual general meeting of the Blyvooruitzicht Gold Mining Company, Limited, held in Johannesburg on the 21st instant. Moving the adoption of report and accounts, the chairman said that net expenditure for the year totalled £249,923, leaving a balance of working capital on June 30, 1941, of £487,974, of which £411,043 had been represented by net cash, including fixed deposits after allowing for liabilities.

The total expenditure incurred from the inception of the company to June 30, 1941, had been £1,962,026. During the year under review No. 1 Shaft had been sunk 2,039 feet and sinking operations had been stopped in June at a depth of 5,042 feet. The shaft passed from dolomite into Black Reef Series at 3,917 feet and from the latter into Witwatersrand quartzites at 3,957 feet. The Carbon Leader had been exposed at a depth of 4,685 feet dipping at about twenty degrees to south. Sampling around walls of the shaft had given an average value of 40.3 pennyweight per ton over width of 27.4 inches. The reef had a well defined mineralised body varying from pebbly grit to true conglomerate and characterised by the presence of seams of carbon with pyrites particularly in the lower portion.

During the year a total of 2,212 feet of development, 2,039 feet of vertical shaft sinking and 108,630 cubic feet of excavation had been done. By the end of the year the fifth level crosscut had intercepted the carbon leader and a small amount of driving on reef had been done. A total of 205 feet had been sampled which averaged 82.5 pennyweight per ton, over a width of 16.6 inches.

Since the close of the year the reef had been intersected and driving had started on the sixth level. Combining the results of all reef development done since the commencement of operations to the end of the last month, gave a total of 1,850 feet sampled, all of which was payable, the average value being 65.0 pennyweight per ton over a width of 14.3 inches equal to 930 inch pennyweight.

After giving details of developments, the chairman said, "The occurrence of these high values is an encouraging feature, strengthening our belief that in due course the mine will become a successful producer."

Unfortunately, due to war conditions and the difficulty of obtaining necessary additional capital or even plant and material required to proceed with the sinking of No. 2 Shaft and its underground development, work had to be limited to the development at No. 1 Shaft for the time being. No work had therefore been done at No. 2 Shaft during the year.

In May last it had been decided to erect a small plant for crushing and treating of ore from development operations. The plant would have a capacity of 8,000 tons per month, and would eventually form part of permanent reduction works. Work in connection with the erection of that plant was proceeding and should no unforeseen delays occur in the delivery of the necessary equipment, it was expected that the plant would be completed early in 1942. Revenue obtained from gold produced by that plant would be applied to cost of development, and would not provide profits for distribution.

The company continued to give full support to the National war effort, and as many employees as possible had been released for military service.

NEW MODDERFONTEIN GOLD MINING COMPANY, LIMITED

ORE RESERVE POSITION

Dr Hans Pirow, the chairman, presided at the annual general meeting of the New Modderfontein Gold Mining Company, Limited, held in Johannesburg, on 21st instant.

Moving the adoption of the report and accounts, the chairman said the total profit amounted to £1,046,977. Dividends absorbed £490,000 and provision for taxation had been £555,945.

As from January 1, 1941, the special tax of 11 per cent. of taxable income before deduction of redemption allowances and losses brought forward from previous years had been raised to 16 per cent.

Available ore reserve at June 30, 1941, had been estimated to be 5,207,300 tons, having an average value of 3.0 pennyweights per ton over a stopping width of 47.1 inches, compared with 6,201,500 tons averaging 3.2 pennyweights per ton over a stopping width of 47.5 inches on June 30, 1940.

Payable ore developed during the year amounted to 665,800 tons valued at 2.6 pennyweights per ton. That represented a decrease of 94,800 tons and an increase in value of 0.1 pennyweight per ton on the previous year's return.

Development had been carried on at all points where it was considered payable values might be encountered. Most favourable results had been obtained on the South Reef and Marker and on N.A. 1 and 2 Leaders. On N.A. 6 and 7 Leaders a moderate tonnage of payable ore had been added to reserves. Development on N.A. 3, 4 and 5 Leaders had shown that only small additional tonnages of payable ore could be expected from these reefs. Development of all those Leaders was approaching completion, and only relatively small areas remained to be proved. It could therefore be expected that the quantity of ore developed on them would continue to decrease in future years.

The area over which the Kimberley and Black Reefs occurred in the company's property was limited to a small section along the southern boundary and south of No. 1 Circular Shaft, and it could not be expected to provide more than a comparatively small tonnage of payable ore. The ore reserve was bound to show further declines each year and would in due course be insufficient to enable both the reduction works to be run at full capacity. In those circumstances it had been decided to commence mining operations in the reef pillar left to support the north mill which was estimated to contain approximately 600,000 tons of ore having an average value of 3.8 pennyweights per ton.

The company continued to give full support to the national war effort and as many employees as possible had been released for military service. The company also undertook its share in the production of munitions.

The report and accounts were adopted.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

EXTRA TAXATION BURDENS

In moving the adoption of the report and accounts at the annual general meeting of the Consolidated Main Reef Mines and Estate, Limited, in Johannesburg on 20th instant, Dr Hans Pirow, chairman, who presided, said that the working profit last year amounted to £793,907 of which dividends had absorbed £343,091.

Total expenditure on capital account had been £64,624, the principal items being additions to reduction plant, enlargement of native compounds and hospital and improvements in underground ventilation. It was expected that capital expenditure during the current year would be on a slightly lower scale.

Provision for taxation at £363,712 had shown a further increase of some £57,000. That was due to the variations in the rate of the special contribution which had been 11 per cent. for the first six months of the year and 16 per cent. for the second six months of the year as against 9 per cent. provided for the second six months of the previous year.

Provision had also to be made for the additional special contribution of 2 per cent. for the second half of the year 1939/40 which

had been imposed retrospectively after the close of that financial year.

The development footage accomplished during the year had shown an increase of 17,621 feet on the figure of the previous year. Although the payable ore had also increased by 410,500 tons, it had been still insufficient fully to maintain the ore reserve position and advantage was being taken of favourable native labour conditions to increase the development footage during the current year.

The ore reserve had been re-calculated as at June 30, 1941, and the available reserve had totalled 10,564,000 tons of average value of 3.6 dwts. per ton.

COMMODITY AND INDUSTRY NEWS

haulage in view of the shortage of transport.

Vegetable Oils and Oil Seeds.—Increased allocations of controlled vegetable oils are being made to the food industries to meet the larger fats ration. Supplies are ample for the purpose. The technical trades are also well provided for. Raw material continues to come to hand from overseas in good volume to enable production of oil to be maintained. The oil seeds market is firm and further advances in shippers' quotations for Indian and Plate linseed have taken place. The surplus of the old crop in Argentina is being reduced. The new crop is progressing favourably and is provisionally expected to yield 1,300,000 tons, against 1,480,000 tons in the previous season. The minimum price of the new crop has been fixed at 9.25 pesos per 100 kilos. In India the outlook for the linseed crop is improved, though more rain is wanted in some districts. Indian ground nuts are in demand and shippers are holding for advanced figures.

Cotton.—Under the new loom licences, many firms have been empowered to continue producing on the same scale as recently, but some nucleus concerns have been subjected to a reduction of about 5 per cent. Firms whose status has not yet been defined have been given licences for a limited number of weeks, and they have been urged to come to some arrangement with nucleus firms. It is not expected that the smaller cloth output will balance the two branches of spinning and weaving and the shortage of yarn shows every sign of continuing. More cases have been reported of cloth exporters having exhausted their quotas and less business has been done. There has been steady buying for the Government in heavy materials and in miscellaneous fabrics for the essential home services. In the yarn section more spinners are now rationing their customers. Some mills that usually use Egyptian cotton are turning on to fine American descriptions.

GOVERNMENT RETURNS

For the week ended Nov. 22, 1941, total ordinary revenue was £33,235,000, against ordinary expenditure of £82,411,000, and issues to sinking funds of £155,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,907,753,000 against £1,604,227,000 for the corresponding period a year ago.

OVERSEA WEEKLY TRAFFIC RECEIPTS

Name

The ROYAL BANK of SCOTLAND

To the ANNUAL GENERAL COURT OF PROPRIETORS, on Wednesday, 26th November, 1941

The Directors now submit to the Proprietors the annexed Abstract Statement of the Affairs of the Bank at the Second Saturday of October, 1941, with relative Profit and Loss Account, certified by the Auditors.

Dividend for half-year paid at Midsummer at the rate of 17 per cent. per annum, required	£361,250	0	0
Less Income Tax	180,625	0	0

It is now proposed to pay a Dividend at Christmas for the second half-year at the rate of 17 per cent. per annum which will require	£361,250	0	0
Less Income Tax	180,625	0	0

There has been written off expenditure on Bank Buildings and Heritable Property	£180,625	0	0
Carried to Pension Reserve Fund	£30,000	0	0
And added to Inner Reserves against Contingencies, the Balance of	30,000	0	0
	70,272	6	7

All the Bank's Investments are valued in the annexed State of Affairs at or under the prices ruling at the date of the Balance. The Directors record with deep regret the death of Mr. Robert Nevill Dundas, W.S., who had been an Ordinary Director from 1929. In virtue of the powers conferred upon them by the Royal Bank of Scotland Act, 1873, the Directors elected Mr. C. Augustus Carlow, Coalmaster, Leven, as an Ordinary Director. Mr. Carlow holds office until this Annual General Court only, but is eligible for re-election. The Governor, the Deputy-Governor, the Extraordinary Directors and the Senior Ordinary Director (Mr. Maitland) all retire at this time, and are eligible for re-election. Auditors also fall to be appointed for the ensuing year, and Mr. George James Gregor, C.A., and Mr. S. W. Murphy, C.A., offer themselves for re-election.

WILLIAM WHYTE,
Cashier and General Manager.

ABSTRACT STATE OF AFFAIRS, at 11th October, 1941

D. SPEED, Chief Accountant

AUDITORS' REPORT

As Auditors appointed by the Proprietors of THE ROYAL BANK OF SCOTLAND, we have checked the Cash on hand at Head Office, Glasgow and London (City Office), the Cash with London Bankers, the Securities for money at call and short notice, the Government Securities and other Investments, and examined the details of the other Assets and of the Liabilities set forth in the foregoing Abstract State of Affairs; and we now certify that in our opinion said Abstract State is a full and fair Balance Sheet, properly drawn up, and exhibiting a true and correct view of the state of the Bank's Affairs, as shown by the books, at 11th October, 1941.

Edinburgh, 11th November, 1941

GEO. JAMES GREGOR, C.A., Auditor.
S. W. MURPHY, C.A., Auditor.

THE ECONOMIST

Target for Tomorrow

THE crisis of manpower has become acute. The Government's plans, announced this week, are intended to allot a station in war work to every man and every woman. Apart from married women, there are no untapped sources of extra labour left of any size ; and the pressing duty, while these changes upon those already employed are being rung, will be to make sure that no hands and no brains are wasted in the Forces, in the Civil Service, or in the war factories. When the last round up is being made in civilian occupations by the new manpower boards—with the limitation of supplies, the policy of concentration and the menace of bankruptcy to squeeze their victims—there will be no small danger that, perforce, labour will be more economically used in non-essential work than in essential. In 1942, the efficient use of labour in national service and in war work will be more crucial than its enlistment ; and the overriding need will be to comb out the war effort itself continuously.

It is no surprise that this crisis has come. It was always plain that the supreme bottleneck in these tiny islands in total war would be manpower; and the fall of France and Hitler's conquest of western and central Europe made it doubly sure. The shortage was delayed, it is true—by the slow progress of the British war effort. A year ago arms output was pinched, not by lack of numbers, but by unambitious planning, by the want of new factories still in building and by the threatened dwindling of material supplies; much more important than the shortage of ships to bring in imports was the shortage of dollars to buy them with. In March this year, the scene was transformed. The German attack on shipping was at its peak, admittedly, but the passage of Lend-Lease by the United States Congress reopened the ocean gates to materials; and a new and extended "budget" for war production brought the Cabinet's programmes nearer to the nation's manufacturing capacity. Not only was a growing proportion of America's 130 millions of population freed by Lend-Lease to aid in their factories the 48 millions of the United Kingdom—and the 20

millions of the white populations of the belligerent Dominions—against the enslaved 210 millions of German Europe. The corollaries of Lend-Lease—air and naval surveillance by the United States navy on the Atlantic and the use and arming of American merchantmen—have also brought American manpower into the shooting war.

But fighting remains, with war work, the principal prerogative of British manpower. The target of this week's "extension of the obligation to national service" is to man and equip great armies. It was officially defined by Lord Moyne in October:

Although the Armed Forces, men and women together, including full-time ARP workers, will next year be about the same as at the end of the last war, figures for those employed on munitions production will be just about double.

Mr Churchill made it still plainer on Tuesday. The arms factories and war plant are now ready, or will be this winter, to supply, with the contribution of the United States, armies on guard at home, in the field, in the Middle East and India ; the Royal Air Force, which will expand most of all ; and the Navy. This country is in the Third Stage of Armament when a great quantity of weapons is at last being produced ; efficiently manned, it can move to the Fourth Stage, which Germany has been in for two years, when all that are wanted can be made. The United States is still passing through the Second Stage, the phase of planning and preparation, when relatively few weapons are produced ; and aid to Russia must retard the flow of American supplies to Britain. For another year, the two tasks of warfare and production are mainly ours. That is why the time has come to throw in our reserves of man-power as we threw in our reserves of dollars a year ago.

It is not a question now of calling the idle to work, though even the most minute remaining pockets of idleness require ruthless pinching-out. Nor is it now a question of surrendering luxuries. It is rather a question of treating as luxuries goods and services—especially ser-

vices and, above all, domestic services—which are normally regarded as necessities. War economy has already put a term to most idle and luxurious living; and the bottom of the reservoir is in sight. The problem now is to make certain that the best use is made of the men and women already in work; and the keynote of the Government's plans is transfer and substitution. Every man and woman, wherever possible, will be promoted nearer to the front line. The backbone of the new policy is the abandonment, by monthly stages, of the schedule of reserved occupations which, by rule of thumb, sorted manpower into sheep and goats, soldiers and civilians, and allowed many indispensable individuals to be swallowed by the Forces, while less useful men were labelled untouchable. The test now, for men and women, will be twofold: whether the jobs they are doing are essential and whether they, individually, are irreplaceable in them. It is the policy of individual reservation which has been called for by some ever since England's war-making became more than a sideline; and it will be applied by manpower boards.

It may be argued that, once again, Ministers have moved too late; that the translation of general industrial registration into effective mobilisation by training and transfer on a large scale should have preceded, and not accompanied, the bottleneck; and that to rely upon the restrictive effect of war economy to press men and women, by unemployment and haphazard bankruptcy, into their right war work was naïvely optimistic. These strictures stand; but now that the process of registration and scrutiny is to be applied to young persons over 16 years of age, to women between 20 and 41 and to men between 18 and 51, the question is rather whether the policy is again, not too late, but too little. Will the workers be brought forward?

Compulsion will now be applied to unmarried women between 20 and 30, mainly to fill 170,000 vacancies in the ATS, but also for civil defence and filling factories; and it will be extended to men between 40 and 51. Conscripts have no choice. They must serve in some war work, and it will be the duty of the tribunals to see, not only that these young women and older men are summoned to the Services as substitutes in static and sedentary posts to free men for the front, but also—which should not be forgotten—that none is taken from essential work to less useful service. It is the area outside conscription (which still applies directly only to the Services) that is most problematical. The crucial task in this, the tightest and most strained stage in manpower policy, is to ensure that those who are not conscripted are directed for certain, with no chance of wastage or evasion, into essential work. Industrial conscription is still avoided, because of opposition by the trade unions; but, conscription or no conscription, the obligation must be surely

laid on every available citizen to do war service; it is the end, not the means, that matters. Compulsion for the Services is not to be applied to wives, and wives with serving husbands or household duties are not to be asked to work away from home.

Nevertheless (as Mr Churchill said) it is in this great field of married women or women doing necessary household work, comprising about 11 million persons, that we see our largest reserves for industry and for home defence in the future.

The test must be, not marital status, but availability and mobility. It is the amenities of home life that must now be eaten into to furnish the war effort with more workers; and the obligation to work must be imposed, as a democratic duty, upon wives without full-time family cares, no less than upon men and spinsters. There must be no escape for young or old, male or female, no privilege, no discrimination, no favour. Manpower is too scarce; and the free women citizens of this country will surely ask no less. The first task is to make ready their places, part or whole time, the second to bring them in, with every care for their welfare, their dependants and their conditions of work.

The doubts about the new plan, then, are about its administration; is the net tight enough? As it stands, it is entirely welcome. To move every available man into the front line of fighters or workers, and to fill his place in the forces, in industry or in business by an older man or a woman, is the common sense way to sharpen the spear against Hitler. But caution is called for. Posts in or near the front line are not sacrosanct; if they are needless or overmanned, in the Services, the Government departments or the war factories, they too must be combed and cropped. Nor is every post in the rear to be lightly abolished. There must be a balance. "If all the efforts of everyone were devoted to making war (the Prime Minister pointed out) there would be no food or fuel, no transport or clothes"; there are jobs outside the Services and the war factories which are essential or which, until an even greater extremity than the present has appeared, are indispensable, and many women in their homes are "ministering to the needs of the active population."

The fair and efficient solution is very simple. It is to judge every job, military or civilian, every case of every individual, every home and every business on its merits—and the new plans may mean just this. The men and women needed must be forthcoming; that is the overriding consideration. It is gain, not loss, to England that the roll of democratic duties has been thus broadened and deepened; but it would be a grievous loss if this vast mobilisation were permitted to run to waste in swollen regiments, inefficient workshops and overstaffed offices. Men and women must be saved, not squandered.

Dirty Work at the Crossroads

JAPAN is proving even more adept than Italy in the art of pre-belligerency. The hour of destiny is always about to strike. Historic decisions are for ever about to be taken. Every phase of emergency is achieved until it seems that no further move is possible in any direction save that of war. Yet again and again the nation is checked on the brink of the final choice. Its leaders halt under the signpost and take counsel. They reiterate that Japan is, indeed, at the crossroads, but they show an obvious hesitation in advancing down any of the diverging roads.

This time it has seemed as though conflict were inevitable. The whole Far East is lying under the dark shadow of immediate war. In Hongkong, all British troops have been recalled to barracks, and those who would not be on duty during hostilities have been advised to leave at once. Large Imperial reinforcements have arrived in Burma. In Singapore and the whole of Malaya, a "state of emergency" has been declared, all British troops are at their war stations and all reservists have been called up. Australia, too, after a meeting of the War Cabinet,

is at its war station. Thailand is calling up reservists, and in the Dutch East Indies the army and air force have mobilised. This picture of Allied preparedness is completed by the appointment of Sir Tom Phillips to be Admiral in Command of the Eastern Fleet and the arrival of the *Prince of Wales* at Singapore.

The week-end hitch in the Washington talks between the United States and Japan was responsible for this sudden deepening of the crisis. Several points in the story are still far from clear. For example, judging by the latitude and exploratory character of Mr Kurusu's mission, there seemed to be no particular reason why the basic disagreement latent in the two Governments' approach should have come to light at this particular moment. For whatever reason, the news that President Roosevelt had called the ABCD Powers into consultation was followed immediately by reports of a suggested "truce." Japan would guarantee to remove her troops from the frontiers of Thailand and possibly even from Indo-China, and would moreover undertake to "do nothing" for the period of

the truce—alleged to be three months. In return, the ABCD Powers would resume more normal trading relations with Japan by relaxing the freezing measures. The suggested truce was, in short, as pretty a piece of appeasement as one might hope to see.

In the first version of these reports the authorship of the plan was ascribed to the United States' Administration—though even the State Department's rather pacific record in its dealings with Japan hardly made it credible. This possibility was, however, quashed by the official announcement that an American note to Japan had re-stated, as the only basis for an agreement, the principles first laid down in Mr. Cordell Hull's Memorandum of July 16, 1937, in which the Administration's attitude of July 16, 1937, in which the Administration's attitude towards aggression, the violation of national rights and the infringement of treaties was expressed in unmistakable language.

These first rumours were followed, in the American Press, by attacks upon the British Government for having suggested the truce. It is hardly credible that, after so long and so futile an attempt to make appeasement work both in Europe and the Far East, British statesmen should be willing to give the discredited policy yet another opportunity. The rumours are quite unsubstantiated; indeed, the officials in Washington have gone out of their way to state that the American and British Governments are working in complete harmony. It can therefore be assumed, as well as profoundly hoped, that the whole "truce" episode was a Japanese canard, an attempt to serve the double purpose of sowing confusion in the hostile coalition and of putting out the terms on which they hoped to secure the much-needed breathing space for the replenishment of their war supplies. The attempt has been a failure. The ABCD Powers have accepted the United States' lead, and President Roosevelt has given expression to the new vigour in the policy of the democracies by officially demanding from Japan an explanation of the Japanese reinforcements in Indo-China.

For the democracies this is clearly the only policy to follow. Now and in the coming months of crisis they must preserve and strengthen their front, adding to it Russia, and hold with absolute determination to the principles of the Cordell Hull Memorandum:

We advocate national and international self-restraint. We advocate abstinence by all nations from use of force in pursuit of policy and from interference in the internal affairs of other nations. We advocate adjustment of problems in international relations by processes of peaceful negotiation and agreement. We advocate faithful observance of international agreements. Upholding the principle of the sanctity of treaties, we believe in modification of provisions of treaties, when need therefor arises, by orderly processes carried out in a spirit of mutual helpfulness and accommodation. We believe in respect by all nations for the rights of others and performance by all nations of established obligations. We understand for the revitalising and strengthening of international law. We advocate steps towards the promotion of economic security and stability the world over. . . . We avoid entering into alliances or entangling commitments, but we believe in co-operative efforts by peaceful and practicable means in support of the principles hereinbefore stated.

This document precludes any "arrangements" with Japan at the expense of China, of Thailand, or of the Maritime Province of the Soviet Union. It precludes any settlement which is not based on the total restitution of China's rights, including the withdrawal of the Japanese Army from Manchuria. It does not preclude subsequent negotiation with Japan, to meet the country's special difficulties and to modify existing treaties. All it does is to repudiate everything Japan has done by force since 1931, and the peace-loving Powers should make this point the bedrock of their joint policy in the Far East.

The Hull Memorandum is only a statement of general principles, most of which have been violated since 1931 without there being, until recently, any noticeable repercussions or cutting off of military supplies on the part of the ABCD Powers. Thus it is not enough simply

to reiterate the principles now. They must be given teeth. Japan must be convinced that, whatever the generals and admirals decide to launch the next blow, in Vladivostok, Yunnan, Thailand, Singapore or the Dutch East Indies, the united resources of five nations will be thrown into the struggle against it. At the same time, the staff talks, the co-ordination of effort and supplies which such a front requires to become anything like effective must be carried out with all possible speed. Japan has, after all, spent long enough at the crossroads for the democracies to have mounted their big guns on the road ahead. The report that 100 American aircraft, manned by American pilots serving in the Chinese army, will constitute a fighter patrol over the Burma Road, is an encouraging example of what co-operation and co-ordination could do to strengthen all the weak points along the Far Eastern front.

The decision of peace or war does not lie with the ABCD Powers, unless they beat an appeasing retreat. It

lies with the gentlemen at the crossroads, and it is by no means certain that their decision will be for immediate war. General Tojo has coupled fierce denunciations of British and American policy in the Far East with the announcement that, however great the gap between the Japanese or American standpoint, the Washington talks will continue. Admiral Nomura has gone so far as to say: "It is a question of war or peace, but war would not help and there is no reason why we should not settle these issues by diplomacy." Most of the evidence points to Japanese caution and to a desire to play for time. Germany's reported request to the Japanese to hold on until February, by which time Russia will be under the necessity of withdrawing its Far Eastern Army, is about as true or false as such reports generally are; but it is not certain that Japan has nothing to gain by playing for time. The turn of the battle in South Russia suggests patience and caution and Japanese statesmen have not always been lacking in either.

Thus it is possible that, in spite of the recurring crises, Japan and the Far East are in for quite a long spell at the crossroads. The ABCD Powers have nothing to fear from the lull, provided they use it to pool their resources and concert their policy against the final day.

Finance and Wages

FOR those who believe in the democratic process, one of the most encouraging features of the past two years has been the readiness of the general public to learn the basic lessons of war economics. The lesson has, perhaps, not been learned perfectly; but at least if the trend of discussion in this war is compared with the last, the improvement in realism and logic is beyond question. One of the central doctrines that has been accepted is that, in wartime, finance plays a minor rôle. In peace, money plays an invaluable double service as incentive and reward, as director and discriminator. But in wartime these functions are taken over by the conscious action of the State. There are other incentives, and even other rewards; direction comes from the organs of the State and discrimination is transmuted into priority. Finance can do very little either to win or to lose a war; its opportunity for service is as a lubricant for wheels which derive their driving force elsewhere. This is, of course, a doctrine for wartime only. In any peacetime community, other than a wholly planned and compulsorily directed one, finance will resume its normal functions—or perhaps it would be safer to say most of its normal functions, for the tendency of the modern age is undoubtedly towards some diminution of the power of finance.

This order of ideas, in both its wartime and its peacetime connotation, has come to be associated with the phrase "the humbug of finance." Like so much else of the convenient currency of economic discussion, the phrase was invented by Mr J. M. Keynes; but *The Economist* can claim some secondary credit for popularising the phrase—it was the title of an article in the issue of May 3, 1941. As so often happens, however, the idea is being carried, in general discussion, far further than its originators ever intended. Much of the current discussion is based on the premise that money does not matter at all; that the national economy can be kept on an even keel by non-monetary controls, irrespective of the quantity of money in existence or even of the total of money incomes; that it does not matter how much money people have in their pockets, so long as they cannot exceed their rations. True, nobody has yet carried the argument quite so far as to suggest that it is safe to abolish all taxation and govern by the printing press. But some of the current arguments differ only in degree, not in kind, from this ultimate absurdity. It is, for example, being increasingly urged that there is no sound economic argument against a general increase in wages, since it cannot lead to increased spending. And if it is asked why, in that case, there is any desire to have higher wages, the answer is given that it is to make sure of a larger slice of the national income when spending begins again after the war.

All this is, of course, a very far cry from the ideas that "the humbug of finance" was originally intended to connote, as can be seen from the article of seven months ago to which reference has been made. At that time, the argument went no further than to urge that, when real and monetary considerations came into conflict, the real should prevail. In innumerable instances, the mobilisation of men and materials for war—a real objective—is hampered and impeded by the natural unwillingness of individuals to be driven into bankruptcy and by the no less natural unwillingness of the State to discriminate so severely against those who are unlucky. It was further argued that, since sacrifices will be readily imposed and willingly accepted only if they are fairly distributed, finance can properly be used to this end—the War Damage Act is an admirable example of finance imaginatively used. But though a case was thus made for a wider extension of the principle of compensation for losses suffered, it was made perfectly clear that the compensation would normally be payable only after the war was over. And so far from a case being made for using finance to change the post-war distribution of wealth, the

basic argument was that financial policy should be so conceived that "when the war was over the pre-war distribution of activities and consumption could be recreated." Finally, it was made clear that, though theoretically attractive, a complete detachment of money incomes from real activities was impracticable.

These former arguments have not been recalled in any attempt to establish a copyright over a phrase, or even over an order of ideas, but merely to demonstrate how far the sound interpretation and the unsound interpretation of a single basic idea can diverge. In current discussion, the discounting of financial considerations is running to excess. To argue that finance should not be dominant is not to argue that it should be disregarded. If in the first eighteen months of the war it was necessary to insist on the paramountcy of physical quantities and real efforts over monetary measurements and financial devices, it must now be insisted that the revolt from finance has gone too far and, if it is not checked, will lead, not indeed to military defeat, but to social disorder. Even in Nazi Germany, where the physical, or non-monetary, policy has always been carried far further than in Britain, it has been found necessary to take steps to absorb some of the plethoric purchasing power. The former doctrine was that the Nazi structure of rationing schemes, restrictions and prohibitions was so complete and so strong that no particular care need be taken either to tax incomes away or to induce savings. But this is now seen to be too logical for practice, and in the last few weeks, as was described in *The Economist* last week, the Nazis have turned to higher taxes and to what virtually amounts to compulsory savings.

In Great Britain, where the controls are much less complete and the sanctions behind them infinitely less severe, there is all the greater need for limiting, so far as possible, the loose purchasing power in the hands of the public. It is as foolish to imagine that the problem of preventing inflation (using that well-worn phrase as a symbol for the whole problem of preserving the national economy from a greater and more damaging degree of distortion than is absolutely unavoidable) can be solved by physical restrictions alone as that it is a task for monetary devices only. For those who have eyes to see, there is plenty of evidence of purchasing power spilling over the dam that has been built to contain it. It is true that the cost of ordinary living has been stabilised with substantial success—or that it had been stabilised until the recent increases in food production costs, which Mr Hudson says are going to be put on to the consumer—and that there is no widespread, flagrant profiteering by the ordinary trader, which was such a scandal in the last war. But there are plenty of signs of suppressed inflation—without there being any need to go to the black markets (which are probably still small) to find them. In a full war economy, any market which is legal but uncontrolled and comparatively unrestricted can be called a grey market, and the grey markets, of all shades from off-black to off-white, flourish exceedingly. Department store sales, in spite of restrictions, are excellent, and expensive durable merchandise, in the peculiar circumstances of wartime, is selling much better than hot cakes. One large store in London can sell suites of furniture costing over £500 in greater numbers in one week than in one or more months before the war. Such markets as those in race-horses and antiques are booming. And every article of popular consumption which is not rationed is demanded in very large quantities. Is it, for example, to be supposed that the enormous wartime demand for tobacco reflects a national attack of nerves—or a plethora of pocket-money?

Manifestly, the dam leaks and consumption is increasing wherever it is not held back. One leak is the black market. Another leak is the ability and willingness of the propertied classes to spend out of capital. But both

of these leaks are probably very small. The big leaks are four. First, the fact that it is still possible for a smart man to make capital profits, which are not subject to taxation. Secondly, the fact that small one-man trading businesses escape EPT. Thirdly, the fact that, under the stimulus of EPT, unnecessary business expenses continue and even increase—as witness the waste of paper in the trade journals on the advertising of unobtainable goods. And, fourthly, the fact that the cash incomes of the wage earners are very substantially above their pre-war level. This is unquestionably by far the biggest leak—the only one that affects a whole wide class of the population, since the spending of income-tax payers and business firms has, in general, been very completely controlled. It is pure romanticism to suggest that increased incomes for the wage-earner will not be spent—or to believe that the hard-headed British working man wants more money solely because of its benefits in the hereafter and not at all because of its value at present. It is still true that the possession of more money makes more consumption possible. So long as that remains true, it will be necessary, in wartime, to limit the amounts of money that get into the pockets of the public.

The argument can be carried still further. Even if the wartime controls of consumption were completely watertight, it would be a mistake to permit a general raising of incomes to permanently higher levels. To do so would

merely be to ensure that the inflation came when the controls were removed—or, alternatively, to ensure that the restrictions were never abolished. To suggest a wider policy of compensation, looking to the non-recurring replacement of their capital losses by those individuals who have been singled out by chance for misfortune is one thing; to work for a permanently larger stream of purchasing power is an entirely different matter. And when the suggestion is, not that the general level of incomes should be so increased, but the incomes of half the community—with the deliberate intention of stealing a march on the other half—it has the added disadvantage of inviting a competitive scramble for position in the post-war race. Once again, to suggest that the power of finance should be used to prevent arbitrary inequity during the war—to prevent anyone's attention being distracted from his war effort by "the additional bitter burden of being discriminated against by accident"—is one thing; deliberately to create these discriminations is another.

A crop of demands for wage increases is up for settlement at the present moment, and if the decisions go in favour of the workers, there will be a further crop to come. There is undoubtedly a case in power politics for these demands—that is to say, the unions are in a strong position. But there is no case at all for saying that the effect of granting them would be other than harmful to the stability of the national economy.

NOTES OF THE WEEK

Socialist Bargaining

There was one unfortunate aspect of the manpower debate. Mr. James Griffiths, speaking from the Labour front bench immediately after the Prime Minister (and it has since been made clear that he was speaking for the Parliamentary Labour Party), gave it as his opinion that "the situation in Europe and the world convinces us that powers of this kind are essential." But he proceeded to enumerate a list of other measures which were also essential; and it appears that Government acceptance of this list of proposals is to be made a condition of Labour support for the forthcoming Manpower Bill. The list includes an increase in service pay and dependants' allowances; more generous pensions; treatment; more drastic control over industrial operations; and public ownership of "all munitions factories," the rail- and transport industries and the coal mines. Some of these items will win general agreement—increased dependants' allowances, for example. The effect of more drastic control over industrial operations would depend entirely on the nature of the control; there is a crying shortage of competent managerial skill at present, both in public and private service, and it must not be imagined that "more state control" by itself will make a tithe of difference. On the other hand if, as Mr Griffiths hinted, the phrase means that the controls should be taken out of the hands of the vested interests, it would, as *The Economist* has often insisted, mean a great gain in efficiency. The nationalisation of transport and the mines might well do good, though in the former case the benefit could hardly be expected to be sensational. The nationalisation of "all munitions factories" is, in present circumstances, a meaningless phrase. But considered on its merits, Mr Griffiths's list is not unreasonable.

It is not, however, to be considered on its merits. It is a bargaining counter, a threat, an irrelevant *quid pro quo* for a measure which Mr Griffiths admitted to be necessary. This sort of tactics simply will not do in wartime, and the Prime Minister should set his face very firmly against it. Let Mr Griffiths's proposals by all means be considered—but after the Manpower Bill is passed, and without any prior commitment. If there is to be bargaining, the point must be made that, in this war, Property has already conceded far more than Labour. Its income has been drastically reduced; Labour's has been increased. Its post-war prospects have been treated with the scantest consideration—not even with the promise of a Restoration of Practices Act. The Manpower Bill does not impose on Labour conscription more drastic than has been imposed on Property; it merely applies to Labour the treatment already, in effect,

accorded to Property. All through this war, there has been more difficulty in budging the Left by an inch than the Right by an ell, and it is already becoming apparent that the major obstacles to any really far-reaching post-war reconstruction will be among the vested interests of the Left rather than of the Right. This is a matter of principle. It is to be hoped that the Labour Party will withdraw their threat. Mr Attlee himself has asked them to. But if he fails, there must be a proof that, even in wartime, minorities cannot dictate.

* * *

The First Retreat

For the first time in the Russian campaign, a Russian counter-attack has been able to develop into a sizeable counter-offensive. The armies which swept the Germans out of Rostov have pursued them along the coast to Taganrog and perhaps beyond, while thrusts into territory occupied by the Germans in the Donetz basin threaten the flank of the retreating army. There is just a chance that a large body of troops may be encircled. The mere fact of forcing a German retreat is in itself the best news of recent weeks. But the importance of the Russian success is heightened by a variety of military and strategic considerations. First and most obviously, the Germans have suffered a severe setback at the beginning of their offensive on the Caucasus. The capture of Rostov was confidently announced as the preliminary phase in a quick campaign to secure the Caucasian oilfields, and the difficulties of widespread winter fighting on the other fronts suggested that the Germans intended to concentrate on their southern objectives. Another very encouraging feature is the evidence this counter-offensive presents of the resilience and reserves of the Russian army. Nowhere was retreat so quick and catastrophic as in this sector. Nowhere, therefore, did it seem more difficult to rally and reorganise the Russian forces. Not only has Marshal Timoshenko achieved this remarkable feat. He has gone further and forged an effective striking force out of Budenny's demoralised men. The break through in the south must almost certainly have a favourable effect upon the course of the Moscow campaign. Here the hardening ground is assisting the invader, and after a week of local actions it looks as though a new drive were imminent. It can hardly come with the force it might have achieved had the southern front held firm. Now the question of relieving Kleist's hard-pressed armies must arise, and the problem of diverting reserves from one front to another is fearsome indeed on a line the length of the German line in Russia. Every ounce of material and manpower is needed to put the greatest possible punch into

new drives on Klin or Stalinogorsk. Any diversion will weaken the punch and weaken the prospects of effectively encircling Moscow.

Libya: No Decision

Comment is difficult on a battle whose fortunes change from hour to hour. In the course of this week's fighting in Libya, the main events were the closing of the gap between British forces in Sidi Rezegh and Tobruk; the creation of a strong diversion eastwards by General Rommel when a German armoured column crossed into Egypt, there to be split up and heavily engaged by British frontier forces; new attacks upon the Libyan "corridor" by Germany's remaining armoured units; and a break-through by the German 15th Armoured Division from the west to Sidi Rezegh, which, by joining up with the 21st Armoured Division, re-established contact between Rommel's forces inside and outside the British ring. Sidi Rezegh has already changed hands half a dozen times, and the new situation only represents a temporary position in the perpetual flux of the battle. The final issue turns on supplies. It is believed that Rommel has been unable to bring up any fresh mechanised units. He is fighting to the last tank with what remains of his original three divisions. Reports from Cairo suggest that the reinforcement of the British forces is going on and that the loss of Sidi Rezegh must not be looked on as anything but a temporary setback. Complete superiority in the air has certainly been achieved from the start, but an interesting and perhaps disturbing feature of the campaign is the small extent to which air superiority has proved in any way decisive in this battle of tanks. Possibly the aircraft available are not equipped with the fire power necessary for effective attacks on tanks. However, the course of the Russian war points in the same direction, to the supremacy and therefore to the supreme importance of the tank. Air power will not settle the issue in Libya. Reinforcements will. Thus the operations of the Navy in the Mediterranean, both for landing supplies at Tobruk and for preventing the despatch of Axis supplies to Tripoli or Benghazi, are an integral part of the campaign. The forces commanded by Captain Agnew in the cruiser *Aurora* have had a number of notable successes, sinking two supply ships carrying artillery and fuel as well as a large destroyer. The fate of the whole campaign will depend upon their ability, in co-operation with the RAF, to keep the guns and the tanks away from Rommel.

* * *

American Price Control

As was to be expected, the settlement of the strike in the "captive" coal mines has had a sympathetic effect on other labour troubles. The threatened railway stoppage is not to take place, and the agitation in Congress for anti-strike legislation is less violent. It has not, however, ceased, and a Bill is under discussion which would impose a compulsory "cooling-off" period. On other sectors of the anti-inflation front, the news is not good. The House of Representatives has, it is true, passed a Price Control Bill, but a coalition of Republicans and Conservative Democrats succeeded in emasculating what was never a very strong measure. Price ceilings are to be fixed commodity by commodity, not in blanket fashion. And as if this did not present enough opportunities for wire-pulling, the decisions of the Administrator are to be subject to a five-man Board of Review. Enforcement has been made more difficult by removal of the provisions that would have empowered the Administrator to issue and withhold licences. Wage rates are not to be fixed at all, and farm products are subject only to the so-called "rubber ceiling"—that is, they are not to be fixed below (a) 110 per cent of "parity" (itself a moving concept); (b) the actual prices ruling on October 1, 1941 (which averaged 135 per cent of parity); (c) the average prices of the twenty years July 1, 1919, to June 30, 1939. This, of course, is not a Price Control Bill, but a practical joke. It is lucky for the democratic cause that the outcome of the war does not hang on what happens to prices in America. What is perhaps rather more disturbing is to witness the relaxation of two brand-new restrictions on civil activity that were imposed in the interest of higher war production. The 30 per cent curtailment of civilian power consumption in six south-eastern states has been

postponed, and the restrictions placed on the use of lead and tin foils in packaging have been suspended for 30 days. There may be good reasons in either case—or there may merely have been irresistible pressure. Unlike the course of prices, the restriction of civilian use of scarce resources in the United States does have a direct and immediate bearing on the military prospects of the war.

* * *

Rt. Hon. Box or Cox?

The expedient of appointing members of the War Cabinet to crucial posts abroad has, in general, been welcomed by *The Economist*. In peace or in war, the special relations between Britain and the United States of America, at this juncture in the world's history, call for the presence in Washington of a member of the nation's innermost councils. In Cairo, Mr Lyttelton's organisation, which as Minister of State he described to Parliament during his recent visit to London, is simply a reflection or microcosm of the War Cabinet; and Mr Lyttelton is appropriately, by his office and by his personal qualities, a Cabinet Minister. Now it appears, from an answer in the Commons by the Lord Privy Seal, that neither Lord Halifax nor Mr Lyttelton is a member of the War Cabinet while on duty abroad; only when they return to this country, it seems, do they resume their Cabinet functions and responsibilities. This emerged from the question why the name of Lord Halifax is omitted from the list of the War Cabinet printed in *Hansard*, and Mr Attlee could not explain why Mr Lyttelton, unlike Lord Halifax, was included; he said their cases were on all fours. The point may be quite academic and merely one of verbal definition; and it is obvious that neither of these gentlemen can be in Washington or Cairo and London at the same time. But it is surely important to know whether or not the Ambassador in Washington and the Minister of State in Cairo are really members of the War Cabinet, fully responsible with their colleagues for their conduct—as has hitherto been generally assumed. The statement that Lord Halifax and Mr Lyttelton only become Cabinet Ministers when they land in England—somewhat similarly to the way in which Mr Menzies, as Australian Prime Minister, "sat in" at Cabinet meetings during his stay here—makes nonsense of the new conception of the Cabinet's overseas branches; and raises some important practical points about their constitutional responsibility. Either they are Cabinet Ministers or they are not; they cannot go on, each of them playing Box and Cox single-handed.

* * *

Minimum Exports

At the week-end, Mr Harcourt Johnstone, Secretary to the Department of Overseas Trade, restated the principles of wartime export policy. Simply, they are to earn currencies to pay for essential imports and to supply the essential needs of other parts of the Empire. Essentiality is the test, as it was before Lend-Lease vastly reduced the scale of the export problem by furnishing essential imports without payment of dollars. It is not because of Lend-Lease, or any new obligations to the United States, that the policy now is "how little need we export?". Potentially, this question replaced the peacetime "how much can we export?" as soon as the war began; and it was only because the direct war effort failed for eighteen months or so to engage its due proportion of the nation's industrial resources that exporters did not feel the pinch of a higher necessity earlier, and were able to go on exporting where they could without much discrimination. There was, it is true, a more selective export drive after this laxer period, as the shortage of dollars and other hard currencies to pay for imported supplies dwindled; the operative words in the question "how little need we export?" are "little" and "need," and until Lend-Lease broke the strain the need for dollars was immense—much too great, in fact, for even the most ambitious sales campaign to sustain side by side with the domestic war effort. Currencies, including dollars, are still needed. Empire countries must so far as possible be supplied with necessities without any expenditure of dollars or other hard currencies, that is, if not from their own or other sterling countries' resources, by exports from Britain. But it is minimum and not maximum—or even moderate—exports that policy must aim at; war economy, and not American influence, dictates it.

Science and Truth

In his presidential address to the Royal Society this week, Sir Henry Dale laid down certain principles on which research should be based. He sympathised with the view that freedom and opportunity, rather than organisation, provided the conditions for the highest type of research; on the other hand, he felt that enlightened organisation and control, such as the Medical Research Council works under, could be a benefit rather than a hindrance. The state can support science, and can use scientific knowledge for better governance, without interfering with the freedom of science. The threat, as Sir Henry sees it, is in the possible entanglement of science in controversial politics, in the use of science as a weapon of political pressure, in the danger that "the rigid standards of true science would be relaxed by allowing the convenience of results for policy or for propaganda to enter into the assessment of their validity as evidence." Sir Henry presumably had chiefly in mind the picture of science in Nazi Germany; but he also said that the duty of science is "to seek the truth for its own sake in complete freedom from any kind of extraneous influence," and such an influence does not necessarily come from the state—it can come from much nearer home and if often all the more dangerous in that it is not so easily recognisable. Last week *The Economist* carried a full page advertisement of an association for therapeutical research, formed, according to the advertisement, by five of the biggest drug companies in the country "for the more effective prosecution of research in their industry." The companies concerned have done extremely valuable research work in the past and will no doubt do so again in their new organisation; there will certainly always be room for therapeutic research so long as there is illness and disease; and the pooling of researchers and research facilities in co-operative work will always be valuable. But, again according to the advertisement, products evolved from the researches of the new corporation "will be marketed and sold by the constituent companies under a common name." Co-operation in research apparently means combination in business. There thus intrudes into the valuable field of research into new therapeutical substances, which insofar as it is commercially organised must, admittedly, be commercial, an added dose of the very extraneous influence which Sir Henry said should be kept out. It is impossible not to feel that the "convenience of results" for the companies concerned may enter—even though unconsciously—"into the assessment of their validity as evidence."

* * *

Restraint of Medicine

The manufacture and sale of drugs is a business like any other. The possibility that research by associations of manufacturers and distributors of drugs may be mixed with commercial convenience, and that the claims of new therapeutical substances may be established more because they have such authoritative backing than because they are fully founded, is an incident of trade. But it is a danger; and there is the further risk that such a body may become a monopoly. The new therapeutical research body, for instance, states that "it will, where desirable, negotiate agreements with other manufacturers of recognised standing." But there

can, of course, be no guarantee that the products of these other manufacturers will be able to obtain equal treatment when faced with the competition of such a formidable combine; their research laboratories may evolve therapeutical substances which are as efficient as those of the association and cheaper, but the odds against their getting them recognised by the medical and pharmaceutical professions and on to the market will be very heavy. An alliance of large houses is able to bear the cost of greater publicity, and its marketing facilities, through the constituent companies and their subsidiaries, are world wide. The danger of a monopoly of this sort is doubly serious when it occurs in the sphere of public health, because the public is quite unable to decide for itself between the various claims of the drugs on offer. It is probable that the drugs to be sponsored by the new body will be mainly those which can only be administered under the direction of a doctor; there is no reason to suppose that they will belie the high repute of its constituent companies. Nevertheless, even a doctor can be led astray by the claims of drugs, as is shown by the frequent misuse of chemo-therapy in general practice; and doctors themselves are not altogether free from the charge of hiding monopoly under the guise of expertness. The British Medical Association has been of great value to the medical profession in protecting its legitimate interests and is even now sponsoring a planning commission to study the country's medical services. Last week, it produced a plan for improving the health services of factories by the appointment of whole-time or part-time medical officers and the establishment of an efficient medical liaison between the factory and outside medical services. The principle is admirable, but the BMA's suggestion for an outside advisory body to help employers in making appointments must be treated with more reserve. Such a body can hardly fail to be run by the BMA itself, and it is well known that many doctors, including members of the BMA, resent its growing power over their independence.

* * *

The Future of Abyssinia

With the surrender of Gondar, the last Italian stronghold in Abyssinia has fallen after a prolonged and very gallant siege. Today the authority of the Emperor is re-established, even if only nominally, throughout the Empire he lost in 1936, and one of the immediate questions to arise is the policy the British Government should pursue in its relations with the newly liberated Abyssinian State. There are, perhaps, some arguments for leaving the Emperor to build up his new realm alone. Abyssinia will surely set great store by its newly recovered independence, and the presence of British garrisons and ubiquitous British officials might stir up keen resentment. Possibly, too, from the standpoint of Britain's good name, it might be politic to avoid the least grounds for accusations of "selfish imperialism," "hypocritical expansionist policies," and the like. Obviously, however, such a course would be completely impracticable for the time being. The most compelling reason for the maintenance in Abyssinia of a large measure of British control is the obvious fact that the war is not yet over. Should the Germans retrieve their present reverses in Southern Ukraine and sweep the war down into the Middle East, should the campaign in Libya go un-

believably badly, once more control of the Red Sea would become a military factor of crucial importance. To leave to the uncertain authority of the Emperor vast tracts of land bordering upon approaches to the Suez Canal would be folly. Moreover, on a long term view, there are reasons for the maintenance for the time being of some measure of British control. The Emperor faces formidable difficulties in his restored domain. The tradition of Abyssinia has long-combined fierce and proud independence over against the outside world, with almost equally fierce independence between the various principalities—Gojjam, Shoa, Amhara and Tigre—which make up a sort of federalism under the rather doubtful authority of the Negus. On the frontier fringes lie the subject tribes—Galla, Sidamo, Somali and Danakil. The only way in which, in the new independence, these scattered units can be held together is by the creation of an efficient centralised administration, capable of combating the inherently centrifugal tendencies of the Abyssinian State. The establishment of such an administration out of the meagre resources of the restored Emperor would be quite impossible. The Emperor's income is at the most some £500,000 a year. Under wartime conditions it would be far less. In the sphere of administration proper, the five years of Italian occupation have removed from education and responsibility the Abyssinians on whom the Emperor would now have to rely. The continuance of British aid, therefore, seems not only inevitable but desirable. Nevertheless, the eyes of the world will be on any aid given by Britain to Abyssinia. Unless its intention is genuinely to do what the Mandate system was planned to do, "to prepare peoples to stand alone in the strenuous conditions of modern life," then once again Britain will be open to the charge of having added to its own dominion under the banner of a humanist crusade. It is no exaggeration to say that the honesty of British policy in dealing with more backward peoples is on trial in Abyssinia. Britain has a chance to show that it can be generous in the matter of capital expenditure; that it can be patient and unbiased and can transcend the national plane in the matter of experts and advisers; and can turn into a practical and immediate policy its general and oft-repeated ideal of freedom and national independence.

Meeting at St. Florentin

The fact that the high German official chosen to meet Pétain at St. Florentin was Goering suggests that the old Marshal is doing his best still to confine direct collaboration within the framework of the Monothro agreement. To full economic collaboration the French have been committed for the past year, and if the Germans choose to put on the screws, and demand a higher percentage of France's output at this juncture, Pétain has no bargaining position upon which to make a stand. The Germans are feeling the strain of the Russian campaign and Goering, as head of the *Luftwaffe*, is probably mainly concerned in securing greater output from the French aircraft industry. Since it is already delivering to the Nazis eight out of every ten aeroplanes it produces, the Germans can hardly increase the percentage. It is total output they wish to push up to a higher figure. For this, French industrialists will demand increases in their quotas of raw materials and machine tools and, here again, Goering, as controller of the Four Year Plan, is the man on whose decision the question of extra supplies will depend. There is evidence to suggest that the Germans are handling these negotiations with France with more than usual skill. They know that, apart from Darlan and one or two other total quislings, the French leaders and, above all, the French people will not tolerate direct military collaboration. Here there can be no process—as in the economic field—of "getting mixed up together." But it perfectly suits Germany's plans that French and German military policy should develop along parallel lines. If the Libyan campaign ends in a British victory, French North Africa becomes the only obstacle in the way of a British advance to the Atlantic, to that point of the African coast which is eventually the obvious entry point for active United States' intervention. The German and French quisling press are therefore playing up the "danger" to France's Colonial Empire of an "Anglo-Saxon" offensive. The French are being encouraged to get themselves on a war footing to defend themselves against the British and American aggressor, to man the frontiers of Tunisia, to reinforce Dakar, to institute Atlantic air patrols for the early sighting of an "aggressive" American Fleet. All this can be camouflaged as legitimate self-defence; yet it serves Germany's purpose

as well as if a German officer were sitting in every garrison in Morocco.

Sheep and Goats

Of the two latest adherents to the Anti-Comintern Pact, Denmark and Finland, Denmark has provided strong evidence in the past week that her signature was obtained under duress. The German authorities apparently threatened the Danish Government with hostile occupation under a Reich Commissar, an argument which seemed sufficiently forceful to the Foreign Minister Hr Scavenius, to ensure his docility at the Berlin Conference. But the news was so ill received by Danish public opinion that on November 25 spirited demonstrations, in which the police intervened several times, were staged in Copenhagen. Indeed, public displeasure has been so fearlessly expressed that there seems to be some doubt as to whether Hr Scavenius' signature will successfully purchase freedom from further interference. Moreover, adherence to the pact has brought Danes abroad a significant step nearer the creation of a Free Danish movement fully allied with the democratic powers. Thus, Count Reventlow, Danish Minister in London, with the complete agreement of his Legation and Consulate-General, has informed the Danish Government of his unwillingness to take further orders from the Danish Foreign Office. Count Reventlow's decision follows similar action by the Danish Ministers in Washington and Teheran.

It is unfortunate that Finnish reactions have been infinitely less independent and self-respecting. Reports of the private session of the Finnish parliament, called by the Finnish Prime Minister, M Rangel, at the end of last week, indicate that, outside the Swedish party, enthusiasm for the prosecution of the war until the whole of Eastern Karelia is brought under Finnish control varied only in degree. Marshal Mannerheim's Order of the Day, issued on the same occasion, hinted that Finnish ambitions were nearly achieved, but that the attainment of the new strategic frontier is an indispensable condition of peace with Russia. This attitude is maintained despite the Prime Minister's revelation that Great Britain has threatened to declare war on Finland—presumably on Hungary and Roumania as well, since all these countries are at war with Russia. It is well known that the Russo-Finnish war of 1939-40 and the present expedition to subdue territories outside the former Finnish frontiers have imposed a serious drain on Finnish manpower; and (as an article by a correspondent on page 687 shows) there are very strong social and economic reasons in favour of a Finnish armistice. It will be a thousand pities if the Finnish Government persists in its short-sighted view of the national self-interest, for it appears that zero hour is now very close. Once Great Britain and Finland are at war, the issues of the Karelian frontier dispute must be generalised in terms of the quarrel between Nazi Germany and the Allied Powers, with all that that implies for the post-war settlement.

Domestic Service

Mr Churchill made two points about married women on Tuesday. In their homes they are ministering to the needs of the active population; but they are also the nation's only reserve in the future for industry and civil defence. The problem is to obtain work from women who have inescapable home ties, which, in the vast majority of cases, will prove to be the care of young children. Owing to the technical difficulties of fitting part-time workers into industrial routine, it is improbable that part-time work can be made compulsory. Yet there is every reason for making it increasingly feasible for volunteers. If it is impossible to make part-time work compulsory, it is still possible to make the provision of part-time facilities obligatory upon employers—and the Government. The fact has to be faced that the provision of day nurseries on an adequate scale, an obviously necessary and desirable step, is an impossibility in the immediate future. The most hopeful solution is that of dovetailing the activities of neighbours who are willing to take over each other's domestic work and factory work in turns, either by splitting the working day or by splitting the working week. It must be strongly urged that a family of young children, or any other sort of family tie, cannot be allowed to rank as grounds for exemption or for the performance of half-time work if the whole-time services of suitable domestic help are employed, any more than the mere existence of a husband, at home or away, should

exempt a childless wife from war work. There is a reserve of domestic help in the ranks of unemployed women between 51 and 60, and even above this age, which could well be employed to release the young mother at least for part of the day. Many women above the conscription age limit, who have never yet worked for a wage, have some sort of domestic skill which should not be allowed to lie fallow. If labour reserves are to be used to the full, it must be made feasible for women, who are not liable for conscription, to offer such service as they are able to contribute. This entails an obligation on employers to consider unorthodox forms of employment and an obligation on women in late middle life to take over much of the domestic work of the nation.

