Nothing could be more satisfactory than the settlement in Iran. After a very few days' rather tepid resistance, the Iranian army received the order to cease fire, and negotiations opened at once between British and Russian representatives and the Shah's new Prime Minister and Foreign Minister. After four days' discussion, these negotiations have ended in agreement. Britain and Russia repeat their absolute guarantee of Iran's political independence and integrity, and the revenues from the oilfields will continue to flow undisturbed into the royal exchequer; at the same time, British and Russian armies will maintain order in certain specified areas north and south—Britain's area naturally includes the oilfields—and the vital supply routes by road and rail to Russia are guaranteed. It may be said in passing that the Allies' greatest lack in this area may now prove to be a Todt organisation for the patching together and creation of adequate military roads. Only on one point is negotiation to continue—the question of the Germans. The difficulty is that, while it would no doubt express the Allies' respect for Iran's independence if the German Legation at Teheran were not closed, the Legation has been the centre of the Nazis' propaganda network in the Middle East, and it would seem folly to leave the headquarters of such an organisation intact. However, a compromise may be possible which leaves what one might call a token diplomat in charge, and either interns or extradites all the other German agents and diplomats. The happy end to the Iranian incident is bound to have the best possible repercussions in the Middle East generally, particularly in Turkey, where the comments of Press and radio were previously very critical. The reinforcement of the Turks' Eastern frontier may do them a very good turn now that there are obvious signs of growing German pressure. The Germans are far less likely to risk an autumn campaign across Anatolia to the bleak snows of Caucasia if a united Anglo-Russian force awaits them there. Von Papen has left Ankara to visit both his doctor and Hitler, and the gloomier prophets foretell an immediate deterioration in German-Turkish relations. The Turks prefer to think that Hitler has too much on his hands to risk another front at this advanced stage of the year.

Playing for Time

The Labour Day speech of the President of the United States will have reassured all those who feared that peace talks with Germany were a possibility. But then only a minute fraction of the population can possibly have thought this. The destruction of Nazism is a goal very generally accepted by the American people. It is the means that raise such violent divergence of opinion. The President's speech did nothing, however, to allay anxiety on the score of the Far Eastern situation. The knowledge that Prince Konoye has sent a personal message to the President and that he has had long conversations with Admiral Nomura, does not in itself prove or disprove the suspicion that appeasement is in the air, but the fact remains that there is no satisfactory answer to the question: what did the President and the Ambassador talk about? Japan is obviously playing for time. The next stage in aggression is presumably timed to coincide with the hoped-for Russian collapse. In the meantime, the Japanese are anxious to ensure that America does not help, by shipping supplies to Russia, to prolong Russian resistance, and also that in no circumstances will she go to war in the Pacific. It is probable that the Japanese Cabinet is conducting a tight-rope walk between these potentially incompatible policies. It follows that the various threats—to establish an "oceanic security zone," to march on to the creation of a Greater East Asia and the like—and the putting up of hotheads like Colonel Mabuchi to make provocative statements may be attempts to browbeat the Americans into a supine acceptance of Japan's forward policy. The trouble is that, in the long run, the only thing which can keep the Pacific from war is the unequivocal readiness of the United States to go to war if necessary.

America Wonders

Mr Brendan Bracken, in his maiden public speech as Minister of Information, asked for sympathy and understanding for the "teething troubles" of defence production in the United States. Actually, criticism across the Atlantic has been much more drastic than it has been here. There is a quite widespread suspicion there that the effect of the Lease and Lend has been to make the United States Britain's tributary, a suspicion which is at its peak when the scarcity of oil on the eastern seaboard is discussed. When President Roosevelt last week produced out of the Office of Emergency Management (which comprehended the rival and overlapping Office of Production Management and Office of Price Administration and Civilian Supplies) the Board of Supply Priorities and Allocations under the Vice-President, Mr Wallace, he was countering criticism of his administrative methods, of the multiplication of separate *ad hoc* bodies and of the delay in decisions at the top. But he was also careful, in his executive order setting up the Board, to state explicitly, in view of the membership of Mr Hopkins, who is Lease and Lend administrator, that there was no intention of subordinating American policy to that of any other country. These are domestic troubles, and just now they seem to be important. The United States has been persuaded that Britain has now saved itself by its own—and, it is believed, America's—exertions. It has not been persuaded, in spite of the President's well-known and plainly stated views, either that America is in very direct danger, or that it is America's mission, having aided Britain, to destroy Nazi Germany. The Atlantic Charter and the American Congress—and many of the people—are very far apart; and it is important to realise that it is in this context that aid to Britain and, still more cautiously, aid to Russia must be interpreted. Mr Harriman will be head of the United States delegation to the Allied conference in Moscow. A Russian Purchasing Mission has flown to Washington; and an American military mission may go to Moscow. But the temper of the American people seems still to be very non-belligerent. Indignant criticism of their attitude from this side of the Atlantic is, indeed, probably not very helpful, but British comments on the "teething" troubles in production, which have equally been gone through in this country, might be reasonably useful in preventing them from becoming a more or less permanent trusion upon the rights of a sovereign people to suggest that the rate of production of several crucial machines and weapons is still lower than it could be; that, even in the

United States, teeming with resources, the vital materials of war production will have to be, not only eked out, but also reserved for essential purposes; and that those New Dealers who regard rearmament as a great programme of public works, and resist all cuts in civilian consumption, are in some ways more dangerous to America's war effort than the President's most isolationist opponents. These are simply suggestions of ways in which the accepted defence programme can be given something more to bite on.

Plus Ça Change . . .

The Ministry of Labour has announced its revised procedure for the recruiting of women. There is clearly a big difference between its attitude now and when the registration of women first took place. Then, women and employers were allowed to think that any full-time occupation would exempt them from being called up—or even interviewed. Probably this was due to the Government's quite unfounded anxiety that the use of even mild compulsion in the recruiting of women would be ill received; or to the better founded fear that the staff would not be available to interview and record recruits. In the event, a considerable number of women in full-time employment have been interviewed, and in an appreciable number of cases they have been advised to join one of the women's services if they wish to avoid being compelled to work in a factory. But the soft-peddling of the original announcement did great harm by obscuring the urgency of the need for women recruits in the Services and in industry; and it was easy enough for an employer to say that a woman employee was indispensable and to get away with it. Exemption was automatic. For future registrations, therefore, it is said that a more selective procedure for interviewing will be used. It has been announced that the only women who will not be interviewed will be, first, those in full-time paid employment in an undertaking working for the Government or for export, or in a concentrated industry; secondly, women in full-time employment in an undertaking covered by the Essential Work Order; thirdly, women covered by the Schedule of Reserved Occupations; and, finally, married women who are responsible for the household. Actually, there does not seem to be any great improvement in the new procedure—or, indeed, any great improvement in the new procedure—apart from the classes who will not be interviewed in any case, employers will still be able to claim indispensability and women serious hardship. Moreover, the Schedule of Reserved Occupations still covers a multitude of unessential jobs. It is only by its results that the "new procedure" can be judged; but there will have to be a far stricter interpretation of indispensability and essentialness if the 200,000 women wanted for the Services by the year-end and the 500,000 wanted for industry are to be found.

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

The Railway Agreement

After several months of negotiation, agreement has been reached between the Government, on the one hand, and the main-line railways and the London Passenger Transport Board, on the other, about the financial remuneration of the latter during the war period. Ostensibly, the first war agreement of February, 1940, was thrown into the melting-pot by the Government's decision to put all public utilities on the same basis with regard to war damage. Actually, the agreement was unworkable, because its provision that charges should follow costs was inevitably inflationary. It has long been evident that a subsidy, in some form, was essential; and, as was pointed out in *The Economist* of August 2nd (on page 140), the problem was to combine this with incentives to efficient management and economy. The outcome of these months of study has been a reversion to the practice of the last war, the railways being given a fixed payment, or rent charge, for the period of the war and for at least twelve months after, of £43 millions annually. This compares with a guaranteed minimum—excluding in each case certain revenue amounting to rather over £1,000,000 per annum—of £40 millions under the 1940 scheme, but this does not mean that the taxpayer is being mulcted more heavily, for this payment is subject to the settlement of war damage payments under the terms of a projected Bill. The details of this measure have still to be revealed, but the general basis is that the cost of replacement will be shared equally by the Government and the utility companies. The effect of this upon stockholders, and other matters not mentioned in the Ministry's statement, is discussed on page 301. From the wider national standpoint, the arrangement leaves much to be desired. None but the least reasonable advocates of railway nationalisation would claim that it is unduly generous to the stockholder; but, so far as is at present disclosed, there is nothing whatever to encourage the managements to pursue efficiency or to resist rises in the cost of materials and wages. Until Parliament reassembles, and full details are laid before it, nothing can be said about such matters as deferred maintenance, which proved so costly under the 1921 Act; but it is, at best, disappointing that it should prove impossible to do better than revert to the highly unsatisfactory arrangement of twenty-seven years ago.

Bank Deposits or Savings Bonds?

Last week, Lord Kindersley gave a review to representatives of the Press of the progress of the National Savings Campaign. The technique of popular appeal is being well developed. The war weapons weeks, with their appeal to local patriotism, have done excellent work; and the present summer campaign is directed to the smallest unit in the movement, the savings group and not the locality. It provides specific targets, ranging from a battleship, priced at £8,000,000, to a forage cap at 2s. 6d. Soon, the movement will go back to community rather than group efforts and aim at warships. The psychology of these devices is sound. It is simple; and there is the symbolism of a concrete objective. But to make it equally sound, economically, the movement must be infused to a still greater degree with the harsh gospel of abstinence. It is abstention from civilian consumption which will lay the ghost of inflation; and not the attainment of "targets" by subscriptions to Government issues of which the totals may well be swollen by the creation of bank credits or by the reinvestment of the proceeds of maturing loans. It was not promising for this more widespread appreciation of the economic realities of savings that Lord Kindersley should have laid so much stress on the desirability of converting funds now lying on current account or deposit with the banks into savings bonds—as though such conversion would set free for the war effort any material or labour at present used in satisfying non-essential civilian consumption. In contrasting the holding of funds in a deposit account with their investment in a Government security Lord Kindersley stated that, in the latter case, the individual transferred the command over goods and services, which that money gave, from himself to the Government. In the former case, he said, the money was admittedly re-lent by the bank to the Government; but the individual remained free to draw on his account and duplicate the use of the purchasing power which had already been transferred by the bank to the Government. The contrast would only be as clear cut as this if, in fact, Government securities were blocked. But they are not. The individual is as free to sell his securities

and spend the proceeds as he is to draw on his banking account. The inhibitions against his doing so may, of course, be greater in one case than in the other. But the fact remains that the individual who has done his fundamental duty of cutting down personal expenditure to the minimum, and leaves the resulting savings on deposit with a bank, has achieved just as much in liberating resources for war purposes as the investor who puts his savings into 3 per cent Savings Bonds. The point is that savings publicity could be used to better effect than simply in thus encouraging the bank depositor to switch into savings bonds—and so multiplying the yield from his investment by six and trebling the cost of the consequent borrowing to the Government.

Mr Menzies Goes

The Australian political crisis came to a head at the end of last week, when Mr Menzies resigned the Premiership and was succeeded by Mr Fadden, who is leader of the Country Party and was acting Prime Minister while Mr Menzies was in London. Mr Menzies himself is to retain the Ministry of Defence Co-ordination, and for the time being it does not appear that there will be any other changes in the Cabinet. The question of the London visit, which precipitated the crisis, is still unsettled; it is not yet decided whether a visit will be made, whether Mr Menzies or another will be the visitor, or what the status of the visitor will be. What does seem certain, however, is that the political situation is as unstable as before. Evidently the most gifted man in the Commonwealth Parliament, Mr Menzies lacked the common touch; and there can be no doubt that his inability to meet other people, especially his colleagues, on their own ground was a source of constant friction. But, even now, friction has not been eliminated. The Labour Party remains angrily suspicious, and the Government's position in Parliament has been made more precarious by the withdrawal of Mr A. W. Coles from the United Australia Party. He has announced that he will sit as an Independent and that his future actions will depend on the Government's. If he votes against the Government, its slender majority will disappear. In the meantime, the Budget is approaching, and it is probable that, if Mr Fadden falls, it will be over this obstacle, which was only cleared last year by making tax concessions to the Labour Party. That Mr Fadden realises this is shown by his statement that his aim is "to leave the public with every possible fragment of spending power which can be spared from the war effort—but not at the expense of the war effort." This, of course, is starting at the wrong end of the stick, as his aim should be to minimise non-war spending in order to set free the greatest possible amount of resources for the war. The statement contrasts badly with Mr Menzies' broadcast in June, when he announced the complete overhauling of civilian consumption, the concentration of civilian industries on a limited number of essentials, the prohibition of strikes and lock-outs and so on. It is up to Mr Fadden—and Australia—to prove that the change of leadership does not mean that the Commonwealth's war effort is to be slowed down.

The Acid Test

At Edinburgh this week, with a significant lead from Sir Walter Citrine, whose views on Soviet Russia are well known, the Trades Union Congress called for the utmost aid to Russia and decided to participate in an Anglo-Russian Trades Union Council. On the other hand, the suggestion that the Congress, in the new circumstances, should collaborate with the Communists was turned down as obdurately as ever. No other response was possible. It is hoped by some people that the Russian alliance will act like the chemicals that turn litmus paper red. But neither Britain nor the TUC are in alliance with Communism; and there has been no suggestion from Moscow that they should be. It is simply a question of collaborating in a common war effort. Trade union co-operation between the two countries will be valuable in developing their war potential and in exchanging information about conditions and difficulties; and if the British Communists are wholehearted in their new campaign to encourage war production, they should not find any obstacles placed in their way by trade unionists. Mr Tanner complained at the TUC that, in a recent speech the Minister of Aircraft Produc-

tion had expressed the wish that Germany and Russia would exhaust each other in battle, like Kilkenny cats; and Colonel Moore Brabazon does seem to have said things carelessly which were open to this interpretation. But the attitude that Mr Tanner complained of is precisely that which was adopted by both Soviet Russia and the British Communist party vis-à-vis Germany and Britain, until Hitler's sudden attack forced a change of front.

Britain's War Effort

That Great Britain has not yet reached the limit of its productive capacity and has not yet transferred to the war effort all the resources that are not essential to the maintenance of the health and efficiency of the population is unquestionable. More difficult, however, is the task of expressing this still untapped war potential in statistical terms. An attempt has been made to do this by Mr N. Kaldor in the current issue of the *Economic Journal*, largely on the basis of the raw materials provided in the White Paper on the national income and expenditure in 1938 and 1940 (Cmd. 6261), issued by the Treasury last April. Mr Kaldor estimates that the total national output rose by 10 per cent between 1938 and the last quarter of 1940 and that it should be possible, with the further increase in the employment of women and the concentration of civilian output in the most efficient firms, to raise it by a further 5-8 per cent. The reduction in consumption between 1938 and the last quarter of 1940 is estimated by Mr Kaldor at 10 per cent, but he contends that a 25 per cent cut, which would leave the people of this country still better off than the Germans, is quite feasible. While Mr Kaldor gives no figures for the increase—if any—in total production since the last quarter of 1940, he calculated that the present rate of consumption is probably 16-18 per cent below the level of 1938. Mr Kaldor's contention that total production can be raised by 15-18 per cent and consumption reduced by 25 per cent, compared with the 1938 level, is not unreasonable, and every effort must be made to reach this goal as quickly as possible. Even then the proportion of the national income (as defined by the White Paper) devoted to consumption would still be about 50 per cent, against 63 per cent in the last quarter of 1940 and 77 per cent in 1938.

Progress and Production

The fact that there is no reason to suppose that the war will destroy the material foundations of Western civilisation does not, of course, rule out the need that may be evident for concern about its moral or spiritual standards. Nor, even on the purely material side, should it be overlooked that the standard of living cannot simply be raised all round by Act of Parliament. The average standard of living—of the world community, or of any single national community—can only be raised by an increase in production per man-hour, by some improvement in the means of production, human or mechanical. This fact is the fundamental argument for the freest possible movement of capital, goods and labour within and between nations; and, without such an increase in the power to produce, the standard of living of some can only be raised—as in wartime, when the stock of civilian goods is deliberately restricted—by a lowering of the standard of others. It is commonly said that to raise the standard of living of "backward" or undeveloped peoples would be to the advantage of the more "advanced" peoples, because there would be an increased demand for the latter's products. This is true, but the increased demand of the former can only come about in one of two ways. Either the backward peoples must not only increase their output, but also induce the rest of the world to absorb the increased output at the same price as before; or they must receive an increased quantity of manufactured goods in return for the same quantity of their own produce. There is no magic by which every Chinaman, simply by choice, can increase the length of his shirt by an inch, and so bring the mills of Lancashire into full employment. Either the Chinaman must increase his output of, say, rice, and still get the same price per unit for it; or Lancashire must be prepared, in effect, to give an increased quantity of cotton goods for the same amount of rice. It is a question of the rate of exchange between Chinese man-hours and Lancashire man-hours; and the only way in which the equation can be altered advantageously is by an increase in actual production per man-hour.

Cares of Small Caterers

It is easy to sympathise with the statement issued recently by the executive of the Association of Purveyors of Light Refreshments, which represents some 750 firms. The most substantial complaint is that, by withholding supplies, the authorities are forcing many firms to close down branches, the consequent gap being filled by the establishment of publicly-owned British restaurants. It is certainly inequitable that the general scarcity should be allowed to press more heavily on this class of caterer, who, as the statement points out, fulfils in many cases the function of a works canteen, than on the large-scale caterer in the restaurant or hotel. The small men complain that their meat ration was not raised when the domestic ration was raised, that offals were not derationed at that time, and that they receive no eggs in the shell and no cheese—the last complaint has now been met by the Ministry of Food. Clearly, it is a hard case, but it must be pointed out that the true comparison lies with the resources made available to the large-scale caterer, the works canteen and the British restaurant and not with the allowance for use in the home. Rations for use at home must be allotted with the knowledge that many of their consumers cannot readily go out for meals and with the realisation that it is undesirable to foster a dual standard of rationing: one for those who must feed at home off the rations allocated to their individual ration book; and one for those who have money and opportunity to dodge the *per caput* ration by eating daily in restaurants.

Shorter Notes

In line with the change in Polish-Soviet relations described in an article in *The Economist* last week, further changes have been made in the Polish Cabinet, and the National Council has been dissolved by the President's decree. The decree points out that in the present international situation new tasks have arisen for the Council concerning the political, social and economic problems of future Poland. The composition of the Council must, therefore, be changed, in order to adapt it to the political position in Poland and to the participation in the Council of Polish representatives now living in the U.S.S.R.

Mr Morris Wilson, deputy-chairman of the British Supply Council in North America, has been appointed chairman in succession to Mr Arthur Purvis. Mr E. P. Taylor, representative of the Canadian Government in Washington in respect of the Supply Agreement between Canada and the United States, has been appointed to the post of chief executive officer of the British Supply Council. This is a new post which has been created to provide for the increasingly heavy duties falling upon the Council, and Mr Taylor will be responsible for the conduct of its day-to-day business.

Literæ Humaniores.—A civil servant wanted to say that women might come to work without stockings. This is how he said it:—In common with other Government Departments the Inland Revenue are requested to make it known to women members of their staff and to all who are in charge of district and other offices that in present circumstances stockings are not deemed an essential part of costume for official business.

THE WORLD OVERSEAS

Japan's War Supplies

(From a Correspondent)

July 31st.

THE outbreak of the Russo-German war has only increase Japanese military clamour, at home and abroad, for still larger stocks of all sorts of essential materials. It is true that in some instances, at Shanghai, Saigon, Bangkok and Singapore, Japanese firms, acting as purchasing agents for Germany after the disruption of totalitarian transit trade via Siberia, refused to take delivery of commodities bought previously, cancelled contracts and forfeited guarantee deposits. It is also true that, in a number of cases, the Japanese fighting forces declined offers to take over the contracts and commodities in question. Yet they did so only because they considered the contract prices too high and the other conditions also too severe, and because they expect that, after the disappearance of the German demand, they will be able to buy these same supplies considerably cheaper or to extract them by more or less forceful means on specially preferred conditions and credit terms from such helpless countries as French Indo-China. The Japanese military effort to accumulate still larger supplies continues unabated.

Of all the major countries, Japan to-day would appear to be, in relation to its economic capacity and eventual war requirements, the best stocked. The extraordinary, and ever increasing, shortage of commodities offered in Japan for current civilian consumption ought not to be misunderstood, and the notorious difficulties of industry to secure all sorts of materials ought not to be misinterpreted. Both the Japanese Army and Navy to-day hold—in Japan proper, Korea, Manchuria and Japanese-occupied China—unusually large stocks, not only of arms, munitions, and other military and naval equipment, but also of raw materials and fuel. Such stocks include large quantities of iron ore, iron and steel scrap, coal, fuel oil, gasoline, lubricants, rubber, non-ferrous metals, rice, clothing material and leather. Many private industries essential for war have been induced to hold large stocks of this sort in reserve for a sudden emergency, and instructed not to touch them for current consumption.

Reliable foreign trade, production and warehousing figures are no longer published in Japan; the vital details of the State Budget are shrouded in secrecy. Yet reliable observers agree that these supplies are large enough to cover Japanese wartime requirements for periods ranging, in the various goods, from six to fifteen months. It is estimated that they will permit Japan, while continuing the war in China, to face an Anglo-American trade embargo for about a year, or to allow her to fight a southward *blitzkrieg* for a duration of some six months. Germany's attack upon Russia was not foreseen in Tokyo; and the new situation thereby created has led the Japanese fighting services to demand an urgent further increase of their war stocks, so as to enable them to face, besides the continuation of the China war, and an Anglo-Saxon embargo or a southern *blitzkrieg*, aggressive action against Russia in case it should collapse before the German onslaught.

Throughout the past twelve months, the third Konoye Government has devoted its supreme economic and financial effort to the accumulation of the unprecedented reserve stocks demanded by Japan's fighting forces. Soon after this Government was set up, Prince Konoye bought domestic peace from Japan's Army and Navy, at the price of completely subordinating his country's economy to these Services' direction. Independent economic and financial policy ceased in Japan a year ago; the Tokyo Government departments concerned with economic and financial matters have ever since simply obeyed the fighting forces' orders; the Government abandoned the mammoth concerns of private big business, and the latter had to abandon the

exercise of political influence and to co-operate unconditionally. After Japan's adherence to the Tripartite Pact, a complete apparatus of German financial, economic and technical advisers was imported, and was superimposed on the Tokyo War Office upon the whole of Japan's financial and economy. This apparatus of German advisers, who in the middle of last winter ceased to advise and began to direct, is chiefly responsible for the huge accumulation of war stocks which has been achieved. These Germans are also responsible for the increasing difficulties of current industrial production and for the huge decrease in the supply of commodities for civilian consumption in Japan. Working upon German principles and with German methods, often indiscriminately applied to different Japanese circumstances, they frequently turned out results different from those achieved in Germany.

How it was Done

The accumulation in Japan of large additional stocks of war supplies was accomplished, first, through the systematic economising of war and other materials originally earmarked for use in the China war. The recent Japanese military and naval campaigns in China were all characterised by a desire to economise in material, often to the extent of seriously compromising the result of the operations in question. A considerable part of Tokyo's Chinese appropriations has lately undoubtedly been absorbed otherwise, and chiefly in the acquisition of new stocks. This was achieved, secondly, by the continued tightening up during the past twelve months of Japan's foreign trade and foreign exchange controls with a view to eliminating the last non-war imports and at the same time reducing exports to the minimum level required by foreign exchange needs. These controls in Japan are now fashioned almost exactly after the German pattern; in the last few months, the new Japanese foreign exchange regulations are mostly literal translations from corresponding German regulations. The increase in stocks was achieved, thirdly, by the further curtailment of civilian consumption all along the line. Rationing, on ticket system and otherwise, is being ever extended, and now applies to all major foodstuffs, clothing materials and household goods. Educational and amusement facilities are heavily curtailed. The ratio of compulsory savings on all classes of incomes and profits is being constantly increased, not only with a view to converting new savings into Government bonds, but also to prevent civilians from raiding the markets with their nominally increased purchasing power.

While in these three fields German methods have proved fairly successful in amassing additional stocks of war supplies, concurrent efforts to increase Japanese industrial war production have been far less so. It would seem that the very success of the three measures is largely responsible for the lack of success in the extension of war industrial and auxiliary industrial plants and in boosting their production. In Japanese business circles, it is an open secret that most of the plans in this direction have failed; this since early last year, the rate of progress in Japanese industrial production—in war industries alone, without taking into account the decline in the output of civilian industries—was slowed down, and for months has been negligible. On this account there has been considerable dissatisfaction in Japanese military and industrial quarters. April this year, Sumitomo's tycoon, Ogura, was made a member of the Cabinet for the special task of fanning the expansion of war industrial production, but now Ogura is considered a complete failure. Influential Japanese military and naval leaders have recently become critical of the German advisers' industrial methods, and are plaining paying attention to the suggestion of private big business

that production should be encouraged by the old standard method of increasing prices and allowing higher private profits on war and related materials. The end of trans-Siberian totalitarian trade has also paralysed a number of projects for expanding war industries in both Japan and Manchuria; German deliveries of machinery cannot be expected any longer, and large quantities of such machinery destined for Japan are marooned by the war in Russia.

The Ukrainian Trump Card

[BY A CORRESPONDENT]

August 19th

FOR years the Germans have promised to play their Ukrainian trump card against Russia. Special Ukrainian "Research" Institutes have worked in Berlin and Vienna; special gangs of Ukrainian terrorists have been trained and kept in readiness; and providential Ukrainian "Leaders," illustrious failures of the past, such as Hetman Skoropadski, have been busily preparing themselves for the Day promised them in *Mein Kampf*. German specialists in advertisement have elaborated the Ukrainian theme with their usual bombast, and consequently many people, even outside Germany, were brought to believe that, by playing the Ukrainian card, the Nazis would win the hand, and that—once the Day arrived—some sort of a national Ukrainian *levée en masse* would be raised against the Soviets.

The Day has come, but the great political masterstroke has not. At the moment, the German armies have advanced deeply into the Ukraine. But this is a purely military achievement, and not even German propaganda can claim any success in the political sphere. The *Weichselsender*, in its numerous Ukrainian transmissions, has nothing to say about the much-heralded Ukrainian irredentist movement, or about peasants greeting their German "liberators" with flowers. These happy pictures still remain one of Herr Rosenberg's pleasant visions; the Ukrainian *moujik* seems to greet the unwelcome "liberators" in his own peculiar manner—with the harassing fire of guerilla detachments and with scorched villages and fields. It is, therefore, mainly through frightfulness that the *Weichselsender* tries now to impress the dull Ukrainians; and grim warnings, threatening the participants of guerilla bands with capital punishment, are the most favourite and frequently repeated items in its Ukrainian transmissions.

It is now becoming increasingly clear that German policy in regard to the Ukraine has taken a new turn. During the first days of the Russian campaign, German propaganda still tried to use the slogan of a Great and United Ukraine. This was probably meant to enlist the support of the Ukrainians in the former Polish territories. When the German armies crossed the old Soviet frontier, this slogan disappeared from all broadcast propaganda and was replaced by the more modest battle-cry—*Heil Ukraine!* The term Great Ukraine has always stood for a Ukraine comprising both the Soviet and the Polish lands inhabited by Ukrainians; and it was the prospect of a fusion of all these provinces that made many Ukrainian nationalists place their hopes in Berlin. That the change of slogans has not been a fortuitous slip of the tongue by the propagandists of the *Weichselsender*, but a sign of a premeditated turn in German policy, was soon confirmed by a measure which almost escaped public notice abroad: the incorporation of the districts of Lvov, Stanislov and Tarnopol into the General Governorate of Poland. These three districts (Eastern Galicia) have been considered by the Ukrainian nationalists as an inseparable part of Great Ukraine, and they have actually played the part of a Ukrainian irredentist Piedmont. The area, covering about 62,000 square kilometres, is inhabited by a population of about 6½ millions, of which, according to Polish figures, about half consisted of Ukrainians and Ruthenians. (Soviet and Ukrainian sources consider the distinction between Ukrainians and Ruthenians artificial, and put their numbers much higher). Under the short-lived Soviet occupation, the area was united with the Soviet Ukraine into one republic. Its incorporation into the Polish General Governorate must have thrown into utter confusion those obscure circles of zealous Ukrainian nationalist conspirators, who for years have been the tools of the *Auswärtige Amt*, and have had assigned to them the rôle of Ukrainian quislings. Their dream of a Great Ukraine, united under their rule, has burst like a pricked bubble. Whatever further German plans there may be in this field, the Nazis

have already achieved a negative result in alienating the sympathies of the Ukrainian nationalist groups; and their prospective quislings, should they still find some, can from now on hardly hope for any popular backing.

A similar change of policy can be seen with regard to the other invaded republics, White Russia and the Baltic States. According to usually well-informed Swedish correspondents, these territories are to form one German dependency, the Ostland, under a German Governor-General. The fact that the Lithuanian puppet government of Colonel Skirpa, which installed itself in Kovno soon after the entry of the Germans, has been disowned by Berlin seems to confirm these reports. The long-prepared game of liberating "oppressed nations" has been thrown overboard all along the line. In the Ukraine, the change is most spectacular, and it is here that in the long run the new turn is bound to bring the invaders the most disastrous consequences, no matter what their temporary territorial gains.

What has caused the Germans to waste their trump? The incorporation of Eastern Galicia into the General Governorate of Poland might perhaps have been calculated to impress some Polish circles, whom Hitler is now trying to win over, by pretending to restore to a subjugated Poland its eastern frontiers. It might have been planned as a counter-move to the Polish-Soviet Agreement. But motives deeper than these considerations lie behind the new policy. It was one thing to blackmail the Soviets and the Poles with the Great Ukrainian trump card, but it is quite another thing to fulfil the threat. A Great Ukraine, with its some 45 million inhabitants and its enormous industrial and agricultural potential, even if originally set up as a German protectorate, would, in the long run, be an economic and political unit far too formidable to be kept under effective control. The fundamental principle of the German New Order has been to break up Europe into as many *disiecta membra* as possible, and not to help big national units to existence. And the Ukraine could not be made an exception to the rule.

In the sphere of economic policy, the Germans have also adopted a line bound to antagonise even that section of the peasantry which might have been inclined to use the opportunity for a return to private ownership of land. While still promising to restore individual property in some undefined future, the German authorities have warned all peasants in the occupied Soviet lands against any attempts to leave the collective farms. For the purpose of *Wehrwirtschaft*, it is easier to tackle a small number of large collective farms than a multitude of small ones. German officials in charge of requisitioning have had, willy nilly, to appear as the temporary defenders of the Kolkhoz system, a paradox undreamt of by philosophers.

A Missed Opportunity

On the whole, the Ukrainian campaign, so far as its political and not its military aspects are concerned, has become, from the German point of view, a missed opportunity. And an opportunity there was. There was no lack of grievances in this part of Europe, no lack of popular resentment caused by both Soviet and Polish mistakes. It has often been Hitler's deliberate policy to exploit the grievances of other nations in order to harness them to the carriage of German Imperialism; that the Ukrainian problem could have afforded some scope for similar manoeuvres is beyond doubt. Luckily enough, German preparations and designs in this sphere have been frustrated by excessive German rapacity. It is through this predominant factor of its own policy that the Third Reich is depriving itself of some political trump cards, among which the Ukrainian one was not the least important.

LETTERS OF CREDIT AND DRAFTS ISSUED

Prodigies of German rapacity are in their turn merely a matter of political blindness. They also reflect the needy position of the German war machine and the relentless efforts that have to be made in order to feed it and keep it going. Considerations of all kinds, no matter how important, have to be subordinated to this supreme end. The midsummer night's dream of a Great Ukraine has, in fact, been devoured by the armoured and motorised German Moloch.

The New Phase

[FROM OUR NEW YORK CORRESPONDENT.]

August 11th

THE preliminary estimate of the July index of production shows a figure of 162—five points over June, 31 points over July, 1940, and 58 points above the summer of 1939. At this point the phrase "Business As Usual" is meaningless; it is a boom level, with almost full utilisation of human and material resources. In the past two years, production of all kinds, for civil or military demand, has advanced *pari passu*; and, while the boom was generated largely by the military demand, the civil aspects of the boom were conspicuous. Added to the increased purchases of consumption goods, there was a spurt in residential building that is usual in all American booms, but intensified in this instance by the migration of workers to centres of the armament industry. In this phase, employment was increasing and wages were rising, but such was the elasticity of the system that prices advanced but moderately; and direct taxation, while somewhat increased, still fell only on a small fraction of the population. In short, it was no alternative of "guns or butter"; there were more guns and more butter.

It is quite clear that this phase has passed or, rather, is passing. While no one would undertake to name an index figure representing a ceiling of production, it seems likely that our economy is entering a phase which will be less marked by a comprehensive increase of production of all kinds than by the likelihood that further expansion of military production will be compensated by some abatement of production for civil consumption. To be sure, the establishment of a limited scheme of priorities in the first quarter of the year, and the gradual expansion of the list in the second quarter, acknowledged this prospect; but not in such a way as to bring it to the attention of the man in the street.

The First Shortages

In the past fortnight, the change has been brought home, although in neither of the two instances was the cause precisely that cited above. The embargo on trade with Japan was followed by a complete cessation of the manufacture of silk stockings; and within a few days stocks were practically sold out. Silk stockings were the badge and uniform of the American Woman, who is said to use almost 50,000,000 dozen pairs a year. The second instance derived from another cause. Some 17 States along the Atlantic seaboard usually receive their petroleum supplies by tanker; the transfer of tankers to England is given as the reason for an impending scarcity of gasoline in that section. What is called a "gasoline curfew" has been imposed, prohibiting sales between 7 p.m. and 7 a.m., but it has had no perceptible results in diminishing consumption. A suggested reason for this plan is that it was designed to prepare the public mind for an effective limitation in the early future.

BANK OF MONTREAL

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

The articles generally quoted as showing spectacular increases in demand over last year—motor cars, refrigerators, electric stoves—have two qualities in common. They are directly competitive with armament demand, and they are characteristically sold on "instalments." That is, they represent a civil demand stimulated not only by increased pay-rolls, but by credit expansion. The materials of which they are fabricated are in many instances covered by priority rulings. The latest step is to introduce some sort of limitation on "instalment" selling, by action to be taken by the Federal Reserve Board.

These instances are so mild that they may seem almost trivial. But two factors must be taken into account. It was argued that there was little use in limiting civil demand as long as there was but partial utilisation of human and material resources; and that there was no use in limiting production for civil demand until, and except as, the preparatory work on defence production was so far advanced that the transition from civil production to armament production could be reasonably smooth.

The important things to note are the enormous elasticity in the total potential latent in our capacity and, secondly, the elasticity in specific potential available when the aggregate potential is reached. There is still evidence of elasticity in the total potential. It is still estimated that the number of "unemployed" exceeds five millions. Presumably a proportion of them are not readily employable, whether from location, disabilities or lack of desired skill or aptitude; but there is still a "reserve" of labour. Further, it is said that, to date, the bulk of armament contracts have been let to a comparatively few large firms, for obvious reasons; but it is claimed that there is a multitude of smaller concerns quite capable of undertaking special or sub-contracts. While not so accessible as the large suppliers, these must be counted as a reserve of productive capacity. Nevertheless, we have definitely passed from one phase, which conferred only economic benefits upon the great majority of the population, to a phase which will exact an uncertain degree of deprivation, mild or severe, from at least a considerable proportion of the public.

Smaller Imports in Eire

[FROM OUR DUBLIN CORRESPONDENT]

August 18th

THE trade statistics indicate that the passive balance on visible account is tending downwards. In the twelve months July, 1940, to June, 1941, imports amounted to £34,525,000 and exports to £30,276,000. The debit balance of £4,249,000 is considerably less than the credit balance on invisible account, and Eire's sterling resources are being augmented in consequence. In the month of June the passive trade balance sank to £3,873, which is the lowest on record except during last October and November, when exports exceeded imports. The growing pressure of the blockade is to be seen in the fall of imports from £4,758,000 in June, 1940, to £2,234,000 in June of this year, while the effect of cattle disease is represented in the fall in the value of the export of live animals from £884,000 to £20,192. Now that live stock exports have been resumed, the passive balance should tend to be still further reduced.

The Minister for Finance has announced that £10 millions will have to be borrowed during the current financial year. The original estimate for borrowing was £4,452,000, but expenditure has increased since the Budget. While this additional borrowing is regrettable, especially in view of the warning in the report of the Banking Commission against adding to the deadweight debt, it must be seen in its correct perspective and its end effects not exaggerated. Compared with the huge sums borrowed in other European countries during the war, the addition to the debt in Ireland is relatively small, and the presence of ample idle money awaiting remunerative employment is shown by the increase in the deposits in the banks. The really disquieting aspect of the Irish debt situation is the failure of the national income to expand. If there were adequate reason for believing that the national income would expand in the post-war period, the borrowing during the years of war would inflict no lasting injury on the country.

The speeches of the chairmen at the half-yearly meetings of the banks indicate that the banks are all experiencing the same difficulties. Profits are reduced as the result of rising costs and lower revenue. The principal cause of the rise of costs is the Arbitration Award fixing the officials' salaries at a level which is regarded as too high by the directors,

but other costs, for example expenditure on ARP, have also risen. On the revenue side, interest rates have remained low, and the demand for accommodation has shrunk because of the shortage of supplies of raw materials and because increased liquid assets have been carried from motives of prudence. Many of the increased deposits are regarded as temporary and liable to early withdrawal. Hints were dropped on the need for increasing the banks' charges to their customers, but such a step would be very unpopular and would give rise to considerable resentment.

Sugar has been added to the small group of rationed commodities. The standard ration is fixed at one pound per head per week. This is equivalent to about 80 per cent of last year's consumption and should prove ample. Special arrangements are made for supplementary rations for jam-making, and the needs of industrial users will be considered individually. Ireland has experienced no real shortage of any essential food since the outbreak of war. Tea is rationed in rather small quantities, and bread, while abundant, is rather dark in colour. On the other hand, there is plenty of meat, vegetables, eggs and butter. The articles in which scarcity is most evident, coal, petrol and cigarettes, are not included in the food group.

Plans are already being made for next year's agricultural production. At a meeting of the Agricultural Production Consultative Council, presided over by the Minister of Agriculture, the difficulties to be overcome were thoroughly discussed. While there is no hope that exports of store cattle to Great Britain will be resumed in the near future, increased facilities for the export of cattle for immediate slaughter have been announced. The revision of the guaranteed prices for cereal crops was dealt with from the point of view of their effect in encouraging the production of wheat, oats and barley respectively. Special encouragement will continue to be given to the production of wheat. Many articles necessary for an increased agricultural output are in short supply, and efforts are being made to provide substitutes for certain types of fertilisers and feeding-stuffs hitherto imported. The need of maintaining an adequate supply of labour for the harvest was among the matters under consideration.

Industrial Production in Chile

[FROM OUR SANTIAGO CORRESPONDENT]

July 31st

BEFORE the war of 1914-18, Chile's industrial production was negligible, but when normal sources of supply were cut off during those years industry leaped ahead, and after the war, aided by a benevolent protective wall, these industries held their own year after year despite depressions and slumps. History is again being repeated; the present war has given another fillip to national industry, and figures recently published are interesting.

Taking the years 1927-29 as a basis, production has steadily increased during the past five years, as the following index illustrates:—

1936		144.5	1939		153.4
1937		153.4	1940		175.8
1938		159.6			

It will be noticed that the years 1937 to 1939 showed little increase, and in fact 1939 saw a slight decline in comparison with 1938. It was then considered that industrial saturation point had been reached, but, with the outbreak of the present war, Chile has been forced to become more self-sufficing.