Earnings in Industry

In view of the renewed pressure for higher wage rates, the publication of the results of the Ministry of Labour's investigation into workers' earnings during one week last July is timely. It provides the facts for any intelligent discussion of the problem. The sample taken by the Ministry is fairly representative of earnings in industry as a whole, for it covers some 6,000,000 employees in 56,600 establishments; but the percentage of workers covered in individual industries varies. The average increase in the earnings of all workers between October, 1938, and July, 1941, was 42.3 per cent, against a rise of 29 per cent in the official cost of living index; wage rates, on the other hand, rose by only 18 per cent. The discrepancy between the rise in weekly earnings and wage rates is, of course, explained by longer working hours, overtime and night shifts, and by the extension of the system of payment by results. But as the analysis on page 697 shows, the change in average earnings between October, 1938, and July, 1941, has been anything but uniform. While those of youths and boys rose by 57 per cent and those of men by 43 per cent, the average earnings of women advanced by 36 per cent and those of girls by 35 per cent. Again, there have been wide disparities in the movement of earnings in different industries. In the building and contracting trades, they rose by 48 per cent and in the metal engineering and shipbuilding industries by 49 per cent; on the other hand, average earnings in the public utility services rose by only 20 per cent. Similar discrepancies are to be found in the movements of wages within groups of industries. There are no indications that these divergencies are being smoothed out; many of them cannot be justified by differences in skill or in the nature of the work; and they add emphasis to the need for a national wages policy.

Death of a President

The unfortunate death of the Chilean president, Senor Aguirre Cerda, on November 25, terminates the first Popular Front administration in the South American continent. By law, elections must be held within 70 days. So far, however, no candidates have been nominated and it is consequently impossible to assess the likelihood of a Radical being returned to office or of the possibility of the survival of a left wing coalition similar in composition to that of a left wing coalition similar in composition to that of the late President's policy of *Chilenidad*, national development, reform, and, since the earthquake of January, 1939, of reconstruction, commanded solid national backing. But there were already signs of dissension (on which our Santiago correspondent reports on page 688) before his death. His own party, the Radicals, had withdrawn all their members from his Cabinet, and they returned only when he got rid of his Minister of the Interior, whose love for law and order was greater than for Communists. These rifts may now be deepened. A domestic crisis at the present juncture is particularly unfortunate since the late president had proved himself particularly adept at preserving national unity on foreign issues. Chilean suspicion of the trend of United States foreign policy occasionally evokes explosive comment in the USA press. Yet there is little ground for misunderstanding or misrepresentation of the Chilean attitude which, in recent months, has shown itself increasingly vigorous in condemnation of Nazi policy both inside and outside Europe. Thus, Chile recently took the lead in lodging a protest in Berlin against the shooting of French hostages and, since August last, control of fifth column activities has been tightened and a number of arrests made. It is commonly reported that army circles

are sympathetic to Germany, and there is a large German minority, but there is no doubt that national sympathies are predominantly pro-ally and that this sentiment was one of the few bonds which cemented the precarious union of the left wing parties in Senor Aguirre Cerda's Popular Front Government.

Shorter Notes

In the Hampstead by-election, out of an electorate of some 65,000 only some 11,000 voted. The Government candidate was returned with a majority of 4,896 votes over Mr Pemberton-Billing, and the other two Independent candidates forfeited their deposits. In the Harrow by-election an even smaller percentage of the electorate voted. The Government candidate was again returned with 14,540 votes, a majority of 11,107 over the Independent Democrat.

The sixth Director-General of the Ministry of Information has been appointed. Mr Cyril J. Radcliffe, formerly Controller of the Press and Censorship Divisions, succeeds Sir Walter Monckton, who gave up the post, which he held far longer than any of his predecessors, on taking up his appointment in Cairo as Director-General of British Propaganda and Information Services under Mr Oliver Lyttelton, Minister of State.

The news that President Roosevelt has decided to apply the Lend-Lease Act to Turkey comes at an apposite moment. There are very circumstantial reports of military activity on Turkey's Thracian frontier, where, it appears, a German headquarters has been established at Liubimets, only some seven miles from the Turkish border, and the territory to the south of Liubimets to the Aegean is under sole German control, even the Bulgarian authorities apparently being excluded.

Owing to the extremely difficult conditions under which printers are working in wartime errors and misprints are bound to creep in. Last week's errata are:

Page 644, lines 39-40. In the sentence "Whatever the sum of money that the public will find, it can either be used to secure high wages and high prices for a limited volume of production or less wages and high prices for a larger volume of production," the italicised phrase should read "or less high wages and prices."

Page 657, second column, line 36. In the sentence "... the £2 10s. preference shares of De Beers, which at £12½ yield 7.9 per cent. . . ." the italicised phrase should read "7.9 per cent."

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

THE WORLD OVERSEAS

State Control in Free China

(From Our Shanghai Correspondent Temporarily at Chungking)

October 22nd

GOVERNMENT participation in Free China's business is greater than ever. Throughout the Sino-Japanese war, the National Government has had constantly to open up new lines of communication and trade as well as new industries. Private business was little prepared, and still less able, to run substantial risks and to lock up capital in new ventures. Pressed by war emergencies, the Government itself again and again has had to promote and finance new economic enterprise. As a result, most of Free China's new wartime lines of business are Government-managed.

In foreign trade, the Government leads. Practically all exports are Government-controlled commodity exports in payment of foreign loans to China and other liabilities. Supervised and directed by the Foreign Trade and National Resources Commissions, Government and semi-Government companies purchase, transport and market abroad almost all Free China's export goods. What remains of private enterprise in this field is negligible. The Government predominates again in import trade. It receives all the foreign supplies secured under China's wartime loans and under lease-lend, and it also buys the bulk of the remainder of Free China's imports. A special Government agency, for instance, transacts imports of cotton yarns and piece-goods. Since September 1, 1941, except for small private imports carried on Burma trucks run under the British flag, only cargo for the Government may be imported via the Burma-Yunnan route.

In industry, all of the newly opened coal, iron and non-ferrous ore mines, the new blast furnaces and steel works, as well as most of the new machine shops and plants manufacturing electrical machinery and materials, are Government-financed and Government-directed. To such plants the Government allots the capital required out of the national budget, or through one or all of the four Government banks. The Bank of China has become a major shareholder in more than 20 important industrial companies, including Ming Seng Shipping, Szechuen Silk Filature, Szechuen Animal Products, as well as wood, oil and paper mills and a modern sugar refinery.

The Chinese Government banks have gradually spread a dense network of branch offices all over the hinterland of west and south-west China, where prior to the war they were of little or no importance. The Bank of China now has over 50 branches in Szechuen and over 20 in Yunnan. The Bank of Communications has 20 branches in Szechuen. The Farmers' Bank has far more than 200 branches in Free China. These banks finance all business connected in any way with the Government. Their extension of credit to an increasing number of private banks is only a sideline. The Central Bank of China does not do commercial business, but remains the Treasury's financial agent; it is destined to be a bankers' bank.

It is impossible to obtain a clear idea of the profitability of the State economy in Free China. In most lines, it would not seem to be a paying proposition. Indeed, Government enterprise was not started as a business undertaking, but to answer urgent war requirements in trade, industry and banking which otherwise would not have been met. The Government's loss in its business operations, which is most

probably huge, forms but another item of China's war costs. On the other hand, the octopus of Government business tends to become self-perpetuating and aggressive. As it spreads and acquires ever greater weight, it increasingly crowds out what remains of private business. It encroaches now upon fields which private business could still handle, and the latter finds itself excluded from an increasing number of formerly remunerative spheres of activity. Private business men are gradually losing any feeling of economic responsibility they may have had. Moreover, pushed on to economic byways by inflation, they are more and more engaging in speculation.

In private business, the older private banks still predominate in Szechuen and other provinces, after holding their own against the wartime invasion of the new branches of Shanghai Chinese banks. These older private banks are mostly run in a semi-modern way, still extending credit on a personal basis and adhering to fortnightly and old-style holiday settlements. They pay depositors high rates of interest, ranging from 10 to over 30 per cent per annum, operate with a comparatively large overhead expenditure and in current business experience a high loss ratio. Notoriously short of funds, they compete violently with each other for private deposits. They charge their debtors correspondingly high rates; in Szechuen's salt industrial district of Tseliutzing, bank interest runs up to 60 per cent per annum. The rural credit of private banks is still more expensive, and Szechuen usurers charge farmers rates of more than 100 per cent per annum.

The March of Inflation

The high interest rates of private banks prove disastrous for private industries and regular private trade, especially as the constant progress of inflation makes private business require ever larger operating capital. There is little or no inducement left for new private industrial investment. The funds of private banks and other private capital are primarily attracted by fields into which enters a speculative element promising high extra profits. Without any end to inflation in sight, speculation is a one-way bullish venture, with the risk incurred reduced to the problem whether or not commodity prices will rise faster and higher than the accumulation of bank interest charges.

In the field of foreign trade, private business is chiefly concerned with the importation of Shanghai and Hongkong products via the French Leased Territory of Kwangchow-wan, in Burmese trucks via Yunnan, and by means of smuggling everywhere. The volume of these imports in numerous commodity lines still exceeds Free China's own production of consumption goods. The majority of clothing articles, footwear, medicines and drugs, cosmetics, tinned goods, etc., displayed in the shops of Free China's cities are imported. Transport costs are high; for a ton of commercial cargo from Rangoon to Chungking, they amount to almost £150. Importation by plane from Hongkong costs about 5s. per lb. of merchandise. Private freight insurance is unobtainable, and in transit as well as at destination there is everywhere in Free China a considerable air-raid risk. Yet prices of these goods are quoted far higher than is justified by these costs and risks alone. They are between three and ten times higher than Shanghai prices, and from five to six times higher than Hongkong prices. Among the main reasons are persistent speculative hoarding and withholding from the market of the commodities in question by every hand through which they pass; the periodical cornering of certain commodity markets by groups of speculators; and extremely high profit margins. Chungking wholesalers average profits of between 25 and 30 per cent, while retailers will insist on profits ranging from 50 to 100 per cent and more.

The population's power to purchase imported consumption goods steadily decreases, as a result of the soaring prices, which far exceed the readjustment of incomes, and markets for such goods narrow down. Hoarders and speculators, therefore, have lately turned more and more to manipulating staple foods, such as rice, salt and sugar, boosting food prices to three and four times the Shanghai level. In several areas which are suffering a food shortage speculators are at the same time holding back large stocks of food. Just before the current harvest season, Szechuen rice prices had been driven artificially to an all-time high of 1s. per lb.

The Chinese National Government are aware of this situation and are trying various solutions. A few outstanding speculators and corrupt officials have been jailed or summarily executed. Land tax is now being collected in kind, and part of the foodstuffs thus collected is to be sold cheaply in the open market in an effort to cut down prices. Government officials and employees are supplied with rice at one-quarter of market prices, and in special shops are being sold imported goods at cost. Yet it still remains to be seen whether these measures can or will fundamentally remedy the situation, especially after the passing of the harvesting season, which normally brings a marked relief.

Finland's War Burden

[BY A CORRESPONDENT]

November 24th

WHATEVER advantages Finland may derive from the occupation of Karelia in the not so immediate future, present economic gains are very small in relation to the cost. The Finns admit that about half the buildings in the captured areas have been destroyed by the Russians, and, where the houses are still standing, almost everything movable has disappeared. The total destruction of Western Karelia—the territory ceded last year to Russia and now recaptured by the Finns—has recently been estimated, by a Government commission, at 10,800 million Finnish marks. This figure, when compared with an estimated total loss, through destruction and cession of territories after the first Russo-Finnish war, of rather more than 15,000 million Finnish marks, clearly indicates the thoroughness of the Russians' "scorched earth" policy in those areas. (Neither figure includes losses of Government property.)

The agricultural situation in Karelia has been described as very poor by various Finnish observers; for instance, scarcely one-sixth of the ordinary potato crop is available this year. It was estimated in August that the reorganisation of Karelian agriculture would take about two years. It is doubtful whether even this estimate fully takes into account the evident labour shortage or the difficulties of organisation. Significantly, it was not possible, until the end of September, to harvest those crops which had been left undestroyed by the Russians. The shortage of labour is also illustrated by the fact that a great deal of work in the recaptured villages is done by women soldiers; as many as 50,000 members of the Lotta (the Finnish women's organisation) have had military training, and they play a more active part in warfare than similar units in most other belligerent countries.

It is also significant that of 220,000 people who fled from Karelia after the first Russo-Finnish war, only some 50,000-60,000 will probably be repatriated by the end of this year while the rest will have to wait until after the war.

The industrial life of the country is also hit by the labour shortage; the paper and cellulose industries might export large quantities of their produce to Germany if a sufficient number of workers were available. Other industries are suffering, in addition, from a shortage of iron, tin, cotton and other raw materials. The most immediate economic problem facing the Government, however, is how to feed the people during the winter, and no attempt is being made to hide the seriousness of the situation. In ordinary circumstances, even after the territorial losses of 1940, the home production of agricultural goods might well have covered about two-thirds of the country's needs. But the war has resulted in a considerable drop in Finland's agricultural output, especially since a long drought and early frosts have added to the existing difficulties. Stocks of food are no longer available, and it has been difficult,

in many cases, to induce the farmers to deliver their crops at the established maximum prices. An undeclared delivery strike by the farmers is in particular to blame for a temporary shortage of potatoes, the Finns' staple food in present circumstances.

Short Commons

The Finns' diet, formerly praised for its richness by many a traveller, has greatly deteriorated during the last two years. Even during the summer, Finland was "not far from famine," according to various Finnish newspapers, and in certain distressed towns people were "literally starving." In Helsingfors itself the population has been living almost entirely on vegetables for a long time now. Meat, except on rare occasions, is only available on the black market, and at extremely high prices. The Germans are said to have sent large quantities of eggs to Finland, in order to relieve the situation, but either these claims are exaggerated or all the eggs are also absorbed by the black market; in any case, the ordinary egg supply is quite insufficient. Fish is also very scarce on the ordinary market, though reports have been current about fair catches of Baltic herring, pike and cod. The fat ration was 21 ounces in October, and consisted almost entirely of margarine; the weekly milk ration was little more than 1 pint per person. Bread, officially rationed at 80 ounces a week, is usually sold out during the early hours of the day. Vegetables, other than potatoes, and fruit seem so far to have been a little more plentiful than in some other Continental countries owing, largely, to imports from Italy, but prices are high and the quality is frequently poor. One of the worst features of domestic life is queueing, which has to be done for almost everything, and it is extremely difficult for working people to obtain their rations unless they have their meals in restaurants. Many Finns try to make good some of the obvious deficiencies in their diet by buying vitamin tablets, and a leading Finnish research worker has pointed out, in a special report, that the lack of calories has already resulted in the decreasing efficiency of manual workers. Another result of the deterioration of living conditions has been, according to the Finnish Press, an alarming rise in the rate of infant mortality.

Many of the shortages of food and other consumption goods are caused by the dislocation of traffic. There is, for instance, an insufficient supply of firewood in the towns though, at the same time, huge quantities of wood are lying near the waterways with no means of transport available. The coal and coke supply for private householders has been cut down to 30 per cent of normal, and the temperature of heated rooms must not exceed 59 degrees Fahrenheit.

It is hardly possible to estimate the number of Finnish casualties in the present campaign, since the Finns have dismissed all suggestions of heavy losses without publishing accurate figures themselves. It must be remembered, however, that during the 1939-1940 campaign they lost about 29,000 dead and permanently disabled men, or about 3 per cent of all men between 18 and 45 years of age. There is no likelihood that the toll of dead and wounded during the present prolonged fighting has been very much smaller than at that time.

A record of how Finland is paying for the war would be incomplete if no mention were made of the more subjective losses sustained by the Finnish nation. These may soon amount, to quote Mr Cordell Hull, to a complete abandonment of the country's democratic institutions, and such a sacrifice might easily prove more fatal to the nation than anything else the unhappy Finns have suffered during the last two years.

Price Control in Canada

[FROM OUR OTTAWA CORRESPONDENT]

November 3rd

ON November 2nd, the Canadian Government made public the provisions of the Order-in-Council which establishes a comprehensive ceiling for prices of goods and services and enlarges the powers of the Wartime Prices and Trade Board. The Order makes it an offence to buy or sell after November 17th any goods or services at prices higher than the lawful maximum. This maximum is defined as the highest price at which a person or firm sold or supplied goods or services of the same kind and quality during the period September 15th to October 11th inclusive. The maximum price for goods or services, which may not have been sold or supplied during this basic period, is to be the same as the maximum price of goods or services of substantially similar kind or quality sold or supplied during that time.

Authority is given to the Wartime Prices and Trade Board to vary any maximum price, to prescribe other or additional conditions and terms of sale and to exempt any person or goods or services from the regulations. The Order itself exempts from the operation of the ceiling goods sold for export; the sale by any person of his personal or household effects; isolated sales of goods by persons not normally handling them; bills of exchange, securities and title deeds; and sales of goods by auction where this procedure is not adopted merely to evade the regulations. Prices previously fixed by the Board or fixed by any other Federal, Provincial or local authority with the concurrence of the Board are also exempted from the ceiling. Goods may be sold or services supplied at prices lower than the fixed medium, but charges for goods or services in excess of the maximum are not enforceable, and any sum paid over the maximum is recoverable. Goods bought and sold in contravention of the regulations are liable to seizure by the Crown, and for proven violations of the Order, the penalties prescribed are fines up to a maximum of \$5,000 or two years' imprisonment, or both. The list of services brought under the price ceiling is as follows:—

- The supply of electricity, gas, steam heat and water;
- Telegraph, wireless and telephone services;
- Transport and harbour facilities;
- Warehousing and storage;
- Undertaking and embalming;
- Laundering, cleaning, tailoring and dressmaking;
- Hairdressing and beauty parlour services;
- Plumbing, heating, painting, decorating, cleaning and renovating;
- Repairs of all kinds;
- The supply of meals, refreshments and beverages;
- The exhibition of moving pictures.

The Board is also empowered to recommend the removal or reduction of duties and taxes and the payment of subsidies. At the request of the Department of Munitions and Supply, all sales to it are exempted from the Board's regulations because the Department wants to reserve the right to order supplies with as much speed as possible and for quick delivery additional costs might be involved. It is expected that, from time to time, special exemptions will be accorded to certain perishable products like citrus fruits and vegetables.

The new plan of price-fixing is being supported by practically all the Canadian press, and the business community, though it has no liking for it, is making the necessary adjustments. It is estimated that a new army of some 5,000 officials will be required to administer the system. The details of the parallel plan for putting a ceiling upon wages have not yet been announced, but labour is showing great coolness towards it. Its spokesmen take

the ground that it will wipe out collective bargaining, and that in not a few industries wages will be frozen at an unjustifiably low scale.

The Conscription Controversy

The Federal Parliament reassembled on November 3rd, but its sitting will only last two or three weeks, and the Government proposes that it should adjourn soon until early in the New Year. On the opening day, Mr Mackenzie King contented himself with a general review of the war situation, and sedulously avoided any disclosure of the Government's plans or policy about certain pressing issues such as full military conscription. Meanwhile, controversial debate about this question has been proceeding in the country. Ministers have given no sign of altering their views, and the Montreal branch of the St. Jean Baptiste Society, the great racial organisation of the French-Canadians, has forwarded to the Federal Cabinet a copy of a resolution opposing conscription in Canada for overseas service. But a number of Liberal members from the English-speaking provinces are now known to be favourable to full conscription, and some Liberal papers have begun to advocate it. There is, however, no unanimity in the Conservative camp, for, although Colonel Drew, the provincial leader of the party in Ontario, has pronounced for the removal of all limitations upon compulsory service, Mr Hanson, the parliamentary leader of the party at Ottawa, while admitting that such a step has now become necessary, declines to commit his followers to full conscription. He has expressed fears that, if the party were to make conscription a political issue, the Liberals would proceed, in Quebec and elsewhere, to revive all the old prejudices against it for party advantage, and declares that it should only be introduced with the concurrence of all parties. However, Mr Hanson, on the grounds of ill-health, has announced his impending retirement from his temporary leadership.

There has lately been visible evidence that the war has given a marked stimulus to the growth of the CCF, Canada's Socialist party. In a provincial election held in British Columbia on October 21st, although it only carried fourteen seats, which, however, doubled its representation, it actually secured a larger proportion (33.2 per cent) of the popular vote than either the Liberals or the Conservatives; as the Liberals have lost their former majority, it is expected that the two old parties will have to form a Coalition Ministry. In a provincial election in Nova Scotia held a week later, the Liberals easily secured a new mandate, but the CCF, which had only one seat in the previous legislature, managed to return three out of its six candidates. The opinion therefore prevails that this already noticeable trend to the Left is certain to be accentuated by post-war conditions and that sooner or later the two old parties may be compelled to merge their identities in a single party in order to cope effectively with the new movement.

Chilean Political Situation

[FROM OUR SANTIAGO CORRESPONDENT]

October 24th

AFTER several stormy months, culminating in the retirement of the Radicals from the Government, all outstanding differences have been smoothed over, and the Radicals have agreed to representation in the Government once more. The rebel Radical, Olavarria, Minister of the Interior, has also resigned, and, though banned from the party some time ago, is on the point of being reinstated. The other two personal and non-party friends of the President, who took office at the time of the split in the Radical Party, have now resigned, since their function has expired with the settling of the difficulties. To replace these three Ministers, the President has appointed three Radicals—Dr Leonardo Guzman as Minister of the Interior; Don Tomas Mora Pinedo as Minister of Justice; and Don Ulises Vergara as Minister of Education. A fourth Cabinet post has been created, that of Minister of Commerce and Supply, and another Radical, Don Arturo Rivera, has been appointed to take charge of this Ministry.

Two of the new appointments are very interesting. Dr Guzman was formerly Minister of Public Health and in that capacity did excellent work, particularly after the 1939 earthquake in the south of Chile. He is an outspoken

The ENGINEERS' WAR

They build the tanks, the aeroplanes, the guns and the ships. They are the key-men of all war production. They are asking for a square deal. Their time rate is as low as 74/6d. per week.

Do you agree that such a wage is reasonable for the best Engineers in the World? Poorly paid before the war, they still receive far less than many unskilled war workers, despite the vital work they do.

The employers have refused them an increase in wages. Now the Engineers are submitting their claims to arbitration. They are confident that they have an unanswerable case and they want a

PUBLIC HEARING

It is an Engineers' war and the Engineers are doing all they can to win it. They have relaxed their rules and customs. They have welcomed anyone to work alongside them in the factories and are training them. Engineers are giving the Fighting Forces a square deal.

They, also, want a SQUARE DEAL

man of character, and probably one of the staunchest supporters in Chile of the democratic cause. He is the author of numerous forthright press articles in favour of the Allied cause, and it is expected that the Nazi undercurrent in Chile will not be allowed to make much progress. He is a great lover of both Britain and France—particularly the latter. On assuming office, one of his first steps was to authorise the holding of an anti-Fascist-Nazi demonstration after permission to hold it had been refused by his predecessor. The Governor of Santiago, reputedly of Nazi leanings, has also resigned. On the representation of the German Embassy, he had repeatedly banned the exhibition of anti-Nazi films in Santiago, though such films had been approved by the Board of Censors. The new Minister's ruling is that any film passed by the Board of Censors may be shown without any outside interference.

The newly-created post of Minister of Commerce and Supply is especially interesting at present, because Chile is having difficulty in finding raw materials to keep its young industries supplied. There is a marked shortage of all kinds of supplies, particularly of iron and steel. This may be surprising, since Chile is a large producer of iron, and from the Tofo Mines alone, several million tons of ore are shipped to the United States in specially chartered ships. The Chilean smelter at Corral is not large enough to meet the country's needs or to use this vast supply, and, before being in a position to do so, would require a capital investment of about £2,000,000. Again, there is the important artificial silk industry, which is having difficulty in finding supplies of raw material. This used to come from Europe and the United States, but both sources of supply are now closed; the latter owing to the shortage of supplies in the American market.

The new Minister may be able to co-ordinate supplies, but it is probable that one of his first steps will be to make an inventory of all stocks of essential materials within the country and to ration them. It is known that large stocks exist, but these are being held up by speculators who are demanding prohibitive prices.

The bitter opposition between the Socialist and Communist Parties appears to have quietened down recently, no doubt owing to the Russo-German war. The strife is latent and may break out once more. There is no more word of the proposed Bill to outlaw the Communist Party.

Rubber and Tin

THE International Rubber Regulation Committee and the International Tin Committee both met this week, the one to determine the export quota for the first quarter of 1942 and the other to discuss the terms of the prolongation of the tin agreement and to fix the export quota for the first half of next year.

The rubber export quota for January-March, 1942, is to remain unchanged at 120 per cent of the basic quantities determined by the agreement between the Governments of the producing countries. Since the basic exports of the countries adhering to the regulation scheme, exclusive of French Indo-China, total 1,563,000 tons for 1942, their permissible exports during the first quarter of next year are 469,000 tons. But actual exports during this period are unlikely to exceed 400,000 tons. As consumption is at the rate of only about 300,000 tons per quarter, there should be an ample margin for the accumulation of further stocks, especially in the United States. This is, indeed, the purpose of the maintenance of a high quota. The Committee also decided to continue its policy of controlling future productive capacity in the regulating countries; no new planting will be permitted in 1942 and 1943, other than that already permitted for experimental purposes. Every form of restriction is to be regarded with suspicion, the more so when, as in this case, it will affect supplies several years hence. But it would be equally foolish to argue that a limitation of supply is never necessary, and as genuine consumption even in wartime is running at rather less than 80 per cent of the standard tonnages, it may be conceded that a case has been made out.

The Tin Committee was able to announce that the Governments of Bolivia, the Belgian Congo, the Dutch East Indies, Malaya and Nigeria had reached agreement concerning the prolongation of regulation for a further period of five years from January 1, 1942. The Government of Thailand, on the other hand, failed to accept the draft agreement and rejected the proposed revision of the standard quantities which form the basis of the calculation of the export quotas, while French Indo-China, whose tin policy is now presumably dictated from Tokyo, was not represented at the Committee. But the output of Indo-China is small, and, even if Thailand refuses to participate in the new scheme, except on its own somewhat exacting terms, the Governments of the remaining five countries are in favour of continuing the regulation of exports. The

ability of Thailand to disturb the working of the scheme is limited by the control of the other Governments over the available refining capacity. The details of the draft agreement have not yet been disclosed, but the basic exports allotted to the countries concerned were given in the communiqué issued by the Committee:—

	BASIC TIN EXPORTS			
	Present Standard	% of Total	Proposed Standard	% of Total
Belgian Congo	15,035	7.2	20,178	8.0
Bolivia	46,027	22.2	46,768	18.6
Dutch East Indies	39,055	18.9	55,113	21.9
Malaya	77,335	37.3	95,474	38.0
Nigeria	10,890	5.3	15,367	6.1
Thailand	18,628	9.0	18,500	7.4
Total	206,970	100.0	251,400	100.0

The revised basic exports, which have been the subject of protracted negotiations, represent an attempt to adjust that of each country to its capacity. They are based on actual exports during the twelve months ended June 30, 1941, when the export quota was 130 per cent of the basic tonnages, and when most of the countries adhering to the regulation scheme were in fact exporting as much as they could. This method of adjustment, which undoubtedly achieves a measure of rough justice, inevitably involved slight changes in the share of each country in the basic aggregate; it meant an increase in those of the Belgian Congo, the Dutch East Indies, Nigeria and Malaya, and a decrease in those of Bolivia and Thailand. Since the current export quota allows the majority of tin-producing countries to export virtually to the limit of their present capacity, the revision of the basic exports will have little immediate effect on supplies; it will only become of importance in the event of a reduction in the quota. But of this there is no likelihood for some time to come, for the United States is as anxious to accumulate a large stock of tin as of rubber; indeed, on the assumption that the five Governments will accept the new agreement, even without Thailand, the International Tin Committee has fixed the export quota for the first half of next year at 105 per cent of the new basic exports, which corresponds closely to the current quota of 130 per cent, based on present standards.

The need for continuing the tin and rubber regulation schemes has been questioned on the ground that the full output of both raw materials is now finding a ready market at prices profitable to producers. But to carry this argument to its logical conclusion would involve regulation when demand falls below productive capacity and its suspension whenever current output can be fully absorbed. Such arguments fail to take account of the main objective of the regulation of the supply of raw materials—though this has not always been apparent from the policy actually pursued—which is to even out the wide fluctuations in prices and production, inherent in a free market, which have been a curse to unorganised producers and their employees in the past. Indeed, the chief aim of commodity control is to put the producers of raw materials in a position similar to that of manufacturers, who normally can adjust their output more readily to changes in demand, and consequently achieve a greater measure of stability in prices. But the prices of finished goods vary with changes in demand, and manufacturers—even those who completely control the prices of their products—sometimes work at a loss. The raw material industries cannot expect at all times to secure prices which ensure a reasonable profit to the marginal producer. They cannot expect a guaranteed income, and control schemes should not try to make the

average price over a period of years, taking in a period of boom and slump, any higher than it would have been in the absence of control. This is a golden rule not only of equity but also of expediency; it has been demonstrated often and conclusively that a control scheme that is operated as a restriction scheme, in the interests of higher average prices, inevitably breaks down. It follows that Government control and consumer representation are essential to the satisfactory operation of commodity schemes.

Both the tin and rubber regulation schemes have now been in operation for a number of years, the one since 1931 and the other since 1934. Both schemes are under the direct control of Governments—though, so far as the British Government is concerned, of the Department whose main concern in these matters is with the producers. In its original form, neither scheme provided for really adequate consumer representation, but since the outbreak of war the policies of the two Regulation Committees have been shaped in collaboration with the Government of the United States, the chief consuming country for both tin and rubber. The chief method adopted to secure greater stability in prices is to fix export quotas, quarterly or half-yearly in advance, in accordance with estimates of demand outruns absorption in times of expanding business activity when consumers are anxious to increase their rubber and tin stocks, and *vice versa*, in times of falling activity, fluctuations in prices have remained considerable. In fact, the disparity between the highest and lowest price of tin, for example, was probably as great in the pre-war years of control than before the introduction of control. Thus, in the boom year of 1937, the highest and lowest prices were £311 per ton and £181 per ton; for the slump year of 1930, before the introduction of the control scheme, the figures were £181 and £105 per ton. In consequence, various devices have been experimented with to improve the performance of the quota method. In tin, a buffer pool was formed—this is to be continued by the new draft agreement—which was designed to reduce fluctuations in prices by the method of direct intervention on the market. On the whole, the success of the tin and rubber schemes in evening out price fluctuations has been limited; but, as the following record shows, the general trend of prices has been

upwards, with a consequent improvement in the financial position of the rubber and tin producing industries:—

AVERAGE RUBBER AND TIN PRICES IN LONDON

	Rubber (per lb.)	Tin (per ton)
	d.	£
1933	34	195
1934	6 ³ / ₂	230
1935	6	226
1936	7 ¹ / ₂	205
1937	9 ¹ / ₂	242
1938	7 ³ / ₂	190
1939	9	226
1940	12 ¹ / ₁₆	257

Since the outbreak of war, fluctuations in prices have been substantially reduced, but only because of official intervention and close collaboration between the British and American Governments. Both industries have been fortunate in experiencing an increase in demand since the outbreak of war, in spite of the Allied blockade of Continental Europe, and hence a fair measure of prosperity. The expansion in demand is due very largely to the anxiety of the United States to lay in large stocks as an insurance against any temporary shortage that might arise as a result of a dislocation of communications with the Far East. In that event, a temporary decline in rubber and tin prices in the Far Eastern producing countries may be unavoidable.

There is no reason why the two regulation schemes should not be completely suspended. But they are both still in the experimental stage. A good deal can be learned from their experience. Thus, it is doubtful whether price fluctuations can be sufficiently evened out by the methods tried out before the war. Indeed, it may be necessary to go one step further and add price control to the regulation of exports. In the case of aluminium and nickel, for example, where the number of producers is small, fixed prices have been established long ago. But though price-fixing may be necessary as a reinforcement of the technical effectiveness of control schemes, it obviously increases their power for evil as much as for good. If there is a strong case at present for a very much larger participation of consuming interests and of Governments, as trustees for the common good, the case would become overwhelming with any extension of the schemes into the field of price control.

Finance and Banking

Fiduciary Circulation Raised

The expected increase in the fiduciary circulation was announced on Wednesday and duly appears in the latest Bank of England return. The authorities have been deaf to the suggestions that they should increase the fiduciary total to a level at which it would not require further adjustment for a considerable period. An increase from £730 millions to £1,000 millions, for example, should, with good management of the financial situation, have seen us through the war. Instead, it has been decided to make the customary £50 millions increase. The previous such increase sufficed for exactly three months. The Bank return shows the customary transfer of Government securities from the Banking to the Issue Department to provide the backing for the increased fiduciary circulation, but the net reduction in the Banking Department's holding amounts to £43,780,000 only, suggesting further ways and means borrowing from the Bank over the week to last Wednesday. Such borrowing would be readily explained by the heavy Government disbursements that have had to be made and by the exceptionally low level of public deposits. These have been further reduced by £2,491,000 to £7,599,000 over the week. The active circulation continues its steady expansion, a further £6,805,000 of notes being withdrawn during the week, and this movement, after allowing for the higher fiduciary circulation, only leaves £63,394,000 of unissued notes in reserve. These various changes leave the basis of bank cash virtually unchanged, bankers' deposits showing a fall of £80,000 over the week, which leaves the total at the very comfortable level of £136,349,000. The level of bankers' deposits reflects the exceptional ease apparent in the money market this week. The heavy dividend distributions at the beginning of the week, and the subsequent £30 millions payments on vested South African securities, have temporarily flooded the market with loanable credit. The banks have, in consequence, been keen buyers of bills and loans from non-clearing banks, which have been readily available at $\frac{1}{2}$ per cent.

Bank Deposit Analysis

The clearing banks have been required by the Treasury, acting on behalf of the Central Statistical Office, to make an analysis of changes in personal deposits over the twelve months to June 30th last. The object of the inquiry (which will, of course, respect the complete anonymity of bank accounts) is to obtain a more detailed analysis of personal savings than has hitherto been available. The estimate of such savings made by the Central Statistical Office and given in the Treasury White Paper issued at the time of the last budget was a residual for which complete factual evidence could not be provided. The main void in this evidence was the lack of any data for calculating how much of the increase in bank deposits was the counterpart of genuine savings. It is to this question that an answer is being sought by the analysis now taking place. Every bank branch will have to select which of the accounts kept with it are of a "personal" character. This means ruling out all corporate accounts, those of trustees, shopkeepers, farmers, and the like. Then a 5 per cent sample of the residual personal accounts will be taken and for each twentieth account, the balance as on June 30 last will be compared with that on June 29, 1940. On the basis of this sample, the proportional and absolute changes in personal deposits over this period will then be calculated.

The value of this investigation, which, incidentally, will entail considerable work for the banks, may seem somewhat problematical. Many of the accounts excluded from the investigation, such as those of small shopkeepers and farmers, include personal as well as business transactions. It is evident, moreover, that the exact incidence of the receipts and payments which determine the size of a bank balance on a particular day is to some extent fortuitous while the choice of June 30th as the day in question is calculated to increase the distortion caused by such chance influences as clearing delays. To make matters worse, the instructions

The War and Life Assurance

In these days of stress the necessity for assuring against the normal uncertainties of life is stronger than ever and you can provide in the very best way for those dependent upon you by taking out a Whole Life Assurance under THE DISTINCTIVE SYSTEM of The Scottish Provident Institution.

The rates of premium are low, thus securing a large assurance cover (excluding war risks) from the outset, while the right to participate in the surplus is retained.

Montreal Debt Developments

Progress with the formation of an executive committee to represent British holders of securities of the City of Montreal is slow, it being difficult to find people of the right standing who are free to undertake such duties at this stage of the war. Progress has, however, been made, and meanwhile the provisional committee, formed by the Stock Exchange authorities, has issued a statement which may help to stimulate the individual holder. It is pointed out that issues are made in London on the assumption that local legislation cannot vary the terms of the prospectus, and that, hitherto, this principle has never seriously been challenged. Evidently, the proposed action of Montreal goes even further than that, and this is the principal reason why it must, at all costs, be fought. One further vital point brought out is that the bulk of the money raised in London was for the execution of public works of a revenue producing nature, which should provide for the service of the loans without calling upon the taxable capacity of Montreal. In view of these other facts, the committee consider that if there is any need for a plan, and no evidence has been produced of this need, the London issues should be exempt from its operation. They then revert to the even surer grounds that no plan should be put forward, let alone adopted, without prior consultation with all parties concerned. Meanwhile, there is nothing new from Canada, certainly no indication that either Montreal or Quebec is prepared to consult on the lines suggested. For the moment, the urgent matter is still the formation of a representative committee. If that is secured, and it fails to obtain a reasonable settlement, there is always the possibility of an appeal to higher authority, with a view to effecting some move in the direction of published accounts, such as would render difficult a repetition of the recent, and admitted, mismanagement of the City's affairs.

Company Notes

P. & O. Dividend

Investors should find it satisfactory that the final 3 per cent P. & O. dividend will be accompanied by a 3 per cent cash bonus, making 8½ per cent for the year on deferred stock. To a certain extent, the rise had been discounted, but investors now feel generally confirmed in expecting that the full accounts will reveal a further improvement in total profits. In the year to September 30, 1940, total income rose by nearly £600,000 to £2,976,520. Equity earnings, before deduction of £300,000 transferred to tonnage replacement reserve, rose from 9.9 to 31.4 per cent and the total distribution was raised by 1 per cent. The latest increase restores deferred dividends to the level of 1937-38 when earnings amounted to only 8.2 per cent. The failure to raise the total payment above this level, despite probable benefits under full requisitioning, is, of course, due to the necessity of providing adequately for post war construction and for war time contingencies. The £1 deferred stock declined on the announcement, yielding 5½ per cent at the current price of 30s. 4½d.

Crompton Parkinson Results

The announcement a few weeks ago of a further spread in the Crompton Parkinson interests through the acquisition of Young Accumulator lends special interest to the latest profit figures. The preliminary statement for the year to September 30th last shows a decline in profits, after tax, other than that on dividends, only from £400,514 to £391,404, which argues that the gross figure rose ahead of taxation. Central Benevolent Fund receives £5,000 as in the four previous years and the total distribution on ordinary and "A" ordinary capital of 20 per cent—including a 5 per cent cash bonus—is maintained. Equity earnings are reduced from £351,856 to £342,746, but the rate of cover is up from 35.0 to 35.8 per cent. The whole of the surplus goes to raise the carry forward from £187,360

to £284,218—a level which takes no account of the £4,000 gross due at the end of the year in respect of the final dividend and cash bonus on Young Accumulator shares. Profits of the Crompton Parkinson subsidiary, British Electric Transformer, are down from £52,532 to £18,387. Crompton Parkinson, as ordinary shareholders, receive a dividend of 7½ per cent less tax covered by earnings of 10.2 per cent against 40 per cent tax free in the previous year, equivalent to 69 per cent less tax, a net loss of revenue of £36,250. The carry forward is raised from £5,107 to £6,463. In the absence of full accounts, further analysis is unprofitable, though it is possible to say that results of Crompton Parkinson so far disclosed are fully up to stockholders' most optimistic expectations. The 5s. ordinary stock, at 22s., yields £4 12s. per cent.

Indian Iron Expansion

The expansion of the Indian Iron and Steel Company's business continues, and total revenue, including net addition to stocks, reached a new record of 5,70 lakhs of rupees, against 4,64 lakhs for the year to March 31, 1940, and a previous record of 5,13 lakhs for 1937-38. Expenses increased by some 80 lakhs, while the tax appropriation was doubled at 28 lakhs and the operation of the debenture sinking fund resumed, with an appropriation of 3 lakhs. In consequence, the amount available for dividend was increased only from Rs. 50,07,845 to Rs. 58,57,898. The total payment is raised from 20 to 22½ per cent, and, whereas there was a slight over-distribution a year ago, on this occasion the carry forward is raised from Rs. 4,53,614 to Rs. 6,01,939. The payment is still well below the level of 1937-38. The company is, of course, now fully occupied on war work, especially since the falling off in Japanese demand, now completely stopped. Selling prices are virtually unchanged and the larger turnover is due, in the main, to an increased off-take of pig-iron. The rise in earnings also owes something to sundry income whose source is not specified. The principal changes in the accounts are associated with the reserve appropriations, mainly for tax purposes, the bulk of which has been invested in fixed assets, although there is the usual increase in stock and debtors. Since the close of the year, the tax liability for 1938-39 has been assessed, and paid under protest. The decision of the High Court was not favourable to the company and leave has been obtained to appeal to the Privy Council. The actual provision for taxes in the accounts for that year was 13 lakhs, but this is not necessarily a reliable guide to the amount involved. Since the construction programme was completed early in the year, it seems probable that, once more, earnings have not kept pace with the expansion in turnover. The price of the Rs. 10 ordinary shares is some 57s. ex dividend, giving a yield of some £5 18s. 5d. per cent.

Lever and Unilever NV

News has now reached this country of the allocation of profits earned in 1940 by the Dutch concern, Lever Bros. and Unilever NV. According to a statement which derives from the Reich Commissar for NV, dividends are to be paid on the company's 5, 6 and 7 per cent preference capital, but no payment is to be made to ordinary shareholders who received 3 per cent in 1939 and 7½ per cent in the previous year. The report of the Reich Commissar, Dr Posse, which is discussed at some length in the Free Dutch weekly, *Vrij Nederland*, of November 29th, gives net profits of NV at Fl. 17,056,267 against Fl. 31,755,204. This figure includes dividends received from interests operating in the Reich, including the Protectorate of Bohemia and Moravia and Yugoslavia, but excludes profits from interests in Finland, Hungary, Italy, Poland or Roumania. Reserves receive Fl. 2,000,000 against Fl. 4,000,000 to contingencies in 1939 and Fl. 5,500,000 in 1938 to contingencies and general reserve. It appears from the balance sheet that preference dividends require Fl. 8,583,160. Since the carry forward is reduced from Fl. 16,400,113 to Fl. 11,131,686, the figures, in the absence of the full accounts, suggest that there has been unexplained expenditure amounting to Fl. 11,741,534 against items of some Fl. 3,770,000 in 1939. These figures must be accepted with some caution. The profit of Fl. 17 millions odd clearly does not include receipts from overseas enterprises, but it is felt to be very satisfactory if it includes nothing in respect of this item. The true state of affairs will probably not be known until after the war. Meanwhile, the payment

of the preference dividends releases the funds retained by Limited in its carry forward against the possibility of having to cover them. On the face of it, the 1940 accounts of NV suggest that the specific reserve created for ordinary dividends will have to be used for that purpose, subject to Treasury consent and other safeguards. The balance sheet shows a fall in cash holdings from Fl. 10,654,494 to Fl. 7,750,962 accompanied by a jump in debtors from Fl. 1,040,930 to Fl. 6,803,296 for which investment of liquid assets available in Germany in Reich Treasury bills is responsible. The Dutch concern's current debt to Limited is up from Fl. 19,085,297 to Fl. 21,045,816, the increase is presumably being incurred before May 10, 1940. The reserve fund, after the latest allocation, stands at Fl. 107,000,000. The production of margarine and the cultivation of oil seeds in the Balkans and other areas are of prime importance to the German economy throughout Europe, and it is highly probable that earnings, before tax, in that area will continue to rise.

Associated Equipment Accounts

Full accounts of AEC for the year to September 30th last show a more substantial rise in total profits from £717,799 to £799,577 than was anticipated on the basis of the preliminary statement, discussed in *The Economist* of November 22nd. The decline in the tax free rate of equity earnings from 12.6 to 8.8 per cent is due wholly to the depreciation in tax provision from £421,500 to £560,000. Depreciation requires rather less at £105,477 against £105,551. The maintenance of the tax free rate of dividend on ordinary stock at 7½ per cent permits the transfer of £18,000 against £82,000 to general reserve and the customary increase of £2,000 in the carry forward, bringing this total to £268,000. The chairman points out that the excess of liquid assets over current liabilities amounts to £1,536,732—a figure which actually shows a small decline on the excess of £1,542,335 for the previous year, but which still indicates great strength. The rise in creditors including taxation is, according to Mr Reeve, from £704,418 to £854,912, is, according to Mr Reeve, due almost entirely to the increase in tax provision. War damage provision of £15,000 is charged to general reserve so that this fund is increased only by £3,000 to £673,000 after the current allocation from profits. Among current assets, debtors are sharply reduced from £736,495 to £375,570, while stock is nearly £350,000 higher at £1,778,005 and cash holdings are up from £159,094 to £336,309. The concern is, of course, employed to capacity on Government work, and it is satisfactory to learn that contract prices have now been agreed for last year and the previous year. At existing tax rates there seem to be good prospects of maintaining current payments. The £1 ordinary stock, at 50s. 9d. ex dividend, yields £2 19s. per cent tax free.

Dennis Brothers' Profits

The full accounts of Dennis Brothers for the year to September 30th last show a fall in total net income, after provision for EPT, from £145,095 to £129,400. After the transfer of £10,000, against £25,000, to factory and plant renewal account, equity earnings are reduced only from £99,688 to £98,563, representing a rise in the rate from 132.6 to 137.4 per cent. Shareholders, however, receive a total distribution of 125, against 133.33, per cent, the surplus being used to increase the carry-forward from £166,443 to £171,102. The balance-sheet shows the inevitable rise in debtors and creditors, from £189,233 to £314,006, and from £192,930 to £293,138, respectively. Cash holdings, at £161,105 against £155,157, are slightly higher, and stock at £442,811, against £467,829, slightly lower, owing to more rapid turnover. The company continues to lend £50,000 free of interest to the Treasury and to hold £94,062 of 3½ per cent War Loan. Total reserves, after the increase of £10,000 from current profits, stand at £706,171. The chairman, Mr N. P. Andrew, points out in his statement that the weight of war taxation prevents any rise in distributable profits resulting from the increased turnover. Moreover, it has been necessary to reduce the allocation to renewal fund, while no addition was made to physical plant last year, the balance-sheet value, after depreciation, standing at £251,514. Since EPT was provided at 100 per cent last year, there is, however, no inevitability that the ordinary dividend need be further reduced in the absence of a fresh

rise in the rate of income-tax. The 1s. ordinary shares, now standing at 21s. 6d., yield £5 16s. 3d. per cent.

Gold Mining Profits

According to the annual report of Venterspost, development on the Main Reef shows a decline in payability from 76 to 66 per cent, still a satisfactory figure. Stopping width, which is slightly lower at 89 inches, is still high for the Rand. With a slight improvement in grade, inch-dwts. are almost unchanged at 328. Development on the Contact Reef showed a general improvement, payability having risen from 30 to 44 per cent and inch-dwts. from 459 to 744. The year's development for the whole mine can, therefore, be classed as eminently satisfactory, and the mill is now crushing to its full capacity of 100,000 tons a month. Should development continue as at present, the mine, which is the first subsidiary of West Witwatersrand Areas, should be able to produce at low cost a very large annual tonnage, with possibly a large increase in the reduction plant after the war. A glance at the plan of Sub Nigel shows that major development in depth towards the Vlakfontein is nearing completion, so that the mine will become increasingly dependent upon the comparatively new Eastern Lease, where development has recently shown an improvement, as indicated in the following table:—

	Footage Sampled	Payable	Percentage of Payability	Inch dwts.
Year to June, 1940—				
Whole Mine.....	97,970	47,605	49	447
Eastern Lease.....	17,080	3,040	18	241
Year to June, 1941—				
Whole Mine.....	81,665	36,015	44	470
Eastern Lease.....	13,960	3,750	27	605

It is, of course, the new Eastern Lease area which will ultimately determine the future of Sub Nigel, and prospects here must be more speculative than those in the old portion of the mine. In spite of increased development footage, the New Modderfontein report shows that the ore reserves have fallen heavily, now representing about two years' supply at the present rate of crushing. Remaining undeveloped areas in which payable ore can be expected are steadily declining, so that ore reserves will in future be unable to supply both mills, and it has, therefore, been decided to start mining the pillar which supports the North Mill. The life of the mine is very limited, and profits and dividends will probably continue to fall. The shares can only be considered as a speculation on their eventual break-up value. The report of Nourse shows that, in spite of an increased development footage, the ore reserves fell, representing now about four years' supply to the mill. Development in the upper portion of the mine is almost completed, and remaining undeveloped ground is in the narrow area being developed in the deeper south-east portion, where, however, values are encouraging. Ore reserves will probably continue to fall. The following table indicates ore reserves, payability and dividends for the four mines discussed above:

Company (Year ending June 30)	Ore Reserves		Grade		Dividends		Price	Yield
	Actual	Change	1940	1941	1940	1941		
New Modder 10/-	5,962	-958	3.3	3.1	4/9	3/6	15/7½	22.40
Nourse £1	3,913	-338	4.4	4.3	4/6	4/6	51/3	8.78
Sub Nigel 10/-	3,080	+223	13.3	13.0	15/-	13/3	148/9	8.91
Venterspost 10/-	2,714	+315	4.4	4.4	...	1/4½	37/6	3.66

In a note on Blyvooruitzicht in *The Economist* of November 22nd, it was made to appear, owing to an omission, that the price of 30s. for the shares was considered unduly high. It was not the price of the shares which was in question, but the indefinite continuance of the high development values exposed to date.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

A FIRM but quiet tone marked the close before the week-end in the markets, but, while at the reopening news from Russia and Libya assisted sentiment, the general tendency was to await developments, and turnover, consequently, has declined. The reinvestment of some of the South African loan disbursements and dividend payments led to a revival in the gilt-edged market where, as in other sections, stock is in short supply. In view of this, relatively little buying in the industrial market, particularly of tobacco and brewery issues, has maintained the steady advance in prices. Conditions in the commodity share markets, however, were quiet pending developments.

A revival of institutional demand occasioned numerous small improvements in the gilt-edged market. Thus, on the previous Friday, gains of $\frac{1}{8}$ were registered for $2\frac{1}{2}$ per cent Consols, Victory Bonds, and $3\frac{1}{2}$ per cent Conversion and War Loan, while Local Loans and $2\frac{1}{2}$ per cent Funding Loan both advanced $\frac{3}{8}$. Comparatively light support for long-dated and irredeemable issues at the reopening was sufficient to raise $2\frac{1}{2}$ per cent Consols and Local Loans $\frac{1}{8}$, while $3\frac{1}{2}$ per cent Conversion and War Loan both improved $\frac{1}{8}$. Among dated issues, $2\frac{1}{2}$ per cent Funding gained $\frac{3}{8}$, and $2\frac{1}{2}$ per cent National Defence Bonds 1944/48 improved $\frac{1}{8}$. On Tuesday, turnover subsided still further, but $3\frac{1}{2}$ per cent War Loan and Conversion both improved $\frac{1}{8}$. Later the market continued quiet, some small gains reflecting the scarcity of stock.

The chief feature of the foreign bond market has been sharp fluctuations in Japanese bonds. After closing at the week-end with small declines, Japanese issues were marked down sharply at the reopening, the 5 per cent loan of 1907 and the 4 per cent of 1910 losing 3 points. The following day the resignation of M. Togo led to a sharp rally, in which most issues gained 3 points, and later remained firm. Chinese bonds were firm before the week-end, but suffered from profit-taking on Monday when the 5 per cent loans of 1912 and 1913 both lost a point. The next day saw some improvement, most issues gaining 1 point and the 5 per cent 1912 loan 2 points. Among South American issues, Brazilian and Chilean

bonds were easy on the previous Friday, but the latter rallied on Tuesday. European issues were mainly without interest, but the 5 per cent Austrian loan gained 2 points on Tuesday, while next day Greek bonds and French rails were in demand.

Apart from a gain of $\frac{1}{8}$ in LNER defd. on the previous Friday, conditions in the home rail market were quiet until Tuesday, when a revival of interest led to a general advance in junior issues. GW ordinary and Southern pref'd. both gained $\frac{1}{8}$, while LMS ordinary and Southern defd. improved $\frac{1}{8}$. Senior issues were generally unchanged. Much-reduced activity in midweek led to small declines for Southern deferred and preferred issues, other prices remaining steady. In sharp contrast to other sections, the foreign rail market was dull, total lack of interest leading to a general and persistent decline in all issues. A sole exception were Cordoba "B" debentures, which gained $2\frac{1}{2}$ points on the previous Friday. Elsewhere Canadian Pacific preference was weak. The fall in Argentine railway equities and senior stocks was accelerated in midweek.

The tone in the industrial market remained firm, but turnover declined appreciably, and interest was no longer widespread, investors showing marked preference for brewery and tobacco issues. Favourable results of various breweries encouraged further support, and both before and after the week-end prices continued to improve. Gains of 1s. were numerous, while, on Tuesday, Benskins jumped 2s. 3d. and Ind Coope 2s. 6d. on the dividend announcements. Quiet dealing in the aircraft and motors group had little effect on prices, though on Tuesday, Fairey Aviation gained 1s. 9d. on the final dividend prospects, while Rolls-Royce lost $\frac{1}{8}$ and Leyland $\frac{1}{8}$. R. Thomas preference gained 1s. on the dividend announcement before the week-end, while at the reopening John Brown lost 1s. 3d. on the reduced interim dividend. In general, iron and steel prices moved within narrow limits. Shipping issues recovered on Monday, while the following day Cunard advanced 1s. and Indo-China defd. $\frac{1}{8}$. In midweek, the announcement of an increased bonus for P & O defd. failed to offset the general weakness. Small gains in the early part of current week reflected quiet support for the textile group. Steady buying of tobacco issues resulted in numerous gains for the leaders.

Carreras rising $\frac{1}{8}$ and Gallaher $\frac{1}{8}$ before the week-end, while at the reopening BAT, Gallaher, Imps all improved $\frac{1}{8}$. A rise of $\frac{1}{8}$ in Imps on Tuesday was accompanied by a gain of $\frac{1}{8}$ for BAT, although Carreras repeated the previous day's loss of $\frac{1}{8}$. Stores issues were also in demand, Woolworth gaining 1s. and Marks & Spencer 6d. on Tuesday, when in the miscellaneous section Murex and Turner & Newall both attracted buyers. Later, an easier tendency developed, but prices generally remained steady, although tobacco issues lost ground.

Turnover, rather than prices, in the kaffir market was affected by the prevailing uncertainty, although quiet trading occasioned a loss of $\frac{1}{8}$ for Central Mining at the opening of the current week. On Tuesday, a slightly easier tendency set in, and although Geduld rose $\frac{1}{8}$, Libanon 10d. and West Wit Areas $\frac{1}{2}$, most changes were downward. Threat of hostilities in the Pacific led to quiet and rather easier conditions in the rubber market, but in the tea market, where stock was in short supply, Jhanzie rose 1s. 6d., and Jorehaut and Lokai both gained 1s. on the previous Friday. Oil issues were generally lower before the week-end, although Shell gained $\frac{1}{8}$ against the trend, Anglo-Iranian and Burmah both losing the same amount. The tone at the reopening was distinctly firmer, Shell rising $\frac{1}{8}$, Anglo-Iranian $\frac{1}{8}$ and Burmah $\frac{1}{8}$. The following day, Shell and Anglo-Iranian both improved a further $\frac{1}{8}$, while Royal Dutch rose 2 points. Dull conditions in midweek were reflected in slightly lower prices in the oil and kaffir markets.

New York

THE Far Eastern problem constituted the chief handicap to business on Wall Street before the week-end, and with internal uncertainties still prominent no marked trend developed. The good turnover was due principally to persistent selling for tax purposes, but prices were generally steady. Lack of any incentive at the reopening led to a dull session, but on Tuesday, following on the railway wage settlement, a widespread recovery, with gains up to a point, took place, although sentiment was restrained somewhat on the realisation of the full implications of the new wage increases. Persistent profit-taking in midweek was well absorbed, and most issues improved, Chemical stocks gaining up to 2 points.

Industry and Trade

Concentration of Tinplate Industry

The Welsh tinplate trade is one of the re-rolling branches of the iron and steel industry whose activity has been severely curtailed by the war; a large proportion of the steel formerly used in the production of tinplate for use at home or for export has had to be diverted to other purposes. In 1937, the output of tinned, black and terne plates and of sheets reached nearly 1,000,000 tons, of a gross value, at works, of about £18 millions, and an export trade of 460,000 tons, valued f.o.b. at £10,750,000. Even before the war, part of the industry's plant was obsolete and had become redundant as a result of the erection of a modern continuous strip mill at Ebbw Vale. At present, less than half the mills are working and many of them are not on full time. Here then is an industry ripe for concentration. According to the Census of Production of 1935, 66 establishments were employed in the manufacture of tinplate, with an average annual output of less than 12,000 tons. Even before the war, the national interest dictated the concentration of production at the plants of the Ebbw Vale type and the scrapping of the multitude of small old mills. A committee of manufacturers has been investigating the problem of redundant capacity for some considerable time, but without introducing a realistic scheme. Efforts have also been made to find alternative employment for some of the idle works. Finally, last July, the Ministry of Supply decided to appoint a committee under the chairmanship of Lord Essendon to investigate the problem. The committee's report has now been in the hands of the Government for some time; while its recommendations have not been made public, it is understood that they are anything but drastic. There can be only one solution to the problem. The modern plant at Ebbw Vale should be operated at capacity, while any surplus work should be distributed among the more efficient of the other mills; the older plants that cannot be adapted to other work should be scrapped.

Production Control

Sir John Wardlaw-Milne emphasised during the debate on manpower policy in the House of Commons on Tuesday, that the increase in industry's personnel was only one means of securing an expansion in output, and that another remedy consisted in the better use of workers. There is a double need—for more munition workers as well as for securing an appreciable increase in the output per worker. Much can be done to achieve increased efficiency by better organisation in individual factories and by improved methods of production control. That many industrialists are alive to this need is revealed by the contents of the *Technical Bulletin* issued by the Institution of Production Engineers. A writer in the latest of these bulletins suggests a number of headings under which these problems should be discussed. First, there is the task of devising a production plan which involves the measuring of capacity and load. Secondly, means must be found to check actual performance as accurately as possible; and, thirdly, there is the problem of preventing temporary shortages of materials and stores. These discussions are to be welcomed, because they stimulate research and the pooling of ideas.

The Rise in Earnings

The November issue of the *Ministry of Labour Gazette* carries a year further the enquiry into earnings which is conducted at regular intervals by the Ministry. As before, some firms making returns did not differentiate between men, women, and girls, so that the figures relating to men, women, and girls are based on only 95 per cent of the returns covered by the figures for all workers. The average earnings covered by the figures for all workers were, in the week ended July 12, 1941, 75s. 5d., an increase of 42 per cent compared with the last pay week of October, 1938. There were wide variations between different industries, due in part to variations in the proportions of men, women, boys and girls employed in different industries, for the

wages of these four groups have risen in different proportions as the table below shows:

	Average Earnings in week ended		Percentage increase since
	July 12, 1941	October, 1938	
	s. d.		
Men (21 and over)	99 3		43
Boys (under 21)	40 7		57
Women (18 and over)	44 4		36
Girls (under 18)	25 2		35

The striking increase in the earnings of youths and boys is common to all the principal industrial groups; the only group in which their percentage increase does not exceed

Put every penny into war savings

COMPANY MEETINGS

ROYAL BANK OF SCOTLAND

ANNUAL GENERAL COURT OF PROPRIETORS

HIGHLY LIQUID POSITION

LARGE INVESTMENTS IN GOVERNMENT LOANS

DUKE OF BUCCLEUCH'S ADDRESS

The annual General Court of Proprietors of The Royal Bank of Scotland was held at Edinburgh on Wednesday, 26th ultimo, His Grace the Duke of Buccleuch and Queensberry, G.C.V.O., Governor of the Bank, presiding.

His Grace said:

I assume it will be your pleasure that the annual report and balance-sheet, with auditors' report, will be taken as read.

Before dealing with the ordinary business of the meeting, I should refer to the great loss which the bank has suffered through the death, on August 27, 1941, of Mr R. N. Dundas, W.S., who had been a director of the bank since 1929. By his death we have lost a director whose wide experience of affairs was of great value to us and whose kindly qualities endeared him to all his colleagues.

The twelve months covered by our accounts mark the second complete year of the war. The anxieties of the previous year have continued throughout, but although the outlook is still obscure, we can, without minimising the heavy task in front of us, look with growing confidence to the future.

DEPOSITS AND OTHER LIABILITIES

Turning to the balance-sheet, we show, for a Scottish bank, an impressive total of assets amounting to £98,263,226.

Under the heading "Liabilities," deposits and other credit balances have increased by £6,915,856 to the figure of £82,007,146 appearing in the balance-sheet.

Notes in circulation at £4,602,641 show an increase over the previous year of fully £800,000.

The growth under this heading can be largely attributed to the rise in employment and to the increases which have taken place in wages, but the withdrawal, due to the war, of banking facilities through the closing of many branches and the shorter banking hours, are factors which must delay the return of notes to the banks. I agree with the timely warning given the other day against the dangers and folly of hoarding notes.

The total of £2,077,186 for acceptances and indorsements of foreign bills and other obligations shows little change from the figure of last year.

LIQUID ASSETS AND INVESTMENTS

On the assets side our holdings of cash, balances with the Bank of England and other banks, money in London at call and short notice, which reach the large sum of £18,000,000, provide ample evidence of a highly liquid position and, along with Treasury deposit receipts, which stand in the balance-sheet at £6,500,000, represent fully 28 per cent. of our liability for deposits and notes issued. I may add in passing that the amount of Treasury deposit receipts has increased since the date of our balance to £10,000,000.

British Government securities at £34,765,619 are up by almost £6,000,000 on the year.

It will be seen that the whole of the increase in our deposits, in addition to the sums arising through a reduction in our advances—to which I shall refer later—has gone to aid the Government loan programme for financing the war.

I can again say that a high proportion of our investments in Government stocks is in short- and medium-dated loans and that all these and our other investments are valued at or under market prices ruling on the date of our balance.

In spite of the lack of commercial bills, we are able to show a portfolio, which includes Treasury bills, of just over £3,000,000.

ADVANCES

The total of our advances has declined to £23,926,630 from £25,910,494 a year ago, when we then recorded a fall of £2,000,000 in what is regarded as the most remunerative part of a bank's business.

A decline in advances has been a common feature in all recent banking reports, and is largely due to the changed conditions brought about by the war. Thus, with Government control over commodities and greatly restricted imports, requests for accommodation have lessened. I can, however, say that we are doing everything we can, consistent with sound banking practice, to assist those of our customers who are engaged on work of national importance.

PROFITS

The net profit of the year at £491,522 6s 7d is £65,836 13s 8d less than the amount declared a year ago.

I am sure that the stockholders will not be surprised at the lower profit shown in view of the higher taxation and the continued increase in the charges of management.

APPROPRIATIONS

The directors are pleased to be in a position to recommend that a dividend for the half-year on the capital stock at the rate of 17 per cent. per annum be declared, and that £30,000 be applied in writing off expenditure on bank buildings and heritable property, and that £30,000 be carried to staff pension reserve fund. After these appropriations there remains the sum of £70,272 6s 7d, which it is proposed to carry to our inner reserves against contingencies.

BUSINESS OF THE BANK

The business of the bank and of our associates in England—Glyn, Mills and Co., and Williams Deacon's Bank, Limited—has been well maintained.

To fill a vacancy on the board, Mr Charles Augustus Carlow, Coalmaster, Leven, was elected. Mr Carlow, who is a prominent figure in the coal mining industry, holds office until this Court, when he comes up for re-election.

AGRICULTURE AND TIMBER

I do not propose to attempt, under these war-time conditions, any full review on Scottish industry, but, as one who is keenly interested in farming and forestry, I am glad to report that, during the past year, the farming industry as a whole has had a more reasonable measure of prosperity, with arable farming relatively the most prosperous section. Unfortunately, hill sheep farming, which is so important to Scotland, has had a most adverse year, accentuated by the severe weather conditions of the past winter.

Labour shortage has, in many areas, seriously limited the scope of production and prevented farmers from giving their land the full attention needed to attain the best results.

Tremendous demands are being made on timber resources in Scotland, with the result that stocks of mature softwood timber are diminishing.

Complaints are heard from time to time of the injurious burden of Excess Profits Tax upon industrial firms which will have to make heavy replacements of plant after the war. Shipping com-

panies have had their claim met in some measure by credits for tonnage replacements, and forestry also deserves consideration in order to meet the cost of reafforestation.

Some provision seems necessary for the future of the Scottish timber industry, which again is serving a national need, and indeed a national extremity.

TRIBUTE TO OFFICIALS AND STAFF

We have at the present time 592 members of our staff who are serving with H.M. Forces in every theatre of the war and in nearly every branch of the services.

We deeply regret that four members of our staff have made the supreme sacrifice and our sympathy goes out to their relatives. Fourteen others are missing or known to be prisoners.

The absence on active service of almost 43 per cent. of our pre-war staff has thrown an additional strain on those who remain and we wish to express our deep appreciation of the loyal manner in which the staff—permanent and temporary—have carried on.

I am specially glad to have the opportunity of thanking those members of the staff who have also so willingly undertaken guard and fire-watching duties, which have involved absence from their homes on many occasions throughout the year.

To Mr Whyte, our general manager, the assistant general managers, the senior officials at head office, and the managers at London, Glasgow and Dundee offices, our special thanks are once again due for the devoted efficiency with which they have met the exceptional difficulties and responsibilities of the times.

APPROVAL OF ACCOUNTS—DIVIDEND

I now beg to propose that the report, containing a statement of the accounts and balance-sheet, be approved, and that out of the profits of the year a dividend at the rate of 17 per cent. per annum for the half-year, under deduction of tax, be declared in conformity therewith.

The report was approved and the governor, deputy-governor, extraordinary directors and the retiring ordinary directors were re-elected and auditors were reappointed for the ensuing year.

CASTLEFIELD (KLANG) RUBBER ESTATE, LIMITED

SUBSTANTIALLY IMPROVED RESULTS

The thirty-fifth annual general meeting of Castlefield (Klang) Rubber Estate, Limited, was held, on the 20th ultimo, in Oxford.

Mr W. Arthur Addinsell, chairman of the company, moved the adoption of the report and accounts and the declaration of a dividend of 10 per cent. for the year ended June 30, 1941.

In the course of his address the chairman said: The substantial improvement in the results is mainly due to the higher releases under the Restriction Scheme and the better price obtained for our output. We harvested a crop of over two million pounds, which is the highest in the history of the company.

The gross profit figure was £57,525 (compared with £38,666 for the previous year), equivalent to over 28 per cent. on the issued capital. Taxation, however, requires a larger proportion of our earnings. Including the estimated Excess Profits Tax liability, approximately £36,000 will be paid to the Exchequer in respect of the financial year.

It represents 63½ per cent. of the profit, but we have the satisfaction of knowing that we are contributing substantially to the war effort and helping the nation in its grim and epic struggle.

REPLANTING EXPENDITURE

Expenditure during the year on special cultivation and replanting totalled £3,711. An area of 78 acres was replanted on Castlefield Estate and 107 acres were felled and cleared ready for replanting this year.

Since the year 1936 a total of 806 acres has been replanted, of which 509 acres have been budded and 297 acres planted with clonal seed.

The fixing of the quota at 120 per cent. since October 1st last

means that production is virtually unrestricted—to supply our American friends with sufficient rubber for their current needs, to accumulate reserve stocks for industrial purposes and defence, and as a precaution against supplies being cut off.

To obtain full production many producers have had to bring in areas which in normal times would have been rested, and the trees would have benefited considerably. Those companies are therefore exhausting a proportion of their capital by using up bark reserves. For this reason alone the refusal of the Treasury to include rubber in the list of commodities declared admissible for EPT allowance as wasting assets is inexplicable. By working to full capacity producers are subordinating commercial interests to the service of the country.

By producing quantities in excess of normal, anticipatory profits are being obtained, the major portion of which will be paid to the Government as Excess Profits Tax. It is hoped that some tangible recognition will be given by the authorities, and a special allowance made before calculating the liability for taxation.

The resolution was adopted.

BUKIT KAJANG RUBBER ESTATES, LIMITED

INCREASED NET PROFIT

The thirty-second annual general meeting of Bukit Kajang Rubber Estates, Limited, was held, on the 20th ultimo, in Oxford.

Mr W. Arthur Addinsell, chairman of the company, moved the adoption of the report and accounts and the declaration of a dividend of 10 per cent. for the year ended June 30, 1941.

In the course of his address, Mr Addinsell said:

The net profit, after payment of £3,222 export duty to the Straits Settlement and Johore Governments and charging home expenses and crediting dividends on investments, amounted to £53,061—an increase of nearly £20,000 on the previous year.

If that were the end of the story we should have cause for much gratification, but it is necessary to provide no less than £32,450 for taxation. Excess Profits Tax is estimated at £29,000, and the balance will be required to amplify the income-tax deducted from dividends.

With regard to the estates administration, the policy of manuring the middle-aged and young clearings, and gradual replanting of the old areas, is being pursued. The replanting programme for the current year extends to 100 acres, and with the passing of years this rate may have to be accelerated. Accordingly, although the special cultivation and replanting reserve was in credit to the extent of £2,206 at the close of the year, it is deemed prudent to allocate a further £3,500.

Included in the fixed assets is our investment in Edensor Rubber Estate, Limited, and I am pleased to inform you that company has commenced to remunerate its shareholders with an inaugural dividend approximating 4 per cent. on the loan capital invested.

I would also draw your attention to the item of £12,500 invested in National War Bonds.

CROP FIGURES

A crop of 1,862,704 lb. was harvested, which was fully sufficient to met the export rights available. For the first quarter of the current financial year the Quota release was fixed at 97½ per cent., and was advanced to 120 per cent. as from October 1st.

We are advised that the estates will be able to produce sufficient rubber, with the unexportable stock in hand at June 30th, to exhaust the export licences available to December 31st, but if the release continues at 120 per cent. next calendar year, it will not be attainable during the first three or four months because they cover the wintering period.

I consider that we have abundant justification for taking full credit for the contributions this company, as a unit of the rubber-producing industry, is making to the war effort, by supplying a vital war material and providing the financial means of carrying on the conflict.

The resolution was adopted.

ANGLO-IRANIAN OIL COMPANY, LIMITED

FIVE PER CENT. DIVIDEND MAINTAINED

SIR WILLIAM FRASER'S STATEMENT

The thirty-second ordinary general meeting of the Anglo-Iranian Oil Company, Limited, was held, on the 2nd instant, at Britannic House, Finsbury Circus, E.C., Sir William Fraser, C.B.E. (the chairman), presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

TRIBUTE TO THE LATE LORD CADMAN

On May 31, 1941, the company suffered a grievous loss by the death of its chairman, the late Lord Cadman, who had served the company in that capacity for fourteen years. Many high tributes have been paid to Lord Cadman's personality and to his achievements in public life. His greatest work, however, was that which he did for the Anglo-Iranian Oil Company. I am sure that all stockholders will join with the board in an expression of deep sorrow at the death of their distinguished chairman. The board has appointed Mr H. B. Heath Eves to be their deputy-chairman, and Sir Warren Fisher to be a director of the company.

Our operations have proceeded as satisfactorily as was possible in the circumstances, and I am glad to inform stockholders that the interests of the company did not suffer seriously in the course of the disturbances in Iraq in May last and in the occupation of Southern Iran by British forces in August. I regret that it is impossible for me to give any further information on our activities, but I am sure the reason for this will be fully appreciated, and I trust that stockholders will be content to remain uninformed until such time as it is possible to speak without detriment to the national interest.

In the balance-sheet the most striking feature is the large increase in the amounts under "creditors" and "debtors." This is a direct result of the war. "Refinery, tank installations, etc." shows a decrease of £804,313. This is due to the depreciation which has been provided and to the fact that new constructional work remained at the minimum to which it was reduced on the outbreak of war. The board are unable to ascertain the position of the company's assets in enemy or enemy-occupied territory included under "investments in subsidiary companies," and they have considered it advisable to make a further addition to the substantial reserves made in previous years.

PROVISION FOR TAXATION

The "balance of profits, etc." shows an increase of £911,613 over the comparable figure for the previous year. Against this amount, however, there is an increase of £1,019,550 in "provision for income-tax and national defence contribution." The result is that the balance brought down, £2,841,909, approximates closely to that for the previous year.

In December, 1939, an interim dividend of 5 per cent. was paid on the ordinary stock. At the annual general meeting of the company in August, 1940, the late chairman said:

The trading profits earned during the year are sufficient to have enabled a small final dividend to be paid, but I am sure that stockholders will agree that in times like the present it is essential to conserve the resources of the company.

In considering the results of the company's operations during 1940, the board felt that they should continue this policy, and they have recommended that a dividend of 5 per cent., the same as that for 1939, be paid on the ordinary stock. This leaves a balance of £1,101,351 on profit and loss account to be carried forward, an increase of £138,800 over the amount brought forward from 1939, thus adding to the reserve which this item constitutes.

TRIBUTE TO THE STAFF

I reported earlier in this statement that our operations had proceeded as satisfactorily as possible in the circumstances. For that fact, a high measure of praise is due to the company's staff, whether they are serving on sea, in the United Kingdom, in Iran, Iraq or elsewhere. There have, unfortunately, been casualties among the staff of the company. Men have been killed and injured. Some are prisoners of war. To the relatives of those who have fallen, we offer our deepest sympathy; and to those who are injured or prisoners, we wish a speedy recovery or an early release from captivity.

The report was unanimously adopted.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

RESULTS OF INCREASED TAXATION

The ordinary general meeting of the Consolidated Gold Fields of South Africa, Limited, was held, on the 4th instant, in London, Mr H. C. Porter (the chairman) presiding.

The following is an extract from the chairman's address circulated with the report and accounts:—

In the profit and loss account of New Consolidated Gold Fields, Limited, dividends, profits, etc., amount to £723,501, compared with £739,218, a small decrease of £15,717. Profits on sales of investments were less by £116,000, opportunities for profitable realisation having been rare until the closing months of the year. Our revenue in general has been detrimentally affected by taxation. The profit carried to the appropriation account is £653,917, about £10,000 less than last year. This year we have to provide £200,000 for U.K. taxation, against nothing last year, in view of the rise in value which took place during the year in our holdings. A dividend of 2s. per share, less tax, has been declared. The payment of this dividend enables your company to distribute a similar amount.

The liquid position of the new company is very strong. Including gilt-edged holdings it was at June 30th well over £2,000,000, an increase of £370,000 over last year's figure. Last year I informed you that after the close of the financial year a marked change for the better in the fortunes of our company came about, and it is gratifying to be able to report that the improvement which began at that date continued throughout the year with which I am now dealing.

The scale of taxation of the gold mines in the South African Union has been considerably increased. The direct result of the increased taxation has been a substantial reduction in the amount declared in dividends, notwithstanding the expansion in operations, so that shareholders in gold mining companies are making increased contribution to the Union's war effort. The mining industry accepts that it should pay its full share of the cost of the war, but the imposition of the tax on shareholders outside the Union is not calculated to encourage the investment of overseas capital for the development of new mines when the war is over, although it is to be hoped that when that day comes the Government in power will eliminate this special tax and, in fact, reduce all forms of taxation on the industry to reasonable proportions in order to foster expansion.

The Excess Profits Tax has fallen with particular severity on the West African gold mining industry, which, for the greater part, only reached full production after the standard period. Though certain concessions have been embodied in recent Finance Acts, their actual value remains to be determined and no effective relief has yet been secured.

The report was unanimously adopted.

THE STRAND HOTEL, LIMITED

IMPROVED RESULTS

The annual general meeting of this company was held, on the 4th instant, in London.

The following are extracts from Major M. Gluckstein's statement which was circulated with the report and accounts:—A year ago, when referring to the company's prospects, I said that if the figures were no worse than those then under review, and our capital assets remained intact, we should feel that we had no reason to complain. Actually the year's working shows some improvement on that of the previous year, although the volume of our business was still much below normal.

After allowing for the dividends on the preference shares, the year's figures permit the payment of a dividend of 7 per cent. on the participating preferred ordinary shares, and there remains a small balance to add to the amount to be carried forward in the profit and loss account. The dividend on the participating preferred ordinary shares compares with just over 2½ per cent. last year, and in view of present conditions the results of the year's working can be regarded as satisfactory.

You will not expect any forecast of the company's prospects for the current year. I can only say that at present our turnover, bearing in mind all the circumstances, is satisfactory.

The report and accounts were adopted.

Shorter Comments

(Continued from page 699)

Canadian Pacific (\$000s).—Gross earnings in October \$21,577 (\$16,892), working expenses \$15,639 (\$11,421), net earnings \$5,938 (\$5,471). Aggregate gross earnings January 1st-October 31st \$180,034 (\$138,740), aggregate net earnings \$35,666 (\$25,761).

Canadian National (\$000s).—Gross earnings in October \$28,761 (\$22,985), working expenses \$22,722 (\$17,744), net

earnings \$6,039 (\$5,241). Aggregate net
earnings January 1st-October 31st
\$54,628 (\$33,210).

Celanese Corporation of America.—The previous quarter's dividend of 50 cents per Common share has been repeated for the quarter ending December 31st. The Common stock (n.p.v.) is quoted at £6 in London.

Canadian Celanese, Limited.—In addition to the usual quarterly dividend of 25 cents, Common stockholders are to receive a bonus of 50 cents, against 25

cents paid in the two previous quarters. The year's dividend totals \$2 (\$1.90).

The year's dividend totals \$2 (\$11.50).
Nichanga Consolidated Copper Mines.
 —Sales of copper in year ending March 31st amounted to £552,564; operating costs of pilot plant £544,485; resulting in net profit, after general expenses, of £17,943. Of this, £8,113 is put to depreciation reserve and £9,830 to winding off preliminary expenses. This compares with last year's interest receipts of £176.40, when it was decided to suspend the development programme, and to develop the capacity of the pilot plant.

to the actual consumer, whose feeding habits are dictated to him—at every stage the industry is subject to decisions that are taken in the public interest, without regard to the balance between profit and loss. Yet there is singularly little public ownership from one end of the industry to the other.

Clearly there is a real and fundamental antithesis between these two ways of running a business. On the one hand, there are all those activities—a growing list in recent times—in which the community is not prepared to allow demand and supply to work without control. The most obvious and fundamental of these are those activities that provide the people with the basic necessities of a decent existence—primarily food, housing, education, health. No community in the modern world is willing to leave these activities alone, to leave them to pay their own way according to the principles of the market place. On the other hand, there are all those activities which the state, however much it may interfere with them, is unwilling to subsidise and must therefore leave in the last resort to earn their living, to cover their costs, to follow the profit motive. This is the real antithesis in modern society, and it is one to which public or private ownership is almost completely irrelevant. It is as possible for "private enterprise" to fit into the category that is run by order of the state as it is for publicly owned corporations to exist by the principles of the free market. This must not, of course, be construed into an argument either for or against public ownership. Nationalisation should be a purely technical matter of organisation. There are many industries that would be the better for it; there are others where it would do no harm; and there are others where nobody in his senses would suggest it. The proper course for public controversy is to detach itself from this particular red herring and concentrate its attention on the real issue, the antithesis between industries run by order and industries run by freedom.

This is an antithesis, but it should not be a conflict. The secret of the political success of democracy, at least in the English-speaking peoples, is that it has learnt how to preserve a just balance between Order and Freedom. The British democracy, for example, would be less successful if its discipline were not tempered by freedom and its freedom by discipline. Perhaps the reason why democracy has failed, in the twentieth century, to repeat in the economic sphere its political success, is that it has not applied the same formula. In economic matters, Free-

dom and Order, instead of complementing each other, have obstructed each other. Every attempt to organise a field of economic activity by principles other than the marriage of demand and supply tends to be defeated by the stubborn rearguard actions of "free enterprise" and "sound money." The exception to this rule is the largest of all activities—war; and it is allowed to be an exception simply because the desirability of the community's doing something that does not pay is in this case, obvious; it is very much harder work to convince the public that any other non-paying activity of the community could also be worth while. But on the other hand, in the sphere where activity must pay its way, there is a tendency to obstruct its path by penal taxation, by cramping regulations and by general abuse of the so-called "profit motive."

It is very important that there should be clear thinking on this broad issue. For if once it could be generally recognised that, in economic matters as in political, the successful practice of democracy requires the principles both of Order and of Freedom, the way would be open for a truly progressive and distinctive democratic economy. The watchword should be "Take the brakes off." In those economic activities that are properly within the province of Order—especially those concerned with assuring a decent standard of living for all—let the organising and planning power of the state be used to the full; let it, if need be, assure a food supply by the communistic method of giving it free, as is now done in education; but in any case let it adopt whatever methods are best suited for its purposes. But let the brakes be taken off in the province of Freedom also. Let it there be recognised that, since enterprise, whether individual, corporate or socialised, is the essential main-spring, successful enterprise must be neither penalised nor derided.

Is there not here the prospect of a grand reconciliation of the creeds? Is it not possible for the Right to realise that enterprise will be the more free the more successfully the state is allowed to organise economic security? And is it not possible for the Left to admit that, once security is assured, its interest lies in stimulating to the full the free enterprise on which the prosperity of the whole community depends. When the question is asked whether we want more state planning or more free enterprise, the only sensible answer is that we want a great deal more of both.

Unity for War

THE world has entered its first phase of universal totalitarian war. To wage it successfully, the Allied nations need a scale and scope of military planning as universal and totalitarian as the war itself. The present demand for an "Allied Supreme Command" or a "United Allied Council," even if its form is impracticable, does reflect the lesson, painfully learnt in the first two years of war, that in total war all means of war are short, that the pooling and allocation of supplies, the rationing and restriction of demand, are the secret of war economy and that priorities and allocation demand a central plan. Now that the major units concerned are the British Empire, the United States, Russia and China, the basic problem is no different from the one faced by Britain and France alone in the first nine months of the war. Only the machinery is far more difficult to devise.

In the all-embracing activity of total war, it is possible to mark off three different spheres of action. They overlap, of course, as things must do when they are all subordinate to one common end, but they can be kept reasonably distinct. The first is strategy, a category which now embraces not only the general military planning of the various campaigns, but also those activities which

were formerly claimed by politics and diplomacy. Relations with the few remaining neutrals, propaganda, even internal political relations, are all subordinate to the single task of victory.

Next comes the sphere of war production proper, the actual output of the machines and the munitions of war. This category fades off without any clear boundaries into the third sphere, that of general economic policy. One of the great psychological steps to be taken in total war is to realise that the aim of these two separate categories is the same, the mobilisation of the most efficient possible war machine. They differ only as the two sides of the same medal—the one concerned with More Guns, the other with Less Butter.

If there is to be a genuine unity of effort between the Allies, none of these categories can be omitted. It may be said that, of the three, some degree of unity of production has already been achieved. In London, the North American Supply Committee and the Allied Supplies Executive, in Washington the British Supply Council, the Office of Lend-Lease Administration (now known as OLLA) and the Supply Priorities and Allocations Board (SPAB)—all these, working together, have established

a considerable degree of unity in planning. Joint Anglo-American aid to Russia and the recent offer to the United States of the facilities of three British-owned shell factories in Canada are only two obvious examples of the process, by which both the sources of supply of munitions and their uses against the enemy are being consolidated into a single plan. The existing machinery, if strengthened, is probably sufficient to meet the production problem, which may well be simplified by the fact that the United States, alone among the Allies, will, in the long run, have an excess production of war material.

The organisation of general economic policy, on the other hand, is still very much in embryo. Lend-Lease arrangements cover more than munitions of war. Aid to Russia has included foodstuffs and raw materials as well as tanks and aircraft. Anglo-American shipping policies are at least partly co-ordinated. The joint operations of the Ministry of Economic Warfare and of the Economic Defence Board have included the buying up of strategic raw materials, and both bodies are concerned themselves with the problem of surpluses and their distribution to Europe after the war. All these activities clearly fall within the sphere of general economic co-operation, yet the mere listing of them shows how incomplete is the field thus covered. The difficulty is, of course, that the necessities of total war are easier to grasp in the sphere of armament production than in that of the national economy generally, where there are the most tenacious resistances to be worn down before it can be seen that in modern warfare there is no such thing as civil production. It is only after each Allied country has reached the point at which supplies for civil consumption need to be rationed, controlled and eked out that a joint inter-Allied plan for this sphere is possible. It is only when each Ally has a national manpower policy that any thought can be given to a joint manpower policy. Yet until the pooling of resources is accomplished, the Allies' war effort will go forward in a wasteful fashion, with many of its major problems undecided.

Little, for example, has been done in the sphere of manpower, although the precedents are there—the most striking is the new venture in British-controlled Eritrea, where American workers are building a fully equipped military supply and repair base. Transport difficulties—if nothing else—would hinder a pooling of labour such as Hitler has achieved in the "new order," but in all administrative, technical and skilled grades of work, a far wider interchange could be secured. Another sphere, which so far has been barely touched, is that of supplying the civil needs of the four-fifths of mankind that is now enrolled in a single alliance. Food has come to Britain and gone to Russia; the British Supply Centre in Cairo has distributed foodstuffs and bought up stocks in the Middle East; the problem of South America's surpluses has also been considered. But until a week ago, many of these problems were discussed in the old peacetime framework of a struggle for markets. The problem now is one of supply, and what is wanted is a review not of this or that need, but of the Allied supply position as a whole. For this, the plan and the machinery are both lacking.

There are two models for such machinery. One is the experiment in total co-operation worked out by the French and the British Governments in the first nine months of the war. The fact that the experiment collapsed with the rest of Franco-British co-operation in June of last year is, of course, no discredit to the machinery set up—nor does the fact that it was never, in these early months, called on to deal with the more critical phases of any economic problem mean that it could not have handled them when they arose. The basic conception of this Franco-British machinery was a joint committee linking each Ministry in London with its opposite number in Paris, with a joint co-ordinating committee at the top. Another obvious precedent is the machinery for co-operation growing up between the United States and Canada. Here, side by side with the Permanent Joint Board for Defence, a number of joint economic committees have been set up. Their task is to effect "the

more economic, more efficient and more co-ordinated utilisation of the combined resources of the two countries in the production of defence requirements," and "to reduce the possible post-war economic dislocation consequent upon the changes each country is at present undergoing." The objects of general economic collaboration among all the Allies could hardly be better expressed.

Both these experiments are bilateral, whereas the problem of Allied supply is multilateral. But it would be a mistake, in the pursuit of tidiness and symmetry, to insist on one supreme and universal Economic Council. There are two reasons that would inevitably prevent any such council from being more than a formality. The first is distance and difficulty of communication. From any one of the centres of Allied power to any other is several days' journey; men who have real weight in their own nation's counsels could not often be assembled in one place at one time, and subordinate delegates might accomplish little more than the normal diplomatic machinery. The second reason is that not everything concerns every country equally. For example, China is not vitally concerned with the question of co-ordinating shipping facilities. Even Russia's concern is not so immediate as that of some of Britain's smaller Continental Allies. Again, there are many arrangements between Russia and China which are of no immediate importance to the other allies. Nevertheless, a broad framework of multilateral machinery will be necessary if bilateral arrangements are to be kept within a proper framework. Apart from a structure of committees which will necessarily be largely bilateral, each country should nominate a small group of men of the highest rank whose task will be co-ordination and perspective. If a Supreme Allied Council is not possible, a corps of Ministers of State At Large could perform many of its functions.

Ultimately both war production and general economic policy depend upon the political discussions of the Allied Governments. Here in the overriding sphere of grand strategy, no machinery, no subordinate organisations can take responsibility from Mr Roosevelt, the British War Cabinet, Stalin, and General Chiang Kai-shek. It is hardly worth repeating that the closest possible understanding and confidence should be established between the governments. It is equally obvious that personal contact in the manner of the Atlantic Meeting can only be reserved for the hours of supreme significance. Probably more could be done—and done more imaginatively—in the way of representation in the Allied capitals, and in the sending of senior Ministers on special missions. For example, British representation in Washington could well be improved. Here the Lyttelton precedent of a Minister of State side by side with an Ambassador is obviously relevant. So possibly is Mr Lyttelton himself.

The sphere of military staff co-operation, though it depends immediately upon the decisions of the governments, demands more regular contact. Quite apart from Russia's unclarified attitude to the Japanese war, the clear strategic division of the war into a European and Far Eastern sphere of land fighting—the naval war is indivisible—makes it impracticable to propose one supreme Allied Command on a world-wide scale; but one commander-in-chief to each front is essential if there are to be effective decisions and prompt action. The Eastern Pacific falls naturally to the United States, North Africa to the British, Eastern Europe to Russia, but there are intermediate spheres—the Atlantic, Persia and the Caucasus and the triangle Singapore-Surabaya-Manila—where there is no obvious decision, and agreement must be reached.

There is a long road to cover and there are many pitfalls to avoid before the goal of total unity for total war is reached. Yet they are not insurmountable provided that the goal of victory is always to the fore and practical politics, not prejudice or ideology, determine what form the machinery of unity shall take. The Allies have little to fear if they go forward together under the banner of confidence and common sense. Indeed, they have much to hope for: the surest foundation for organs of permanent co-operation after the war would be a record of achievement in winning the victory.

Eleventh Hour in India

THERE are stirrings in the Indian deadlock.

I would ask again whether it is not possible for the divisions which exist to be bridged, and for India to go forward as one, in support of ideals for which there is such general and overwhelming support throughout the country.

Lord Linlithgow, the Viceroy, made this appeal on Monday. The *Times of India* is convinced that, if anything can bring about internal unity, it is Japan's aggression. Mr Gandhi has repeated that Congress wishes neither disaster to British arms nor the victory of Nazis or Fascists. Pandit Jawaharlal Nehru, fresh from prison, has admitted that the progressive forces of the world are aligned with Russia, Britain, the United States and China. On the eve of the pre-Christmas meeting of Congress, M. Rajagopalachariar, former Congress Prime Minister of Madras, has called for coalition governments in the provinces and at the centre.

Congress is divided. Neither Mr Gandhi nor Pandit Nehru is willing, while India is "unfree," to support the war they favour. The President of Congress, also just released from prison, is "unable to visualise any change" in the non-co-operative policy of Congress; and there is the same fissure on the other main, Moslem, wing of the Indian Opposition. In Bengal, Mr Fazlul Huq, the Premier and member of the Moslem League, resigned his office as head of a Moslem government on December 1st and announced the formation of a coalition party with non-Moslems. Mr Jinnah, President of the Moslem League, threatened him with disciplinary action; but, on December 12th, Mr Fazlul Huq accepted the invitation of the Governor of Bengal to form a coalition administration. Officially, the anti-British attitude of Congress and the anti-Hindu attitude of the Moslem League remain intact. But the call to co-operate against the common enemy is being listened to by many inside both bodies.

The Japanese danger may conceivably bring Indian politics back to realities. The existing unreality was frankly admitted by Mr Gandhi just before the Japanese move.

The Government claim (he said) that, despite Congress efforts, they are able to get all the men and money they want from India. Therefore Congress opposition in their estimate can only be moral efforts and a moral demonstration. I for one am entirely satisfied with that.

The Mahatma, in short, is content to oppose the British war effort by the "symbolical" anti-war speeches of his followers, so long as he believes that the British will win. India is now the pivot of Eastern defence, the base of supplies and reservoir of manpower for a front which stretches from Libya through Iran to Malaya. Large orders for war material have been placed in India by all the Eastern Group countries. India's capacity for munitions production is being raised to a peak; the Chatfield plan for modernising metal and steel manufacture is nearly finished; engineering and shipbuilding output is being accelerated. In less than eighteen months, the Army in India has come near to the numbers raised in four years in 1914-18. The total of combatants, a fifth of them technical personnel, is now almost a million. The people of India know that Burma and Malaya, both now invaded by the Japanese, are their eastern bastions; last week they were officially told that early air attacks must be expected on Assam, Bengal, Bihar and Orissa.

The coming meeting of Congress will reveal at one and the same time more disposition to co-operate in the war effort and more stubbornness in resistance. Whether the present "symbolical" civil disobedience will be continued, abandoned or turned into something more active and ugly, it is impossible to say until Congress, or more correctly its caucus, the Working Committee, has decided. Certainly, more Indian politicians than at any

time since the war started are now persuaded of the need for unity and collaboration. The closing-in of the world war may save India from the internecine conflict that has seemed possible, even imminent, ever since the constitutional arrangements of 1935 were abrogated, at the beginning of the war, by the withdrawal of Congress from participation in Indian government.

Non-co-operation is an Indian habit, war or no war. The Constitution of 1935 has not failed (as Mr Churchill said it would) because it opened the door for Indian Nationalists to seize power and brush aside all safeguards. On the contrary, it has failed because the Nationalists have refused to exercise any power at all. The view of Mr Guy Wint in a timely book which he and Sir George Schuster have just written in collaboration* is that

if the major parties had shown a reasonable disposition to co-operate with Great Britain and with one another, the transition [under the Act of 1935] to a stage completely satisfying India's aspirations would have been smooth, easy and rapid. . . . One by one the remaining fetters would have rusted and fallen away.

Congress, the strongest Nationalist party, was from the first unwilling to work the Act, even to its own advantage. In 1939, when war was declared without ratification by the central legislature, the Working Committee of Congress ordered a return to non-co-operation. The Viceroy's offer to include "representative Indians" on his Executive Council was refused by the Moslem League as well as by Congress; and neither of these two main political parties has accepted places on the new Defence Council and expanded Executive Council set up earlier this year.

It is arguable that these offers came too late and too much in the shape of "concessions"; that the mistake was made in India, as in South Africa, of ignoring beforehand, ostrich-like, the political problems that an outbreak of war would inevitably raise; and that neither the Executive Council nor the Defence Council have in fact sufficient authority in the conduct of war and administration to justify Nationalist participation. Admittedly, it is nonsensical for people in this country, or in India, to accuse the Indian Government of "reaction" or "oppression" every time it refuses to accept proposals from the Nationalists which are patently absurd or impracticable. And, in the context of the liberal reforms which have been slowly matured for a generation, their proposals are usually unworkable, because it is probably true to say that neither Congress nor the Moslem League has any real faith in Parliamentary self-government. It is a misfortune that Indian Nationalism now is not the same as in 1885 or 1909. Then, the typical Nationalist, who was probably a western-educated Hindu, wanted national unity and home rule; and the reforms of 1919 and 1935 were designed to give India precisely these two things. But the typical Nationalist now is different; he tends to be either a member of Congress who believes that self-government means rule by a single mass party, as in Russia or China, or a Moslem who believes that popular government is a plot to place power in the hands of the more numerous Hindus. But it is equally nonsensical to suggest that all the faults have been, or are, on one side. It cannot be pretended that the Indian Government has played its full part. The trouble is not that the Government has been obstructive or "Imperialist," but rather that it has taken too negative a view of its responsibilities. It has honestly tried to implement the liberal constitutions of 1919 and 1935; it has "fulfilled its obligations." But it has tended to regard the acceptance of Indian self-government, somewhat pharisaically, as a reason for

* "India and Democracy." By Sir George Schuster and Guy Wint. Macmillan. 444 pages. 12s. 6d. Mr Wint surveys the historical and political background, Sir George Schuster the economic and administrative prerequisites of good government.

abdication of its own duty to offer a positive lead in policy and negotiation. There have been personal interventions from the lofty height of the Viceregal Lodge. But, generally, the Government has neither sought the confidence of Indian politicians nor given them its own. Mr Wint speaks of "racial aloofness and the racial estrangement between the dominant power and its subjects."

There has never grown up between Englishmen and Indians the community of life which was the priceless possession of the inhabitants of the Roman world.

Here is the gap in which the free future of India is being lost. It is not the abuses of British rule that have fostered the intransigence and illogicality of Indian Nationalism, but its remote and tactless manner.

The question now, at the eleventh hour, is whether the last word for all India must therefore be left to be spoken by slighted and irresponsible politicians. Mr Wint is pessimistic:

In 1753 (he writes), after a visit to Paris, Lord Chesterfield wrote: "All the symptoms which I have ever met with in history, previous to great changes and revolutions in government, exist and daily increase in France"; and a rather similar observation forms itself in the mind of a visitor to contemporary India.

Congress is not a political party, but a mass movement, dominated by a small and ambitious clique, and the Moslem League is a reply to Congress. Since the Act of 1935 put "power on the counter," Indian politics have been dominated by the communal feud; it is the ambition of the Moslem League to split India into separate states; of the Moslem League and Moslems, there remain the barriers of religious beliefs and peculiar customs. India is segmented by its traditional ways of life and the character of its varied peoples.

It is a constant impediment to every kind of enterprise that some of those engaged, either feeling themselves slighted or because their viewpoint has not *in toto* been accepted, are likely at some stage to walk out.

NOTES OF THE WEEK

The Threat to Singapore

The first fortnight's fighting tends to confirm the original impression that Japan's main purpose is to neutralise, even if not capture outright, the great Allied base of Singapore. The blow at Pearl Harbour was, perhaps, primarily designed to prevent any movement westwards of the main American battle fleet. The attacks on the Philippines—which have slackened in recent days—were possibly also designed to concentrate all the attention of the United States Asiatic fleet and of the Philippine armies on home defence. The Dutch East Indies have not so far been attacked, but besides the occupation of Thailand and the Kra peninsula, new landings are reported from North Borneo, which lies between the Philippines and Singapore. The situation developing in Malaya is undoubtedly grave. Thailand's surrender has proved absolute, and the Japanese have good land and air bases for attacks southwards to Singapore and north-westwards to Burma. So far the attacks are mainly developing to the south. Kota Bharu has fallen to them and they are advancing dangerously in Kedah. It is true that, apart from a landing at Kuantan, these reverses are still taking place at a fair distance from Singapore. But the Japanese do not need to occupy Singapore to reduce its efficiency as the centre of Allied resistance. From the west, it is approached by the narrow waters of the Malacca Straits. If the Japanese secure Penang and spill over into Sumatra, this westward approach will be closed. The occupation of Portuguese Timor by Australian and Dutch forces may help the defence of Australia, but it can hardly affect the threat to Singapore. The Governor of the Straits Settlements has admitted that things are "very difficult," and it does seem as though the whole defence position—on land as on sea—is handicapped by lack of fighter support. Perhaps the best news in the Far Eastern situation was brought back—against all expectation—by Colonel Knox from Pearl Harbour. Heavy though the losses were—one battleship and five other warships

The deadlock and the danger seem complete. But there are other signs. In Bengal, the Punjab, Sind and Assam, 100 million Indians, a quarter of the whole, are still being ruled by parliamentary coalitions under the 1935 Act. All over India, war production and recruitment are going forward practically unimpeded. The Viceroy's Councils, with their new Indian members, are representative neither of the political parties nor of Indian talent; but they are working more effectively and being consulted more by the Executive than was feared or expected. The present position in politics and administration is, on the face of it, untenable; but somehow it has not broken down in disorder; and this must be set against all the dangerous debits in the Indian scene.

The solution of the constitutional impasse is as far off as ever. It may well be that the parliamentary method cannot be fully rooted in Indian soil; and it is likely that, for the stability of Indian self-government, it will be necessary to look to American, rather than British, examples for the status of the Executive. Sir George Schuster is probably right when he maintains that what India needs most, economically, is a practical programme to raise the productivity of Indian agriculture and the nutrition of the people; and that only by collaboration in these economic tasks can Indians work out the political salvation of their country; *solvitur ambulando*. But the politicians refuse to collaborate. The question is whether India's present danger will weaken that refusal enough to provide a new opportunity in the practical tasks of war and defence. Already the politicians are newly searching their hearts—or their fears. It is plainly the responsibility of the great Indian parties themselves to say "yes" or "no" to the challenge. But it is the responsibility of the British and Indian Governments to leave nothing undone to invite them as partners to their duty. Collaboration in this emergency will not solve the constitutional riddle, though it might save India; but it is probably the only way to make a solution possible in the post-war future; it may even be the last chance.

lost, another battleship badly damaged, heavy aircraft losses and 2,729 naval officers and men killed—the American Pacific fleet's fighting force is not impaired, and it has put to sea to seek contact with the enemy.

Australia Looks Homewards

The course of the war in the Pacific is rousing Australia to a fever of excitement and criticism. Single men aged 35-45 and married men aged 18-35 (the young single men have already been called up) will be called up for full-time service in the army; aircraft production is to be given the first degree of priority; and all women, except those in essential services, and children are being compulsorily evacuated from Port Darwin. The Minister for External Affairs has also announced that the Government is working for the establishment of political and military organisations to exercise supreme control of the Pacific war effort, and that Mr Duff Cooper has been asked to arrange for Australian representation on the War Council in Singapore. So immediate, in fact, is the danger to Australia, and so much is there to be done in so short a time that recriminations from the Australian people and press seem a little out of place. Mr Curtin has himself urged that there should be no fault-finding; yet, a Sydney newspaper is blaming the higher commands for over-optimism about the state of Imperial preparedness in the Far East, and Mr Evatt's revelation that the United Kingdom had apparently blanketed Australia's suggestion, before Japan's aggression took place, for a pact of mutual defence between the British Empire and Russia seems to have raised a storm. Australian alarm is very understandable, and there is good reason to sympathise with the people's feeling that they have been lulled into a false sense of security by the authorities. But they have only themselves to blame for their own unpreparedness. Until now, it has not been possible to awake in them any sense of urgency or to make them insist on a

National Government which would have prepared them for the situation that has now arisen. Even to-day Mr Curtin has turned down Mr Fadden's suggestion for a supreme non-party Executive War Council; and "Dunkirk methods" are consequently to be applied by a party Government with a bare parliamentary majority. The Labour Government, said Mr Evatt, had inherited a situation in which . . . "the defence of the Commonwealth had been treated as a subordinate and subsidiary part in a distant war. Henceforth Australia . . . would need the help of those she had helped." If Australia now insists on looking homewards for the rest of a war that is indivisible, she should also look homewards in apportioning the blame for her present straits.

* * *

American Mobilisation

The news from the United States is almost exclusively items of mobilisation. Many of these events are of local concern—the vast legal paraphernalia of bringing into operation emergency provisions long prepared. Many, again, are repetitions of what, on this side of the Atlantic, has long become familiar but was once new and strange. In every country, it appears, or at least in every democracy, ARP is not taken seriously until after the declaration of war, at the earliest. The alarms—perhaps, since this is now a field of technical terminology, it would be better to call them alarms—on the Atlantic Coast have died down; but California has been put in a state of emergency owing to repeated visits by enemy reconnaissance planes. The teething troubles of censorship are also apparent, and it is hoped that Mr Byron Price, the newly appointed Director of Censorship, will have more success in establishing a just balance of interest between the services and the public than his opposite numbers in England achieved for many months. From the flood of other reports, it is difficult to select for mention and impossible to append any comment. These, in barest outline, are some of the measures that have been taken:—

Both Houses of Congress have approved a supplementary defence appropriation of \$8,244 millions and the House has voted an additional supplementary appropriation of \$10,000 millions.

The House, after some argument, has voted to extend the obligation of national service to all men from 21 to 44. No figure has been reported for the number of men in these age groups, but the total may well be in excess of 20,000,000. The Army is to be immediately expanded from its present 1,600,000 to 2,000,000, and all geographical restrictions on its employment have been removed. The US Employment Service throughout the country is to assist in recruiting crews for merchant vessels.

Defence work is, wherever possible, to be on a basis of seven three-shift days. The Ford and General Motors plants have been put on this schedule at the positive request of the United Automobile Workers—one of the chief constituents of the CIO. Both the AFL and the CIO have announced a "no strike" policy. The President has summoned a Labour Management Conference for December 17th. In the meantime the Senate has suspended consideration of all anti-strike legislation.

The Secretary of the Treasury has announced that the increase in expenditure will require a corresponding increase in taxation. No control over the capital and money markets is contemplated for the present.

Prices have been fixed for a number of raw materials and foodstuffs, including cocoa, coffee, pepper, wool, shellac, coconut and palm oil, spices, tea, fats, and dairy products. Complete requisitioning of and control over tin has been assumed. The sale of rubber tyres has been prohibited until January 4th and will then be subject to rationing. From December 23rd all exports will be subject to control.

It is reported that in 1940 there were 126,947 Japanese in the Continental United States, 88½ per cent of them in the three Pacific Coast states.

The America First Committee has been completely dissolved.

* * *

£1,000,000,000 More

The Chancellor's speech in moving the fourth Vote of Credit this year for £1,000 millions did not add a very great deal to the existing public knowledge of the financial position. Its chief item of news was the announcement of a new series of securities for tax anticipation purposes; this is commented upon on page 756. Some of the Chancellor's figures, however, together with those given in earlier statements, make it possible to piece together a more complete statement of expenditure. The chief facts are given in the table at the top of the next column.

	(£ millions)	Estimated Expenditure, 1941-42	Estimated Expenditure, 1941-42
	Actual 1940-41	estimate	estimate
1. Consolidated Fund			
Nat. Debt, etc.	230	272	272
2. Civil Supply Services	417	435	435
Votes of Credit			
3. Domestic expenditure		2,993	
4. Expenditure financed out of adverse balance of payments (other than U.S.)	3,220	507	5,700
5. Expenditure in U.S.A.			300
Total Expenditure	3,867	(4,207)	4,707

The increase in the total is striking, especially when it is remembered that all Lend-Lease supplies are excluded, although similar goods imported in 1940-41 had to be paid for. Unfortunately, it is not possible to estimate exactly how much allowance should be made for this. It would appear that domestic expenditure, on war and normal purposes, has increased from something like £2,800 millions in 1940-41 to something between £3,700 and £3,900 millions in 1941-42 (the £200 millions increase cannot be allocated between items 3 and 4) and to a probable present rate of between £4,000 and £4,200 millions a year. As the Chancellor remarked, these figures in themselves do not prove that the "gap" has widened. But they establish a certain presumption to that effect and the serious tone of the Chancellor's remarks on savings and taxation should be taken as a warning that still greater efforts will be required in both directions.

* * *

War Pay and Allowances

That the latest scheme for the grant of allowances to dependants of serving men has been only a qualified success is tacitly admitted by the Government. The whole matter will be reconsidered by a Government Committee during the Christmas recess. There was nothing in this week's debate in the Commons to suggest that this scheme, which has been in operation since October 16th, has not, within its own limitations, been well administered. Sir Walter Womersley provided impressive figures of the numbers of cases dealt with, and there was some general surprise that the total of claims remained so low—not exceeding 60,000. No amount of sympathetic and swift treatment, however, can remove the basic objection to the existing method of paying allowances. War service grants are not allotted as of right to the families of serving men, but only as the result of individual investigation of circumstances. The distinction between the means test proper and this form of inspection of commitments is perhaps plainer to the investigator than to the victim of the inquiry—a fact which no doubt goes some way to explain the low total of claims so far submitted. There is no likelihood of satisfying public opinion on this matter, whether inside or outside the Services, until the war service grants technique is reserved for cases of exceptional hardship, while the average soldier's family draws of right an adequate allowance, which ranks simply as an earmarked portion of the fighting man's pay. This is the only way to eliminate the essential grievance of the conscript, which is not so much that the man in the factory earns more, but that his own wife and family are in straitened circumstances simply because he has been called to the colours; and the more drastic solution, which was very largely adopted in France, of conscripting every man in the country and returning him to his factory at a soldier's pay only removes the discrepancy without removing the hardship.

* * *

Ostriches Among the Engineers

The National Arbitration Tribunal last week awarded a flat rate increase of 5s. a week to all adult male workers in the engineering industry. The award is less than a third of the "substantial increase in wages" claimed by the trade unions; but it will nevertheless stimulate fresh demands in other industries. In their case for more engineering wages, the unions cited the higher cost of living and bigger taxes on commodities—neither of them good grounds for an increase. The worth of the official index as an exact measure of the cost of living is, admittedly, doubtful. But there are no grounds for alleging that, while the index has virtually been unchanged for many months, the cost of living has, in fact, rocketed up. The cost of living is menaced, it is true, by the new rise in agricultural wages—unless the increased cost is met, as it should be, by a direct Govern-

ment subvention. But the fact is that price control, with the aid of large Government subsidies in the case of foodstuffs, and now covers the main items in the household budget; and rationing, now that it extends to canned foods as well as the clothing, ensures a reasonably fair distribution of the supplies available, except perhaps among the very poorest—whom the engineering unions do not represent. It is the shortage of supplies, rather than the cost of living, that holds down the standard of living of the community, engineers and all; and no amount of monetary manipulation can provide the ships, the manpower and the materials to increase them. It is only by a reduction in the consumption of almost all the nation, including the engineers, that the material resources to carry on the war can be released; and the unions' suggestion that the effects of the purchase tax, which was put on to restrict consumption, should be counteracted by an increase in wages is contrary to common sense. To increase wages in order to counteract any form of wartime taxation is simply to defeat the purpose of the tax, which is to cut down the purchasing power in the hands of the public. The issue is not the detailed merits of the engineers' claim, but the unsoundness of their argument. So long as every group of workers believes that it is possible to maintain its peacetime standard of living in a war economy, and so long as there is no national wages policy, these absurdities will be solemnly repeated—as one group scrambles to gain an advantage over the others in sectional bargaining.