As is natural, energy and fuel show the biggest increases, and the production of coke rose from 85,032 tons in 1939 to 96,500 tons in 1940; production of gas was 86 million cubic metres in 1939 and 93½ million cubic metres in 1940; electricity production was 509,353,312 kw. in 1939, against 569,806,473 kw. in 1940. Coal owners have found difficulty in increasing production to keep pace with the demand, but this is also due to Communist agitation at the mines. Rationing among the major consuming industries and railways has been in force for some considerable time, despite importation. The shortage of coal is having a serious effect on the production of gas, which is now insufficient to meet domestic demand; transport is also being hampered owing to the restriction of train services. Such matters tend to

slow down the wheels of industrial production; nevertheless, the index shows an improvement.

The position of several of the more important industries for 1940, together with the 1939 figures, is given in the following table:—

Commodity	1939	1940
Cement production (tons)	340,765	588,925
Glass production (kilos)	6,705,000	10,973,000
Match production (cases)	124,042	150,290
Knitting wool (kilos)	354,237	410,761
Cloth production (metres)	3,243,462	3,957,337
Writing and printed paper (kilos)	13,250,788	18,541,882
Wrapping paper (kilos)	11,762,149	13,297,678
Sugar refining (kilos)	120,920,951	123,958,056
Cigarettes (pkts. of 10)	417,000,000	417,000,000
Boots and shoes (pairs)	3,135,599	4,880,209

During 1939 and 1940 other new industries have been started, but figures are not yet available. Such industries include cotton spinning, spinning of artificial silk yarns, chemicals, etc.

To keep pace with this increase in industry and the constantly rising costs of labour and raw materials, the major producers have all substantially increased their capital during the past two years—particularly during 1940—and it is fully expected that this will continue. Fortunately, there is no lack of capital for the older established industries, nor do the new ventures find difficulty in this respect.

THE BUSINESS WORLD

French Stock Exchanges

THE broad outline of the development of the French bourses is easily understandable if it is related to those circumstances which govern the entire economic situation in France. France, which has for the last year been a closed and authoritarian economy, is obliged to put into circulation a considerable volume of money to meet State expenditure and to pay to the German authorities the war indemnity of Frs. 400 millions daily. In the absence of goods and of raw materials, the only possible investment alternatives for money in circulation are State securities or industrial equities. The rise in market values apparent in the bourses over the past year is to be explained essentially by the abundance of money in a closed economy where it is difficult to find other employment for savings.

The payment of the indemnity of Frs. 400 millions daily—Frs. 146,000 millions per annum—is made through the creation of a credit at the Bank of France in favour of the occupation authorities, who charge to this account the expenses connected with the upkeep of the army of occupation. The *Reichskreditkasse* notes, which circulated in the early months, have been withdrawn, and the franc alone is now in use. The amounts credited to the account at the Bank of France are considerably in excess of the true needs of the German authorities, who between June, 1940, and January, 1941, drew upon these credits to the extent of only 43 per cent. The remainder is accumulating at the Bank of France, with the result that out of a total of Frs. 146,000 millions, Frs. 65,000 millions have been spent by the occupation authorities. The French State obtains the necessary resources from the Bank of France through a special account of advances to the Treasury; in other words, by the creation of money pure and simple. The French Government is reported to have consented, in a recent agreement with Germany, to pay the indemnity in gold or in foreign exchange at the reduced total of Frs. 300 millions daily. The German authorities will in any case spend the same sums, in terms of francs, and the country will, into the bargain, have lost gold or foreign exchange.

The expenditure of the Vichy Government, taking the average of the first two quarters of 1941, amounts to some Frs. 140,000 millions annually. In the first quarter, the ordinary Budget totalled Frs. 24,411 millions, the supplementary Budget Frs. 15,291 millions. In the second quarter, the figures were Frs. 22,731 millions and Frs. 10,032 millions. A recent calculation of the Ministry of Finance places annual expenditure at some Frs. 134,000 millions.

What receipts can the State count on? For some months after the Armistice there can be no doubt that State revenue was considerably depleted by the general disorganisation, by the sudden disruption of the war economy and by losses of all kinds to which individuals were subjected. This resulted in a considerable rise in the fiduciary issue, which reached a level of Frs. 218,000 millions at the end of 1940 against Frs. 158,000 millions on May 9th of that year. The rate of increase appears to have slowed down since the end of the year. Thus, the note circulation increased to Frs. 232,000 millions on April 31, 1941. According to the first issue of the official statistical bulletin, normal budgetary receipts amounted to Frs. 6,170 millions in January, 1941, against Frs. 4,674 millions in the previous year and to Frs. 5,854 millions in February last against Frs. 6,935 millions. Thus, annual receipts should be approximately Frs. 70,000 millions—the Minister of Finance estimated them at Frs. 68,000 millions—leaving a gap of more than Frs. 200,000 millions

to be covered by loan or the creation of money—or of Frs. 150,000 millions, if only the fraction of the indemnity actually spent is included. It must be remembered that in estimating the total of State expenditure account must be taken of the needs of the *communes* and *départements* and of the public services.

The money put into circulation returns to the State by the normal channels. Bank deposits increased by 50 per cent in the past six months of 1940. The short-term Government issues were taken up by banks and by private individuals. It has been possible to reduce the discount rate to 1½ per cent and the Treasury bill rate and the rate on National Defence Bonds have been lowered correspondingly. So far, the State has issued no new loan; the authorities are waiting until the rise in Stock Exchange prices permits conversion operations. In the meantime, surplus funds are invested in State loans and, through the Bourse, in other securities, and the price of both gilt-edged securities and equities has rapidly increased.

If the average price level of 1939 is taken as a base, the general index of gilt-edged issues was 117 on May 30th, that of French industrial equities was 276. The following prices afford a few indications of the level of gilt-edged securities: 3 per cent *rentes* fluctuated during June between 90 and 95; the 4 per cent issue of 1917 at the end of June was in the neighbourhood of 97; the 4 per cent 1925 stock with guarantee of exchange changed hands at 170; 4½ per cent Treasury Loan, 1933, was around 1,200. The quotations of the same shares were, on August 1st: Frs. 91.60, 99.50, 170.70, 1,232. As far as equities are concerned, it is revealing to dissect the general index. Thus, it will be seen that the rise is most marked among textile shares (433)†; next come coal (338), water, gas and electricity (286); transport (271); metallurgy (258), and credit institutions (202). On the other hand, the rise in foreign securities and in French stocks issued abroad has remained slight. The general index of 167 covers an immense disparity among its constituents. Gold mines at 98 are below the average for 1939; the rise in oil shares to 124 is moderate; for the remaining mining shares, on the other hand, the index rose to 248.

How is it possible to explain this divergence in movement, or at least the difference in rhythm? In the first place, the majority of foreign companies no longer pay dividends in France, and will not do so for the duration. Then, the owners of these securities know that they are threatened by requisition on the part of the Vichy Government on behalf of the German authorities—and it is probable that a considerable part, at least of the foreign bonds, in the occupied zone have been seized by the Germans. Finally, the degree of optimism and pessimism with which the French public regards the outlook for the oil and gold-mining companies varies with the progress of hostilities.

The variation in rise between the different categories of French securities is to be explained by reference to the conditions prevailing in particular industries. To a certain

† The percentage increase is calculated on the highest price in the neighbourhood of May 30th.

‡ It appears that purchases of securities on German account played no important part. Until March 19th, there were no dealings in equities on the Paris Bourse. Transactions are controlled and, moreover, the Germans intervene directly in French businesses in which they are interested.

extent, the price movements make it possible to hazard a guess as to the measure of activity in each industry and of the importance of the German contracts received. The majority of firms, especially in the occupied zone, are only able to work in so far as they receive raw materials, and they receive raw materials to the extent that the Germans have an interest in their output. The rise in the textile price index, for instance, is derived from the rise in rayon share prices: it is public knowledge that an agreement has been concluded between *Rayonne Française* and the German *Zellwolle* concern, by which the latter obtains 30 per cent of the capital of the French company and, in exchange for patents and raw materials, receives a proportion of the French output.

Other differences are to be explained by the distinction between the two zones: thus, the rise in the prices of coal mines in Central France and the *Midi*, which are working to supply the unoccupied zone, is, at 394, more marked than that of the northern coal mines, at 282, which work under the direction of the German authorities and sell at prices fixed by them.

At Paris, where the Bourse was reopened for trading in equities on March 19th, as at Lyons, markets are extremely restricted. In fact, there is scarcely a market at all in the normal sense of the word. Price movements in either direction are disjointed and irregular. The Bourse is no longer a barometer of economic activity, an indicator of the optimism or pessimism of business circles, or an open field for speculation. The majority of factories are working

for Germany, and only a small proportion of industry's output remains for the French consumer.

The supreme function of the French bourses is to attract bank deposits and idle resources, which, in the absence of security, are searching for profitable investments. The authorities, far from displaying pleasure at the rapid rise in the prices which took place during January and March, have taken measures, in line with Germany, to restrain the rise. The purchase of industrial securities has the appearance of a flight from the currency, and the rise in prices could be interpreted as inspired by the expectation of devaluation. Moreover, the Government fears that resources are being directed more toward industrial equities than toward gilt-edged securities, and it is trying to fix them indirectly by deducting a levy on speculative profits, by limiting the extent of daily price movements to 3 per cent, by limiting dividend rates to 6 per cent of the capital employed and by controlling share transactions. During recent months, the rise on the Stock Exchange has stopped and rates show a tendency to decline. Two main reasons can be given to explain this new phase. Firstly, the measures taken by the Government, particularly the levy on Stock Exchange profits. Secondly, many companies are increasing their capital by launching new issues on the market. They are profiting by the abundance of available money to meet their financial needs at favourable rates of interest. Thus, for the first time since the defeat, there are possibilities of long-term investments, which tend to slow down the rise on the Stock Exchange.

Policy for Oil Imports

COAL and oil are the twin pillars of the modern war economy, though, in some countries, hydro-electric power also plays an important part. They are the principal sources of energy and of a multitude of chemicals and other products vital in war. Although, by weight, Great Britain's consumption of oil products is probably no more than about 6 per cent of its coal requirements, both are equally indispensable, for the possibilities of substitution are strictly limited. But while Great Britain is fortunate in possessing adequate supplies of coal below ground, virtually the whole of its petroleum requirements, amounting to some 11½ million tons in 1938, has to be imported. And although one of the obstacles to imports, the shortage of foreign exchange, has been removed, so far as purchases in the United States are concerned, by the Lease and Lend Act, the other, the shortage of tanker shipping tonnage, remains. This shortage is serious. Mr Soubry, a member of the Petroleum Board, pointed out in a statement at Ottawa at the end of July that Great Britain had lost one-half of its ocean-going tanker tonnage. And the United States would hardly be willing to suffer the inconvenience involved to the eastern states by the transfer of part of its tanker fleet to the service of this country if this were not vital to the maintenance of an adequate supply of petroleum products to the outpost of democracy. Although the shipyards work feverishly in an effort to increase the output of new tankers, shipping capacity is likely to remain scarce throughout the war. And so long as it remains scarce, rigorous economy in the consumption of petroleum products must be combined with the most efficient utilisation of available shipping capacity if the urgent and growing needs of industry, agriculture and of the armed Forces are to be met.

Broadly, the consumption of petroleum products can be economised by confining their use to essential purposes, by substituting coal and its derivatives for oil wherever possible, and by reclaiming waste products. Private motor- ing offered much the greatest scope for economy under the first heading, for this form of activity not only absorbed a large proportion of the pre-war intake of oil, but can be drastically curtailed without hampering the war effort. The number of private cars in use has already been reduced well below the pre-war level of about two million units, while the consumption of petrol and lubricating oil per car has been severely curtailed by the rationing of petrol. Indeed, as the Treasury's White Paper on National Income and Expenditure, issued last April, showed, personal expenditure on private motor vehicles, inclusive of running expenses, declined from £118 millions in 1938 to £50 millions in 1940. But, even now, the possession of a licensed private car still automatically entitles its owner to a basic—if small—ration, and a needs test is only applied in the allocation of supplementary allowances. As *The Economist* has

pointed out before, the time has surely come when all but essential private motoring must be cut out; this could be done by the application of a strict needs test to the issue of car licences and petrol coupons; and, moreover, there are a number of minor oil-consuming habits, such as the use of motor-boats for pleasure purposes, which can be curtailed still further without harmful effect. The total saved might only be small in relation to total consumption; but every possible saving is important and urgent.

In industry, agriculture and in transport, as well as in the armed forces, reductions in the consumption of oil products by a curtailment in activity is hardly possible. Both in industry and agriculture production must be expanded, while transport must carry a heavier load. And the oil requirements of the armed forces must grow with the increase in their equipment. In these oil-consuming activities, the emphasis must be on the elimination of unnecessary operations and of all forms of waste and, where possible, on the substitution of coal for oil products. The extent to which coal can be used in place of oil products, however, is limited, not only for technical reasons, but because coal itself is in short supply; nevertheless, the possibilities have probably not yet been exhausted, in the case of tar and pitch, for example.

Again, while steps have been taken to reclaim lubricating oil, which, in contrast to petrol and fuel oils, is not always

The War and Life Assurance

In these days of stress the necessity for assuring against the normal uncertainties of life is stronger than ever and you can provide in the very best way for those dependent upon you by taking out a Whole Life Assurance under THE DISTINCTIVE SYSTEM of The Scottish Provident Institution.

The rates of premium are low, thus securing a large assurance cover (excluding war risks) from the outset, while the right to participate in the surplus is retained.

● Write for The Distinctive System booklet

now been announced. Equally surprising would be a radical departure from the precedent of these rates when the conversion of larger amounts comes to be considered. It will be seen that the cross rate given to the Maria Theresa thaler allows it a sterling value of about 1s. 10d., which is slightly more than the metallic parity at the present sterling price of silver. Substantial quantities of these coins have been making their way to the former Italian territories and it is through them that the displacement of the previous lire circulation is in the main being effected.

Control for South African Banking

Legislation has been introduced in the Union of South Africa designed to place commercial banks operating in that country under stricter control. The reason is to be found in the recent extension of activities of financial institutions which, though outside the recognised circle of banks, transact a loan and deposit business and have in some cases done so without taking the precautions demanded by normal banking prudence in maintaining reasonable standards of liquidity. The Bill which has been

Investment

The Market for Shorts

During the major part of the past week, the gilt-edged market has remained under the after effects of anticipatory investment in National War Bonds, 1946-48. For the most part, this section of the House was less active than one or another of the industrial markets, but to this there was an exception in favour of the older 1945-47 bonds. The effect of the closing of the "tap" for the later issue has been to create quite a fair market in their predecessors, although

FIXED-INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935 = 100)

Financial News indices of 20 fixed-interest securities
(converted to new base) and 30 ordinary shares

it is still the case that really large business requires time. There is an improvement also in the ease of dealing in the bonds of the later issue, but it is far less marked. Towards the end of the week, there was a resumption of buying of longer-dated funds and a revival in Dominion loans. The former suggests that institutional investors are now benefiting from Government disbursements out of the large receipts of 2½ weeks ago, and the latter that September 1st payments on unconverted Australian loan, and advance re-investment of next month's disbursements on requisitioned Canadian stocks, are making their weight felt. If this

introduced will appoint a registrar of banks with whom all banks transacting business in the Union will have to be registered. A bank applying for registration will have to have a paid-up capital of at least £30,000, plus £5,000 for each branch or office in excess of three. Capital and reserves will at all times have to exceed 10 per cent of all deposits up to £200,000 and 5 per cent of all additional deposits. Each bank will have to maintain with the Reserve Bank balances amounting to at least 10 per cent of the demand liabilities and 3 per cent of its time liabilities. Liquid assets (cash, balances with other banks, bills and gilt-edged securities) will have to bear a ratio of more than 30 per cent of the deposit liabilities. The monthly published statements of the commercial banks will have to be made according to a set form intended to extract from them all the essential information. In future, all banking amalgamations will be subject to the sanction of the Minister of Finance. All the old-established banks operating in the Union more than conform with the standards set out in the proposed legislation, some of which were already enforced by measures such as the Bank Act of 1917 and the Currency and Banking Act, 1920, which are in part to be repealed by the new measure.

demand for longer-dated, fixed-interest stocks develops it will represent the first real advance after a period of some six weeks of virtual stability. This long pause in itself suggests—in the absence of any adverse development—that a resumption of the upward trend is due, but its commencement must wait upon renewed buying by the banks.

The Course of Equities

Although August was much more of a holiday month this year than last, the effects began to appear late, so far as the Stock Exchange was concerned, and markets were not only reasonably active but distinctly buoyant until news of the third German offensive in Russia leaked out. This caused a minor reaction, but, nevertheless, both the chart of the indices compiled by *The Financial News* and the figures of *The Actuaries' Investment Index* show an improvement in equities for the fourth month in succession. With the exception of the upswing from July, 1940,

to January, 1941, both inclusive, this is the most sustained recovery in two years of hostilities. The price figure of the Actuaries' index for all classes of industrial equities is, at the highest end-month level since March, 1940, almost up to the pre-war figure, and is only some 5 per cent below the peak of February, 1940, before the collapse of resistance in Western Europe and the full effect of EPT. Over the two years, the yield of $2\frac{1}{2}$ per cent Consols has dropped from 3.92 to 3.08, while that on equities is down from 5.96 to 5.35. The margin between the two is higher by somewhat over one-tenth. Put another way, whereas at the outbreak of war one was content with a gross income of 30s. 6d. on equities for every 20s. on the oldest of the Funds, almost 35s. is now expected. The current yield on

industrial ordinary shares would be higher, but for the fact that prices discount eventual recovery in the case of numerous companies of good reputation whose dividends have been reduced by the exigencies of war. The effect of these adverse factors has not yet reached its zenith, but it should do so within the next nine months or so, unless the expansion of our war effort to its maximum is even more delayed than seems probable. But unless anything happens to defer the estimated date of peace—whatever that may be—the factor of post-war recovery will assume growing importance as the months pass. It is possible that this, coupled with all the factors included under the upward drag of money rates, will suffice to raise some prices more than enough to offset the effect of dividend reductions upon others. At the moment, it almost appears that the rather general rise will be resumed, but caution suggests the possibility of a more or less protracted pause, until the prospects for the autumn and winter in the west and the Atlantic are less obscure.

Rent Charge for Railways

The authorities are to be congratulated on their decision to reveal without delay the main outlines of their new agreement with the railways, but the statement leaves so much at large that the proprietors are very little nearer being able to determine even the wartime value of their investments. For the guaranteed minimum of £40 millions and the Stage 2 figure of some £43½ millions there has been substituted a fixed payment of £43 millions. Up to the guaranteed minimum this is divided between the four railways and the LPTB in the proportions ruling under the old agreement, but the remainder appears to bear some relation to the standard revenues of the lines under the Act of 1921, with a similar consideration for London Transport. The effect of this is to benefit that concern and the two northern railways to the detriment of the Southern and Great Western. The following table shows the actual

	Old Agreement†			New Agreement†	
	%	Minimum £ Mn.	Stage 2 £ Mn.	%	Maximum £ Mn.
Gt. Western	16	6.4	7.0	15.5	6.67

† All figures include £1,000,000 miscellaneous revenue.

amounts involved and the percentages under the two arrangements. So far the new plan agrees closely with recent forecasts, and if this new figure were guaranteed as a minimum for the period of hostilities it would, with interest on recent capital expenditure and dividends from road transport—excluded from both agreements—give the stockholder a very reasonable return. He, however, loses not only the possibility of making more than £3 millions above the minimum guaranteed under the old plan, but also the protective cushion afforded by the right to charge £10 millions of war damage costs to the pool. The new statement says specifically, not only that the railways will contribute as other public utilities, but that the revised arrangement will run, in this particular matter, as from the commencement of control. It is not possible to say what this means in any detail until more information is made available.

A Hard Bargain?

Nor is this the only point concerning which judgment must be reserved until fuller particulars are given. Under the original agreement, the Government was responsible for a substantial part of the companies' ARP outlays. This item must have been heavy during the current year, and there is no indication as to who is to foot the bill. But more important than the amount of money available to the companies over the next three years or so is what is to happen after that period. If the railways are to return to private ownership, it is of crucial importance to stockholders that clear and adequate provision should be made for

arrears of maintenance. Although the annual rent charge paid from 1914-18 was considerably larger than that now given, and although it was a net figure, the State had a bill of some £60 millions to meet on this account. This is a matter which should not be left at large. If it is argued, as it will be in many quarters, that the railways are peculiarly suited to a first experiment in nationalisation, the terms of agreement are, perhaps, not less important. The new arrangement removes from railway equities all attraction as an inflation hedge for the period of the war. It represents approximately $3\frac{1}{2}$ per cent on the capital involved. A return of this amount, guaranteed in perpetuity, would be too generous treatment, but there is at least a possibility that this will be regarded as a maximum possible revenue for the railways, when working to capacity, and that the basis for nationalisation would be correspondingly reduced. The market apparently discounts some such development in prices, which advanced a trifle on the news and now give yields ranging from $11\frac{1}{4}$ to $7\frac{1}{4}$ per cent on the basis of 1940 payments.

South American Investments

Economic nationalism in Europe before 1939 was already restricting the demand for raw materials and food-stuffs from the South American Republics, and so forcing on the erection of secondary industry, to which similar policies in that continent already disposed its nationals. The war has almost certainly held up the creation of new industries, in so far as these were dependent upon imported plant, etc., but in cases, such as Brazil, where conditions are favourable for an industry based on local materials, it has probably speeded up the change over from a passive to an active trade balance. It is this course of events which explains the decision, made this week, to expedite the liquidation of the San Paulo 7 per cent Coffee Loan. Holders of the sterling and dollar issues are invited to tender bonds for repayment, and the price of the stock rose $10\frac{1}{2}$ points on the news to 76. The service of the loan is only being met in part under the recent agreement, but the spectacle of borrowers buying up, at depressed levels, stocks on which they find it inconvenient to provide funds for the full dividend payments, is now a familiar one. Indeed, the quotation for the stock under discussion suggests that the performance of Brazil, in regard to this specially secured loan, has been reasonably satisfactory. Few countries in South America are as well placed as is Brazil, either because the demand for their products has fallen more heavily, or because they have less suitable materials for home use. This presumably explains the failure of Argentina to proceed with the Pinedo plan for the acquisition of foreign-owned railways. But a reminder of the fate eventually awaiting most British investments in the continent is afforded by the news that, subject to ratification, the Chilean authorities have decided to take over the Nitrate Railways. The terms have yet to be fixed, but the decision was sufficiently popular to cause a rise of 13s. to some 59s. in the £10 ordinary shares. The projected repayments of the San Paulo Coffee Loan amount to \$600,000, followed by monthly instalments of half that amount, to be applied, in the proportions of some 64 per cent and 36 per cent respectively, to the sterling tranche of some £6,500,000 and the dollar issue of \$18 millions. If

RISING VALUES

continued, these payments will take some fifteen years, without allowing for accumulation, of which there is no mention, to complete redemption. They should, however, suffice to keep up the price of the stock while the plan of special redemptions continues to operate. Holders should not tender until nearer the final date of September 16th.

Company Notes

C. & E. Morton Reconstruction

It is usually taken for granted that the reconstruction of a company's capital is only undertaken when conditions in general, including, of course, the company's domestic affairs, are sufficiently settled to permit of a clear picture of future prospects. It is, therefore, rather surprising to find a concern embarking on such an arrangement at this stage of the war. Nevertheless, the affairs of C. and E. Morton are so far on the mend that, after a decade, during which very little was earned on any class of capital, there are now modest profits. After EPT, these amounted to £37,500 in 1939 and £41,268 last year, and a debit on profit and loss account of £43,473 has been converted into a credit of £35,289, in addition to which there is a general reserve of £21,430. The company are provision merchants and confectionery makers, and appear to owe their recovery, in some measure, to the closing of the frontiers by war. The board are satisfied with the present valuation of assets, except that £44,000 should be provided to write down intangible items and holdings in subsidiaries; but, as a precautionary measure, they consider that stocks, amounting to £262,000, should be written down, as they anticipate a fall in prices after the war. The proposal that a possible future loss should warrant a present variation of contractual rights is sufficiently startling, but the terms suggested are even more so. The ordinary shares are privately held, and the board states that the 8 per cent cumulative preferred ordinary are almost exclusively in the same hands. It is proposed that both classes should be written down by half, and that the latter should surrender 10 years' arrears of dividend and be converted into ordinary shares. But the preference capital has 9½ years of dividend due, and until this is dealt with the claims of the junior shares do not rank. It is nevertheless suggested that this, too, should be cancelled, cumulative preferential rights reduced from 7 to 5 per cent and holders, in exchange, be given one-fifth of distributable profits after their 5 per cent dividend has been met. They are also to have their right to vote deferred. If, for simplicity, the two junior classes may be treated as one, the effect of future distributions will be that the junior classes start to participate in profits as soon as these exceed £20,000, instead of after £28,000 for the preferred and £46,000 for the ordinary under the present rights. With distributable profits between £20,000 and £60,000, they benefit at the expense of the preference shareholders, while above that figure the position is reversed. This takes no account of the loss of arrears, of cumulative rights and the power to vote. In view of the probable level of profits, there seems every reason for the holders of the senior security to stand on their rights and oppose the scheme, a measure advised and supported by the Association of Investment Trusts.

The Guinness Report

The full figures of Arthur Guinness confirm the interpretation given of the preliminary statement in *The Economist* of last week. Total income, after all provisions, including income tax, is down from £1,721,971 to

£1,568,972, but tax on dividends alone is up by £182,625, and the true rate of earnings on the ordinary capital has dropped only from 31.1 to 30.5 per cent. While depreciation is little changed, maintenance charges are substantially up on the year, a reflection, perhaps, of higher costs. Owing to the increase in this item the decision to pay a larger dividend has meant a smaller surplus for reserves and carry forward. The following table sets out earnings and their allocation over the past three years:—

	Years to 30th June,		
	1939	1940	1941
Profit after tax	1,800,934	1,721,971	1,568,972
Maintenance and depreciation	215,347	222,488	273,721
Fees, etc.	13,811	14,240	13,903
Preference dividend	87,000	69,000	64,500

Ordinary shares:—

Earned	1,484,776	1,416,243	1,216,848
Paid	1,413,750	1,140,000	1,036,875
Earned %	27.3	31.1	30.5
Paid %	26	25	26

Contingencies	*100,000	275,000	200,000
Carry forward	876,311	877,554	857,527

* General Reserve.

The balance sheet of the company shows few changes worthy of comment. Fixed assets suffered a modest decline, but there is a marked expansion in both debtors and cash, while stocks are virtually unchanged, and investments, at £4,718,855, show a very small decrease. Owing to the smaller balance on profit and loss, before paying the dividends, net of tax, creditors have risen rather more than debtors and cash, but the liquid position is still very strong. The continued rise in the £1 stock units to 88s. has reduced the yield to some £6 per cent.

Furness Withy Earnings

After the remarkable expansion in profits shown a year ago a rise in income for 1940-41 from £618,651 to £665,072, after tax in both cases, may seem a small affair to shareholders in Furness, Withy and Company. The rise in the gross figure must, however, have been really substantial, and the result is even more encouraging than the raising of the dividend from 5 to 6 per cent, announced a fortnight ago. The depreciation charge is high at £350,000 against £300,000, but even so the percentage earnings for the ordinary capital amount to 9.2 against 7.9. In his speech, the chairman, Lord Essendon, states that, notwithstanding the rise in the total figure after tax, steamship profits fell on the year, by reason of the vessels being under requisition during almost the whole period. As dividends were also lower, the rise came from other sections of the business, whose exact nature is not disclosed. The following table shows earnings and their distribution for the past three years:—

	Years to 30th April,		
	1939	1940	1941
Profit after Tax	505,121	618,651	665,072
Depreciation	300,000	300,000	350,000
Preference Dividend	54,375	45,000	38,437

Ordinary Shares:—

Earned	150,746	273,651	276,635
Paid	174,000	172,500	180,000
Earned %	3.5	7.9	9.2
Paid %	4	5	6

Fleet Replacement	100,000	100,000	100,000
Carry Forward	188,428	189,579	186,214

So far as can be gauged from the figures of the balance sheet, which is not qualified by any statement by the auditors, beyond the usual "clean" certificate, losses of ships have been moderate. Shipping property is included at £1,780,235, against £2,158,221, and investments in shipping subsidiaries are unchanged; that is to say, these items are down by little more than the amount of depreciation provided. There is an increase in current assets from £1,721,291 to £2,852,253, and there is now an excess of these over current and near liabilities of £565,250, against a deficit of £358,531 a year ago. Against this the net amounts due to subsidiaries have risen from £644,098 to £703,806. The absence of a consolidated account makes it difficult to assess the exact position of the group. The immediate outlook is, of course, dependent in no small

degree on the course of the war, but the price of 21s. for the £1 units, giving a yield of £5 14s. 3d., suggests confidence as to longer-term prospects.

National Canning Progress

The National Canning Company, which for some eight years prior to the outbreak of war was doing a modest business, has since then expanded rapidly. From an average of rather under £40,000 for that period, income, before administrative expenses and taxation, rose to £87,618 for the year to May 31, 1940, and to £157,007 during the subsequent twelvemonth. Of the latter rise more than the under which, having suffered the full force of EPT, from £28,300 to £100,000, while the war damage contribution takes a further £3,350 and other expenses are generally higher. These smaller increases are, however, offset by the fact that full provision of £1,791 was made a year ago for the expenses of a new issue of capital. At that time, the total distribution on the ordinary shares was raised from

London

Note: all dealings are for cash

The cessation of hostilities in Iran and the announcement of the long awaited railway agreement led to a firm close in the market before the week-end. The feature in the early part of the current week has been the revival of the gilt-edged market, now that the credit stringency created by the last-minute demand for the 2½ per cent National War Bonds 1946-48 has passed. This, however, was rather overshadowed by the boom in Brazilian issues that ensued on the announcement that sufficient funds were available for the gradual redemption of the 7 per cent San Paulo Coffee Loan. Elsewhere the tone was generally good, and selective buying, coupled with a shortage of stock, has induced a further improvement in industrial equities, while home railways were firm on Friday on the new agreement.

The gilt-edged market closed quietly before the week-end, but at the re-opening some institutional buying led to a general improvement, although most gains did not exceed ½. The following day, however, shortage of stock rather than extensive buying led to numerous good gains. Thus, 2½ per cent Consols, 3½ per cent Conversion and War Loan all rose ½, while Local Loans and Victory Bonds both gained ½, among other smaller rises. In midweek there was a further general advance of ½ to ¾.

More spectacular were the developments in the foreign bond market. On the news of the partial retirement of the 7 per cent Coffee Loan, which jumped 9½ points on Tuesday, while the 7½ per cent issue gained 4 points, a general boom in Brazilian issues developed, gains of 2 to 3 points being registered by the 5 per cent issues of 1898 and 1914, and the 6½ per cent loan of 1927. Elsewhere, Japanese issues rose sharply before the week-end, but on Tuesday prices eased slightly, but later recovered.

The new agreement was the chief influence both before and after the week-end in the home rail market. After the sharp advance of Friday the general uncertainty about war damage and some profit-taking led to renewed declines when the market reopened on Monday. GWR and LMS ordinary lost ¼ and ½ respectively, LNE defd. ½, while Southern pref. improved ½, although the defd. issue dropped ½. London Transport "C" was a weak spot, declining 1½ points. The next day prices were firmer, but a subsequent reaction more than eliminated the day's rises. Among foreign rails the news of an impending

indemnified expropriation of the Nitrate Railway's undertaking in Chile caused the ordinary shares to jump 9s. 6d. on Monday. Argentine rails were quiet but firm, while elsewhere Canadian Pacific preference and ordinary issues improved ½ on Tuesday, when Nitrate Railway rose a further 3s. 6d.

Trading in the industrial market before the weekend was slight, but the tone was good. While quiet conditions prevailed in the earlier part of the week, small rises were general and selective buying persisted. Brewery shares continued to attract investors, and gains of 6d. were general in the early part of the week. Heavy industrial issues were irregular but Thornycroft was persistently good, while in the motor and aircraft section Austin gained 1s. 3d. against the trend on Monday, and the following day Leyland reversed the previous day's loss of ½, and De Havilland gained ½. Among Textile issues, Courtaulds and Calico Printers improved slightly. Electrical equipment issues were narrowly irregular, while shipping issues were dull. Tobacco shares found steady support and small persistent gains both before and after the week-end were general. Among miscellaneous issues Brazil Traction jumped 1½ on Tuesday, when International Nickel gained ¾. Later, prices reacted slightly, but breweries were strong on the Guinness report.

Before the week-end the kaffir market was quiet, but in the early part of the week investment demand led to some improvement in prices, although gains were generally small. The improvement in the Far Eastern political situation led to revived interest in the tin market, and with a shortage of stock numerous gains were registered. Similarly in the rubber market Far Eastern issues were in demand. Investment business in the oil market was negligible, although in the early part of the week Anglo-Iranian, Shell, and V.O.C. all improved on enquiry.

New York

The impending Labour Day holiday and the desire to await the outcome of the U.S.-Japanese talks led to a quiet market before the week-end, although the tone was firm at Saturday's close, with aircraft and rubber issues outstanding. At the reopening on Tuesday, sentiment was affected by renewed tax uncertainties and the introduction of the new credit restriction measures, but the markets remained steady with aircraft issues prominent. In midweek some profit-taking resulted in an irregular close. The Iron Age estimates steel mill activity at 96.5 per cent of capacity against a revised figure of 99.5 per cent in the previous week.

NORANDA MINES, LIMITED

DIVIDEND NOTICE.

Notice is hereby given that an interim dividend of \$1.00 per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines, Limited, payable September 15th, 1941, to shareholders of record at the close of business, August 20th, 1941.

By Order of the Board.

J. R. BRADFIELD, Secretary.

Toronto, August 6th, 1941.

Industry and Trade

Design of Merchant Ships

In its twentieth report of the current session, the Select Committee on National Expenditure drew attention to a number of complaints concerning the design of merchant ships now under construction to the order of the Ministry of War Transport, or of private owners under licence from the Ministry. It is claimed "that their design does not accord sufficiently with the accepted modern practice," and "that the ships now building are mostly powered for a speed which even in normal times is considered too slow by most shipowners for modern traffic." Both suggestions deserve investigation by the Merchant Shipbuilding Department of the Admiralty in co-operation with the Ministry of War Transport and the Classification Societies. But the Committee's report suggests that its own investigation of the problem has not been exhaustive. The designs of merchant vessels must be determined by the need for producing maximum import capacity in wartime conditions, and by available shipbuilding and marine engineering facilities. Considerations of the types of vessel most suitable after the war are now clearly out of place. Since fast ships cannot be built as quickly as comparatively slow ones, and as many of the berths normally engaged in the construction of high-quality merchant vessels are now utilised for naval building, a compromise is inevitable. Practical considerations rule out any large-scale switch from the construction of tramp vessels to the building of cargo liners, though it may be possible, by further standardisation and simplification of designs, to increase the output of ships measured in terms of carrying capacity.

Labour Shortage in Coal Mining

As was to be expected, the coal-mining industry has failed to reach the output target proposed last April by the Coal Production Council, and, consequently, the Mines Department has been unable to build up the 24 million tons of additional stocks contemplated last March. As a result, the Government has at last decided in favour of more direct intervention in the application of the recent arrangements of the Ministry of Labour and National Service for increasing the labour force of the industry. On August 5th it was announced in the House of Commons that, of the 95,000 employees in munition and other works who had registered as ex-miners, some 24,000 had expressed their willingness to return to the collieries. At that date, however, only 6,264, or 12 per cent of the number which the Minister of Labour and the Secretary for Mines had in June appealed for to return voluntarily to the mines, had actually reported for duty. The slowness in the rate of absorption is also revealed by the fact that, of the total number of over 10,000 men offered in one area up to mid-August, only about 35 per cent had been accepted as suitable, while 20 per cent had actually been taken on. The comparatively small proportion of suitable persons

among those who registered in July is attributed to the fact that their ages ranged from 20 to 60, and that the qualifying period for registration dated back as far as 1935. Hitherto, the practice has been for colliery undertakings to inform the local Coal Production Committees of the number and category of the workers needed by them, and then for the Ministry of Labour, either directly or through the Coal Production Committee, to submit men for their acceptance. Under the new procedure, the Ministry of Labour, in consultation with the District Coal Production Committees, will assume responsibility for the suitability of the new workers; it will allot them directly to the collieries in their scheduled numbers and grades; and it will leave them to be dealt with under the terms of the Essential Work Order if they prove incapable. Under this scheme "directions will be given by the Ministry of Labour to all eligible men without regard to whether they declared themselves upon registration as willing or not to return," and colliery managements are warned that they must in no circumstances impede the operation of the new arrangements by delay or refusal to give employment at once to the men directed to them. They have been further told that "the President of the Board of Trade has given an undertaking to the Minister of Labour and National Service that any obstruction to the employment of men will be overcome by directions to colliery managements under the powers conferred on the Board of Trade by Defence Regulations." These are stern measures, and it is hoped that they will quickly achieve their object of facilitating the employment of additional men; but it must be assumed that they are to be applied only within the limits of the principle of the 1911 Coal Mines Act fixing legal responsibility "for the control, management and direction of the functions of the new coal mining labour supply officers as recently agreed upon between the industry and the Ministry of Labour."

Clothing Supplies

The rationing of clothes has necessitated the revision of the old methods of limiting supplies. The new Limitation of Supplies (Cloth and Apparel) Order, which is to be published shortly, will bring to an end the old quota restrictions on all section of the cloth and clothing industry, except manufacturers. The effect of the new Order will be to leave the control and distribution of supplies from the manufacturer to the consumer to coupon rationing. Under the old limitation of supplies system, manufacturers and wholesalers of controlled goods were registered for each class of goods in which they did business. They were required to restrict aggregate sales in each class to retailers of their sales in a standard period. Some elasticity was allowed for in the distribution of the quotas among their

customers, in that they were not tied to supply them to any quota, but the coupon scheme will ensure a more equitable allocation to retailers than was formerly possible. Under the new Order, manufacturers will still be registered and quotas will be applied to them. The Director-General of Clothing aims at providing a range of clothing at low prices, and special quotas, higher than those under the old Order, are to be assigned to manufacturers for the making of certain cloths, hose and other knitted wear, required to ensure an adequate supply of clothing of general utility grades, particularly in the lower ranges of prices. Cloth and clothing supplied under the special quotas will be labelled with an appropriate identification mark, and the marked cloth will be used only for the production of garments of utility grades. These goods will be subject to special control. A list of cloths which may be sold under the special quota and of the types of garments to be made from them is attached to the new Order. As before, manufacturers will be permitted to supply goods without regard to quota restrictions to overseas customers, to Government Departments, to local authorities and certain other organisations, and to other persons registered in respect of the same goods. Registration is required in respect of the manufacture of woven cloth, knitted cloth, hose and other knitwear, corsets, gloves, fur apparel, footwear and handknitting yarn. The new Order will supersede the Limitation of Supplies (Woven Textiles) (No. 7) Order due to expire on September 30th, and, in respect of certain classes of goods, the Limitation of Supplies (Miscellaneous) (No. 11) Order, which expires on November 30th.