* * *

Wages and Production

In their method of making the award of higher wages to engineering workers, the National Arbitration Tribunal seem to have gone strangely astray. The engineer's "all-in" wage rate is made up of a "basic wage" and a "war bonus," inherited from 1914-18; the "bonus" has become, in effect, a part of the "basic wage." Rightly, the Tribunal point out in their report that this bonus, changes in which have been the usual way of altering engineering wage rates since 1917, differs from "bonuses in industry which have only come into being since the war and are related solely to changes arising out of the war." Wrongly, they say that the increase they have granted should be "applied in the same manner as the existing national bonus." The engineers' claim was a wartime claim, related to "changes arising out of the war"; the award, on the other hand, is an increase in basic wages, an addition to the labour costs of engineering likely to be as permanent as the bonus of 1914-18 has proved to be. In wartime, there may often be grounds for increasing earnings—for vital work or for higher output, to attract recruits from unessential employment or to encourage extra effort. But there is practically never any case for increasing basic wage rates. An effective wages policy, introduced in the early stages of the war, would have frozen wage rates all round, in non-essential work even before essential, and then, by piece rates, temporary wartime bonuses, overtime pay and other additions, would have prevented earnings to rise in the essential industries at the points where incentives to attract more workers or to step up production were most needed. The impolicy which has prevailed of allowing wage rates to hurry upwards, indiscriminately, disproportionately and everywhere, makes the worst of both worlds. Now, while the war is on, there is inflation without incentives; after the war, reconstruction will start off with the structure of industrial costs irrelevantly and needlessly swollen. The right policy is obvious enough; if it is necessary to tempt workers into war factories, offer them higher earnings, guaranteed if need be, not higher wage rates; and if, when the workers are in, more output is required, pay by results, by higher earnings, again, not by higher wages, which are as likely to mean less output as more.

Battle for North Africa

Since the raising of the siege of Tobruk and the general movement of the Axis forces westwards, General Rommel has been carrying out a skilful delaying action. By retreating on a broad front, he has succeeded in preventing the British from encircling the main force or from bringing the all or part of it to battle. The main body has now reached the high ground well behind Derna with the British in close pursuit, and it may be that the next pitched battle will be fought here. In the meantime, both sides have been attempting to determine the next phase in the campaign, the British by intense naval activity in the Mediterranean, the Axis Powers by increased pressure on Vichy. For Rommel

there are two main issues, either to hold out until sufficient reinforcements have crossed the Mediterranean to reverse the battle in Libya, or to retreat with the knowledge that the Tunisian backdoor is open. For the second, Vichy's consent is essential. For the first, the use of French ships and French bases would be a very great help. It is thus legitimate to suppose that in the recent interviews between Goering and Pétain or Darlan and Ciano, these items have made up part of the agenda. There are signs of a new and subtle development in the Axis "third degree" methods with the unhappy Marshal. The new technique recalls the gloomy winter of 1938 when Italy played the good boy with Chamberlain and clamoured for Tunis from France, while Germany insulted the British and signed a Pact of friendship with France. To-day the Nazis appear to be stiffening their attitude towards the French. The reprisals that are being taken for attacks on German soldiers are so brutal that even Vichy has been led to protest. Italy, on the contrary, has just completed the return of the last French prisoner of war and nothing has been heard for months of Tunis, Corsica and Nice. It is against this background that Darlan's interview with Ciano must be considered. It may well be that the Italians, not the Germans, are asking for naval assistance and the use of bases. In return, they have something to offer—the surrender of their claims on French territory. It is even possible that the old whisper of a Latin bloc to divide Hitler's imperium has been put about. Whether the Marshal's desire not to cede ships and bases can be overcome by this devious route is still uncertain. But a Vichy spokesman reported that the French Cabinet had approved Admiral Darlan's "plan."

* * *

The Germans Withdraw

The Germans have abandoned the attempt to take Moscow before the spring. The last offensive of the year has failed and the German divisions are being drawn off to a winter line and winter quarters. A month ago, the pincer movement round Moscow had reached beyond Klin in the north and Serpukhov in the south. In some sectors, the German divisions were much less than 30 miles from the

city. Now the Russians have reoccupied Kalinin and are pressing on Tula. The Germans are undoubtedly finding the withdrawal a very uncomfortable business, for, like a spring that has been pressed down and snaps back into place with the relief of pressure, the Russian armies are harassing the retreating German forces so effectively that in some sectors it is hard to distinguish between an orderly withdrawal and a forced retreat. The rout is probably not so great as some enthusiasts suggest—nothing to resemble, for example, the first flight from Rostov—and while in the south, Von Rundstedt appears to be re-establishing his line, it is probable that in every sector, the Germans are withdrawing to positions which have been prepared during the last offensive. The Russians will certainly render very unpleasant the attempt to hold a winter line. Months of demoralising passivity broken by harassing guerilla warfare may well lie before the enemy armies in Russia. Yet the final issue is probably production, not morale. When the campaign reopens in the spring, will the Russian output of tanks, guns and aircraft, diminished by the losses of the Ukraine, in part balanced by new capacity beyond the Urals, equal the output of German Europe? The Russians have secured a notable triumph in the first round. But this is no guarantee that the second will not be even more bitter and prolonged.

* * *

Latin America and the War

The reaction of the Latin American republics to the Axis attack on the United States reveals the success of the Roosevelt Administration's patient diplomacy over the past nine years. Latin America might so easily have adopted as many different positions as there are republics, with endless ensuing opportunities for intrigue and mischief-making. Instead, the Continent has acted as a unit—or, more accurately, as two closely related units. The Caribbean and Central American group have gone so far as actually to declare war on the Axis and are therefore fully in the war. Mexico, it should be observed, is an exception to this group. Contrary to earlier reports, it appears that there has been no Mexican declaration of war. Mexico has preferred to adopt the attitude of the South American states. All these (with one possible exception) have declared their intention of observing Article 15 of the Havana Conference. This article lays down that an American republic attacked from outside shall not be regarded as a belligerent by the other republics, who will accordingly be free to give it defensive assistance beyond the usual rules of neutrality. Some of them have gone further than a strict interpretation of their duties. Thus Mexico has broken off diplomatic relations with all the Axis powers, and Colombia with Japan, while Bolivia and Uruguay have frozen Axis credits. The only possible exception to this front of solidarity is Peru, which has had closer relations with Japan in the recent past than the other republics. But even there the President has pledged the United States every assistance in measures which are deemed necessary to meet the situation in the Pacific. In Argentina, some rather strange domestic political uses are being made of the new turn of affairs. Señor Castillo, the Acting President, has proclaimed a state of emergency. The first use of his powers has been to ban a pro-Ally gathering. The forthcoming conference of Foreign Ministers in Rio can be expected to clear up obscurities such as this, as well as to lay down in more detail the principles of "non-belligerent unneutrality."

* * *

Food and the Future

Lord Woolton has decided against an immediate reduction in rations. This is regrettable; the adjustment of consumption to the new shipping position created by the start of war in the Pacific cannot, in any case, be long delayed, and it should have been made immediately. The Ministry of Food will plainly have to contribute a considerable volume of shipping space toward the solution of the new, and more stringent, merchant shipping problem. That the cut in consumption has not been immediate is evidence of the sound stock position which the Ministry has been able to build up; but it is a grave mistake to draw on stocks until it is absolutely necessary. It will be some weeks before the new shipping position makes itself felt in terms of supplies held by retailers, but there can be no room for doubt that the entry of Japan into the war implies a duty to reduce rations as soon as it can be done. Ability to bring in foodstuffs from both the United States and Australia is temporarily restricted; and substantial stocks are still a necessary insurance

against bombing and sinkings. It is fortunate that large consignments of USA Lend-Lease foodstuffs were successfully transported before the Japanese declaration of war; the mechanism of points rationing, which has been applied to these foodstuffs, provides a convenient and exceedingly flexible method of adjusting rations to supplies, while preserving the greatest possible variety of choice. The normal adult in this country is still better fed than the normal citizen of any other European country, and he faces the prospect of less and plainer food with equanimity.

* * *

Sanctions

It is not enough to have regulations against racketeers; they exist in plenty. It is also necessary to enforce them against the tribe of parasites who manipulate the black markets in limited wartime supplies. To impose fines which, against the profits of illegal trading, are merely a bagatelle is neither penalty nor deterrent; and it is a belated common sense that has led the Government to make a new defence regulation which provides that, in addition to the existing maximum penalties of fine or imprisonment, offenders may be fined three times the value of the goods or three times the price at which they were sold or offered for sale. The present penalties usually leave a handsome net profit to the law-breakers. Now, if the new regulation is administered relentlessly—which is the condition of its success—the game should not be worth the candle. For a long time, it has been a mystery, not only how these leeches get their supplies, but also why their goods are not simply confiscated, while they go straight to gaol. Now, suspected goods can be seized and sold; and, over the whole range of foodstuffs, raw materials, clothes, all goods covered by Limitation of Supplies and other Board of Trade Orders, petrol and coal, the courts can nail and cripple the criminals—if they choose to match the Government's new determination with equal ruthlessness.

Hail and Farewell

A revised edition of the Schedule of Reserved Occupations has just been published. But from January 1st the Schedule is to be gradually ousted by the investigation of individual applications for deferment of service. It was devised in 1939 to be the regulator or "governor" of the wartime distribution of manpower. The aim was to avoid the maldistribution and waste which occurred in the last war, when essential industries were deprived of key-workers; and the method was to lay down, according to age and occupation, what men would be called up for military service and what men would not. The plan was to adjust the supply to the demand progressively; and, from the outset, the Schedule was specifically "subject to amendment from time to time." As the needs of the armed forces grew, it was necessary to make more recruits available. As the war economy became more comprehensive, it was necessary to cut down the list of reserved occupations and confront men with the choice between military service and transfer to essential industry; the periodic changes in the Schedule have registered the surrender, first, of luxuries, and then of amenities, in aid of the war effort. In practice, the Schedule was itself somewhat wasteful from the beginning. By its rough and ready rule of thumb, which sorted the working population into essential and un-essential in broad categories, individuals were often called up who were actually indispensable in their jobs, so long as these were allowed to continue; many more individuals, reserved on account of their skill or qualifications, were in fact left to do work which was neither useful nor essential; and, because recognised aptitudes in industry or business tended to be the sole basis of discrimination, vital occupations, such as coal-mining, farming and building, were dangerously denuded of heavy labour which was rated unskilled. Before Dunkirk, the Schedule was probably adequate for its purpose. After the fall of France, when the prospect of a shortage of manpower for fighting and producing became certain, it was obvious that, if every man was to be used to the best effect, each individual case would have to be scrutinised on its merits, and not simply decided according to the general formulae of the Schedule; the meshes of the net were too big. Since then, the Schedule has been an unconscionable time-a-dying. In the new edition, the reserved occupations are (as usual) shown with an age against each (in certain occupations two ages are shown, the lower one being for men employed by firms on the Register of Pro-

tected Establishments—which is now closed), and these ages of reservation will be raised by one year on the first of each month, beginning on January 1st. A man of 38, in an occupation reserved at 35, will be dereserved in the spring; in an occupation reserved at 30, he will be freed in the autumn. The reason for this method is presumably to control the flow of dereserved men before the manpower boards who, on the application of employers or employees, will consider pleas for deferment—a very arduous administrative duty. If the need arises, it will be simple to raise the ages of reservation more rapidly. It is nevertheless arguable that the ages in many occupations might have been raised more drastically at once; throughout next year, many men will remain in work which is only nominally useful. But the new policy is obviously on the right lines. The shortage of men for national service is squarely faced. The test of the usefulness of the job and the indispensability of the individual in it, and a large proportion of the occupations in the new Schedule are marked as ones in which deferment will not normally be granted. Care is to be taken to ensure that the blunders which resulted from applying rule of thumb to occupations with special problems will not be repeated. In agriculture, building and civil engineering, the Civil Service and coal-mining, the call-up will be settled by special arrangements, and the reservation ages in these occupations will not be raised month by month. There are already special arrangements for the medical and dental professions, for men with scientific, engineering and agricultural degrees or diplomas, and for students. The sifting may be slow, but it can be exceeding sure.

Economic Warfare

The proposal to abolish the Ministry of Economic Warfare, which was made and refused in the House of Commons a few days ago, is surely false economy. It is true that a large part of the Ministry's work has been brought to a close by the course of the war. In the early stages, MEW made treaties with neutral powers about trade and financial relations with the enemy; it was a link with the United States, as well as with the important blocs of European, Latin American and Far Eastern neutrals. Now, apart from a few harassed relicts, there are no neutrals. In the last resort, the success of the blockade is assured, neither by MEW nor by the Admiralty, but by the grand alliance of the free peoples against aggression. Nevertheless, even in the field of contraband and prize, there still remain important tasks of classification and adjudication to be performed through the Ministry. Moreover, MEW has always been far more than a Ministry of Blockade. On the factual side, MEW is the Intelligence Department of all the Services that wage war against the economic structure of Axis war-making. It is the intelligencers of MEW who mark industrial, trade and transport targets for the RAF. It is presumably upon the data collected by MEW's experts that the balance of economic power is struck in the planning of strategy and production; and it is not possible, without impracticable duplication of expert staffs, card indexes and statistical information, for the Foreign Office, the Ministry of Information, the Service Departments or the War Cabinet to do the work which at present MEW does, or should do, for them. It is, of course, true that there is already some duplication; there are probably too many economic experts and statisticians at too many places doing the same jobs, collecting and collating the same facts about the enemy's economic resources and productive capacity. But this is an argument for pruning elsewhere, not for getting rid of MEW. Moreover, the United States is now an ally. Among its most important war agencies is the Economic Defence Board set up last July "to supervise economic defence in the widest sense." The liaison between MEW and the Economic Defence Board is already important; a chief weapon of the Allies is still blockade and financial pressure; and there is still an ample function to be performed by MEW and the Economic Defence Board in collaboration.

* * *

Bulgarian Destiny

With last week's declaration of war on Great Britain and the United States, Bulgaria and Croatia fulfilled their obligations under the Tripartite Pact and all but completed the formal alignment of the puppet states. Only the position of Slovakia remains obscure, but no doubt German thoroughness will remove this anomaly in due course. The Bulgarian decision, announced in parliament by the Prime

Minister, Professor Filov, is the latest incident in a sorry record of international relations which for thirty years has proved the basis of Balkan disruption. The declaration does not in itself provide evidence that Bulgaria is about to undertake a more active part in the war. But there is good reason to believe that the German High Command is in fact meditating a move against Turkey. In such a campaign, the assistance of Bulgaria would be useful, while from the Bulgarian side a war against Turkey would, at least with the general public, be preferable to a war against Russia. Clearly, an adventure in Asia Minor, even if undertaken with the limited objective of securing the Dardanelles for the passage of the Italian navy, would hardly be possible for Germany unless a front were stabilised in Russia. If this were achieved, an attack upon Turkey would provide an indirect means of relieving pressure on Rommel in North Africa and would prepare bases for a spring attack upon the flank of the Russian southern army. So far, Bulgarian attachment to the Axis has been profitable and painless; if Bulgaria is forced to make war in anything more than name, she, too, will discover that the position of a puppet state in German Europe is very little superior to that of the conquered nations, while long term prospects are infinitely less happy.

National Service Bill in Parliament

The National Service (No. 2) Act, 1941, which received the Royal Assent this week, passed through both Houses of Parliament without substantial amendment; but during its passage the Government spokesmen cleared up several obscurities and also gave assurances on the administration of some of its more controversial clauses. It appears that the general obligation to serve imposed by Clause 1 does not cover aliens, who will be the subject of a separate Bill, at present under negotiation with the Allied Governments. The somewhat obscure provisos to this clause become clearer when it is realised that there is a distinction between a civil defence force and a civil defence service. The Minister of Home Security has the power to declare certain organisations to be a civil defence force, and so far he has applied this power to the Police War Reserve, the National Fire Service and the Civil Defence Reserve. The distinction was made after the earlier National Service Act of this year had allowed conscripts to be posted to civil defence; and the position is that persons called up for whole-time duties in a civil defence force enjoy the rights set out in the National Service Acts of 1939-41 as though they had been posted to the armed forces. A further proviso to Clause 1 gives the Minister of Labour power to make defence regulations enabling him to direct persons into civil defence as he already can into industry under Regulation 58A. For the civil defence forces, this power of direction will naturally only be for part-time duties, as whole-time duties are covered by the National Service Acts. For civil defence services, on the other hand, the direction may be for whole-time or part-time duties. Also covered by this proviso is the power of the Minister of Labour to make a defence regulation enabling him to direct persons into the Home Guard for part-time service. The various amendments to the Bill included, first, one making statutory the intention not to conscribe women for lethal duties without their written consent; secondly, one making a wife separated from her husband by decree or court order a single woman for the purposes of the Act; and, lastly, one limiting the exemption of a woman with an adopted child to cases where the adoption took place before the passing of the Act, though genuine cases of adoption after the Act will be considered by the hardship committees.

THE WORLD OVERSEAS

Hongkong Before the Siege

(From Our Hongkong Correspondent)

November 17th

It took more than a year to convince Chinese traders that the war in Europe was a World War. Until shipments from England were diverted to the Cape route, it was assumed that it was unnecessary to order replacements of stocks more than six months ahead; but when weeks elapsed without producing fresh supplies, and stocks began to melt away, a surge of buying set in. In the meantime, prices began to rise steadily, and the normal demand was swollen by buyers from other places in the Far East which were also running short of British products. The disappearance of European goods also helped to swell the demand for British manufactures, particularly piece-goods, and caused Shanghai dealers to send their buyers to Hongkong to make spot purchases. During the past three months, there have been some big shipments of British piece-goods arriving in Hongkong. Most of these goods were ordered towards the end of last year for normal market requirements. They have arrived with the market nearly bare, and the demand from Shanghai and Free China unsatisfied; consequently, the goods have been cleared *ex ship*, and local dealers have been selling at a highly profitable rate. This state of affairs is by no means confined to piece-goods, but in the case of metals and a few other commodities required for essential purposes, the Government has stepped in and set up a control. Provisions of British manufacture are also in short supply, and are being sold at grossly inflated prices, but as these lines are not necessities for 95 per cent of the population, and are difficult to control, no official action has so far been taken.

The requirements of local industry, such as cotton yarn, woven cloth, metals and chemicals, have increased considerably. South Africa, which is now unable to buy from Japan, has been ordering on a large scale from Hongkong, and if freight space had not been so limited, much more could have been supplied. Orders from the War Supplies Board on behalf of the Eastern Group Council are filling up local manufacturers to such an extent that it is highly probable that commercial orders will have to be refused before long. But even the War Supplies Board's requirements may not be fulfilled, as much of the supply of raw material depends upon priority decisions in London and Washington. At the moment, the Colony is prospering, but no one is so foolish as to ignore the dangers which surround us, and the uncertainties of the immediate future.

The arrival of a substantial force of Canadian infantry, and the possibility of further reinforcements, came as a pleasant surprise to Hongkong, but probably caused greater relief in Shanghai. The lingering anxiety on the part of some residents lest Hongkong should be sacrificed as an appeasement offering can now be set aside, and the evident determination to defend this Colony to the last will not go without notice in Tokyo—or in Chungking for that matter. Civil defence plans have been steadily developed, and there is not a phase of siege conditions which will be without its appropriate corps of auxiliaries.

Bribery and Corruption

Wartime regulation of trade has brought to the surface an evil which for many years past has been allowed to work underground. "Squeeze" is the normal accompaniment of Chinese commercial life, and it still plays a part in official transactions, despite the efforts of Chiang Kai-shek and his immediate circle. It is not surprising, therefore, that Chinese wishing to pass goods through the Trade Control here, or to evade a shipping regulation, should endeavour to purchase immunity, and once such a practice becomes established, it is not long before a set scale of fees is adopted. While there may be some excuse for the toleration of such a system by Chinese subordinates, there is nothing but condemnation for any European official who becomes a party to such corruption. Unfortunately, the system has become so widespread that the temptation to condone it is strong, but public opinion, Chinese as well as British, is beginning to demand action on the part of the authorities. Two recent official inquiries have revealed a disturbing state of affairs, and although Government regulations forbidding bribes are extremely rigid, there is always great difficulty in producing evidence to secure the conviction of offenders. However, the Chief Justice has now been appointed as a Commissioner to conduct a general inquiry into bribery and corruption in the Colony, and as the proceedings will be *in camera*, it is hoped that many of those who shrink from testifying in a public court will provide evidence enabling the authorities to deal effectively with a loathsome practice.

Thailand's Natural Wealth

[BY A CORRESPONDENT]

December 16th

It is not surprising that the occupation of Thailand played an important part in the first stage of the new Japanese war. Apart from its unusual strategical importance, Thailand is a country of considerable natural wealth. Its inclusion, unscathed, in the Japanese sphere of interest, therefore, is a serious adverse factor for the Allies.

It is true that most of the decisive Japanese deficiencies in materials will not be alleviated by the occupation of Thailand. The country produces only an insignificant quantity of coal of poor quality, and the iron output from the deposits in the north is so limited that it is not even adequate for the country's own very small needs. There is also no mineral oil in Thailand, and the supply of vegetable oil (mainly palm oil and copra) is too small to be of major value to the Japanese. The same is also true of the output of cocoa, cotton, and similar produce. In fact, four products make up roughly nine-tenths of Siam's exports, the total value of which amounted to about £20,000,000 last year; they are rice, tin ore, rubber and timber.

The cultivation of rice has always been the backbone of Siam's national economy. Nearly nine-tenths of the country's cultivated land, and between three-quarters and four-fifths of the population, are devoted to rice production in all the lower lying parts of the country. Up to five years ago, nearly two-thirds of Thailand's total exports consisted of rice. Its share has now fallen to about one-half; this decline, however, is not due to a fall in rice production, but to the relative increase in the export of other products, and in particular that of tin and rubber.

Thailand's area under rice fluctuated between 6,000,000 and 7,700,000 acres in the past five years, that is, only slightly less than Japan's own rice area. The output of cleaned rice was, during the same period, between 3,000,000 and 3,500,000 long tons per year, compared with the 7,500,000 and 9,000,000 tons harvested in Japan proper. Thailand is one of the few rice-producing countries which can spare a substantial part of their crop for export, and in

the past five years it has exported an annual quantity of between 1,300,000 and 2,000,000 tons, equal to one-fifth of world shipments. The great bulk of Thailand's rice exports has always been directed to British Malaya, Hongkong and China, while shipments to Japan remained, before 1940, below 50,000 tons even in favourable years. In good crop years, Japan, helped by the shipments from Korea and Formosa, is more or less self-sufficient in rice, but not only have the last three Japanese and Japanese controlled crops been below average, it is also more than likely that the greater war effort will prevent Japan from cultivating its own rice areas with the same intensity as in normal times. In this connection, the huge Thai surplus becomes important. If it can be shipped to Japan or used to supply the Japanese forces in China and the new war zones, Japan's food problem will be solved.

Tin, which accounts for 20 per cent of Thailand's total value of exports, is the second export product. Unlike rice cultivation, which is a native industry, the Thai tin mines are largely controlled by British capital. They are concentrated in both the eastern and western coastal areas of Siamese-Malaya, including the particularly rich Puket Island halfway between the frontiers of Kedah (British Malaya) and Burma. During the past decade the Thai tin output (metal content in concentrates) in 1929 to 17,447 tons in 1940. In the first ten months of 1941, a total of 13,530 tons was produced, against 13,937 tons in the corresponding period of 1940. The Thai supply of tin ore will more than meet Japan's deficiency, but its value to the Japanese is largely nullified by the fact that Thailand does not possess tin smelters, and Japan's refining capacity is too small to treat the even minor tonnages of Thai ore. So far, the whole of the Thai supply has been shipped for treatment to the British smelters in Malaya. One of the two Malayan tin smelting centres, Penang—the second is Singapore—is at present endangered by the Japanese attacks in Kedah. If, as seems likely, the Penang smelters are wrecked in case of a possible Japanese occupation, a long time will pass before Japan can make use of its tin gains in Thailand.

The rubber industry in southern Thailand will be of more immediate value to the Japanese. After supplying no more than 3,600 tons of rubber in 1931, this industry has seen a big expansion in recent years, and last year no less than 43,940 long tons of rubber were shipped from Thailand. In the first ten months of this year Thai rubber exports, at 38,993 tons, were 3,800 tons up on the year, while plantations laid down since 1937 are likely to raise the country's potential output to about 50,000 tons by 1943. Japan consumed up to 70,000 tons of rubber in normal years, though increased military requirements are likely to raise this figure in periods of intensive war operations. French Indo-China produces about 65,000 tons of rubber, and the inclusion of Thailand's production thus solves Japan's rubber problem.

Thailand's timber exports accounted for just under 5 per cent of its total value of exports in recent years. The timber exported consists mainly of teak, used extensively for ship-building. Between 50,000 and 75,000 tons were shipped annually from the mountainous country of upper Thailand. While this timber will hardly be of particular value to Japan, which has sufficient supplies from other sources, its fall under Japanese control will to some extent hit the British Empire, which was previously the main consumer.

It should also be remembered that however important Japan's economic gains in Thailand may appear, in actual fact their benefit will depend on Japan's ability to ship them safely.

Landlord and Tenant in Eire

(FROM OUR DUBLIN CORRESPONDENT)

November 24th

THE relations between landlord and tenant of agricultural land in Ireland have been, as is well known, extensively regulated by law. The landlords have been entirely bought out by the machinery of the Land Purchase Acts and an occupying ownership created. The relations of landlord and tenant in the towns have been the subject of considerable investigation and some legislation in recent years. In 1936, as a result of resolutions passed by the Dail and Senate, the Minister for Justice set up a tribunal to inquire into the law relating to tenancies of dwelling-houses in urban areas. This tribunal, which consisted of four members, has now presented no less than five reports. There is an Agreed Report signed by all the members,

and, in addition, each member has presented a separate report. As each separate report contains a good many reservations on the part of each signatory to the "Agreed" Report, the amount of actual agreement among the members amounts to very little. The reports are of great interest to the student of law, economics, ethics and sociology, but it is to be feared that they will do little to improve the lot of the Irish urban householder in whose interest they profess to be prepared.

The Agreed Report contains a useful review of the past and present state of the law of landlord and tenant of non-agricultural land in Ireland. The principal statutes involved are the Increase of Rent Restrictions Acts 1923-1926 and the Landlord and Tenant Act, 1931. The Commission states that "the Rent Act Code is of outstanding complexity and difficulty." The Rent Acts govern only houses built prior to 1919 not exceeding certain poor law valuations. Certain houses in these categories have been decontrolled by reason of tenancies coming to an end. The Landlord and Tenant Act of 1931 aims at securing that tenants at the end of their leases shall obtain renewals on fair terms. This Act is in contrast to the English legislation on the same subject, which aims simply at providing compensation for tenants on the termination of their leases. This difference in the legislation in the two countries reflects the tenacity of the idea of tenant-right in Ireland, which formed the basis of the agricultural land code prior to land purchase. The policy of rent control, which had its genesis in the housing shortage caused during the last war, proceeded on the assumption that existing rents were fair and should be stabilised subject to certain tolerated increases for rates, repairs and other stated reasons. With the passage of time, the code relating to rent control has become badly in need of revision, and, indeed, the whole policy of limiting rents by law is seriously called in question.

The principal matter upon which the tribunal is unanimous (although even on this there are several individual reservations) is that a new method of determining the standard rent should be substituted for the old. The suggestion is that the standard rent should be that which might have been expected in a letting of not more than five years, made in August, 1914. It is further recommended that, in leases not exceeding twenty-one years, the implied liability for repairs should be transferred from the tenant to the landlord, or, alternatively, that the tenant's liability should be confined to repairs costing not more than 10 per cent of the rent. Proposals are made for the appointment of special officials to see that the Acts are enforced in the case of poor tenants. Another important recommendation is that, upon the sale of every new house, there should be an implied warranty that certain defined building standards have been observed.

Divided Counsels

The separate reports of the four members reveal fundamental differences of opinion on first principles which rendered unanimity impossible. The chairman, a High Court Judge, traces the gradual interference with contracts by the Courts of Equity and by the Legislature, and concludes that a far-going regulation of contractual relations is necessary if any ethical evils are to be avoided. This report criticises recent British legislation on the ground that it is based on expediency rather than on principle. Rent control, it is argued, is either right or wrong. If it is right, it should be pushed to its logical conclusion; if it is wrong, it should be dropped altogether. A fundamentally different viewpoint is put forward by another member of the Commission, a Commissioner of Valuation, who argues that all rent control is an unjustifiable interference with private property, morally tantamount to theft. This member

German Europe

German Wages.—A short time ago, the Minister of Labour appointed a Special Trustee of Labour to introduce "efficiency wages" into the building industry. His task was to work out the "efficiency-times" necessary to carry out the various processes in the industry. These "efficiency-times" multiplied by the basic wage rates already established will form the new "efficiency wages." A worker who exceeds the standard time may actually receive less than the former minimum set by the basic wage rate.

These so-called "efficiency wages" are, of course, only a kind of piece-rate; but, being calculated on the time required to do a job efficiently, they can be applied to any working process. The idea of "efficiency wages" is an old Nazi demand. There was a time when the Nazis wanted to abolish all general wage scales, but they found it impossible to replace the established system of scales applying to whole industries by individual wages settled by individual employers.

In the war there has been, first, the wages stop, prohibiting any changes in the level of wages which obtained on October 16, 1939. But overtime pay, which was then abolished, was reintroduced by stages, and full overtime pay was restored in September 1940. By September 1940, weekly earnings exceeded those of September 1939 by 7.7 per cent—as a result of the longer hours and the additional payments which war conditions had made necessary, such as separation and travelling allowances, bonuses, additional sickness benefits, payments to men called-up and so on. But the annual reports of companies suggest that this rise came to an end in 1940. Compared in each case with the preceding year, the wages bill of 119 important companies increased in 1938 by 15.6 per cent, in 1939 by 9.25 per cent, and in 1940 by 0.3 per cent.

The rise in the purchasing power of the wage-earning classes is mainly the result of payments to soldiers and their dependants. Severe rationing made it difficult to spend the extra incomes; and one interesting result was the general demand for goods of higher quality and the increase in small savings—it must be noted that a considerable part of the total of small savings was deposited by independent artisans and the numerous small employers, who have been well employed by extensive sub-contracting.

In the matter of wages there is the special problem of the large number of foreign workers and prisoners of war who have replaced called-up Germans. Also hundreds of thousands of workers have been transferred to new occupations; and both the foreigners and the transferred workers are normally less efficient than the workers they are replacing. As a rule, foreign workers are paid the established rates; prisoners of war receive 60 per cent of the wage rates; women workers are paid 80 per cent of the time rates paid for war work formerly done by men, but they receive the same piece rates. If less efficient work is remunerated at the old rates, this constitutes a twofold danger. Costs of production, already very high because of substitute production, are increased, and the volume of purchasing power in the hands of the public is increased. The introduction of the new modified form of piece wages is intended as a remedy. The "efficiency wages" will no doubt be arranged in such a way that a general reduction in wages is the result. The Labour Trustees are virtually wage dictators.

The wage problem in German agriculture is particularly difficult. From the start of the rearmament programme before the war, workers left the land in growing numbers. The demand for better farm wages and working conditions was refused, because the costs of production, especially of cereals, were already exceptionally high. War conditions made the problem more acute, and the Press is now discussing State subsidies for agricultural wages. Probably no solution will be attempted during the war; the very low wages paid to prisoners of war have temporarily solved it.

Wage policy is one of the weak spots in Nazi war economy. Shortly after Hitler came to power, the Trustees of Labour were forced to declare the old wage rates minimum wages. Industry had been too thorough in cutting wages, and as the rearmament programme proceeded, the shortage of workers forced employers to increase wages in order to keep their workers or to attract new ones. This policy was ended by fixing maximum rates shortly before the war,

and the war itself brought the wages stop. Now a general reduction of wages has begun under the guise of these "efficiency wages." It follows the official pressure on employers to reduce their prices for public orders.

*

Conversions.—For some months, a wave of conversions has been going on in the German capital markets, mainly of communal loans, industrial debentures, and mortgage bonds. Mostly they take the form of reductions from 4½ per cent to 4 per cent, though there are instances where State loans have been converted to 3½ per cent. The policy of cheap money (see *The Economist* of March 22, 1941, page 379), started shortly after the beginning of the war, was chiefly intended to reduce the cost of public borrowing; for some time the states and local authorities were not allowed to carry out conversions. But the exceptional financial liquidity which developed and the successive reductions in bank rate and other interest rates created, even in a controlled capital market, anomalous technical conditions. The average quotation of fixed interest securities rose from 98.95 in August 1939, to 103.11 in September-October 1941; in the same period 5 per cent industrial debentures rose from 98.62 to 104.99.

There is no doubt that the conversions of fixed interest securities will continue. The Ministry of Economic Affairs has reluctantly given local authorities permission to issue new loans at 4 per cent, and this set the ball rolling. Generally speaking, debtors are in a favourable position. Later the Ministry consented to the conversion of the total loans of localities from 4½ per cent to 4 per cent. The conversion of industrial debentures is in full swing. The capital involved is small, compared with Reich loans and share issues, but the most important point is that the movement intensifies the fall in the income of individual investors. The reductions in the interest rate on Reich loans during 1940 mainly affected banks, savings banks, and the insurance companies. Now, the public seems to feel that debtors are taking advantage of exceptional conditions in the capital market to mulct the private investor. It is argued that the conditions favourable for this wholesale conversion have been mainly created by the war economy, which is temporary; and the question is asked whether it is in the interest of the national economy, as distinct from the interest of private concerns, institutions and local authorities, that this reduction of interest should take its course. The movement towards lower interest rates was welcome as long as it served the purpose of reducing the costs of public borrowing for meeting the costs of the war. Now, however, it is argued that the most important thing is that those influences should be checked which cause a further increase in share prices; and the continued reduction in the interest rate is thought to be one of the causes of this rise.

*

Potato Supplies.—Greater Germany's potato crop is estimated at 65 million metric tons, against 70 million tons in 1940. At the same time, potato consumption is steadily increasing. Before the war, human consumption amounted to 12 million tons; this year's consumption is estimated at 23 million tons. In big towns, the consumption of potatoes has doubled or even trebled. At the same time, more potatoes are needed for feeding pigs and for a number of industrial processes, such as potato-starch, alcohol, potato flakes, etc. That supply difficulties are expected is shown by the forming of a "Reich reserve" of potatoes. In big towns, customers will have to register with grocers for the purchase of potatoes, although there is still no rationing. Restaurants have been ordered to boil potatoes in their skins three days every week and the public is asked not to waste potatoes by peeling. Feeding animals with potatoes supplied to urban areas is strictly prohibited. The most difficult problem seems to be the transport of potatoes to big towns.

The war-time increase in the consumption of 10 million tons makes an additional 12,500 goods trains necessary, at a time when Germany's transport system is overburdened by war transport. Early frost can easily wreck the supply system for the storage clamps cannot be opened during frost. A crop of 65 million tons should be sufficient for Germany's population, but there is no doubt that the supply position will be strained.

THE BUSINESS WORLD

Rubber and Tin Prospects

THE repercussions of Japan's attack on the market have shown how hard it has been for investors to accept the likelihood of a breach of the territorial integrity of the British Empire. Possibly the ultimate value of tin and rubber possessions in Malaya was as much threatened in August 1914, March 1918, and June 1940, as it is to-day, because defeat at the centre would have ended Britain's sovereignty in the Seven Seas. But, possibly because the British people are illogical (and therefore hard to beat), it needed the presence of enemy troops inside Malaya to needed the presence of enemy troops inside Malaya to bring home this threat. The representatives of the plantation and tin-mining industries have been eloquent on the post-war effects of the accumulation of large strategic stocks of both commodities by America, and the similar, if more restricted, official buying at home. There has also been much talk of price factors and of the effect of EPT on profits. Something, but a good deal less, has been heard of their effects on output, and it has been left largely to the more cautious advisers of the investing public to stress the possible effects of hostilities—and that more frequently in terms of interruption to transport than of actual occupation. None the less, caution had so far prevailed that the yields on shares in the two industries were among the highest in the whole list, tin and rubber shares having had only a very moderate share in the recovery movement of the seventeen months prior to Japan's attack. It is evident that the investor underestimated the initial striking power of Japan, but it is still far from clear what this will mean in terms of output. What is important to inquire is whether official quarters have been more cautious, and how far the best provision possible has been made against the event.

On a backward look, it is clear that the sole test which can now be applied to British policy in administering the Empire's resources of rubber and tin during the past two years is quantitative. By this criterion, a tribute can appropriately be paid to the international controls. In pre-war days, the International Rubber Committee, rightly or wrongly, had the reputation of being decidedly more liberal than the Tin Committee in fixing production quotas. But since the war, although the machinery of percentage regulation of output has been kept officially in being, production has long been on an all-out basis, and all concerned have cheerfully co-operated in measures to fulfil American reserve purchases. The attitude of the two controls in the British Government, again, seems on the whole to have been well advised. Outside the Government's own arrangements, the markets for both commodities in London were left free at the outset. It was only after a year and a half, when the price of rubber showed signs of running away, that the Government closed the market down; and the Japanese attack had actually begun before the London tin market shared the same fate.

If there are any regrets for the policy of recent months, judged by its quantitative effects, they arise solely out of the application of 100 per cent EPT, with extremely few concessions, to both industries. Their protests have been insistently voiced, on the ground that as extractive industries they had a strong economic case for special allowances for their high "risk" element and for the wastage of their assets. The "negative incentive" of EPT has certainly not prevented the achievement of high production in both industries. But whether, under a different regime, output might have been still higher, will always be a moot point, particularly in view of the fact that Malaya's exports of rubber and tin, alike, have fallen, in recent months, below the standard allowed by the international regulation schemes.

So far as Malaya is concerned—and probably the Dutch East Indies also—historical criteria have now lost all relevance, and, until the Allies have won the day in the Pacific (and in Europe and Africa) even economic considerations are among those factors which are silent *inter arma*. Normally, Malaya produces a little under half of the world's rubber, and the Dutch East Indies rather more than a quarter. The revised figures of basic tin exports, issued by

the International Committee on the very eve of the Japanese attack, gave Malaya 38 per cent and the Dutch East Indies 22 per cent of the total for all countries in the scheme. If either country came temporarily under enemy occupation, therefore, the interruption of supplies would be on a serious scale in both instances. The extent of British home stocks is not officially known, but it may be presumed that in the case of rubber they amount to a fair number of months' supply, while in that of tin there are important resources available in non-Pacific areas. Nigeria and the Belgian Congo, for example, together contributed 14 per cent of the basic tin exports under the revised scheme, and Bolivia a further 18½ per cent.

Much the most important consumer of both products, however, in peace and still more in war time, is the United States. It has been estimated that United States stocks of rubber represent approximately twelve months' requirements and those of tin a little more—on the basis of consumption during 1941. This year's consumption includes demand for civilian uses, which will now, presumably, be ruthlessly restricted. And in the case of rubber at least, supplies can be supplemented by increased use of the reclaimed product—whose consumption even now is equal to nearly two-fifths of the absorption of crude rubber—and by development of synthetic rubber production. American rubber manufacturers have for some time been conducting successful research into synthetic possibilities, though the actual production has not yet reached as much as 4 per cent of the consumption of crude rubber. An announcement has been made in Washington that productive capacity will reach 80,000 tons per annum in the course of 1942—but this compares with an absorption of crude rubber of 648,000 tons in 1940. Available knowledge of the technical processes involved, however, is sufficiently advanced to make the laying down of plant, on a scale sufficient to represent an appreciable addition to total supplies, say, in 1944, a feasible proposition, provided "commercial" standards are frankly abandoned and the necessary priorities for materials for plant construction are forthcoming.

If supplies were interrupted, they could probably be eked out by technical ingenuity and by drawing on large "hidden reserves" (such as American cars in private ownership) for, say, a couple of years. In the case of tin, there are various substitutes, including some plastic products, and on the "civilian" side the chief problem will be to find means of replacing tinplate as a container of tinned foods.

To think in terms of the total elimination of new supplies from the producing areas may be prudent, but at this stage it is surely ultra-pessimistic. The areas affected are well adapted to put up a strong defence, and Japan's control of

INSURANCE COMPANY LIMITED

Head Office: 1 Dale Street, Liverpool, 2 (Chief Office): 1 Cornhill, E.C.3 London:

the seas, on which the efficiency of her expeditionary forces entirely depends, will undoubtedly have a serious challenge to meet. So far, the Dutch East Indies, whose defensive dispositions are believed to be formidable, have been unassailed. In Malaya, the configuration of the country is against any easy attack, from the eastern side, upon the rubber plantation and tin mining areas which (with a few exceptions) are all relatively near the west coast. With the Japanese already in Siam, and astride the Kra Isthmus, the most dangerous thrust will probably come from the north—indeed, it has already begun by the Japanese invasion through Kedah, the most northerly State of Malaya. There are important rubber areas in the south of Kedah, while a considerable proportion of the total tin comes from the Kinta Valley in Perak, lying in that region.

In the table opposite some representative rubber and tin companies are arranged in order of "geographical vulnerability," from areas where the enemy already has a footing, southward through various States of Western Malaya, in due order, down to the Dutch East Indies. In every case, the percentage fall in share quotations on the Stock Exchange is shown, between the last working day before Japan's attack and December 15th, when the market had had a week for appraisal of the new situation. It will be seen that the market had made little attempt to differentiate between companies in different areas according to their relative accessibility or otherwise to enemy penetration. There are wide disparities in the percentages by which different shares have fallen which are capable of no explanation except that the market has become rather "ragged." But the decline in prices as a whole still leaves values high enough to discount considerable success in checking the Japanese attack. Recent falls go some way to discount the temporary, enemy occupation of some producing areas, but they are almost totally unselective. Thus, investors in their own way, can claim to be setting an example of confidence which events may justify in the long run.

Exchequer receipts and payments. The new bonds must therefore be regarded as an interesting, technical equilibrating device, and not as a new contribution to the solution of the fundamental financial problem.

The American Precedent

Tax Anticipation Notes have been on sale in the United States since August 1st last. If the new British security is to follow the American precedent it will be non-transferable and, if encashed prior to being tendered in payment of taxes, it will be redeemable at the purchase price and without accretion of interest. The American notes are available in two series. The first is intended for the comparatively small taxpayer and limited to \$1,200 in any one year for any one taxpayer. They bear interest at just under 2 per cent. The second or "B" series returns about ½ per cent interest and the notes are available in any amount. It is interesting to find that in the first three months of issue of these notes, the series "B" has virtually monopolised the market for them. The total raised by Tax Anticipation Notes up to the end of October was \$1,818,000,000, of which only \$33,000,000 was provided by series "A". The notes, in other words, are appeal almost entirely to the large, corporate taxpayer. It is probable that a very similar experience will meet the introduction of the device in this country. For that reason, it is to be hoped that if only one series of the bonds is to be made available to the British public, the rate of interest will be kept low, certainly not above 1 per cent. At present, the money deposited at the banks in preparation for tax payments earns at most ½ per cent for the depositor and is lent to the Government at 1 to 1½ per cent. The inducement for the depositor to invest such funds in the new bonds need not, therefore, be very great in order to be effective.

South American Banking

Lord Wardington's review of the banking and financial situation in South America at this week's meeting of the Bank of London and South America emphasised the considerable improvement which has occurred over the past year in the balance of payments of the countries in question. Much of that improvement is the result of the defence

programme in the United States and of the attendant purchases of large reserve stocks of strategic materials. But, in addition, there has been some improvement in exports of meat to Great Britain and of cotton to Canada. Another interesting factor has been the influx of refugee investment capital from the United States into such countries as Argentina and Uruguay. The result of this change in the South American balances of payments has been most evident where a free exchange market has been available to record it. The improvement of the Argentine and Uruguayan pesos in terms of US dollars has been the most striking of such evidence. Payments of the South American countries with the sterling area are now in all cases covered by payments agreements which have canalised all payments at fixed official rates of exchange. Substantial amounts of sterling have been accumulating on these Latin American accounts, and Lord Wardington envisaged the possibility of variations to the existing agreements allowing such balances to be used for purposes other than the settlement of existing commitments in the sterling area.

Hongkong and Shanghai Bank

Banking business, no doubt, continues in besieged Hongkong, but that city is no longer the best location from which to direct a world-wide banking business. The Hongkong and Shanghai Banking Corporation, whose Head Office is in Hongkong, has therefore taken steps to transfer control of the organisation to London. On instruction communicated by the Governor of Hongkong, and with the approval of the British Government, that control has now been vested in the person of the London Manager, Mr Arthur Morse. All branches outside Hongkong and enemy occupied territory have been instructed to accept orders from him. By this arrangement the problem of the exact location of the Head Office has been left carefully in abeyance. There had been earlier suggestions that the Head Office of the bank should be transferred first to Singapore, then to London. This, however, is a matter involving the registration of the company, and, therefore, its liability to taxation, and in present circumstances it has been thought better to leave the question undefined.

Finance and Banking

The Circulation

In the money market, the supply of credit has been barely sufficient to meet the needs of the discount houses. The banks have been compelled to begin their year-end preparations earlier than in recent years, and their purchases of bills from the discount market have been exceptionally small this week. The discount market, for its part, has been better supplied with bills than in previous weeks, having received a 29 per cent allotment at last week's tender for Treasury bills. The improvement in this allotment from 23 to 29 per cent was due to the withdrawal of many "outside" applicants following Far Eastern events. The abstention from the tender of many non-market houses which normally apply for bills may be seen in the fall of total applications from £172,100,000 to £155,705,000. The banks' diffidence in buying bills was also due to the comparatively heavy Treasury deposit payments due this week. Fresh deposits of £60,000,000 were called for, as against nominal maturities of £40,000,000. Owing to previous conversions of TDR's into longer term securities, actual maturities amounted to no more than £32,000,000, and therefore £28,000,000 of fresh money had to be found by the banks. The basis of bank cash upon which these payments encroached had, moreover, to stand the strain of a further increase of £13,467,000 in the note circulation. The Bank return shows that the effect of this expansion on the credit basis has been offset to the extent of £6,789,000 only by an increase in the holding of Government securities. As public deposits have at the same time recovered by £2,975,000, bankers' deposits show a reduction of £7,883,000. The seasonal increase in the circulation, superimposed on the secular upward trend, has already eaten into the additional reserve of notes created by the latest increase in the fiduciary circulation. Unissued notes in the banking department, recently strengthened by £50,000,000, have now fallen to £40,182,000.

Tax Anticipation Bonds

In the course of his statement on the fourth supplementary vote of credit for £1,000,000,000, Sir Kingsley Wood announced the imminent issue of a new type of Government security designed to attract the investment of funds in process of accumulation for making tax payments due at some later date. The new security will be available in units of £25 or multiples of £25. It will be eligible for the payment of certain taxes, namely Income Tax (other than schedule E, which is now deducted at source), Surtax, National Defence Contribution, Excess Profits Tax, Land Tax and War Damage Contribution. Provided they are tendered in payment of these taxes within a given period (which is as yet unspecified), the bonds will bear interest at a rate yet to be announced. The scheme is principally aimed at large taxpayers and, in particular, at companies accumulating liquid funds for EPT payments. Seen in this light, it is evident that the new issue will bring very little contribution to the closing of whatever inflationary gap may still persist in the financial structure. The funds that will be tapped by the new issue must, in the main, be those which are now deposited with the banks in preparation for tax payments and which are already being re-lent to the Government through the banking system in the form of Treasury bills or Treasury deposits. Only if the new bonds encourage earlier saving and preparation for such tax payments will their anti-inflationary contribution be real. This, however, is not to suggest that the new securities will not play a useful role in Government finance and in the improved control of the banking situation. They will tend to avoid the accumulation of tax moneys in the banks and the corresponding seasonal fluctuations in the floating debt. By evening out the effective flow of tax payments into the Exchequer, they should help to achieve a better balance over a period between Government revenue and expenditure, and should ease the task of the monetary authorities in immunising the money market and general credit position from the effects of a sharply uneven incidence of

Investment

The Investor Waits

The past week has been one of declining turnover in the stock market, coupled with continued heavy falls in tin and rubber shares and fluctuations, not always small, in almost every section—apart from heavy industrials, electrical equipment shares and home railways, which have improved. Price falls in tin and rubber shares, since December 5th, range from 10 per cent to over four times that figure, and it is evident that the actual drop experienced in any particular case is largely a matter of chance. The corresponding declines in industrial equities and fixed interest stocks over the same period are, according to the indices of *The Financial News*, some 4.2 and 0.6 per cent. To put the movement in perspective, it may be useful to recall that between the end of February and the end of June 1940, equities fell, according to *The Actuaries' Investment Index*, by 35.8 per cent, and in the last month of that period by 21.4 per cent. (At the end of November this fall had been more than made good.) It is evident that the fortunes of individual tin, rubber and other merchandising concerns operating in the Pacific area must depend upon the detailed course of the war there, which cannot be forecast. Even at present prices, a very material interruption to trade for a considerable period appears to be discounted, especially bearing in mind the high yields obtainable on many of these shares in recent months. This is not to say that further falls will not occur, but there is plainly room for a selective adjustment in the process. In other securities, weakness owes more to the possible repercussions of the extended battle front upon conditions in this country.

Taxes and Inflation

Interest in Sir Kingsley Wood's statement, announcing the fourth vote of credit for £1,000 millions, centres upon his introduction of tax anticipation certificates, on the lines

of American practice. No information is available as to whether these will be marketable, or as to the rate of interest offered. All the indications are, however, that even transferability will, at best, be strictly limited, while the interest can scarcely be such as to allow the new instrument to compete directly with normal gilt-edged securities, even if it can be dealt in. In fact, the case for the certificates reposes largely on the contention that companies have refrained from investing money held to meet maturing tax payments. From the standpoint of the investing public, therefore, the Chancellor's statements are to be studied for any little light they throw on the general budgetary position. Actually, the light is very small. A very large part of his statement, and of the debate which followed, was devoted to the need for increased savings. He gave an assurance that the "gap," after taking in non-budgetary receipts, will not be greatly increased over that estimated in April last, but there was no answer to a question about how far the country is from reaching maximum outlay—leaving on one side the further rise in costs which seems inevitable. The stress placed on the need to refrain from expenditure is welcome, and it reinforces, if that is necessary, the belief that there will be further curtailment of individual expenditure; but it cannot be said that the debate throws any fresh light either on next year's outlays—even those of the coming quarter cannot be accurately estimated—or upon the means of meeting them. This is perhaps natural, but some official pronouncement of a policy designed to avoid inflation, which Sir Kingsley Wood described as "a danger which, if allowed to develop, may threaten the basis of the material welfare and the peace of mind of all of us," should be made without further delay.

Imperial Smelting Earnings

The profit and loss account of Imperial Smelting for the year to June 30th last shows gross interest and dividends

received of £298,842, compared with £280,640 for 1939-40, a result which amply justifies the hopes expressed by the chairman a year ago. Unfortunately, EPT absorbs £48,500, against nil, but there are this year no preference dividend arrears to be cleared, so that it is possible to increase the payment on ordinary from 3½ to 4 per cent and to restore the draft made on the carry forward a year ago. The consolidated profits of the whole group are given on a different basis, and it is a pity that comparable figures for the previous year are not included. In preparing the table below, it has been assumed that a rise in trading profit and a fall in dividend receipts of similar amount reflect an internal transfer of some subsidiary or associate to one of the operating concerns, and only the total of these two sources of income is given. The figures in this form are believed to be comparable:

	Years ending June 30,		
	1939	1940	1941
Total income.....	241,641	501,307	503,940
Depreciation	70,164	132,707	113,174
Administrative expenses.....	62,186	73,463	76,685
Deb. redemption	10,433	12,140	10,433
Tax (other than tax on divs.) and EPT	3,873	10,045	†62,848
Preference div.	124,189	186,282	134,538
Ordinary shares:—			
Earned	Dr. 29,204	*84,160	106,262
Paid	...	88,811	101,498
Earned %	...	3.32	4.38
Paid %	...	3½	4
Carry forward.....	74,532	69,871	74,635

* After £2,520 written off preliminary expenses.

† Includes EPT £48,500.

The consolidated statement of assets and liabilities for the subsidiaries and the parent is repeated in its usual form. It shows rises of some £116,000 in depreciation reserve, and of £379,000 in creditors, of which £175,000 is due to higher tax provision. Against this, loans to associates are doubled at £93,200, debtors and cash are up by some £258,000 and £82,000 respectively, while stocks are surprisingly stable at £706,000. There is every reason to suppose that most sections of the group's multifarious activities have been fully occupied, and will continue to work to capacity, subject to adequacy of supplies. The £1 ordinary shares have suffered in the general decline and now stand at 11s. ex dividend, against a recent high of 13s. cum dividend. At the present price, the yield is some £7 5s. 5d. per cent.

Turner and Newall Profits

The Turner & Newall £1 ordinary stock dropped 6s. 3d. on the news of the reduction in the final payment from 11½ to 8½ per cent, making a total of 12½ against 15 per cent. The preliminary statement shows that trading profits, in the year to September 30th, rose from £2,136,726 to £2,545,721, the highest level of the past ten years. Tax liability, including tax on dividends, rose more substantially from £1,277,239 to £1,847,762 and, with depreciation almost unchanged at £188,908, there is a fall in the rate of equity earnings from 18.4 to 15.8 per cent. The net amount earned for ordinary shares fell from about £590,000 to £445,823. The board are to be congratulated in showing the total tax provision of the company and on giving both gross and net amount of dividends. It would be even better if the net amounts of preference and ordinary payments were stated separately. General reserve receives the customary £100,000, and there is, consequently, a draft of £6,326 on the carry forward, which is reduced to £65,189. It is clear from the preliminary figures that the reduction in ordinary dividends is due solely to the weight of taxation and the desirability of maintaining allocations to reserve. There is no doubt that the group, which is prominent in the production of asbestos and rubber insulating equipment, and is a controlled undertaking under the Ministry of Supply, has been working to capacity last year. The £1 ordinary stock, at 66s. 3d., yields £3 16s. 6d. per cent.

P. and O. Earnings

The full accounts of the Peninsular and Oriental Steam Navigation Company for the year to September 30th last show that net earnings from the company's own fleet were

lower on the year, as were dividends from other maritime investments. Under full requisitioning, expenses were much reduced, as is shown by the table given below, and income from other sources rose, but there is a fall in earnings for the deferred capital from 32.3 to 23.8 per cent. It has been necessary to write £100,000 off properties, as a reserve to cover possible damage, against transfers totalling almost £93,000 for losses on sale of investments and on continental interests a year ago. The increase in the dividend on the deferred capital from 7½ to 8 per cent is at the cost of reducing the appropriation to tonnage replacement reserve from £300,000 to £250,000 and placing nothing, against £250,000, to general reserve.

	Years to 30th September,		
	1939	1940	1941
Earnings of fleet.....	1,381,281	2,075,794	1,458,335
Total revenue	2,383,139	2,976,520	2,421,821
Depreciation	885,000	1,034,068	980,214

† Includes £27,209 War Damage contributions.

‡ Income Tax written back, £192,902; and £16,249, profit on sale of ships, set against £216,090 loss on sale of securities.