Fall in Retail Trade

The average daily value of retail sales in July, as recorded by the Bank of England, shows a sharp drop compared with the previous month and with July, 1940. As the accompanying table shows, the value of food sales has been running below last year's level for some months, a reflection of price control and of a reduction in the volume of turnover. The trend of sale of other merchandise has been downwards since the end of last year. The improvement in June was probably due almost entirely to the

PERCENTAGE CHANGES IN RETAIL SALES FROM PRECEDING YEAR

		Food and Perishables	Other Merchandise
1940	August	+ 5.4	+21.0
	September	-11.5	+ 6.7
	October	- 5.2	+20.9
	November	- 0.3	+ 1.3
	December	+ 0.8	- 6.7
1941	January	+ 5.8	- 8.8
	February	+ 3.5	+ 1.8
	March	- 2.1	- 2.1
	April	+ 0.9	+ 2.9
	May	- 4.3	- 2.4
	June	- 3.1	+ 6.8
	July	- 6.7	-15.9

introduction of clothes rationing at the beginning of that month. As the heavy fall in turnover in July shows, the slump was short-lived, though smaller clearing sales probably contributed to the decline. Sales of piece-goods, which in June were 88.3 per cent higher than in the corresponding month last year, registered a fall of 24.1 per cent in July. In view of the progressive decline in the volume of retail trade and of the pressing need to speed up the recruitment of men and women for war work, it is to be hoped that the adjustment of the retail trade to present conditions will not be long delayed.

Export Policy

While it is essential that all branches of economic policy remain completely fluid during the war, it is important that material changes of policy should be made known to those concerned. The Federation of British Industries has recently pointed out that there has been a complete change in the orientation of British export policy during the past year, but that many British exporters are still unaware that the export drive of 1939-1940 is no longer the

official policy of the Government. Owing to the changed situation after the collapse of France, it is no longer possible to encourage exports of all kinds. Apart from exports which produce, directly or indirectly, dollar payments, or which enable the sterling countries of the Empire to dispense with dollar payments, only a limited amount of foreign trade can be encouraged. Moreover, the Dominions and Colonies have been urged to co-operate by restricting all their imports to essentials by purchasing, where possible, from other Empire sterling countries in preference to Great Britain. As no machinery existed for keeping manufacturers informed of the steps taken by Empire countries to implement this policy, it has led to some considerable disorganisation of British export trade. The passage of the Lease-Lend Act added further to the list of qualifications required by any commodity in order to be regarded as a legitimate export. All these restrictions were necessary, but it is unfortunate that they have so far not been accompanied by appropriate steps to make known to British business men just how they stood in respect of exports. Since the terms of the Lease-Lend Act are bound to operate against British exports to friendly non-belligerents such as the Latin American republics, there is urgent need for amicable discussion between representatives of this country, the United States, and the countries most affected. Drastic curtailments of certain British exports must involve these countries in serious hardship, both for lack of essential goods, unobtainable elsewhere, and because it reduces the outlet for their own exportable surpluses. This is bad propaganda for a world order which is to be free of the injustices that mark the treatment of weaker countries under the Nazi New Order. Moreover, it is very bad long-term policy. It is not easy, in war, to pay proper attention to the interests of those who, in peace time, are valued customers, but it must be done. If Britain does not keep in repair the framework of her peacetime trade, economic recovery after the war will be much more difficult.

A Complete Banking Service

THROUGH its widespread organisation, Barclays Bank offers the fullest possible facilities for the transaction of every kind of Banking Business, at home and abroad

CONVERSIONS AND REPAYMENTS

Niger Company Limited.—This Company will redeem at par on December 15th, 1941—the next interest date—its £1,319,564 5 per cent. Consolidated Guaranteed Debenture Stock.

Shorter Comments

Intl. Telephone & Telegraph.—Operating rev. qtr. ended 31st March \$7,253,882 (\$6,544,662). Net earnings

\$2,223,381 (\$2,409,648), after exes., tax, etc., \$5,332,473 (\$4,990,332).

Chrysler Corp.—6 months' earnings \$20,975,000 (\$30,494,000), equal to \$4.82 (\$7.01) per share. Div. \$1.50 (\$1.25) per Common share.

Electrolux Corporation.—Profit, 1940, after all charges including tax, \$1,397,165 (\$1,658,469). Earnings per share \$1.13 (\$1.34). Net profit first quarter, 1941, \$432,916 (\$521,424) after tax.

Transvaal Gold Working Profit.—The total estimated working profit of the gold mines of the Witwatersrand for July, 1941, was £3,881,871, against £3,794,434 in June, 1941.

Canadian Pacific Railway.—Gross earnings July, 1941, \$19,359,000 (\$15,303,000), working exes. \$16,164,000 (\$12,899,000), net earnings \$3,195,000 (\$2,404,000). Agg. net earnings Jan. 1-July 31 \$119,199,000 (\$90,688,000).

America's Oil Refineries

It is by now common knowledge that the U.S. oil industry possesses a large shut-in capacity sufficient to enable it at very short notice to meet any foreseeable increase in the demand for crude petroleum. But it has been questioned whether the refining branch is so well placed. Refinery capacity in the United States has, in fact, been considerably expanded during the past three years and—what is equally important—its quality has been steadily improved by the addition of facilities for the manufacture of the highest grades of motor fuel. At the beginning of the year, according to the *Oil and Gas Journal*, there were 548 refineries scattered through 37 states of the American Union, with a total throughput capacity of 4,861,700 barrels daily; this is equivalent to over 240 million tons a year. Eighty-nine plants—representing a capacity of 291,940 barrels daily and divided roughly equally between California and the area east of the Rockies—were, however, idle on the date in question. There is a strong presumption that some of these refineries are now obsolete. On the assumption that one-third of the shut-down plants are economically usable, the total active capacity would be in the neighbourhood of 4,620,000 barrels daily, the contribution of the major oil states being as follows: Texas 1,370,000 barrels daily; California 860,000; Pennsylvania 335,000; New Jersey, 250,000; Illinois, 250,000; Indiana 220,000; Oklahoma 215,000; Louisiana 200,000; Kansas 175,000. While the activity of the refineries has been increased to satisfy the growing demand—during the week ended July 12th, they dealt with an average of 4,090,000 barrels of crude oil per day, compared with 3,565,000 a year ago—there would still seem to be an ample margin on the basis of the *Oil and Gas Journal's* statistics. Moreover, the capacity for producing 100-octane fuel, needed for aeroplane engines, was estimated at 1,500,000 tons per annum earlier this year, while a doubling of this capacity has been planned to meet expanding needs.

On the basis of the ample margin between the recent throughput of the American refineries and their statistical capacity, it has been widely held that, with the exception of super-aviation fuels, the industry is in a position to meet any possible expansion in demand. On the other hand, according to the July issue of the *Refiner and National Gasoline Manufacturer*, refining plants were already operating very close to capacity during the week ended June 28th in the East Coast, Appalachian, Mid-Western, Mid-Continent, and Gulf Coast district, while the industry as a whole was working at about 92 per cent of its rated capacity. Moreover, measured in terms of days' supplies, it is pointed out that stocks of petrol, of lubricants and of heavy fuel, are smaller than in recent years. On this showing, it seems

questionable whether the American refinery industry will in fact be able to meet all future demands, quite apart from transport difficulties, and whether it will not be necessary, as it will be in the case of steel, to resort to more drastic rationing in order to ensure adequate supplies for essential purposes in the proportions and qualities needed.

Manganese

The closing of the Black Sea to trade since June last has led to the interruption of Russia's manganese ore exports. Russia is the world's largest producer of manganese ore, supplying about one-half of the world's output, now running at about 6,500,000 tons per year, with an average manganese content of 50 per cent. There are two important deposits in Russia. The first, contributing one-third of Russia's production, is situated around Nikopol in the Ukraine, while the second, supplying two-thirds of the output, is found at Tshiaturi on the Southern slopes of the Caucasus. While the Nikopol ore is shipped mainly via Nikolaiev, the Tshiaturi ore finds its way to the world market through the port of Poti. Shipments from these Black Sea ports are no longer possible, while the Nikopol district has been occupied by the German army. Fortunately, the Tshiaturi mines, which have been fully mechanised in recent years, are able to supply about twice as much ore as Russia is likely to require. But the capacity of the Trans-Siberian Railway and of the Trans-Iranian Railway is inadequate to permit large-scale exports. The United States, however, which has hitherto relied partly on Russian supplies, is not likely to be threatened by a shortage. Since the last war, when America was inconvenienced by the lack of Russian supplies, because India was then the only other important producer, an enormous extension of the British Empire's manganese production has taken place. India is now able to produce 1,500,000 tons of ore per year, which is twice as much as at the peak of the world war. In addition, the Gold Coast and South Africa have entered the list of large manganese producers; the combined output from their extensive and rich deposits almost equals the capacity of India. Together with the supplies of low-grade ore from Cuba and Brazil, the manganese surplus of the British Empire will be large enough to cover all the essential needs of the United States. In fact, Empire ore has already secured the leading position on the United States market; in 1940, about 55 per cent of its imports of 1,300,000 tons came from the Empire, while Russia supplied less than 15 per cent. While the changes in Russia will thus hardly create difficulties in Great Britain and America, they may adversely affect Germany's supply position at least for some time to come if, as is possible, the Nikopol mines were wrecked, for the bulk of the Nikopol ore plus certain quantities of Tshiaturi ore have been supplied to Germany since September, 1939.

COMMODITY AND INDUSTRY NEWS

Tin prices were firmer at the end of last week, but weakened again on Tuesday. Standard cash closed at £256 5s.-£256 10s. a ton on Wednesday, compared with the previous Wednesday's price of £256 5s.-£256 15s. Three months was £259 5s.-£259 15s. a ton compared with £259 15s.-£260. Rubber, smoked sheet, has been quoted at 13½-13¾d. a lb., for all positions, since August 25th.

Tin Statistics.—The Tin Research Institute estimates world production of tin in July at 18,100 tons, compared with 19,900 tons in July, 1940. Production for the first seven months of this year at 147,900 tons was 22,800 tons higher than the corresponding period of last year. United States deliveries were 12,575 tons in July, 2,305 tons lower than the June figure. Deliveries between January and July were 92,947 tons, against 57,934 tons in 1940. World stocks of tin, including smelters' stocks and carry-over, increased by 327 tons during July to 56,302 tons. Stocks at the end of July, 1940, were 48,830 tons. Exports from the producing countries

during July show drops which are usual in the first month of a new quarter.

Maximum Pepper Prices.—The Ministry of Food has now fixed maximum prices on sales of pepper of five tons or more to processors and wholesalers, following its decision last month to be the sole importer of pepper. The prices, quoted per lb., which came into force on September 1st, are as follows: Whole pepper, not picked over or cleaned, white Muntok, 8d.; black, 5d., in bond; whole, picked over or cleaned, white, 1s. 1d., black, 8½d., duty paid; ground, sold by net weight, white, 1s. 4½d.; black, 9d., duty paid. Prices will be controlled from October 1st for sales by a wholesaler to a retailer, and from November 1st on retail sales. The prices fixed by the Ministry are very much below those which had been ruling in the market. On August 29th white Muntok, spot, in bond, sold at 1s. 6d. a lb., while the price of Lampung black was 9½d. There have, therefore, been few sellers in the market at the controlled prices.

Cotton Market.—The increased inquiry in the market has been well maintained.

Actual business, however, has been irregular, and it has been much easier to sell than to buy. Many shippers of cloth have wanted to use their export quotas, and fair sales have been put through in printed and dyed goods for Java, finishing styles and sheetings for South America and domestic goods for the Dominions; a few sales have been mentioned for Egypt. Government buying has not been important, but further operations have taken place in essential goods for the Home Services. It has been exceedingly difficult to buy yarns, and most of the transactions have been to meet Government requirements. It is understood that the Cotton Importers and Distributors Company is about to distribute to spinners a considerable quantity of Belgian Congo cotton. It is believed in some quarters that the new Limitation of Supplies Order will result in more textiles being available for the civilian home population.

Silk Control.—The Control of Silk (No. 7) Order came into force on September 3rd, consolidating the three

(Continued on page 308)

COMPANY MEETINGS

TELEPHONE RENTALS, LIMITED

INCREASED PROFITS

IMPORTANCE OF COMPANY'S SERVICES

The annual general meeting of Telephone Rentals, Limited, as held, on the 4th instant, in London.

Mr Fred T. Jackson (chairman and managing director) said that dividends from subsidiary companies declared during the year amounted to £136,268, as compared with £130,334 for the preceding year. Dividends on sundry investments and interest receivable amounted to £8,904, or rather more than twice the corresponding figure for the previous years. The net profit, 136,312, showed an increase of £8,945 over last year's figure. The charge for income tax showed a substantial increase and the general reserve had been raised to £225,000 by the transfer of a further £25,000. An interim dividend of 4 per cent. had already been paid, and the directors now recommend a final dividend of 6 per cent., less income tax.

Before the war the provision of methods of quick communication was highly important. During the war tele-communication was absolutely indispensable. The shortage of workers made its use imperative for the speeding up of output, for the services the companies installed not only provided the quick inter-communication necessary between factory departments, but also enabled the principal executives in the administration to contact within almost a few seconds other executives in whatever part of the factory they might happen to be. He was not making any exaggerated claim as to the vital necessity of the various services they provided, as they had ample written evidence from subscribers that the companies' installations were of vital importance and quite indispensable to the very large number who were engaged on direct war work.

They had had considerable difficulties arising through the shortage of labour and the shortage of materials, but the position now was much more satisfactory, and he was able to assure shareholders that they would be able to secure supplies of the most important apparatus they used and retain the necessary skilled labour to maintain the very large number of instruments which had been installed.

NEW SUBSCRIBERS

The operating companies had not only been successful in maintaining their position, but in adding a considerable number of new subscribers.

As to the current year, they had various difficulties to face, particularly in connection with increased cost of materials and rising wages. In addition, they had had to carry the cost of war damage insurance of installations they had installed on subscribers' premises and commodity insurance of the very considerable stocks they had accumulated. They had therefore, approached their subscribers asking them to agree to a small increase in the annual rents they were paying, and the majority had agreed. Demand for the companies' installations continued on the most satisfactory scale and was certainly proof of the good services they had been able to render to those firms who had been subscribers for many years past. He saw no reason, judging from the experience they had had up to the present time, for not being able to forecast a successful 1941.

In conclusion the chairman paid a tribute to all in the organisation for the hard work and the cheerful manner in which they had performed it during the period under review. No firm in this country had a more loyal and enthusiastic personnel than this company.

The report was unanimously adopted.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes. In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever. Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brettenham House, Lancaster Place, W.C.2.

FORD MOTOR COMPANY LIMITED.

CHAIRMAN'S STATEMENT

The Twelfth Ordinary General Meeting of Ford Motor Company Ltd. was held on 2nd instant at The Institute of Chartered Accountants, Moorgate Place, London, E.C.2, The Rt. Hon. Lord Perry of Stock Harvard, K.B.E., LL.D., Chairman, presiding. The Chairman's statement, which had been circulated with the Report and Accounts, is as follows, and was taken as read:—

Owing to abnormal conditions, your Directors have decided that it would be advisable to vary usual procedure. Accordingly no Chairman's Speech will be made at the forthcoming Annual General Meeting. It will be difficult for many members to attend and, consequently, I am appending this statement to the Annual Report. Only the usual formal business will be transacted at the Meeting.

It is regretted that the Annual General Meeting is being held later in the year than is usual. It has been unavoidable. A number of matters affecting the financial results required official negotiation. The Balance Sheet and Profit and Loss Account now submitted reflect a true and exact position, with- out the qualifications and reservations which would have been necessary to attach to an earlier statement.

The Balance Sheet and Profit and Loss Account published in the Report show comparative figures with the previous year. The Company has always submitted a full and detailed statement of accounts to members and this policy has been continued. Consequently, there are few comments which I need make.

It will be observed that the affairs of the Company are in a strong and satisfactory position. Merchandise Stock, Debts due to the Company and Cash Assets total approximately £8,000,000. Current Liabilities amount to approximately £2,750,000.

I feel assured that members will fully appreciate the consistent and conservative policy of the Directors in past years. The accounts now published make it clear that the Company should emerge from the existing lamentable hostilities with ample liquid resources to deal with the problems and possibilities of post war activities.

It is regretted that Export business has suffered severely. During the year the Company has been assisted to a considerable extent by Ford Motor Company, Dearborn, U.S.A., in the supply of materials and supplies.

Our Dealer Organisation has lived up to and enhanced its established reputation for giving the best possible service facilities to the motoring public. We appreciate what they have done and are doing.

The Company is continuing its policy of taking a close interest in the welfare of its personnel. The assistance given to dependants of men in the various Forces and to those who have suffered loss or injury in Air Raids has been appreciated. Large Reserves are in hand to continue and extend further help as occasion arises.

A vigorous branch of the War Savings Campaign has been established; the Company's employees strongly support the Movement and regularly contribute thereto. In addition a considerable proportion contribute regularly to the Lord Mayor's Red Cross Fund.

Members will be pleased to know that Mr. Henry Ford and Mr. Edsel B. Ford have generously donated a very substantial sum of money for the purpose of providing equipped mobile Food Canteens for use under Government auspices among people whose normal mode of life is disrupted by the war. It is expected that 350 equipped vans will be made available for constant daily distribution of hot food to the thousands of sufferers throughout the country whose homes have been wrecked by enemy action. Our Dealer Organisation has agreed, gratuitously, to garage and maintain the Food Vans in this good work.

Most of the Continental Associated Companies are either in Enemy or Enemy-Occupied territories and I have little information concerning them. However, the same conservative financial administration which has characterised the management of this Company has been practised with the Associated Companies. Their liquid position, moreover, was sound and some of them had credits in U.S.A. or England. They had few external debts and they owned their undertakings free of any mortgages. It is hoped, therefore, that re-organisation after the war will not be an impossible task and that they will quickly again enjoy prosperity.

I would like to supplement what is said in the Directors' Report to members in regard to the Company's personnel and their reaction to the hazardous conditions which have prevailed in the area. I have first-hand knowledge of the splendid way they have acted. Ours was one of the first Companies to arrange to work through the raids. I would like to express my personal appreciation of their magnificent and unremitting devotion to duty.

FORD MOTOR COMPANY LIMITED
88, REGENT STREET, LONDON. W.1, & DAGENHAM,
ESSEX.

GOLD EXPLORATION AND FINANCE OF AUSTRALIA, LIMITED

DEBT BALANCE REDUCED

The seventh ordinary general meeting of Gold Exploration and Finance Company of Australia, Limited, was held on 2nd instant in London, Mr P. E. Marmion presiding.

The following are extracts from the Chairman's statement:—

Dividends and interest receivable for the year amount to £94,337, as against £91,496 for the previous year. The debit balance on profit and loss account was reduced by £71,382 to £210,288. Victoria Gold Dredging again had a successful year, and maintained its distribution at 11s. (A) per share.

The operating profit of Gold Mines of Kalgoorlie showed the substantial increase of £57,650, or 47 per cent. over that of the previous year, but unfortunately, as almost twice this amount is required for taxation, the stockholders have to be content with a rather smaller dividend.

Your company's principal interest in Western Australia is represented by its loan to Central Norseman Gold Corporation, and the 81 per cent. shareholding in the company owned by our subsidiary Western Mining Corporation. The Norseman company's mill treated 98,734 tons of its own ore in the period to March 25th last, compared with 88,267 tons for the preceding year, the yield being 36,077 ozs. as against 37,678, a reduction of 1.23 dwt. per ton. The operating profit, excluding development and depreciation, was £A218,000.

To sum up the position at Norseman, it may be said that while production and development continue satisfactory north of the Phoenix shaft to below No. 20 level, results between the Phoenix and the Ajax shafts have not come up to expectations. Meantime, every effort is being made to test the possibilities of lateral extension on the Mararoa reef, and of new ore shoots in the parallel reefs and at the Princess Royal mine.

Our holding of Victoria Gold Dredging shares continues to be our most lucrative investment. Dredging rights have been secured over an adjoining area estimated to contain approximately 2½ million cubic yards of payable grade. This area adds about a year to the estimated life of the property.

The report was adopted

GOLD MINES OF KALGOORLIE, LIMITED

SEVERITY OF TAXATION

The seventh ordinary general meeting of Gold Mines of Kalgoorlie, Limited, was held, on 2nd instant, in London, Mr P. E. Marmion presiding.

The following are extracts from the Chairman's statement:—

The gross value of the gold recovered was £364,941, from which £28,570, representing more than half of the increase in revenue due to the rise in the price of gold, was paid over to the Commonwealth Government. The burden of United Kingdom taxation unhappily falls with exceptional and, if I may say so, with unjustified severity upon your company, because in 1936 and 1937, the "standard" years for assessing liability to E.P.T., it was in its infancy, and the mine only in the process of development. Apart, therefore, from the rise in the price of gold in the latter part of 1939, the improvement in our profits since those years is due entirely to natural expansion. Any "Excess Profits" in the case of your company accruing as the result of the war could only be those derived from the increased price of gold. More than half the increase in revenue caused by the higher gold price passes direct to the Commonwealth Government, and for the two years for which your company is assessable to E.P.T. here it appears that that tax alone will take not only the whole of the rest of the increase in revenue but also nearly twice as much again.

Your board feels that the results of the first complete year's milling with the enlarged plant fully justify their policy of progressive expansion, the latest stage of which was planned and undertaken almost a year before the outbreak of war. At the time it was impossible to foresee not only that circumstances would arise necessitating the present drastic taxation, but also that the method devised for assessing this taxation would, in effect, lead to this company incurring such a heavy penalty for its enterprise. In addition to the benefit of the foreign exchange derived from the gold production, your company is contributing to the nation's war effort about 80 per cent. of the profit that would otherwise be available for distribution.

The report was adopted, and the final dividend of 6d. per unit was approved.

COMMODITY AND INDUSTRY NEWS—continued from page 306

previous Orders and introducing certain changes. Spinners are now free to carry out without a licence the initial processing of waste silk up to and including the sliver stage. Control is extended to thrown and spun silk yarns, and dealings in silk abroad and at home are controlled.

Price Control in Canada.—An Order-in-Council has been published this week by the Canadian Government authorising control of silk and rubber prices. The Controller of Supplies for the Department of Munitions is to establish

priorities for the use of these commodities and he has power to take possession of supplies of equipment used in their manufacture. Silk and rubber are the first commodities to be controlled under Canada's new price-fixing scheme.

Licensing of Seed Merchants.—From October 1st agricultural and vegetable seeds may only be purchased from growers or imported by licensed seedsmen. Established seed merchants who purchase seeds direct from growers or who import them from overseas are asked to apply to the Agricultural Departments for a licence. These decisions are embodied in the Agricultural and Vegetable Seeds Order, and cover England and Wales, Scotland and Northern Ireland. By an Order made by the Minister of Food preservers preserving more than one ton of vegetable products in a year are to be licensed.

Oils and Fats.—There will be no change in the existing prices of oils and fats allocated to primary wholesalers and large trade users for the four weeks ending September 27th. The price of palm oil acid oil which was under consideration, is to remain unchanged.

GOVERNMENT RETURNS

For the week ended August 30, 1941, total ordinary revenue was £37,636,000, against ordinary expenditure of £91,598,000 and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,223,945,000 against £935,068,000 for the corresponding period a year ago.

statements against England's interests. For the writer or the editor or the speaker the test in wartime is very simple. He will ask whether his criticism is calculated to aid his country's war effort and its friends more than it can be used to help its enemies. He will know what the law forbids him to say or to reveal. He will make it his endeavour to display a true perspective, not to write up what is wrong or to write down what has been achieved—or *vice versa*. He will not oppose the war simply because, for the nonce, it is not the policy of some foreign Power, which was the crime of the *Daily Worker*. Unless he regards them as indispensable for making and winning the war, he will not enter into speculations likely to alarm and dismay friends and allies, which was the fault of the *Times*' excursion into European leadership—and, according to his critics, of Colonel Moore-Brabazon's first spoken thoughts on the Russo-German conflict. He will not tilt against the misuse of materials, plant or labour without acknowledging the extent to which resources are already being well used—or without the conviction that his assaults will help and not hinder. He will not allow zeal, impatience or ambition to lead him into the ranks of the Woe Woe men to whom jaundice is a policy. He will not mingle with the jockeying partisans who set out to sabotage the national effort with shibboleths—now proclaiming that defeat is better than "bureaucracy" and now that dishonour and disgrace are to be preferred to the "ruin," the "big business" or the "Socialism" that war is alleged to bring in its train. He will let patriotism and common sense be his guides.

These are commonplaces as natural to the greater part of the English Press as breathing itself. They go deeper than the duty to criticise. A famous American broadcaster recently coined the slogan "Let Us Be Frank." He was talking of Anglo-American relations; and it is certain that many recent alarms and excursions about English comments on American policy—and American comments on English policy—have been due to the previous unnatural prudery about the two democracies' different points of view and mutual needs. And there is need for frankness on this side of the Atlantic. Mr Churchill was amply justified in his encouraging report on the war on Tuesday. The struggle at sea has moved sharply in our favour. The rate of imports has become

outstandingly high; and the limit to war production now is labour and skill in work and technical organisation rather than materials or equipment. On the eastern front, the Nazis are paying a fantastic price for their aggression. But the war in Russia, for all the great resistance of the Russians, is being won by the Germans.

Too many journalists, who formerly inveighed against "complacency," are now writing up the Russian war almost as a series of striking victories, simply because they like and admire the Russians. It has been left to the *Evening Standard*, which has been notable for its frank and realistic appraisal of the recent course of the war, to point out that every move that Hitler has made towards greater triumphs has first been described as his greatest and most foolish blunder; that the magnificent defence of the Russian army is sufficient proof of the sound strategic reasons that led the Germans to seek to destroy it before pressing forward to the west; that, "timetable" or no "timetable," the German armies have conquered 350,000 square miles of territory since June 22nd; that the industry and agriculture of the Ukraine are a serious loss to Russia; that Leningrad, "a prize as big as Paris," is now under fire; that, to the south, across the Dnieper, "the South Wales of Russia" in the Don basin is in immediate danger; and that the best recognition of Soviet valour and endurance would be, not wishful plaudits, but the utmost aid, whatever the cost. This is frankness and responsibility in alliance. It gives only part of a story in which German losses and Russian counter-thrusts loom largely; but it is made up of solid facts. Mr Churchill has promised immediate and full assistance to the Soviets without delay; and the speed and scope of the help will need to equal the speed and scope of Nazi *Wehrmacht*.

A No Press is plainly no improvement on a Yes Press; the one disrupts while the other undermines. Criticism is not an end in itself; but, as a means to victory, it should be unsparing and unsparing. Mr Lloyd George used to say that it was the critics who won the last war; and the same will be true of this one. The responsibility of criticism is not light; but it is certain beyond all doubt that a Press which is muzzled at home, by its own choice or by coercion, is many times more dangerous to the state than a Press which is misused and misinterpreted abroad.

Non-Belligerent Blockade

THERE is a certain habit of impatience growing up among the British people when they consider the American war effort and watch the stresses and strains develop which—though this is a point they tend to forget—vexed their own evolution towards total war. This impatience is undesirable, and everything should be stressed that puts into proper perspective the speed with which the United States is moving from a peace to a war footing. The sphere of economic warfare is a case in point. It is a far cry from today, with the machinery for complete embargo perfected, shipping requisitioned, black lists prepared and an Economic Defence Board established, back to the first months of the war when the United States was trading extensively with the neutral fringe of Europe, with the Far East and even with Germany. The British blockade then caused friction and ill feeling. The outcry over the censorship of letters at Bermuda which led the Clipper services to take another route was only one reflection of a general atmosphere of non-cooperation and mistrust.

The mood ended abruptly with the collapse of France and, as a concrete manifestation of America's new attitude to the war, the Defence Act was passed on July 1st, 1940, forbidding the export of military materials of which there was a short supply. The list included tin, rubber and ferro-alloys from the first. Iron and steel were added in the following August. Later, the list was widely extended and, today, the only important exceptions to it are

tanning materials and cotton. For the export of most other commodities, an export licence is required, and this system of export control gives the Administration complete discretion in the quantity and direction of United States exports. The extension of export control to the Philippines on May 30th this year closed an important point of leakage, Copra, coconut oil and chrome had been going to Japan, and from there, moving by devious routes, to Germany.

These measures of export control have been reinforced by a steady extension of the financial blockade. As one by one the Nazis occupied European territories, the assets of these countries were frozen and, even before the last logical step of freezing Axis assets was taken on June 14th—and extended to Japanese assets on July 26th—preliminary steps had been taken to prevent the Axis Powers from benefiting by stock exchange operations either in the United States or in Europe. All important securities had to be deposited at the Federal Reserve Bank, until it had been proved that they had no connections with interests in occupied territory, and all dealings on the New York Exchange were forbidden, save in securities held in the United States. With the extension of freezing, all but barter trade was automatically at an end between the United States and the Axis Powers; and barter trade is, of course, subject to all the limitations of the export licensing system.

This system, based on financial blockade and export control, has been extended in an "offensive" sense by a

vigorous policy of buying up strategic raw materials, conducted mainly through the Federal Loan Agency. All the United States copper firms in South America keep their copper production for the United States, with the result that, on an output—in metal content—of 450,000 tons of that, only 25,000 tons are not pre-empted. The total tin and tungsten production of Bolivia is reserved for the United States and Britain. Some American states have assisted this indirect embargo. Brazil and Mexico have listed a number of key materials which are to be exported "only to the western hemisphere"; and there are export licence schemes in both Chile and Peru.

These chief instruments of blockade have been supplemented by the requisitioning of Axis and neutral shipping for United States and Allied purposes, and by the introduction, in July this year, of United States shipping warrants. These do not exactly correspond to British ship warrants which are given to any ship owner who undertakes not actively to help the enemy. The United States warrants require an undertaking to use the ships for the purpose of defence or supply. A final rounding off of the economic defence position is provided by the black lists, which operate principally in South America. Here again, the process has been one of steady evolution. A number of American firms have for months past observed the British Black List of firms trading with the Axis, although their co-operation was stultified by the readiness of other American firms to provide blacklisted firms with facilities denied them by Britain. In July, however, a general American Black List, covering some 1,800 firms, was introduced, two to three hundred more than the number on the British list. Trade with these firms is cut off by the prohibition of export licences for business with them and by the freezing of their assets in the United States.

These various measures create the machinery for complete control over the foreign trade of the United States; and it was only fitting that, with the practical work advanced so far, an agency should have been created to co-ordinate all the various measures which come together to make up the United States' economic war effort. On July 31st, the President, under the powers conferred upon him by the unlimited national emergency, established an Economic Defence Board under the chairmanship of Mr Henry Wallace, the Vice-President of the United States, on which the Secretaries of State, of the Treasury, of War, of the Navy, of Agriculture, of Commerce and the Attorney-General were to serve. The functions of this Board are to supervise economic defence in the widest sense; and they include advice to the President upon further economic defence measures; co-ordination of the various agencies already engaged on economic defence; and, a new and significant step, advice to the President "on the relationship of economic defence measures to post-war economic reconstruction, and on the steps to be taken to protect the trade position of the United States, and to expedite the establishment of sound, peace-time international economic relationships."

The framework and functioning of the United States' system of economic defence does not altogether follow the model set up by the British Ministry of Economic Warfare. For one thing, the United States is not at war, and "all aid short of war" has not, until recently, been held to include offensive economic measures. America's economic war effort has been conceived in terms purely of defence, unlike the British blockade, which, from the first, was looked on as essentially an offensive weapon. The United States has not concerted a policy to attack the Axis, but to improve American defence. If, in the process, the Axis Powers have been gradually cut off from vital sources of supply, the fact is largely incidental. Exports were requisitioned—to ensure the flow of war material to Britain. Only with the freezing of assets and the Black List has the United States moved forward to what might be called offensive action.

Some of the weaknesses of the United States' economic effort have parallels in Britain's conduct of economic warfare. Others are indigenous, for example, the degree of departmental confusion and overlapping. Britain had

the advantage of starting out with a Ministry of Economic Warfare and a clear idea—in spite of the hesitations imposed, in the event, by the Foreign Office and the Cabinet—of what the policy of that Ministry would be—that is, total blockade. The United States has drifted into economic warfare via economic defence measures, and these are still being carried on by the departments in which they originated. To give a few examples, the Treasury is responsible for freezing assets; the Export Licence Control has been under the War Department since it was set up under the President's powers as Commander-in-Chief; the allocation of raw materials and decisions on scarcity rest with the Office of Production Management; the Maritime Commission requisitioned the ships; and the Federal Loan Agency has been responsible for the buying up of strategic raw materials. In so far as it can co-ordinate all these multifarious activities, the new Economic Defence Board will be adding order and drive to the work of economic defence. The danger of confusion, however, remains, in that the men called together on the Board are already overburdened by the work of their own departments, while the articles of establishment lay it down "that the administration of the various activities relating to economic defence shall remain with the several departments . . . now charged with such duties."

A weakness which has marred both the British and American conduct of economic warfare springs from the difficulty of defining the role of neutrality in total war. The Ministry of Economic Warfare set out with its objective of total blockade, but was obliged again and again—particularly in the case of Italy—to modify its policy in the interests of "diplomacy." The Foreign Office's view of diplomacy was barely modified by the advent of total war. It consisted of conciliation, concession and a balancing of interests. In such an atmosphere, a little more coal or a little more steel seemed irrelevant beside the task of "keeping Italy—or Spain or Holland or whatever country—out of the war." Thus Hitler was able to take over fully stocked countries.

The American economic war effort has suffered even more severely from the hesitations of diplomacy, there represented by the State Department. It is generally believed that freezing was delayed by many months—during which Axis assets took refuge elsewhere—thanks to the delays of the diplomats. Again, the policy of trading with "neutrals," such as Vichy France, has caused a certain friction and an obvious lack of co-ordination in Anglo-American policy. The rumours which have arisen over the President's recent contacts with the Japanese, coupled with reports that some American oil tankers have reached Spain, give grounds for some anxiety lest "diplomacy" should be still clogging the wheels of the economic war machine. It is not yet fully realised that providing nations with vital war materials, because to deprive them of them would precipitate war, is only not "appeasement" because no one so far has given the policy that name.

It is at this point that the disadvantages of considering economic war from the purely defensive angle become apparent. It is not enough to safeguard the supplies of war materials to America and the Allies. The offensive step must be taken to ensure that no countries which are Hitler's allies or potential victims are in a position to restock the German war machine. It must no longer be possible to plead that shipping oil to the Japanese keeps them out of the war. It only makes them stronger when at last they come in. As the *New York Post* admirably summed it up on July 21st: "Had we understood economic warfare half a dozen years ago, the Fascist world would not be in the position in which it stands to-day. It conquered half of China with our petroleum, and built the Panzer divisions in part with our scrap metal. It forged an instrument against us out of our own democratic fruitfulness."

Now at long last the democracies have jointly forged a counter-weapon of economic war. Everything depends upon the resolution with which they go forward to the attack.

Against Inflation

LAST week-end, Sir Kingsley Wood expressed the hope that it would be possible to carry on through the present financial year without recourse to further taxation—a feat which would be unprecedented in this war. Actually, there is evidence that it will be a tight squeeze. The large demand for fresh labour in the Services and in war industry is one of many signs that production is getting into its stride. The stage of factory building is well advanced. The summer's improvement in the shipping position has notably improved the supply of materials; and the estimates of imports upon which Mr Churchill's "war supply budget" of last March was based look (in the Prime Minister's own words on Tuesday) "as though they will not only be made good but exceeded."

There are, of course, very many frictions in organisation still to be dealt with. A large-scale policy of transfer and training is immediately needed to man the expanding war effort; and an effective middle way in recruitment between chance and compulsion has not yet been found. A degree of dilution will be demanded from labour, and of rationalisation from managements, that it may be a major task to secure. The general supply position is better at every stage of production; and the target of production programmes has now been set nearer to the nation's full capacity. The total and the average of performance have risen markedly; but the checks and lags that remain have lost none of their significance.

The welcome contrast in production with the position a year ago can be seen in the figures of public expenditure. In the quarter April to June, 1940, expenditure was at the rate of £2,706 millions a year, or £7.4 millions a day; in April to June, 1941, it was at the rate of £4,282 millions a year, or £11.7 millions a day. In July this year, it was at the rate of £4,191 millions a year, a slight falling-off; but in August the rate was £4,464 millions a year, or £12.2 millions a day. Estimated expenditure for the whole of 1941-42 was £4,207 millions (including the value of purchases in other countries except those obtained under Lease and Lend), and it seems certain that this figure, already surpassed by the rate of spending in the first, and probably the least expensive, quarter, will be appreciably exceeded. It cannot surely be proposed, at this crucial stage in the war, when the "advance" has still to be sounded, to spend at a smaller rate in three or six months' time than the rate of expenditure now. It is true that there will not be the same increase in spending during the twelve months as in 1940-41, when expenditure in the fourth quarter was 79 per cent higher than in the first quarter. The war effort did not begin in earnest until May and June last year. Expenditure should not rise *pari passu* with output in the third year of the war, when the initial burst of outlay on factories and productive equipment has been considerably spent. The limits of the country's capacity and resources will not permit of the raising of output by the same amount as it has already been raised. Moreover, munitions, equipment and materials are now coming in under Lease and Lend which last year were paid for in cash and accounted for in the Budget. Nevertheless, total expenditure, when the balance is struck next March, is more likely to be well over £4,500 millions than £4,207 millions.

In April, doubt was expressed on three grounds whether the Chancellor would in fact be able to make both ends meet. The first suspicion, that production had again been under-estimated, seems likely to be justified. The second suspicion, that it was over-sanguine to assume that the level of costs could speedily and effectively be stabilised by a mere pronouncement, has not been removed. The upward course of transport charges has been checked, and the cost of living index has been steadied. The Ministry of Food is carrying trading losses at the rate of £100 millions a year, and the Ministry of War Transport is carrying substantial losses on shipping services, to hold prices down. But the cost of coal has been allowed to rise

once since April; and wages have been increased consistently. The third suspicion, that voluntary means could not fill the "gap" between revenue and expenditure with genuine savings, that is, the proceeds of actual abstention from consumption, is only enhanced by the probability that the "gap" itself may be £300-£400 millions more than the Budget bargained for.

The fact is that, if there are good reasons for the Chancellor's belief that he can weather 1941-42 without inflation and without an interim Budget, they have very little to do with conventional fiscal considerations. In practice, it has been by the control of spending rather than by the restriction of spending power that the fight against inflation has been waged. The material for inflation already exists. In 1940-41, in spite of more optimistic calculations, there was probably a gap of some hundreds of millions between Government expenditure, on the one hand, and the release of real resources of manpower or materials, either by abstention from consumption or by drawing upon domestic or external capital, on the other; and the gap was filled by the creation of bank credit. In the current year, in spite of encouraging savings statistics, the gap almost certainly persists. Every sign is that there is month by month a growing excess of spendable incomes over the value of goods available at present prices. Nevertheless both the Government and its critics are agreed that there has in fact been little inflation, much less at any rate than the increase in the volume of money in existence would suggest. What has happened is that people with more money to spend than before have, in the event, spent only little more. Inflation has been checked, not by the effective curtailment of "excess" incomes (by means of taxes—swingeing though these imposts have undoubtedly been—savings or restraints on wages and salaries), but by the control of consumption—by the restriction of supplies, by extended rationing and by a general disposition on the part of consumers to hang on to their money, to hold larger cash balances and not, on the whole, to scramble for scarce goods.

This anti-inflation front is not, of course, complete. Black markets, runs on unrationed goods, the "tobacco rush" and a perceptible degree of speculation in shares and in land are all signs of more money seeking employment in spite of physical restrictions on consumption, on the one hand, and financial penalties in the shape of drastic direct taxation, on the other. What might be called the "inflation potential" is high. But the relative success of anti-inflation controls applied at the point of expenditure and the comparative lack of success of controls over incomes has led many people to look to physical rather than fiscal or financial means to lay the bog. This view is peculiarly that of the trade unions who, at the Trades Union Congress in Edinburgh, have just declared their implacable opposition to wage-fixing.

"Hands off the wages system" is their slogan. The TUC has accepted rationing, price control and the subsidising of essential commodities by the Treasury as the main weapons against inflation. Sir Walter Citrine accepted "the principle that the money which is spent from earnings upon goods in short supply, in so far as these goods are not rationed, tends to increase the price without any advantage to the purchasers." He admitted that, "if voluntary saving is found to be inadequate, we shall be faced with other and more stringent needs." But he was convinced that the stabilisation of wages would mean "a depressed standard of living" for the workers for the rest of the war; and, most significantly, he stated that the TUC was "exploring any means whereby, while not only preserving the relative position of the workers and their relative share in the national pool of wealth, the share and their claim to it would be increased when the opportunity came in the post-war period."

This is frank enough. It is, of course, an inescapable fact that, while the war effort is making its vast claims upon the nation's resources, the standard of living of all

workers except the poorest must be "depressed" compared with pre-war standards—whatever policy is adopted. It is only their *relative* position that they can, and should, maintain—except for certain groups of workers who, in the schedule of wartime importance, are at present obviously underpaid, an important consideration which is still too little appreciated either by Ministers or trade unionists. The most sensible argument for not fixing wartime wages is actually not a plank in the TUC's platform. This starts from the contention that war production is suffering from lack of incentives. Just as it is in human nature that the small and moderately sized firms, who together count powerfully in total production, would work with more will with EPT reduced to 70 per cent or less, so would workers pass much more rapidly into the essential industries, which tend to preserve the wage levels of the depressed trades they were before the war, if they could be offered higher wages. Labour difficulties in the vital sectors of mining and farming have shown how great an obstacle to output this problem can be; and it is claimed that the rise in aircraft wages shows how it has had to be solved to raise output. If higher wages are needed to swell the flow into war work, the argument runs, inflation is preferable to frustration.

But it is a "peace aim" which dominates the TUC's attitude to wages—the desire to increase their share after the war. Whether this will be accepted by the majority of people in this country as any more proper an objective in wartime than the natural desire of other groups to increase post-war profits or post-war rents or

any other post-war policy must, of course, be questioned. It is, admittedly, a practical proposition that more money should be paid out now if it will raise output, provided that steps can be taken to prevent it from being spent. The demand of the TUC is not that the workers should be able to spend whatever "excess" wartime incomes they can obtain by bargaining, but simply that they should continue to receive these payments to be put aside and spent later on; in this way both workers' earnings and wage levels will be as high as possible after the war. It is a case of plainest self interest. The unions rejected Mr Keynes's wartime plan for deferred payment because they contended it would preserve the existing distribution of wealth; they are in favour of this new model because they believe it will alter this distribution—as indeed it will if wages rise while other incomes are held down.

There are important points of agreement among all parties on this question of inflation. It is agreed that control over expenditure by the widest possible rationing and price control is of paramount urgency. But it would be the gravest negligence, as indeed Sir Walter Citrine admitted at Edinburgh, to jettison the financial weapons altogether. It is still the Chancellor's duty to minimise the inflationary danger by every possible means, by mopping up "excess" incomes and by restraining increases. It remains a fact that the stabilisation of prices is a fair and workmanlike way, in conjunction with rationing, of meeting the danger, provided always that output is not positively impeded; and the price of labour cannot reasonably be exempted.

Soviet War Economy

THE military outlook on the eastern front, where fighting still rages fiercely near the great centres of Russian life in the west, remains uncertain in the extreme. The Germans have already captured territories larger in size than Greater Germany. In the Ukraine, they have taken industrial and agricultural centres of great importance. Dnieperstroï has gone and Leningrad is in peril, and upon these two centres a great part of Russia's ability to replace its losses rested. Much of the territory which the Russians have lost is perhaps of no great importance in the calculus of military strength. But there has been a tremendous consumption of war material; and the urgent problem for all free peoples in every part of the world is the task of furnishing the defenders of Russia with the supplies of machines and materials which they will need increasingly as the fighting continues.

It would be wrong, however, to regard the Russian military effort as dependent for its future course upon outside aid. Aid there must be if resistance is not to slacken; but the framework of Russian economy is still unshattered. Leningrad, Moscow, Kiev and even Odessa are still untaken. The invaders have not yet crossed into the rich industrial Donetz basin. Russian strategy and Russian production have been the basis of almost three months' magnificent resistance; and, if the present lines of defence hold, they will be a foundation of Allied defence on land for a long time to come. The Russian system of economy has been hidden for more than two decades in the mists of violent controversy. But it is possible to discern the main outlines of Soviet production; and it is worth while, with the main bastions still held after twelve weeks of the bitterest fighting, to examine some of the characteristics of the Russian war economy.

When Hitler came to power in Germany, Soviet Russia initiated the second Five-Year Plan. In 1933 defence expenditure amounted to 1,500 million roubles, or 3.6 per cent of the gross value of Russia's total industrial output. In 1940, the third year of the third Five-Year Plan, defence expenditure had increased to 56,102 million roubles, or 40.7 per cent of total industrial output. In 1941, this percentage should have been increased to 44 per cent. For thirteen years, Soviet Russia's industrial effort has been concentrated on producing the means of pro-

duction, that is, plant, equipment and machinery. Between 1938 and 1940 the output of these capital goods increased by 52 per cent compared with 1937; the output of goods for consumption increased in the same period by only 33 per cent; and, as long ago as 1937, it was estimated that roughly half the total output of machinery consisted of armaments.

In 1937, defence expenditure was over a fifth of budget expenditure; and in both 1940 and the estimates for 1941, it was nearly a third. Soviet Russia's budget is not comparable with the budgets of other countries, because industry, agriculture and transport are State owned, and the State accounts comprehend almost all of the national income. The budget represents the balance sheet of the Union's entire economic activity rather than, as in other countries, the share in the national income taken by the Government; and it is the financial means by which the Union's resources are distributed among the different sections of the economy, between industry, agriculture and transport and between capital and consumption goods. It is simply the book-keeping aspect of State economic planning. A budget system which controls and directs production by the proportions in which it allocates the expenditure of the proceeds of past production, which are collected by means of taxes on turnover (over three-fifths of total revenue) and deductions from the surpluses (or "profits") of the State

Owing to the paper shortage, *The Economist* has decided to publish only one Banking Supplement a year for the time being instead of two. This year's Supplement will be published with next week's issue and will contain articles on banking at home and abroad, in addition to most of the usual statistical matter.

undertakings, and, in conjunction with the rationing of individual consumption, by State loans and other levies, is readily adaptable to the uses of a war economy. The wartime need to cut civilian consumption and increase the output of non-consumable goods was familiar in peacetime Russia; the method of meeting an extraordinary demand is by means of loans subscribed by the workers directly and deducted from wages at the source; and there are also the deposits in 60,000 savings banks, which are normally the most important source of supply for short-term credits to industry, trade and agriculture. All the banks deposit their reserves with the State Bank (*Gosbank*), the bank of issue, which is responsible for all short-term credits, while long-term credits for capital expenditure are granted by special investment banks. No fundamental changes are necessary for war economy, for the diversion of the greater part of the country's economic resources to war production can be achieved simply by changes in degree.

Actually, transition to a complete war economy in Russia may very well result in a further relaxation in the rigidity of central planning. Under the Five Year Plans since 1928, the attempt has been made to marshal the country's entire economic resources for the manufacture of the means of production. Civilian consumption had to be cut down, just as civilian consumption has to be reduced in wartime, when the greater part of the national income is diverted to the expansion of war plants factories and to war production. The planning of capital expenditure was first conceived as a comprehensive plan extending down to the smallest detail of consumption in town or village. But it did not work so satisfactorily in practice. Initiative, in manager, worker and peasant, was the first victim of this comprehensive planning. There were bottlenecks and dislocations. Some parts of the plans were over fulfilled; others lagged behind.

Initiative had to be restored. The flagging enterprise of the workers was first revived by the introduction of shock workers (*Udarniki*) who entered into "socialist competition" to fulfil the plan figures on construction jobs and in the factories. Another and more effective means of reviving initiative was differentiating again between the wages paid to different workers according to their work. To-day initiative is achieved, not only by this differentiation of wages, but also by the Stakhanovite movement, which fosters individual output in mines, factories and farms.

The initiative of the peasants has been revived by allotting them plots of collectivised land for their own gardening, and by the introduction of independent livestock breeding which began at the end of the first Five Year Plan in the eastern territories. Measures against an attack by Japan required a rapid increase in agricultural and industrial production in the east and, in practice, output was greatly increased by reducing the rigidity of the plan. The plan became regarded, not as a single set programme determining every detail of economic life, but rather as a long term programme of capital expenditure, adjusted every year by the annual programmes of the

commissariats for each different branch of industry and tempered by the inducement which it was necessary to offer in order to secure maximum output from the different sections of the population.

Events in 1940 and the early part of this year show how this planned economy was moving from peace to war. The most important decree, or *ukase*, of the Presidium of the Supreme Soviet, re-introduced, from June 26, 1940, the eight-hour day and the seven-day week. At the same time, a discussion began about the importance of regional and local as distinct from central planning. All except the heavy and main engineering industries were decentralised from January 9, 1941. The aim was clear. The remaining centralised industries, which had been partly occupied by manufacturing for regional and local consumption, could now concentrate on satisfying direct State demand—that is, for armaments. The regional industries, under the supervision of the regional administrations, could concentrate on satisfying local demand. Locally produced surpluses were allowed to remain in the districts where they were produced. Finally, the whole country was reorganised in nine large regions, in each of which the centralised, as well as the regional, industries were expected to reach the highest possible pitch of self-sufficiency.

Thus, the development of staple industries by rigid overall planning has been followed by a policy of decentralisation, which should be peculiarly valuable in the war against Germany. To a large extent, local initiative has been assured; and large reserves of plant, factory space and machinery which were under construction or still unused when the German attack on Russia began should make a rapid increase in output possible, in spite of the enemy's inroads. It may even be possible to make good the loss of the industrial region west of the Dnieper. The greatest difficulty is undoubtedly a shortage of skilled workers, for already in 1939 and 1940 a shortage was making itself felt. The large scale technical training of young workers was begun during 1940, and official reports estimated that, during 1941, roughly 750,000 newly trained young workers would take up positions in factories.

Soviet Russia is faced with different problems in shaping its war economy from those experienced by other countries. There is a problem of decentralisation rather than the problem of centralisation so familiar in this country; and the thorny problem of war profiteering does not exist. The construction of specialised State factories is no new problem, but has been a constant feature of all Five Year Plans. The building of factories in safe areas has been speeded up ever since the beginning of the Third Five Year Plan in 1938; and the plan for 1941 introduced special measures for the building of war factories in record time. If the fighting can be stabilised on the lines now reached there is every hope that Soviet Russia will be able to complete the transition to a complete and effective war economy during this autumn and winter. But in the months closest to hand it is to Britain—and America—that the defenders of Russia will look for aid in the common fight.

NOTES OF THE WEEK

Progress Reported

Mr. Churchill had a great deal to tell the House of Commons on Tuesday. He made it plain that the core of the so-called Atlantic Charter was the agreement between himself and President Roosevelt that the task in hand was "the final destruction of the Nazi tyranny." He scouted any suggestion that the broad principles laid down should here and now be more specifically worked out in territorial or administrative detail; and he made it plain that the promise of full sovereignty for the peoples of the world did not alter the Government's policy within the British Commonwealth itself. In his first reference to India since becoming Prime Minister, Mr. Churchill emphasised that the Government is pledged to help India to obtain "free and

equal partnership in the British Commonwealth"; and the Prime Minister of Ulster has denied that the promise of sovereignty was a recognition of Mr. De Valera's plans for a free and united Ireland. The central point in the Prime Minister's survey was his assurance that the Battle of the Atlantic, while by no means won, was being waged currently with remarkable success. A main factor in the summer's improvement appears to have been the insulation of a very large part of the Atlantic from enemy action by the presence of American warships. The number of German submarines in operation is said to be still at the same formidable total as earlier in the year; and there is no doubt that, if the restraining influence of American patrols continues to curtail too drastically the effectiveness of underwater attack, their presence will be progressively ignored

and the casualties of the battle will rise again. There is no secret about the method of combating U-boat warfare. It is a matter of escort numbers on the water and in the air, and if the Germans do invite the active participation of the American fleet, they themselves will pay for greater successes by greater losses.

Meanwhile, the rate of import has risen to a remarkably high figure for wartime; and not the least of the points of policy to be decided by the War Cabinet in these decisive days is the means of using this increased capacity to the best advantage. It would be plain folly to waste this benefit, which may be purely temporary, in furnishing "extras" either to the nation's diet or to industry. This is above all a time to build up fresh stocks of foodstuffs and materials against more difficult days later on. As Mr. Churchill said, it is "vain talk" to say that the Battle of the Atlantic has been won, and to dissipate the advantages of recent successes would be to act most vainly. For the rest, at sea, in the Near and Middle East and in Russia, Mr Churchill had encouraging words. He was able to give the remarkable information that the sinkings of British and American ships in July and August did not amount to much more than one-third of the German and Italian tonnage sunk by British aircraft and British submarines. The strain on Axis communications is obviously intense. But the strain upon Allied communications remains the key factor in the future development of the war. In the Middle East there is the gigantic task of supplying a force of three-quarters of a million men; in the Far East there is the Japanese danger; in the heart of Eurasia there is the Russian Front, linked only by slender passages to the resources of the free nations outside. Of Russia, the Prime Minister chose to record German losses rather than German gains—or Russian losses. In the winter it will be a battle of replacement; and it is still true to say that victory depends upon the ability of Britain and America, not only to keep open the seas, but also to open up and widen all the roads that lead to the battle-fronts in Africa, in Russia and in China.

Counter-attack or Counter-offensive?

Germany's general strategy in Russia remains the same in this the twelfth week of the campaign. In the early days of the invasion, the claim was made that the three armies—of Voroshilov, Timoshenko and Budyonny—had been cut off from each other. The statement at that time was not an accomplished fact, but a plan for future operations. These have gone successfully in the south, where Budyonny's army has been thrown back. They are going successfully in the north, where the investment of Leningrad continues, and the Germans are throwing their arc wide in order to draw off and encircle as many as possible of Voroshilov's men. It is still not certain that there will be any direct and costly attack upon the city itself, valuable as its war industries and supplies undoubtedly are. Only in the centre is there some evidence of a miscarriage of German plans. The recapture of Elnya and the violent fighting round Roslavi are not in themselves unduly significant, since, according to all previous estimations of the front, the Germans were not supposed to have advanced so far. The Nazi armies in this sector were undoubtedly occupied in their usual tactic of punching out the Russian salient, this time between Smolensk and Gomel. They struck towards Briansk hoping to find the line at this point weakened by the Russian counter-attacks in the Smolensk and Gomel sectors. In fact, they have been very vigorously counter-attacked by the Russians and have had to fall back a little towards their earlier line in front of Mohilev and Rogachev. The crucial question is whether Marshal Timoshenko has launched a counter-attack or a counter-offensive. The Russians speak of a counter-offensive for the first time; but it is not their claim, but the actual length of front along which the attack is developing, that is conclusive. If the attack is limited to the Briansk sector, the danger is that the Germans will once more strike at the genuine offensive is developing along the whole central sector, then the Germans are up against the toughest military problem they have so far had to face. They admit fierce fighting against "superior Russian forces," but add that their tanks have broken the Russian line.

Iran Accepts the Terms

After a week's delay, the Iranian Government has agreed to the British and Russian terms. British and Russian troops are to occupy strategic positions, the British in the south, the Russians in the north. The through routes for supply are to be safeguarded and the Iranians will facilitate the transit of goods. All Italian and German nationals are to be handed over to the British and Soviet authorities, but the diplomatic status of the Legation staffs will be respected. Besides the German and Italian, the Roumanian and Hungarian Legations are also to close. The speed with which agreement has been reached closes what might have been an ugly incident in the most satisfactory manner possible. Now the urgent task is to speed up British and American supplies to Russia. The route through Iran is the pre-eminent link in the Anglo-Russian alliance; Mr Churchill made that plain on Tuesday. The trans-Iranian railway is fortunately British gauge, and the Caspian Sea gives immediate access to the Volga Basin, and thence to Russia's industrial second line in the Urals. The Allies undoubtedly need a Todt organisation to make the crooked ways smooth for the passage of supplies; but, with the goodwill of the Iranians and resolute planning on the Allied side, the Iranian route may yet turn the fortunes of war.

Before the Shooting?

There appears to be a change in German policy with regard to American ships. The *Robin Moor* incident was the first attempt to test American reactions—an experiment which perhaps resembled the "trial" bombing of Dublin. The reactions—a howl from the Isolationists and a quiet extension of the security patrols—were inconclusive. The news that the U.S. destroyer *Greer* has been attacked, the steamship *Sessa* sunk off Iceland, and the steamer *Steel Seafarer* in the Red Sea, suggests that a new experiment is under way. The choice of targets is significant. The *Greer* was presumably on security patrol. The *Sessa* was carrying supplies to Iceland. The *Steel Seafarer* was operating on the American supply route to the Near East. All three ships were thus engaged on operations which have come under heavy fire from the Isolationists on the grounds that they were "provocative." The line of criticism is the old one. "If men are shooting in the streets, stay indoors if you don't want to get hurt." The German argument may well be that to attack ships now will strengthen the hands of the Isolationists and lead to a demand for the withdrawal of the United States from these advance posts of pre-belligerency. If the shooting has the opposite effect of inflaming public opinion and creating a general demand for intervention, then the Germans can still hope that a state of war in America will interfere with war supplies to Russia at a critical moment, and even that Japan can be cajoled and threatened into the struggle.

Trade under Lease and Lend

It has been evident ever since the beginning of the supply of materials to this country under the United States Lease and Lend Act that some reconsideration of both import and export policy was necessary. The question has come to a head in recent weeks because of the complaints of American traders that British exporters were using materials obtained under Lease and Lend to supply goods to the United States or to South America on better terms than their American competitors. As a result, an undertaking has been given by the British to the American Government and embodied in a White Paper that steps will be taken to secure that no advantage is obtained by British manufacturers for export because of Lease and Lend over their competitors in the United States. It is explicitly agreed that it would not be tolerable if material from the United States, made available for British defence, were used to maintain or expand British export trade at the expense of United States exporters. No exception will be taken to this statement of principle. Indeed, the recent uneasiness about the misuse of Lease and Lend materials has not been confined to the United States. There have been British critics, including manufacturers for export, who have raised precisely this question, and, as a result of their views, certain practices, not important in themselves, have been ended. Actually, there has probably been more smoke than fire about this matter. An appreciable number of orders were placed by British exporters in the United States and in South America in the days before Cash and Carry was replaced by Lease and Lend, and these orders must neces-

sarily be fulfilled, which has in a number of instances led to a misunderstanding. British export trade must, of course, go on. This should be the British Government's first standpoint. It would be fantastic to stop all British exports of steel goods because steel is coming in under Lease and Lend; and export trade is part of the war effort which Lease and Lend is assisting. Americans no more than Britons must gain an advantage from Lease and Lend. But the principles at stake are clear enough. They are that Lease and Lend material should be used for the purpose for which it is intended, that is, the defence of Britain. In the first discussions about the policy of Lease and Lend, it was even assumed for a time that the transactions would be confined entirely to Government accounts, and that it would not be possible for the Government to pass on materials to be handled by private traders and private manufacturers. In the event, of course, because of the essentially private character of the British economy, even in wartime, it has not proved practicable, and it has become accordingly all the more important that Lease and Lend materials should not be used either for private British gain or to the detriment of American interests. It should, of course, be realised that, according to President Roosevelt's own thesis, the defence of Britain which Lease and Lend is intended to facilitate is also the defence of the Western hemisphere of which the United States is a part. Lease and Lend is not entirely an act of philanthropy on the part of those Americans who may be compelled to do without those materials which are transferred to Britain; and the terms of Lease and Lend imply, not a free gift, but ultimate repayment in kind. It is because the umbrella of Lease and Lend has been made so capacious as to include not only those materials and munitions of war which were originally intended, but also all sorts of materials and foodstuffs, that these vexations have arisen. It is, for instance, very difficult to keep track of materials in the case of products which employ many materials in their manufacture. But the only possible policy for the British Government and for British exporters is to meet American wishes—where they are just.

Policy for Imports and Exports

Before Lease and Lend, the first consideration in export policy was to earn the greatest possible amount of dollars (or other "hard" currencies) in order to be able to pay cash for supplies from the United States. Similarly, the policy for imports was mainly determined, not only by considerations of shipping space, but also by considerations of foreign exchange. Since Lease and Lend, these standards have obviously been open to modification. The bulk of Britain's essential imports from the other side of the Atlantic are not paid for by cash. There is now very considerable disquiet among British exporters lest the export drive which they had been urged to work and organise and prepare is, because of these changes, to be allowed to relapse. It should be made plain beyond all doubt that the policy of the Government is still to maintain as much useful export trade as can be managed with the resources available. Exports are still necessary to pay for imports from countries apart from the United States. Moreover, it is more than ever needful to obtain dollars wherever possible in order to minimise the drain upon the future which is represented by Lease and Lend. The only limiting factor in the prosecution of exports, apart from the urgent need for resources to sustain the war effort by more direct means, should be the obligation on the part of Britain not to give any substance to the cynical belief in some quarters of the United States that John Bull has discovered a method of paying for the war at the expense of the United States. But British export policy should not be commanded from Washington—or Pittsburgh—under the cover of Lease and Lend. The British trader should occupy at least as important a place in the considerations which make up British policy as the American trader; and it is for this reason that the whole question of trade under Lease and Lend (to which *The Economist* hopes to turn in a leading article in the near future) should be defined officially.

New Activity in the Middle East

With the coming of autumn, the campaigning season in the Middle East is about to reopen, and there are signs of new activity in this sector of the vast battlefield. The reinforcement of Axis troops in Libya has given Allied submarines new quarry in the Mediterranean, and a heavy toll has been taken of troopships and supply vessels. Air reinforcements are arriving in Sicily, Greece and Crete, and labour battalions are busy extending existing airfields and

building new ones. There are reports and rumours of a stream of German high officials passing through the Balkans; General Litz has been mentioned, Major Todt as well, and, more incredibly, Admiral Raeder. Now it is the turn of the German Commander-in-Chief, General Brauchitsch, to appear in Sofia. All these comings and goings may be purely defensive, a concerting of counter-measures against an Allied attack on land, sea and air. So far German operations in this area have been primarily protective, to secure the Balkan flank, and cut Russia off from the Dardanelles' supply route. It seems on the face of it unlikely that at this time a new offensive will be launched away from the main front. Turkey, however, is in a sense on the main front. If the oil of the Caucasus is Hitler's objective, and a pincer movement his strategy, he is unlikely to allow the northern thrust to develop beyond the Dnieper, while leaving the southern thrust to hang fire on the frontiers of Eastern Thrace. Dr Clodius, the harbinger of disaster, is in Ankara, attempting a trade deal which would establish a German monopoly of the Turkish market. The presence of Admiral Raeder and General Brauchitsch in Bulgaria may be explained in connection with an attempt to coerce the Bulgarians into the war not against their "brother Slavs," but against their Turkish neighbours. The co-ordination of an attack on Turkey would require consultation between Italy, Bulgaria and their German masters. This appears to have taken place. Meanwhile, the Turks are manning their frontiers and keeping their powder dry.

The Middle Eastern Scene

If the Allies do strike across the only land frontier on which they and the Germans stand face to face, they will do so from an immeasurably stronger position than that of December, 1940, when their last great attack was launched. In one of the most impressive moments of his war survey, the Prime Minister put the present situation into its right perspective. A year ago, Syrian resistance had collapsed, and in its place was a treacherous administration ready to pact with the Germans. In Iraq, Rashid Ali was already preparing for his later *coup*. Abyssinia lay, a hostile empire, in the British rear. British Somaliland had fallen. The Italians had advanced into Kenya. To-day, from the coasts of Italian Somaliland to the Caucasian frontiers of Russia, the Allies are in control, and their control is not only a safeguard for the war itself. It is a promise of better things to come—greater economic co-operation, the restoration of sovereignty to Abyssinia, a surer independence for Iraq and Egypt, a new status of freedom in Syria, with France occupying a "special" position similar to that arranged for by the Anglo-Iraqi treaty. Nor is this improvement confined to the political background. Instead of the army of 80,000 men who held the Italians, then drove them out of their Empire and then held the Nazis on a line from Sollum to the frontiers of the Sudan, there stands in Egypt and scattered through the Middle East, a vast concourse of trained and seasoned soldiers, some 750,000 strong. Equipment is streaming in, the United States has established a direct supply route to Suez, the Allied forces have, above all, been strengthened in the air. Even if this improvement gives no grounds for complacency, with the Prime Minister "we are entitled to be content."

Operations in the Arctic

Little has been heard of Allied operations in Arctic waters since the attack on Kirkenes by the Fleet Air Arm. Now the approach of winter will soon put an end to naval activity in these frozen waters, but, before the darkness and the ice descends, the Army and Navy closed the season with successful action on land and sea. A mixed Canadian, British and Norwegian force raided Spitzbergen in the Lofoten manner, destroyed coal and wireless installations and took off with them all the Norwegian inhabitants, miners and their families, some 700 of whom will now serve with the Norwegian forces. That the Germans had hitherto neglected Spitzbergen was due to the fact that there were Russian concessions on the islands and, until June 22nd, the Nazis preferred to keep them out of the war zone. The Allied raid was carried through to frustrate any German attempt to profit by the mines and to put an end to use by the Nazis of the meteorological reports despatched from the islands. This amphibious operation has been followed by a successful attack on German convoys supplying their troops in the Murmansk sector. Three ships were certainly sunk and probably some others. In neither operation were there any casualties, and both may well have embarrassed the German supply position in the extreme north.

Box and Cox

Mr. Mackenzie King has returned to Canada, and has reaffirmed his opposition to an Imperial War Cabinet and his conviction that the present system of consultation with Britain is, so far as Canada is concerned, perfectly adequate. On the day that Mr. King arrived back in Ottawa, it was announced that Sir Earle Page, Minister of Commerce, will visit London to establish personal Cabinet liaison between the United Kingdom and Australian Governments. There is no question of giving the envoy special powers or special status, but since Mr. Fadden has received Mr. Churchill's assurance that every facility will be given to Sir Earle Page, it can be presumed that he will attend meetings of the British War Cabinet. There he will present Australia's point of view on certain immediate problems of war strategy, but he will not be able to make any decisions on behalf of his Government—reference back will have to take place as it does now, when consultation is carried on through the Dominions Secretary and the High Commissioner. The only improvement on the present method is presumably the fact that Sir Earle Page, by virtue of his office, will be able to "speak for" Australia "with full and clear authority"—which Mr. Menzies felt he could not do in view of recent political events. This does not necessarily imply that the Australian Government feels that the High Commissioner is too much of a yes-man; but the fact that it wants Australia's views to be expressed forcibly to the British Cabinet does prompt the conclusion that it is not altogether confident about the decisions to be made in London—presumably with regard to the Far East. If Sir Earle Page's presence in London makes Australia happier, it will be an additional reason for welcoming him here, but the problem of enabling the Dominions to participate more really in Imperial decisions is no nearer solution.

The Finns Fight On

It looks as though the Finnish peace effort has misfired. Whether the move first came from Russia or from Finland is not certain. But it is sure that the only popular aspect of the war to the Finns was the possibility of recovering the lost territories. In the first months, the Germans did very little fighting in the southern parts of the Finnish front. The Finnish army advanced, and the people evacuated last year were brought back to their old homes. When the army approached Viborg, it was generally expected in Finland that the war would be over as soon as the city had been recaptured. And, immediately after, came rumours of Finnish-Russian peace negotiations, through the mediation of the United States. A Finnish general was reported to have visited Hitler in order to ask for permission to make separate peace. The Germans seem to have nipped this peace move in its initial stage. Supported by Mannerheim and the men of the extreme right, the battle is apparently to continue. Although the Swedish party, which is the only opposition party in Finland, was expressing widespread popular uneasiness when it demanded that Finland should state its war aims—did Finland fight only to regain its lost territories; did it mean to take part in the German aggression against Russia itself; did it fight for the Fascist conception of a "Greater Finland," including large genuinely Russian territories?—the Germans and the Finnish Fascists have succeeded in getting their way. A new offensive has begun, which the Finns claim has brought them to Olonets and the River Svir. From official sources, there is no support for the hope expressed by the social-democratic newspaper in Helsinki, after the capture of Viborg, "that the swords would be made into ploughshares." Instead, news came from Finland of the arrest of several Socialist members of parliament, accused of "left-wing sympathies." The arrested M.P.s are the same people, who, in the spell between Finland's two wars, tried to develop cultural relations with Russia. A continuation of the war under German orders, as part of the aggression against Russia has, of course, no popular support in Finland—and still less in Sweden, from where some Finns had hoped for at least moral support. Finland now faces a financial situation still more disastrous than before the Russian-German war. While Finland must export industrial products, it must also import foodstuffs. The import trade from Russia has been cut off, and the only country from which Finland can get any supplies is Sweden. But Sweden cannot export in any large quantity. Thus Finland, which in two wars in

eighteen months has lost 50,000 men of its population of three millions, faces a winter of starvation—with German troops using its soil for a war from which the Finnish people have nothing to gain and everything to lose.

Mobilising the Fire Guard

On Sunday, September 14th, the first general registration for the fire guard takes place. All men between the ages of 18 and 60—except members of the armed forces, the Home Guard and the Royal Observer Corps; members of the police force; seamen; doctors; and the blind and the mad—who live in areas where the Fire Prevention (Business Premises) Order is in force will register on that day and the following Saturday and Sunday. Temporary removal does not enable a man to evade registration, and if he cannot register at his temporary address, he will have to do so on his return home. After registering, a man may claim exemption on various grounds, such as excessive hardship or if he is already doing 48 hours of civil defence duty a month. Some time must necessarily elapse after registration before the fire guard can be effectively mobilised; but it is to be hoped that the interval will be as short as possible, because it was an essential part of the new scheme that after mobilisation should come training, and time for this before the winter sets in is running short. Meanwhile, the TUC has accepted with bad grace the Government's draft of the new Fire Prevention (Business Premises) Order. This provides for the right of workers to make representations against a scheme; the establishment of national and regional advisory councils on which workers and employers will be represented; the provision of amenities such as sleeping accommodation; and compensation for loss of earnings through injury—£3 10s. a week or the amount of earnings, whichever is the less. Presumably, the National Advisory Council, which is to consider the means of enforcing the Order and what are exceptionally long hours on vital work—which may entitle a man to exemption—will cover the whole of the fire guard, not only those doing duty at business premises. But the rate of compensation would appear to apply only to the business premises scheme; fire watchers, whether compulsory or voluntary, guarding their own homes or other people's, or churches, cinemas and miscellaneous buildings, may have to be content with the 35s. a week allowed under the Personal Injuries (Civilians) Scheme. Thus, just when a uniform national fire watching plan was getting under way the TUC has caused a ridiculous anomaly to appear.

Children and Officers

Last week the Trades Union Congress again shelved the question of family allowances, which was referred to the General Council for "full study." The attitude is no longer simply *non possumus*, but the belief obviously persists that allowances, even if paid by the State and not by industries, would depress wages. It is a belief which, without reflection, young unmarried officers in the Army may share. The pay of junior officers is not to be increased, but all officers, regardless of age or rank, are to receive 4s.

a day for a wife, 6s. a day for a wife and child, 7s. 6d. for a wife and two children and an additional rs. a day for every extra child. For all officers, the new principle is introduced that the allowances vary directly with the size of the family; and for officers under 30 years of age, whose allowances will now be the same as those over 30, the change represents an increase of one-third in the case of a family of wife and one child. Officers over 30 only benefit if they have more than one child. There have been many complaints, on what have appeared to be very good grounds, that, in view of their commitments, the basic pay of junior officers is insufficient. But the War Office's solution is to cut down their expenses rather than to increase their pay; and the test of this week's announcement (which was accompanied by the announcement of similar changes in the Navy and RAF) will be the extent to which these commitments are in fact curtailed. Meanwhile, it is worth noting that a resolution at the TUC meeting raised the whole question of the adequacy of the pay and allowances of the rank and file of the Services.

War-time Survey

In reply to a question on Tuesday, the Parliamentary Secretary to the Ministry of Information stated that he was now reviewing the work of the Social Survey Section of his Department. Actually, it is common knowledge that the wartime survey group which has been furnishing the Government with information as the result of scientific inquiries among the population has in fact been broken up. Some say that it "walked out"; others that it was "pushed." It matters little. The point is that, within the Ministry of Information, there has been a change in staff which has preserved the pretence of a wartime survey without its personnel. The issue is sorely confused by personal considerations and individual ambition—on both sides. But there are two questions before the Government at the present time—apart from the loutish (to borrow and make better use of a Goebbelsian adjective) refusal of a large part of the Press to see anything in survey work but "snooping" or "tracking." One is whether or not the admirable group of researchers who have learnt to work together with common techniques and a high standard of integrity and efficiency is to be made use of again. If it is not—and this is true whatever the rights and wrongs of the present recriminations may be—a great deal of time, skill, energy, zeal and even devotion will be lost. The second is whether the Ministry of Information, with all its associations of propaganda and publicity, is the best place for this organisation to function. It has been suggested that the work should be done for the Board of Trade instead. This would have the advantage of serving the obviously important need of the Board for information about the reactions of traders and customers to rationing and the limitation of supplies. It would have the disadvantage of confining its activities to the work of one Department; and it still seems probable that the right place for this investigatory machine is in attachment to the War Cabinet Offices, where it could be made the medium of accurate and unbiased inquiry into all the problems of public opinion and public demand which face every Minister and every Department in wartime.

Workers' Transport

Winter is not far off, and the problem of remedying at least the more blatant deficiencies in workers' travel between their homes and work places is urgent. The chief difficulties are, as the Twenty-first Report from the Commons' Select Committee on National Expenditure points out, that services are inadequate; that workers often have to wait for an hour and a half or more for a bus; that there are seldom shelters at the places where they have to wait; that when they do find a place, they may have to stand; and, finally, that when, as in some rural areas, services are operated by owners of one or two vehicles, breakdowns are frequent and repair facilities inadequate. Some districts have worked out their own remedies. Birmingham has eased congestion by staggering hours in a number of large firms. In the middle of last winter, Oldham, too, adopted a similar plan on a small scale, which proved most successful; groups of mills situated outside the town start work half an hour earlier than those in other districts and stop half an hour earlier; and this means a substantial saving in buses, which are then available for

use in other districts. In consultation with the London Passenger Transport Board, the Regional Board has divided the London area in 32 districts; firms have been asked to form groups; and these cover, at present, some 700 of the larger firms in the London area. The trouble is that all workers naturally prefer to get home before the black-out. If transport is arranged on this basis, unexpected overtime may mean no transport is available to take workers home—as sometimes happened last winter. This is not the fault of the transport workers, who have shown great willingness to drive through black-outs and blitzes. It simply means that there must be more planning between factories and the transport agencies. "A solution," comments the Industrial Welfare Society, who has taken a great interest in this problem, "is not only vital to the transport organisations, but also for the health and welfare of workers and to ensure maximum production."

Beauty and the Beast

Beauty has suffered badly in this war, both from the destruction dealt by the *Luftwaffe* and from the ceaseless encroachment upon the countryside by the armed forces and war industries. The loss of the nation's beautiful buildings is accepted as the fortune of war, and the loss of the nation's beautiful countryside is tolerated in the interest of the nation's security. But when a proposal is made to destroy that countryside even further, not as a means towards winning the war, but for the private gain of a few, it cannot be tolerated for a moment. The promoters of the Glen Affric power scheme argued that it was in the interests of the Highlanders themselves, because it would help their industrialisation and thus raise them from the poverty which is their present lot. It is true that beauty must sometimes give way in the name of material progress, and it is also true that, on some occasions, this progress has been thwarted by vested interests who have no concern for the welfare of the people and are only anxious to preserve their selfish rights. But, in the case of Glen Affric, there could be no assurance that the scheme would promote the welfare of the Highlanders, because it was not introduced as a Government measure, and the opposition of the Secretary of State for Scotland secured its rejection in the House. In any case, the improvement of the Highlanders' standard of living should not be dependent on the action of a private company. If some industrialisation is necessary, then it should be made part of a comprehensive Government plan for betterment, and not left to follow haphazardly from the introduction of a power scheme primarily aimed at satisfying the industrial Lowlands. There is hardly an industrial centre in the country which is not a crying example of the evils of undirected development. Unfortunately, as Mr W. A. Goodbody pointed out in a letter to the *Times*, schemes such as Glen Affric have to be fought by private individuals or small local authorities with scanty financial resources against strong financial interests which can eventually wear down the opposition—especially during a war. Since the beauty of the Highlands and the welfare of the Highlanders are both a matter of national concern, it is time that this steady infiltration by private interests—here and elsewhere—was estopped.

Shorter Notes

The following table of comparative losses of aircraft has been officially compiled:—

	1939	Axis	R.A.F.
Great Britain	1940	23	...
	1941	3,038	847
At Sea	1939	568	37

THE WORLD OVERSEAS

Lease-Lend and Duff Cooper

(By a Correspondent)

September 1st

NOT unnaturally, the public in this country has tended to think of the American Lease and Lend programme exclusively in terms of aid to Great Britain. It forgets that it includes aid to Britain's Allies, to South America, and now to Russia and to China. Particularly the aid to China is taking on a growing importance at Washington. In a sense, this part of the programme conflicts with aid to Great Britain, since the material sent to the one country is material denied to the other. But, on a larger view, the two parts of the programme are supplementary, for it is the American material which will maintain Chinese resistance—the resistance which is so vital to British interests. Aid to Great Britain and aid to China are thus two parts of a single mechanism, and the one must be, and is being, planned with reference to the other. And as the planning of the scope of the aid to China is thus a matter of joint Anglo-American interest, so also is the execution of the programme, since for various reasons it happens that American aid can only be made fully effective if certain action is taken by the British Government or by the Governments under its influence.

The scale of the programme of aid to China is, of course, dwarfed in comparison with the aid to the Empire. For liaison with Mr Hopkins' Lease-Lend administration the Chinese Government has set up in Washington an agency broadly similar to the corresponding British organisation. This is presided over by Dr T. V. Soong, the former Finance Minister.

As might have been expected after the repeated raids on Chungking, the chief interest of the Chinese is in the supply of aeroplanes. The creation of a really efficient, though not necessarily very large, air force would, they say, transform the whole character of the war and tilt the balance definitely in China's favour. It is this part of the China programme which is also of greatest interest to Britain. For a Chinese air force is an air force on the flank of a Japanese navy or army moving southwards. It is a force which could harass its communications, spy out its movements, and perhaps even bomb its industrial bases in the homeland. Here aid to China coincides with aid to the Empire. A Chinese striking force in the air would be a most substantial comfort to the mind of the Commander-in-Chief at Singapore. How large is the air force which China may expect from the United States is, of course, a carefully kept secret. The limiting factor is the competing claims upon all available aircraft by Great Britain. Every bomber and fighter for China has to be fought for from the British Air Commission. Nobody—American or Chinese—questions that British and Russian needs are paramount, since in the long run the fate of China depends on the defeat of Hitler in Europe, but it is worth emphasising that the division of supplies between China, Britain and Russia in the proportion which best forwards their common interests is one of the nicest and most vital questions of war strategy.

Aeroplanes are not the only material which America is sending to China. It is prepared to despatch small arms, artillery, ammunition, stores of all kind, medical stocks and trucks in very large quantities. Their despatch has, however, one proviso. Aeroplanes can be flown into China; other supplies have to go overland. The proviso therefore is that ways should be found for these supplies actually to reach China. In other words, the basic problem of the Lease-Lend administration in the east as in the west is one of communications. In the west, the obstacle is the submarine and bomber infested Atlantic Ocean. In the east it is the fact that all approaches to China except one have been sealed; and this approach is the celebrated but vulnerable and precarious Burma Road.