The balance sheet shows a fall of some £1,290,000 in the net valuation of the fleet to £5,382,947, most of which is due to losses. Receipts on account of these ships were substantially above book values and there is a total rise in the replacement reserve of £1,879,875 to £2,991,475, after bringing in the year's appropriation. In addition to this, the credit in the Government Tonnage Replacement Account amounts to £484,500. This and other allocations result in a considerable improvement in the cash position. Floating assets are up by £2,246,771 on the year, some two-thirds of the rise occurring in holdings of gilt-edged securities. Among liabilities, sums deposited by a subsidiary are lower by some £2,277,000 at £750,000 odd, but other current liabilities have increased from £3,058,086 to £4,086,329. The outbreak of war in the Far East must substantially increase the risk of losses during the current period. Two years of conflict have reduced the net valuation of the fleet by £2,335,000 and other fixed assets by £132,000, but reserves, other than the provident good service account, have increased by £3,331,000, and this ignores the sum payable by the Government on replacement of the fleet. The immediate outlook is probably for lower earnings, but the price of the deferred stock units of £1 is 27s. 3d. ex dividend, yielding £5 17s. 5d., which suggests reasonable confidence.

Carreras' Good Year

Total profits of Carreras in the year to October 31 last rose from £2,205,693 to £2,216,078, the highest level of the last decade. Tax liability, including tax on dividends, amounts to £1,534,464 against £1,072,955, while depreciation is reduced from £79,314 to £60,263. Total staff fund allocations are increased from £19,107 to £30,207. Allowing for the higher standard rate of income tax, the rate of equity earnings is up from 25.9 to 29.3 per cent, while dividends on all classes of ordinary shares are raised from 26½ to 27½ per cent. The surplus is devoted to raising the carry-forward from £276,447 to £311,168. The balance-sheet shows a decline in the excess of liquid assets over current liabilities from £3,930,212 to £3,373,348, due to the considerable fall in stock from £2,952,938 to £1,786,537, which also accounts for the rise in cash holdings from £459,586 to £1,258,652. The liabilities side of the account shows a reduction in creditors, including taxation, from £1,845,831 to £1,758,357. It may perhaps be assumed that the rise in profit was due mainly to increased turnover, although economies in packing may have more than offset a probable rise in distribution charges. The turnover was secured in part from depletion of stock and the maintenance of earning capacity depends upon ability to replenish it. The £1 ordinary shares at 112s. 6d. ex dividend yield £4 17s. 9d. per cent.

ABC Recovery

The full accounts of the Aerated Bread Company for the year to September 27th show a substantial improvement in profits from £51,972 to £258,605 on trading account, and from a total of £58,880 to £205,937. Charges against earnings are heavier than in the previous year, taxation requiring £67,500 against nil and total war damage contribution £51,157 against nil, but this includes all five yearly contributions payable 1941-45 in respect of properties. More-over, £100,000 has been placed to depreciation reserve against £6,375, thus covering 1939-40 arrears. Consequently earnings for preference capital amount only to £1,007 against £4,726 in the previous year and £34,954 in 1938-39. The directors have decided to conserve the whole of the surplus, bringing the carry-forward to £57,216. Thus, service on the 6½ per cent cumulative preference capital remains in arrears since June 1, 1939. The balance sheet shows a reduction in bank overdraft from £677,557 to £488,261. The rise in the total of creditors from £162,262 to £200,276 is due solely to the inclusion of £41,389 for taxation, while an increase in debtors from £75,900 to £93,813 arises from the submission of claims under the War Damage Act. Enemy action, and the difficulty of replacing supplies, accounts for the decline in stock from £147,822 to £114,448. Cash holdings are slightly higher at £8,315 against £7,025, while the total of reserves and carry forward is raised from £144,542 to £245,549. The chairman, Lord Greenwood, attributes last year's improvement in profits to increased turnover combined with administrative economies, but it is not apparent how far the expansion can be carried over to peacetime conditions. There is no doubt that, in present conditions, the management is wise to conserve surplus earnings. The £1, 6½ per cent, preference shares now stand at 17s. 6d. and the £1 ordinary shares at 10s. 6d.

Stewarts and Lloyds of South Africa

Total profits of Stewarts and Lloyds (SA) for the year to June 30th are reduced from £343,061 to £334,012 after managerial expenses and provincial taxation. Depreciation claims £46,591, against £72,827, including £25,000 special depreciation. There was no transfer to Employees Second Trust reserve, against £20,000, or to stock reserve, against £75,000, but the allocation for contingencies is up from £10,000 to £105,000. As this item is treated as a current liability in the balance sheet, it can scarcely be considered as available for dividend payments. On this basis, and without adjustment for taxation, equity earnings, of £126,413 against £109,613, represent 30.8 against 26.7, providing ample cover for the ordinary dividend, which is raised from 15 to 20 per cent. General reserve receives £50,000, against £45,000, and there is a small draft on the carry forward, which is reduced from £83,985 to £78,398. The balance sheet shows a rise in the surplus of liquid assets over current liabilities from £1,175,218 to £1,229,384. Creditors, including an account with a subsidiary, are up from £123,920 to £189,170. Stock is over £200,000 higher at £787,194, while debtors have risen from £692,220 to £805,617 and cash holdings from £130,576 to £249,642. The company has clearly enjoyed a satisfactory year's trading. Its output plays a vital part in South African war production and will no doubt increase substantially. The £1, 6 per cent 1st preference shares, at 25s. 7½d. ex dividend, yield £4 13s. 8d. per cent.

First Kaffir Dividends

The start of the kaffir dividend season indicates that the majority of mines are able to repeat June dividend rates. In 12 cases out of 25, however, payments are below those of a year ago. Increases are announced only by a very few concerns, which have not yet reached their full capacity as dividend payers. Thus, in the Union Corporation group, no company lowered its December payment below that of June, 1941, but while most yearly totals are down, Marievale is, against 3d. on the 10s. shares. In the Rand Mines—Central Mining group, Crown Mines is paying a final of 7s. 6d. against an interim of 8s., making 15s. 6d., against 18s. 6d., and New Modder a December interim of 1s. 3d. against a final last June of 1s. 6d. In this group, only Transvaal Consolidated is raising its dividend, which

amounts to 1s. 3d. for the year, against 1s. on the 10s. shares. In the Consolidated Gold Fields group, Venterspost and Vogelstruisbult are raising total dividends, while Simmer and Jack is paying a final of 5d. against an interim

* Financial Year ends June 30.

of 6d., making 11d. against 1s. 3d. for the year. All other payments in this group are the same as at June last. The general declines among mature mines are to be attributed to rising costs and higher Union taxation, accentuated in some cases by declining grades of ore.

Even in wartime, this country absorbs about half the world's tea exports. The Ministry of Food, which took over the control of imports early in the war, has announced its arrangements for the purchase of next season's tea. Dutch East Indies growers will provide 48 million lbs of Java and Sumatra tea ; 280 million lbs. will come from India, 148 million lbs from Ceylon and 24 million lbs from East Africa. In addition, the Ministry of Food hopes to acquire about one million lbs of China and Malaya tea. The total quantity contracted for is 501 million lbs, approximately the same as last year, and about 100 million lbs. above consumption, which is estimated at about 400 million lbs. per year.

The Board of Trade has made various adjustments in the rationing of certain garments; some previously exempted items are now included in the clothes ration, and exemption has been extended to some articles which had been rationed. The changes are, in general, based upon experience gained in the six months during which the ration scheme has been in operation. A few garments were not previously specifically mentioned in the original lists, and actually need fewer coupons than were demanded for them in their original grouping. For example, unlined, single-texture cycling capes, which previously exchanged for 16, 15 and 10 coupons for men's, women's and children's sizes respectively, now rate at 6 coupons in children's sizes and at 4 coupons in children's sizes. Some of the old rates did not allow manufacturers sufficient coupons to make up certain garments which are needed, and pointings have been revised. Kilts, an outstanding example of coupon loss to the manufacturer, were rated at 8 coupons for adults and 6 for children. The new ratings are 16 coupons for men's kilts, 14 for women's and 8 for children's. In place of coupon-free cloth under licence, the making of officers' uniforms, manufacturers will receive documents equivalent to the number of coupons required by coupon ratings for uniforms. Certain widths of cloth require fewer coupons, and the definition of fents (remnants) has been revised. Retailers may now give "change," consisting of coupons in special strips, where coupon vouchers are tendered. Coupons may also be credited or returned to a customer for goods taken back by the shopkeeper within a period of 28 days instead of

*even if it means
going without a little*
BOVRIL

Tea is an almost exclusively Asiatic product, but over 60 per cent of normal world shipments come from areas west of Singapore. None the less, the extension of the war in the Pacific cannot fail to affect world shipments. It is possible that, if the Ministry of Food's contracts are fulfilled, there will be a serious shortage of supplies for other countries. This might, however, in certain circumstances, be made up from the substantial stocks in this country. The value of the Ministry of Food's bulk buying contracts has once again been stressed by the price provisions under the new tea contracts. Despite the steep rise of prices on the free market in recent months, the price paid by the Ministry in the Dutch East Indies remains unchanged at last year's level of 10d. per lb f.o.b. Batavia. In the British producing areas, the price is again based on the average of 1936 to 1938, plus certain allowances for wartime increases in production costs. These provisions, while keeping tea prices in this country at a reasonable level, are fair to the producers though they do not give them excessively high returns.

Earnings in the Metal Trades

In the analysis given on December 6th of the rise in earnings in the several industrial groups, there was not space to deal with the separate industries within each group. In many instances, these showed wide variations; and the highest earnings for men are 127s. 5d. in motor vehicle and aircraft manufacture, their lowest 94s. 9d. in nuts, bolts, etc. The increases over 1938 range from 66.3 per cent in shipbuilding and ship repairing to 22.5 per cent in tin-plate and sheet manufacture. The figures for men, boys and women are given below:

EARNINGS IN METAL ENGINEERING AND SHIPBUILDING INDUSTRIES

	Earnings in week ended July 12, 1941			Percentage Increase compared with last pay week in October, 1938		
	Men (over 21)	Boys	Women (over 18)	Men (over 21)	Boys	Women (over 18)
Blast furnaces	107 3	48 4	...	30.0	44.6	...
Iron puddling, steel etc.	111 5	45 11	...	39.4	48.9	...
Non-ferrous metal mfg.	103 7	50 7	45 4	44.9	67.2	43.2
Tin plate and steel sheet	102 10	39 7	36 10	22.5	58.9	5.5
Iron and steel tubes	106 0	44 7	44 10	49.1	55.5	52.4
Wire, netting, ropes	98 9	38 3	40 4	44.3	50.0	37.9
General engineering and engineering foundry	106 8	40 4	50 7	44.8	65.8	57.7
Electrical engineering	107 4	38 9	47 2	44.2	56.6	45.5
Marine engineering	108 2	37 8	...	44.1	104.5	...
Constructional engineering	101 8	38 1	...	41.2	56.0	...
Motor vehicle and aircraft	127 5	48 5	54 9	53.4	71.4	36.6
Shipbuilding, repairing	116 7	37 10	...	66.3	82.3	...
Railway carriage and tram manufacturing	96 1	41 9	...	33.8	73.4	...
Electrical apparatus	104 11	42 4	42 9	43.7	38.0	18.2
Hand tools, etc.	101 3	38 1	38 8	48.2	60.4	38.5
Bolts, nuts, screws, etc.	94 9	38 9	44 4	46.9	60.3	48.6
Brass, etc., goods	97 6	39 10	43 8	41.6	52.2	43.2
Heating and ventilating engineering	104 1	39 8	...	36.4	50.2	...
Watches, jewellery, etc.	95 1	38 6	40 0	33.8	50.5	30.4
Other metal industries	106 3	43 0	45 3	52.0	54.5	41.4
Total	111 5	41 11	48 2	48.7	63.8	47.4

Women earn most in motor vehicle and aircraft manufacture and in general engineering, and least in the tinplate and in the hand tools industries. Their biggest increase in earnings has occurred in general engineering, with iron and steel tubes a good second. Boys, on the other hand, find non-ferrous metal manufacture the most profitable industry, and earn least in constructional engineering and in the manufacture of hand tools. The most spectacular figure is the increase of 104½ per cent in the earnings of boys in marine engineering, which contrasts with a rise of only 38 per cent for boys in the manufacture of electrical apparatus. There are only three industries in the whole group in which boys' wages have not increased by

over 50 per cent. In making comparisons between all these various figures it must be remembered that divergences and decreases in the proportion of skilled workers can alter the average earnings without any change in rates of payment or hours worked.

Coffee Control

Though coffee is consumed in very small quantities in this country—probably smaller than in any other civilised country—it has not escaped Ministry of Food control. The Ministry has prepared a scheme to begin on January 1, 1942, covering imports and distribution, which will be carried out through importers and registered dealers. Dealers will be registered if they have paid duty on 50 tons or more of coffee during any consecutive twelve months from July 1, 1937, to June 30, 1939. Retailers will obtain supplies from these dealers. The public auction of coffee will cease. The Ministry of Food will allocate any further imports to the registered dealers on the basis of their previous transactions. Last March, a maximum retail price of 2s. 8d. per lb. was fixed, and retailers were also obliged to stock coffee at 1s. 8d. per lb. Since 2s. 8d. was not an excessive price for coffee, it can be assumed that stocks of better coffee were disappearing. Pre-war consumption in this country has been estimated at about 300,000 cwts a year. It is unlikely, in spite of tea rationing, that this figure is very much changed, though easy-to-make coffee preparations appear to have gained popularity. Imports into this country averaged slightly more than 400,000 cwts between 1936 and 1938. Of this total, about 125,000 cwts came from Costa Rica, and British East Africa provided some 112,000 cwts. While large stocks are held in this country, it is probable that the varieties are not the same as in pre-war days. The rationing of coffee is not contemplated and retail prices will remain at the levels fixed last March.

The "Closed Shop" in British Mining

The Mineworkers' Federation, having got rid of the conditions governing the payment of the attendance bonus, is now endeavouring to bring the application of the Essential Work Order into greater harmony with its own views and policy. On July 18th, the General Order was amended to make illness a valid excuse for absenteeism, and the miners are now asking that this exception should be applied to the coal mining industry and also extended to cover absences due to accidents, lack of workmen's transport facilities and trade union business. A far more serious issue is that raised by the request of the Federation that the cost-of-living war addition of 2s. 8d. per shift and the attendance bonus of 1s. per shift should be withheld from non-unionists. In recent years, the employers' view that membership of a trade union was the personal concern of the worker has been greatly modified by the growth of the practice of collective bargaining. Though the employers in one or two of the districts have, during the last two years, converted their collieries into "closed shops," the majority, while prepared to help with the collection of trade union dues, have been reluctant to surrender completely the principle of non-interference; and since the Essential Work Order has been in operation the number of non-unionists have increased substantially in some of the coalfields. Apparently, the colliery owners have been advised that the payment of the war wage and the attendance bonus is now an integral part of the contract of every miner at present employed. It has been ascertained also that the National Service Officer could not give permission for the termination of employment on the ground that a workman was not a member of a trade union, unless such membership was already a condition of employment. In Yorkshire, a threatened stoppage has been averted by a decision of the owners to withhold the payment of the attendance bonus from non-unionists, subject to an undertaking on the part of the Yorkshire Mineworkers' Association to indemnify them in respect of any future claim for wages or damages. In Northumberland and Durham the employers and the workmen's representatives are stated to have reached "a mutual understanding to end non-unionism." During the last war it became compulsory under the Defence of the Realm Regulations for every miner to be a trade unionist for the duration of the war.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

PROGRESS IN DIFFICULT YEAR

STATEMENT BY SIR JOHN CAULCUTT

The following statement has been issued to the shareholders by the chairman, Sir John Caulcutt, KCMG, on the report of directors and balance sheet for the year ended September 30, 1941:

Before proceeding to deal with the general business of the bank, I wish to express our deep regret at the death of Dr Alexander Aiken. Dr Aiken has rendered distinguished public services in South Africa, and his knowledge of business affairs in Johannesburg must have been almost unrivalled; with his great qualities and wide experience he was an invaluable member of our South African board, and we deplore his loss.

LOSSES ON ACTIVE SERVICE

I also regret to have to announce that since the beginning of the war we have lost the following members of our staff while on active service: C. G. Berlyn, Howick branch, Natal; K. A. Brown, Johannesburg branch; I. P. Cleaton-Jones, Main Street branch, Johannesburg; C. Clokie, Durban branch; S. P. de Bustros, Alexandria branch; W. S. B. Doyle, Umtali branch, Southern Rhodesia; A. L. Earp-Jones, Claremont branch, Cape Province; C. C. Gordon, Commissioner Street central branch, Johannesburg; P. E. Hardy, Woodstock branch, Cape Province; A. E. Mackie, Jamaica branch; J. R. Pugh, Durban, Natal Bank branch; A. W. Rodger, Johannesburg branch; I. W. G. Slabber, Long Street branch, Capetown; T. Sturgis, head office; and the following by death due to enemy action: H. S. Armstead, Gracechurch Street branch; Miss M. M. Bodfish, Gracechurch Street branch; Miss B. R. Dewar, Circus Place branch; A. J. Elkins, head office; W. A. Martin, Barbados branch; Miss M. F. Withers, Circus Place branch.

We pay tribute to their memory and extend to their relatives our deepest sympathy.

In addition to the foregoing, two of our officials on active service have been reported missing and eight have become prisoners of war.

CONTRIBUTION TO WAR EFFORT

I am proposing on this occasion, having regard to the times, to confine my remarks to the domestic affairs of the bank, in connection with which I feel shareholders will be interested to know that nearly 1,000 members of our staff, here and overseas, have joined the forces. I am pleased to say that owing to the widespread distribution of our branch system we have been able to render many services to the Governments of the territories in which we operate. In this way we have been able to make a special contribution to the war effort.

Following the military occupation of Abyssinia and Eritrea, and, at the request of the authorities, we have opened branches at Addis-Ababa and at Asmara.

The omission of the usual territorial survey of conditions does not mean that there is nothing of interest which could be said about events in the various countries with which we are concerned, but I feel that justice could not be done to the subject without incurring risk of infringing the regulations of the censor.

BALANCE SHEET

Turning now to the figures of the bank, current and deposit accounts, at approximately £157,000,000, show a further record figure for this bank, being an increase for the year of over £30,000,000. Cash in hand has been maintained at about 33 per cent. of the liabilities, while the total amount of advances is approximately the same as a year ago. Our increased resources are reflected in the figures for investments, which include a substantial contribution to new Government issues; and in the figure for bills, in which are included our holdings of United Kingdom and South African treasury bills. The market value of investments is in excess of the figure at which they stand in our books.

The net profit for the year ended September 30, 1941, after making provision for taxation and for bad and doubtful debts and contingencies, amounted to £399,685, compared with £423,692 last year. The sum of £171,936 was brought forward from October 1, 1940, making a total to be dealt with of £571,621.

ADDITIONS TO RESERVE

Having regard to the continued growth in the bank's liabilities to the public, the directors have decided to transfer £200,000 from the current year's profits to the reserve fund. In addition, a sum of £300,000 has been transferred to that fund from the contingency account, to which account we have during the past three years allocated £470,000 from our profits. These transfers will bring the reserve fund to a figure of £2,600,000.

After making the above appropriation it is proposed to pay a final dividend of 4 per cent. (actual) on the cumulative preference shares and 3½ per cent. (actual) on the "A" and "B" shares, less income tax at 8s. 10d. in the £ in all cases, payable on December 29, 1941, leaving £196,470 to be carried forward.

CONVERSION OF SHARES INTO STOCK

The importance of curtailing clerical work as far as possible will be appreciated, and, with this end in view, it has been decided to invite you, in accordance with powers conferred by our articles of association, to pass a resolution authorising the conversion of the bank's fully paid shares into stock. If approved, this measure will eliminate the labour involved in recording and checking the numbers of shares on the registers, certificates and transfers, and means that the £1 "A" shares and £1 eight per cent. cumulative preference shares will, after January 1, 1942, be known as "A" stock and eight per cent. cumulative preference stock, respectively, and will be transferable in multiples of £1. In recommending the passing of this resolution, I have little doubt that it will be acceptable to you.

I would ask shareholders to note that the existing certificates will not be called in: they should be retained by shareholders, and will be accepted by the bank when transfers are being effected.

TRIBUTE TO MANAGERS AND STAFFS

I have pleasure in expressing once again the board's thanks and appreciation to the boards overseas, to the general managers in London and in South Africa, and to the whole of our staff here and overseas, for the manner in which they are carrying on the business of the bank in these exceptional times. Their devotion to duty has been exemplified in ways which will surely cause the year 1941 to be remarkable in the history of this bank.

I think shareholders may be interested to know that the staff on night duty at one of our principal London offices probably saved the building from total destruction during a raid in May of this year. They remained at their post throughout the night, fighting a bad fire which followed a severe blasting of the building by a land mine. I am glad to say that owing to great good fortune nobody was seriously injured. The business of the branch was carried on next day in temporary premises, without interruption or inconvenience to customers. Thanks to our system of duplication of records, all the books were balanced without delay or difficulty. Repairs to the premises have now been carried out, and the branch has for some months past been re-established in its old quarters.

On the whole, I think we may feel that we have, so far, been fortunate in our experience, particularly when we consider the territories which we serve and the possibilities of air attack to which they are subject.

I think we can look back on the past year's working with some satisfaction: it has been an eventful year, marked by many anxieties but some progress. I feel we have grounds for viewing the future with confidence.

THE NATIONAL BANK OF SCOTLAND LIMITED

A VERY SATISFACTORY RESULT

LORD ZETLAND ON NATIONAL FINANCE

The one hundred and sixteenth annual general meeting of the proprietors of The National Bank of Scotland Limited was held in the bank's head office on 18th instant. The Most Honourable in the Marquess of Zetland, PC, GCSI, GCIE, the Governor of the bank, presiding. The Governor said: Turning to the statement of accounts before you, it will be observed from the profit and loss account that the heavy burden of taxation and other charges resulting from the war has had its effect upon the profits for the year, which show a reduction of some £17,000 at £262,000. These profits are arrived at after making full provision for all interest, and you will not be surprised to learn that Government taxation alone absorbs a sum greater than the net profit figures shown. Dividends are recommended at the rate of 16 per cent. per annum on the consolidated capital stock and at the rate of 5 per cent. per annum on the "A" stock.

THE BANK'S LIABILITIES

When I last addressed you I commented upon the high figure at which the notes in circulation stood at November 1, 1940, viz., £4,190,678, an increase of £900,000 over the figures at the same date in 1939. You will observe that the notes in circulation at November 1st last have reached the still higher figure of £5,280,862, an increase of more than £1,000,000 during the year, a striking indication of the large sums being expended week by week mainly on wages in connection with war work. The deposits likewise show a large increase at £50,806,000, the figures being higher than last year by almost £9,000,000, and this has taken place notwithstanding the considerable drain through the substantial support given by our customers to Government loans and war savings schemes in War Weapons and Warship Weeks throughout the country. Acceptances, guarantees and other obligations on account of clients are slightly higher at £2,945,000.

THE BANK'S ASSETS

On this side of the balance sheet, cash, money at call and short notice, balances with the Bank of England and other banks, as well as cheques in course of collection, total £14,451,000, showing well as cheques in course of collection, total £14,451,000, showing apart altogether from Treasury deposit receipts of £3,500,000 a thoroughly liquid position. The holding of other British Government securities has increased by £10,000,000 during the year and now stands at £30,535,000. As mentioned in the report, the new stands at £30,535,000. As mentioned in the report, the value of the investments held by the bank, at prices ruling at November 1st last, exceeds the figures stated in the balance sheet. Advances on current and other accounts again show a fall and are just under £10,000,000. Bills discounted, at £254,500, now represent a small and dwindling proportion of bank loans.

The balance sheet figures have reached a new high level at £62,722,000, an increase of £10,000,000 in the year. As you will no doubt have observed, the higher resources at the disposal of the bank have all been utilised in furthering the financing of the country's war effort (firstly) by the support given to the various Government war issues, investments in Government securities being higher by £10,000,000 than a year ago, and (secondly) by an increase in the amount lent to the Exchequer by way of Treasury deposit receipts.

IMPORTANCE OF SAVINGS

Some at least of the figures with which I have been dealing, and particularly those referring to the large increase in the note circulation and in the deposits with the bank, seem to invite comment on more general grounds. In spite of the spectacular results of many of the War Weapons and Warship Weeks in different parts of the country, they give rise to doubt whether as large a part as possible of the increased earnings of the public is finding its way to the Exchequer through the agency of National War Bonds, Savings Bonds, Savings Certificates and Post Office Savings Bank deposits. And no one who has given any thought to the matter can be indifferent to the urgent need from the

point of view of financial stability of every penny possible being brought into the net of the Treasury as an offset to the unprecedented expenditure which the war effort entails—expenditure so vast as to stagger the imagination even of the most practised statistician.

As an aid to some understanding of the stupendous figures of present-day national expenditure, which by reason of their very magnitude are to most of us meaningless, it is, perhaps, worth while drawing a comparison with the past. In the year 1913 our national expenditure was £188,000,000, or a little more than £500,000 a day. Income tax stood at what was then regarded as the very high rate of 1s. 2d. in the pound. Today it stands at 10s. in the pound while surtax and a whole series of other ingeniously devised charges play their part in bringing in an annual revenue undreamed of in the history of this or any other country.

NATIONAL EXPENDITURE

But what of our expenditure? It is not, as it was in 1913, a mere half million a day, but some thirteen million pounds sterling in the course of every twenty-four hours; and vast though the amount brought in by taxation undoubtedly is, it is altogether inadequate to meet expenditure on this colossal scale. How, then, is the growing gap between the Nation's income and its expenditure to be filled if not by individual savings lent to the State? The danger to which we become exposed if these fall short of what is required is obvious, for to the extent to which we fail to fill the gap, by so much do we increase the evils of inflation—soaring prices swiftly followed by rising wages and increasing costs of production culminating inevitably in a fall which, under the increasing momentum of the process, may become catastrophic, in the value of the pound. This is an aspect of the struggle upon which we are engaged that demands constant attention, surely, not from the Government only, but from every individual who by refraining from spending becomes increasingly able to lend.

TRADING POSITION

So much for considerations of a general nature. In normal circumstances I should have followed the course customary at these meetings of making some observations on the state of trade and industry during the period covered by the accounts; there is, however, little scope for any such review when as you are all well aware there has been a still more marked restriction on normal trading and a further concentration and extension of effort on production for purposes closely connected with the prosecution of the war. This is shown in yet another contraction in our banking advances, despite the support given wherever required to customers engaged upon Government contracts for vital war supplies.

The greater prosperity attending the operations of those engaged in arable and dairy farming has also had the effect of reducing the financial assistance required in those branches of the agricultural industry. It is much to be regretted that the important section engaged in hill sheep farming suffered a further setback since our last annual meeting through the disastrous storms of a severe winter as well as from other adverse conditions. There is some satisfaction however to be derived from the Government's recognition of these misfortunes by the grant of a subsidy which has been trebled in amount in respect of certain stocks and by the appointment of a commission to examine and report upon the serious state of the industry and to recommend measures for placing it upon an economic footing. Attention has also been called in addresses from this chair to the state before the war of the Scottish fishing industry, which had for years experienced very adverse conditions and had been brought to a position occasioning much anxiety to all connected with it. It is greatly to be hoped that the Government is preparing measures for the immediate post-war period which will ensure the rehabilitation and re-equipment of our fishing fleets, the men and vessels of which have rendered and continue to render vitally important and most hazardous services to their country in these days of peril.

The report and accounts were unanimously adopted.

BANK OF LONDON AND SOUTH AMERICA, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

CHAIRMAN'S STATEMENT

The meeting of the Bank of London and South America, Limited, was held, on the 16th instant, in London. The Rt. Hon. Lord Wardington, the chairman, presided.

The following is a summary of the statement by the chairman which had been circulated with the report and accounts on December 8th and was taken as read: Broadly speaking, the main economic development in the Western Hemisphere over the past year—and especially during recent months—has been the marked intensification of inter-American trade, particularly with the United States, which has done much to offset lost trade with Europe. The governing factor in this respect has been the North American demand for commodities, which has facilitated the disposal by the Southern Republics of some of their surpluses—a demand which has more recently been broadened by the requirements of Washington's defence programme.

A year ago I pointed out that, following the loss of practically all European Continental markets, the problem of mounting export surpluses loomed large in Latin-America, but, with the important exception of the grain situation in Argentina, to which I will refer later, international co-operation has done much to lessen the acute nature of this problem. Wool and hides have been shipped in large quantities and at good prices to the United States, meat has been exported regularly to Great Britain, the coffee crops have been sold to the United States at much improved prices under the successful Pan-American quota agreement, cotton has found ready markets in Japan and Canada, while the demand for copper and other minerals has been constant. In the latter connection, the defence preparations in the United States entail the purchase of large reserve stocks of commodities and strategic materials, and it is reported that all base metals produced south of the Rio Grande are virtually reserved for armament purposes in the United States.

LEND-LEASE SUPPLIES

Conversely, and following the same policy of hemispheric defence, materials for that purpose are now being supplied by the United States to South America under the Lend-Lease Act, substantial facilities of this nature having, for example, recently been extended to Brazil and Uruguay. These credits are apparently quite apart from those authorised to Latin-American Governments for some time past by the Export-Import Bank of Washington for the sale of industrial capital goods. Incidentally, it is understood that these Export-Import Bank credits have so far been utilised to only a comparatively limited extent, although reports have reached us from New York that fresh developments in the direction of short-term banking credits are now contemplated by that institution so as to overcome difficulties of financing current trade caused by war-time delays in delivering American manufactured goods.

In short, under the threat of Axis penetration into the Western Hemisphere, so strikingly revealed by President Roosevelt in his Navy Day speech, the Washington Administration is pursuing a policy of ever-closer politico-economic co-operation with the Governments of South and Central America.

The development of trade between the various South and Central American Republics themselves has also been appreciable, noticeably in Brazil, where cotton textiles and many other lines of manufactured goods now figure prominently as exports to neighbouring countries. Canada, too, has participated in the general expansion of inter-American commercial relations, which has been marked by much activity in concluding new trade agreements.

REVERSAL OF IMPORT CONDITIONS

Due primarily to the shortage of shipping, the concentration of British industries upon war work and the operation of the priority delivery system in the United States, there appears to have been a complete swing-round in conditions in the import markets of Latin-America during the past few months. In fact, there is now a shortage of essential imported goods, notably fuel and materials required for public utility companies, national manufacturing industries, etc. Broadly speaking, it appears that South

American importers are now willing to buy and able to obtain the necessary exchange cover for any goods that supplying countries can ship.

The foreign trade outlook of the United Kingdom is now decidedly obscure. The Government is compelled in the national interest to devote the whole of the country's industrial resources to achieving victory, and as the war goes on the calls upon supplies and man-power will make it increasingly difficult to maintain exports. It is true that all the other great industrial nations of the world are similarly engaged in or preparing for war, but export trade is so vital to these islands that the task of reconstituting it after the war must not be made needlessly hard, and the principle of legitimate competition in foreign markets must be preserved so far as is possible. Evidence is not lacking that official circles both in London and Washington have this question well in mind, and are already studying the problem of the post-war restoration of British export trade, so that I feel that further comment at this juncture would be premature.

STERLING REMITTANCE LIMITATIONS

The past year has seen the completion of payments arrangements between Great Britain and all countries in Latin-America. The general principle of these arrangements is to canalise payments at fixed official rates between the sterling area and Latin-America, and as it appears that a substantial amount of sterling is accumulating, for example, in the Argentine special account, a decision may have to be reached in the future as to the utilisation of such balance for purposes other than the settlement of existing commitments in the sterling area. In considering the general question of the relation of South America's present favourable trade balances to the service or redemption of foreign debts, regard must be had to two important factors. Firstly, such favourable balances are largely in American dollars, so that, from the point of view of sterling debts, the question of arbitrage arises under existing exchange restrictions. Secondly, the export figures as published in some countries include commodities the full value of which does not return to the country of origin, so that, allowing additionally for such invisible items as freight and insurance, Government and private remittances, etc., the recorded favourable trade balances cannot always be regarded as fully effective.

PROFIT AND DIVIDEND

The net profit, including the amount brought forward, is £774,612, as against last year's figure of £709,327, or an increase of £65,000. When you consider that the markets of the European Continent have been closed to the field of our activities—a field which in pre-war days was so important to us—you will perhaps be looking for the reason of the improved result. We find it in one word—organisation. Your board, your management and your staff assiduously and untiringly spend their energies in availing themselves of all opportunities of acquiring new business. The conservative policy that your board has always followed, and the result achieved this year, has, I am glad to say, enabled them on this occasion to recommend a small increase in the dividend, which I have no doubt will be welcomed by you in these difficult times. The directors now recommend the payment of a final dividend of 4 per cent. (making 6 per cent. for the year, subject to income tax), amounting to £161,600, leaving to be carried forward to profit and loss account the sum of £177,212, as against £177,327 last year.

THE FUTURE

Having given a brief survey of the chief economic trends in the individual countries of South and Central America, the chairman continued:—

The immediate outlook in South America, as elsewhere, is obscured by the possibility—one might almost say probability—of an extension rather than the cessation of hostilities, so that any comments upon future prospects would serve no useful purpose.

The report and accounts were unanimously adopted.

ANSELL'S BREWERY, LIMITED

RECORD OUTPUT

Lieut.-Col. J. A. Fairhurst, TD, DL, JP (chairman), presided over the forty-first ordinary general meeting, held, on the 18th instant, in Birmingham. The directors' report and accounts were approved.

Profits (net)	£528,866	12	9
Brought forward	251,176	3	5
	£780,042	16	2

Dividends on preference and ordinary stock (paid and to be paid)	£367,500
To properties reserve	70,000
To general reserve	25,000
To income tax reserve	40,000
To Air Raid Damage Insurance Reserve	25,000
	527,500 0 0
To be carried forward	£252,542 16 2

POINTS FROM CHAIRMAN'S SPEECH

In the course of his speech, the chairman said: This company and its subsidiaries have contributed by way of taxation over five million pounds last year.

So far our contracts for malt have cost us 140 per cent. above the price we paid in 1939-40. This factor will reduce our gross profits, and will probably relieve us of the liability of paying Excess Profits Tax, although net profits will not be affected.

There is grave anxiety as to whether a sufficient quantity of barley can be malted owing to the loss of experienced men, so that immediate Government measures are necessary if a shortage of beer is to be averted in 1942.

The brewing trade have been remarkably successful with their policy of preventing any general increase in the price of beer (excepting the beer tax). This is a feather in their cap, because there could be no surer way of starting general inflation than an increase in the price of the working man's beer.

Notwithstanding the difficulties of the past year, we have been able, by working the plant to its utmost capacity, to turn out more beer than ever before in the history of the brewery. This has been insufficient to satisfy the demand in this important munition area.

Consequently, in order to ensure an equitable distribution among all classes of our customers we were compelled to resort to a system of rationing.

UNSUBSTANTIATED ACCUSATIONS.

The recent Government Order under which permission may be granted for works' canteens has aroused the familiar fanaticism of the teetotallers, who are attributing to the Government this time all kinds of ridiculous motives.

For instance, a parson in a statement to his congregation, which appeared in the Press under the heading "Methodist Minister's Immoderation," has in effect accused the Government of conspiring with the trade to perpetrate the ruin of young women recruits.

The outburst of this Methodist parson is another concrete case of gross misrepresentation calculated to discredit not only the brewers but the Government.

As a matter of fact, it has been ascertained that the object of the Government is to provide canteens in remote areas where large numbers of workers have been removed to newly established munition factories, and where beer would only be supplied along with a meal.

We ourselves have had to reluctantly refuse the requests of certain highly placed Ministry officials to increase supplies to munition workers where, they stated, evidence existed that the shortage of beer was affecting production, because, working as we were to full capacity, it would have meant the curtailment of supplies to other classes of customers.

GUY MOTORS, LIMITED

STRONG POSITION

Presiding at the twenty-sixth annual general meeting at Wolverhampton, on the 17th instant, Mr Sydney S. Guy, the chairman, said:—

The balance sheet calls for little comment. The fixed assets and the capital accounts stand at substantially the same figures as last year. The creditors and accrued charges are higher than usual, this being partly due to reserves for taxation, and also to increased deliveries of materials and other supplies during the last months of the year. In consequence there is a corresponding increase in stock-on-hand. The drop in debtors is due to arrangements which have been made for more prompt payment for contracts.

The turnover for the year was most satisfactory.

The reserve accounts have been increased by the sums approved at the last meeting to £175,299, and if the directors' recommendations this year are also approved the reserve fund will be raised to a figure which is very nearly equal to the subscribed capital.

PROFIT AND DIVIDEND

The profit and loss account, after making provision for taxation and all normal trading charges, shows a net profit of £46,011 which, with the balance brought forward, gives £52,391 available profit. The reduction in the net profit shown is, of course, due to the effect of increased taxation.

Your directors have pleasure in recommending that a dividend of 15 per cent. be paid on the ordinary stock, and I would remind you that this is the fifth year in succession that a dividend of 15 per cent. has been proposed.

If the ordinary dividend is approved, then there will fall to be paid a dividend of 7½ per cent. on the preference stock.

Your directors then recommend that the usual provision be made for debenture redemption and for the staff profit-sharing bonus, which will amount this year to £5,500. The staff and employees have responded magnificently to the call for the greatest possible effort. These efforts have been gratefully acknowledged by the directors, and I ask that you will give them due recognition by approving this measure.

ALLOWANCES FOR DEPRECIATION

I mentioned in my speech last year that your directors had no objection to the Excess Profit Tax and they wholeheartedly agreed that abnormal profits should not be made out of the war. I also referred to the totally inadequate allowance for depreciation granted by the Inland Revenue. Since then, those allowances have been increased, and while this is satisfactory so far as it goes, we still consider that, having regard to present conditions, with long hours and extensive diluted labour, together with the difficulty of releasing plant for overhaul, the relief is not sufficient. Accordingly we consider it necessary to reserve a further £5,000 to cover this exceptional depreciation.

I entirely agree with the views expressed by Sir John Wardlaw Milne, in the House of Commons on July 10th, "I consider the depreciation on machinery and the amount allowed for obsolescence in certain private enterprises is inadequate, and the losses due to the exceptional war effort will not be recovered," and "I wonder whether we have gone too far in that restraint upon private enterprise to get the best results."

DISPOSAL OF SURPLUS VEHICLES

Some of you may have seen recently comments in the Press on a matter directly affecting our future business. An arrangement has been reached between the commercial vehicle industry and the Government whereby surplus vehicles for disposal are being taken over by the manufacturer and handled by the retail trade on terms ensuring a fair price to the eventual purchaser. The scheme is working satisfactorily, and I hope that it will be the means of preventing a recurrence of the chaotic conditions brought about in the industry after the last war.

With the great shortage of transport, and the difficulty of carrying out regular maintenance, the policy of your company in building "Guy's for Life and Lower Running Costs" has proved to be an inestimable advantage to those users who were wise enough to invest in Guy vehicles, a fact which will, no doubt, be remembered in years to come with beneficial effects on the company's future business.

Finally, I would refer you to the matter of directors' remuneration, which is included in the agenda. The amount of directors' fees is fixed by the shareholders and I am asking you formally to approve of an increase in the allocation from £1,000 to £1,500 to be divided amongst the directors as they decide.

The purpose of my request is not to increase the fees of the individual directors, but to permit an increase in the number of directors (if at any time it should be considered desirable) at a remuneration compatible with their responsibilities."

The report and balance sheet were unanimously adopted, and a vote of thanks to the chairman closed the meeting.

RHOKANA CORPORATION, LIMITED

TAXATION'S EFFECT ON DIVIDEND

The annual general meeting of Rhokana Corporation, Limited, was held, on the 17th instant, in London, the Rt. Hon. Sir Auckland Geddes, PC, GCMG, KCB (the chairman), presiding.

The following are extracts from the chairman's statement circulated with the report and accounts:—

Our trading profit amounted to £2,157,018. After providing for debenture and loan interest, depreciation reserve account and development reserve account the amount carried to the appropriation account was £1,882,803.

Whereas in the previous year we received a dividend from Mufulira Copper Mines, Limited, of £177,668, we have received no dividend from that company in respect of the year ended June 30, 1941. The Mufulira board has announced that it is owing to heavy taxation that they cannot recommend a dividend in respect of the period mentioned. The appropriation account shows provision for taxation of £1,006,044.

The directors recommend a final dividend of 15 per cent., bringing the total dividend for the year to 30 per cent. as compared with 6½ per cent., 6½ per cent., 50 per cent. and 40 per cent. for the years ended June 30, 1937, 1938, 1939 and 1940 respectively.

I must again contrast the amount of the issued ordinary and "A" share capital of the Corporation of £2,500,002 with the capital which has been raised and employed in the Corporation's undertakings, which is just under £18,000,000. Distribution therefore this year of £750,000 by way of dividend represents a return of 4.17 per cent. on capital invested in a wasting asset.

I think it is a somewhat significant commentary on the operation of the existing taxation legislation that the amount available for distribution to shareholders of this Corporation is less than one-half of what was available in the years ended June 30, 1937 and 1938. The directors, however, do not allow this consideration to affect their policy of making the maximum effort to produce copper and cobalt which are so urgently needed in the national interest.

The report was unanimously adopted, the dividends as recommended were approved and the conversion of the shares into stock was also approved.

LONDON AND RHODESIAN MINING AND LAND COMPANY, LIMITED

The ordinary general meeting of the London and Rhodesian Mining and Land Company, Limited, was held, on 18th instant, in London, the Rt. Hon. Viscount Elibank (the chairman) presiding.

The following are extracts from the chairman's statement circulated with the report and accounts: The net profit for the year is £55,715, compared with £67,391 in 1940, and stockholders have received a dividend of 5 per cent. This year the total of our investments taken at cost or under is £374,482. Last year the figure was £471,299. At June 30th last the market value of certain of our investments, together with others valued by the directors, showed considerable appreciation.

Stockholders received in January last an interim dividend of 5 per cent. in respect of the year's profits, but the question of paying a final dividend cannot be considered. The directors have again declared an interim dividend of 5 per cent. for the current year. All being well, profits during the current year should show some improvement, but I cannot make any forecast as to the payment of a final dividend.

Having regard to the times in which we live, I believe stockholders will be well satisfied with the company's progress.

The report was unanimously adopted.

IMPERIAL SMELTING CORPORATION, LIMITED

MR. J. R. GOVETT'S STATEMENT

The twelfth annual general meeting of the Imperial Smelting Corporation Limited, was held, on the 18th instant, at 95, Gresham Street, London, E.C.2.

The following statement by the chairman (Mr. J. R. Govett) was circulated to the shareholders with the report and accounts:—

In view of the fact that I am not able to give you the usual detailed account of the corporation's activities, and for the convenience of shareholders who are unable to attend the meeting, it has been decided to circulate this statement with the report and accounts in place of the speech which, under normal conditions, I would have made at the annual meeting.

The annual meeting will therefore be of a formal nature only and confined to the passing of the report and accounts, and re-election of directors and auditors, but any shareholders who wish to be present will be welcome.

The corporation and its subsidiary and associated companies have been actively engaged during the period under review.

The profits available for distribution have been reduced not only by the charge for taxation (which includes Excess Profits Tax) shown in the accounts, but also by war damage contributions and premiums and debenture redemption, all of which is inadmissible in computing the Group's liability for Excess Profits Tax and Income-tax. The charge for Income-tax would have been greater but for tax recovered and tax reserves build up in past years.

DIVIDEND

The dividend on the ordinary shares recommended by the directors is 4 per cent. as against 3½ per cent. in the previous year, when, however, the accumulated arrears of preference dividend were also paid off. After payment of this dividend there will be left a balance of £53,871 to be carried forward, as against £50,919, the amount brought forward from the previous year.

Under existing conditions the results of the past year may be considered satisfactory.

I would like to express our appreciation of the work of our joint managing directors, and for the way in which they have carried the many increased responsibilities that have arisen. To Mr Stanley Robson, to Mr Donald Orr and to Mr F. A. Crew, and to all their staff, I must extend our thanks for the work that has been done, often under the most difficult conditions.

Finally, I would like to record our gratitude to all our employees who have carried on their work in the face of great trials and difficulties.

E. W. TARRY AND COMPANY, LIMITED

The annual general meeting of E. W. Tarry and Company, Limited, was held, on 18th instant, in London.

Sir J. Fortescue Flannery, Bt., DL (the chairman), said that last year he had said that it was useless to speculate about the trend of affairs in days of war but that he was confident of the economic future of South Africa. Since then that country had enjoyed much business activity and there had been a remarkable expansion in new industries, especially in the Union. The industrial activity had undoubtedly been stimulated by the war, with the consequent demand for a wide range of products, but there were many opportunities in that great country for further enterprise and growth. When they came to consider the accounts it was evident that the company had shared in the prosperity.

The year they were reviewing had been a prosperous one; the sales had reached record figures and, although high selling prices had to some extent influenced the total value of sales, they must attribute that fine achievement in the main to the judicious management in South Africa. The net profit was £42,501, and having regard to the prevailing war conditions, he felt there was every reason to consider the result very satisfactory. It was proposed to pay a dividend of 7½ per cent. on the ordinary shares.

The report was unanimously adopted.

DICTOGRAPH TELEPHONES, LIMITED

INCREASED DEMAND FOR LOUD SPEAKERS

The fifth ordinary general meeting of Dictograph Telephones, Limited, was held, on the 16th instant, at Croydon.

Mr Philip V. Summer (the chairman), who presided, said that for approximately two-thirds of the year under review conditions had created the most difficult trading period so far experienced.

In view of losses through air raid damage, restrictions on the movements of employees due to black-out regulations, further recruitment of employees for HM Forces and interruption of production through air-raid alerts, the results could be regarded as very satisfactory.

The company was playing its part in the national effort, having regard to the importance of communication systems generally.

Installations of loudspeakers for control of personnel during air raids, location of executives, and the broadcast to employees of musical and radio programmes had now become almost a standard feature of war-time factories; the demand for those installations had continued to increase rapidly. The company's output was fully absorbed, and they had as much work on hand as its present personnel could undertake. The demand for these products to date had fully justified the directors' opinion that an active market would continue after the war for that type of installation.

He would again emphasise the valuable medium so created for approach by national leaders and qualified Government spokesmen not only to the workpeople at the benches and the machines, but also to the management of those establishments.

It was gratifying to the directors to report a year of satisfactory progress on the part of Gramophone Reproducers, Limited, and the subsidiary company had declared a dividend.

The whole of the capital losses sustained by the company during the year had been written off rental installations account; so far as such losses were the subject of war damage claims, they had been included under sundry debtors.

The report and accounts were unanimously adopted, and the dividend recommended was approved.

J. BROCKHOUSE AND COMPANY, LIMITED

A REMARKABLE RECORD

The forty-fourth general meeting of J. Brockhouse & Company, Limited, was held, on the 17th instant, at West Bromwich.

Mr J. T. Brockhouse, JP (chairman and managing director), said that for years they had been building up their resources and strengthening their company from every angle. They had thus been able to meet the exceptional wartime conditions when the emergency came. The finances were set on a strong and sound basis, their machinery and plant had been brought up to date for spread over Great Britain. The greatest care had been taken in choosing the executive to run their various activities and the strongest co-operation and encouragement was given to them by the Board.

Their record for the past few years was really remarkable. On the consolidated profit and loss account their trading profit for 1938 was £172,000, for 1939 £415,000, for 1940 £611,000 and for

BA Midland Railway.—Rent to June 30th from BAGS and BA Western Railways £158,091 (£164,272). To expenses £2,904 (£1,881), debenture interest £92,970 (£96,000), preference dividend £39,880 (£40,000). Ordinary dividend £15,035 (£20,000). Interest on advances from BAGS and BA Western £5,365 (£10,400). NDC £2,746 (£3,000), balance £1,562 (same).

Marshall Field and Co. (Chicago) (\$000s).—Nine months' gross profit to

September 30th \$6,175 (\$3,483). Federal tax provision \$3,419 (\$1,059). Net profit \$2,756 (\$2,424), equal to \$1.07 (90 cents) per preferred share.

Pennsylvania Railroad. (\$000s).—Gross revenue for Sept. \$56,250 (\$42,687); net operating income \$10,710 (\$8,394); nine months gross revenue \$446,309 (\$347,190); net operating income \$71,386 (\$59,751).

Mexican Light & Power Co. (Canadian \$).—Net earnings for Oct. \$316,230 (\$134,896), aggregate net earnings Jan.-

Oct. \$2,053,953 (\$1,434,450). The improvement in gross earnings since June is due to the increased tariffs effective from June 15th.

Mexican Railway.—Profit for year ending June 30th, Ps.8,247,289 (7,924,977), working exes. Ps.8,494,761 (8,255,984), leaving deficit Ps.247,472 (331,007) equivalent to £13,748 (£18,389), raising total debit forward to £1,685,567.

Canadian Breweries.—Three months' profit to Oct. 31st after tax and all charges \$189,130 (\$178,926). Year to Oct. 31st, \$570,570 (\$526,445).

the year under review £788,000. When one took into account the fact that profits on some contracts were more restricted than they had been—in many cases only 4 per cent. profit was possible—an idea was given of the rise in turnover those figures represented.

They were planning for peace in all they did to-day. Buildings and plant had never been in better condition. Considering the expansion of the last few years, they were moderately rated on the balance sheet. They had a strong and energetic team of managers and it would be with the utmost confidence that they would face peace-time conditions when the opportunity arose.

The amount available for distribution was £507,238. They recommended a final dividend of 12½ per cent., making 20 per cent., less tax, for the year on the ordinary stock and shares. He felt confident that the shareholders would consider 20 per cent. a satisfactory dividend. When it was first fixed some years ago, the Board felt that it was a percentage which could be maintained, and, whilst it was impossible to prophesy, they trusted that it would never be necessary to reduce it.

The report and accounts were unanimously adopted.

PRICES, TAILORS, LIMITED

SERVICE TO THE PUBLIC

The thirteenth annual general meeting of Prices, Tailors, Limited, was held, on the 16th instant, at Leeds, Sir Henry Price (chairman and managing director) presiding.

The following is an extract from the chairman's speech circulated with the report and accounts:—The trading profit and dividends received amount to £503,611 compared with £542,216 for the previous year. The preference and preferred ordinary dividends have already been paid and £78,000, after deduction of tax, has been transferred to Prices Trust Company by way of dividend upon our ordinary share capital.

The year under review has been one of constantly changing conditions. Up to the introduction of the purchase tax in October 1940, the company had continued trading at pre-war standard prices plus 10 per cent. to cover increases in material and other costs. The introduction of the purchase tax necessitated further price changes, and later in the year we had the introduction of the Limitation of Supplies Order to disturb the normal flow of materials from our manufacturers, and this called for important deviations from our pre-war trading methods. The introduction of the coupon system on June 1, 1941, imposed yet another restriction upon normal retail trade.

It is clear, then, that throughout the year we have had to continue to adjust our policy to meet new conditions and restrictions, and it is not surprising, therefore, that the trading profit shows a slight decrease as compared with last year.

In normal times I could, with some confidence, give you an idea of future trading prospects, but I am sure you will agree that in these times it would be more than unwise to attempt to do so.

So long as there are men, women and youths in civilian occupations, civilian clothing will be needed and your company will continue to supply these needs, maintaining, as far as conditions will allow, established high standards of materials and workmanship at the lowest possible prices.

The report and accounts were unanimously adopted and the dividend recommendations were approved.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended Dec. 13, 1941, total ordinary revenue was £33,806,000, against ordinary expenditure of £98,637,000, and issues to sinking funds of £155,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £2,111,204,000 against £1,818,361,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS

Tin Market.—The Ministry of Supply has informed the Metal Exchange that tin dealings will not be resumed. The Ministry will not object, however, to the delivery of tin which is urgently required, provided consumers obtain a licence from the Control. Tin can be bought from the Control for this purpose, but no price has yet been stated. It is understood that the international tin restriction scheme will be continued in spite of the war in the Far East. Basic tonnages will remain unchanged, though Thailand can no longer participate in the scheme.

Cotton Export Quotas.—The present quotas for the export of cotton piece-goods expire at the end of this year, and in view of the developments in the war situation, there has been considerable interest recently as to what the amount would be from January 1st. The Cotton Board has announced that, with the approval of the Board of Trade, new buying and market allocations for the period beginning January 1st are now being prepared; and it is hoped that these will be in the hands of exporters before the end of December. It is stated, however, that the allocations for markets now accessible will be on the basis of 50 per cent of the volume of allocations for the current period. The remaining 50 per cent is being withheld for the present, pending a decision by the Government as to whether certain changes are desirable. Lancashire traders expected some reduction in the possible amount of export trade, but there has been some surprise at the substantial cut in the quotas. Owing to the entry of Japan into the war, the chief markets affected are Java and Rangoon. Substantial orders have still to be completed and most shippers seem determined to fulfil their contracts. Some manufacturers hold the opinion that any loss of export trade will be made up by the increasing demands for the Home and Dominions Governments. It is reported in Manchester that the United States want to purchase large quantities of certain fabrics to meet the war emergency. It remains to be seen whether Lancashire manufacturers can find the necessary supplies.

Wool Rationing by Markets.—It has been announced by the Wool Control that the amount of raw wool available for the manufacture of fabrics to be exported will be less in the year ending October 31, 1942, than in the preceding year.

The amount of the reduction is to depend upon the desirability of the destination. No indication has been given yet of the size of the cut or the way it will operate as between different markets. It is believed by the manufacturers that each country will have its quota, to be divided as fairly as may be among the firms interested, but there is no means of knowing what this quota is to be.

Scrap Metal.—The responsibility for the collection of domestic ferrous scrap has been handed over to the Ministry of Works and Buildings by the Ministry of Supply. The shortage of iron and steel scrap has become even more acute, since imported supplies have practically ceased. Bombed buildings have yielded about 25,000 tons of scrap since July and little remains to be recovered from that source. The removal of railings is proceeding slowly. The Ministry of Works and Buildings is to continue the National Scrap Survey of fixed and industrial scrap, and it is to be em-

powered to take over supplies of this kind.

Price Control.—A Board of Trade Order which came into force on December 17th added a number of articles to the list of price regulated goods under the Prices of Goods Act, 1939. They include toys, motor-cycles, cooking, heating and other appliances and apparatus for personal or domestic use, boot polishes and floor polishes, trunks, ladies' handbags, suitcases and shopping baskets.

Diamond Dies.—The existing control of diamond dies has been enlarged to include diamond tools. Mr R. L. Prain, Deputy Controller of Diamond Dies, has been appointed by the Minister of Supply to be Controller of Diamond Dies and Tools.

QUARTERLY TRADE SUPP.

General Hitler

THE news that Hitler has dismissed von Brauchitsch, the German Commander-in-Chief, and himself taken over personal and supreme direction of the German armies has set all the old rumours circulating of a split between army and party, of a fundamental cleavage in the German body politic and, inevitably, of imminent schism and collapse—with the generals attempting to negotiate over the Fuehrer's prostrate body. The picture is, of course, the merest moonshine. Any question of an army and a party divided against each other—such as when Röhm was liquidated in 1934. Since that day the army has been one vast SA of the Nazi Party, the military expression of the party's will. To speak of divisions and cleavage here is to underestimate the basically totalitarian organisation of Nazi Germany. When the party cracks, the army cracks with it. If the army is finally routed, the party, too, will not be able to escape complete annihilation.