The capacity of this road is very limited. It is true that expert reports have unanimously agreed that the present extreme delays in transport are due partly to graft and incompetence; yet they are also agreed that, with the best management in the world, the road could hardly carry as much as 40,000 tons a month compared with the 75,000 tons a month which used to flow through the Indo-China roads and railway. Already very large stocks have been piled up in Rangoon, and the prospect is that as American shiploads reach this port their cargoes will accumulate in immense and rapidly deteriorating dumps. The Lease-Lend plan, so far as it affects Far Eastern strategy, would thus end in fiasco.

New Life Lines Wanted

It is precisely here that it would seem that Great Britain can make its contribution. The common interest of Britain, Russia, America and China is that Chinese resistance should continue. To this end China is contributing manpower and America the tools; and Great Britain can contribute the services, especially those for enlarging and maintaining the vital lines of approach to China. These avenues lie through British territory. China has a very long frontier with India and Burma, which is at present, except by the Burma Road, impassable, but which can certainly be pierced in other places as well. Admittedly, the terrain is among the most precipitous in the world. Nevertheless, under war conditions, construction miracles are everywhere being performed, and it is known that the building of a railway to supplement the Burma Road, and of an alternative and safer road to the north starting not from Burma but from India, and also the organisation of an air transport system, are all alike technically possible. Some of these projects have indeed already been accepted in principle by the British Government. But it must always be kept in mind that time is the vital factor, and that if these new lines are to have a decisive effect on the war, they must be completed within a matter of months, not years.

This is the background. The despatch of Mr Duff Cooper to Singapore is perhaps the best augury that the British Government has appreciated the problem in its immensity and its urgency. Mr Duff Cooper will have many other interests besides those of communications—the military plans, the diplomatic negotiations with China and the Dutch East Indies. Yet all problems in the Far East at present turn upon communications. And Mr Duff Cooper's best chance of writing his name into the history of the war will be as a kind of generalissimo of the Asiatic life-lines, as the supreme organiser of the intricate network of sea-lanes, air-lanes and motor-roads by means of which the imperial ambitions of Japan can be checked. It is a great task—it requires great energy and the closest co-operation with America and China, and perhaps the creation at Singapore of an administrative machinery to make this co-operation effective. But it is also a great opportunity.

Western Business Leaves North China

[FROM OUR SHANGHAI CORRESPONDENT]

August 4th

LAST summer's Anglo-Japanese arrangements to liquidate the blockade of the British Concession in Tientsin on the whole turned out satisfactory and according to expectations. They successfully eliminated from Anglo-Japanese relations in North China the element of outright violence. But those arrangements could not prevent Japan from obtaining full paramountcy in North China's domestic and foreign trade. For years to come, Free China's armies have no prospect of driving out the Japanese from China north of the Yellow River. There is no longer any chance in the near future of expansion or even maintenance for western business in North China; the outlook is rather for a wearisome defensive fight, against heavy odds and little support from the outside, which may be expected only to slow down the pace of apparently inevitable retreat. Non-Japanese foreign business interests in North China, therefore, are no longer very keen on holding out at any price; and while their withdrawal as yet is by no means precipitate, opportunities of selling out in good style and at reasonably fair prices are no longer missed.

As regards British North China interests, the outstanding sale so far was that of the Taku Tug and Lighter Company's fleet of thirty-four lighters of over 15,000 tons gross, nine tugs and three other vessels, as well as docks and engine works at Taku, effected in July, to the semi-official Japanese East Asia Shipping Company. The price of £250,000 is considered satisfactory in the circumstances, and shareholders appear to have been well advised to let go in time of an investment whose value had come to depend entirely upon the goodwill, if any, of Japanese military authorities in North China. In Tientsin in recent months, there have also been a number of important sales of British real estate into Japanese and Chinese hands, also at prices deemed reasonable. Some other small and middle-sized British commercial firms had by last winter liquidated their Tientsin affairs for good. There are no really substantial American investments in North China, but prominent American firms there are also retrenching and withdrawing. The National City Bank of New York on July 31, 1941, closed its Peiping branch office. The American chemical mammoth concern, E. I. Du Pont de Nemours and Company, during the past few months has closed both its Tientsin and Tsinan offices, withdrawing altogether from business in North China.

North China's foreign trade is now entirely under Japanese control, exercised both through the Chinese Maritime Customs machinery and through foreign exchange control operated by Japan's semi-official Yokohama Specie Bank. Neither imports nor exports are possible except under a strict double regime of Customs and foreign exchange permits. All foreign trade transactions have to be framed into import-export "link" deals, mostly arranged artificially, but always with exchange proceeds from exports surpassing exchange allotments for imports. A certain improvement over last year has been the informal abandonment of the Peiping FRB puppet dollar's official exchange rate of US\$0.23875 for FRB\$1.00 in favour of a new "commercial link rate" of around US\$0.11. This latter rate roughly corresponds to open market valuations in Shanghai of FRB currency.

Japanese Middlemen

A definitely unfavourable development is that more and more special firms, recently organised by the Japanese military on the pattern of proceedings in Central China, monopolise the delivery at ports of export goods as well as the distribution in the interior of import commodities. This results in the complete separation of western foreign traders in these port cities from their suppliers and customers in the hinterland, as well as in the full Japanese control of demand, supply and internal prices of foreign trade goods. The rate of foreign trade profits for western firms consequently has been much curtailed, while the cream of these profits goes to the Japanese units inserted between the ports and the interior.

American firms still retain the biggest volume of non-Japanese foreign trade in North China. Exports to the United States, declared in June this year through the

Tientsin U.S. Consulate-General alone, were still valued at £550,000, consisting mostly of bristles, skins, woollen carpets and egg products unclaimed by Japan for itself. The bulk of these export goods, however, had to be acquired on the spot at Tientsin from Japanese commodity control units, which reduced formerly independent American exporters to the status of mere commission agents; part of these exports to America were even handled up to the New York markets by Japanese firms themselves. Other non-Japanese exporters in North China have been reduced to similar circumstances. Over 60 per cent of all exports from North China now appear in Japanese hands. Japanese firms monopolise the entire foreign trade in the region included within the puppet state of Meng-Chiang (Inner Mongolia), whose former exports to Anglo-Saxon countries of wool, furs and skins were mostly in British hands. Japanese firms equally monopolise all the North China trade with Japan proper and its dependencies. And Japanese firms have cut out entirely all western firms from any participation in what remains of Tientsin's once large transit trade with Manchuria.

In North China's imports, Japanese goods this year account for almost 90 per cent of the total. The import permit system is being manipulated with a view to excluding all western goods competitive with products which Japan is still able to supply, or expects to supply in years to come. The import-export link system is being operated in such a way as not only to provide the Yokohama Specie Bank with a net foreign exchange surplus from every single link transaction, but also to offset receipts of most of the convertible foreign exchange secured from Anglo-Saxon countries against imports from Japan paid for in yen. Even where import permits have been secured for non-Japanese goods, the interior markets remain inaccessible to western importers except through official or private Japanese middlemen.

Tientsin's trade position in the whole of North China continues to weaken. Western trade interests in North China are chiefly concentrated at Tientsin, where the continuous existence of foreign territorial Concessions, especially of the British Concession, naturally still tends somewhat to restrict the scope of Japanese economic and financial control. This is a reason for the Japanese to discriminate against Tientsin and to favour, at the city's expense, other North China ports where numerous export goods are more amply supplied, import permits are more easily obtainable, and more favourable exchange rates are being granted than at Tientsin. Strong Japanese interests favour, in particular, Tsingtao, which they expect in the long run to supersede Tientsin, especially with the help of Tsingtao's new railroad connection straight through Hopei Province with the Peiping-Hankow Railway and Shansi Province.

Financial Policy in Eire

[FROM OUR DUBLIN CORRESPONDENT]

August 26th

THE Government has decided to keep down the price of bread by a subsidy. The price of imported and home-grown wheat has risen, and many costs of milling and baking have increased. The annual consumption of wheat in Eire is about 350,000 tons, of which about 290,000 tons will be supplied at home this year. In order to prevent the price of bread from rising, a subsidy of £2,000,000 will be necessary. Of this sum, £750,000 will be contributed from the accumulated reserve funds of two bodies concerned with the importation of wheat before and during the war, and the balance of £1,250,000 will be provided from public funds. The Government has announced that in no circumstances will the subsidy be increased in future years.

Presumably it is the intention of the Government that its share of the subsidy should be provided by additional taxation. The Minister for Finance recently announced that new taxation would be necessary and that the only possible source of additional revenue is income tax. It is quite true that indirect taxation is incapable of yielding any more. Indeed, the yields of many Customs duties will probably fall as a result of the decline of imports. Additional direct taxation would not yield much and would prove very deterrent to enterprise and employment. In respect of war taxation, the circumstances of Great Britain and Ireland are entirely different, but this fact does not appear to be fully grasped by the Minister for Finance. In Eire there has been no expansion of money incomes caused by the

war. The income structure is very inelastic; there are very few surtax payers, and the capacity of the direct taxpayer is already strained to the utmost. Any increase in direct taxation would be definitely inadvisable.

If this opinion be correct, it would appear that additional revenue is not available from any source. Expenditure cannot be curtailed at present in view of the war. The conclusion is inescapable that the Government should borrow to meet a large part of its current commitments. The warnings of the Banking Commission against adding to the public debt are only partially valid in present circumstances. That Report, which was issued in 1938, was concerned with the normal practices of peace rather than with the abnormal practices of war. The Banking Commission's objection to the pre-war borrowing was largely based on the unproductive, recurrent and cumulative nature of the expenditure for which the borrowing was incurred. It is true that most of the present war expenditure is unproductive and that any debt now incurred would be deadweight, but tiding over an unprecedented and temporary emergency is precisely one of the purposes for which borrowing may properly be undertaken.

Furthermore, the Banking Commission was concerned with the growing debit balance on international account. The balance of payments was passive and was becoming more passive every year. In these conditions, borrowing that did not encourage exports was properly regarded with disapproval. But at present the balance of payments is active, and imports are being kept down by the realities of scarcity and blockade. In the twelve months between June, 1940, and June, 1941, the sterling assets of the Irish banks have increased by £9,000,000. During the same period deposits have increased by £13,000,000, advances have declined by £5,000,000, cash and money at call and short notice have increased by £11,000,000 and investments have increased by £11,000,000. These statistics disclose the accumulation of considerable savings, and the monetary situation appears to be definitely favourable for successful borrowing operations.

The Lesser Evil

To advocate a loan rather than additional taxation is to advocate the lesser of two evils. Additional borrowing is, at best, a disagreeable course, but it is less dangerous in its consequences at the present time than additional taxation. There is a likeness between the affairs of an individual and of a nation. If a man finds himself in an exceptional emergency he may be justified in living on capital for a short period. If reduction of expenditure is impossible, and if additional income can be earned only by a dangerous overstraining of his energy and resources, to live on capital may be the lesser of two evils. But it is an expedient which is in its very nature temporary, and when the emergency has passed, the normal standards of prudent finance should be immediately restored. The proposal that Eire should make use of its abundant credit to tide itself over a period of crisis in no way conflicts with the recommendations of the Banking Commission that, in normal circumstances, the Budget should be rigorously balanced, deadweight debt should not be increased and existing loans should be, at least partially, redeemed.

Hongkong and the Far Eastern Crisis

[FROM OUR HONGKONG CORRESPONDENT]

August 5th

As a direct result of the Anglo-American sanctions against Japan, Hongkong has joined the sterling bloc. For some time past, the position of this colony has been anomalous, for, although its close working relationship with China left no option at the outbreak of war but to remain with China outside the sterling area, the course of events has led to certain restrictions and the exchange market has been subject to a measure of control. The freezing of China's assets as well as those of Japan meant that Hongkong could no longer remain an appendage of China, and on August 1st the colony entered the economic fold of the British Empire.

The change over seems to be proceeding smoothly, and although there was much uncertainty for a day or two, it

is now clear that normal commercial transactions will meet with no serious obstacles. There will, of course, be close supervision by the Government, and, so far, experience of the control of trade instituted a few months back has not reconciled business houses and Chinese traders to the loss of their much cherished freedom to buy and sell as they choose. Certain local industries will directly benefit from the entry into the sterling bloc, as the markets of Malaya, which have been closed to Hongkong since the outbreak of war, will now be reopened. What will happen in the case of the large exchange of trade between Hongkong and Shanghai remains to be seen, but no doubt this will soon be adjusted. Presumably special arrangements will be made in regard to shipments from Hongkong to Free China via Rangoon, this trade having developed considerably since the reopening of the Burma Road.

It is a matter of regret that the surrender of the Vichy Government to Japan could not have been forestalled. While there is nothing but praise for the promptitude with which the British, American and Netherlands Governments acted in applying economic sanctions, there is little confidence here or in Shanghai that this action will have any effect on Japan's determination to bring Indo-China and Thailand within the Co-prosperity Sphere of Greater East Asia. It now remains to be seen how Japan reacts to economic pressure. The past week has produced many conflicting reports of the extent to which its trade will be penalised by Britain and America. First we were told that supplies of oil would be denied; then we heard that frozen assets would not prevent shipments of oil being made. Next came the announcement that America was putting an embargo on fuel oil and aviation spirit to areas outside the Western Hemisphere and British Empire, but as Japan was not specifically mentioned, this move could be given two interpretations. The general feeling here at the moment is that neither America nor Britain wishes to put the screw on too tightly. Yet Japan has recalled its great mercantile fleet from the high seas, and this sacrifice of

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

earning power suggests that the Japanese Cabinet are not likely to deviate from the course which has been set. The large-scale movement of troops in Manchuria is scarcely a sign of repentance for having chosen the evil way. At the same time, it is hard to believe that Japan has cast all discretion to the winds, and the Japanese Government may still imagine that the game of bluff, at which it has the advantage, can be continued for some time to come. The whole situation is bewildering, but, despite the jeremiads of American journalists at present gathered here in some strength, Hongkong refuses to be rattled, and pursues its daily course with no apparent concern for the peril which hovers over it. If Japan can no longer avoid open warfare with the democracies, we shall, of course, be isolated from the main defences of the Empire, but in view of the military and civil defence preparations which have been carried out so extensively during the past few years, we trust we shall remain intact.

Foreign Trade Drop

The trade returns for the first half of this year show the inevitable shrinkage due to reduced shipping facilities. Both imports and exports were 7½ per cent less than the corresponding figures for the first half of 1940, but, taking into account the big increase of costs, together with higher freight and insurance affecting import values, the volume of trade must have contracted appreciably. Nevertheless, a comparison with the three years previous to 1940 suggests that the falling off is not so serious as might have been expected, and, so far as local exports are concerned, there has undoubtedly been a marked advance.

	IMPORTS	EXPORTS
	(in millions)	
First half:		
1939	\$301.0	\$270.0
	(£18.5)	(£16.6)
1940	\$419.6	\$326.5
	(£25.9)	(£20.2)
1941	\$387.3	\$302.5
	(£23.9)	(£18.7)

During the second quarter of the year there was a further rise in the cost of living, and the official index for all groups shows a figure of 216.5, compared with 192.4 for the first quarter of the year and 173.3 for the whole of 1940. The basis year is 1922. Foodstuffs, as was to be expected, show the largest advance of individual groups, the average for the June quarter being 234.3, compared with 199.8 for the March quarter and 174.8 for the whole of 1940. But a more striking indication of the rise in the cost of living to the poorer classes is an official statement that the cost of food and fuel (chiefly rice and firewood) per head per week rose from \$2.43 in June to \$2.54 in July, compared with \$1.20 in July, 1937. Although the Government and the principal foreign and Chinese corporations and commercial concerns have granted high cost of living allowances, the bulk of the wage-earners are not so fortunate, and are suffering cruelly from the ever increasing rise in the price of necessities.

Price Control Measures in Canada

[FROM OUR OTTAWA CORRESPONDENT]

August 20th

THERE are increasing signs that, with full employment now in sight, sterner measures for the curtailment of consumption of goods must be taken if there are to be adequate supplies of labour and material for the commitments of the war programme. There are also indications that a comprehensive system of price control may soon be put into effect. The Wartime Prices and Trade Board has been transferred from the ægis of the Department of Labour to that of the Department of Finance, and it is expected that its powers will soon be extended to cover practically all phases of processing and distribution. It will work in close co-operation with the War Industries Control Board, which is also deeply concerned about the rise in prices of raw materials; and it is probable that these two agencies will be given the task of working out a scheme of price

control. The need for some such control, which would check agitation by workers for higher wages, has lately been emphasised by serious strikes in the coalfields of Cape Breton, at Arvida in Quebec, Hamilton and other places. The question of priorities is also becoming acute, and the Government has lately appointed a special board of steel experts, who will try to arrange an equitable distribution of the available domestic steel supplies.

The grain harvest of the prairie provinces began earlier than usual this year. Recent rains have improved the later sown crops, but the crop experts will not forecast a greater wheat yield for the prairie country than 270 million bushels, which would be little more than half the yield of 1940. This sharp decline in production cannot be regarded as wholly a calamity, because the Bureau of Statistics placed the carry-over of Canadian wheat at the end of the crop year on July 31st at 480 million bushels, which represented an increase of nearly 180 million bushels over last year's then record carry-over of 300½ million bushels; another large crop would have produced an almost insoluble storage problem. Canada has been represented at a conference held in Washington between delegates of countries interested in the wheat problem, and, while no official statement about its proceedings has been issued, it is understood that plans were considered for a division of the available export markets between the producing countries on a quota basis and the possibility of a free distribution of surplus stocks of wheat to impoverished countries after the war.

Letter to the Editor

Political Economics

TO THE EDITOR OF THE ECONOMIST

SIR,—A Note entitled "Political Economics" in *The Economist* of August 23rd discussed an article published in the Bulletin of the Institute of Statistics, Oxford, that dealt with the problems of wage stabilisation and prices in connection with the recent White Paper. The writer of the Note considers that the article in the Bulletin, in its discussion on possible wage policy, trespasses on politics instead of remaining in the fields of economics and statistics, hence the unusually worded heading of the Note.

But the writer in the Bulletin does not, as the Note states, "advocate continued bargaining for higher wages"; he only says that this is the legitimate field of trade union action. The writer points out the existing differences in wages, and says: "A wage stop decreed from above would tend to do more harm than good by preventing all those adjustments which, via the money incentive, would increase the war effort, and would do injustice to the present and future claims of workers on the national income." This is not politics in any injurious sense, but a statement of the effects to be anticipated from a policy. In his summary, however, the writer in the Bulletin approaches more closely to political terminology. "The democratic machinery for settling labour questions could be fully maintained. . . . Bargaining would be for a fair share in the present supply of consumers' goods . . . and . . . in national savings." "Fair" is not necessarily equivalent to "higher," but the argument of the article is that without general rationing fairness will not be attained.

Economics alone does not decide for us whether wage stabilisation or rationing are better solutions for the problem of war finance than inflation; it can only show us the implications of any particular measure, but the criterion of preference remains non-economic. If one is to contribute intelligently to the discussion of economic policies, one cannot ignore the interconnection between business and politics. *The Economist* has for many years stressed this interconnection. "Since its foundation nearly a hundred years ago," wrote Sir Walter Layton on his retirement from the editorship, "*The Economist* has never failed to stress the interplay of those two phases of public life." It is to be hoped that the derogatory heading of the Note is not a sign that this great tradition is to be discarded, and that *The Economist* will not view with disfavour attempts to show the political significance of economic action, if at some other time the Bulletin is concerned with these aspects.—Yours faithfully,

ARTHUR L. BOWLEY,
Acting Director.

Institute of Statistics, Oxford.

German Europe

Wages and Social Policy.—The promised reform of wages and social institutions has been abandoned for the duration of the war. Additional wages and social benefits may, however, be introduced if they help the war effort; the incorporation of large new territories made some adjustments necessary in any case. The characteristic features of Germany's wartime social policy, which were partly introduced before the war, are the conscription of labour, the prohibition of the free movement of labour and the wages stop. Wage rates remained unchanged, and weekly earnings fell as long as overtime payments were prohibited. After the full restoration of overtime and other payments in September, 1940, weekly money wages soon reached the level of August, 1939.

The fact that social benefits and wages are closely related at one time threatened the carefully planned system of wartime employment and wages. Encouraged by the authorities themselves, employers introduced many different kinds of individual social benefits in addition to the official benefits. Some factories formed additional old-age pension institutions, others paid during sickness the difference between wages and sickness insurance benefit. Big concerns introduced special family allowances. Kindergartens, works canteens and extra pay for deferred holidays were established. In short, every possible means of increasing wages was tried out for the purpose of keeping workmen or attracting badly-needed recruits.

No general stop could be put on this policy, and the Ministry of Labour, in collaboration with the German Labour Front, was forced to generalise these individual policies. First, the employment of factory doctors was made compulsory; and the Labour Front took control of works canteens and of working conditions with the purpose of preventing these virtual increases in wages. At the same time, the increasing employment of women raised new problems. Married women with children were either employed for half-days or given a free Saturday every week. They were given holidays when their husbands were on leave from the Services. The widespread separation of families compelled the institution of separation allowances.

Yet the main problem remained unsolved. The wages stop seriously threatened the efficiency of workers, which was first experienced in the coal-mining industry, where an all-round increase in wages became necessary. This was followed by improved benefits under the health and old-age insurance for miners, which is still a separate part of the State insurance. The pressure in other industries remained; and in May, 1941, conditions under the general sickness insurance were also improved. The latest measure was the increase in old-age pensions decreed on July 30, 1941. These increases, however, only restored the reductions made during the economic crisis in 1930-32.

There is no doubt that the old-established system of social insurance has mainly been used by the Nazi regime as a source of public borrowing and a means of additional taxation. Unemployment, for example, virtually disappeared a long time ago, but contributions are still paid at the excessive rate imposed during the economic crisis in 1930-31. By the extension of compulsory insurance to higher incomes, the yield from contributions increased considerably. Private life and sickness insurance institutions are already complaining about State competition. The Labour Front, on the other hand, has grown into a big insurance company. It interferes everywhere with the old-established State insurances, which lack centralisation. There are three different old-age insurances—for miners, for all other industrial and agricultural workers, and for clerical or black-coated workers who receive salaries. There is the separate workmen's compensation organisation, sickness insurance, and, lastly, unemployment insurance. Benefits are frequently below subsistence level and the public welfare organisation of the communes had to assist 1,384,000 persons in September, 1940. Lastly, there is the purely Nazi organisation of "winter help," which distributed money to roughly 400,000 persons during the last winter in Berlin alone. Marriage and child allowances round off the picture of Germany's social policy.

Social policy is closely linked to the control of labour. Vocational guidance is now compulsory and dates back to 1925-26. The training and re-training of adult workers is practised on a large scale. The occupational competitions held of apprentices and the so-called factory competitions held by the Labour Front must be regarded as substitutes for the

incentive normally provided by rising wages. The preventive health services, mainly established in the armament and munition industries, have been greatly extended since the beginning of the war; they include regular medical examinations, X-ray treatment and the distribution of vitamin tablets.

Dividend Stop.—After more than three months' discussion, a general dividend stop, limiting dividends to 6 per cent, was decreed at the end of June, 1941. The dividend stop replaces the Loan-Stock Law, which was repealed shortly before the war, when the so-called "new financial policy" was introduced. The German Press makes it clear that the stop was accepted mainly because of psychological reasons. It was felt that some limitation of dividends was necessary as an addition to the price and wages stop. The decree makes provisions for a general adjustment of the capital of under-capitalised companies. The issue of bonus shares is expected to relieve the shortage on the bourses, where share quotations are still booming.

Railways.—During 1940, the German state railways were greatly extended by the acquisition of some private railway companies and the incorporation of French, Belgian, and Luxembourg territory. The financial results of the year show substantial increases indicating the heavy demand of military transport and greater economic activity:

	Income		Running Costs		Gross Profits
	Total	Passenger	Goods	Costs	Profits
1938	5,134	1,432	3,356	3,926	372
1939	5,813	1,690	3,771	4,520	468
1940	7,603	2,430	4,720	5,435	473

There was a much larger increase in passenger income than in goods income. It would be wrong, however, to assume that these figures indicate the actual development of traffic. The greater part of freight rebates were abolished, and the number of passengers using the more expensive classes of travel increased. Total income increased by 30.8 per cent, but running costs by only 20 per cent. Capital expenditure for the replacement of tracks, buildings and rolling stock amounted to Rm. 1,695 millions, against Rm. 455 millions in 1938, and Rm. 825 millions in 1939. These figures show that the long-delayed programme of renewing tracks and rolling stocks was well under way in 1940.

Consumers' Co-operatives.—The awkward problem of the consumers' co-operative, in which millions of workers had invested their savings, has been suddenly solved by a decree which makes more than one thousand co-operatives, comprising some 12,000 retail centres, the property of the Labour Front. Dr. Ley, the Front's leader, has stated that it has proved impossible to change the co-operatives into independent retail shops, as was decreed in 1935. Serious discontent among the members would have developed, and industrial districts would have lost efficient distributing organisations. They are still necessary to-day, but the Nazi Government considers their collective basis an unwanted privilege of the members. So Dr. Ley simply took over their assets, which he called a capitalist power. After the war the retail centres will be given to demobilised soldiers; and the necessary capital will be lent by the Labour Front.

Closed Down Industry.—Shortly after the war began the co-operative financial help for closed-down or curtailed civilian industries was introduced by imposing a levy on the whole of industry. In June, 1941, a fund amounting to Rm. 35 millions had been accumulated, of which only Rm. 8 millions had been distributed. The trustees of the fund expect, however, an increasing demand because of further reductions in the civilian sector of the industry. Even among the independent artisans there was little demand for financial help. The retail and wholesale organisations granted assistance to 1,800 members for maintaining the rent of shops. Applications for financial help came mainly from the textile and clothing industry, from motor-garages and from the furniture industry.

THE BUSINESS WORLD

Brewery Shares and Morale

THE balance sheets of British breweries, published during the last few weeks, make a showing which affords a remarkable contrast to the popular impression based on the undoubted existence of intermittent "shortages" of the industry's product. Lately, there have been a number of places where "those who stood before the tavern shouted: 'Open wide the door'"—and sometimes unsuccessfully. A visitor from Mars might have concluded that the brewery industry, in this war, was as other consumption trades, whose output had been cut to a fraction of its pre-war size, in the national interest. Actually, beer consumption, like tobacco consumption, has recently been running appreciably above its pre-war level. Such unsatisfied local demand as is not due to temporary and local transport difficulties has resulted from the fact that in wartime the national appetite for beer seems virtually insatiable.

It is, indeed, fortunate for the industry that the authorities have apparently accepted the view that beer, like tobacco, is less a consumable product than a factor in wartime morale. "Concentration" in the industry has been going on for many years, both on the production and the retail selling side, but it has certainly not attained anything like the Draconian character of the policy enforced on, say, the textile trades. Wartime experience, in fact, has shown that the industry's difficulties have little to do with quantitative restriction, but are attributable to two quite distinct factors. The first, common to all units in the industry, is the increasing level of costs. The second is the unequal incidence, in a highly localised industry, of enemy bombing and civilian evacuation. The really prosperous areas of the country at the present time, from a brewing point of view, are the munition-making areas, where local brewers frequently cannot cope with a demand which may be anything up to twice as great as in pre-war days. In the more heavily bombed areas, particularly in London, while the falling off in demand has not reached anything like catastrophic dimensions, purely physical difficulties have been quite considerable, and have left their mark on the earning power even of the largest companies, despite the existence of a mutual arrangement between producers to help each other, by way of supplies, to the utmost practicable extent.

Nevertheless, the accounts of those breweries whose financial years run, in most cases, to June 30th, show that the leading feature of brewery finance in peacetime—relative stability of profits at a fairly high rate on equity capital—has not so far been really seriously modified by war conditions. The table opposite, which includes companies operating in the north and north-east of England, in the London area and in Wales, as well as the all-embracing Guinness organisation, is equally noteworthy for the relatively strong resistance to depression shown by earning power in the badly-hit areas, and the absence of any striking expansion in the war-prosperous areas.

Stability, indeed, appears to have been the keynote of brewery finance in recent months. Few of the companies appearing in the table disclose their working expenses, but the single exception to that rule—Watney Combe—showed a rise from £827,000 to £948,000 between 1938-39 and 1939-40, followed by relative stability in 1940-41, when expenses of £932,000 were disclosed. Similarly, the stock-in-trade figures of the seven companies, on balance-sheet dates in 1939, aggregated £2,890,000. A year later, the figure had risen by 33 per cent to £3,840,000. The 1941 stock-in-trade total, however, showed a further rise of only 1 per cent to £3,883,000. This argues a creditable and successful adjustment to wartime conditions, which would seem to have been carried through, in large part, during the earlier months of the war. In this respect, the industry has been helped by the forbearance of the Chancellor, who last April was content to leave the beer duty at twenty-one times the 1914 level, after having increased it in his Emergency

* After allowing for 1 year's Preld. Ord. Div. only.

Budget of July, 1940. The industry is undoubtedly making a formidable contribution to the Exchequer—much the highest, indeed, in its long history as a mainstay of the national revenue. But the larger part is being paid by the consumer. As the above table suggests, the industry is well placed in the matter of EPT, thanks to the fact that many of Britain's heavy industries, which largely provide brewing with its "marginal" customers, were more active in the base period than they had been for many years earlier. Some breweries are paying not EPT but NDC, and the undoubted increases in the total taxation which the companies are paying on their own profits come mainly under the heading of higher income tax.

All in all, investors may expect conditions to become more rather than less difficult as the war continues, but there is certainly no likelihood at the moment of any serious deterioration in earning power. The means by which the industry has achieved a slightly higher output from a slightly diminished supply of raw materials, since the war, may be inferred by consumers who remember what happened to average "strengths" in the last war. Against the higher costs of materials like malt and hops—and coal—the industry has been able to make considerable reductions in advertising expenditure, while the expensive (though progressive) policy of rebuilding and modernising licensed houses has had perforce to be suspended. But so far, the Government has resisted all pressure for a significant reduction in the quantities of essential materials available for brewing, particularly sugar and grain, which are in limited supply in the country as a whole.

Among the industry's difficulties, probably the shortage of labour is potentially the most serious. The nature of the work puts a definite limit on the extent to which called-up workers can be replaced by over-age men or by women. Transport is another difficulty on the physical side. Financially, the industry is a heavy contributor under the War Damage Act, and payments under this head will leave their mark on representative company accounts for the next five years at least. There seems, in fact, little likelihood that brewery dividends will increase during the war. Directorial policy, exemplified by the latest distributions, is likely to be increasingly conservative, and from that angle the recent rise in the market values of leading brewery shares is somewhat anomalous. As recently as the end of last April, the Actuaries' Index of brewery share prices (December 31, 1928 = 100) stood at 84.6, the average dividend yield on the twenty constituent shares being 6.89 per cent. By the end of last month, the price index had risen by 22 per cent to 102.9 and the average yield had dropped to 5.61 per cent.

The market, in fact, seems to be putting a fully adequate valuation on the favourable factors in the industry's outlook, without, possibly, laying equal stress on moral (as distinct from financial) factors. Directors have every inducement to keep dividends under strict control at a time when too effective a suggestion of prosperity might leave the

industry open to unwelcome attentions from Government control or generate unfavourable public opinion. Selective investment in brewery shares at present prices may have much to commend it, but that would not necessarily hold if values were to rise much further—as, to judge by the current tone of the market, they seem likely to do.

Finance and Banking

Bond Dealings in Lombard Street

The discount houses have during the past week enjoyed one of the most active bond dealing periods since the beginning of the war. The establishment of a real two-way market in National War Bonds has made it possible for them to unload some of their appreciable holdings of this security. The market seems to have joined the banks in swelling the last-minute applications for National War Bonds, and their participation in this movement no doubt helped to explain the exceptional stringency in the money market during the latter part of August. Now that the price of this issue has floated well off the basic figure of par, the whole market in shorts has sprung into more active life than it could claim as long as the War Bonds were available on tap. The market is now beginning to anticipate the terms of the next tap issue, and the general consensus of hope is that another 2½ per cent issue will make its appearance with perhaps an increase of two years in the currency to allow for the improvement which has taken place in the market for shorts since the tap for War Bonds was turned off. The need for a fairly early introduction of the new loan is indicated by the fact that this week the banks have been asked to pay £45 millions by way of Treasury deposits. This is against nominal maturities of £40 millions, but actual maturities probably well below this figure. Despite these heavy payments, the banks have been keen buyers of bills, thus indicating the complete return to abundance in bank cash which has taken place. The market obtained another generous allotment of Treasury bills at last week's tender, namely, 41 per cent, and has thus been in a position to feed the banks' appetite, though, it should be noted, not to the point of satiety. The exceptional ease of credit is reflected in the latest Bank return, which shows an increase of £11,099,000 in bankers' deposits, raising them to the abnormally high figure of £133,775,000. This is the result of heavy Government disbursements, which have drained public deposits by £5,223,000 to £9,274,000, and which have necessitated ways and means borrowing evident in an increase of £9,430,000 in Government securities. On the evidence of these figures, the appearance of the next Government loan ought not to be long delayed.

August Clearing Bank Statements

The outstanding volume of bank credit remained comparatively stable during August. The clearing banks' deposits over that month rose by £6,318,000 only, but established themselves at a new record within £3,000,000 of the £3,000,000,000 mark. Within this stability, however, there was a considerable redistribution of assets. As was to be expected, the main movement is the further increase in investments, reflecting the heavy bank subscriptions to

National War Bonds in the final days of their tap issue. They have risen over the month by £32,700,000 to £935,177,000. For the counterpart to this movement, one turns to the item of Treasury deposits, for it has been generally assumed—and was suggested by the August debt return—that these bank subscriptions had been largely financed by the recall of Treasury deposit money. The latest return shows a reduction of £7,500,000 in this item. As in this period there were no maturities, and the banks were asked to pay £30,000,000 of additional Treasury deposits, it may be assumed that not only were the banks' subscriptions fully covered by such encashments of deposits prior to maturity, but that additional encashments were made in order to cover clients' subscriptions to National War Bonds. Advances continue their long-term decline, the past month showing a reduction of £15,357,000 in this item. Their total is now some £97,000,000 below that of investments. The August returns show a fairly comfortable cash position; this item was nearly £10,000,000 up on the July figure, and its ratio to deposits up from 10.24 to 10.55 per cent, figures which do not altogether accord with the evidence of stringency apparent at the time when the banks were making up for their August statements.

Chinese Exchange Agreement

The highly intricate exchange problems arising out of the conjunction of British and American freezing of Chinese assets with the combined effort of the two countries to stabilise the exchange value of the Chungking yuan have this week been brought nearer a makeshift solution. The coincidence of these two elements in the Chinese exchange situation has in a way facilitated the search for a solution, since the freezing of Chinese assets (a move aimed, of course, at the Japanese) has made possible some control of the sterling and dollar accounts of Chinese residents, including those of the crucial Shanghai Settlement. Without such control, Anglo-American help for the yuan could hardly fail to strengthen the exchange resources of the Japanese or their puppet authorities in China. What has now been achieved, as a result of prolonged negotiations in Hongkong between representatives of the new Stabilisation Board and the "authorised" banks in Shanghai, is a voluntary undertaking by these banks to desist altogether from operations in the free market in exchange for an undertaking by the Stabilisation Board to provide them with dollar and sterling exchange at fixed rates and within certain limits in respect of permitted imports. The rates fixed are 3 5/32d. and 5 5/16 cents to the yuan. The authorised banks are the fourteen Chinese, American, British and Dutch institutions licensed to deal in foreign exchange under the recent freezing order. It will be noted that the method chosen to obtain the co-operation of the Shanghai banks in working the new control is somewhat reminiscent of the voluntary undertaking of the American banks last year to freeze out the free market for sterling in New York and abide by the official rates.

The rates for the yuan fixed by the Stabilisation Board give a cross dollar-sterling parity of \$4.04 and thus eradicate the discount on the official dollar rate, at which sterling has since the beginning of the war been quoted in the Shanghai market. By licensing each transaction in respect of which dollar or sterling exchange will be granted, the Stabilisation Board will virtually ensure that none of the exchange disbursements which it makes finds its way into Japanese or Japanese-controlled channels. In the past all the efforts to support the yuan had to be made in a free market, in which it was well-nigh impossible to ensure that the exchange so expended did not ultimately find its way to one of the Japanese-sponsored banks whose currency was endeavouring to oust that of the Chungking Government. That possibility

is now effectively removed. A free market in foreign exchange will probably remain in Shanghai, but it will be one in which none of the reputable international banks in that centre will operate, and should rapidly become a shadow of what that market has been in the past two years. This throttling of the Shanghai market will close the only important remaining gap in the cordon around sterling exchange control. The efficacy with which the new Stabilisation Board will begin its operations more than makes up for the delay which was allowed to elapse in getting it started.

Insurance of Food and Supplies

The report recently issued by the Committee of Public Accounts discusses the arrangements for fire and marine insurance of raw materials and foodstuffs, concluded early in 1940 by the Ministries of Food and Supply. The Committee recall that it is not the normal Treasury practice to insure Government property; an exception was made in the case of commodities purchased in peacetime for private use but handled during the war by the Ministries of Food and Supply, because the withdrawal of these insurances might have reacted adversely on the machinery of the London insurance market. No criticism is offered of the fire insurance arrangements; comment is directed towards the marine contracts and covers two points—the method of assessing values and the rates of premium. Concerning values, the Committee question the propriety of following normal trade practices and fixing values in excess of landed costs, to cover such items as administrative expenses, remuneration to distributors, inland transport and storage, and reserves; they recommend that this particular aspect be considered during the general review of the policy of fixing prices of controlled war materials. In the matter of rates, the Committee express the hope that "full information will be available next year as to the outcome of the business, and that some investigation of the books and records of the undertakings will have been carried out in order that it may be possible to judge whether the Government contribution is not more than is reasonably necessary to secure the national objects on which the policy is based." These observations have caused some surprise in marine underwriting circles, where it is pointed out that marine insurance policies are "valued" contracts, so that if insured values are high, claims are in proportion. Furthermore, the Government contracts, on the first year's operations, have been anything but profitable to underwriters, a circumstance so well known that it is hard to understand how it can have escaped the notice of the Committee. It seems a pity that, in a public report of this kind, the suggestion has been made that the Government are paying underwriters more than is necessary if in fact the reverse is the true position.

Workmen's Compensation Rebate

Employers insured against workmen's compensation liabilities with companies which are members of the Accident Offices Association are to receive a rebate of 7.14 per cent of premiums for the year 1940, in accordance with the undertaking entered into with the Home Office. This rebate represents the difference between the ascertained loss ratio of 57.86 per cent and the agreed figure of 65 per cent, and compares with a rebate of 2.73 per cent for the year 1939; over the whole period since 1924 during which the undertaking has been in force, the allowance has varied between 2.16 per cent and 14.32 per cent. On this occasion employers derive some benefit from the upward adjustment of the agreed loss ratio, from 62½ per cent to 65 per cent, which was arranged last year, when rates were increased by 10 per cent to meet the higher rates of compensation provided for by the Workmen's Compensation (Supplementary Allowances) Act, 1940; the adjustment takes into account the fact that, by spreading their fixed costs over a larger volume of premiums, insurers are able to work at a lower expense ratio. While the undertaking is an effective method of ensuring that the companies' profits are kept at a modest level, it is not a particularly sound arrangement, since it fails to recognise that an insurance company provides service as well as indemnity, and by spending money on safety work fulfils just as important an economic and social function as in paying claims when they occur. Adherence to the fixed ratio of 65:35 for claims and expenses respectively does not appear to be a system calculated to en-

courage the offices to increase their expenditure on accident prevention, for any ensuing reduction in claims would involve a lower allowance for expenses, and thus tend to eliminate any small margin of profit which may still remain in the business.