The reason for von Brauchitsch's dismissal is much simpler. It falls into the normal category of a general taking the consequences of defeat. The Moscow campaign has proved to be the first major disaster in the triumphant progress of the German army. The Commander-in-Chief must bear the responsibility for the failure, and Hitler has decided that the responsibility is heavy enough to warrant removal. Against the constant tendency to over-dramatise German affairs should be set the fact that this is not the first time a commander has been removed after an unsuccessful campaign.

It is not so much von Brauchitsch's disappearance as Hitler's decision to take his place that illustrates the gravity of the situation. In a sense Hitler has been the supreme war lord since February, 1938, just as the Kaiser was supreme war lord throughout the last war. A general responsibility lay with him, but the plans of campaign, the organisation and use of reserves and other major decisions were taken by the Commander-in-Chief.

Now Hitler is apparently to advance from his more invulnerable and remote authority as all-overseeing All Highest into the immediate sphere of plan, decision and execution. He is to see if his magic still works; or, which is far more important, he is to persuade the German people that it can still work.

The situation has not yet deteriorated to the point of needing magic or miracle to restore it, but it has deteriorated. The whole aim and purpose of the German attack on Russia was to achieve a knockout blow before the Russian millions could be mobilised and equipped. Hence the drive on Moscow, for only the capture of the political, economic and military nerve-centre could lead to a total disintegration of the nation's resistance. Moscow has not fallen, although Smolensk was reached in the first weeks in July. This is the supreme importance of von Brauchitsch's failure. Moscow is not simply a loss of prestige; it may mean the loss of the war. Behind the Moscow line, Russian industry has been evacuated to the Urals; millions of recruits are receiving arms and training; fresh reinforcements, as well as seasoned troops, held the city in the critical days in October. Now the chance of quick victory has passed for good. There can be no knockout blow, for there is no one place to knock out; there is on the contrary a hydra-headed Red Army fed by Russia's still vast reserves of industry and manpower.

The war must thus continue, and with winter upon them, the Germans must stabilise a front. Preparations in the rear have undoubtedly been made, but was the planning on the scale of maintaining millions of men in the bitter cold? For the Russians winter equipment is normal, but it is questionable whether the Germans have the sheepskins and felt boots—without which sentry duty on their new line is almost certain death—whether their medical stores include adequate supplies of remedies for frostbite, whether they have had sufficient experience to evolve frost-proof motor spirits or tractors or wheels

in Russia is only five years old, the famines which accompanied collectivisation barely ten. The Spanish Civil War was marked by incredible ferocity on both sides. Iron Guards outdid the Nazis in Roumania. The Ustasi are pursuing a policy of mass extermination of Serbs and Moslems in Croatia to-day. Even the enfeebled Vichy régime relies for the shreds of its authority on secret police and the concentration camp.

Now it is obvious that the British record in this respect is something for which the nation can feel a justified pride. The treatment of conscientious objectors, the treatment of aliens—after a couple of months' hysteria and muddled management on the part of the authorities and the public—stand out in glowing contrast to the abject fate of the weak and the helpless in other lands. The rule of law and habits of peace and decency have been preserved in the middle of total war, and that is no small tribute to the British community. Yet this quite justified satisfaction ought to make the people even more outraged when isolated cases of Europe's disease of brutality do occur. For example, the episode of the *Dunera* makes uncomfortable reading. It appears that the internees who made the voyage out to Australia were submitted to inexplicable hardships; they were robbed and beaten; they were herded together in conditions which were for all the world those of a concentration camp; and they found themselves powerless to obtain any redress from those responsible on board. Some idea of the treatment meted out to the men can be given by this quotation from an account drawn up by them on arrival in Australia:

The order had been issued to run or walk fast during these exercises. Those who did not walk fast were driven along by the sentries with rifle butts or were bruised by blows. At the ends of the decks Lewis guns, loaded and completely manned, were kept trained on the internees in readiness to shoot. At times officers and sergeants assaulted the passing internees, pushed them, beat them and insulted and swore at them while hitting them.

If brutality is a widespread phenomenon in Europe, it is useless to blind people to the problem by concentrating simply on the German varieties. On the contrary, a good case can be made for arguing that the solution of the German dilemma will be reached only from the European end. The Germans are not, after all, politically an original people. The idea of the *raison d'état* which underlay Prussianism came at several removes from Machiavelli, at one remove from Richelieu and Louis Quatorze. The idea of a state dedicated to conquest and based on conscription was worked out in Sweden before it was transplanted to Prussia. The idea of the unified nation state was first realised in France and was the dream of all European Liberals in the nineteenth century. National Socialism is borrowed at one remove from Italy, at two removes from Bolshevism. The originality of the Germans lies in a trait which might perhaps be expected from a race of theorists—their power of carrying programmes and principles to logical and therefore unbearable conclusions. Germany is the mirror in which Europe sees, distorted to more than life size, its own repellent countenance. In a Europe ridden by racial hatreds and absolute government and private and public brutality, small wonder that the Germans have produced the most efficient version.

The causes of Germany's excesses are likewise the causes of Europe's disease. Tyrannical government and public and private violence are not new. They mark the history—"nasty, brutish and short"—of man's slow evolution. But there are new factors in Europe's contemporary crisis which give it a particular significance. The means of cruelty and destruction are greater than ever before. A secret police equipped with wireless, armoured cars and machine-guns is inevitably more formidable than horsemen with muskets. A Gestapo or OGPU trained in psychological manipulation has new ways of torturing its victims to confession or death. The twentieth century regression is all the worse in that it is not the *status quo ante* that has been restored. However arbitrary the rule of a Roman emperor or a mediæval prince, both were conscious of a rule of law independent

of their appetite. To-day the good of the class or the race is the only criterion of justice. The idea of a universal law in which the rights of man, irrespective of race or creed or class, were guaranteed, has been driven out. Gestapo, OGPU, private lawlessness are only particular manifestations of this new—and total—anarchy. At the same time, material insecurity has partly caused, partly accelerated the decline. The fringe of the middle-class vainly struggling to maintain a standard, together with the mass of the unemployed, have provided the hysteria and the desperation which vitalises the totalitarian faiths.

It is against this background that the futility of both Vansittartism and appeasement can best be judged. There is no "racial" explanation of a disease whose roots are deep in the economic and moral disorders of Europe. For German and non-German alike, one of the conditions of post-war betterment is the re-creation of security—steady jobs and steady wages for the labouring masses, opportunity and wider horizons for the white collar workers and the skilled technicians. Thus the guarantee given by the British Government that it will not encompass the economic ruin of Germany after the war is on entirely the right lines.

The provision of security cannot, however, imply further "appeasement." The process is one of cure and rehabilitation, and at the end of the war there will be incurables as well as invalids. After all that the Germans have suffered at Hitler's and Goebbels' hands, they will remain a pathological case for two or three generations. Appeasement—that is, appealing to better qualities—is a nonsensical policy when the better qualities are simply not there. It will be impossible for a long time to appeal to the Germans in the name of international justice. At the same time, a lasting settlement of the European problem cannot be envisaged in any form that does not leave room for an equal, and equally pacific, Germany. That solution may be deferred for generations—but it remains the goal, and the disarmament and restraint of Germany is only the negative and preliminary phase of a new constructive British attitude. The positive element should be willingness to put force behind the law and a steady determination to see the law enforced. The system of co-operation for higher standards of living forecast in the Atlantic charter and the British Government's guarantee of fair economic treatment for all envisage a community of European nations in which each state member will benefit by the work and assistance of its neighbours. The corollary of this must be the acceptance by the state members of certain obligations, of which the most important is obviously the preservation of the basic Rights of Man. Free speech, due process of law, religious and cultural rights can no longer be regarded as matters "internal" to any state government. They are the concern of Europe as a whole. The creation of a new security system on these lines will depend entirely upon the sustained will, effort and interest of the victors, not least of Britain; and if there is a positive element in Vansittartism, it is that it can play a part in securing the abandonment of the two symbols of Britain's inter-war sloth—pacifism and isolationism.

Ultimately, however, the enforcement of law requires the acceptance of the rule of law, a willingness of the great majority of people to live by law. The problem facing the victors in Germany as in Europe is whether, after the Nazi tornado, the land will not have been stripped of all the loyalties, standards, principles and faiths that were knit together to form the texture of European life. Here, more than in economic and military security, lies the real problem of the peace. Appeasement denies the problem. Vansittartism renders it insoluble. It can only be met by the Western democracies if their faith in the conduct of civilised existence is at least as fervent as the energy the Nazis, the Fascists, the Iron Guards, the Ustasi and their own hooligans have displayed in tearing civilisation down. The tasks of post-war Europe are not only those of the economist, the doctor, the policeman. The missionary and the crusader must find their place.

Social Insurance in Russia

AN Anglo-Soviet Medical Committee was set up this autumn. Among its objects is the study of environmental and social medicine in Russia, and its findings will be of interest to legislators as well as to doctors. National health insurance, old age pensions and workman's compensation, all on the list of urgent reforms in this country, are closely linked with medicine; and there are two problems. The first is how technical progress in medicine, such as the treatment of industrial disease or the after-care of tuberculous workers, can be better used to cure or prevent ill-health; it is a medical problem. The other is, how to "socialise" medical progress by making it available on a large scale to the whole population. This is a matter of administration and finance. In Britain, for instance, there are no statutory benefits under social insurance for the rehabilitation of injured workers; and there is a grievous lack of rehabilitation centres and fracture clinics. Yet in 1939, an American witness told the Royal Commission on Workman's Compensation that the famous rehabilitation arrangements of New Jersey received their first stimulus "from England."

The interesting question, therefore, in Russia, is how far the Russians have found it possible to translate the achievements of medicine, in pathology, surgery, and therapy, into terms of social security. In 1913, there were 175,634 hospital beds in Russia; in 1928, 246,100 and in 1932, 405,800. But the population of Russia in 1933 was 165,748,400; and the figure of just over two beds per 1,000 of the population compares badly with the norm of five beds per thousand taken by the International Labour Office, or with the seven beds per thousand in this country. Nevertheless, the planning of social insurance and medical services in Russia has distinctive and important traits. As in other new industrialised countries, such as the British Dominions, it has not been hampered by the legacy of the past in social care; the Russian system is comprehensive and unified, and contrasts markedly with the British system, where public and private bodies are intermingled and where the Ministry of Health, the Home Office, the Ministry of Pensions, the Ministry of Labour, the Assistance Board, the Treasury, friendly societies, approved societies, hospitals' savings associations, insurance companies, collecting societies and trade unions are all associated in its working.

The state regulation of social insurance in Russia is no special mark of socialism. The tendency to administer social insurance by the state or by state-controlled institutions is universal. It was introduced in Germany by Bismarck, who was by no means a Communist. It has taken characteristic forms in Switzerland, Sweden and Ontario. Almost everywhere, industrial accident insurance is operated by state-controlled mutual indemnity associations, composed of representatives of employers and employees. In the United States, there are state-fund insurance systems for workman's compensation in eighteen states. In Victoria, Australia, there is a State Accident Insurance Office with an expense ratio of only 9.7 per cent compared with a ratio of 39.6 per cent in private offices. The fact that social insurance in Russia is not a matter of private profit is neither particularly Russian nor particularly socialist.

Although the state in Russia has full control over social insurance, the tendency has been to decentralise the system in so far as the interests and requirements of different industrial or territorial groups vary. Until 1933, social insurance in Russia was administered by eleven occupational federations under the supervision of the People's Commissariat for Labour; it resembled the system in Germany and Ontario. In 1933, administration was handed over to the General Council of Trade Unions and its 47 affiliated associations, later raised in number to 163. Thus, Russian social insurance is dove-tailed to the ramifications of Russian economic activity and not centralised in a single administration.

In fact, the great administrative difference between the Russian and other systems is not in administration proper but in finance. The funds for social insurance are entirely raised from enterprises, institutions or individuals employing labour. They are not collected from workers. Contributions bear a fixed relation to the size of the wages bill and in no circumstances can they be deducted from wages. Thus the Russian system disregards the so-called "thrift" principle which in other countries lays part of the burden of insurance upon the workers themselves. But, in two other ways, Soviet Russia has preserved the methods of "capitalist" countries. No procedure has been introduced by which every individual worker is equally entitled to whatever social aid is available. Instead of the principle of "work or maintenance" for which several generations of socialists have called, the insurance principle and the public assistance principle have both been preserved; the distinction between social insurance and the care of the destitute has not disappeared, even in Russia. Secondly, the insurance benefits given are not based upon a standard flat rate for all people, but vary widely. In Russia, there are differences in benefit in invalidity schemes according to the nature of the work done, the length of the qualifying period and "normal" remuneration; in Britain pensions are paid at a flat rate. In Russia, pensions as well as sickness benefit are differentiated.

The chief interest of the Russian system is the wide scope of the benefits given, and in particular, under sickness insurance, every kind of medical benefit is granted to the insured population free of charge. The cost of medical benefit is borne by the state and local authorities. Under his insurance, the worker is entitled to every form of medical service, attendance by physicians and surgeons, orthopaedic treatment and artificial limbs, hospital treatment and maintenance in sanatoria or rest homes, most of which belong to trade unions. His dependants are covered by insurance in case of medical or economic need. Funeral expenses, so dearly bought by British workers through industrial assurance, are included among insurance cash benefits in the official statistics; and children's health, physical culture and tourist travelling are included among medical benefits. It may well be that the provision of benefits is, in practice, less generous than this definition of them; but their breadth of scope should be of great interest to a country like Britain, where such extra benefits can only be provided, if at all, when the finances of approved societies will permit it.

The question to be asked of all systems of social insurance is whether they provide results in really human terms. Will they cure the sick and rehabilitate the injured? In Britain, the current of the time is towards regarding social security in physical as distinct from financial terms. British doctors have frequently urged the need to provide a chain of treatment for sick or injured workers, leading from diagnosis to the final cure through all the necessary stages; others have underlined the need to adapt this unified care to regional conditions by the provision of local industrial clinics. The clinic, fully equipped and open to all, is the core of prevention as well as of cure. Here again, the example of Russia may be significant. Unified treatment is possible because the whole system of state insurance, for the destitute, the sick, the injured, the aged and the deficient is unified; local and individual attention is possible because administration is decentralised in the hands of bodies immediately concerned with working and living conditions. How far this system does, in fact, deliver the goods, is unknown. How far the scope and liberality of the benefits under Russian social insurance are realised in practice, cannot be said. All that is known is that social insurance in Russia is organised and conducted according to many principles which have won the support of reformers in other countries. There is in Russia a unified system of social insurance on a uniform basis. Is the social security of the Russian working class family in fact a greater reality? That is the question.

NOTES OF THE WEEK

Mr. Churchill in Washington

The secret of Mr Churchill's second Atlantic trip was better kept than the first. Nevertheless, it can hardly be a surprise to learn that the Prime Minister, supported by the Minister of Supply and the heads of the three fighting services, has gone in person to consult with the President. The entry of the United States into full belligerency has obviously created vast new opportunities, as well as raised difficult new problems, and there is no time to be lost in securing the utmost unity of planning and purpose. The matters to be discussed are adequately outlined by the composition of the delegation. There is the co-ordination of strategy in five continents, four oceans and three elements—with the joint crisis in Malaya and the Philippines as the urgent first item on the agenda. Secondly, there is the problem of supply. An indication of the new temper in America has been given by this week's decision to merge the functions, hitherto separate, of planning the expansion of munitions production and the contraction of civilian consumption. This new outlook completely transforms the picture; there will be a great deal of adjustment of programmes to be undertaken, in England hardly less than in America. Everything—guns, planes, tanks and ships; production in Britain, in Canada, in America, in the Eastern group; production of munitions and of civilian goods; consumption in any of the free continents—is now merged into a single vast problem of joint supply. There may, or may not, be a new declaration of principle by the President and the Prime Minister; but, in any case, even more than on the last occasion, the hard work to be done by the Conference will be detailed and properly secret. There may, or may not, be a decision to create new formal machinery for consultation; but the Prime Minister's ocean crossing will have shown in the clearest possible manner how much more important is the substance than the form of collaboration. The important thing is that the new Allies are getting mixed up together. There are consultations going on in Chungking also; and it may be taken for granted that the importance of associating Russia with the new solidarity is not being neglected.

Grave News from the Far East

The Far Eastern storm centre remains over Malaya, where the news is uniformly bad. After a rapid advance through Kedah, the Japanese were able to occupy Penang, devastated by air attack and thus to secure a base opening on to the Indian Ocean and commanding the very approaches to Singapore. Advancing further into Perak, the Japanese are now within striking distance of Ipoh in the centre of the tin-mining area. The mines are also menaced from the east, where other Japanese forces are pushing on from Kota Bharu. So far, the British armies, which were frequently stated to have been "heavily reinforced," have not been able to stop the Japanese advance, and the danger not only to Singapore but to Rangoon and hence to the Burma Road is very grave indeed. This last issue is clearly one of the most vital, for it is China's continued resistance that is containing an army which would otherwise be capable of overrunning the whole of "East Asia." The Chinese are giving magnificent direct assistance by launching attacks in the rear of the Japanese armies behind Hongkong—where the beleaguered British garrison still holds out—but the battle for Chungking may well be fought between Rangoon and Mandalay. The British are not bearing the brunt alone for the Philippines are again the centre of fierce fighting. Earlier attacks on Luzon were contained and for several days there was a lull in the fighting. However, the Japanese then effected a new landing on Mindanao, the most southerly island, where the majority of the islands' 30,000 Japanese live. This was followed by the biggest landing yet attempted by the Japanese. Some 80,000 troops, brought up in eighty heavily escorted transports, launched an attack against Luzon on a twenty-mile front between Lingayen and Agoo. These widespread landings in all the islands tell an unhappy tale of naval superiority and control of the seas. Airpower is of crucial importance in these narrow waters—as the Dutch airforce is proving by its fine performance against Japanese warships and transports. But in the air, too, the Allies are inferior

and the only bases from which effective blows could be struck against Japan itself—Russia's Siberian bases—are still, inexplicably, neutral.

Crisis in Singapore

Mr Duff Cooper, who, as Chancellor of the Duchy of Lancaster, was sent *en mission* to the Far East to survey the co-ordination of strategy and administration in that region, is now to settle down in Singapore. He has been appointed Resident Minister for Far Eastern Affairs, and will preside over a War Council which, like Mr Lyttelton's Council in Cairo, will be representative of all the British fighting services and governing bodies concerned. Like Mr Lyttelton, too, Mr Duff Cooper will have Cabinet rank, and will serve under, and report directly to, the War Cabinet in London. He takes over his duties at a moment when every aspect of official policy in the Far East is being questioned and criticised. There is the whole of Far Eastern strategy to be remodelled; and the Singapore organisation will have the same tasks of supply and reinforcement as the Cairo Council, with the added difficulty that at sea, on the Malayan mainland, and in the archipelagoes, the advancing enemy has the initiative and superior strength. Mr Lyttelton's task was to mount an offensive. Mr Cooper's is to sustain a siege; and he will need, first of all, to allay the alarm which runs from Burma to Australasia about the unpreparedness of the Empire's eastern defences. Australia is represented on the Singapore Council, but there has apparently been some dispute with the Commonwealth Government about the mode of choosing or nominating this representative. Danger has made Australia more than ever conscious of its independent nationhood. War was declared on Japan direct, and not, as in the case of Germany and Italy, through the Dominions Office; and it is reported that it is Australia's wish to have a fully accredited Minister in Singapore beside Mr Cooper. Mr Cooper himself may lack some of the strong qualities which have enabled Mr Lyttelton in Cairo to weld commanders and civilian administrators into a compact and efficient team. His success, in the teeth of peril, would be a triumphant further endorsement of the policy of uniting the British war effort by itinerant Ministers; and without the fullest good will of the Australian Government and people, he will not be successful.

Labour Peers

The announcement that, "on the advice of the Prime Minister and HM Government," peerages have been conferred on Mr Wedgwood Benn, Mr Josiah Wedgwood, Mr Charles Latham and Mr Fletcher was accompanied by the curious statement that the creations "are not made as political honours or rewards, but as a special measure of State policy. They are designed to strengthen the Labour Party in the Upper House." This would seem to be barely polite to the new peers, who will not only strengthen the Labour benches in the Lords but add to the usefulness of the House; they are all politicians of experience and personality. There are now seven Labour seats vacant in the House of Commons, and the nature of the persons nominated to fill them (for that is what it amounts to) will be very closely watched. Mr George Gibson, a former chairman of the Trades Union Congress, has already been adopted for one of the constituencies. Mr Gibson is an able man in the middle fifties; he will be a valuable recruit. It is to be hoped that the other six will all be much younger men, and that they will not all be Trade Union officials.

Russia: The Retreat Continues

The German retreat from Tikhvin has been followed up by the Russians, who are now pressing on to the frozen shores of Lake Ladoga. For the Finns, the new situation is grave. The Germans can give them no help for the next four months—on the contrary, will rely on them to hold a vital sector of the line. But if Russian mobilisation and re-equipment have gone far enough to devote to the Finnish front as many divisions—not a very great number—as were necessary to drive through the Mannerheim Line early in 1940, the Finns may see their interven-

tion end in complete disaster; the Russians would not on this occasion halt at Viipuri. In the centre, the recapture of Volokolamsk is further evidence—if it were needed—that the Germans are dictating neither the speed nor the extent of their retreat. Only in the south has their resistance stiffened. There are reports of counter-attacks in the Donetz basin and a renewed onslaught on Sevastopol. It is still too early to say whether the Germans can stabilise the front. Their one aim must obviously be to dig in and secure a respite and breathing space for reorganising their armies for the spring offensive. "Digging-in" is, however, more easily said than done in 50 or 60 degrees of frost and under perpetual harassing from the Russian armies in front and the Russian guerillas behind. However speedily and successfully the Germans establish new positions, it will not be the same invincible German army that emerges next spring after a long nightmare of bitter cold and perpetual minor military action.

First Round in Africa

General Rommel's armies are in full flight. Derna and Makili have fallen, and it says much for the increased striking power and drive of the British desert forces that in just over a month after the launching of the attack, Benghazi is in sight. The advance has lately been more rapid than in General Wavell's original campaign and against a much more formidable enemy. The immediate problem for General Ritchie is to prevent Rommel's forces from escaping westwards along the Gulf of Sirte. At the moment of writing, they are in the neighbourhood of Benghazi and there may still be time to close the coast road at El Agheila. Here the British columns which reached Jalo in the first week of the campaign should be able to play a part. However, even if Rommel's forces are trapped and annihilated, the fate of North Africa is by no means settled. The next phase—the capture of Tripoli—depends primarily upon

reinforcements. How heavy were the blows inflicted by Rommel before he was himself knocked out? To what extent can Egypt make good the losses and re-equip the Eighth Army for the formidable task of advancing in overwhelming strength to the frontiers of Tunisia? Time is the other determining factor. The Italians speak of the passage of a large convoy to Tripoli; the *Luftwaffe* is concentrating once again in Southern Italy, which, significantly, has been placed in a state of siege; there are reports of German reinforcements in Greece and Crete. The worse the man battle goes in Russia, the more vital it is for the Germans to keep open an alternative route to the Middle East and to Russia's flank. Only the very first round has been won in Africa. Almost certainly, the hardest fighting is yet to come.

Hesitation in the West

There can be little doubt that increased pressure has been put on Vichy and Spain in the last weeks. The time for placing all Europe in a state of siege has clearly come, with Russia undefeated in the east and the United States in the war on the Atlantic front. Only one gap remains, the territory lying between the frontiers of unoccupied France and Gibraltar. The discussions which have taken place with Vichy and the exchanges of view between the German Ambassador and the leaders of the Spanish State

in Madrid have been without doubt directed towards securing more active French and Spanish participation, while in the background the submarine attacks on French, Portuguese and Spanish ships in Spanish territorial waters have served the alternate purposes of attempting to embroil the non-combatant countries with Britain or of imparting a veiled warning. The Germans are not likely to have it their own way, however. The drain of the Russian fighting is great enough to check military movements which would draw off more manpower to the west. Either France, Spain and Portugal will co-operate freely or the Germans must think twice before undertaking new commitments. And the moment is not well chosen for persuading them to co-operate. The Russian situation is doubtful and, even more important, the United States and parts of Latin America, have entered the war. The first reactions to the Nazis' pressure are thus ambiguous. The Vichy Government has surprisingly withdrawn its charges against Britain for the sinking of one of its food ships. General Franco has announced his country's continued "non-belligerency." The Germans are perhaps beginning to learn that the most effective diplomacy depends upon a background of unbroken success.

18B Again

There cannot be any doubt that the House of Commons feels very strongly about the famous Regulation 18B, and the arbitrary power it places in the Home Secretary's hands to detain those whom he thinks he has reasonable cause to believe are dangerous to the state. The latest debate on the subject took place on Thursday of last week and concerned the cancellation of a broadcast that was to have been given by Mr. D. E. W. Gibb. Since *The Economist* was indirectly implicated in the affair, it will be as well to rehearse the facts. It will be recalled that the attitude towards 18B that has been editorially taken in these columns has been broadly in support of the Home Secretary. But this position has not been taken with any enthusiasm or with any of Mr Morrison's own complete certainty of the perfection of the present arrangements, but simply because of the inability to see any workable alternative. This view was set out in Notes in the issues of November 8th and 29th—the latter on the occasion of the debate in the House of Commons on the amendment to the Address. In the interval, however, an article was printed giving a somewhat different view and one more hostile to the Regulation, as interpreted by the courts. This article was printed as "By a Correspondent"—the usual device for indicating a lack of complete agreement with its contentions—and it has now been revealed that its author was Mr Gibb. (The fact that Mr Gibb is a member of the Board of The Economist Newspaper, Ltd., is, of course, purely coincidental). This article attracted the attention of the BBC and Mr Gibb was invited to prepare a script for a broadcast to give both sides of the controversy. The broadcast was never given. The BBC consulted the Minister of Information about its impartiality, the Minister of Information consulted the Home Secretary and, on the latter's representations, banned the script. Mr Morrison's view was that the script was not an impartial review of both sides of the controversy. The script has been published in full in *Hand-sard* and every one can judge for himself. Had the BBC held an adverse view and amended or suppressed it, there could have been no complaint. What is utterly improper is that the judge of the script's impartiality should be the greatest partisan of them all—the Home Secretary himself. If Mr Morrison is a sincere man, as he is, he is incapable of judging the objectivity of a statement that tries to hold the balance even between himself and his critics. If he were a man of judicial temperament (as he must be to administer 18B), he would have refused to express any opinion on the script and sent it back to those whose duty it is to decide. The episode was a small one; but it has very considerably shaken confidence in Mr Morrison's administration of his enormous powers.

Women Conscripts

Last week the first Royal Proclamation calling up conscript women under the National Service Acts was signed by the King. The proclamation applies to all women who have reached the age of 20 and have not reached the age of 31, except for married women not separated from their husbands, mothers with children under 14 and

material and talking to the point; and a periodical of fact and comment is distributed for their use, which—in spite of Mr A. J. Cummings' recent diatribe against one issue dealing with Russia—usually reaches a satisfactory standard. Unfortunately, like so many things in the new Army, these discussions are looked at with suspicion by some commanding officers. In several units, there has been no attempt at all to start them; in others, they are regimented and purely formal, with not a vestige of the free talk among men of every range of education and experience which is their only justification. If this scheme is intended to be more than an idle gesture—and for a democratic army in total war, it would seem to be essential—the obligation to carry it out should surely be laid upon every commanding officer, and enforced by an impartial and effective system of inspection.

Tax Evasion

The Treasury's attention should be directed to the hawking about of a method of tax evasion. It involves a contract between a payer of surtax on the highest scale and a charitable organisation which is exempt from income-tax. The scheme begins with the charity making a present of, say, £10,000 to the taxpayer, and the taxpayer in return entering into a covenant for seven years to pay the charity £8,000 a year gross, i.e., £4,000 a year after deduction of a 10s. income-tax. The charity, by virtue of its privileged position, recovers the £4,000 income-tax, and the taxpayer reduces by £8,000 the income on which he pays surtax, thus saving himself £3,800 a year. This brings the net cost of his subscription to the charity down to £200 a year. Paying £200 a year for seven years costs him £1,400, and as he has started off with a present of £10,000 from the charity, he is (without taking interest into account) £8,600 in pocket. The charity will probably have to pay commission for the introduction, but subject to that, and to taxation remaining at its present level, the balance-sheet at the end of the seven years would be as follows:—

Charity + £46,000. Revenue - £54,600.
Taxpayer + £8,600.

It is not a device that reflects any credit on anyone.

Mr Curtin and The Economist

Mr Curtin, the Australian Prime Minister, has thought fit to make a special statement about *The Economist*. As reported by cable, he says *The Economist*—

is a notorious advocate of a chattel relationship of labour to money. In its view, the only true function of labour is to be the stay and prop of the traditional Tory party. Everything *The Economist* has said in regard to Australia's participation in the war has been to oppose increases in soldiers' pay and to be the London mouthpiece of reactionary Australian politicians. It is the reactionary politicians of the British Empire, including Australia, who are responsible for a great deal of what all of us are now sorry for and are suffering by.

It is very difficult to imagine what can have inspired this outburst. There have been very few references to Australian soldiers' pay in *The Economist*, and even fewer remarks that could be interpreted as an expression of opinion. As it happens, the latest and almost the only one of these—written on the occasion of the new Labour Government's Budget—took the view that increases in soldiers' pay and similar allowances could be justified on the score of hardship. It is, of course, quite untrue that *The Economist* is the London mouthpiece of reactionary Australian politicians. *The Economist* is not in contact, directly or indirectly, with any Australian politicians whatsoever, reactionary or otherwise. For the rest, it can only be said that nonsense is nonsense even when it comes from a Prime Minister. If paper were not scarce, the appropriate reply would be to present Mr Curtin with a subscription to *The Economist* in order that his next statement on its views could be founded on facts rather than imagination. He might even be brought to apologise for his ignorant untruths.

Shorter Notes

The preventive occupation of Portuguese Timor by Dutch and Australian troops on December 17th can only be hailed with relief by the Allied public. The island of Timor, situated at the eastern extremity of the Malayan

archipelago, little over 300 miles from the Australian mainland, occupies a position of considerable strategic importance in terms of the Pacific conflict. Negotiations for joint defence in case of need were started between the Allied and Portuguese governments early in November and, by December 8th, it had been agreed that Allied troops should intervene in the event of actual Japanese attack, but, since the Allied action preceded a Japanese attack, Nazi pressure on the Iberian peninsula clearly made it impossible for the Portuguese Government to condone such action officially after the event.

The following table gives the number of civilian casualties in air raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Total Sept.-Dec., 1940.....	21,669	30,556	52,225
1941:—			
January.....	1,550	2,021	3,571
February.....	793	1,068	1,861
March.....	4,293	4,794	9,092
April.....	6,131	6,900	13,031
May.....	5,520	5,207	10,727
June.....	406	461	867
July.....	501	447	948
August.....	169	136	305
September.....	217	269	486
October.....	262	361	623
November.....	89	155	244
Totals to date.....	41,605	52,375	93,980

Of those killed in November, 39 were men, 36 were women, and 14 were children under 16.

According to Sir Kingsley Wood, as a further means of economising paper, arrangements have been arrived at between the Paper Control, the banks and the printers, limiting the size of cheques. After existing stocks have been used up, the maximum size of standard cheques will be six inches by three inches for single signatures and six by three and a half inches for two signatures or more, plus a maximum of 2½ inches for counterfoils and binding. For special cheques, the maximum sizes will be 9½ by 4 inches overall for cheques for use with machine accountancy and 10½ by 4½ inches for specially printed cheques, but where the design or type of these cheques is changed they will have to conform to the maximum sizes of standard cheques.

In reply to a question in Parliament, Mr Bevin stated that the present Central and Supplementary Registers of the Ministry of Labour are to be merged into a new Appointments Department. Exactly how far its procedure and functions will differ from those of the old Central Register is not yet clear, but Mr Bevin said that it will deal with persons possessing specified administrative, managerial, professional or technical qualifications and with others whose normal salary exceeds £420 a year. It will maintain a separate register of persons seeking employment, and its provincial organisation will be closely associated with the new district manpower boards.

The number of old age pensioners and the number receiving supplementary pensions, together with the annual cost, is shown in the following table, printed in *Hansard*:—

	No. of Recipients	Annual Cost £
Old age pensions:—		
(a) Contributory—under 70.....	1,230,000	32,000,000
(b) Contributory—70 and over...	1,450,000	37,600,000
(c) Non-contributory.....	510,000	13,120,000
	3,190,000	82,720,000
Supplementary pensions.....	1,340,000	27,500,000

THE WORLD OVERSEAS

Party Thought in the United States

(From Our Washington Correspondent)

[This article was written before the United States entered the war, but it is published for its historical interest, since it shows the already confused state of the political parties on the eve of an event which may abolish the old distinctions altogether.]

November 26th

THE unsettled state of both major parties was underlined by the Neutrality Act debate; it is likely to remain important.

Looseness of party thought in the United States is no novelty. Party leaders have never dreamed of disciplining their policies into a party line—an area of agreement is the best they can hope for, and even that area usually requires skilful gerrymandering. In some measure, this is due to the highly federal structure of national parties, which, as Sir Wilmot Lewis put it, “requires that they shall be all things to all states.” Eighty-three years ago, when Lincoln and Douglas were campaigning in Illinois, one of the taunts hurled by the little giant at the big was that he was saying one thing in the northern part of the state and another in the southern. The difference in political idiom between state and state is, of course, correspondingly greater. The problems created by this difference have been noticeable recently, because they are more striking in the case of the Democratic party than in the case of the Republican. Geographically, Democratic strength is found in the mass of citizenry in the big Northern cities and in the solid South. Republican strength is found in the offices of the big corporations, and in the rural regions above the Mason-Dixon line and west of the Mississippi.

Politically, these alliances have made sense. Economically, they have made something closely approaching nonsense.

The Populist revolt, the Progressive Movement, the Roosevelt landslides in the Middle West, have periodically raised questions about the degree of common interest between finance capitalism and commercial agriculture. And if the political unity between Middle Western agriculture and North-Eastern industry covers important economic divergences, the political antagonism between the South and that same industry covers some economic relationships that are very close indeed. The capital required for Southern industrialisation has come from the North. The paying jobs in the South have been for the satraps of that capital—in iron and steel, in textiles, in insurance, in chemicals, in coal and tobacco. Under the name of the Democratic Party, satraps have run their state governments along approved corporate lines—in some cases they have practically served northern industry as rotten boroughs.

In view of these confusions, the question of what is a Republican or what is a Democrat becomes hard to answer indeed.

During the 1920's the isolationism of the League-defeating Republicans in Washington was no particular burden to the Hamiltonians in New York, who were busily making international loans because they had inscribed the distance between the political and the economic capital in the slogan, “More business in government and less government in business.” Then came the Republican eclipse of the 1930's, in whose obscurity the main battles were on domestic issues. But since World War II took the stage, the relation between economic and political policy has become inescapable; the party has had to declare its intentions again, and is having trouble in doing so. (Part of the trouble comes from two changes that run counter to established myths. The isolationism of the Middle West is axiomatic, but the twenty years just behind us have proved to many farmers their interdependence with world markets. Likewise, axio-

matically, the big financial interests have been interventionist, but here again the years between wars have left their mark; branch plant owners in territory now occupied by Hitler acquired a stake in appeasement, which in some cases gives a new turn to the protection of investments.)

Most of the old Senate isolationists have died off—Johnson of California and Nye of North Dakota are about the only ones of that group left. But a new crop of non-interventionists is coming up in Congress—Taft of Ohio, Clark of Missouri, Vandenberg of Michigan, Fish of New York, Lodge of Massachusetts. The general behaviour of these Republicans is that of an opposition party whose opposition includes disapproval of the Administration's policy in foreign affairs. It acts as the “outs” might normally be expected to act. The anomalous part about its position is that it is midway between the position of the official Republican candidate for President and that of the Republican-dominated America First Committee.

Mr Willkie's views on world policy are so far removed from those of the majority of his party in Congress that one designation seems totally inadequate to cover them. This situation has been recognised in one or two of his recent speeches; it has also led a group of Republicans to urge supplanting Mr Willkie as head of the party by the House Minority Leader, Joseph Martin, Jr., of Massachusetts. But Mr Willkie does not stand alone. With him are an able group, whose Republican background cannot be easily challenged. Foremost of these is Governor Stassen of Minnesota, one of the most vigorous of the Party's younger men, whose capacities as a potential Presidential candidate cannot be overlooked by a party that at its last convention found itself short on home-grown presidential timber.

Between Wood and Willkie

Both of these men are headliners whose popularity is rising at the same time that the tide is turning against America First. The America First Committee is in no sense a product of the Republican Party—but far more than a majority of its members are Republicans, and the greatest common bond among them is hatred of Roosevelt. But the international issue on which America First has picked its domestic fight has subjected the Committee to the inconvenience of a motley collection of Axis allies. Their attendance at meetings, solicitation of funds and members, and editorial approval have given the Committee a progressively bad press, climaxed by the Lindbergh speeches at Philadelphia, where he demanded: “Is it not time for us to turn to new policies and to a new leadership?”; at Des Moines, where he raised the anti-Semitic issue; and at Fort Wayne, where he said, “If the time comes when we can no longer meet face to face as free men in a free country, then we will meet together at the elections next year and by our vote clasp hands though we be a thousand miles apart.”

These proposals have not caught on. But it is doubtful whether America First will fade out of the picture following current resignations from the Committee—it seems more likely to assume a new form which will accelerate the confusion within the Republican Party. Prior to the Neutrality Act vote, an America First convention in Washington pledged the Committee to seek the defeat of the Congressmen voting for revision and to support those who opposed all change in the Act next time they come up for election. Chairman Wood's public statement after the vote was taken ended with what has now become the slogan of America First—“We will meet you at the polls.”

Between Wood and Willkie, where can the Republican Party take its stand?

The Neutrality Act vote emphasised matters of comparable importance to the Democratic Party when a group of Southern Congressmen threatened to withhold their votes from all measures of foreign policy until action is taken by the administration on the labour situation at home.

Southern support to date of New Deal domestic legislation is explicable only in terms of history. For eighty years the Southern states have been one-party states, the name of whose party happened to be Democratic. But whereas the Democratic Party in the North has tended to be the people's party, founded on the urban masses, the Democratic Party in the South has been the party of the classes—the restrictive operation of the poll tax, in effect, denies others the vote. Most Southern Democrats, therefore, are people who elsewhere would be likely to be Republicans—all the more so since the industrialisation of the South has gradually been shifting their base from fields to factories, from cotton to corporations.

Consequently, they have viewed the recent national triumphs of their party with far from unmixed pleasure. The New Deal programme has been very hard to take. The welfare legislation has been looked upon by the ruling groups as threatening existing relationships with both negroes and poor whites; the legislation sanctioning collective bargaining has been even more bitterly regarded.

Until recently, however, the South has had little power to struggle against these innovations. It has been too safe an area at the polls to figure in intra-party bargains. Since the South would be reliably Democratic no matter what the word "Democratic" stood for, the content of the word has been supplied by the Democrats of the states where the two-party system was a reality—a reality whose statistics might turn up in the wrong column if the platform were not properly framed. And in many places that meant framed to appeal to labour.

Southern unrest at this situation was apparent in 1936; in the summer of 1940 the number of Southern Court House towns displaying "Democrats for Willkie" signs showed the extent of the effort that was under way to reconcile a tradition with a conviction. Now the Southerners have found a lever. Major votes on war issues are at present close votes. The Southern bloc is in the advantageous position of makeweight. For the moment, therefore, the struggle in the Democratic Party over domestic policy is likely to be as bitter as the struggle in the Republican Party over the war issues. How long current party names and current political alignments will last, based to the extent that they are on traditions rather than current realities, begins to be a matter for practical speculation.

A Loss to the King Government

[FROM OUR OTTAWA CORRESPONDENT]

December 1st

THE strengthening of the official Opposition at Ottawa by Mr Arthur Meighen's resumption of the leadership of the Conservative party has been swiftly followed by a serious weakening of the King Government through the death, after a brief illness, of Mr Ernest Lapointe, the Minister of Justice. There were distinct limitations to Mr Lapointe's Liberalism. He never showed much enthusiasm for economic and social reforms; his administration of the Defence of Canada regulations since the war began left much to be desired; and his influence was continually exerted in disastrous fashion, notably in connection with the withdrawal of oil sanctions at Geneva in order to weaken Canadian support for the system of collective security. But since Laurier died, French Canada has not produced a politician of such unsullied integrity, and for nearly forty years he gave his country faithful service according to his lights, being at the time of his death the dean of the House of Commons. In the past decade he enjoyed among his French Canadian compatriots an authority and influence almost equal to Laurier's, and the much greater enthusiasm which they have shown for the national war effort in the present struggle than they did in the last war is due in no small measure to the effective, if cautious, leadership given to them by Mr Lapointe. As leader of the French Canadian Liberals, he has been Mr Mackenzie King's right-hand man in recent Ministries, and there is nobody in sight who could begin to fill his place. More-

over, Mr Cardin, another senior Minister from Quebec, is in failing health, and Mr Mackenzie King is, therefore, faced with the problem of reorganising his Cabinet.

Meanwhile, the agitation in the English-speaking provinces for the removal of the existing limitations upon compulsory military service continues, and its supporters have found fresh support in the recent admission of Brigadier Vanier, formerly Canadian Minister to France, who now commands the military district of Quebec, that the voluntary system was not providing sufficient recruits for Canada's active service army. But, speaking at Montreal on December 1st, Mr Thorson, the Minister for National War Services, contended that the system of voluntary enlistment for overseas service was still giving adequate results. Apparently, Ministers have not at present any intention of enforcing full conscription, but they realise the urgent necessity of evolving an alternative plan, which will keep the fighting forces up to the requisite strength without diminishing the national war effort. They have accordingly set officials to work upon an exhaustive examination of the human resources of the Dominion, and are understood to be contemplating the use of women's services on a much larger scale than at present.

The new system of price control came into force on December 1st. Mr Donald Gordon, the able and energetic deputy-governor of the Bank of Canada, has been appointed chairman of the Wartime Prices and Trade Board, and great confidence is placed in his organising ability. But, for the moment, the business community, although it is giving its cordial co-operation, is decidedly bewildered by the complications of the new price regime, and some time must obviously elapse before it will be in smooth working order. The Board has undertaken to indemnify importers of goods essential for war industries and needs against loss from increased prices at the sources of supply. For non-essential imports it intends to maintain the consumer ceiling by the adjustment or abolition of taxes or duties and, when necessary, by the application of subsidies.

Boom Conditions

No winter has ever begun for Canada with such a high level of economic activity; only for certain sections of the agricultural community can conditions be considered unsatisfactory. For the first time for many years there is no problem of winter unemployment, and the national income, which for the first nine months of 1941 was estimated by the Bureau of Statistics at \$3,891 millions, as compared with \$3,511 millions in the same period of 1940, has been running on an average 10 per cent higher each month than during last year.

As a result of the outflow of war contracts from Ottawa, the primary iron and steel companies have been operating on a scale far beyond their reputed capacity. During October the output of steel at 222,853 tons, compared with 200,559 tons in September and 185,091 tons in October, 1940, established a new high record. For the first ten months of 1941 the total production of steel has been 1,971,909 tons, an increase of nearly 20 per cent over the total recorded for the same period of 1940. The production of pig iron in October was 137,114 tons, compared with 111,757 tons in September and 109,385 tons in October, 1940; for the ten months period it was 1,082,222 tons, compared with 948,841 tons. All plants which are capable of producing munitions are working at full speed, and although they are handicapped in some cases by shortages of materials and skilled labour, the general rate of production is highly satisfactory. The motor manufacturing plants, after a certain slackening of activity, have been increasing their output, which in October amounted to 19,360 units, compared with 14,496 in September and 21,134 in October, 1940.

Tightening State Control in Italy

[BY A CORRESPONDENT]

December 10th

IN the last few months "anti-plutocratic" utterances of leading Fascists have preceded or accompanied sweeping economic reforms. Under the new decrees, announced in October, all transactions in real estate must be registered and are subject to a high special tax. All holdings of company shares must also be registered, and all bearer shares are to be changed into registered shares. Dividends will be restricted to 7 per cent (though very few companies have

so far paid a higher dividend) and the existing taxation laws regarding shares and coupons have been somewhat altered with a view to further discouraging the sale of such securities.

While it is thus more difficult for capital owners to speculate in the real estate markets or on the stock exchanges, the Government has also taken special measures against hoarding. The retail sale of gold, jewellery, etc., has been prohibited. During the month of October, when a general inventory was made in all shops, the sale of footwear and textile goods, except hats, gloves and ties, was also forbidden, without any warning being given beforehand to the population. Since November 1st the sale of these goods has been permitted again, but they are so rigidly rationed that, for instance, a man is unable to buy the one suit of clothes and a pair of full-leather shoes in the same year. It has been rightly suggested that this does not mean any hardship for the majority of the Italian people, but who cannot even afford to use up their official rations. But it appears to be a very effective measure against large-scale buying by the well-to-do. Attempts at hoarding are further discouraged by the regulation that, when these goods are sold, the customer must produce an identity card and his name and address must be registered by the salesman. The same rule applies to the sale of soap and washing materials, leather goods, metal goods and non-contemporary works of art.

These regulations have been accompanied by others providing for a smoother working of the price and marketing control, while at the same time new powers have been given to the Fascist Party officials. Already during the summer the Fascist Party was entrusted with the control of prices. In October, it was decreed that no appointment of prices "of public interest" must be made in Italy for any post "of public interest" must be made in Italy without the special consent of the Party, and a little later it was announced that the Italian Corporations would be purged of "unreliable people"; every corporation, with the insignificant exception of those for the glass trade and the amusement industries, was affected by the wholesale dismissal of former high officials.

High Food Prices

All these measures have been found necessary, according to the Italian press, in order to check the attempt of the capital-owning classes to avoid the accumulation of savings or state securities; it has been pointed out that since the outbreak of war large amounts of savings have been invested in company shares and real estate. This tendency, which is obviously born of the inflation scare and the general distrust in the Government's war policy, led to an unprecedented rise in the prices of shares, real estate, and movable goods, which threatened the stability of the lira. The retail price of bread seems lately to have been kept stable, but other prices of consumption goods have risen considerably between the summer of 1940 and 1941; for instance, the price (in Rome) of potatoes rose by 10 per cent, butter by 33 per cent, beef by over 50 per cent, eggs by 100 per cent. Wines and fruit are by 50 to 100 per cent dearer than a year ago and the price of fresh vegetables has nearly doubled. It should also be added, first, that the cost-of-living index had already risen by 65 per cent between 1935 and 1940, and, secondly, that the figures quoted do not take into account the enormous price increases in the black markets.

The price of building property is said to have risen, in many instances, to three or four times its former amount during the last few months, and the prices of many company shares, for which no spectacular dividend can be expected, have also risen considerably. The announcement of the compulsory registration of shares seems to have checked this upward trend, at least for the time being, and the general level of share prices has fallen by more than 20 per cent since the beginning of October. Italian export prices had also been affected by the upward trend, and the problem of their stabilisation has formed an important item on the agenda of the latest Italo-German trade talks.

The attitude of the investing public has been no less detrimental to Italy's war finances than it was to the stability of the lira. Ordinary revenue does not seem to have risen above its pre-war level of 30,000 million lira per year. According to a recent report of the Minister of Finance, the Italian extraordinary war expenditure amounted, from July 1, 1940, to October 8, 1941, to about 76,000 million lira, or almost exactly 5,000 million lira per month. Since the monthly expenditure had been stated at several occasions at the beginning of this period to be above 5,000 million lira, it seems clear, especially in view of the de-

creasing purchasing power of the lira, that there has been a considerable reduction recently in Italy's real war expenditure. Without the help of the Germans, who send large quantities of unpaid materials south of the Brenner, Italy's financial position would be even worse.

In February and September this year the Italian Government issued two series of 5 per cent Treasury bills, repayable after nine years, which brought in a total of 39,100 million lira; a large proportion of the extraordinary war budget has had to be financed by short-term measures, and the only way of further increasing the war chest has been to force the owners of capital, in one way or another, to lend their money to the Government.

On the whole the Government is still trying to enlarge the volume of war production, both industrial and agricultural, and to pursue its policy of self-sufficiency. It has been announced that new subsidies would be paid to agrarians so that in 1942 the "struggle for grain" will have some better results than in the last two harvests. Ninety thousand "special workers" are to be trained during 1942 for industrial jobs. This figure represents over 10 per cent of the total number of workers in the engineering, chemical and extractive industries before the outbreak of war; it seems to confirm a Swiss report that even in Italy, owing to the military mobilisation, the extension of war industry and the enforced migration to Germany, a certain labour shortage has arisen in the industrial field; there is, of course, still a large reserve of other labour in Italy.

The Fascist Party's "anti-plutocratic" propaganda has probably yet another object—to make an excuse for the poor living conditions of the masses. At the same time as investment was restricted by new Government decrees, the bread card was introduced and many other consumption goods were likewise rationed. The weekly bread rations are 50 ounces for ordinary people, 75 ounces for heavy workers, and 100 ounces for very heavy workers; most other rations are differentiated according to provinces, so that the available quantities might nowhere exceed the amount which is consumed in ordinary conditions. Fish, which, however, is scarce, preserves, many vegetables and fruit are practically the only unrationed foodstuffs. Even in the north, rooms must not be heated before December 1st, and then only during a limited number of hours per day. Restaurants have to close, and the ordinary bus and tram service must cease at 10 p.m. every night.

The wartime economic policy of any totalitarian community may be considered under a double aspect. Any measures curtailing the freedom of the individual are mostly introduced as a wartime necessity just as in a democratic country. But there are indications that a certain difference of opinions about the true significance of these measures for the problems of post-war policy exists in Italy herself. The more radical school of Fascists are hailing the end of the bearer shares and the new price regulations as an important step in the construction of a Corporative Order in Italy. Similar measures have indeed been propagated in peace-time already, and for a typically Fascist thinker there is no reason why this policy should be abandoned when this war is over. A more moderate interpretation of the economic war policy has been forwarded a few months ago by an article in the Catholic *Avvenire d'Italia*, where it was pointed out that the price regulations could only be defended as a wartime measure but that they would tend to kill the initiative of any industrialist or trader and should therefore be abandoned as soon as possible. The Government has so far avoided the issue and the wording of the new decree does not make it possible to see whether the registration of shares and the other measures recently taken are intended to function for good—i.e., in the unlikely event of the Fascist regime surviving the present war.

Turkey's Mineral Resources

[BY A CORRESPONDENT]

December 1st

THE recent refusal of the Turkish Government to modify its agreement to sell chrome to Great Britain and the United States has reminded the world that in the past few years the mineral resources of Turkey have been greatly developed. Details of this development are regularly recorded in the journal of the Turkish "Institute for the Study and Survey of Minerals," and the first two quarterly issues for 1941 supply interesting particulars of the progress made to date in the production of hard and soft coal, iron, chrome, copper and other minerals.

Turkey is fortunate in possessing extensive coalfields, the largest of which is that of the Zonguldak-Eregli area on the Black Sea coast. The production of hard coal from these fields was sufficient before the war, not only to meet the needs of home consumption, but also to allow considerable exports. The war, however, greatly dislocated Turkey's foreign trade. Many commodities could not be imported, and this blocking of sources of supply intensified the Government's already existing desire to develop home industries.

This programme of self-sufficiency provided in particular for an extension of the railway system, an increase in the use of electricity and gas, and the development of steel manufactures. Hence the home demand for hard coal was much widened. The result was a drop in Turkish exports of hard coal in 1940, which, however, was offset by a doubling of the price obtained per ton. Moreover, production was 21 per cent higher, and economy in home consumption was effected by an increased use of lignite and soft coal, the production of which was doubled during the same period.

The output of both types from the Eregli mines in particular was much increased in 1940 as a result of their purchase by the Government. At the end of the year they were consigned for exploitation to a Government corporation which has since embarked on a reorganisation and "rationalisation" of the whole field, giving especial attention to the improvement of roads and labour conditions. Recent geological investigations show that the field extends in unsuspected directions, and new areas are in the process of being opened up. Finally, a school for the training of mining technicians has been established at Zonguldak, and a special Government agency has been created for the distribution and sale of hard coal throughout the country.

The main consumers of hard coal are the State railways, the iron and steel industries (which used almost three times as much in 1940 as they had in 1939), steamship companies, and electricity supply centres. Others whose consumption increased considerably in 1940 are the silk and textile, paper and sugar industries.

The Turkish Government has for some time sought to encourage the use of soft coal, not only in place of hard coal for industrial purposes, but also among the peasantry in place of wood and dung for domestic heating. Its aim here has been, on the one hand, to conserve timber in accordance with its afforestation policy, and to promote the use of natural manure in agriculture. To make possible the adoption of soft coal as fuel by the peasants, arrangements were made for the distribution from rural centres, at low but economic prices, not only of the coal itself but of stoves suitable for burning it in. The result has been a steady increase in its use and a corresponding increase in its production. Production has been effected chiefly under the auspices of the state-owned Eti and Sumer Banks—the first of which controls the fields at Sowa, Degernisar and Tavsaui and the second that in the Aydm district—and of the State Railways, which own the Celtik mines in the Amasya-Merzifon area. These all increased their output in 1940, compared with the previous year.

The year 1939 was an epoch in the history of Turkish industry, in that it saw the large iron and steel factories established at Karabuk begin production. Before they did so, Turkey had been obliged to import all the iron and steel products required for railway construction, building, shipbuilding and sanitation. Hence the Karabuk plant began by concentrating on the production of rails and sleepers, girders, wire, steel plates for ships and tubes. The saving effected in Turkish currency has been

gratifying; the average monthly payments on this account fell from 2,348,000 liras in 1938 to 502,000 liras in 1940.

Turkey provides its own iron ore for these manufactures. It is mined chiefly at Divrik, where, though climatic conditions interrupt the work during the winter, production is enough for domestic needs. Indeed, the stocks accumulated in 1939 were so large that production in 1940 was somewhat reduced.

Less Chrome

Strangely enough—since the mineral plays so important a part in armament manufacture—Turkey's production of chrome declined somewhat in 1940, chiefly owing to the insecurity of sea transport. Of the 182,327 tons produced last year, 95 per cent were sold to Great Britain, the United States and France, the only other states to which sales were made being Norway and Sweden. Chrome exports last year earned Turkey 3,224,000 liras in foreign exchange. Fourteen companies are concerned in chrome exportation, the Eti Bank again controlling half this activity.

In contrast to chrome exports, copper exports made great advances between 1938 and 1940. Almost two and a half times as much was sold abroad in 1939 as in 1938; and in 1940 the amount sold to the United States alone was over three-quarters of the total exported in 1939. Prices also rose sharply last year and earned Turkey almost two million liras' worth of foreign exchange. In 1940, production from the mines of Ergain and Kuvarshan showed an increase of just under 27 per cent over 1939. Rather less than a quarter of this was devoted to Turkish armament manufacture.

Such are the particulars furnished by the *Journal* of the actual exploitation of Turkey's mineral resources. But it is clear that these have not yet been fully explored. Investigations are, in fact, being carried on in various directions, particularly for further supplies of soft coal, iron and copper and for oil; all of these have already produced results, oil, for instance, having been found at Romon Dogu. The *Journal* itself is evidence of the Government's ambition and enterprise in this sphere. For its pages are, for the most part, devoted to articles by European geologists, scientists and experts (mostly, unfortunately, German) on such subjects as Turkey's unexploited resources and the latest European discoveries in the use of minerals—one article, for instance, deals with the manufacture of paper and cardboard from lignite.

A remarkable feature of this effort on the part of the Turks to develop their mineral wealth in recent years is the extent to which they have been able to rely on their own capital for the purpose. The leaders of the republic were in part spurred to this achievement by unhappy memories of the past when foreign loans resulted in foreign interference. But in view of the poverty of the country when the new regime was established after eleven years of almost ceaseless war, the present Prime Minister, Dr. Refik Saydam, was well justified when, in a speech which is reported in the spring number of the *Journal*, he pointed with pride to this accumulation of capital as affording Turkey resources such as no other comparable state could boast.

Switzerland's Budget Difficulties

[FROM OUR GENEVA CORRESPONDENT]

November 14th

THE Swiss Federal Government has just published its budget for 1942, a budget which the Press describes as the most critical since the beginning of the war. Receipts are estimated at 317 million francs and expenditure at 479 millions, thus leaving an estimated deficit of 162 million francs. This indicates that taxation, though already heavy, will be further raised in order to avoid a too great increase in the public debt. It shows that the financial situation of the Confederation is far from favourable, and it should be further remarked that the budget only includes the ordinary military expenses of 116 million francs, and that expenditure incurred for the upkeep of the army and the continued building of fortifications is carried to a special

mobilisation account. From August, 1934, when Switzerland began rearming, up to the end of August, 1941, about 2,800 million francs were expended on national defence. Of this huge total, some 733 millions will be repaid by the end of the year, but the remaining 2,067 millions, added to the railway debt and to the existing public debt, are likely to bring up the debt of the Confederation to about 6,900 million francs by the end of 1941, and nobody knows how all this is to be repaid, even partly to repay it.

There may, it is true, be a reduction in the railway debt, as circumstances are benefiting the Federal railways. Traffic struck a record in 1940, when goods traffic showed a rise of 45 per cent over 1939, and passenger traffic an increase of about 5 per cent, with the result that the railway surplus was 168 million francs, against 149 millions in 1939. Up to the end of September, 1941, receipts totalled 322 millions—34 millions more than during the corresponding period of 1940—and the surplus reached 149 millions, a rise of 20 million francs over the first nine months of last year. These results are due, on the one hand, to the stoppage of motor traffic, and, on the other, to the increasing transit traffic of goods between Italy and Germany. It is so active that there is now a train every 10 minutes on the St. Gotthard line, and it has been necessary to dispatch many of these transit trains through the Loetschberg and Simplon tunnels. That imposes a heavy strain on Swiss railwaymen, lines and engines, but it may also explain why Switzerland has so far been left in peace by her powerful neighbours, to whom Swiss railroads are essential. While all sorts of raw materials and fuel are thus passing through, Switzerland lacks the products essential for keeping her industry going. There is a dearth of coal, iron, steel, copper, oil, and rubber, and though accumulated stocks are not yet completely exhausted, the situation is growing more serious every day.

Curiously enough, unemployment is very small; the reason is that workers thrown out of work in one industry are at once absorbed by another, as demand is much higher than supply, and in the metal industry sales on the home market show an increase of 100 per cent over last year.

Some factories are working for Germany, a few only for war purposes, but though they are to get the necessary raw materials from Germany, they complain of not receiving them in adequate quantities. Two factories, which are producing spare parts for aircraft, have already had to stop their production three times, after having turned out some 10,000 pieces each time, because the Germans had meanwhile altered the specifications.

Germany's Economic Order in Belgium

[BY A CORRESPONDENT]

October 19th

MORE than a quarter of the 1½ million workers normally employed in Belgium's industry are now working for Germany. Roughly, 210,000 Belgian workers were sent to Germany and 190,000 are working on German orders in Belgian industry. The number of registered unemployed still amounts to some 70,000, and the number of unemployed who refused to go to Germany is even greater—they are no longer registered and receive no unemployment benefit. Industrial activity is therefore on a low level compared with 1939. After a surprisingly quick recovery made by the coal-mining and steel industry during 1940, output seems to have been decreasing during recent months, partly because iron ore supplies from France are insufficient. In addition, strikes and passive resistance in mines and factories have frequently been reported. Recently, miners in the Borinage district went on strike for eight days. In the metal and textile industries 125,000 workers went on strike for some time, and miners even protested against the attack on Soviet Russia by stopping work.

The industries manufacturing railway material, and the shipbuilding yards, have been particularly useful for Germany's war economy. Here, the number of workers has been increasing, but pre-war output has not been maintained. The textile industry, on the other hand, has been reduced to some 30 per cent of pre-war activity. The big Belgian glass industry has been forced into the German cartel, and prices and exports are thus directly controlled

by the German glass industry. A Central Office for the diamond industry has introduced compulsory registration, and restricted the cutting and sales of diamonds for industrial purposes. All other civilian industries have been closed down or severely restricted.

As in other countries, Germany imposed on Belgium an economic organisation after the model of the German compulsory organisation. After the reorganisation of the Ministry of Economic Affairs, so-called commodity offices were established in all leading industries. These offices allocate raw materials, control the industries and decree compulsory concentration. The next step was the foundation of a compulsory central organisation for employers, with groups for each industry, also after the German model. At the same time, agriculture was compulsorily organised after the model of the German *Reichsnährstand* and marketing organisations.

Shortly after the occupation, German industrial and financial concerns began their private penetration of Belgium's economy. The leading *Ougrée Marihay* works were assimilated into the German Steel Cartel, and the *Vereinigte Stahlwerke* acquired the Belgian Phenix Works, the leading manufacturers of galvanised sheets. At present, a considerable number of firms in the heavy industries have been brought into German hands. Subsidiaries of German banks—the *Kontinentale Bank* in Brussels founded by the *Dresdener Bank*, the *Banque de l'Ouest* in Brussels, and the *SA Banque de Travail* in Antwerp, founded by the *Bank der Deutschen Arbeit*, are the chief means of extending German control over Belgium's industry.

Direct economic penetration is supplemented by industrial collaboration in many different forms. The industrial exhibition in Brussels, where 300 German firms exhibit several thousand models, is actually an Order Bourse. In the textile industry, Belgian manufacturers of artificial textile fibres collaborate with German concerns for the expansion of the manufacture of artificial fibres. Another typical example is the recent foundation of the *SA Carburantes Belges*. Its purpose is the purchase and distribution of synthetic oil products, which will be manufactured by Belgian industry in collaboration with the German synthetic oil industry. Industrial collaboration with Germany is a powerful incentive for the centralisation of Belgium's industry, as is shown by the formation of the "Belgian Petroleum Union," comprising 20 firms, the "Union of the Belgian Locomotive Manufacturers," and the *SA Belge de Fibranne*, comprising all manufacturers of artificial textile fibres. The latest step is the organisation of a rationalisation committee, officially called a study committee, for the incorporation of Belgium's industry into Europe's New Economic Order. German experts, who dominate this committee, will thus take actual control of all industries, after the Ministry of Economic Affairs has made rationalisation compulsory in accordance with the committee's recommendation.

Shortage of Food

The greatest obstacle to a successful incorporation of Belgium into Germany's European war economy is the totally insufficient agricultural production. The acreage under cereals has been increased from 270,000 hectares in 1940 to 312,000 hectares in 1941; yet it will never be possible to achieve agricultural self-sufficiency. Germany is obviously not able to supply Belgium with the necessary foodstuffs, and a further expansion of agriculture seems impossible. Last spring, for example, Germany and Holland supplied only 50,000 tons of seed potatoes instead of the promised 70,000 tons. Food rations are, therefore, near starvation level. The weekly bread ration amounts to 3½ pounds; butter and margarine to 3¼ ounces; sugar to 16¼ ounces; meat to 8½ ounces, and potatoes to 8 pounds. The output of beer has been drastically reduced. Normally, the brewery industry consumed 250,000 tons of barley, whereas last year only 80,000 tons were supplied. Before the war, Belgium had the highest per head consumption of beer in the world; now, beer is only supplied when part of the bread card is exchanged. Black markets in foodstuffs are extensive, and exorbitant prices are paid there for cats and dogs. Naturally, the German authorities try to supply first the Belgian workers employed in coal mines, steel plants and factories working on German orders, and municipal authorities constantly complain that milk, in particular, which has been promised for children, is diverted to workers. Lack of foodstuffs, rising prices and fixed wages are thus the source of unrest, sabotage and even strikes in Belgium's industry.

Belgium is thus at present probably one of the weakest links in Germany's wartime organisation of Europe. Its

industry cannot be fully utilised for Germany's war machine because of the lack of raw materials formerly imported from overseas. Only the heavy industries and a small part of the extensive manufacturing industries can be kept working, but the efficiency of the workers is declining because of the shortage of food. There are many instances of direct economic penetration being successfully prevented by Belgian industrialists, but the system of industrial collaboration, which was first tried out in France, seems to be more successful.

Germanisation in Czechoslovakia

[BY A CZECHOSLOVAK CORRESPONDENT]

November 27th

EVERY week brings new reports of the Germanisation of the Protectorate, of the suppression of what still remains of the Czech schools, and of the disbanding of the last municipal authorities in Czech towns. Provocative "German days" are being organised in certain towns such as Louny and Píbram. The newly appointed deputy for the Government Commissar in Pilsen has proclaimed German as the official language of local administration in this Czech town with its 90 per cent Czech majority. German officials have been appointed to all important administrative positions and entrusted with the supervision of the town's cultural organisations, such as libraries, collections, schools and theatres; and a large subsidy has been granted to various

German undertakings from local funds. Already in April, 1940, provincial autonomy had been brought to an end by a decree dissolving the provincial diets and provincial committees. Now a decree has been issued which hands over to the provincial President functions formerly falling to the disbanded bodies. These Presidents will have at their hand subsidiary committees, consisting of eight members and eight deputies. These committees, which are appointed, not elected, will be called Provincial Councils and will serve as purely advisory bodies in technical matters.

These measures are accompanied by attacks upon former members of the Legionaries, Sokols and other national organisations and the Jews. The deportation of the 90,000 Jews to Poland is said to have already begun. Soon all Jews, and, as the German-controlled Press says, "their incorrigible Czech well-wishers," are to be excluded from the Protectorate. New regulations are making it difficult for Jews to travel on railways and trams.

The supply situation is critical. Everything possible is being registered and commandeered. A census of apple trees and the immediate requisitioning of the apple crop have now been ordered. In the black market, which is the public's only protection from starvation, prices have risen to fantastic heights. In certain districts 8 crowns (1s. 6d.) are paid for one egg, 160 crowns (£1 10s.) for two pounds of lard and 250 crowns for an unfattened goose. The Reich balances the import of goods from elsewhere by Czech sugar, or uses its for bribery, when sympathies are to be won over in certain countries. Thus it was announced in October that the total consumption of sugar in Finland was well covered by imports from the Protectorate. Meanwhile there is a shortage of sugar in the Protectorate itself.

Letter to the Editor

Post-War Agriculture

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr Geoffrey Crowther wrote in *Foreign Affairs*, October 1941, "British foreign trade connections are being disrupted; British liquid reserves of gold and investments have been exhausted. It is almost certain that the pound sterling will be weakened, and the dollar strengthened by the war, and that the sterling area will have even greater difficulty . . . in obtaining sufficient supply of dollars." When *The Economist* is at variance with its Editor, who am I to argue the matter further?

But your whole rejoinder to my letter leaves me slightly puzzled. You contradict my arguments, yet in point (3) you admit a large proportion of my conclusions by agreeing (a) to a guaranteed price; (b) that the pre-war low wholesale price level for food so far from helping industry was a major cause of industrial unemployment, and (c) you later on say that you are prepared to pay a limited price to maintain a limited agriculture.

If you are prepared to admit all this—why bother about disagreement on other points? We agree on so much, except that you fear that if anything is done to help agriculture, it will be to the exclusion of all other interests, and at a quite overwhelming expense. But this is not so. We claim only treatment for agriculture equal to that of industry which has already been de-rated, protected, subsidised, cartelised (as with steel), and given legislative power to ensure a fair price and a fair wage (as with coal). This claim is all the stronger in that our wages are imposed on us by Statute. The Sydney Conference in 1938 showed clearly that farmers were no longer thinking in terms of a purely nationalist policy that would harm overseas producers, and therefore our export market. They realised that the depression from which they suffered was equally harmful to producers elsewhere, and that a general problem demanded a general solution. Finally, no one, so far as I know, wants a large subsidised wheat acreage. All we want is sufficient acreage of wheat and other basic crops to maintain mixed farming or, to use the words of the Government party leaders, to give us "a healthy and well-balanced agriculture."

But you ask—what of the cost? Of course, such a question cannot possibly be answered now. Who would be so foolish as to venture a prophecy or a forecast at the present moment? But we do know that your process of taking Sir Daniel Hall's figure of £100 millions and doubling it is fantastic; or perhaps you have added the

Chancellor's figure of £100 millions for food subsidies? If so, these concern the cost-of-living policy and not home agriculture—indeed, most of them go to cheapening imported food. Sir Daniel's figures include de-rating, which is not a subsidy but a transfer of taxation from productive units like land and factories to income and other non-productive units. They include also agricultural education and such other as taxation allowances which have their counterpart in the field of industry. The actual money assistance to agriculture was in 1938-39 about £17 millions, including the subsidy to cheap milk for children.

If therefore we are to base, as you have, our calculations for the future on the past we must take as our basic figure the actual pre-war £17 millions—and then build upon that—rather than your fantasy figure of £200 millions. The result must then be compared with the protection and assistance given to industry, before agriculture is singled out for special attack as having asked for special help—compared also with the cost to the country of the disastrous effects on industry in the past of the policy of *laissez faire* in destroying the purchasing power of food producers, both in this and other countries.

I should say that in such an account I would not reckon the cost of a nutrition policy. On social grounds it is vitally needed, not only in this but in every country in the world. It can provide a market to farmers for commodities that we here are particularly fitted to produce in competition with all other comers. Public expenditure in encouraging the greater consumption of milk, fruit, vegetables and eggs, would be a sound and wise social investment. Whether to charge it against agriculture or the health services would be a matter of bookkeeping. But it certainly could not be considered as part of the cost of maintaining production in face of competition from cheap produce overseas, which is the cost that you are apparently afraid may prove excessive.

December 18, 1941.

DE LA WARR.

[1. There is not the slightest discrepancy between the article in *Foreign Affairs* to which Lord De La Warr refers and the article in *The Economist* on British agriculture. The former argued that the pound sterling will be weaker relatively to the dollar after the war than it was before. The latter argued that this weakening of the pound cannot be expected to go so far as to impede the purchase of primary products—comparatively few of which have to be paid for in dollars. 2. The make-up of the figure of £200 millions a year was explained in the original article. It is a conservative figure.—EDITOR.]

THE BUSINESS WORLD

Personnel Management

AS the progress of registration and calling up leaves fewer and fewer sources of labour untapped—though the draining process leaves room for much improvement—the problem of making the utmost possible use of every unit of labour in the war industries increases in importance. In so far as the maximisation of output per unit of labour depends upon the technical organisation of the other factors of production, upon the equipment provided, the organisation of supplies, and such matters of scientific management as the height of the bench or the speed of the conveyor belt, it is particular to each works and cannot be discussed in general. A great part of the problem, however, is more directly a labour question, and must be solved on similar lines by all industries.

The first requirement for its solution is to produce an atmosphere of confidence and co-operation within a works. This can only be done if the management has a clearly formulated labour policy and has defined the attitude it will take to the human problems, physical and psychological, of the workshops. Having formulated the policy, one trained person—call him or her personnel manager, labour manager, welfare supervisor or what you will—must be responsible for seeing that this policy is carried out. Moreover, the policy and attitude must be understood and interpreted in the daily industrial relations of foremen and supervisors. For it is they, as much as the higher management, who create the tone of a factory. The recent Government statement on production, issued in reply to the recommendations of the Select Committee on National Expenditure, put the seal of official approval on this argument. It is official policy to encourage the creation of personnel departments in all factories of a size to justify their existence.

To enable each worker to do his or her best, in the sense not merely of putting forth the maximum effort but of achieving the maximum result, it is essential to have not only the right physical conditions but also the right psychological appeal. From the fall of France to the resistance in Russia, events have followed hard on each other's heels to maintain the right atmosphere for this in British industry. The importance of output has been illustrated over and over again, and propaganda has been very successful in hammering it home. More difficult, but increasingly necessary of late, has been the work of impressing upon each individual the importance of his or her individual output. Visits by members of the Forces to the factories which actually manufacture their equipment can do more to this end in a few minutes than hours of talk by the most eloquent civilian. The Admiralty showed imagination on these lines when, in reply to a telegram of congratulation upon the sinking of the *Bismarck*, received from a group of coalminers, it sent some of the sailors who had taken part in the sinking to visit the senders of the telegram.

Once the keenness of the individual worker has been roused, it is a matter of almost greater importance to see that nothing happens to blunt it. To rouse the apathetic is that child's play compared with the difficulty of re-inspiring the disillusioned. To avoid disillusionment it is essential that the new recruit to industry be given the feeling that everything is being done to help him to give of his best, and that old and new employees alike should have every confidence in the management. Even if a factory is being thoroughly competently run hitches in the flow of materials or parts may hold up production. It is essential that the reasons for these hold-ups should be explained to the workers, through their elected or trade union representatives, or through the foremen, and that their co-operation should be sought in overcoming or making good consequent losses in output. Mr Bevin and others have urged the extension of works councils and committees. Where they are set up they can be used for something more

constructive than merely handling explanations or instructions from the management to their constituents. They form a method of mobilising the ideas of those actually on the job. There is too much one-way traffic in ideas—all coming down from the management to the workers. Co-operation means joint working and pooling. If workers are habitually taken into the confidence of the management in this way, they will be prepared to give it their confidence in return on those rare occasions when considerations of national safety genuinely preclude an explanation.

Lastly, there remains the question of providing an adequate material incentive for those who are incapable of responding to any other sort of appeal. The importance of this in present conditions is easy to overrate, for the plight of democracy is such as to call for a more intense effort on the part of everyone than he would ever be induced to make for purely selfish reasons. Those who only care for the money reward retire from the field for the rest of the week when their financial requirements are satisfied, and the millions who are now working all out for longer hours than is good for them are certainly not doing so only from motives of material gain.

In this connection arises also the question of discipline, of which much the same may be said. No human being, be he never so powerful, can really force another, however weak, to do anything, as anybody can testify who has tried to set on its feet a small child determined to be carried. All that can be done is to induce people by bribes or penalties to select the required courses of action. This, however, is not discipline. Discipline is only achieved when those under orders are conscious of a purpose in common with those in authority and have confidence in that authority's ability and will to carry it out. Given a labour force whose overriding purpose is to "beat Hitler" and a management that knows its job, little will be heard of questions of discipline.

Many of the labour questions that have attracted public attention, and have been regarded as disciplinary matters, have arisen from insufficient attention to the needs of the workers or from ignorance of their physical limitations. Absenteeism and bad time-keeping have been shown over and over again to be often the result of exhaustion or of domestic responsibilities for which no provision is made. One of the most serious mistakes of this kind which still persists is that of excessive hours of work. After the fall of France the need for replacing lost equipment and arming Britain for immediate defence against the threatened invasion was so urgent that the working week was allowed to assume extravagant lengths. Even for women and young persons the statutory formalities were largely ignored for several weeks, and though these were brought under control again after July, the tendency towards excessive hours for men still continued. A case is cited by the Chief Inspector of Factories of a factory in which weekly hours sometimes reached 84, with no day off. Naturally the workers could not stand the pace, and days were not infrequent on which as many as a quarter of the employees failed to appear. When hours were reduced to 56, with Saturday afternoon and Sunday off, absenteeism became almost negligible, production increased, and the men were able to earn as much as before.

It is a pity that more managements do not avail themselves of the results of the considerable body of research that has been done on the question of hours of labour. While the optimum length of the working week must vary considerably according to the nature of the work, there is little excuse nowadays for such gross blunders as the maintenance of hours which not merely lead to a decreased output in the long run, owing to their cumulative effect in exhausting the workers, but which fail to increase output even over a short period. The 1940 report of the Inspector of Factories quotes several instances of reductions in hours which were

followed by no permanent reduction in output and in some cases even led to an increase. About 52-56 hours seems to be the maximum that it is profitable to work in most industries.

With this question of weekly hours is bound up that of arrangement of shifts. Even where the process of production does not itself require the continuous working of the factory, this is highly desirable in order to make the utmost use of all available productive capacity. Experience has proved overwhelmingly against the abandonment of a periodic free day. If it is not provided, the workers usually are driven by weariness to take it, so that production is dislocated, and Sunday double pay taken, all to no purpose. True, there are some remarkable exceptions to this generalisation, but it applies to the bulk of industry. Various devices are adopted to surmount this difficulty. Where sufficient labour is available, the most effective seems to be some form of arrangement by which an individual worker does an eight-hour shift for seven (or it may be five or six) days, has 32 hours off, and goes onto another shift for seven days. Such rota systems need careful organisation, and sometimes meet with opposition at first owing to their unfamiliarity. Moreover, during intensive air raids, the arrangement of shifts has often to be modified to enable workers to get to or from work before the night raids begin, but this seems to present no insuperable difficulties if it is the subject of amicable agreement.

Next to the matter of hours, the question of transport is perhaps the most crucial. While performances so spectacular as to attract the gift of a bicycle from retired Dominion Prime Ministers are fortunately rare, very many workers do have to perform such feats of physical endurance in getting to and from their employment as should not be asked of anybody. Attention to this, both by improving the means of transport and by providing living quarters nearer the

factories would reduce absenteeism and conserve a great deal of energy now wasted. The extension of canteen facilities, now fortunately proceeding at a greatly improved rate, should have a beneficial effect on production both by maintaining the stamina of the workers and by its psychological effect. In particular, the knowledge that their husbands are well fed at their place of work makes it very much easier for those of their wives who are also in factories to be punctual and regular in their own attendance.

Where women workers are concerned, consideration for their domestic responsibilities is essential if they are not to disorganise their colleagues by irregular attendance. A woman who can be relied upon for six hours a day is far more use than one who officially works eight but who can never be counted upon. But a woman with a family can be reliable only if she is given time off for catering and for such attention to her children or aged and infirm relatives as must be given by her in person. The difficulties of shopping are increasingly recognised and many suggestions have been made and are being tried. The problem of the children is more difficult. For the younger ones an extended provision of residential and day nurseries and increased mobilisation of suitable persons for "minding" all offer partial solutions. So far little has been done to care for the schoolchild during the hours when the mother is not at home and school is not normally open; the extension of school meals will be most valuable in this respect, but needs to be coupled with provision for evening occupation for the children.

Many of these questions cannot be completely resolved without assistance from Government or local authorities. A large part of the solution, however, lies with the individual managements. Upon their initiative and knowledge of human nature depends, to a great extent, what proportion of the potential output of British workers is actually realised.

Finance and Banking

Concentration in Banking

When moving the second reading of the National Service Bill, Mr Bevin pointed out that the principle of concentration must be carried further into the realms of banking and insurance. Negotiations are understood to have taken place between representatives of the clearing banks, the Bank of England and the Treasury to see how much further the movement can be carried. It should be realised that much has already been done, both involuntarily through the action of the enemy and through voluntary agreement among the banks themselves. A number of branches have been destroyed or put out of action by air-raid damage, and in all cases the clients concerned have been accommodated either at another branch of the same bank or, by arrangement, with the neighbouring branch of another bank. Apart from concentration of this kind, the banks have voluntarily closed down between 12 and 15 per cent of their branches and offices. The movement may have to be carried appreciably further if the abandonment of reservation and the compulsory enlistment of women clerks make appreciable encroachments on the staffs now engaged by the banks. Any considerable calling up of women employees between the ages of 20 and 30 would apparently have serious effects on the capacity of the banks to continue functioning with anything like their present structure of branches. It is probable that considerable scope still exists for merging in one office the work now done by the competing branches of different banks in comparatively small localities. But there can be no doubt that with the increase in the money income of the population the work of the banks, taken as a whole, is increasing. One altogether new sphere of activity upon which the banks are soon to enter is the opening of traders' coupon accounts—that is, accounts of which the substance will be coupons, not sums of money. The scheme is being worked out between the banks, the Retail Distributors Association and the Board of Trade. Whatever its ultimate form, it must add appreciably to the amount of work handled by bank staffs.

Discount Market Position

It seems unlikely that the principle of concentration will be applied with anything like compulsory force to the

discount market. The depletion of staffs will make further progress and it may prove difficult for the discount houses to plead for the special exemption of personnel. But beyond this, no official steps are likely to be taken to further the integration movement in the market. Some months ago members of the market were reminded of the long-standing opinion of the Bank of England in favour of fewer and bigger discount houses. Nothing has happened since then to alter that view. Indeed, if that were possible, the bill business of the discount market has become still more stereotyped and automatic than it was at the time the opinion was last repeated, and the structure of the market, therefore, more inviting to concentration. The authorities, however, are likely to pin their faith to more natural forces than those of compulsion. For personal reasons some of the smaller discount firms must now be nearing the point at which they will be merged into the larger units in the market.

Exotic Dollar Markets

The military and political events of the past month have had their most striking financial reactions in the few remaining free foreign exchange markets. Among the most sensitive of these is the Lisbon market in foreign bank notes—a virtual European clearing centre to which refugee traffic and the Clipper service have brought considerable turnover and more than commensurate profits. The main event in Lisbon has been the slump in US dollar notes which followed the Japanese attack. From a rate of about 22 escudos, the US dollar, in this guise, has fallen to about 17 escudos. This compares with a TT rate of about 25 escudos to the dollar. What was perhaps the most important free exchange market in the world, Shanghai, has now reopened under completely new management. According to reports percolating from enemy sources, all foreign banks in Shanghai have reopened after the immediate paralysis caused by the Japanese assumption of control in the International Settlement. The immediate tendency in the market after reopening was to offer foreign currency in exchange for Shanghai dollars, which, though issued under the authority of Chungking, are still the most widely accepted currency in the Settlement. Conditions in the market have apparently been considerably disorganised and

the US dollar has slumped to about half its previous exchange value. These wild fluctuations are, of course, of no greater significance than as an illustration of the chaotic conditions under which these two widely separated markets are being called upon to function.

Currency Chaos in Tangier

A Tangier correspondent writes:—The exchange position in Tangier has recently become chaotic and is playing havoc with local trade. Though the territory is now under Spanish control, the traditional local currency is the Moroccan franc. The Spanish authorities, however, insist that any goods imported from Spain be paid for in pesetas. A dual currency system is therefore in operation. The

authorities endeavour to keep the peseta-franc rate at about 4.50 francs to the peseta. On the basis of the official peseta-sterling rate of 40 to the £ quoted in Madrid, this would give a sterling-franc parity of 180. The machinery for maintaining the parity of the two local currencies is highly defective. The strict control of the exchange market in Spain makes it almost impossible to obtain pesetas, and early in November the shortage caused the black market rate to leap to 18 francs to the peseta. The result of the shortage of pesetas is that goods for which payment must be made in that currency are left unsold. For example, fish imported from Spain is left to rot in the market, though, with two meatless days a week, the demand for it is of record proportions. In the free or black market, the pound has recently been quoted at about 120 pesetas, or three times as much as the official rate in Madrid. On this basis the free sterling-franc rate would be 540 francs to the £.

Investment

Sensitive Markets

Of the general course of stock exchange prices during the past few days, there is little fresh to relate. Falls in securities directly affected by the Far Eastern hostilities have continued, if at a somewhat reduced rate, and price margins are wide. Elsewhere, general, slight weakness has been the rule, helped by the usual year-end realisations for balance-sheet and other purposes. Business has fallen off further, but it is still very much better than it was a year ago, and quite a fair proportion of it represents successful attempts to acquire what is considered cheap stock. The

* Ex dividend.

table above, shows, for a number of representative securities, not directly concerned, the changes on the receipt of the news, and in the fortnight to Monday afternoon last. It will be seen that the progress of the Japanese attack has been responsible for a fall similar in extent to that caused by the outbreak of hostilities. It will also be noted that, as compared with the rise from the worst of the year, the decline since December 5 is strictly moderate. The considerable rise in LMS ordinary is testimony to the fact that the powers of recovery are substantial, and that any really favourable news is capable of outweighing the ill effects of the entry of a new belligerent upon these sections of the market.

Successes Discounted

Since there is a distinct possibility that rubber plantations and tin mines, situated in the Pacific area, may be seized or damaged, it is still futile to attempt to assess their short-term value. But it requires little more than a glance at the second table to show that, even when the threat of losing the physical assets upon which earning power depends is less immediately, the depreciation of holdings with direct interests in the area has been severe. The first six securities in this table are directly involved. The price of Dalgety had evidently not been tested on December 9. The others are, in the main, not directly threatened in most of their activities. That Dunlop Rubber is, none the less, down to the almost the lowest of the year is, of course, due to the guarantee of preference dividends of the Plantations company.

It is probably too much to hope for any early recovery in the securities in the second table. But there are already signs that the market is almost as sensitive to good news as to bad. There can be little doubt that it is as much dissatisfaction with the fact that both ourselves and America were caught unprepared—or, at least, insufficiently equipped—as the actual losses, which this inferiority in men and material has produced, that is responsible for the apathy which has been the characteristic of market circles recently. It is a confirmation of this view that whenever there is any sign of a British initiative, even outside the Pacific, the market rallies forthwith. The continued success of our Russian allies, however, appears to have been discounted in advance, so that their achievements have little effect on quotations, although it is certain that their achievements are the principal justification for the present general level of prices.

Tax Reserve Certificates

The new security, to which reference was made in *The Economist* of last week, designed to expedite and even out the flow of tax revenue into the Exchequer, has been on sale since Tuesday. As was anticipated, it will not be transferable, except in due course of law; but the interest on it, when it is used for the payment of the taxes indicated in the prospectus, will be 1 per cent per annum free of income and surtax, and, of course, exempt from EPT and NDC. The fixing of a rate, which is already 2 per cent gross and may be higher after April next, suggests strongly that the Chancellor is particularly anxious to place limits upon the growth of Treasury Deposit Receipts, on which the net interest payable is scarcely more than half that on the new Tax Reserve Certificates. The high rate suggests too that, in so far as issues of War Bonds owed anything to the temporary investment of tax monies, subscriptions are likely to fall off, since the additional interest on these must be fully absorbed by commissions and the price fluctuations of a very imperfect market. It is obvious that the Treasury does not wish unduly to anticipate the receipt of taxes, for the maximum interest payable is for two years on any certificate, ending at the date when the tax is due—in every case this is the relevant date, not the time of payment or assessment. Further, the weekly revenue return will not be disturbed by anticipation of receipts, for proceeds of the sales of the certificates will rank as extra-budgetary receipts until they are tendered in payment of taxes. The new instrument

seems well designed for its purpose, and the provision for "splitting" certificates, when these are tendered in settlement of taxes, should assist those who have to pay comparatively modest sums. The certificates also form a convenient means of making interest free loans to the Exchequer, especially as the capital can be reclaimed at any time, more than two months after issue, on ten days' notice.

* * *

Pacific War and Sterling Accumulation

One of the factors, which the holder of Dominion and South American bonds has tried to assess in valuing his securities, is the effect of war on the accumulation of sterling balances by the countries in question. It has not always been easy to forecast the extent of changes in these balances and the extension of hostilities seems to call for a fresh set of valuations. To make these, it is necessary to have a fairly accurate idea of the financial relations which will rule between America and this country, on the one hand, and the Dominions and Republics of South America on the other. To restrict the enquiry to the Empire, it seems evident that Australasia and India will have to incur substantial increases in expenditure, and will need some of their produce previously sent here for use in the Pacific rather than for supplementing the efforts of this country in Europe and Africa. Does this mean that India will, in future, play a larger part in paying for the war, with a consequent slowing down, or reversal, of the flow of sterling into the hands of the India Government; and is the rate of Australia's overspending of sterling to be accelerated? In the case of the latter, there is already announced a cut in non-essential imports, while food and raw material purchases by this country will be paid for whether the goods are shipped or not. It appears certain that exhaustion of sterling will not be allowed to reach a point where it creates a real problem. In the case of Canada, Lease-Lend has gone into reverse, or may do so, a development which should both ease the problem of finding U.S. dollars and slow down, or stop, for the time being, the piling up of balances in London. South Africa is, at present less immediately affected. It is probable that there will be an effort in this country to curtail still further all imports in order to release more shipping for other purposes, an example which all areas within, or allied to, the Empire and the United States, must in some measure follow. Who is to pay now for this added effort is a matter of high policy. But it seems reasonable to suggest, now all the world is at war, that each should contribute the goods and services he can, which would mean that, in large measure, the problem of accumulated balances would disappear. In any event, a reduction in the accumulations of India and Canada seems probable.

Company Notes

Lancashire Cotton Expansion

Preliminary figures of the results of Lancashire Cotton Corporation for the year to 31st October last, show an expansion of almost 10 per cent in profit. This is reached after charging, not only tax at the higher rate, but war damage contributions. In consequence, after providing much increased depreciation, and meeting debenture interest and preference dividend, the percentage earned for ordinary is up from 28.4 to 32.4. The payment is unchanged at 7½ per cent, and transfer to general reserve is raised from £150,000

	Years to October 31,		
	1939	1940	1941
Profit after tax and fees	582,807	627,820	†694,977
Depreciation reserve	155,000	155,000	216,989
Debenture interest	75,000	75,000	75,000
Preference dividend	68,875	68,430	68,417
Ordinary stock:—			
Earned	283,932	329,390	334,571
Paid	124,980	125,647	†125,667
Earned %	22.2	28.4	† 32.4
Paid %	7½	7½	7½
General reserve	150,000	*250,000	200,000
Carry forward	249,280	203,023	†211,927

† After war damage contribution. † Approximate.

* Includes £100,000 to stock reserve.

to £200,000. Nothing is placed to stock reserve against £100,000, but there is a modest addition to the carry forward compared with a substantial draft a year ago. The table gives the principal appropriations for three years. It seems inevitable that the year just ended must have reduced the normal demands for the company's products, both at home and overseas. The rise in profits almost certainly reflects some increase in turnover, due solely to Service demands, but it is probable that it owes not a little to the fact that less time was lost in converting to new types of product and that experience in the manufacture of these led to economies. The immediate outlook is obscure. Exports have been further curtailed, and it is more than possible that manufacture for the gratification of individual wants at home will be further reduced. The ordinary shares have, however, stood up well to the general weakness of the past two weeks, falling only from 24s. 6d. to 23s. 3d., at which they yield some £6 13s. 4d. per cent.

* * *

Apex (Trinidad) Oilfields

The preliminary statement of Apex (Trinidad) for the year to September 30th last shows profits of £583,754, which presumably compare with a total of £605,201 for the previous year. The provision for amortisation of wells is raised from £197,593 to £235,112, but there is a substantial saving in the reduction in the transfer to taxation reserve from £190,000 to £131,000. The ordinary shares receive the 30 per cent distributed in the two previous years, less British income-tax at 6s. on the final payment of 17½ per cent. Equity earnings are up from £195,367 to £196,217, which grossed up, as usual, at the full rate of British income-tax, represents a rate of 41.4 against 39.6 per cent. General reserve receives £30,000, as in the previous year, and the carry forward is raised from £131,073 to £132,290. It is probable that the company had to face higher operating and transport costs last year, but that sales of oil were also substantially increased. The outbreak of war in the Pacific lends a new importance to the Trinidad sources of oil supply, and there is good reason to expect that output will be increased in the current year. The 5s. shares, at 28s. 6d., yield £5 7s. 2d. per cent.

* * *

Tate and Lyle Accounts

The rise in disclosed total profits of Tate and Lyle, for the year to September 27th last, from £1,133,312 to £1,193,024, conveys little information as to the level of gross profits last year, since the latest figure is struck after a provision towards tax liability in 1942-43, in addition to current tax, other than that on dividends. The necessity of providing £80,769 against nil for war damage insurance leaves equity earnings reduced from £960,918 to £946,018, representing a rate of 13.5 against 13.9 per cent. Thus, the cover for the ordinary dividend, maintained at 13½ per cent, is sufficient only to raise the carry forward from £71,496 to £72,514.

* 49 weeks ended September 9, 1939.

The balance-sheet reveals a striking jump in stocks of nearly £5,000,000 to £8,467,980. This increase, together with the rise in debtors from £1,746,806 to £2,692,501, is financed by an enlargement of the company's bank loan from £304,194 to £6,020,000. Other balance-sheet changes are insignificant, total reserves being unchanged at £950,000. Sir Leonard Lyle, the president, states that the Ministry of Food has asked the company to hold increased stocks of sugar, and that, in consequence, powers are required to

ISSUE OF TAX RESERVE CERTIFICATES.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND are authorised by The Lords Commissioners of His Majesty's Treasury to receive applications for Tax Reserve Certificates. Applications for Certificates will be received on the 23rd December, 1941, and thereafter until further public notice and may be lodged at any of the offices of the under-mentioned Banks.

Certificates will be issued for £25 or multiples of that sum and payment in full at the rate of £25 for each £25 of Certificates must accompany applications.

The principal of and interest on the Certificates are a charge on the Consolidated Fund of the United Kingdom and the Certificates are Government Securities for the purpose of The Trustee Act, 1925, and The Trusts (Scotland) Act, 1921.

A Certificate will be issued to the applicant, or such other person as may be duly nominated at the time of application, and will entitle the person named therein (the "Certificate Holder") in accordance with the following conditions to tender it together with accrued interest in payment of certain taxes or contributions or, if the Certificate is not so tendered, to obtain repayment of the principal without interest:—

- Certificates may be tendered to the appropriate tax collecting authority in or towards payment of Income Tax (except Schedule E tax), Sur-Tax, National Defence Contribution, Excess Profits Tax, Land Tax or Contribution under Part I of the War Damage Act, 1941, being a tax or contribution which is due from the Certificate Holder at any time not less than two months and not more than two years from the date of the Certificate. For the purposes of these Certificates tax or contribution will be deemed to be due on the dates set out in sub-paragraph (e).
 - If a Certificate is so tendered the principal together with interest will be accepted and applied in or towards payment of the tax or contribution in respect of which the tender is made; interest will be allowed for each complete period of one month from the date of the Certificate to the date on which the tax or contribution is deemed to be due and will be calculated at the rate of 1 per cent. per annum.
 - Subject to the necessary statutory authority, for which application will be made to Parliament, interest allowed on these Certificates will be exempt from Income Tax, Sur-Tax, National Defence Contribution and Excess Profits Tax.
 - If a Certificate is so tendered and the principal together with interest exceeds the amount of the tax or contribution in respect of which it is tendered, there will be applied in payment of the tax or contribution such part of the principal as with interest on that part is equal to the amount of the tax or contribution. At the option of the Certificate Holder the balance of the principal will be repaid without interest or a Balance Certificate will be issued with the same date as the original Certificate for the multiple of £25 next below the balance of the principal, together with a cheque for the remainder of the balance.
 - Taxes or contributions will for the purposes of these Certificates be deemed to be due on the following dates:—

TAX OR CONTRIBUTION.	DUE DATES.
Income Tax (other than Sur-tax)	1st January in the year of assessment for which the tax is payable.
If payable in one sum	1st Instalment—1st January in the year of assessment for which the tax is payable.
If payable in two instalments	2nd Instalment—1st July next following the end of the year of assessment for which the tax is payable.
Sur-tax	1st January next following the end of the year of assessment for which the tax is payable.
National Defence Contribution and Excess Profits Tax	At the expiration of a period of six months from the end of the chargeable accounting period in respect of which the contribution or tax is payable.
Land Tax	1st January in the year of assessment for which the tax is payable.
War Damage Contribution	The appropriate date as laid down by the War Damage Act, 1941.

- For the purposes of Excess Profits Tax the principal of a Certificate to the extent to which it is accepted in satisfaction of any Income Tax, National Defence Contribution, Excess Profits Tax, Land Tax or War Damage Contribution payable in respect of the profits or property of a trade or business, will be treated as capital employed in the trade or business up to the same date as would be the case if the tax or contribution had been satisfied by a cash payment.

2. Certificates not applied in payment of taxes or contributions may be lodged at the Loans Office of the Bank of England for repayment in whole or part (in sums of £25 or a multiple thereof). In such cases repayment will be made within ten days after lodgment. No interest will be paid in respect of any such repayments and no repayment will be made under this paragraph before the expiration of two months from the date of the Certificate. If a part only of the principal is required to be repaid a Balance Certificate (bearing the same date as the original Certificate) will be issued to the Certificate Holder for any balance of principal not repaid.

3. Certificate Holders will be required to indicate by completing the appropriate Instruction endorsed on the Certificates how they desire the moneys represented by the Certificates to be dealt with. When Certificates are to be applied to payment of taxes or contributions the appropriate documents of demand must be attached.

4. Neither the Certificates nor the obligations created by them are transferable and neither the Treasury nor the Bank of England will, except as ordered by a Court of competent jurisdiction, be bound to recognise any transfer, charge, deposit, trust or equity affecting the ownership of a Certificate or the moneys represented thereby.

5. Certificate Holders or their legal personal representatives will be regarded as exclusively entitled to the benefit of the Certificates and the obligations created by them. In the case of joint Certificate Holders the moneys represented by the Certificate will be deemed to be owing to them on a joint account.

Applications for Certificates, which must be accompanied by payment at the rate of £25 for each £25 of Certificates required, may be lodged at the Bank of England Loans Office, E.C.2, or at any office of the following banks:—

IN GREAT BRITAIN:		IN NORTHERN IRELAND:	
Bank of England.	Coutts & Co.	Hibernian Bank, Ltd.	National Bank, Ltd.
Bank of Scotland.	District Bank, Ltd.	Munster & Leinster Bank, Ltd.	Northern Bank, Ltd.
Barclays Bank, Ltd.	Glyn, Mills & Co.		
British Linen Bank.	Grindlay & Co., Ltd.		
Clydesdale Bank, Ltd.	C. Hoare & Co.		
Commercial Bank of Scotland, Ltd.	Isle of Man Bank, Ltd.		
Co-operative Wholesale Society, Ltd.	Lloyds Bank, Ltd.		

Applications must be made on the printed forms which may be obtained, together with copies of this Prospectus, at the Bank of England Loans Office, London, E.C.2, or at any of the Branches of the Bank; at the Bank of Ireland, Belfast, or at any Bank in the United Kingdom.

BANK OF ENGLAND, LONDON.

22nd December, 1941.

Dividends of the three groups, "*Johnnies*," *Anglo-American* and *Anglo-Transvaal*, whose payments are compared in the following table, make a mixed display. In the "*Johnnies*" group, the impression created by earlier announcements, that results have progressively deteriorated over the past eighteen months, appears to be confirmed.

Industry and Trade

Strain on Shipping

On the occasion of the launching of a vessel for the Norwegian merchant fleet from a British shipyard on December 19th, Lord Leathers, Minister of War Transport, drew attention to the increased strain on Allied sea communications caused by Japanese aggression.

The enemy (he said) has not yet made his final effort in the Battle of the Atlantic. Our ability to meet this danger is lessened by the great demands on shipping for other theatres of war. . . . In later years we shall perhaps look back on the next few months as the most difficult of the war.

Lord Leathers concluded that now more than ever we must be certain that every ship was employed where she could render the greatest service to our common cause. The speedy formation of the projected anti-Axis shipping pool should render possible a more intensive use of Allied tonnage. But it will also be necessary to make yet further efforts to cut out all unnecessary movements, by shortening supply lines and by eliminating unessential trade. Moreover, the merchant shipbuilding programmes of the Allies, and especially that of the United States, must be pushed ahead vigorously to increase the supply of ships. But in the last resort, the task of securing the vital communications of the Allies must rest largely with their fighting ships and aircraft. The combined navies and air forces of the Allies, as well as their productive capacity, exceed those of the Axis; but only by close collaboration can they be used with maximum effect.

Thus, of seven companies, only two, Langlaagte and Randfontein Estates, are distributing the same total payment for the year as in 1940. The other five payments are all reduced. The *Anglo-American* group contains three mines which only recently started to distribute dividends, including one, Western Reefs, which has just declared a maiden dividend of 3d. East Daggas is paying 2s. 6d. for the year against 2s. 3d., while New Era is maintaining the previous

DIVIDENDS PER SHARE

* Year ends June 30. † Paid February, 1940.

year's total of 9d. The remaining five companies are paying lower totals than a year ago, but two of them, Daggafontein and "Sallies," have restored the latest payments to the levels of December last after June reductions. In the newly formed *Anglo-Transvaal* group, only Rand Leases (Vogels) has made a reduction in dividend during the past year, when lowering the final payment for the year to June 30 last from 1s. 7½d. to 1s. 6d., the amount distributed for the six months ended June, 1940. Village Main Reef paid a first dividend of ½d. last June, while Associated Manganese Mines paid 1s. for the calendar year, against 7½d. for 1940. The latest announcements confirm the impression that old-established mines may be unable to maintain recent dividend levels, but the *Anglo-American* results suggest that adjustments may in some cases be made to higher costs and taxation.

Clothing Coupon Spending

The rationing of clothes is teaching simple economic theory to veritably every member of the community. The definition of economics as the "science of the use of scarce means to alternative ends" will no longer puzzle even the layman. After tackling his own problem of clothing his person with the limited number of coupons at his disposal, he will sympathise with those who decide larger issues of national economics. It is a pity that Pareto's indifference curves have lost some popularity. Such problems as whether a dress and short jacket at 16 coupons are to be preferred to a coat and skirt at 18 coupons could have been graphically and scientifically solved. The "hill of pleasure" could have been climbed by the shortest path. However, it seems that even without the economist's aids, the average person is able to apportion his scarce coupons among the multifarious articles of clothing he desires. The Board of Trade's survey into consumer coupon spending shows that differences between the various groups are not great, but there are some surprises. Bachelors spent 30 coupons in 19 weeks—more than any other group—but spinsters were a close second with 29. Men in offices and housewives, with 20 and 21 respectively, are the smallest spenders. Only 6 per cent of women and 11 per cent of men had used no coupons. Half the men interviewed in the period had bought boots and shoes and rather more had bought socks; 41 per cent acquired shirts and 17 per cent suits (including waistcoats

—an old habit that dies hard, even at 5 coupons). Stockings by had been bought by 82 per cent of women, shoes by 66 per cent and dresses and blouses by 31 per cent. In spite of the lifting of the ban on women's wearing of slacks in many occupations, only three per cent bought them. Shoes, socks and underwear are estimated to take 60 per cent of men's coupons during the year, but women have budgeted 20 per cent for stockings alone. Men and women will use 16 per cent on footwear, but women allocate fewer coupons to underwear than men, possibly because of lower coupon rating. Among children, boots, shoes, socks and stockings are heavily bought. Because of lack of information on individual pre-rationing purchases of clothing, it is difficult to trace changes of habits. It may, however, be assumed that utility rates higher than mere vanity in to-day's purchases.

Rubber and Tin

Since the effects of the Pacific war on Far Eastern commodities, and in particular on tin and rubber, were discussed in *The Economist* of December 13th, on page 732, the Japanese have not only strengthened their hold on the Thailand, but have also made considerable headway in Northern Malaya. Some of the world's most important tin and rubber producing areas have thus been occupied or are immediately threatened by the enemy. In addition, Penang, the only Malayan tin refining centre besides Singapore, has been evacuated and the refineries of the Eastern Smelting Company, covering roughly one half of Malaya's smelting capacity, have been destroyed. These developments have necessitated additional safeguarding measures both in the chief Eastern producing countries and in the world's leading consuming areas. In British Malaya, including the Straits Settlements, the Government is now granting financial assistance to the rubber and tin producing and exporting interests to counteract the effects of the closing of the local markets. In the Dutch East Indies tin sales had already been virtually centralised, and for rubber the Netherlands Indies Export Organisation has been formed by the Government to acquire the country's entire output of plantation and native rubber for shipment overseas. As the governments of the United States and Great Britain are the sole importers of rubber into their respective countries and have been the only important rubber customers of the Dutch East Indies for some time past, all dealings will now be arranged between Government agencies. In the United States the consumption of rubber has been curtailed since the middle of 1941, and further economies will be introduced in the new year. Moreover, the United States Office of Production Management issued an Order last week by which all stocks, new arrivals under old contracts, future imports and all dealings within the United States of tin are brought under Government control. These new measures will almost certainly be used to secure a major restriction of tin consumption, for which, preparatory plans, involving the substitution of other metals for tin, were designed some months ago. In this country the control of rubber supplies has been rendered watertight by making rubber purchases and sales within Great Britain subject to licensing, which is to be extended to new motor tyres within the next two months. Pending the introduction of the necessary Orders, sales of tyres have been prohibited. Moreover, the Government is considering plans to produce synthetic rubber on a larger scale and, in particular, to make fuller use of reclaimed rubber. In tin, the decision to keep the London Metal Exchange closed has been extended for the duration of the war, and all open contracts are to be settled. The Non-Ferrous Metal Control is expected to take charge of imports, though so far no official statement to this effect has been made; the introduction of a maximum price of about £260 per ton is expected any moment. Moreover, steps are expected to be taken to expand the Cornish tin output to its maximum, with the Government's financial assistance; only recently lack of Government support forced one of the largest Cornish mines (East Pool and Agar) to suspend mining operations.

Greater and Lesser Vermin

Greater and Lesser Vermin

The domestic blackbeetle has now been officially placed upon the same footing as the black marketeer. Under the

perhaps rather ambiguous title of "Infestation: New Powers of Ministry of Food," the Ministry announces the issue of the Infestation Order, 1941, coming into force on January 1, 1942, to deal with the infestation of foodstuffs by insects, rats, mice and all other forms of vermin. Infested premises may be closed by the Ministry until steps have been taken to deal with the infestation. Directions may be issued requiring the owners of the stocks to treat them, and the warehouse keepers to treat the premises and containers. If the directions are not complied with, the Ministry may have them carried out at the owner's expense. It is the duty of all whose business is concerned with warehousing of human and animal foodstuffs to report to the Ministry when their premises become infested. Owing to the greatly increased length of time that foodstuffs are stored, the danger of insect infestation is very much enhanced. If this Order is carried out efficiently the insect and rodent pests will pay for their depredations with their lives. Meanwhile, there has just come into force another Order, which increases the maximum penalties payable by those larger pests who divert the nation's food supply from its lawful destination to the black markets. It is to be hoped that these measures will relieve the nation's relatively meagre larder from ravages which can be avoided by vigorous action. The housewife will be all the more encouraged not to waste food, when she knows that every step taken to ensure that she gets as much as is consistent with wartime economy, and that nothing is available for vermin of any description.

U.S. Fertiliser Situation

It is still true that an army marches on its stomach. In all some thirty different fertiliser minerals are used to increase crop production, but the "big three"—phosphorus, potash and nitrogen—comprise the bulk of the total. Although the United States had only one-sixteenth of the world's population in 1937, it consumed nearly one-fifth of the world's production of 44 million short tons of manufactured fertilisers. And America to-day is particularly fortunate with regard to supplies of the basic materials for the three elements. It has nearly half of the known world resources of phosphate rock, ample potash, and it is possible to produce synthetic nitrogen at low cost if the supply of natural and by-product nitrogen is not sufficient. In a normal year fertiliser-consumption contains 278,000 tons of nitrogen, 665,000 tons of phosphoric oxide (P_2O_5), and 276,000 tons of potash (K.O). Whereas in 1914 the United States obtained almost all its potash and a good deal of nitrogenous material from Europe, to-day, it is virtually independent of the Continent for fertiliser materials. Two years after the outbreak of the last war, the prices of fertilisers were half again as high as in 1914, but in September 1941, they were actually lower than they were when Germany set upon Poland. When the last war broke out the price of potash soared from \$35 to \$350 and even to \$500 a ton for 50 per cent muriate. When the war started, the price was \$25 a ton or \$10 a ton less than in 1914, and the price is still the same. Although domestic consumption of potash increased from 250,000 to 400,000 tons, the American potash industry, virtually non-existent in 1914, is now able to supply the country's needs and leave some surplus for manufacturers of fertilisers and chemicals in Canada and Cuba. Early in 1940, only 70 per cent of the normal nitrogen needs were covered by domestic synthetic and by-product nitrate. Last January, America contracted to purchase 300,000 tons of nitrate from Chile. Nitrogen supplies are tight at the moment, but three synthetic plants are under construction, and prospects of additional supplies from Canada and continued imports of nitrate from Chile are good. An uncertain factor is, of course, military requirements. Even before 1914 America was an exporter of phosphates—the other member of the trio of plant foods. The country's phosphate rock reserves are enormous, and mining operations are flexible enough to take care of increased home needs. The super-phosphate industry is not seriously over-built with a rated capacity of 8 million short tons of 16 per cent product or double the 1940 production. Longer hauls and possible shortage of coastwise shipping are the chief hazards in this branch of the fertiliser industry.

COMPANY MEETINGS

THE COMMERCIAL BANK OF SCOTLAND,
LIMITED

The annual meeting of the shareholders of The Commercial Bank of Scotland, Limited, was held at Edinburgh on the 18th instant. The Earl of Mar and Kellie (governor of the bank) presided.

Before commencing the business of the meeting the governor made suitable reference to the loss which the bank had sustained during the year by the deaths of Mr William Thomson and Mr A. W. Robertson Durham, two of its ordinary directors, and of Mr George Balfour, M.P., one of its extraordinary directors.

In submitting the report the governor said:—I am glad to meet the shareholders again and to submit a report by the directors, which, despite the difficulties of the times, I feel satisfied shows that the bank continues to progress, and gives evidence that its affairs are being conducted with the accustomed care and prudence. Higher taxation and many new expenses associated with war-time conditions have left their mark on the profit and loss account, and in all the circumstances it is not surprising that the net profit for the year is less than that of the previous year by rather over £34,000. I am sure it will be a satisfaction to the shareholders to know that substantial allowances have been continued to men on service, and that special war-time allowances have been granted to assist the staff who are still with us.