Indian Silver for Thalers

The coinage demand for silver in the last few months has been fairly consistent and certainly greater than the amount which could have been accommodated by the arrival of newly mined silver in the London market. These imports consist in the main of Australian silver and have been about sufficient to cover the commercial and industrial demand for silver, which now makes up the sum total of the turnover in the silver market. The coinage demand, of which a considerable part has been for the minting of Maria Theresa thalers, has been satisfied direct by sales from Indian Government stocks. These sales are now handled by the Bank of England, acting on Treasury account. They have eaten sufficiently into the London stocks of the Indian Government to bring to the fore the question of some replenishment of these stocks by direct imports from India. There is ample silver in India from which such replenishments could take place. The last published figure of Indian Government stocks was that for March 31, 1940, when 112,000,000 ounces of silver were held. Since that time there have been fairly heavy sales of silver in the Bombay market on Indian Government account, but on the other hand there has been a reduction in the silver content of new rupee coin, and this has probably swollen the stocks of demonetised silver held on Government account. Any deficiency in London stocks of silver could also be made good by increasing the imports from sterling area countries. Australian exports to this country, for example, could be appreciably increased; but this problem is obviously one of available shipping tonnage and it will have to be treated from that particular angle. Meanwhile, the London open market remains exceptionally quiet, with a cash price which adheres firmly to the ceiling of 23½d. established by the continued readiness of the Bank of England to sell Indian silver at this figure.

Irish Banks' Returns

The returns for the banks operating in Eire for the June quarter, published by the Currency Commission, are as follows:—

	(£000)		June Quarter 1941		
	June Quarter 1940	March Quarter 1941	In Eire	Else-where	Total
LIABILITIES					
Capital, reserves, etc.	17,551	17,591	10,381	7,217	17,599
Notes in circulation	10,798	12,745	5,306	8,115	13,421
Current deposit and other accounts	167,939	174,961	131,844	49,295	181,139
Other liabilities	5,871	7,461	5,161	2,021	7,182
Total	202,160	212,760	152,693	66,648	219,341
ASSETS					
Cash and Balances with London	21,265	25,722	10,018	18,580	28,599
Agents and other Banks	8,241	12,297	...	12,514	12,514
Money at Call and Short Notice	5,663	4,888	4,327	604	4,930
Bills	73,767	70,784	46,044	22,401	68,445

Investments:—(a) Government	10,294	10,378	4,138	5,961	10,100
(b) Others	8,387	9,166	4,537	4,634	9,171
Other Assets	...	...	...	...	...
Total	202,160	212,760	75,745	143,596	219,341
Excess of Assets outside Eire over Liabilities outside Eire	65,954	73,994	...	...	76,947

Irish banking has developed a well-marked trend analogous to that of banks in other parts of the sterling area. The large increase in resources has failed to find employment in the more remunerative category of assets, and the banks have been forced to hold many assets yielding a relatively low return. The liquidity of the banks has been naturally increased, partly because some of the new deposits are regarded as temporary and liable to early withdrawal. No Government bills are held in Eire and only £16,000 elsewhere. The increase in the net sterling assets continues. While this trend is satisfactory from the purely monetary point of view, it, unfortunately, reflects the great difficulty of obtaining imports which is inflicting severe inconvenience in Eire.

Investment

Rise in Funds Resumed

Between July 9th, which was a temporary peak for gilt-edged stocks in general, and September 3rd, eight weeks later, the general trend in this market was irregular. There were substantial relapses in Old Consols, the longer-dated Conversion loans, Local loans and Victory bonds, and smaller improvements in the rest of the market, including the "shorts." It is difficult to find a rational explanation for these diverse movements. The turnover in the market was, in general, small, and they probably represent a series of rather imperfect adjustments after the sustained advance. The past week has produced a general and well-sustained rise throughout the Consol market, with improvements of ½ point and over in the longer-dated stocks and a relatively more marked rise in those of shorter date. Of the latter, both series of National War Bonds are up by at least 3/16 point, while the general advance has made the 3 per cent Savings Bonds, the only Government issue on tap, the cheapest of this class. It is reasonably certain that, except for "shorts," the clearing banks have come back into the market. The figures of these banks for August and of changes in the debt suggest that their operations may have been restricted to conversion of Deposit Receipts into War Bonds in the first half of the month. Since the beginning of September, the amount of new Deposit Receipts they have been called upon to take up does not appear to have been great, although it must considerably exceed the difference between new issues and those of six months before. However large it is, the banks have had plenty of money to buy bills on a fair scale and to lend all the market required. It will not be surprising, therefore, if they have been in the market for modest amounts, which would be quite sufficient to account for the rise in prices, especially as this has been assisted by advance investment of next month's disbursements on requisitioned Canadian stocks. The familiar sequence of events is thus in train once more. The pressure of plentiful money is already lifting prices above the levels at which they have been more or less stationary for some weeks past. The rise is not yet sufficient to warrant talk of a fresh tap issue, but the ground is being prepared. The other features of the week were speculative buying of developing Kaffirs—a gamble on the domestic politics of the Union—and a general strength of South American investments, arising out of developments some of which were mentioned in *The Economist* of a week ago. Neither of these developments owes much to the rise in the Funds or to general considerations making for optimism at home. The middle of the week saw, however, the beginning of the upward drag on equities, which follows every rise in the Funds, in a rather more buoyant tone in a number of sections. It seems probable, however, that any general rise in ordinary shares should be treated with caution.

Company Law Anomaly

Section 225 (1) of the Companies Act, 1929, makes it clear that the only circumstances in which a company can be placed in voluntary liquidation by a simple majority of the members is the occurrence of an event, specifically provided in the articles of association as being due to terminate the life of the undertaking. In all other circumstances, either a special or an extraordinary resolution is necessary. It is in fact quite clearly the intention of the Act that special precautions should be taken that a very substantial majority—not less than three-fourths—of the holdings should favour liquidation before it can be pressed upon the minority. Marvin and Co. (Brazil) own, as virtually their sole earning asset, a Brazilian subsidiary for which they received an offer. This offer was placed before the shareholders as an ordinary resolution, and passed by a considerable majority, in the face of opposition from influential interests, who thought the terms insufficiently attractive, and considered it wrong that it should be submitted as an ordinary resolution, to be passed by a simple majority. The majority secured amounted to some 58 per cent against 42, far short of that required for a special resolution. The purpose for which the company was formed no longer exists. It will be necessary either to sanction the carrying on of a new business, for which the capital was not originally subscribed,

or, more probably, to consent to a liquidation. This simple procedure—available to any holding company—appears completely to remove the protection which it was desired to give to any substantial minority of holders in the matter of liquidation. The fact that, in this particular case, there was little chance of effectively resisting a sale supported by the Brazilian authorities does not affect the principle.

Hudson's Bay Meeting

The meeting of the Hudson's Bay Company, at the end of last week, resulted in a victory for the board on a show of hands by the very meagre attendance. It had been opened by the announcement of a crushing majority for the board in proxies, but this did not prevent a number of members from delivering highly critical speeches. *The Economist* has always called for greater activity on the part of shareholders, and has continuously advocated more informative reports and accounts. The shareholders owe a debt to Mr C. L. Nordon, the leader of the opposition, and to some of his collaborators, who may claim some share in the credit for the better accounts now presented. But perhaps the proprietors' largest debt is on account of the part he played in securing the election of a new board ten years ago, which still holds office. In that decade the fortunes of the company have been partially restored, but the standard of criticism at the company's meetings does not seem to have shown a parallel improvement. Mr Nordon is probably right in several suggestions, aimed at increasing the interest of individual Canadians, or the whole of the Dominion, in the affairs of the company. Whether his programme would be practicable in the form in which he put it forward is a matter of which only experts can judge. These points tended, however, to be obscured by a mass of criticism of detail which, in so far as it concerned the published accounts, did not always reflect a desire to make the fullest use of the material provided by the board. It is clear that the board has a long row to hoe before the company is again prosperous, and that much must depend on matters beyond its control, such as the solution of the problem posed by the fall in the price of Canadian wheat, coupled with the shrinkage in the demand. It is also very probable that organised criticism will help to keep the management healthy and active. But criticism should always be restricted to points of real importance, and the critic should, to carry weight, use to the best of his ability all the facts bearing on the point at issue. This would save not only time, but a great deal of emotional strain, the waste of which was only too painfully evident at last week's meeting.

Dutch Coupon Payments

It has always been recognised that the suspension of payment by the Netherlands Government in London of interest on its loans was due solely to the desire to keep the proceeds out of the hands of the enemy. The suspension

took place a year ago, when the business of registering all holdings outside enemy, or enemy occupied, territory in the hands of non-enemy nations was begun. This has needed longer than was expected, since holdings proved to be more numerous than was thought probable. It is, however, now completed, and the Netherlands authorities have announced that payment for all coupons, subsequent to May 15, 1940, will be resumed at an early date. There are a number of loans involved, all in florins, several of which are or were quoted in London, although business in them has been virtually non-existent of late. As a basis for negotiations, a price of 50-60 has recently been made for the 3 per cent loan. Payments will be made at the prevailing Batavia rate of exchange in the case of sterling, dollar and Swiss franc holdings. Coupons held in the United Kingdom should be presented not earlier than Monday and payment is likely to be deferred for a week or two.

Company Notes

Textile Export Earnings

Shareholders in Whitworth and Mitchell are to be congratulated in that the demand for the company's fabrics has been so well maintained as to permit of a further increase in earnings for the year to June 30th last. Total income, before tax, at £112,572, compared with £107,072, and is the highest since 1932-33. Taxation calls for £45,000, against £40,000, while ARP outlays are almost trebled at £4,490. The amount earned for the ordinary shares is reduced from £31,200 to £28,916, but the distribution and percentage earned are both unchanged at 7½ per cent and 8.7 per cent respectively. This satisfactory result owes not a little to a substantial expansion in the proportion of export to internal business. The board intend to do all in their power to increase this proportion, but their success will depend, *inter alia*, on the development of the shipping position. During the year, a part of enemy and occupied country debts has been paid, and this, as well as the first indications of a reduction in turnover, helps to account for a decline of some £59,741 in debtors. Against this stock-in-trade has risen by £94,274. This is mainly due to increased prices, although the valuation is on a conservative basis. To the extent that it is not covered by reduction in debtors this expansion is financed by a rise in creditors. The immediate future of the company must depend in large measure on the extent to which the export trade can be increased, or even retained. This will be largely conditioned by Government policy, and it has been clear for a number of months that, in general, the post-war position is being left to look after itself, a regrettable necessity in view of the short supply of shipping. It is, however, not clear that this general policy is of universal application. In particular, it appears to be the case that exports to the U.S.A.—producing hard currency, helping to fill ships which would otherwise return in ballast, and supplying American wants—will be tolerated, if not encouraged. There will still remain the questions of supplies of raw materials for the British exporter, and of coming cuts in U.S. consumption, but it appears that Marks and Spencer, to take an outstanding example, are continuing the business of their export subsidiary in the U.S.A., and with a large measure of success. It is unnecessary to stress the value to the country of such new business, and it is clear that it should be encouraged to the extent that it does not clash with more immediate and vital needs. The Marks and Spencer venture is, however, a highly specialised experiment, backed by the enterprise which has brought that firm so rapidly to the fore. It is not certain that the organisation of other concerns is as well adapted to compete in this promising new market, or that their specialised products are wanted there. The £1 ordinary shares of Whitworth and Mitchell, at 12s. 6d. ex dividend, yield some £12 per cent, an indication that there are considerable doubts as to the immediate future, whatever the post-war period may hold.

Great Universal Stores Improvement

After the very sharp reverse in the fortunes of the Great Universal Stores in 1939-40, the group secured a modest improvement in the year ended March 31st last. Trading profit rose only from £480,943 to £489,001, but depreciation was less, and although debenture sinking fund

and war damage contribution appear for the first time, ARP expenditure called for nothing, and the amount earned for ordinary capital is equivalent to 14.1, as against 12.6 per cent, including in each case the undistributed profits of all subsidiaries. The earnings of the group and their allocation for the past three years are set out in the table below:—

	Years ended 31st March		
	1939	1940	1941
<i>Consolidated Figures</i>			
Trading profit.....	614,391	480,943	489,001

* Including shares of subsidiaries not held in the group.
† Including change in carry forward of subsidiaries.
‡ On present capital doubled by bonus in January, 1940.
§ In 1939 £80,559 and in 1940 £22,000 were charged against reserves.

The consolidated balance-sheet shows a small decline in fixed assets, while floating assets fell by £426,923 to £2,911,906, a rise in cash being more than offset by falls in stock and debtors. There is, however, a larger fall in liabilities, and the net excess of cash assets is £1,589,396 against £1,481,313. Stocks, although still substantial at £1,406,476, must have fallen substantially in terms of goods, and the past five months have brought further restrictions. Despite this, the managing director is able to report that the position of the group is being maintained, while the chairman states that the outlook for the chain store company is favourable. The reduction in debtors is an indication that, despite difficult times, payments are being regularly met. One factory was surrendered to the Government during the accounting year, and is likely to make an even smaller contribution during the current period. Although the year is likely to be a difficult one, the board appear to anticipate that profits will be maintained. The fact that the 5s. shares stand at 8s., giving a yield of £7 16s. 3d. per cent, suggests some doubts as to so fortunate a result.

Chosen Corporation Disclosures

Appointed by the Board of Trade in October, 1938, to investigate the affairs of the Chosen Corporation, Sir Harry Peat was able to present a report in July of this year, which was delivered to the applicant, Mr F. E. Banbury, towards the end of last month. It may be recalled that the corporation owned, *inter alia*, two concerns, Nurupi and Kalam, conducting mining operations in the Far East. It was out of the sale of shares of the former company, and the refusal of the board of the corporation to make a return of capital, that the application arose. The report, however, covers many other matters, and, from the summary so far published, it appears that, in most of these, the position is considered unsatisfactory by Sir Harry. The impression gained is that the structure of the group was more complex than was supposed and that relationships between units were not made clear to shareholders, as they should have been. Further, not all the directors insisted upon having precise information as to some of these concerns. Sir Harry is not satisfied that certain shares were issued for adequate consideration; that a sale of shares ought to have been cancelled; that the Gódo company was independent of the group at a crucial time; that the liquidators of Nurupi acted properly in certain matters; and so on. This curiously negative method of reporting has been thrust upon the Board of Trade's inspector by the fact that Mr Rubinstein, managing director of the corporation for several years past, and the present chairman, Mr Miller, failed to answer questions—and because, generally, the information and explanations given by the directors were unsatisfactory. Since the date of their examination, further particulars of the Nurupi accounts, as yet uncertified, have come to hand, which would make possible a more searching questionnaire than was possible at that time.

In these circumstances it is not clear why the investigation has been stopped at this point. Two possibilities suggest themselves, however: that it is thought desirable to proceed with the realisation of the American assets; and that the inspector found himself unduly hampered by the inadequate powers conferred under Section 135 of the Companies Act, 1929. This provides that officers and agents of the company shall answer questions and produce books, and that, if they fail to do so, they may be punished, after due inquiry, by the somewhat cumbersome procedure of an action for contempt of court. It is, however, not apparent that either the company's solicitor or its bankers are brought within the category of those who may be questioned, nor is it clear to what extent the officials and agents of subsidiary and associated concerns are included. These are points at which the section must be strengthened at the earliest opportunity. In the present instance, the completion of the investigation is further impeded by the fact that much of the information would have to be sought in the Far East. Pending a fuller study of the report and exhibits, it is difficult to say whether further investigation is necessary. The latest accounts suggest that in any case there is little or no reason for continuing the existence of Chosen Corporation, since the principal asset of any real value is, or was, an advance in dollars to a subsidiary. It will be surprising if, now that the report is available, pressure for liquidation is not intensified, while it is understood that further action is contemplated by the applicant.

Calico Printers' Earnings

In some quarters there was disappointment at the news that preference shareholders of the Calico Printers' Association were to receive only one year's arrears of dividend out of the earnings of the period ended June 30th last. This is the same as the distribution of the previous year and leaves 3½ years' arrears still to be met. The preliminary statement of results shows a profit, after providing for depreciation, of £220,565, £335,395 against £355,671 for depreciation, of £220,565, which appears to compare with £251,970. After meeting dividends, the appropriation of £50,000 to war contingencies reserve is maintained and the carry forward raised from £91,193 to £110,933, the previous year's increase having exceeded £51,000. In all the circumstances, it is difficult to arrive at any other conclusion than that the result is satisfactory. The accounting periods of the operating companies end somewhat before the middle of the year, but they are late enough for the bulk of the period to coincide with the closing of European markets, and to have covered part of the regime of increased control of output for domestic use. The latter factors will be accentuated during the current year, while there is little hope of exports improving, even if they can be maintained. In these circumstances, it is not surprising that the £1 stock units of the 5 per cent cumulative preference capital stand at 12s. 6d., giving a return of some 8 per cent, ignoring accumulated arrears nominally worth 3s. 6d. per unit.

Triplex Glass Recovery

Preliminary figures of Triplex Safety Glass for the year ended June 30th show that the company has made an almost complete recovery from the slump of the previous year. The only figure provided is one of profit before tax of £159,617 against £72,349 for the previous year and of £163,489 for 1938-39. Some idea of the effect of taxation and of other special war charges may be gained from the fact that the dividend on the ordinary capital, although doubled against last year at 10 per cent, compares with 20 per cent for two years ago. The improvement is in line with the chairman's comments at the annual meeting a year ago, when he disclosed that a factory, which had been making a loss, was again on a profitable basis, and that matters which might have caused a drag on future earnings had been dealt with. The company occupies a dominant position in the relatively new industry of safety glass manufacture, having obtained control of Lancegaye, one of its more successful competitors. There can be no doubt that there is a large demand for its products from the Services as well as from such other motor transport as continues to function. Profit per unit is apparently satisfactory, although earnings are far below the best period of the company's history, 1936-38. The outlook for the war period thus seems

fair, while there should be a further revival in demand when peace comes. The 10s. stock units at 22s. 6d. cum dividend give a return of some £4 10s. 11d. per cent.

Bakery Earnings

Preliminary figures for Allied Bakeries for the year to June 30 last show that the holding company's receipts in gross dividends, from subsidiary baking companies, were a trifle higher than in 1939-40, at £486,812, against £484,458. Unfortunately the group, formed towards the end of 1935, failed to reach its maximum rate of earnings until 1938-39, and in consequence suffers from a poor base period for E.P.T. Taxation is up on the year from £214,272 to £305,525, and the net receipts are almost £100,000 down, a familiar picture to those who see any substantial number of company accounts. The figures provided give no account of expenses for the year, but after meeting the preference dividend and setting aside £25,000 for contingencies, compared with £40,000 to general reserve, the final payment is halved at 5 per cent., making a total of 10 against 15 per cent. A year ago some £10,000 was added to the carry forward, and total earnings for the ordinary capital were 21.1 per cent. On this occasion, there has been a material over-distribution—unless some reserve appropriation has been concealed—for, against the transfer of £25,000 to contingencies, the carry forward is reduced by £34,405 to £45,881. The figures suggest also a rise of some £25,000 in total expenses, a not unlikely figure if the parent company covers war damage premiums. As one of the features of the past year has been the consumption of increased quantities of bread in place of rationed foods, it is probable that the group has not suffered any reduction in demand. This is the more likely as it has recently acquired substantial interests in the Glasgow area, which is one of those benefiting most from both expansion of population and increase in individual wage receipts. The full effect of E.P.T. is presumably reflected in the figures now given, but it is doubtful whether the price of 11s. 9d. for the 5s. shares, yielding some £4 6s. on the reduced dividend, is reasonable.

Seager Evans Accounts

The full accounts of Seager Evans for the year to March 31st show that the improvement, achieved during the preceding broken period of eight months, was approximately maintained. The gross trading profit rose from £118,288 to £158,358, which compares with £117,194 for the year ended July 31, 1939. As compared with the eight months' period, receipts from subsidiaries fell away once more, mainly owing to provisions for E.P.T., so that total income is £189,060, compared with £153,177 for the shorter period. Advertising expenses have been cut to the minimum consistent with keeping the products before the public, and general charges were very little increased, with the result that, after meeting much increased taxation, £43,913 was earned for the ordinary shares compared with £37,842, a rise in the rate from 12.3 to 17.8 per cent. In view of the nature of the business it is not possible to give an exact correction for the broken period. There is again no dividend, but the carry forward is strengthened after placing £32,000 to reserve. The consolidated statement shows a substantial rise in stock-in-trade from £544,268 to £661,778, and the chairman gives the assurance that current values are substantially above this figure. Against this there is a £54,000 decline in debtors, but fixed bank loans and other creditors show falls of £25,000 and £30,000 respectively, so that the liquid position is considerably improved. The outlook depends in part on the degree of control of distilling, but the company appears to have recovered from the worst effects of its reverse of 1938-39. The £1 ordinary shares stand at 15s. 9d., suggesting that the resumption of dividends is expected within a comparatively short period.

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

THE STOCK EXCHANGES

London

Note: all dealings are for cash

AGAINST a background of continued Russian resistance, the strength of the gilt-edged market led to a good close before the week-end. The Chancellor's statement on future taxation prospects helped a further advance in the Funds at the opening of the current week, while the Premier's review of the war further strengthened sentiment, as did re-investment demand. Rather overshadowed by the advance in the Funds, the other markets nevertheless continued firm, interest being concentrated on the South American railway issues, while the kaffir market was also active. Some selective buying continued in the industrial section where tobacco issues were in favour.

After closing for the week-end with a general advance in the gilt-edged market, with both $2\frac{1}{2}$ per cent. National War Bonds $\frac{1}{2}$ higher on revival of institutional buying, the market opened strongly in the current week. Both institutional and investment buying found the market short of stock, and good gains were general. Thus, among funded issues, $2\frac{1}{2}$ per cent Consols gained $\frac{1}{2}$, $3\frac{1}{2}$ per cent Conversion and Local Loans each $\frac{1}{8}$ on Monday, when $2\frac{1}{2}$ per cent National War Bonds 1945-47 advanced $\frac{1}{8}$. The following day $3\frac{1}{2}$ per cent. War Loan advanced $\frac{1}{8}$ to a new high level since 1936, while 4 per cent. Funding rose $\frac{1}{8}$, and Victory Bonds $\frac{1}{4}$. In midweek prices remained very strong, despite some London selling of "shorts."

The foreign bond market was rather quiet but firm. Brazilian issues were supported, but apart from a gain of $1\frac{1}{2}$ points on Monday by the San Paulo 7 per cent Coffee Loan, rises were small. Peruvian Corporation issues were prominent with consistent support, the 6 per cent debenture stock rising $1\frac{1}{2}$ points on Monday and the following day, while before the week-end Chilean issues were strong. Japanese bonds, which before the week-end all declined 1 point, opened weakly on Monday but recovered strongly in mid-week.

Pending clarification of the terms of the agreement, interest in the home rail market lagged, and junior stocks were lower before the week-end, when GWR and LMS ordinary lost $\frac{1}{4}$ and LNER deferred and preferred both eased $\frac{1}{4}$. Monday witnessed a further decline of $\frac{1}{4}$ in GWR ordinary and $\frac{1}{4}$ in Southern deferred, although LMS ordinary recovered the same amount. Senior issues were slightly supported before and after the week-end, while a few falls on Tuesday were more than made good next day. In the foreign rail market consistently good traffic returns led to a revival of interest in South American issues. While investors were interested mainly in the senior issues, junior issues also improved. Thus on Tuesday, after earlier but smaller gains, BAGS ordinary rose $1\frac{1}{2}$, and B. A. Western and C. Argentine each gained 1 point. San Paulo ordinary was prominent with a jump of $6\frac{1}{2}$ points on Monday, while elsewhere, Canadian Pacific issues advanced strongly, on rumours of a possible interim dividend. In mid-week Argentine railway equities continued to advance.

Some irregularity, with prices moving within narrow limits, marked the close before the week-end in the industrial market, but the tone remained firm, while during the current week conditions im-

proved quietly. After some small gains the previous Friday, brewery issues opened firmly, Ohlsson's Cape and Watney deferred advanced $1\frac{1}{2}$ on Monday, while the following day Bass gained, and Simonds lost the same amount. Aircraft and motor issues were firm, Leyland gaining $\frac{1}{8}$ on Monday, while among the heavy issues slightly higher prices ruled for Babcock & Wilcox, Stewarts & Lloyds, Thornycroft and Vickers in the early part of the current week. Textile issues were firm apart from slight declines in Calico Printers and Bleachers, while shipping shares opened the week on a strong note. Chief interest was centred in tobacco issues, and gains of $\frac{1}{8}$ were registered on Monday by Carreras, Gallagher and Imps, while the following day Godfrey Phillips advanced $\frac{3}{4}$ and BAT, Carreras and Gallagher improved $\frac{1}{8}$. Elsewhere Cable & Wireless ordinary was in demand, Eastwoods jumped $1\frac{1}{2}$ on Monday, and Lever & Unilever, Ranks and Spillers all improved. Later the tone became more generally firm with business a trifle brisker.

Both before and after the week-end, the kaffir market enjoyed good support mainly from the Cape. An early gain of $1\frac{1}{2}$ on Monday in Blyvoors led to numerous small improvements among which West Wits. gained $1\frac{1}{2}$, W. Holdings $9\frac{1}{2}$ and Venterspost $3\frac{1}{2}$. The following day the market continued active, with Libanon, Vlakfontein and West Wits, all higher, although Blyvoors reacted slightly. After closing quietly firm at the week-end the rubber market opened the week on a firm note, and on Tuesday United Sui Betong gained $\frac{3}{4}$ among other small gains. Despite a small turnover in the oil market, prices of the leading issues held firm on Monday, while the following day Shell Transport and Burmah improved $\frac{3}{4}$, and Lobitos gained $1\frac{1}{2}$, while the rubber market was idle, the activity in oils and Kaffirs was well maintained.

New York

BOTH before the last week-end and in the current week, uncertainty as to Federal tax policy and the desire to await the outcome of President Roosevelt's speech prevented the development of any definite trend on Wall Street. Aircraft issues were outstanding on the news of new large orders, while on Monday "war" issues were prominent, but profit-taking generally prevented any advance. In midweek prices were generally lower and trade reduced by uncertainties as to the President's speech.

The Iron Age estimates steel mill activity at 97.5 per cent of capacity, as against a revised figure of 96.5 per cent. in the previous week.

Year†	Deb.	Pref.	Ord.
1941 (New Basis)	1,073,558,974	477,460	3,851,485
1940 (New Basis)	742,921,173	1,458,755	14,166,360
1941 (Old Basis)	1,073,350,318	150,000	2,900,000
1940 (Old Basis)	741,984,352	77,500	1,209,132

† Includes Government Issues to Sept. 2nd only.
* "Old Basis" includes public issues and issues to shareholders. "New Basis" is all new capital in which permission to deal has been granted.

Shorter Comments

Celanese Corp. of America.—Is paying on September 30th a dividend of 50c on Common stock, compared with 25c, plus stock dividend of 1 share for each 30 held.

Nitrate Railways Company.—Subject to ratification by the Chilean Congress, a decree has been signed for the expropriation of the Company's undertaking in Chile under payment of an indemnity to be determined. The directors will give shareholders full information as soon as possible.

Industry and Trade

The Miners' Attendance Bonus

As had been expected, the Government has brought pressure upon the Mining Association to agree in full to the miners' demand for the conversion of the new attendance bonus into what is, in effect, an increase in wages. At the meeting on September 4th, of the Joint Consultative Committee, the owners informed the workers' representatives that they were prepared to concede that a miner absent from work should be penalised for that day only. The main consideration which influenced the settlement was a mutual desire to maintain friendly relations between employers and workmen and to preserve the usefulness of the Central Joint Committee. The following agreement was substituted for the conditions hitherto attached to the attendance bonus: "Realising that the fullest possible output of coal is of vital importance to the national war effort, it is agreed that the district and pit production committees shall co-operate fully in the production of coal and that it shall be the responsibility of the district coal production committee to secure that machinery is set up at each pit which shall insure that effective measures shall be taken at the pit to deal with any person whose conduct militates against the maximum possible production of coal." Thus the miners, described as "the greatest victory for common sense," have succeeded in converting the due reward for regular attendance into a virtually unconditional war increase. Every reasonable objection to the attendance bonus in its original form had already been met, but coal miners at present have an unprecedented scarcity value which they have not scrupled to exploit in bargaining. The Government, by its inept coal policy during the spring and summer, has left itself in the ignominious position of having to woo miners, not only actual but potential. Whether miners should or should not be better paid is irrelevant. The intention of the bonus, in the first place, was to secure regular work; and it is impossible not to view with misgiving this agreement, which scarcely amounts to more than a vague assurance that something, sometime, will be done about absenteeism. What "effective measures" are the workers likely to agree to if they view a straightforward attendance bonus with such hostility? A grave responsibility rests upon the pit production committees to see that effective steps are taken to ensure regular attendance and taken with the greatest speed.

Unemployment in August

For the first time since last October, the number of wholly unemployed persons on the registers of the employment exchanges in Great Britain shows a rise, though a negligible one. On August 11th, 219,771 persons were wholly unemployed, compared with 219,577 on July 14th, and the small increase was brought about by a rise of 10,111 in registered unemployed boys and girls—a rise probably almost entirely due to the school-leavers' appearance on the registers. The number of unemployed men declined again, from 102,010 on July 14th to 98,737 on August 11th, and for women the comparable figures were 88,852 and 82,208. The total number of persons temporarily out of employment was 37,950 on August 11th, compared with 46,027 on July 14th. Unemployed persons normally in casual work rose by 892 from July 14th to 12,568 on August 11th. (The number of unemployed girls normally in casual employment was always low, but since July only one is left. Could not a full-time job be found for her?) The total unemployed in the three classes was 270,289 on August 11th, against 277,280 on July 14th and 799,452 on August 12th, 1940. The total numbers of unemployed on the registers in the various administrative regions have lately shown an all-round decline, but between July 14th and August 11th five of the eleven regions of Great Britain record rises. The smaller declines in unemployment which are taking place each month illustrate with increasing force the necessity for combing out non-essential industry to the demands of war industry. News from the North-Western region that 13,000 women aged between 20 and 25 are to be moved from clothing factories to munition work is a small but welcome contribution. An agreement reached in the same region, whereby each firm in the boot and shoe trade is to release $12\frac{1}{2}$ per cent of its workers for war production, is an example worthy of imitation in other trades and regions.

NIMS

Evidence of imagination and drive in the Ministry of Supply is given by the formation of National Industrial Mobile Squads of skilled engineers. Their purpose is to get production at Britain's new war factories under way in the shortest possible time by the loan of highly skilled key men for periods of about one month. Each squad consists of about fifty men, expert fitters, setters, drillers, turners and other craftsmen, from established ordnance factories, who have volunteered to leave their homes and be rushed from one job to another anywhere in the country. They meet at a central point, each with tools and personal kit, and are transported to the selected centre. There they pave the way for the introduction of semi-skilled and female labour. When their job of training and stepping-up production is done, the process is repeated at another new factory, which may be hundreds of miles away. It needs little imagination to realise how trying and exhausting this work, with its concomitant conditions of living, must be. Men with this form of skill are in any case of exceptional value to the country, and by accepting this way of living they multiply their value by a large factor. If the inventive power behind the organisation of this scheme, and the self-sacrifice involved in its execution, could be emulated throughout British industry, the war might be appreciably shortened.

British Policy and Irish Agriculture

The difficulty of allowing for all the repercussions which result from measures of price control are great enough when those repercussions are confined to the controlled community. When there are important reactions upon producers outside the community the complications are intensified. This has been happening to the farmers of Eire, whose products have been in the past largely destined for the British market. Since 1932, a protective policy destined to encourage the fattening of beef cattle at home has been pursued by the British Government, so that the export of fat cattle from Eire gave place to an export of store cattle in Eire has not been profitable, because although of cattle in Eire has not been profitable, because although of feeding stuffs has risen still more. This was inevitable: it was the Government's policy to make the production of cereals more profitable to British farmers than the production of beef, and this policy would have been nullified if their prices had risen equally. Moreover, the fact that a very slightly reduced cattle population had to be maintained on a very much reduced supply of cereals was bound to raise the price of oats disproportionately. Circumstances, in the shape of an exceptional outbreak of foot and mouth disease in Eire, have contributed to some extent to counteract this state of affairs, since the embargo on the export of store cattle has caused Irish farmers to resume the fattening of their cattle, but this is likely to be only temporary, and it does not solve the problem of profitability to the Irish farmer. In the matter of egg production also, because the British controlled prices are based on a subsidy to British producers, and are therefore alleged to be unremunerative to the unsubsidised poultry keepers of Eire. Actually, however, the Ministry of Food is buying eggs, probably at a slight loss, from Irish producers at 20-23 shillings per 120, whereas the pre-war wholesale price of Irish eggs in English towns was 12-14 shillings. This does not seem ungenerous. The fact is that economic relations between a country at war and a non-belligerent can only be kept on a sound basis by a degree of friendly co-operation which is not always easy to obtain.

Welding in War

Employment of welding leads to reduction in weight, economy of material and labour, and increased production—results always valuable, and doubly so in wartime. A saving of weight of as much as 20 per cent is effected by using fabricated construction in shipbuilding, and it is estimated that about half the total output of welding materials in this country is already being diverted for this purpose. The same technique is made use of in the construction of port-

able hangars, military bridging equipment, light armoured cars, and bombs and shells, to save weight. Welding instead of riveting in the construction of an anti-aircraft gun platform saved 19 per cent in weight and 63 per cent in man-hours. A similar change-over for a field carriage assembly reduced the production cost per unit from £269 to £60, largely owing to reduced machining time. Welding not only plays its part in the production of war material, but can also be used to counteract the enemy's efforts to destroy existing structures. Investigations into the strength and behaviour of steel frameworks with rigid joints have indicated that their load-carrying capacity exceeds that of a similar structure with flexible joints by as much as 30 per cent. This means not only saving of material, but a welded structure offers greater resistance to blast than one built to ordinary designs. An Advisory Service on Welding, staffed by experts attached to the Ministry of Supply, is advising firms on designs to ensure that the fullest use is made of welding. Advances in technique have made practicable the welding of armourplate for fighting vehicles, leading to a diminution in deadweight. Welding is a valuable ally in economising the factors of war production and its extended use would quickly bear fruit.

That welded construction results in saving steel is well understood in the United States. Such saving arises from the fact that extra metal required for connecting members in the riveted structure is eliminated in welded production. Furthermore, since steel is not weakened by rivet holes, a further saving is effected, since equivalent strength is obtained with lighter, and hence less, steel. At a time when the ingot steel capacity of America is taxed to the utmost, and steel plate mills are called upon to provide increasingly large tonnage for ships, boilers, tanks, railroad and other equipment, the advantages of the new technique are becoming increasingly obvious. An average of 18 per cent less steel is required to build the welded product or structure than the same one riveted. The following table is drawn from industrial practice in 1939, 1940 and 1941:—

STEEL SAVED BY WELDED STEEL CONSTRUCTION
Actual Examples in lb.

Product or Structure	Actual Examples in No.			Percentage of Weight Saved
	Former Method	Welded	Saved by Welding	
Truck bodies....	2,158	1,958	200	9
Locomotive frame	24,769	17,942	6,827	27
Barge	565,000	500,000	65,000	11
Car float.....	1,976,290	1,666,860	309,430	15
Five-span girder bridge.....	1,597,088	1,175,563	421,525	26
Passenger coach frame.....	94,000	65,000	29,000	30
Freight car under-frame.....	10,490	9,470	1,020	9
Scroll case for turbines.....	391,640	214,830	176,810	42

Source: James F. Lincoln Arc Welding Foundation Report (1941).

Given an average saving of steel of 18 per cent, America's production for national defence would have 360 lb. more usable material in every ton of steel. Applied to the country's annual ingot capacity of 82 million net tons, this would conserve 2½ months' production a year, which indicates how a given amount of steel could be made to go further by a greater employment of the welding process.

Controlled Pepper

Following its decision late last month to take over imports of pepper into this country, the Ministry of Food has established complete control over pepper prices. Details of this control, which will be gradually extended to all stages of the pepper trade, were given on page 306 of our last issue. Though control over prices naturally removes one of the most important functions of the London pepper market, for the time being, at least, it is intended to make use of the market organisation to facilitate distribution of pepper, on the same lines as the London rubber market is being used by the Ministry of Supply. A firm of produce brokers has been selected by the Ministry of Food, after consultation with the Brokers' Association, to act as principal broker for the Ministry in its transactions in the market. Brokerage earned by this firm will be pooled by all the pepper brokers, so that the whole market shares in the benefit derived from official transactions. As the Ministry of Food has neither requisitioned trade stocks nor taken steps to acquire pepper in the producing countries, it cannot

offer any pepper at present. On the other hand, private holders of stocks are inclined to withhold their offerings as they regard the present maximum price-level as too low. If this stoppage of offerings continues, the Ministry of Food may well be forced to take additional measures to revive normal sales. As stocks in this country cover about one year's requirements, the requisitioning of trade stocks would probably be preferred to the immediate resumption of imports. The whole of the world's pepper is exported from Asia and the Dutch East Indies, and the latter, whose annual exports fluctuated between about 600,000 to 1,550,000 cwts. in the last five peace years, produces between 80 and 90 per cent of the world's total. French Indo-China, the largest of the other exporting countries (with an average yearly export of 80,000 cwts.), is now under Japanese control, while Siam, Sarawak and British India—the only other exporting countries worth mentioning—may be affected by the next move Japan may make. In peacetime, British net consumption of pepper was about 50,000 to 60,000 cwts. per year, but owing to much extended canning activities the figure may now be higher. Nevertheless, requirements for twelve months could probably be shipped in one big load. Apart from the fact that the Ministry of Food's control over pepper has greatly reduced the price to all consumers, it may easily help to ensure supplies, as the Ministry could certainly act more swiftly than the trade in shipping larger quantities at short notice if the trend of Far Eastern events required it. Despite the initial dislocation of normal trading through the introduction of low maximum prices, therefore, the Ministry of Food's initiative must be warmly welcomed.

Changes in Chrome Supplies

The Balkan and Russian wars have led to considerable changes in the international chrome supply position. Of current world chrome ore output of about 1,200,000 metric tons of an average Cr.₂O₃ content of 48 per cent, Jugoslavia and Greece together supply about 100,000 tons; Russia produces slightly over 200,000 tons; while some 5,000 tons comes from Bulgaria and other Balkan countries. Before the German conquest of the Balkans, a substantial part of the Yugoslav and Greek supplies was shipped to Great Britain and the United States, but now the whole output will be reserved for Germany. Improvements in the German supply position will, however, depend on the outcome of the Russian campaign, as it is known that since 1939 Russia has supplied substantial quantities of chrome-ore to Germany, although normally Russia is not an exporter. The Russian deposits are situated chiefly in the Ural Mountains and minor deposits exist in the Caucasus, territories still far from the fighting line. It would appear at present that an improvement in the German supply position may be secured rather through higher imports from Turkey than from a Russian conquest. Turkey produces well in excess of 200,000 tons of high-grade ore, a large part of which goes to Great Britain and the United States, but under the recent Turko-German trade arrangement increased supplies have been promised to the Nazis. This development is quietening from the Allies' point of view, as it may cause a scarcity of supplies in the United States. The British Empire has, however, in Southern Rhodesia and South Africa, two of the largest chrome producers, who can spare a considerable part of their annual output of about 500,000 tons; but these quantities would not cover United States needs, especially as the 100,000 to 150,000 tons of Cuban and Philippine ore available to the United States consist mainly of low-grade ore unsuitable for metallurgical purposes. The United States itself at present produces less than 5,000 tons of chrome ore (chiefly in California), but the Bureau of Mines is taking steps to develop a smelting process by which low-grade ore found in other parts of the country could be converted for metallurgical uses. These developments may bring an adequate but expensive solution of the problem. In the meantime, every endeavour should be made to obtain the maximum supply from Turkey and to develop production in Rhodesia and South Africa to capacity. In the early months of this year, Empire production, especially in South Africa, was far from this goal. Adequate supplies of chromium are of substantial significance to the war industry, for use in the manufacture of armour plate and torpedoes. Though some chromium may be saved by reducing the chrome content of certain steel alloy metals, large-scale substitution of other alloying elements for chromium is possible only at the expense of the qualities and properties of the alloys.

COMPANY MEETINGS

UNION INSURANCE SOCIETY OF
CANTON, LIMITED

FAVOURABLE RESULTS

MR J. O. MEEKS'S REVIEW

The ordinary yearly meeting of the Union Insurance Society of Canton, Limited, was held at the society's head office in Sydney, Australia, on June 20th last.

Mr J. O. Meeks (chairman) presided, and, in moving the adoption of the report, revenue account, and balance sheet, said:—The report, revenue accounts, and balance sheet for 1940 were issued on June 10th and you will have had time to consider the figures. I propose, therefore, to follow the usual custom and take these, as well as the auditors' report, as read.

The disturbances of war were the direct cause of the removal of our head and registered offices from Hongkong to Sydney, Australia, for the duration of the war and a limited time thereafter. Had our business in Hongkong only been concerned it would have been accepted as a misfortune of war, but this was not the case. Important interests abroad were affected and connections there became apprehensive of the society's position should the head office be isolated. I am glad to report that the objective of the transfer has been attained, and confidence in the ability of the society to conduct its business on normal lines has been restored.

LARGER MARINE INCOME

You will see that our marine income at £1,278,518 os. 10d. increased materially over last year. This is due to surcharges on marine rates and war risk premium. Sources of income of this sort are, fortunately, not permanent. First-year settlements, marine and war, on the 1940 account totalled £298,625 8s. 11d., representing 23.36 per cent. of the premium, which is satisfactory. Special reserves have been set up to meet abnormal conditions, and it is considered that the transfer to the underwriting suspense account to close the 1939 account will be sufficient, and the balance of the 1940 account should suitably provide for outstanding claims. I hope to leave a reasonable margin of profit.

In the fire account the premium at £608,003 8s. 6d. and claim settlements at £242,282 19s. 9d., representing 39.85 per cent. of the income, are at a normal figure. The society was fortunate in that results in practically all fields were favourable. The results of the accident and general account show welcome improvement. The premium of £278,461 14s. 9d. is less by some £14,000 than the previous year, but the transfer to profit and loss of £21,000 is more satisfactory than has been the case for a number of years.

ADDITIONS TO RESERVES

You will notice in the marine and fire revenue accounts that special reserves have been made for outstanding balances in enemy and enemy-occupied territories. In addition, a further sum has been

COMMODITY AND INDUSTRY NEWS

THERE was more activity in the tin market last Tuesday than for some time, turnover being 275 tons. This may be due indirectly to Russian buying in the Far East. Standard cash was £257-£257 5s. a ton on Wednesday, compared with £256 5s.-£256 10s. a week earlier. Three months was £259 15s.-£260, compared with £259 5s.-£259 15s. A meeting of the International Tin Committee is to be held this month to discuss the future of the restriction agreement, which is due to expire at the end of this year. It is understood that the committee has recommended that standard tonnages should be changed to the actual outputs in the year ending last July 31st. Bolivia and Thailand are the only producing countries whose standards would be lowered by such a change. It is, however, considered likely that some means may be found to overcome any opposition they may raise, as all producers are anxious that some agreement should be reached to safeguard their position.

"Clothing Coupon Quiz."—The Board of Trade has issued a small pamphlet* giving "answers to questions on the rationing of clothing, footwear, cloth and knitting yarn" which have been put to them by retailers and the public since rationing was introduced. The booklet contains sections on the working of the rationing scheme, on the actual coupons themselves, and lists of the numbers of coupons needed for each type of rationed article. The largest section, entitled "Your questions answered," consists of 85 questions with answers, covering virtually all aspects of the scheme. The publication deserves a wide circulation, and is a guide which will serve retailer and consumer alike by putting into simple language the provisions of the Consumer Rationing Orders.

* *Clothing Coupon Quiz*. Issued by the Board of Trade and published by H.M. Stationery Office, price 2d. net.

Standard Pots and Pans.—An Order, with effect from September 24th, has been issued by the Board of Trade, which will enable it to standardise designs and sizes of domestic holloware made wholly or partly of iron or steel. Registered manufacturers are to be licensed and directions for manufacture will be issued from time to time. Standardisation would effect economies in the use of materials and labour, and the public will gain, as supplies will not diminish and prices would tend to be lower.

New American Cotton Crop Estimate.
—A new estimate of the American 1941-42 cotton crop has been published by the United States Department of Agriculture. Their previous forecast, which was given on page 212 of *The Economist* of August 16th, was 10,817,000 bales. The new estimate is an even smaller one of 10,710,000 bales. Yield is now estimated at 25.7 lb. per acre less than the original figure of
(Continued on page 342.)

(Continued on page 342.)

debited to the underwriting suspense account for the years concerned. The total sum reserved in this connection is £100,000. In the profit and loss account we have set up a contingency taxation reserve of £20,000. This was necessary in view of the heavier taxation charges we must meet in future.

In February of this year Mr E. P. Webb resigned as London underwriter, and Mr A. V. Townsend was appointed to succeed him. His appointment was made with full confidence in his ability to carry out successfully the responsibilities of that important post. It is with the deepest regret that your board received advice this week of the death in New York of Mr W. J. Roberts. The society has lost a sincere friend and most able supporter.

There being no questions, the report, revenue account, and balance sheet were unanimously adopted.

HUDSON'S BAY COMPANY

RECORD STORES PROFITS

The two hundred and seventy-second annual general court of the Governor and Company of Adventurers of England Trading into Hudson's Bay was held, on the 5th instant, in London.

Mr P. Ashley Cooper, the governor, said that industrial activity through 1940 had been maintained at a high level, and Canada had produced more goods and services than in any previous year of her history. The company's profit on trading had increased by no less than £273,383, while the land department showed a decrease of £23,835. Provision for income tax had increased by £257,630, leaving only £60,000 for dividends. That had enabled them to pay the preference dividend and to recommend 1 per cent. on the ordinary shares, the same as in the previous year. Although land account receipts had fallen by £10,900, they were again able to recommend a distribution of 1½ per cent. from the proceeds of land sales.

During the year they had provided for H.M. Government considerable sums of dollar currency and had invested as largely as circumstances would permit in the war loans of this country and Canada. Once more their six large stores had broken all previous aggregate profit records and so had the three stores at Winnipeg, Victoria, and Saskatoon broken their individual records.

The reorganisation in Canada previously mentioned had progressed in spite of the added difficulties due to the war, but the process of modernisation was an expensive one. It must, however, be pursued if they were to retain their position and to combat effectively the competition which they met on all sides. The fur-purchasing agencies were rendering useful service and continued to play their part in their organisation. They had had a good collection of Canadian fur, which had been sold well and profitably during the year.

The increase in sales of land was a satisfactory item and was some evidence that the plans and policies for sales promotion adopted by the Canadian committee were bearing fruit.

Resolutions submitted by Mr. C. L. Nordon, one of the proprietors, were defeated by a large majority.

CURRENT STATISTICS

Finance

GOVERNMENT RETURNS

For the week ended September 6, 1941, total ordinary revenue was £25,122,000, against ordinary expenditure of £99,893,000 and issues to sinking funds of £2,178,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,300,896,000 against £991,172,000 for the corresponding period a year ago.

COMMODITY AND INDUSTRY NEWS—continued from page 337

252.5 lbs. per acre. These new estimates may be the cause of the rise in price of American middling cotton, spot, during the week, to 18.40c. per lb. on September 8th, which is the highest level reached for about 12 years.

Cotton Position.—Indications that demand for yarn and piece-goods exceeds the supply have been increasing. In the circumstances spinners and manufacturers have been able to pick and choose orders which they are prepared to accept. No relief in the situation is likely to take place until the Controller has removed the embargo upon selling yarns for delivery after the end of next month. A considerable inquiry has been experienced in piece-goods for foreign markets. A few more offers have come through for India, with occasional sales. Further buying has occurred in cambrics and dyed fancies for Java. Useful support has been met with in standard makes for South America and making-up cloths for the Dominions, especially Canada and South Africa. More favourable shipping facilities are now available for Egypt. Some special Government contracts have been reported for the Admiralty. Yarn sales have been comparatively small as a result of spinners refusing to sell. A further reduction in statistical information relating to raw cotton is that the New York Exchange has discontinued total export figures. Detailed exports were banned some time ago.

Apple Prices.—A new Home Grown Apples (Maximum Prices) Order came into force on September 8th, the earlier one being revoked. The new Order classifies apples into two groups and fixes prices at the various stages of sale for each group. Prices vary from 93s. 4d. to 109s. 8d. a cwt. for Group 1, and from 46s. 8d. to 60s. 8d. a cwt. for Group 2, in the wholesale stages of sale. Retail prices 1s. 3d. and 9d. a lb. respectively.

Lard Licensing.—The Minister of Food has made an Order, which comes into force on September 22nd, prohibiting, except under licence, the production, refining or selling by wholesale of lard and hog grease. Bacon curers and butchers will be permitted, under general licences to be issued shortly, to produce lard without the necessity for holding individual lard producers' licences.

East or West?

THE press and the people of Britain are searching their consciences. The question is whether all possible help is being given to the first nation which has opposed Hitler's total attack with total resistance. The Prime Minister has said that hundreds of fighter planes are being produced for Russia. A wing of the Royal Air Force, complete with ground staff, is in action with the Russians. In the west, the enemy's communications by the northern route with the eastern front are being harried on the sea and from the air. Day and night attacks against German Europe continue. Raw materials from the Empire have already been shipped to Russia; and the British and American delegates to the supply conference are moving towards Moscow.

The question whether more can be done, for Russia in the east or against Germany in the west, is impossible for the layman, without knowledge of the facts, to answer. The heartfelt and general wish that the larger part of the men and equipment of the British Empire need not stand idle, while Soviet Russia is bruised and torn on the world's behalf, is based on no plan of action. It rather rests upon the belief that the addition of many millions of fighting men to the Allied cause in the east must have altered the requirements, not only of production, but also of strategy, in the west. The forces of the British Empire have now to bear heavy commitments, stretching from Iceland to the Far East. In Libya, there is a large and reinforced enemy army. All along the transcontinental front there are long, tenuous communications to be served with ships and to be protected against attack. In the west, a frontal assault would probably be a task involving a weight of equipment, in manpower, in the air and in shipping, which is still not available. In the east, rapid and large-scale supplies and reinforcements are held off from the Russians by hard geographical facts, and by the enemy's control of the Balkans and the Aegean

islands. The vital Persian routeway is rough and narrow.

The problem of the best allocation of British manpower between the Services and production has been widely canvassed. The problem of the geographical disposition of trained and armed manpower has not received the same attention, because the observer cannot know the grand strategic scheme towards which the factories and the forces are being directed. But it is not only the unthinking and the fools who rush in who are wondering whether large British forces must stand by while the Russians carry the burden of the whole world's destiny. With the war in Russia, the old question of the last war "east or west?" has reappeared. At present, there are three-quarters of a million men in the Middle East. The presence of this force there is an earnest of increased strength. It is some assurance that the gates to Suez, the Middle Eastern oilfields and India have for the time been locked; and its heavy duty, if the Russians were to be driven back from the Dnieper, the Crimea and the Don, would be to guard these gates against a Nazi flood swirling north and south round the Black Sea. The maintenance of such a force, remote from the supply centres of the west, requires shipping and supply facilities which in the last war might have maintained a force more than twice its size on the nearer French front.

Three-quarters of a million men is too many to do garrison duty and too few to take up the entire fight against an enemy advancing with secure supplies from inner lines if Russian resistance were to fail in the south. Tactically, the British forces in the Middle East possess a plain advantage. Strategically, with the chance that the Germans may still thrust in force into Asia from the north and, less formidably, from the west towards Suez, their position is less secure. It may well be that they can only be defenders, for if the question is asked whether, say, an invasion of the Balkans or of Italy would

be more practicable than an invasion or a landing in the west, the answer must be that shipping and supply problems, alone, to say nothing of air power, make the nearer venture the least unlikely. The manpower of India is being tapped, trained and equipped; but, if it is in the east that a decision, as well as the defence of the eastern Empire, is to be sought, very many more men and a great deal more aircraft, supplies, equipment and shipping will have to travel the thousands of miles from Britain and the United States.

While three-quarters of a million men are on guard in the Middle East, perhaps three or more times their number are waiting anxiously for action in this country. It is this fact, and the addition of Russia's millions in the east, that has bred discussion of the possibilities of more offensive action in the west, on the long arc from Narvik to Dakar, where the problems of shipping and supply, for all their size, are many thousands of miles less than in the east. It is right that this anxiety should be understood, even if it is based on lack of knowledge.

The War Cabinet has no doubt devised a new strategical plan from the great change, brought about by the advent of Russia as an ally, for it would plainly be a waste of time and fortune if the disposition of British manpower over the continents were still based upon an earlier programme and an earlier strategy in which, with Russia non-belligerent, it was imperative to dispatch men and material in maximum numbers to the Mediterranean and the Middle East in order to contain the whole weight of the invading *Wehrmacht*.

Before the war in Russia, there were three tasks—which still remain: the defence of Britain; the defence of Egypt and the Middle East; and the watch over all the western places within and without the dominion of Germany and Vichy which are accessible to British sea-power and the great British-based air power—a watch that some day it may be possible to turn into a counter-offensive. The people who have called, before or since the June invasion, for military ventures in the west, whatever the cost, have been foolish and irresponsible. But those who feel now that the chink in the enemy's armour, when Russia has risen and resisted in the east, may be found nearer home in the west are simply trying to bring into line the

aspirations of a nation in arms and what they believe to be the facts of the strategical and economic situation.

Only Mr Churchill and his chiefs of staff know the answer to the riddle. They know the resources of men, supplies and ships that are to hand; and Lord Halifax has underlined the need to step up production to meet the demands of strategy. But it needs no inner information to realise that the answer lies in the maximum aid to Russia, for if Russia were to be bled or battered down into helplessness before the western Allies are ready for the grand assault, there would be no riddle, but only the defence of Britain. The call upon British resources, while the fate of Russia is in the balance, is to engage the enemy, if it is possible, to draw off his power and malice from the torn Soviets. The theatre might be the Caucasus or Asia Minor by the side of the Russians, as well as in the air over Leningrad, Moscow, Kiev and the Ukraine. It might be in north or west Africa or across nearer home waters. But it would have to force the enemy to action. It would have to waste his men and his material on land, at sea, and in the skies; and it would have to be much more than defence. It may, as yet, be impossible.

To make a direct assault against the enemy's front with the present resources would very likely be suicide; the time and the strength for the final offensive is long distant still. But to stand inactive on guard may be to accept a world of commitments and then await disaster. And it is by an indirect approach to the enemy's flanks—in the east, where the Russians are neighbours, or in the west, where ships and planes are multiplied by short distances—that Britain's men and ships might be used, even before their full force and numbers have been marshalled, in the counter-offensive that Russia's resistance claims. Russia knows, in the cruellest degree, the hell of invasion that Poland, Norway, Holland, Belgium and France suffered. Britain has not known it, and may not if Russia stands. Britain may well be still too weak to strike the blows that the conscience and the ardour of its people are demanding. This is even likely; and the moral is plain—that the people of British cities and villages must be prepared to toil as desperately, and to sacrifice and endure as much, as the cities and villages of Russia.

Transatlantic Transactions

IN the last few days, the character of American aid has been made plainer. On Tuesday, President Roosevelt reviewed the progress of Lease and Lend; and it was announced on the same day that American ships would carry arms and munitions to some areas of the British Empire. On Wednesday, the American Navy began to provide protection between America and Iceland for all ships carrying Lease and Lend supplies; and a week before, the disturbance caused to Anglo-American trade relations in world markets by Lease and Lend had been met by the British Government's pledge to prevent the misuse, at home or abroad, of American supplies. Since the war started, first under Cash and Carry and, after March this year, under Lease and Lend, the British Empire has obtained about £1,100 millions worth of goods from the United States. In the last three months, supplies worth £42,750,000 have been shipped under the Lease and Lend Act, the great bulk to Britain but some to China and the exiled Governments of occupied Europe.

A daily addition of £350,000 to the supplies of the countries resisting aggression does not seem large, to say the least, in comparison with Britain's own expenditure of £10 millions a day on the war and over £12 millions a day on all purposes; and a large part of the £42,750,000 was probably food—the war supplies that crossed the Atlantic during that period coming largely under earlier cash orders. Moreover, the urgently needed supplies that the American Government is now to make available, for cash, to Russia must in the first instance represent some subtraction from the transatlantic flow. But the United States is simultaneously furnishing supplies for a record

expansion in America's own armed forces; and, if transatlantic deliveries are still low, appropriations are high and growing. Programmes under the original Lease and Lend appropriation will provide aid to the value of nearly £400 millions to countries resisting aggression; contracts have been placed and work started for £250 millions worth of bombers; and the President will soon need a new appropriation from Congress to supplement the £440 millions allocated for Lease and Lend last March.

Lord Halifax has spoken of the "great giant" of American production getting gradually into gear. It is true that the attention of the United States is still concentrated on the grand philosophical debate whether America should go to war; and that, compared with the country's tremendous industrial capacity, production plans in the United States are still insufficient and slow to mature. To Englishmen who remember 1938-40 the scene appears familiar. There has been the same reluctance to understand that in a war (or "defence") economy all resources are inevitably scarce, and that the production of consumers goods cannot be maintained for long at even moderately high levels during rearmament. There are even some critics, in the United States, who forecast that the stringency in steel supplies which recently confounded the critics may be repeated in oil refining capacity—quite apart from the diversion of oil and tankers to Britain.

But the picture is perceptibly changing. In many respects, perhaps, output has not climbed out of the rut; some items of civilian manufacture may be anomalously large; and the administrative machinery for defence

production retains loose joints and overlapping. Criticism on the foundation of British experience can, of course, be helpful. It may be regarded as an essential *quid pro quo* for American aid. But there is no ground, in fairness or in expediency, for random stone-throwing by British critics. The United States is now definitely on the way to doing everything that war involves, except the use of the American army to attack. Under present programmes, Britain and the United States will not outproduce the Axis Powers and German Europe until the middle of 1943; but there is less determination in Washington to defend existing production plans, and a greater readiness to increase them, than there has been, or maybe is, in London. The second half of next year will see the British orders that could not be arranged until Lease and Lend was passed flooding in; and, by every sign, David is slowly but surely taking on his true stature of Goliath. The slowness may be—must be—remarked; but the certainty cannot be questioned. It is not questioned in Berlin or Rome.

In Anglo-American affairs, in fact, the critic tends to find himself between the millstones. If he points to American shortcomings, he does harm to friendly sentiment in the United States. If he draws attention to British shortcomings, he gives fuel to American isolationists—as well as to Dr Goebbels. A Note in *The Economist* on July 26th (page 101) is a case in point. It drew attention to the obligation of Britain not to misuse leased and lent materials—by the re-export of vitamins or the waste of petrol; and this has been widely used in evidence against this country by the isolationist press. Nevertheless, it is probable that such comments do more good than harm—a conclusion that has been responsibly endorsed from across the Atlantic. It is essential to show the Americans that there is no desire or intention to abuse Lease and Lend, in the spirit or in the letter; and British good faith has since been sealed by last week's official agreement.

British Export Policy

The agreement about the use of leased and lent materials was published as a White Paper a week ago. American exports are impeded by the restrictions imposed by the United States Government on the supply of materials required for defence and Lease and Lend; the British Government will accordingly take steps to secure that no advantage is obtained over their American competitors by British manufacturers for export with the use of these materials; and leased and lent supplies will be distributed and employed for the war effort and the good of the whole community, and not for private gain. The justice of this promise has been openly questioned by nobody in this country, though not a few have been taken aback by the realisation that the United States is now, by reason of the importance of American supplies, in a position to exercise a considerable influence on British trade and industrial policy. It is only certain implications which still need the clarification that is now generally looked for. The export drive that was set on foot at the beginning of last year, as part of the war effort, was a quest for foreign exchange with which to pay for essential imports; above all it sought for dollars. It was marred by the wasteful shipment of non-essential goods to Empire countries; and it was disrupted for a time after Dunkirk by the imperative need to devote every possible item of industrial equipment, labour and materials to the immediate task of direct war production week by week. When Hitler was stopped short at the Channel, the campaign to earn hard currencies was resumed, with markedly more discrimination than before. But, with the passing of Lease and Lend last March, the need for dollars abated. It was time for a redefinition of the place of exports in the British war economy.

The export drive was mainly a dollar drive. Lease and Lend makes the payment of dollars for materials from the United States no longer necessary; and the need for making the best use of shipping space makes shipments from America the most economical method of supply. It would be a waste of scarce industrial resources—and especially of imported materials—to manufacture exports

to pay for supplies that can be obtained on credit; and it would be a double waste of shipping. It is true that dollars are still needed to pay for pre-Lease and Lend orders, and for orders outside of Lease and Lend—some \$2,000 millions, it has been estimated, in 1941. But, as Mr Manning Dacey suggested last week in his comprehensive survey of these problems to the Institute of Export, the export of British merchandise could only earn perhaps 8 or 9 per cent of this requirement which, in any event, will have to be met, partly by the sale of Empire rubber, tin and manganese for which American defence demand must grow, but mainly by the sale of gold and the sale, or pledging, of dollar assets.

Mr Dacey's point was that the subsidiary rôle which was, in effect, accorded to British exports in the war effort by last week's White Paper is simply a recognition of fact. It was only worth while to reserve plant, materials and labour for manufacture for export so long as dollars were munitions of war. Two-fifths of the chief peacetime exports were made by industries that are now indispensable to war production. The markets of Europe, where a third of British exports used to go, are closed. Over half British exports went in peacetime to parts of the Empire or to the United States; and, since Lease and Lend, exports to these countries, except to meet essential war or civilian needs, are a dissipation of resources and shipping space. Trade with Japan is, or ought to be, at a standstill. War supplies to Russia and to China are, of course, part of the common war effort; and it is a counterpart of the British blockade that neutral countries, such as Turkey or Britain's important suppliers in Latin America, should be served, where possible—by Britain or by the United States—with the essential manufactures they lack. To aid and provide for allies, collaborators and friends is an integral part of war policy; and to obtain hard currencies in Latin America to pay for Latin American supplies is still important. But, in general, the indirect means of nourishing the war effort by exporting must now give way to direct war production.

There are hard cases. Export industries have been groomed for an export drive that has now to be largely stopped in its stride. But these immediate troubles are not insuperable; the firms, or their plant and labour, can most of them be mobilised for war work at home instead of in foreign markets. It is the prospect of losing overseas markets to American or other rivals that really makes exporters anxious; and it is because of this concern that they are naturally not over-happy that the United States may now be able to propose where and to what extent British exporters may trade. Nor is this a question that can be decided merely in reference to materials actually leased and lent. It is a question of the whole of British trade policy—or, at least, as the White Paper states, of trade in any of the materials that are in short supply in the United States. The materials which are now being leased and lent include almost every kind of material that goes into the manufacture of British exports.

Anglo-American Collaboration

The fact is that these transactions have ceased to be separate matters of British trade policy, on the one hand, and American trade policy, on the other. They are rather part of the single set of Anglo-American trade problems that what Mr Churchill called "the Mississippi flood" has now brought into being; and the urgent task is to recognise and define what the common policy should be. The logic of Lease and Lend—that is, of the arrangement whereby goods are to be supplied by the United States during the war to be replaced by goods supplied by Britain after the war—is that British exports should be reduced to a minimum while the war is on; and that, after the war, British exports should expand correspondingly to repay the debt. It is part and parcel of the Lease and Lend principle that there should be mutual guarantees between Britain and the United States about export policy, not only now, but also after the armistice.

The test that should be applied now, in wartime, is whether any particular kind of trading activity, from either

side of the Atlantic, will strengthen the joint defence position of America and Britain. If it is legitimate to say that the use of Lease and Lend materials by British exporters in competition with American traders is invalid, it is also legitimate to suggest that the use of such materials by American exporters should, in turn, be strictly conditioned by the requirements of the joint defence effort; and that the war should not be an opportunity, in the absence of British traders, for American manufacturers and exporters to open up new markets or establish new trades and monopolies. In the specific case of Latin America, whose supplies are needed by Britain for essential wartime purposes, it should be clear that either the United States should allow British exporters to trade there as freely as possible, whatever the ingredients of their goods, in order to obtain foreign exchange, or that the United States should be prepared, as a corollary of Lease and Lend, to furnish Britain with the foreign exchange necessary to purchase these supplies. At bottom, the test is what expenditure of resources, either in Britain or in the United States, will yield the maximum return for the war against the Hitler tyranny, directly in war supplies or indirectly in foreign exchange.

In sum, what is needed is a Trade Charter which will recognise the fact that Lease and Lend has so "mixed up" the affairs of Britain and the United States that unified direction is imperative; and unified direction should not mean either the subordinating of American to British interests or the dictation of British activities by Americans. Post-war guarantees for British exporters will neither win

nor lose the war; and in the immediate military context they must be regarded as irrelevant. But, without post-war guarantees, the policy of Lease and Lend may collapse after the armistice into the same friction and exacerbation as marked the debt question after the last war. While the war lasts, the fact must be accepted in Britain that there is only a minimum place for exports; and no export can be justified which is not clearly necessary to the winning of the war, and which does not make a better use, in its manufacture, of manpower and materials than could be made in direct war production or in some other export activity.

The need above all is for understanding. Last week's agreement was designed to end a chapter of misunderstanding, misrepresentation and ill-feeling in the United States. It might conceivably only prepare the way for a new chapter of suspicion in both countries, and in the Empire countries which now look to the United States rather than to Britain for many supplies, if it is not followed up by a wider and more detailed trade arrangement between the two countries. It should be made beyond all doubt clear that the object is, not to impair the autonomy of British economic life, but rather to win the war, and to put into practice, for the first time, the economic collaboration which was called for by Mr Churchill and President Roosevelt in the fifth point of the Atlantic Charter. Lease and Lend is necessary for the winning of the war. It may even be the beginning of a new era of international co-operation. But, mishandled, it could breathe new life into old bitterness.

Ten Years Off Gold

EXACTLY ten years ago, on September 21, 1931, the pound sterling left the gold standard. It was a bitter defeat for British economic statesmanship. The restoration of the gold standard in 1925 had been conceived as a deliberate and positive contribution to the resettlement of world finance after the disturbances of the 1914-18 war; and it had been put through against opposition, because of the faith that Great Britain's highest service to the world, in the twentieth century as in the nineteenth, was to ensure the stability and dependability of its money. For several years, it looked as if Mr Norman—whose proposed retention as Governor after his seventieth birthday is the Bank's contribution to the celebration of the tenth anniversary of the pound's downfall—and Mr Churchill had been right and the critics wrong. The restored gold standard worked. Currency after currency followed the pound sterling back into the temple of gold. Some, like the pound, climbed the steps and entered at full stature; others came in through various basements and sub-basements; but by 1929 all but a few chronic exceptions such as the peseta, the tael and the Mexican dollar, were back in the fold. Confidence in the exchanges was restored; capital flowed—too easily—along the international channels.

Then the hurricane struck. There is no need to tell once more how it blew in the autumn of 1929, all through 1930 and the early months of 1931. It is, however, worth recalling that faith in the gold standard was unimpaired. As late as July, 1931, the Macmillan Report had very few doubts about its maintenance—and the Report carried the signature of the chief critic of 1925. All through that heated summer, it was common form that the gold standard must be preserved. A Government fell and political miracles were performed to that end. Pride was swallowed and dollar credits were raised. The files of *The Economist* bear witness to the seriousness with which the struggle was waged. On that dramatic Monday morning, when the country awoke to find itself off gold, there were many people who felt a sense of national defeat.

Even on that Monday morning, however, defeat was not the dominant emotion. The pound sterling had suffered the fate that is worse than death, but there was less shame than relief. And, in the ten years since then,

the public view has hardened that the departure from gold was, in the public tongue, a Good Thing. The chronic depression of the twenties and the crisis of 1929-32 were followed by seven long years of almost uninterrupted and very rapid progress. From being the economic laggard among the great nations, Britain has become the classical demonstration that an elderly, mature community can achieve a rate of economic progress fully as rapidly as in the days of its most boisterous growth. The contrast between the two decades is most striking and, in the public mind, the touchstone is the gold standard. It would be easier to-day to persuade the electorate and the Commons to accept the Corn Laws than the gold standard.

The public mind, however, is given to the fallacy of *post hoc ergo propter hoc*. Some of the events that followed the departure from gold, and are taken as its consequences, should more justly be regarded as fortunate coincidences. There was, for example, the happy accident that the fall of the pound coincided fairly closely in time with the turning point of the world trade cycle. It was also an accident that the departure took effect on a buyers' market and that the prices of imported foodstuffs and raw materials showed very little, or any, appreciable rise. The consequences of the second rapid depreciation, in August, 1939, show what might have happened, and the dependence of British prosperity on cheap food and materials is so great that the departure from the gold standard might have had considerably less favourable effects upon the state of domestic trade.

The whole course of events since 1931 and, in particular, the contrast between the two decades, cannot, however, be put down to coincidence. There have been certain quite definite benefits directly derived from the fall of the pound. There has been, for example, the release which was felt from the depressing effects of over-valuation. It is true that a mere maladjustment of the external value of a currency seems to be too small an explanation for the widespread economic depression and lassitude that ensues, not merely in the export trade, but throughout a country's economic structure—just as the pathological states of the human body seem to be in all proportion to the originating cause. However, a country after another has now learned by exper-

it is allergic to over-valuation, and escape from that state must be accounted a great gain from the depreciation of the pound.

If it were merely a question of over-valuation, that could be corrected by returning to the gold standard at a lower rate. But it is hardly conceivable that the gold standard, at any parity, could be combined with the thoroughgoing cheap money policy which, to the country's inestimable benefit, has prevailed since July, 1932. A fixed rate, if it is combined with a free market (and that is what the gold standard implies), must from time to time be defended. Indeed, experience would indicate that, for a market in as precarious a situation as London, defence is a chronic necessity. Defence of the reserve, in the brief life of the post-war gold standard, was never taken to require very high rates of interest (it is an item of complaint in the United States that the pound went off gold with Bank Rate at no more than 4½ per cent); but it could hardly be combined with a Bank Rate of 2 per cent and an ineffective rate at that. The gold standard and cheap money cannot be combined for any length of time—at least in a country that is on the financial defensive as Great Britain is. It follows that the benefits that have been derived from cheap money must be counted among the advantages of leaving gold.

There have, of course, been disadvantages in the new system. A regime of fluctuating exchanges inevitably imposes some handicap on international trade. Moreover, the sudden and extensive fall of the pound—even in these days the world's leading commercial currency—undoubtedly did considerable harm to the economies of other nations, especially those that were determined to maintain their gold parity. The obverse of the fact that prices did not rise in England is that they fell in gold standard countries. With the fall of the dollar eighteen months later, there was a risk, for some months, that a competitive depreciation of currencies would begin. But both these disadvantages, fluctuation of rates and the risk of competitive depreciation, were removed, without a return to the gold standard, by the Tripartite Agreement of 1936. A more real and lasting effect of the new autonomy of currencies is likely to be the division of the world's currencies into blocs or groups—but even there it remains to be seen whether the greater freedom of trade within the groups offsets the restrictions between the groups. There is very great force in the contention that overseas trade will prosper most if the nations direct their energies towards the maintenance of a high level of domestic activity and purchasing power.

Ten years is perhaps too short a time, and the atmosphere of wartime the wrong occasion, to express a balanced judgment. It may be that, in a few years' time, when war has once more led to inflation, and inflation

has given rise to a search for stability, the present popular judgment on the gold standard will be reversed. But for the moment any such reversal seems unlikely. Indeed, at present, the question whether there will be a return to the gold standard seems to be strangely irrelevant, like an echo from a past age. It is not that there is no choice to be made in the province of international finance. There is a real alternative before the world, the choice between free exchanges and fixed rates with exchange control. But either alternative is only half of the classical gold standard; that regime of free exchanges and fixed rates now seems to be very remote.

Indeed, now that we have ten years of varied experience to give some perspective, the departure from the gold standard seems to mark a much more definite epoch than was apparent at the time. It was the end of the Financial Age, the failure of the last attempt to restore the dominance of finance over economics. The foundations of a new order of ideas have been laid in the ensuing years, in Britain, in America and in Germany, and the war will carry the process much farther. The world is showing an unmistakable tendency to argue that, if a thing is physically possible, whether it be fighting a war or removing unemployment, it must not be stopped by considerations of "sound finance" alone. In war, finance is manifestly a mere camp follower, and the tendency is to reduce it to dependent status in peace as well. Whether the world will find more happiness than grief in this new order of ideas must be awaited with some scepticism; but that this is the trend of events is unmistakable. There is no place in such a system for the categorical imperatives of the gold standard.

Does this, then, mean that the long reign of gold is over? In one sense, completely; the old popular reverence for gold as the one satisfactory form of actually circulating money is dead in Europe and dying in America (where, after all, gold coin still circulated nine years ago). As an international standard of value also, the day of gold is done; the value of currencies is unlikely in the future to be measured by the number of grains of gold for which they will exchange. But, as the international precious substance, there may still be a use for gold. The decision rests with the United States Government; for in any foreseeable time, dollars will be sought after by the rest of the world, and so long as gold remains a sure means of acquiring dollars, gold will be desired by the whole world. No currency, not even the dollar, is now on the gold standard; but gold is on the dollar standard, and it is in the general interest, and specifically the British interest, that it should remain there. The Emperor has abdicated, but he still rules his St. Helena at Fort Knox, Kentucky, the pensioner of a stronger power. Ten years after Waterloo, there is no desire to see a return.

NOTES OF THE WEEK

The "Shoot First" Order

The reception given to the President's order to the United States Navy to attack all commerce raiders operating in waters essential to American defence has had, on the whole, a very favourable reception in the United States, and bears out, once again, the belief that, while the President will not get popular support for a general policy involving the risk of intervention, any particular action he may take will be accepted and even applauded. Nevertheless, the immense pains the President was at to explain his "shoot first" order as an inevitable act of self-defence, which he owed to the safety of the nation, illustrates the care with which public opinion must be handled and the distance the United States has yet to travel to see the war as a world struggle in which it is already involved. The "shoot first" order is now in operation, primarily on the route to Iceland, but the implications of the new policy extend beyond the one Atlantic route. A new executive order has been issued to increase the transport of goods to American bottoms to a number of ports in the British Empire, notably Singapore and the harbours of West

Africa. Will these cargoes be given "adequate protection"? The President based his new policy on the traditional conception of "freedom of the seas," and that freedom must be presumed to prevail everywhere on the high seas, save where the United States—in their combat zones—have voluntarily abandoned it. The immense importance to Japan of the extension in space of the new principle is obvious enough. Are American supplies reaching Vladivostok for Russia, or Singapore for Britain, to be covered by the "shoot first" order? The President's silence is a warning, for otherwise, in the interests of some—mythical—Pacific goodwill, he might have specifically excluded the Far East. No doubt the frank and lengthy exchanges which are still going on between the American and Japanese Governments have made this point clear.

Shipping and the War Effort

The significance of the American Government's decision to take a bigger share in the policing of the high seas, needs no emphasis. The only effective answer to Germany's

attempt, to sap the staying and striking power of the Allies by sinking food and munition ships is force; and the first stage in winning the Battle of the Atlantic is to prevent merchant shipping losses from exceeding replacements. There are indications that this object may actually have been achieved in July and August, when losses showed a marked fall; up to June, losses were appreciably in excess of the output of British and American shipyards, and the merchant fleet at the disposal of the Allies was steadily dwindling. But shipping has more than a defensive rôle in the strategy of the war. The demand for shipping will grow as the power to attack grows; and success on each and all of the world fronts will depend on ships. Ships are needed to sail out of British ports with expeditions as well as to sail in with materials and supplies; already the Middle Eastern force is making tremendous calls on tonnage; and there are Russia and China to be nourished. It will by no means be enough to prevent any further shrinkage in carrying capacity. It will be necessary, for victory, to add greatly to the fleet at present at the disposal of the Allies; and, for this increment, Great Britain must depend mainly upon the shipyards of North America.

The Drive for the Ukraine

By a tremendous effort the Russians have restored the position in the Smolensk sector, where the Germans have been driven back some nineteen miles, roughly to the line they occupied at the end of the battle for Smolensk. True to their old tactics, the Germans now appear to be attacking above and below the Russian counter-offensive, hoping no doubt to find a weak place from which troops have been drawn off. In the north, they describe Bolegoy beyond the Valdai Hills as their—very distant—next objective, and claim to be advancing up the railway from Velikiye Lugi to Toropets. In the south, a new drive from Gomel appears to have brought them to Chernigov, with the result that Kiev is in greater danger of encirclement than ever before. The news is the more disquieting in that the Russians admit the establishment of German bridgeheads on the east bank of the Dnieper and the evacuation of Kremenchug. The river has also been crossed in its lower reaches, and the Germans claim—though this is almost certainly exaggerated—that they have advanced on the Crimea as far as Perekop. After thirteen weeks, the Germans still retain the initiative over practically the entire front. Russian losses in the south now include a considerable part of their industrial replacement capacity; and more is in danger. Only in the north is the onslaught definitely held—in the near approaches to Leningrad. The ring has not yet closed round the city, and for the Germans the problem is how to force the city in time to establish winter quarters there. This is a problem which must concern them now on every front, and it is almost certainly influencing their choice of objectives. The last Russian counter-offensive in the Smolensk area has probably extinguished the hope of wintering in Moscow; and in the south, Von Rundstedt's and Von Bock's armies can either concentrate on capturing Kiev and Kharkov or push forward through the Donetz area towards the Don. With October on their heels, they may well prefer to limit their commitments.

Black Sea Front

With Von Rundstedt's armies attacking across the lower reaches of the Dnieper, it would be an obvious move on the part of the German High Command to attempt to turn Marshal Budyonny's flank by an attack launched against Crimea or the Eastern Ukraine. Given the experience of Crete, an air and sea attack upon Crimea would not be impracticable. True, the distances are a little greater—Varna, Burgas and Constanza are between 250 and 320 miles from Sebastopol, whereas the distance from the Greek mainland and islands to Crete was only 100 to 200 miles. But the bringing of Odessa within reach of the Germans' bomber squadrons and, possibly, of their heavy artillery may well have interfered with the efficiency of the Red Navy. There are signs that some such new adventure is envisaged. If it is true that Brauschitsch and Raeder have been together in Sofia, their meeting suggests co-ordinated sea and air operations, carried through in conjunction with the Bulgarians. At the same time, Russia's sharp note of protest to the Bulgarian Government shows that the Soviets are aware of Germany's intention to use Bulgaria as a base for operations in the Black Sea. Recent reports talk of the

arrival of German E-boats down the Danube and of the equipping of Roumanian and Bulgarian merchantmen as troopships. It is almost certain, too, that Bulgarians are mobilising. The attack, should it be launched, would serve a wider purpose than that of attacking Budyonny on a vulnerable flank. It would be a step towards cutting Russia off from her most important supply route through the Caucasus and Iran, and it would at the same time offer an opportunity of doing this without drawing the Turks into the war. A winter campaign across the heights of Anatolia is not an encouraging prospect, and it may be that the Turks will still see themselves condemned to remain the Sweden of the Middle East.