ALLOCATION OF PROFIT

Out of the profit the directors have allocated £75,000 to contingency account; £20,000 to heritable property accounts; £40,000 to increase the funds of the officers' pension scheme, and £10,000 to increase the widows' and orphans' fund. The allocation to the pension trust exceeds that of previous years by £10,000 as the board feel it is desirable to accelerate the building up of this trust fund, which carries a large and increasing liability for the non-contributory pensions granted to the staff.

Interim dividends on the "A" shares at the rate of 7½ per cent. and on the "B" shares of 5 per cent., less income-tax, were paid in July last, and it is now proposed that a further distribution of 7½ per cent. on the "A" shares (making 15 per cent. for the year) and of 5 per cent. on the "B" shares (making 10 per cent. for the year), both subject to income-tax, be approved. After payment of these dividends and allocations the carry-forward to next year's account amounts to £65,088, compared with £68,097 brought forward from the previous year.

BALANCE-SHEET ITEMS

Turning to the balance-sheet, our notes in circulation have increased very nearly £1,500,000 to the record figure of £6,057,000, and although the substantially increased wage requirements no doubt provide one of the chief factors in the increased note circulation of this and other banks, I think it ought to be emphasised that unnecessary supplies of notes ought not to be retained in private possession. There is a real danger of loss in retaining notes surplus to requirements, which may be destroyed by enemy action or in some other way, and indeed there is a duty to ensure that all surplus funds under present conditions are made active in the war effort.

Our deposits have increased by more than £10,600,000 and touch the record figure of £63,997,000. This increase is a general one spread over almost all the offices of the bank.

Acceptances and engagements on account of customers at £2,102,000 show no material change. This item will no doubt continue at a relatively low figure so long as foreign trading continues on a restricted basis.

LIQUID ASSETS

Turning to the assets side and looking to the cash and other items of the most liquid character, you will observe that the figure has increased from £20,000,000 to rather over £26,000,000, the principal item accounting for the increase being our holding of British Government Treasury deposit receipts, which has increased

by five and a-half million pounds to £10,000,000. As you are aware, these receipts represent six-monthly loans to the British Treasury, arranged weekly in connection with the war finance, and we have been happy to collaborate to the fullest extent made possible by our increasing resources.

Our British Government securities you will see have increased by almost £7,500,000, to the record figure of £37,662,000, and I may tell you that in addition to the £10,000,000 already referred to in the form of Treasury deposit receipts, we have, during the war period to date lent to the Government the not inconsiderable sum of £16,200,000. While on the subject of Government loans it may interest you to know that in addition to making large investments on behalf of customers since the commencement of the small savings campaign we have issued at our offices National Savings Certificates and bonds of small denomination aggregating almost £8,000,000.

BILLS, LOANS AND ADVANCES

Bills discounted and loans and advances together amount to £10,108,000, a reduction of nearly one and three-quarter million pounds in our most remunerative asset. Our experience in this direction has been that of other banks. The reduction has continued primarily as a result of war-time commodity controls which have superseded for the time being private holding of stocks financed by the banks. The reduction has manifested itself notwithstanding the generous attitude adopted by the board towards any facilities acquired by customers in connection with contracts for Government Departments.

Our property accounts show only small change in the year, and I think we have cause for satisfaction that almost the whole of our properties had been put into first-class condition before the outbreak of hostilities.

TRIBUTE TO MANAGEMENT AND STAFF

Throughout the year the general manager and officials have had an ever-increasing burden of responsibility in arranging for the efficient carrying on of the business with the number of trained employees steadily being reduced through the requirements of the Services. At the commencement of the war our total full-time managerial and clerical staff numbered just over 1,400. Of these 627 have gone on Service and we expect to lose within the next month or two a further 100 men. Of the men on Service, 13 have lost their lives; 3 are missing; and 10 are prisoners of war, and I am sure you will desire me to express our most sincere sympathy with the relatives of those who have given their lives for their country, as well as to those who are still suffering the grief and anxiety of uncertainty.

We have recruited some 600 ladies temporarily to the staff, and to them and to the remnant of the permanent staff who are carrying on, sometimes under conditions of considerable difficulty, I am sure we would desire to offer our most sincere thanks. The efficient working of the banking system in this country proceeds so unobtrusively and, if I may say so, is so well organised that only one in approximately 500 of the population of Scotland is employed in the operation of the joint stock banks, a figure which I think will bear favourable comparison with any other comparable public service.

THE DIRECTORATE

It is proposed that I be re-elected governor of the bank and that Lord Milne be re-elected deputy governor, and that the extraordinary directors whose names appear on the list be re-elected. During the year the directors nominated Mr Howard Usher Cunningham to fill the vacancy created by the death of Mr Thomson, and the appointment falls to be confirmed by the shareholders. It is also proposed that Mr Johnstone Smith, who, as senior director, retires at this time, be re-elected. Mr Macfarlan and Mr Annan, the auditors, being eligible, offer themselves for re-election for the current year.

THE ECONOMIST
TRADE SUPPLEMENT

SEPTEMBER 27th, 1941

In view of the need to economise paper the Trade Supplement, published monthly until the end of 1940, is now being published quarterly in the last week of March, June, September and December.

The Trend of Business

THE expansion in the total volume of production during the past three months was comparatively small, for the net addition to the country's labour force was probably slight. But the output of the goods of war has risen at an increased rate, not only because of the intake of additional labour, but also because of the lull in air raids and the improvement in transport and, presumably, the reduction in shipping losses.

Civilian production has been further reduced, but the process of industrial concentration has been slow and is by no means complete. The curtailment of exports, made possible by the Lease-and-Lend Act, which reduces the need for foreign exchange, should set free additional men and machines for the war effort. But, if allowance is made for the requirements of the armed forces, the reserve of labour available for transfer to the defence industries must now be dwindling.

Increasingly, the Government will have to rely on the more efficient utilisation of the resources already at its disposal for further increases in production. There can be no doubt that efficiency in production has in fact been increased. But the scope for further improvement is considerable, in the placing of orders to ensure continuity and balance in output, in the simplification and standardisation of specifications, in the technique of production, in the regional pooling of technical knowledge, equipment and labour, in the steady application of skill and effort. Given an adequate supply of raw materials, there is no doubt that war production could be expanded appreciably, especially in present conditions, when

industry is not subject to the disturbance caused last autumn and winter by heavy air raids.

The supply of raw materials has been fairly satisfactory during the summer, so far as imported commodities are concerned. This is due, in no small measure, to the reduction in shipping losses in July and August. Imports of all kinds have arrived in substantial quantities, and the intake of oil products has been well maintained. In fact, it has been possible to accumulate appreciable stocks of many essential commodities, which should ensure the maintenance of manufacturing activity during periods of strain. In domestic raw materials, the record of the past three months has been less satisfactory. The coal production drive has failed to yield the stocks the Government intended to accumulate by the end of October, though there was no serious shortage during the summer. Again, the salvage campaign has not been entirely satisfactory in its results, while the steel furnaces continued to depend on heavy imports of American scrap. These imports are now to be drastically reduced, and, although stocks are ample at present, the maintenance of the output of crude steel is contingent on a substantial increase in the collection of domestic scrap.

In sum, the record of the past three months on the industrial front is one of steady progress with a few bad patches. Considered in relation to needs on all the war fronts, however, output still needs considerable stepping-up, especially in the case of army equipment, and fresh effort is needed to speed up production to the limit of capacity and ingenuity.

British Industrial Development

COAL

During the past three months, persistent efforts have been made by the Government to increase coal production. Owing to the unsatisfactory response to the appeal of the Minister of Labour and National Service on June 23rd for the voluntary return of 50,000 ex-miners employed in munition works and other occupations, a compulsory registration took place on July 17th and 18th of all workers between 20 and 60 who had been employed in coal-mining for six months or more since the beginning of 1935. The total number registered was 105,376, but of these only 25,468 expressed a willingness to go back to the pits, and by September 8th 16,000 had been actually placed. Meanwhile, the inland industrial demand was expanding and transport facilities had considerably improved; at one period there were 40,000 more colliery wagons available than the industry could employ. Production, however, remained disappointing, and during the five months up to August, the average weekly output fell short of the national target by approximately 9½ per cent. In these circumstances, the Government resorted to exceptional measures in order to increase stocks. Deliveries of domestic coals were restricted to one ton per month in importing areas; a call for strict economy in the use of gas and electricity as well as coal was made by the Government; and a Committee of the Conjoint Conference of Public Utility Undertakings was appointed to assist the Government in dealing with the problems of the concentration of a large proportion of the available supplies on those undertakings with the lowest stocks, and the building up of stocks to a safe level for all undertakings before the winter. In the House of Commons on August 5th, the President of the Board of Trade stated that the then existing stocks of public utilities, railways, industry, merchants and Government dumps were at least one million tons more than at the corresponding period in 1940. Under pressure from the Mineworkers' Federation, the colliery owners, at the request of the Government, agreed to the withdrawal of the conditions governing the payment of the 1s. per shift attendance bonus, and since September 1st, when the amended agreement came into force, a rise in the absenteeism percentage has been reported from some of the coal-fields. By the Government's new price policy, each district is now required to prove its case for an increase in price, and, apart from the general rise of 10d. per ton to meet the cost of the attendance

bonus, local advances have been made only in South Wales, Bristol, and Somerset for all classes of coal; in Lancashire and Cheshire for domestic and industrial qualities; and in Durham for coals shipped coastwise. These advances have ranged from 10d. to 2s. 3d. per ton.

IRON AND STEEL

The output of crude steel and finished products has been maintained at a high level during the past three months, and, on the whole, domestic and imported supplies appear to have been adequate to meet urgent requirements for the defence programme. The flow of raw materials to the blast and steel furnaces has been satisfactory, and present stocks are substantial. But, in view of the drastic prospective curtailment in American scrap exports to this country, the collection of domestic scrap will have to be intensified if the output of crude steel is to be maintained; the replacement of the American scrap by domestic supplies should not present any insuperable problems. Exports of steel are now at a comparatively low level; such limited quantities as are still being sent abroad are designed mainly to assist the war effort. The adaption of the iron and steel industry to wartime needs is still proceeding. The application to the tinplate industry of the policy of concentration has been investigated by the Essendon Committee, and it is expected that its report will recommend drastic reorganisation. The exports of tinplates is now permissible only under special licences, and a further restriction of production is likely owing to the raising of the age of reservation from 18 to 30.

CHEMICALS

Trade in most sections of the chemical market has been on a satisfactory scale during the past three months, with conditions showing little change. The industrial chemicals market has been firm with a fair amount of both home and export business, and the price position has been steady. There have been a number of inquiries in the pharmaceutical and fine chemicals section, although activity has been restricted by the supply position in a number of items. A good demand has been shown for most coal tar products, and the market has been active with prices remaining firm. Demand for all wood distillation products has continued on a high scale, although stocks are still very limited.

LINEN

Flax growers are actively engaged in harvesting the new crop, which looks promising in quality and quantity. The erection and equipment of new decorticating factories is proceeding satisfactorily. It is believed that these plants will be able to ensure capacity output of processed fibre throughout the season. This fibre will represent only a small percentage of the total crop, the bulk of which will be dam retted as before. Assured of a mounting reserve of raw material, the trade hopes that facilities for increasing export trade, which has been seriously handicapped for months past, may be granted. Overseas buyers are anxious to secure at least a proportion of their usual requirements in linen fabrics. Apparently there is but little chance of any increase in the allocation of linens for home consumption in existing circumstances.

WOOL

Though the dominant interest in the wool textile trade during the quarter has been the concentration of production scheme, negotiations for the grouping of firms are far from complete. The announcement of plans would considerably ease the tension which is an inevitable result of uncertainty about the extent to which the industry is to be concentrated and individual firms affected. Interest has now shifted to the Board of Trade's proposals for the provision of essential civilian clothing, through which the trade believes it will gain advantages in increased running time. The proposals were discussed on page 304 of *The Economist* of September 6th, and page 364 of the issue of September 20th. How far the scheme will affect or modify concentration of production is not yet known, but it is bound to introduce new factors into the negotiations. Previously, Government orders were first in the list of priorities, export orders second, and home civilian trade a lame third. The provision of essential civilian clothing in larger quantities will bring about a re-orientation of the major classes of trade, and home trade in the specified qualities will rank with

export trade. Inside the home trade itself, a greater emphasis will be placed on the production of cheaper cloth relatively to the better qualities. Exports have been well supported by the initiative and enterprise of the industry, which has been prepared to take considerable risks in opening new markets. The Wool Control's announcement on future raw material prices is discussed in a Note on page 393.

RAYON

During the quarter the rayon industry has undergone considerable changes. After the outbreak of war, rayon exports were warmly encouraged, and while markets were reduced, the elimination of European competition compensated for this, and progress was made. During the past year, relatively very little fabric was made for the home trade. Output was in no way equal to the probable coupon demand, and stocks were rapidly dwindling. It was recognised that if the allocation of the present reduced production still favoured exports, a serious position would arise at home. It has therefore now been decided to allot approximately 70 per cent of weaving yarn output to the production of home trade cloths, with the balance for export. The Limitation Orders have been materially altered and sales are now mainly confined to "utility" cloths which, in the case of the dress goods trade, mean those selling at less than 3s. 6d. per yard. In practice, this price covers almost the whole usual output, but there is a small "general" quota allowed, under which manufacturers can supply better quality goods to help maintain technical developments. In the lower grade, some degree of standardisation is unavoidable, but every effort is being made to avoid adding to any necessary "drabness." In the hosiery trade, fairly liberal quotas have been allowed, but as these have to replace the very large pre-war imports and are also limited by the availability of raw material, the position is certain to remain very tight. Filament yarn and spun rayon prices were slightly raised, but the increase is still proportionately smaller than in other cloths.

Business Developments Overseas

UNITED STATES

Industrial activity has increased at so fast a rate this year that unemployment was virtually eliminated by the summer. According to the statistics of the National Industrial Conference Board, the number of unemployed at the end of June was only 2,536,000, against 3,848,000 in May, 5,357,000 in April, and 8,132,000 in June, 1940. However, of the 2,536,000 persons classified as unemployed at the end of June, 1,997,000 were engaged on Government emergency projects; the number of persons without occupation was thus only about half a million. The expansion in activity was not confined to the defence industries; it proceeded on a wide front, embracing all the modern accessories of the consumer, such as motor cars, refrigerators, and the rest. By the summer, when a state of full employment had been reached, the needs in labour and materials of the growing defence and civilian sections of industry could no longer be met in full. Steps were therefore taken, by means of a limitation of raw material supplies, to reduce the output of unessential civilian production. Hitherto, the extent of the reduction in the goods of peace has been small. But if the momentum of the expansion in the output of the goods of war is to be maintained, unessential production must now be progressively and drastically restricted.

BRITISH EMPIRE

CANADA.—Total business activity continued to expand in recent months. As in the United States, the output of many civilian goods increased side by side with the expansion in the production of war goods until the summer, but the country is now faced with the need for a reduction in the former. There are indications that the growth of retail sales has been arrested. War contracts, inclusive of new plant, placed up to the end of June were \$1,096 millions on Canadian and \$815 millions on British account. In agriculture, the heavy increase in British purchases, due to the loss of European supplies, and the need for drawing requirements from the nearest sources, has brought about a complete change. Except in the case of wheat, surpluses have given way to a condition of scarcity.

AUSTRALIA.—Most industrial plants are working at top speed, and a vigorous effort is being made to expand the output, and increase the range of munitions still further. For example, it is reported that, apart from naval vessels, Australia now has some 60 merchant ships of 7,600 tons each under construction, and the Dominion is now producing many of the modern tools of war. The high level of employment in consumption goods industries suggests that there is scope for further expansion in their production.

SOUTH AFRICA.—In industry, production and employment have remained steady. The output of gold continues at a high level; 1,212,708 fine ounces were produced in August, against 1,199,699 fine ounces in July. According to a cable from the Standard Bank of South Africa, agricultural conditions have undergone little change in recent weeks. Import and export control has been tightened.

LATIN AMERICA

Argentina is facing a shortage of certain imported goods, and some foreign articles have entirely disappeared. As a result, demand for and prices of both home and foreign products are rising. The index of wholesale prices (1929=100) was 144 in June, compared with 129 in January of this year and June, 1940, but the cost of living index has been relatively stable. Fuel stocks continue to fall. Some 2,500,000 metric tons of maize (of which there was an exportable surplus of 8,631,409 tons on August 16th) have been

sold at low prices for use as fuel. The six months ended June, 1941, show a trade balance in Argentina's favour of 226,263,000 pesos, against 94,423,000 pesos a year before. Compared with the first six months of 1940, the volume of imports for the same period this year dropped by 28.7 per cent and exports by 50.2 per cent. The decline in market values was 39 per cent and 20.8 per cent respectively. Imports of textiles from Brazil have been increasing at the expense of Britain in cottons, though the latter's position as far as woollen textiles is concerned has been maintained. The National Coffee Department of Brazil fixed basic minimum prices for sales of free coffee for export on July 9th, Santos soft 4 being listed at Rs.40\$000 per 10 kilos. On July 30th the minimum prices were raised by Rs.6\$000. Uruguay is experiencing a considerable shortage of materials, particularly of fuel, and iron and steel products, owing to difficulties in arranging imports. Petrol consumption has been curtailed by rationing and other fuel products may also be rationed.

GERMANY AND GERMAN EUROPE

A new phase of restricting civilian industries began some time before the attack on the Soviet Union, and the original plan of concentrating war production in the most efficient plants and factories has made steady progress. Control of the use of machinery, raw materials, and substitutes has been strengthened. Shortage of labour is more pronounced than ever, because of the extraordinary demand on manpower for the army and particularly for the different labour corps engaged in Soviet Russia. The reserves of labour, i.e., old age pensioners, married women, the retail trade and inefficient shops and factories, have been combed again for additional workers. The number of prisoners of war and foreign workers employed in agriculture and industry has increased and can be estimated at 3.5-4 millions. The system of pooling machinery and of sub-contracting war orders in various forms is slowly being replaced by grouping firms into large units. The profit and dividend stops, combined with special facilities for capital reconstruction of companies, resulted in a wave of capital increases with the objects of arresting the continued boom in share prices and of overcoming the stop on dividends. The index of the cost of living continued to advance more markedly than the wholesale price index. Industrial collaboration with occupied countries, especially with France, Belgium, and Holland has been increased; and the orders placed in these countries are reported to be running into several thousand million Reichsmarks. In these countries unemployment has virtually disappeared. Industrial activity is strictly limited to war production. There is, however, a steadily growing demand for capital expenditure, which cannot be supplied. Even in Germany replacement of machinery has become very difficult. German principles of war economy are now evident in all occupied countries. Rises in the indices of wholesale prices and of the cost of living were considerable, varying from 30 per cent to 100 per cent over the period from the beginning of the war to July, 1941. Denmark, Norway, Roumania, and Jugoslavia show the greatest advances. The European harvest is reported to be above the poor yields of 1940. In the Danubian countries and in Italy, however, the harvest seems to be as poor as in 1940. Bread rationing has been introduced in Hungary, Roumania, and Italy. Germany's imports are appreciably smaller since the attack on Soviet Russia, and the raw material situation in some of the occupied countries deteriorated when imports from Soviet Russia ceased.

THE ECONOMIST

TRADE SUPPLEMENT

DECEMBER 27, 1941

The Trend of Business

THE general trend of industrial activity has remained upwards during the past quarter. The output of goods for civilian consumption has been further curtailed, but the decline has been more than offset by the expansion in war production. The improvement in the total volume of production has been facilitated by the continued absence of serious air raids, by the comparatively low level of shipping losses, and by a further increase in industrial personnel.

Great Britain's industrial mobilisation has reached the stage when the output of finished war equipment is increasing fairly rapidly as a result of the completion of a large proportion of the preparatory work, consisting of the construction of new munition factories and of the tooling of both new and existing industrial plants. But the increase in munition-making capacity has been accompanied by a growing scarcity of labour. In order to solve the problem of strengthening the fighting services, as well as the industrial army providing them with equipment, the Government has passed the National Service Act this month; broadly, the Act is designed to bring within the scope of the war effort all able-bodied men and women.

Substantial though the improvement has been in the output of war equipment during the past three months, Great Britain has not yet developed its production to the full. In part this is due to the very great technical and administrative difficulties of changing over to a war economy which, as Mr Churchill pointed out in the House of Commons on December 2nd, can only be solved gradually. Nevertheless, it is still widely held that the speed of the transfer could have been faster and is still not fast enough. Apart from recurrent com-

plaints about faulty ordering, insufficient standardisation of tools and equipment, there is widespread criticism of the slowness with which production facilities are harnessed to the war effort. The system of decentralisation through the Regional Boards of the Production Executive is still far from satisfactory. Sir John Anderson, Lord President of the Council, admitted in the House of Commons on December 3rd that the Government had not yet gone so far as in the last war in vesting executive powers in the Regional Boards. There is a good deal of variation in the efficiency of existing Boards; some have shown initiative in organising local production facilities and in the pooling and exchange of equipment and knowledge, but others have done comparatively little.

The supply of raw materials for the production of war equipment has been fairly satisfactory. Imported materials have been coming in fairly regularly as a result of the reduction in shipping losses; indeed, it has been possible to replenish stocks. Home production of raw materials has also been increased. Although coal production has not come fully up to official expectations, stocks have shown some increase. Iron ore production, too, has been speeded up, thus partly offsetting the reduction in imports of the ingredients of iron and steel.

In view of the present strategic position of the Allies, it is essential that the tempo of industrial mobilisation should be speeded up still further, so that they can at last seize the initiative and exploit to the full the setbacks suffered by Germany in Russia and North Africa.

British Industrial Development

COAL

During the December quarter the number of ex-miners brought into employment was increased to over 27,000; there was little interruption of work by enemy action, and industrial relations improved after the removal of the friction over the conditions of the attendance bonus. The average weekly output was a little higher than in the September quarter, but it fell short of the target. Some local stoppages were reported through lack of empty wagons, but the position rapidly mended with the help of a Government scheme for the unloading on newly acquired and equipped Government dumps at or near the collieries, of wagons needed to prevent interruption of work. Some prices were raised in South Wales, Lancashire and Northumberland, and over the year the increase in the average pithead proceeds per ton was 12-13 per cent. Wage costs during 1941 rose by about 14 per cent, and the improvement in earnings per shift since September, 1939, was approximately 36-37 per cent, without allowance for the additional number of shifts worked per week.

IRON AND STEEL

The iron and steel industry has achieved an expansion in output during the last quarter of this year, in spite of the reduction in the import of raw materials from the United States. The improvement has been secured by a yet greater increase in the home production of iron ore and by an intensification of the scrap collection campaign. In view of the scarcity of scrap in the United States, imports from that country are expected to remain at a comparatively low rate during the next few months. Although stocks are substantial the output of steel cannot be maintained at the current rate without a still more vigorous effort to increase the flow of domestic scrap to the steelworks. The report of the Essendon Committee on the reorganisation and concentration of the tinplate industry has been submitted to the Ministry of Supply; but its proposals have not been published.

CHEMICALS

During the past three months there has been a steady tone throughout the industrial chemicals market, with business moving

along rather restricted channels. Supplies of all the leading products have been allocated for essential purposes, enabling the flow of deliveries against contracts to be maintained. The restricted supply position has limited bookings in the fine chemicals section. With the increased home demand, export business in the coal tar products market has taken second place. Prices generally have been steady and most of the difficulties resulting from the coal tar control are gradually being overcome. All wood distillation products have been in great demand, although practically no stocks are available.

COTTON

Considerable business was offered, but many contracts had to be refused owing to shortages of supply. During the quarter the concentration of production was completed, and the output of spindles and looms is now about 55 per cent of capacity. The Essential Work Order was applied to the spinning branch, and application has been made for the weaving section to be included. Labour shortage was acute and a drive to get married women to return to the mills has so far achieved little success. Export cloth was chiefly for Java, South America and the Dominions. Quotas will be reduced by half in the New Year. There is a greater tendency for the industry as a whole to centre its efforts on war needs, and a reduction in the output of civilian goods is expected. Raw cotton imports showed decided improvement, and local stocks are larger than for some time. The fact that spinners cannot sell their output beyond twelve weeks has forced manufacturers to limit their sales. The appointment of Mr Frank Platt as Controller, in place of Sir Percy Ashley, who resigned, was well received in trade circles.

WOOL

The rationing period for the four months commencing November 1st was the first which included raw material for the utility clothing scheme. Some twenty types of cloth were included in the Board of Trade's list issued under the Clothing and Apparel (No. 2) Order. Since the inception of the scheme a considerable amount of machinery has been employed, and it appears that some balance between coupons and available goods is being achieved. The last

relationship. Other merchant banks took special initiative in the financing of comparatively small firms starting operations in one or other of the depressed areas. But it should be noted that this intrusion of the merchant banks into the field of industrial banking has never amounted to much in absolute terms. The resources at the disposal of these institutions are in any case small in relation to the capital needs of any one of Britain's large industries. The published balance sheets of these banks give no indication of any appreciable extension of their activity in this direction. But the fact that, here and there, such participation has in fact been acquired is worth noting, for it is something completely new in British banking practice and policy; and it provides a development along which some merchant banks may well seek salvation and escape from the impasse into which the throttling of international trade and the rigours of a controlled economy have driven them. The nature of their resources, and, in particular, the more permanent character of the deposits entrusted to them, would allow them to undertake such business with a prospect of impunity which the joint stock banks could never achieve if they made a similar investment.

This somewhat negative record of British banking in supplying the long term capital needs of industry is far from reprehensible. The history of British banking would have been far more stormy, and its present structure far less solid, had serious attempts been made in the past to compromise between the principles of deposit and industrial banking. The present-day position in this respect is, however, losing some of the clear cut simplicity of which it could boast in pre-war days, when a free open capital market stood ready to satisfy most of the reasonable long-term capital requirements of industry. That market is now closed, and its watch dog, the Capital Issues Advisory Committee, has only opened its door to a small number of comparatively unimportant capital issues—most of them being increases of capital and issues of additional shares to existing shareholders. The object of this control is to canalise the flow of national savings into Government issues and to ensure that all the demands for additional industrial capital, which are in fact satisfied, are directly concerned with the war effort. If a firm engaged on non-essential work needs additional capital, it can be quite certain of not getting it. Where such capital is required by a firm working for one of the supply ministries, it can usually obtain its requirements in kind from the department for which it is working. The Ministry of Supply, the Admiralty and the Ministry of Aircraft Production will in such circumstances erect or extend factories and provide and instal machinery and other permanent equipment in the form of what has generally become known as an "embodiment loan." This plant is lent to the operating firm, the agreement occasionally incorporating an option to the firm in question to purchase the plant at the end of the war.

These facilities do not provide for working capital, the acquisition of stocks of materials or other types of self-liquidating credit transactions which should readily be

handled by the firm's own bankers. Even the banks, however, are occasionally brought into the machinery set up to provide the longer term credit which in normal circumstances they would not grant. The finance for plant extensions, installation of machinery and other permanent investment of this kind is occasionally provided by banks under Government guarantee. This procedure is, however, comparatively rare. The banks' accepted rôle remains the traditional one of satisfying the demand for working capital. That rôle is not, however, played in the traditional way. The main criterion in the banks' loan policy is no longer the credit worthiness of the borrower, but the nature of his activities. If his business can be classed as an essential war industry, the banks, in satisfying his ordinary credit requirements, will go a long way in disregarding the customary standards of banking prudence. The checks against "overtrading," for example, can no longer be applied when the national interest demands that every firm engaged on armament work should overtrade. But the essence of these standards must remain, and in particular bank advances, however disproportionate they may become to the capital invested in the firm, must still lay some claim to self-liquidity. This does not mean that some bank credit is not in fact being used for financing work of a permanent nature, even without Government guarantee. Where the liquidity of a firm will allow the repayment of such advances without requiring the liquidation of the assets for which the advance was granted, such accommodation may be given, and the standards of prudent banking will have been fully adhered to.

The machinery which has been built up to meet the credit and capital requirements of industry in the abnormal conditions of war is far from perfect. It is a haphazard structure. An organisation such as that which should now supply the long term needs of industry is not built up in the course of a few months without friction and without leaving considerable gaps uncovered. There has been considerable criticism from industry in the recent past that essential work and development is being held back for lack of the necessary credit facilities. As far as working capital is concerned, there seems to be very little ground for these complaints. An effective liaison system has been established between the banks and the various supply departments; and any complaint of inadequacy of working capital by a firm working on Government account, if lodged in the proper quarters, should meet with rapid satisfaction. The banks, for their part, find no relish in the serious decline of their loans and advances. They are therefore unlikely to turn a deaf ear to the legitimate demands of industrial customers engaged on work of national importance. If they did, their deafness would soon receive the appropriately audible remonstrances from the supply departments concerned. There is, however, room for both expanding and co-ordinating the machinery at present available to receive and decide upon requests for additional long-term capital. This organisation is at present wholly decentralised, each supply department working in virtual isolation. If the strands of the many requests for capital meet at any one point, it is where Treasury sanction has to be obtained for the expenditure involved. But the control exercised at this point is anything but constructive, and it initiates no policy. Nor is the machinery available for implementing the decisions taken by each supply department and approved by the Treasury as effective or uniform in its working as might be desired. Expansion in long-term industrial equipment demands a measure of planning, which probably exists in somewhat nebulous form but which could be improved. The grant of such capital should, for example, have reference, not merely to the immediate problem of war production, but to such questions as the post-war location of industry and the transferability of the plant and equipment in question to peacetime needs. The greater co-ordination of these capital-issuing activities of the various supply departments would provide the germ of a National Investment Board which, at least for the period of the post-war reconstruction, will have to direct the flow of capital investment in this country.

American Banking Trends

(From Our New York Correspondent)

THE banking figures of the past twelve months are primarily the reflection of the following factors—the gold movement; the usual Federal deficit; the deficits specifically attributable to America's armament programme; and the influences arising from the civil boom.

As usual, the account must begin with the gold inflow, now in its eighth year as a major phenomenon. Up to the end of 1940, this gold inflow was regularly far in excess of current output, and, in the last six months of 1940, still averaged about \$200 millions a month. In the first half of 1941, it dropped to about \$100 millions. Up to mid-1940 this gold was reflected in a continuous expansion of member bank cash, a large fraction becoming excess reserves. Over the past year this conventional phenomenon has not been repeated. Two factors turned the long expansion of reserves into a contraction—the growth of non-member balances, whether Treasury, non-member clearing accounts, or foreign; and the continued and accelerating expansion of the currency. At the same time, the great expansion of member bank credit increased the sum of required reserves. As a result, total reserves were stabilised in the last half of 1940, and fell by about \$800 millions in the past six months. Excess reserves, which had been about \$6,800 millions at the end of June, 1940, had fallen by about \$400 millions by the year end and by more than \$1,000 millions more by the end of June, 1941—by more than \$1,500 millions in twelve months, during which time the gold stock had actually risen by \$2,700 millions. This change is one of the most con-

spicuous changes of trend in banking and monetary statistics, but so enormous is the "cushion" of excess reserves that, as yet, it has had no perceptible influence. The greatest single factor is the currency demand; "money in circulation" is now about double the amount in the late twenties.

RESERVE BANK AND TREASURY ITEMS

(\$000,000)

	June 25, 1940	Dec. 25, 1940	June 25, 1941
U.S. Securities	2,473	2,184	2,184
Gold Stock	19,871	21,930	22,620
Gold Certificates	17,653	19,681	20,314
Member-Bank Balances	13,723	13,837	12,985
Of Which Excess Reserves	6,801	6,438	5,150
Non-Member Bank Balances	1,405	2,000	2,186
Treasury Balances	301	481	1,081
Money in Circulation	7,780	8,817	9,490
Of Which Federal Reserve Notes	5,144	5,965	6,633

Although it was stated above that banking phenomena were mostly reflections of the Federal deficit, it will be noted that this does not hold for the Reserve Banks. In late 1940, they reduced their holding of Government securities by a small amount; and in the first half of 1941, when deficit financing assumed large magnitudes, they did not add to their own holdings.

It is increasingly uncertain if an accurate picture of what is called commercial banking can be obtained from statements of the Reporting Member Banks. To a growing extent, various Government agencies have entered

spheres of commercial banking; and new institutions, or old, but expanding, non-banking institutions have extended their activities in the area of personal credit, consumer financing and factoring. To a degree these institutions and agencies are competitors of the reporting banks; to a degree they are jobbers or retailers of funds derived directly or indirectly from the banking system.

REPORTING MEMBER BANKS (\$000,000)

	June 26, 1940	Dec. 25, 1940	June 25, 1941
Total Loans and Investments	23,581	25,604	28,279
Total Loans	8,435	9,354	10,324
Of Which Commercial Loans	7,573	8,343	9,385
U.S. and Guaranteed Securities	11,610	12,568	14,304
Other Investments	3,536	3,682	3,651
Demand Deposits	20,681	22,382	24,046

The table of the Reporting Member Banks over the past year shows an increase of approximately 20 per cent in loans and investments as well as in deposits. The distinguishing feature introduced this year is the marked increase in commercial loans. To the extent that these commercial loans have related to the armament programme, they are in their origin similar to the Federal financing itself. But there is reason to relate much of it to the financing of the civil boom which has accompanied the military effort.

The distribution of bank credit for the Reporting Member Banks as a group is illustrative of neither New York nor the 100 Reporting Banks' outside New York.

NEW YORK BANKS (\$000,000)

	June 26, 1940	Dec. 25, 1940	June 25, 1941
Total Loans and Investments	9,277	10,323	11,812
Total Loans	2,753	3,093	3,433
Of Which Commercial Loans	2,318	2,534	2,920
U.S. and Guaranteed Securities	5,238	5,850	6,977
Other Investments	1,286	1,380	1,402
Demand Deposits	9,621	10,479	10,986

While the commercial loans of the New York banks have risen over the past year, the increase has been relatively small; on the other hand, the New York banks have been heavy buyers of Government securities. As late as early 1931 loans were double the investments; by the end of 1932, loans were equal to investments; now loans are half of investments. The reason for this great change in banking function lies in the relation of the banks to the stock market. Formerly, financing the corporate capital market by lending for the purpose of carrying securities, on the market or elsewhere, constituted a large and commonly the largest lending activity of the New York banks. Their security loans were deflated in the depression, and have not been rebuilt in the recovery; and with their apparent extinction disappeared one of the great historic functions of the New York Banks.

One of the most puzzling features of American banking is to be found in the relation of the New York banks to the banking system as a whole. In total loans and investments, the ratio of New York to the interior in 1929 was 1:2; the relation is now 3:4. In 1929, about 40 per cent of the demand deposits of these banks were in New York; now it is about 45 per cent. In 1929 the investments of the interior banks were double those of New

Banking in the Dominions

BANKING in the Empire in the last year has tended very much to follow the same lines as in the United Kingdom, and for the same reasons—a rise in deposits owing to Government war expenditure, a fall in advances owing to the increasing inroads made by the Government into industry, and a consequent rise in investments as the only outlet, under these circumstances, for surplus funds.

Only in Canada is there a slight variation on this theme, but it is an interesting variation because the Canadian chartered banks have been forced to watch their advances fall away and consequently to pile up their holdings of Government securities even earlier than

TOTAL LOANS AND INVESTMENTS	June, 1929	June, 1941
New York	7,281	11,812
Interior	14,950	16,467
TOTAL LOANS		
New York	5,468	3,433
Interior	11,012	6,891
TOTAL INVESTMENTS		
New York	1,812	8,379
Interior	3,938	9,576
DEMAND DEPOSITS		
New York	5,200	10,986
Interior	7,802	13,060
RESERVES		
New York	720	5,617
Interior	952	5,171

York; now they are approaching equality. Loans in both groups are about half of what they were in 1929, mostly by reason of the almost complete absence of share speculations with bank credit. In both groups, the sum of the reserves and the holdings of Government securities exceeds the demand deposits.

At the end of June, 1941, about 60 per cent of the total loans and investments of the New York banks and about 45 per cent of the total loans and investments of reporting banks outside New York consisted of U.S. and guaranteed securities. For the two groups combined the proportion is about 50 per cent. In this situation, it is clear that any internal strain falls not upon a market, but upon the pools of excess reserves; and that these can meet (as they are meeting) substantial fluctuations without provoking even a ripple in the structure of money rates.

It is extremely difficult to appraise economically the changes in banking practice over the past twelve years. In 1929 what were called loans predominated over what were called investments. That is, in the '20's the banks supplied credit for capital purposes, in the form of loans against capital securities. In recent years, the banks have been supplying credit for capital purposes in the form of investment in capital issues. So stated, there seems to be a good deal of similarity of substance combined with a dissimilarity of nomenclature. In both instances, bank credit was a substitute for, or a supplement to, savings. In both instances, the demand for capital appears either to have exceeded the amount of savings, or the amount of savings available for the specific demand. In the '20's, this demand came from corporate enterprise; in recent years, in so far as it has been reflected in banking data, it has come mostly, or almost exclusively, from the Government. In the present instance, the maintenance of the value against which the credit has been created is not dependent on a market, but is rather presumably protected by the reserve banks and the Treasury. In the '20's, it was a use of bank credit by enterprise, subject to the accountability of profit and loss, while in recent years it is an extension of bank credit to the State, which is subject to no such accountability. In the '20's, it was an extension of credit against a value subject to the fluctuations of a market; in recent years, specific provision has been made for isolating this value from the influence of a market. The record of this transition in banking theory and practice is statistically clear, and the mechanics of the present system are simple and well understood. But its significance to the economy and to the banking system is not at all clear as yet.

the British joint-stock banks. As the table on page 42 shows, already by 1939 their holdings of Dominion and Provincial Government securities had crept up to the level of their total loans, and, compared with 1929—admittedly an exceptional year—the switchover is striking. In the last twelve months, however, the welcome increase in current loans to the public, which had begun in 1939, persisted; and by October, 1940, the total had passed the thousand million dollar mark for the first time for some years. Thereafter, with some slight setbacks, the upward movement has continued and by May this year the figure had reached

\$1,032 millions. This, however, is only equivalent to 30 per cent of deposits, and holdings of Government securities, though they remained fairly stationary throughout last year, had by the spring of 1941 easily beaten advances and risen to 45 per cent of deposits. But the fact that, throughout the past two years, loans have shown a small absolute rise is some comfort for the banks.

This small divergence from the general trend of other Dominion and British banking may be explained by the civil boom which is accompanying production for war purposes. In this respect Canada is like the United States, where, as our New York correspondent points out on page 8, the reporting member banks have also experienced this year an increase in commercial loans. In the years of depression and recovery in the thirties, the Canadian banks followed the same trends as their neighbours, and this parallel movement is persisting in the years of war—which, of course, is producing much the same economic conditions in both countries. In both countries, too, it is probable that the banks are directly financing the armament programmes, by loans to industries working for the war effort, to a greater extent than banks in the United Kingdom and other parts of the Empire. The annual analysis of Canadian chartered bank loans showed that, on October 31 last year, loans to "other manufacturing" industries were \$62 millions higher than at the same date of 1939. But part of the rise in advances must be attributed to loans to grain growers and merchants in view of the huge carry-over of wheat.

A strong contrast is provided by the banking figures for the Union of South Africa, which are also found on page 42. Here there was not the same big fall in advances in the thirties, but there has been a fairly steady decline since the war began; and this year advances alone—the figure for discounts only amounts to some £5½ millions—have, as in the United Kingdom and Canada, been beaten by investments, whereas before the war they were well ahead.

The problem of the South African banks, ever since the country left the gold standard nearly nine years ago, has been to find a profitable outlet for the huge increase in their deposits which was caused by the high price of gold—directly through the very favourable balance of payments, and indirectly through the general stimulus to economic conditions given by the activity in the gold-mining districts. Their problem was intensified by the fact that the taxation of the gold mines gave the Union Government persistent budget surpluses, so that its recourse to borrowing was rare and mostly represented the replacing of external debt as it fell due by internal loans. It was this repayment of London loans which ex-

plains the rise in the banks' investments after 1935, and it was continued in 1940, when £7,900,000 5 per cent London stock was redeemed. But the increase in the Union's war expenditure has given a further outlet to the banks in Government securities, for a large part of it is being charged to loan account. Thus, in 1941-42, defence expenditure has been raised from about £60 millions to £72 millions, of which 60 per cent—£43,200,000—is to be met by borrowing. Some of this will be provided by the Public Debt Commissioners; but the Minister of Finance forecast issues to the public in his Budget speech, and the banks will no doubt be avid subscribers since, in spite of the borrowing of the previous year and the repayment of the London loan, their cash had risen by the end of 1940 to 39 per cent of deposits. Even allowing for the comparatively high cash ratio to which the South African banks have always been accustomed, this is an extraordinarily high figure.

It is a little strange that the banks have not participated in the general economic activity generated by the Government's war expenditure, as has apparently happened in Canada. It is possible, however, that the rise, if any, in advances to industry—secondary industries have certainly made further headway since the war—have been more than offset by a decline in advances to farmers. The British Government's bulk purchases of wool and maize must have eliminated to a very considerable extent the growers' need for bank advances.

In Australia, the past year, so far as the banks are concerned, has been a logical sequel to its forerunner. Deposits rose to £A360 millions in June, 1941, compared with an average of £A350 millions in 1940 and £321 millions in 1939. The increase has occurred almost entirely in current deposits, thus illustrating the public's desire for liquidity and for investments in war loans instead of interest-bearing deposits.

As in the United Kingdom, the trading banks have been actively co-operating with the authorities in the control of investment by limiting advances to ventures of value for war purposes. Investment in new undertakings has been strictly supervised, and the banks have followed the broad lines of policy laid down by the authorities. Bank advances in Australia have always shown a far higher ratio to deposits than in the other Dominions or the United Kingdom; but, as a result of the Government's policy, in June, 1941, the ratio was only 79 per cent, compared with an average of 90 per cent for the year 1939.

The reverse of this policy is shown in the increase in the banks' holdings of Government securities and Treasury Bills. In June this year, Government and municipal securities stood at £A62 millions, compared with

BARCLAYS BANK (CANADA) . . . Montreal and Toronto

£A44 millions in June 1940. Holdings of Treasury bills rose from an average of £A23 millions in 1939 to £A40 millions in 1940; since then there has been a slight decline, the figure for June, 1941, being £A36 millions. The big jump between 1939 and 1940 was caused by the centralisation of London and other external funds in the Commonwealth Bank, and the recession in the past twelve months indicates the determination of the authorities to finance war expenditure as far as possible out of taxation and savings. It is now apparent, as the Commonwealth Bank pointed out in its half-yearly report issued in March, that further war production in Australia will be achieved only by diverting resources from civilian production.

In New Zealand, already before the war, the social and economic policy of the Government had started an upward movement in banking figures, so that, unlike Australia, the effects of war finance were simply superimposed upon a trend that was already well in evidence. The deposits of the trading banks rose from £NZ64 millions in December, 1938, to £NZ79 millions in December, 1940, and £NZ82 millions in March, 1941, and, as in the case of Australia, the entire increase was in demand deposits. Time deposits, in fact, showed a slight decline. Advances fell from £NZ58 millions to £NZ48 millions in December, but rose to £NZ53½ millions in March. This rise, however, which was partly seasonal, was not in proportion to the increase in deposits, and the switch-over from the balance of private enterprise to public loan investments is illustrated by the rise in Government securities from £NZ9 millions in December, 1938, to £NZ 18 millions at the end of last year.

So far as central banking is concerned, in all the Dominions, there has been a rise in the note circulation, owing to the increased spending power in the hands of the public. There are some divergences, however, as regards the overseas assets of the central banks. Between July, 1940 and 1941, the London money of the Commonwealth Bank fell by approximately £A8 millions. This decline was due to the gap between exports, on the one hand, and imports, external interest payments and

overseas war expenditure on the other. Actually, the deficit on these items in the financial year 1940-41 amounted to £A11 millions; the gap was therefore partly offset by capital imports.

In New Zealand, net overseas assets rose considerably from £NZ6.7 millions at the end of 1938 and £NZ15.7 millions at the end of 1939 to £NZ23.5 millions in December, 1940. On March 31 this year they were about £NZ30 millions. This improvement in New Zealand's balance of payments is partly due to the stringent import and exchange control, which had already been put into force before the war to correct the very unfavourable exchange position into which the Dominion had fallen, and partly to the higher prices paid by Great Britain for most of New Zealand's exports.

The South African figures of overseas assets are interesting. The British Government's purchases of the Union's gold production means, at the current price and output, a credit item of about £110 millions a year for the country's balance of payments. According to the Minister of Finance, in his Budget speech this year, the favourable balance of payments was, in fact, £20,530,000 last year, even after allowing for the redemption of the London 5 per cent loan. Yet this favourable balance is reflected, not, as might have been expected, in the South African Reserve Bank's holdings of foreign exchange, but in its gold reserve, which, calculated at current rates, increased by £26,880,000 during the year. The Bank apparently sells the Union's currently produced gold to the Bank of England and then uses the surplus in its favour, after allowing for the import surplus, interest payments abroad, the repatriation of gold shares, and so on, for buying back some of the gold instead of buying British Treasury Bills.

The whole of the Bank of Canada's gold and most of its foreign exchange was acquired by the Foreign Exchange Control Board in May, 1940. Since then its holdings of foreign exchange have consisted only of sterling held for account of the Board, or the Dominion Government, in connection with the latter's programme of repatriating Canadian securities held in the United Kingdom, and have varied accordingly.

Banking in German Europe

(By a Correspondent)

THE central banks in German occupied countries are mostly operating without any appreciable gold stocks. A considerable part of these were held abroad long before the German occupation took place, and some refugee Governments were able to remove their remaining gold to safety. A considerable part of Belgium's gold, estimated at £60 millions, was, however, shipped back to Brussels through the mediation of the Vichy Government. Some indication of the gold stocks held abroad by occupied countries is given by the size of the assets of European states frozen in the United States of America. The total assets of seven occupied countries frozen in the United States amount to \$4,340 millions.

The German controlled central banks continue, however, to include in their returns the gold stocks which are no longer available to them. German *Reichskreditkassenscheine* and German Reichsmark holdings are usually shown under the item foreign exchange, and the German commissars are allowing these holdings to be used as note cover. In some countries, especially in Holland, the compulsory delivery of gold and foreign currencies by the people actually increased the gold holdings. But the greater part was speedily requisitioned by Germany. The Danish central bank reported during 1940 a continued loss of gold. Gold stocks and holdings of foreign exchange in the Balkan countries moved unevenly. Hungary's losses were exceptional because of an adverse trade balance with overseas countries. Roumania's gold stocks increased nominally by revaluation in Germany's favour. Bulgaria's holdings rose slightly, and holdings in Greece reached record figures because of

the loan granted by Great Britain. The combined holdings of gold and foreign exchange and the note circulation in occupied and neutral countries developed as follows (December, 1939=100):—

	Gold and Foreign Exchange		Note Circulation	
	Dec., 1940	Mar. 31, 1941	Dec., 1940	Mar. 31, 1941
France	86.9	—	144.7	—
Belgium	102.7	101.6	124.2	135.7
Holland	108.7	108.3	134.7	183.3
Denmark	98.2	89.7	123.6	117.9
Hungary	78.6	75.1	142.3	140.4
Roumania	155.0	156.0	131.8	141.2
Bulgaria	115.2	115.2	153.5	183.7
Jugoslavia	137.8	140.6	142.7	169.7
Greece	323.0	518.0	162.7	186.5
Switzerland	121.0	132.3	117.0	130.0
Sweden	112.5	115.7	104.3	100.0
Finland	61.5	58.1	137.5	141.8
Germany	101.1	100.4	119.0	120.3
Bohemia & Moravia	92.7	93.1	101.6	111.4

No figures have been published for the Norwegian central bank established by the Germans in Oslo—the legal Bank of Norway is carrying on in London. The French central bank has not yet resumed the publication of weekly returns.

The disproportionate and persistent increase in the note circulation of almost every country is caused by extraordinary state expenditure and inadequate taxation. In western and northern Europe, the costs of occupation are advanced by the central banks. In the Balkan countries, central bank credits have been used for rearmament

works. In Switzerland there has been extensive hoarding of banknotes, and in all countries wholesale and retail prices have increased by varying amounts—from 30 to 80 per cent—during the period from August, 1939, to March 31st, 1941. The inflationary tendency of these developments is obvious in view of the decline in business activity in the occupied and neutral countries during 1940. But Germany has effected everywhere a system of exchange by the rationing of civilian goods and rigid exchange, price and wages control after the German model.

Direct German control has made the use of *Kreditkassen* and *Kreditkassenscheine* no longer necessary in western and northern Europe. But branches of the *Kreditkassen* have been opened in Zagreb, Belgrade, Bucharest, Salonika and Sofia, as well as in Kovno, Riga, Pskov, Bialystok, Minsk and Lwov, towns captured from the Russians. In Yugoslavia, the political partition has been accompanied by a banking one, and two central banks are now operating, one in Zagreb for Croatia and the other in Belgrade, for Serbia. In Belgium, the Germans founded a special *Emissions Bank* (bank of issue) for the purpose of advancing credits to the State. The name is thus misleading. The old central bank is still the real bank of issue, but the *Emissions Bank* acted as central bank for the *Reichskreditkassen* when they were established in Belgium.

Helped by the exceptional financial liquidity and pressed by the need for large borrowing, the central banks have pursued a policy of cheap money by successive reductions of bank and interest rates. The following table shows the current bank rates with the previous rates in parentheses:—

	Rate in effect June, 1941	In Effect since
France (2)	1½	Mar. 17, 1941
Belgium (2½)	2	Jan. 5, 1940
Holland (3)	2½	June 26, 1941
Denmark (4½)	4	Oct. 16, 1940
Norway (4½)	3	May 13, 1940
Hungary (4)	3	Oct. 22, 1940
Roumania (3½)	3	Sept. 12, 1940
Bulgaria (6)	5	Dec. 1, 1940

Germany's indirect control of the finances of the occupied countries, achieved by a central clearing system and the large exports to the Reich, which force the central banks concerned to accumulate Reichsmarks that serve as note cover, has been strengthened by the expansion of German commercial banks, especially into south eastern Europe. Commercial banking in the occupied countries has developed on lines similar to banking in Germany. The most outstanding feature is the increase in deposits in the leading banks, as is shown in the following table:—

	December, 1939=100	December, 1940	March 31, 1941
France	146.0	155.6	142.5
Belgium	126.8	133.5	133.5
Holland	113.2	118.7	118.7
Hungary	106.8	110.4	110.4
Roumania	102.6	106.7	106.7
Switzerland	98.1	100.0	100.0
Sweden	125.2	125.0	125.0
Finland	132.0	—	—
Germany	130.0	137.0	137.0
Bohemia and Moravia	—	—	—

The deposits of three leading Norwegian banks increased during 1940 by 57 per cent, and those of the leading Danish banks by 8 per cent. It is true that during the actual fighting in France, Holland and Belgium, deposits fell rapidly, but as soon as the fighting was over there began a hasty liquidation of stocks of commodities. Factories came to a standstill, and later civilian industries were restricted. Idle capital was returned to the banks, and the banks themselves found no opportunities for advancing money to private industry. Loans and advances decreased accordingly, and the exceptional liquidity of the banks was everywhere used for investments in Treasury bonds and bills.

Deposits in savings banks, however, showed a different trend. In western and northern European countries, including Sweden and Switzerland, total savings deposits fell during 1940 and were still falling during the first

quarter of 1941. This was probably due to the widespread unemployment in the occupied countries and to the reduced industrial activity in the two neutrals, coupled with rising prices. In Hungary, Roumania and Bulgaria, on the other hand, savings deposits have increased on an average by 10 per cent, owing to the good employment resulting from the extensive rearmament programmes. But the spectacular increase in savings in Germany, variously estimated at from 20 to 30 per cent during 1940, was not achieved by any other country.

The Italian central bank has suspended all detailed information, but the few figures available make it clear that the trend is the same. Considerably greater returns from the note circulation tax, for instance, indicates a rising note circulation. The commercial banks, which give more detailed information, show the familiar rise in deposits, which has amounted to as much as 52 per cent for the deposits of the *Banca Nazionale del Lavoro*, which is owned by the state. Closer collaboration with Germany, and, in particular, the export of workers to the Reich, has resulted in the establishment of branch banks there.

The underlying trends of banking in German Europe are thus obvious. The German system of control effected by commissars and economic reforms after the German model have made the German Reichsmark into a kind of note cover in most of the occupied countries. There was, indeed, no alternative, in view of the loss of the gold stocks and the fact that Germany is the predominant trading partner. Advantageous and stable rates of exchange are the most important means by which Germany hopes to stabilise financial relations for its European war economy. At the same time Germany has deliberately fostered certain inflationary tendencies by fixing exorbitant costs of occupation and by forced exports from occupied countries to the Reich. New taxes, particularly a turnover tax, as well as the control of prices and wages, have, however, combined with a comprehensive system of rationing to keep inflationary tendencies within such bounds as Germany thinks necessary for its own purposes.

Wills and Trusts in Peace and War

Desirable as it is in normal times to consider appointing the Midland Bank Executor and Trustee Company as your executor or as trustee of an estate or fund in which you are interested, prevailing conditions render such a step even more advisable now.

A complete and efficient service is afforded by the Company which with the aid of a specially trained and expert staff, acting in close collaboration with the organization of the Midland Bank, has gained an invaluable experience. This experience and the many important advantages attaching to the appointment of the Company to act for you are at your disposal for a moderate fee.

The benefits thus to be derived are too numerous to be mentioned here in detail. They will, however, gladly be explained by any Midland Bank branch manager in his capacity as a representative of the Executor and Trustee Company. Whatever you tell him will be treated in the strictest confidence.

If at first you are unable to call upon the manager of the branch most convenient for you, ask him to send you a copy of "The Service of the Midland Bank Executor and Trustee Company" and other informative literature. These may also be obtained from the Head Office in Poultry, London, E.C. 2.

A COMPLETE BANKING SERVICE

Through its widespread organisation
and connections, Barclays Bank offers
the fullest possible facilities for the
transaction of every kind of Banking
Business, either at home or abroad.

Executor and Trustee
Business transacted.

ASSOCIATED COMPANIES:

BARCLAYS BANK (DOMINION, COLONIAL AND
OVERSEAS).

BARCLAYS BANK (CANADA).

BARCLAYS TRUST COMPANY OF CANADA.
THE BRITISH LINEN BANK.B. W. BLYDENSTEIN
& CO.54-55-56 THREADNEEDLE STREET,
LONDON, E.C.2.

BANKERS

ALL BANKING AND
DISCOUNT BUSINESS
TRANSACTIONED.

Deposits received for short and
longer periods at rates to be ob-
tained on application.

More than a century's accumulated
business experience and conservative
progress form the background of
the comprehensive service which the
Westminster Bank is able to place at
its customers' disposal.

The Bank's vast resources, its con-
stant touch with current affairs and
its extensive system of branch offices
in England and Wales and agents
elsewhere, combine to enable it to
offer a wide range of facilities, de-
tails of which will gladly be given on
request by the manager of any branch.