The Shah Abdicates

Nothing in the past history of Riza Khan suggested that he would submit quietly to the reversal by the Allies of the policy upon which he has for some time conducted his diplomacy. Before the war, his relations with Nazi Germany had been drawn closer; and during the war itself, apart from direct Nazi activity, Iran was the refuge and centre of all the anti-Allied forces in the Middle East. It was, for example, a natural step for Rashid Ali and the Mufti of Jerusalem to seek sanctuary there. With this declared policy, the Shah combined a harsh, dominating character, used to absolute rule and increasingly intolerant of any outside check. When this is remembered, the wonder is not that he jibbed at the Allied terms, but that he accepted them at all. In the circumstances, the only conceivable explanation is that the British and the Russians, like the British in Iraq, struck too soon. The Nazi coup in Teheran was probably timed to coincide with the appearance of Von Rundstedt's panzer divisions at Batum. When the Allies took action several weeks too early, the Shah attempted delaying tactics. He accepted the terms, just as Rashid Ali accepted the first shipment of British troops to Basra. This was to allay suspicion; even so, the negotiations trailed on a fortnight. Then, when the terms were finally agreed on, new delays began, this time fantastic administrative difficulties engineered by the German Minister. Presumably the plan was to prolong this period for as long as possible by multiplying the reasons why this or that list of Axis names, or this or that Axis agent, could not be produced. Each day gained gave the hope of holding on until Von Rundstedt had broken through. The British and Russians, however, decided to put an end to the comedy and marched on Teheran. At this point, the Shah could choose between resistance, which apparently his people did not want, compliance, which would have compromised him with the Germans, or abdication, which might conceivably enable him to "rise and fight again" in the event of a German victory in the Caucasus. The Allies have probably not heard the last of Riza Khan.

The Bank Decides

The half-yearly General Court of the Bank of England on Thursday was charged with greater significance than usual. It has recently been felt by many that the time was arriving to place at the head of the Bank's affairs a Governor who had not grown up in rigid attachment to the old narrow economic notions which, for a decade or more, have been outmoded, probably for ever. The Court has decreed otherwise. The opportunity was taken on Thursday to anticipate by some months the nomination of the Court for the Governorship and Deputy Governorship; and the informal rule has been suspended which, for twenty years or so, has ordained that a director of the Bank must retire at seventy years of age. Mr. Montagu Norman will serve for a twenty-third year, at least, as Governor. When so many likely candidates are engaged in national service, it is reasonable that Sir Edward Peacock, Lord Kindersley and Mr. Cecil Lubbock should continue as directors and not be superannuated. But the Governorship is another matter. In effect, or at least in influence, it is a high office of State; and the Court's decision to adhere, in the person of Mr. Norman, to old ways and old ideas is only tempered by the replacement of the late Lord Stamp by Mr. Keynes, a most welcome and encouraging choice. Age apart, Mr. Keynes is essentially one of the new men—their most brilliant—and his views on the "humbug of finance" should bring new life into the Bank.

Recruitment by Lot

There is a song of Gilbert's which proclaims that, while A is happy, B is not. This is almost inevitably the state of affairs which results from an attempt to mobilise manpower by volunteering with a leaven of compulsion. The distinction between those conscripted for military service and those who are left free in their workplaces is probably too much hallowed by tradition to cause the resentment that might be expected. Where bitterness does appear is when the distinction is drawn between one workman and another in industry, or between one citizen and another in civil defence. In industry, compulsion is only used where other methods have failed. Miners are compelled to go back to the pits, whatever their loss in remuneration and working conditions may be. Essential workers are kept at their places by Government order. Unemployed women are pressed into national service; and there are various degrees of suasion which are applied to different categories of workers according to their status and local needs. The anomaly is that the only people who are able to work where they will, when they will, how they will and at whatever wage they can obtain are those employed in the least essential industries. Similarly, in civil defence, there are wide anomalies. In certain areas, fire watching is now compulsory, but the duties which exempt from fire-watching—work in the civil defence services proper or in the Home Guard—are entirely voluntary. This means that, in fact, a man can be exempted from the obligation to do 48 hours a month on fire guard by the fact that he does few or no hours a month in A.R.P. or the Home Guard. Clearly, the time has come to impose a minimum standard of attendance and service in home defence upon every individual—a conclusion which surely follows from the institution of compulsory means to make up the Fire Guard. The simple requirement is that every man—not yet every woman—should be performing some defence duty; and this requirement—even apart from the failure of great numbers of men to register for fire watching—is still very far from being satisfied. Moreover, there may be ironic smiles in Leningrad and Moscow, Kiev and Odessa at the chivalrous British assumption that however useful, indeed necessary, they may be as volunteers, women are not really suited to serve, as conscripts, beside men in the defence services.

The Price of Services

It is good news that action has at length been taken under the Goods and Services (Price Control) Act, 1941, to fix maximum charges for laundry work. The particular instance is less important than the principle involved, that is, that the prices of services, in fact as well as in law, are to be brought under control. The London laundries were prevented from bringing into effect on September 15th a further price increase of 1d. in the shilling, which would have made a total increase of 4d. in the shilling since the outbreak of war. The Central Price Regulation Committee were not convinced that the increase was justified by rising costs. They had issued a memorandum containing suggestions for the control of costs as recently as July 28th, and they approached the Board of Trade, who have made an

order declaring charges on September 1st to be maximum charges. The Committee intimate that they are still open to representation from the laundries concerned; and they may agree to a modification of the order, if significant increases in costs can be proved. In point of fact, there is a strong possibility that the increases that have been made are due to an attempt to retain labour by raising wages. It is well known that many laundries are working short staffs because of the counter-attractions of more remunerative munition work. Since laundry work is an essential service to the community—which is the basic reason for controlling laundry charges—there is a good case for also providing it with an adequate labour supply; and the first step toward this goal might be the application of the Essential Works Order to laundries, thus freeing the labour supply already employed.

Purchase Tax Amendments

Three recent Treasury orders which will come into force, subject to the approval of Parliament, on November 3rd, are designed to stop loopholes in the operation of the purchase tax and to extend the number of exemptions from it on compassionate grounds. The most important change is that which brings small wholesalers and manufacturers, with a gross annual turnover of chargeable goods between the limits of £2,000 and £500, within the scope of the tax. Formerly, only wholesalers and manufacturers above the £2,000 level were obliged to register. Consequently, those small concerns which were able to obtain their raw materials from non-registered sources were in a position to put untaxed goods on the market with consequent loss to the Exchequer. They were also placed in an unreasonably favourable competitive position vis à vis those of their rivals who just came within the scope of the tax. While the yield of the new order may not be considerable, it will eliminate an anomaly which to many dealers and manufacturers barely above the £2,000 level must have proved exceptionally irritating. The remaining orders detail the list of costly drugs exempt from the tax, in place of the existing general exemption, and extend such exemption to gramophones for the use of the blind and solid tyres. All these modifications are sound improvements in the operation of the tax as it is. The recent resolution of the TUC asking for the abolition of purchase tax on "essential" commodities is a demand for modification of a more sweeping kind. The resolution is based on an allegation that the purchase tax has served significantly to reduce working-class standards of living. If criticism is to be levelled against the tax, the charge that prices have been raised without the achievement of a corresponding retrenchment would appear to be a shrewder comment, for its object was to curtail consumption. Yet there is some substance in the TUC motion. The basic problem of war finance is to draw off all surplus spending power from the consumer; and the question is whether the purchase tax does this equitably and effectively. In fact, does not the rich man continue to spend and the necessity of going without fall upon the poorer members of the community? From the outset of the discussion, *The*

BANKERS TRUST COMPANY

Economist has maintained that the taxation of income at source, coupled with comprehensive rationing, was a more promising solution; and the operation of the purchase tax during its first year of existence has done nothing to modify this conclusion.

Payment for Use

It is always healthy when agitation is followed by facts. Ever since the war began, there have been a great many complaints about the way in which buildings and land have been requisitioned by the forces or by Government Departments and about the inadequate payments which had been made in compensation. At the request of the Chancellor of the Exchequer, an investigation has been made into requisitioning and the operation of the Compensation (Defence) Act. The conclusions have been published as a White Paper and the Government has accepted its recommendations in principle. In general, the impression is given that requisitioning and compensation are running with reasonable smoothness. Up to July 4th, 124,000 requisitions had been made by the Army; and out of 100,000 claims for compensation, 86,000 had been settled. The Royal Air Force had made 28,000 requisitions and 10,000 out of 15,000 claims had been settled. The Navy, up to the end of July, had made 10,000 requisitions; and 6,000 out of 7,500 claims had been settled. Of 80,000 claims referred to the valuation department of the Inland Revenue, for re-housing the homeless or for civil evacuation, by the end of June over 60,000 had been settled. The delay has not been unreasonable. Inconvenience has been caused by the requisitioning of flats in the London area, but not, for the most part, unnecessarily. Good agricultural land has sometimes been taken for aerodromes, but only when the gain was probably greater than the loss. There has been considerable damage to property requisitioned for the Services, but the crowded conditions and the equipment of members of the forces makes it inevitable that this should be so. The real problem which arises is whether the compensation which is being paid under the Act of 1939 is sufficient; and it is the conclusion of the White Paper that the absence of compensation for loss of profits is an obvious gap. It is also suggested that, in the case of dispossessed tenants, they might be given the chance of disclaiming their leases and that, in any case, compensation officers should pay proper regard to existing net rents. These conclusions go further than the narrow problem of requisitioning. They are linked to the larger question of compensating all members of the community for losses of property or livelihood due to war conditions or war policies over which they have no control, and it is the absence of any comprehensive and uniform system of compensation which, more than most other factors, still causes individuals to kick against the pricks of wartime necessity and impede the war effort.

Consumers and Producers

Not the least important practical opening for the application of the general principles of economic freedom and collaboration laid down in the Atlantic Charter is afforded by the arrangements which have been made to store supplies of food for the relief of Europe when the Germans are driven back. It is an arrangement which has two sides—not only the store and transport of supplies but also the purchasing of surplus crops. It is precisely the sort of experiment which many people were calling for before the war, after the ironical experience of the depression years when primary produce was destroyed because there was too much of it and it could not be sold. Already there exists an embryonic department under Sir Frederick Leith-Ross and attached to the Ministry of Economic Warfare, and it is expected that, at the forthcoming conference of Allies, an inter-Allied economic organisation will be set up to discuss these post-war problems with particular reference to the needs of Europe. It is immensely important that this should be regarded, not simply as a relief project, but as a means of reviving, expanding and maintaining world production and world trade; and it will only be successful if it is done by agreement, not simply between allies, but between all the partners in the world-wide exchange of primary products for manufactures which is the foundation of international commerce.

The Shape of Things to Come

It is not only on the Russian front that the Nazis are facing an uncomfortable winter. All over the Continent there are stirrings, signs of discontent and popular dissatisfaction, and in some countries resistance is going further than the writing of "V" signs at night, "ca'canny" in the factories or discreet and studied non-co-operation. In the Balkans, it is clear that Yugoslav resistance is by no means at an end. The remnants of the Yugoslav army, which withdrew to the mountains after the collapse of resistance in April, have been able, since the Russian war began, to draw away German troops from their country, to re-equip themselves, to establish contact with the villages and to organise forays and regular raids, which are creating new problems for the depleted German policing forces and terror to the Croat quislings and Ustashi. At the other end of Europe, in Norway, the Germans are reaping the harvest of 18 months' political miscalculation. Here the graph of resistance is rising, not falling, since the early days of occupation. The possibility of maintaining the Quisling regime is generally admitted to be unlikely; and Terboven, the Reich Commissioner, gave official recognition to this fact by declaring a state of civil emergency in Norway on August 2nd. Since that time, repressive measures have been intensified daily. Bishops have been dethroned, distinguished professors driven from their universities, officials from their administrative posts. Now comes the news that the trade unions, possibly the solidest block of Norwegian opinion, have been attacked; and after a series of trials, conducted under martial law, two trade union leaders have been shot. All these signs of revolt and unrest do not, it must be underlined, yet amount to a major problem for the Nazis. The man with the machine gun has repressive powers unknown in the days of the rifle and the barricade. Moreover, it is the outstanding cases of resistance which get known abroad, not the daily, unsensational extent of co-operation, based upon the need for bread and fear of the Gestapo. Nevertheless, a tide is turning here, which, if Russian resistance can be maintained, and British air attack increased, will tell heavily in time against the German morale. The winter is coming. It will be a long winter. And there will be time for this changing tide to run high.

Peace Aims

The attitude of many vested interests to wartime controls is very simple. Either they regard it as their mission, within or outside such departments as the Ministries of Food and Supply, to prepare for their dissolution as soon as the war is over; or else they see in certain restrictions devices which they could use, to their profit, in more normal times. At the beginning of September, all builders and civil contractors who wish to carry on work after October 1st were registered under the scheme of the Ministry of Works and Buildings to control and direct the nation's wartime building resources; and a comment of the *Builder* on this registration is full of meaning: "We should like to see this scheme retained after the war in a strengthened and extended form to regulate the admission into industry of new firms according to a fit standard of experience and integrity"; and "in arriving at any criterion of competence and behaviour it would, of course, be essential to work closely with the National Federations (of Building Trades and Engineering Contractors) and the Institute of Builders." Building standards will be needed in post-war Britain, it is true. But they will surely be set and imposed by the Government on behalf of the community, and not by "the trade." Wartime controls and restrictions, moreover, are a function of wartime scarcity; and, at any rate in private hands or under private direction, they give no guidance for the plenty that should be sought in peacetime. The fact is that a new Versailles is being planned under which reparations will be paid by the ordinary consumer of goods and services. It is not only in building that this move to use wartime controls in order to establish a restrictive "closed corporation" in peacetime is evident. In retail trade, the use of the wartime registration of shops to restrict new entries has already been mooted; and there is hardly a trade association which has not an exclusive territorial ambition of this kind. Mr Greenwood and his attendant reconstructors will not have to forget that the "freer trade" and "equal access" which the Atlantic Charter spoke of both begin at home.

The Fire Service

The civil defence services were set up on a local basis because the services with which they were necessarily linked, fire, water, gas, drainage, education and the rest, were local; because it was from local volunteers that the new services sought their staff; and because there was no half-way house on the British political map between local and central administration. The war has seen great changes. More and more, though the administration of civil defence and welfare is local, its supervision is regional, with headquarters in the Regional Commissioners' offices; and the institution, a month ago, of a National Fire Service, on a regional basis, is a notable step forward in actual organisation. The 1,400 fire brigades of England and Wales are now re-formed into 33 units, with a new code of discipline, new conditions of service, new terms of remuneration, and an entirely new system of control. The great fires in last winter's raids, which taxed the ill-assorted resources of whole regions, and revealed a very heterogeneous range of sovereign fire authorities, have taught their lesson. Each commander will now have all the men and equipment throughout his area under his direction, and will be able to rush them into action at the centre of the battle—whatever their address. But fire-fighting is more than an exercise in political science. Actually, the chaos of authorities last winter was no more, to say the least, than the chaos of equipment; and the Fire Service, in practice, will only be effective insofar as its material needs for men, water and plentiful and standardised equipment are met.

Highland Prosperity

Since the Glen Affric power scheme was quashed, two further successes have been added to the opponents of selfish and injudicious development of the Highlands. The Secretary of State for Scotland has announced the creation of an advisory council on post-war planning in Scotland. This

council will appoint committees to make inquiries into particular problems, and will work in close collaboration with the other bodies, such as those within the orbits of Mr Greenwood and Lord Reith, which are examining the post-war problems of Great Britain as a whole. And, as a wind-fall triumph, comes the news that the Falls of Glomach in Ross-shire have been presented to the National Trust for Scotland through private generosity. The task which faces the advisory council is formidable. It is nothing less than an attempt to bring to the Highlands the material benefits of an industrial revolution without its nineteenth-century accompaniments of spoliation and slums. Life in the Highlands has retained the simplicity and vigour of pre-industrial England; subsistence farming supplemented by the keeping of poultry continues to provide adequate nourishment for those who remain on the land; and wood, peat and paraffin provide fuels for heat and light, which not only the romanticist may find preferable to coal and electricity. There is, however, another side to the picture. The shortage of good pasture gives rise to a permanent scarcity of milk, which even to-day is not fully supplied from neighbouring towns. Sheep farming pays so badly that a steady rural exodus, dating from the ruin of the crofters in the last century, has been accentuated in the last decade. The timber wealth of the Highlands is not economically developed through lack of individual capital, and there is some danger that the needs of the present war may lead to an appreciable measure of deforestation. Shortage of housing space goes far to restrict marriages in a god-fearing race which fears to raise large families in the cramped accommodation accepted by earlier generations. It is open to doubt whether the luxury sports of grouse shooting and deer stalking will continue in the post-war world to provide the Highlanders with a means of livelihood which, before the war, was insufficient to prevent gradual depopulation. The Highlands need the benefits of an industrial revolution, but of one so skilfully engineered that, not only the natural beauty of their countryside, but also all that they have of homely well-being is retained in the process.

THE WORLD OVERSEAS

Australian Wartime Industries

(By a Correspondent Lately in Australia)

September 2nd

FOR the first time in the history of the Commonwealth, Australian secondary industries are yielding more than primary ones. Australia is in the midst of a process which in later years may well be described as the Australian Industrial Revolution. The process started some years before the war; during the 1930's consumption of gas and electricity increased by about 50 per cent, and iron and steel production, which was started during the last war, was more than trebled during these ten years. But the present war has accelerated the rate of industrialisation to an extent unthought of.

It is authoritatively stated that Australia is "fast approaching" its munitions objectives—first, to be self-supporting for its forces at home; and, secondly, to provide ample exportable surpluses for the other countries belonging to the Eastern Group, that is, India, New Zealand, Malaya, East Africa, etc. This ambitious aim could only be achieved in a country like Australia after lengthy preparations. It was not only necessary to build new munition factories, but the production of machine tools had also to be expanded or begun. In many cases, the fruits of the industrial effort are hardly visible yet, but they are bound to be very significant once the preliminary difficulties have been overcome. The first Australian Bren gun, for example, was only finished last January, after under two years' preparation, and Bren guns are now being produced on a large scale. Similarly, a considerable number of tanks will be made in Australia in the not too distant future. The large-

scale production of a special type of the Bristol Beaufort bomber, re-designed for Australian conditions, is already in progress. Similar aircraft have been produced for some time, and Australia has been sending elementary trainer machines to India and Burma.

At the beginning of this year, the naval vessels under construction in Australian docks were stated to total some 40,000 tons. In addition, Australia is engaged on the construction of at least sixty freighters, each with a cargo capacity of 7,600 tons. Floating dock facilities are being improved, and it is hoped to construct merchant ships up to 10,000 tons in the near future.

The present trade difficulties are an additional incentive to industrialisation. Until recently, ready-made paper had been imported from Canada in large quantities, since Australian timber was not considered suitable for the manufacture of paper. But, after elaborate research, Australian paper mills came into operation, and for several months now at least one big Australian daily has been printed on Australian-made paper. Another interesting scheme, which is still in the process of preparation, is to pulverise Australian meat in order to facilitate its export. Pulverised meat would require far less shipping space and might even be sent in ships without cold-storage facilities.

Australia's natural wealth in coal, ores and some other raw materials facilitates the process of wartime industrialisation, even though certain restrictions have had to be imposed on the industrial use of aluminium, tinplate, petroleum, woodpulp, etc. The Government has also laid in vast

stocks of reserve materials, and no really grave shortages are likely to arise, even if shipping in the Pacific should be severed for a certain time. Far more serious, in an under-populated country like Australia, is the problem of how to get a sufficient supply of labour. Employment in Australian factories has risen by 19 per cent between August, 1939, and March, 1941, and the once considerable reserves of unemployed people have been practically absorbed by the industries and the fighting forces. The manufacture of consumption goods is already meeting increased difficulties owing to the shortage of skilled labour. A further expansion of industrial production is, however, imperative; in 1942, no fewer than 100,000 people are to be employed in the munition industry alone; but any further mobilisation of manpower for industry requires measures similar to those adopted by Britain and other belligerent countries. The Government has, indeed, started to enlist women for industrial work and for auxiliary duties in the fighting forces. They have obtained powers to prevent stoppages of work and are trying to impose a more rigid control of consumption by prohibiting and rationing non-essential imports.

Obstacles to Output

All these measures are meeting with a number of obstacles in a country which, spite of the deeds of the Anzacs and the obvious menace from Japan, still feels comparatively safe and far from the actual fighting. As a direct result of the war, and more especially of the industrialisation, the purchasing power of the average Australian has been increased recently. Wage rates are rather higher than before the war, and numerous people have found employment or have changed to better paid or more regular work. In some small ways, it is true, private consumption has been restricted for some time; petroleum for private use has been fairly rigidly rationed, so that the number of new car licences has been reduced by 70 per cent; there are occasional shortages of cigarettes and other consumption goods; and the size of daily newspapers has now been reduced by 55 per cent. Many civilians are reluctant, however, to make additional sacrifices, and Mr Menzies mentioned in June that valuable labour was still engaged in the building of luxury flats.

It is also more difficult in Australia than it is in Britain to unite employers and employees in a common war effort. Strikes and lock-outs have not occurred to the same extent as in the United States, but neither have they been as rare as in this country. As late as last July, Australian dockers had to be warned by their Government because they had held up a boat loading cargo for Britain. It should be added, however, that in recent months the number of industrial disputes has been on the decline; apparently the numerous warnings of leading Government and Opposition spokesmen about the seriousness of the political and military situation have had some effect on the people's attitude. On the other hand, the sense of common danger is still hardly strong enough for the Australians to unite in the common war effort without reservations.

Another obstacle to the Government's industrial war planning is the division of the Commonwealth into six States with sovereign powers in their own territories. There is now, however, just as in the last war, an obvious tendency to increase the powers of the Federal Government, at least temporarily, at the expense of the State Governments. The Commonwealth Government has, for instance, assumed arbitration powers, for the duration of the war, to deal with inter-State industrial disputes. Still more important, the States are now to vacate the field of income tax, thus enabling the Federal Government to introduce a common tax level throughout the Dominion. In spite of these and other difficulties, it is almost certain that Australia will emerge from the present war as an important industrial country.

Mr Fadden's Views

Nobody has pictured post-war industrial Australia more plainly than the country's new Prime Minister, Mr. Fadden. In various speeches delivered before taking over his new post he foretold that Australia would soon have an opportunity to grow into the main centre of world trade. After the war, his argument ran, when Europe will still be bleeding from recent fighting, scores of millions of people from the Old World, even English people, will be looking for new homes overseas. Australia should then, in his opinion, absorb large numbers of European industrial people, preferably of British stock, and thus become an industrial

nation many times larger than at present and with many opportunities. The country should cease to concentrate mainly on the production of primary products for which it would become exceedingly difficult to find suitable markets.

This argument, even if it exaggerates the opportunities of the Commonwealth, shows at least the trend of thought of many Australian people, and nobody can deny that Australia might well develop into a competitor of Britain unless some sort of new economic co-operation can be found. The traditional trade relations between a highly industrialised England and a semi-colonial Australia have been upset, and will never be re-established. The relationship between both these countries will probably be further complicated by the re-orientation of trade relations between Australia and the United States, which is sought for by both Australians and Americans as a natural sequel to the Lease and Lend Act. In all likelihood, the present Australian-American trade talks will result in an increase in the volume of their mutual trade.

It is obviously an important problem of post-war reconstruction to find ways and means of establishing a new economic co-operation between the industrial countries of the Empire. Military considerations are, naturally, of overwhelming importance at present, and the construction of a vast munitions industry in Australia would still be necessary, even if it were certain that, after the war, this industry would be used against Britain. But whether this will be the case, or whether the new Dominion industry will instead supplement the British industrial apparatus by providing the world mainly with goods which are not manufactured in Europe, and by giving new opportunities to English emigrant-workers, will largely depend upon the policy and imagination of those who are responsible for economic life in days to come.

Shanghai and Sanctions

[FROM OUR SHANGHAI CORRESPONDENT]

August 7th

SHANGHAI, as a result of the freezing of Chinese and Japanese assets by Britain and America, has lost its privileged position as one of the world's last free and international foreign exchange markets. This position was based upon the local free convertibility of American dollars, as well as free sterling, into the Chinese national currency. The Anglo-Saxon freezing of Sino-Japanese assets ended free convertibility on July 26th. For the time being, open-market exchange operations here continued within narrow limits, because British, American and Netherlands banks arrange for set-off contracts in respect of outstanding over-bought or oversold exchange positions established prior to July 26th. The American banks also buy back from their depositors American dollars against Chinese currency, while sterling accounts in local British banks are being treated as completely frozen. Finally, American and British banks allow, out of new exchange proceeds from such operations, limited amounts of foreign exchange to *bona fide* importers who can be trusted not to deal on behalf of totalitarians. But these operations are bound to be temporary only; and, within a few weeks or months, all local foreign exchange transactions by British, American and Netherlands banks will be strictly subject to licensing.

The outlines of American exchange financing of trade with Shanghai in the future have already become clear. No goods of any sort may be shipped from the United States to Shanghai or Japanese-occupied areas in China, except when covered with an export permit issued by the U.S. Administrator of Export Control. American banks will release frozen exchange assets, or will sell American currency for Chinese dollars, for payment of American goods, only after American export permits for such goods have been granted. The amount of American currency to be made available for payment of future exports to Shanghai and the Japanese-occupied areas will thus be determined by the United States Administrator of Export Control, and this will be done in close relation to the future value of shipments of goods from these parts of China to the United States. American banks here will finance exports to America only after checking with the American authorities and obtaining the agreement of their New York head offices, which will investigate Chinese export matters. The idea is to balance American trade with

Shanghai and Japanese-occupied China through the curtailment of exports from America. Were this trade allowed to remain unbalanced, the United States would be called upon to release additional foreign exchange—either out of the newly-frozen Sino-Japanese assets in payment of an American export surplus, or directly in payment of a Chinese export surplus.

The local British and Netherlands banks are not yet in possession of detailed instructions from London and Batavia as regards future trade financing. Yet British and Dutch action in this field is likely to follow the American example in subjecting all releases of foreign exchange, on account of Shanghai's and Japanese-occupied China's foreign trade, to import-export licensing in the British Empire and the Netherlands Indies, respectively. A safety valve through which to provide for exchange coverage of necessary imports into Shanghai, not lending themselves to British-American-Dutch trade and exchange regimentation, will be found in the continued operation at Shanghai of the Chinese Government banks, backed by the resources of the Chungking Chinese Currency Stabilisation Fund.

Effect on Trade With Japan

Only some 20 per cent of Shanghai's foreign trade in recent months has been transacted with the Japanese Empire, while most of the remainder of this trade was done with the British Empire, the United States and the Netherlands East Indies. These countries' freezing measures and trade licensing under freezing regulations, therefore, severely affect the bulk of Shanghai's foreign commerce. A heavy curtailment of local imports from the three countries in question is being anticipated, especially in lines in which imports were transacted primarily on behalf of Japanese interests. Of course, the Japanese also will have a word to say in Shanghai's foreign trade regimentation. They strictly control all the export commodities pouring into Shanghai from the interior, and they are in a position to regulate also all other Shanghai exports through measures taken under the Shanghai Customs authority usurped by the Nanking puppet regime of Wang Ching-wei. There are indications that the Japanese will attempt to barter Shanghai export permits, in respect of goods which the democracies might want to obtain against their export per-

mits, for supplies which Japanese interests would like to keep secure via Shanghai.

Exchange speculation in Shanghai has not been on any appreciable scale since the promulgation of the Anglo-Saxon freezing of Chinese and Japanese assets. There is no longer any possibility now of building up large purely speculative exchange positions; and those who might venture to contract exchange forward fictitiously would expose themselves to the most dangerous squeezes, because of their inability to effect or to take genuine deliveries. Local speculation, therefore, has almost entirely withdrawn from the foreign exchange field, and goes in for commodities such as rice, cotton yarn, piece-goods, sugar, and cigarettes. There is also now large-scale gambling in fictitious gold bars on mere marginal differences, with "no deliveries" expressly understood. The large amount—for local circumstances—of some Ch. \$3,000 millions worth of idle Chinese capital continues to hover about Shanghai and to engage in purely speculative activities.

The Chinese dollar's exchange value, contrary to former local expectations, failed to strengthen after the Anglo-Saxon freezing of Chinese and Japanese assets. While this freezing immediately curtailed the amount of foreign exchange provided to importers, it also cut short exports and—which amounts to much more—eliminated, at least temporarily, the most important sustaining factor in the Shanghai exchange market recently—the free repatriation of Chinese refugee capital and its free re-conversion into Chinese currency. The sharp decline, from almost 30 to less than 15 per cent, in the Shanghai dollar's premium over the Free China dollar, as expressed in Shanghai-Chungking interior remittance rates for Chinese currency, is notable; the decline is due to the local dollar's loss of its former free convertibility advantage.

The British freezing of Sino-Japanese assets, and the subsequent inclusion of Hongkong within the sterling exchange control bloc, eliminated almost all Shanghai's supply of free sterling, and made the local free sterling rate rise above U.S. \$4.00 and merge into the New York-London cross-rate. Shanghai speculation upon the sterling/U.S. dollar cross rate has in this way been suppressed too.

[The exchange arrangements made with the Shanghai banks by the Stabilisation Fund for the Free Chinese currency were described in a Financial Note in *The Economist* of last week.—EDITOR.]

The Balkans Under the Axis

Roumania as a Belligerent

(BY A CORRESPONDENT)

September 2nd

BY piecing together the scraps of information finding their way out of Nazi-controlled Europe, it is fairly easy to reconstruct the background of Roumania's entry into the war against Russia. It can now be seen that General Antonescu's visit to Munich, a fortnight before the aggression, served only to put the finishing touch to a long-prepared plan of campaign. It is also clear that the *Conducatorul* (Roumanian for *Fuehrer*) was promised more than merely the restoration of Bessarabia and Northern Bukovina in return for active participation. Ever since last summer, Roumanian eyes have been kept fixed on the western border, the lost parts of Transylvania which all Roumanians prize more highly than all the other ceded provinces. They have been repeatedly and openly encouraged in their hopes of a restoration by the General himself, who, moreover, linked up his declarations on the subject with his two previous visits to Germany.

All these hopes received a shattering blow when Hungary—the other junior partner in the Tripartite Agreement—joined in the aggression against Russia a few days later, in circumstances not yet fully clear, but in all probability directly attributable to fears or even open threats of that very restitution which had primarily brought Roumania into the war. The use Hitler for his part chooses to make of the competing claims in the triangle is further illustrated by reports that he is now playing off the two rivals against each other in pushing their troops beyond their originally assigned posts.

But General Antonescu may have had a further objective of his own in making war on Russia—the bolstering up of his regime in the face of growing discontent and opposition.

He hoped thus to open an outlet for rising passions and, at the same time, by an appeal for national unity, to rally around him some of his political opponents. This is, however, a dangerous stroke which can succeed only if it brings instantaneous and overwhelming military success. As matters stand at present, with substantial physical destruction and a heavy toll of Roumanian casualties, in place of the triumphal march counted upon, the adventure is having the very opposite of the desired effect. The combined upshot of this all-round disillusionment finds its expression in the growing unrest on the Roumanian home front, reported to be spreading even to the battlefield itself.

Bessarabia itself, now fully under German-Roumanian control, should make little immediate contribution to the German war potential. Its communication system, which is defective at the best of times, is now completely upset. The fertile plains of Bessarabia yield, in good crop years, a considerable surplus of wheat, oilseed and fruit; Bessarabia had also been, prior to its occupation by Russia last

Malaya

The Malayan Information Agency exists to provide authentic information on all aspects of trade and travel in British Malaya. Agriculture, mining, commerce, transport—illustrated handbooks, etc., on request.

THE MALAYAN INFORMATION AGENCY
MALAYA HOUSE, TRAFALGAR SQUARE, LONDON, W.C.2

summer, the main centre in Roumania for the cultivation of soya beans, under the auspices of the *I.G. Farbenindustrie*. On the other hand, owing to the vagaries of the climate, the whole region is extremely exposed, both to drought and flood, and relief action has been a frequent occurrence in recent years. As the devastation carried out by the Russians before their withdrawal was complained of in Roumanian communiqués, it is more likely than not that, instead of getting anything out of Bessarabia, its victualling will place a further drain on the depleted Roumanian supplies.

It is perhaps significant that the work of reconstruction in Bessarabia is to be carried out under the "guidance" of the German Minister Flaumer, and that the whole province is to remain for the time being an independent administrative unit, completely isolated from the rest of Roumania.

One Year of Collaboration

July 5, 1941, marked the first anniversary of the day when the newly-formed Cabinet under King Carol announced its adherence to the Axis system. In the course of the ensuing co-operation, Roumania has been subjected to an economic exploitation which differs little, if at all, from the German military occupation of the last war. Now, as then, the true measure of depletion will not become known until later, as the relevant figures are either withheld from the Roumanian public or deliberately falsified. However, there exists ample indirect evidence in other facts and figures.

One telling example was furnished not long ago by the Nazi Press itself, when it was making great play of Roumania's increased export figures and export surplus. It is only necessary to contrast that alluring picture of prosperity with the food situation in Roumania, and the idea of an export surplus assumes quite a different meaning. In the first four months of this year, Roumanian exports reached a new record of 10,000 million lei, while imports amounted to 5,500 millions. Direct comparisons with previous years would be of little value, partly because of the important territorial losses suffered in 1940, partly on account of the radically changed prices. More significant is the fact that 75 per cent of Roumanian exports go to Germany, and that the ratio of such exports to imports from Germany is 100 to 25. Moreover, the exports shown in the trade returns obviously do not include such "invisible" items as the quantities consumed by the German armies inside Roumanian territory.

Under the existing German-Roumanian agreement, the substantial balance of trade "in favour" of Roumania is to be set off against German deliveries of armaments and future German deliveries of agricultural machinery. This implies three things: virtually giving away of Roumania's agricultural and mineral products; going short of food at home; and financing the export surplus by a continuous expansion in the note issue.

Although Roumania produces ordinarily about 35 per cent more food than it consumes, it has been experiencing for some time now an acute shortage of foodstuffs, as well as a gradual disappearance of such consumption goods as soap, boots and clothing, owing to the lack of raw materials in civilian industry. Severe rationing and drastic penalties have done little to ease the situation. Black markets in foodstuffs and other articles are as common as food queues and even "bread riots."

The Value of Italy's New Territories

[BY A CORRESPONDENT]

September 5th

THE Axis Powers have greatly expedited the dismemberment and partition of Yugoslavia. New states and new zones of interest were so hurriedly established that, even now, when nothing more than agreement between the two conquerors is required, there is no real certainty or finality about the lines of demarcation. One thing only may be taken as certain—Italy has once again emerged the loser in the division of the spoils. Hungary has received the wheatlands of the Bacska and Vojvodina. Industrialised and well-cultivated Croatia, although it is nominally under

an Italian "King," is completely run by and for the Germans. Germany has taken the fertile and highly industrialised Lower Styria and North Slovenia; in addition it holds Serbia proper by virtue of occupation.

Thus Italy has been left with South Slovenia and the greater part of Dalmatia—and the protectorate over little Montenegro, whose formal elevation to the status of an independent monarchy cannot really be taken seriously. These areas have always been the poorest areas in Yugoslavia. The last census taken in the territory now occupied by the Italians shows that some 35 to 40 per cent of the male population were unable to earn their own living, in spite of the thin population and the low standard of living in those areas. Thus it follows that, from the point of view of immediate exploitation and the war effort, the areas annexed by Italy have extremely little to offer. But, even on a long-term view, they offer but little scope. A considerable part of the country is infertile. Nature herself has pursued a scorched earth policy. On the other hand, the few assets to be found are precisely those which Italy itself possesses in abundance. The northern part, now under German rule, includes some wealthier farm districts, but, in spite of the inconceivably modest standard of living of the people, Dalmatia and Slovenia as a whole have always been, and will always be, in need of additional food supplies. Thus the chief aim of Fascist economy, complete self-sufficiency in food, becomes more and more distant. The sterility of the soil would make even the most expensive attempts at betterment a failure; a very limited increase might be achieved by more effective methods of cultivation. Before applying better methods it would be necessary, besides investing capital, to arrange for the amalgamation of numerous farms, which are of the smallest type of smallholding and hardly provide a bare existence for their owners. Such agricultural reforms would lead to the formation of medium sized farms, a sharp contrast to the general land reform tendencies in South-Eastern Europe which aim at the partition of large property, and increasing social tension would follow. The only agricultural surplus product is wine, of which Italy itself has more than enough; the same may be said of various kinds of fruit. On the other hand, the large Slovenian woods with their wealth of timber are without question a valuable asset, although it goes without saying that the richest forests are in the German zone. The timber transport position is favourable for Italy's requirements, and labour is cheap.

Profit and Loss

It may even be said that labour is abundant in these scarcely industrialised areas. But this is an advantage only under the present abnormal circumstances; in normal times an increase in manpower is what Italy needs least of all, as is well illustrated by the mass emigration of its workers in the past, and by the continuous drive for overseas colonial settlement. Even during the war, nothing has been heard of a lack of manpower in Italy; on the contrary, it has sent considerable contingents of workers to Germany.

This is one of the many examples showing that the amalgamated areas are not complementary; more often than not, it is a question of pooling deficiencies or those surpluses for which even now Italy proper has inadequate markets. Another example is tourist traffic, which is an important industry both for old and new Italy. It forms one of the main sources of income in Dalmatia, and was also a valuable credit item in the Yugoslavian balance of payments. A new order in which there would be enough paying visitors—visitors bringing foreign currency—to all the places of the Adriatic Sea is very remote. An attempt might be made to push the Dalmatian tourist trade into the background, and thus get rid of unpleasant competition. But any decrease in the Dalmatian tourist traffic would lead in the end to a reduced demand for manufactured goods along the whole coastal area and to further general impoverishment there. Italian industry has hardly gained any markets worth mentioning, especially as it has already been the chief supplier of textiles and other manufactured goods to Yugoslavia; it is now actually losing the greater part of this market to Germany.

An undoubted advantage of the acquisitions is the existence of metal ores in many places. The bauxite mines, belonging to a Swiss holding company, are the most important; their ores are estimated at some hundred million tons. Their products are mainly exported to Germany, for Italy possesses its own bauxite mines. A short time ago, an aluminium works was erected in Dalmatia for processing the bauxite at home. There is also considerable cement production with huge exports to Germany. On the other

Greece Under Occupation

[BY A CORRESPONDENT]

September 1st

THE fact that the Italians have succeeded the Germans in the occupation of what is left of Greece has not substantially changed its position, except that the Italians have proved themselves softer than the Germans, whose rigorous attitude towards the population was in strong conflict with the Southern temperament. From this Italy, in turn, seems to derive fresh hope that it will be entrusted with a kind of protectorate over Greece, or at least that Greece will be ultimately fitted into "the natural zone of Italian influence." The Italians are making intense propaganda in this respect, opening schools for children and starting Italian courses for adults. Germany, preoccupied in the east, has so far carefully avoided to forecast the final outlines of its policy in this region, confining itself to the nebulous statement that it does not intend to interfere in Greek affairs. However, there is little evidence that Germany will in the end agree to the realisation of Italy's far-reaching ambitions and abandon the key position on the Aegean-Salonika. Though the occupation of Greece has been formally relinquished, Germany has in actual fact retained control of the Greek aerodromes, of the means of communication and of other key positions, while the Gestapo remains busy behind the scenes. In fact, German-Italian rivalry, which results in occasional open incidents, presents the only source of consolation to the oppressed Greek nation.

Meanwhile, General Tsolakoglu, the self-appointed head of the so-called Greek Government, has come out openly in favour of the New Order in which, he expects, the *Fuehrer*, "as an admirer of the civilisation of Ancient Greece, will grant her a due share." This subservience to the Axis has only had the effect of reviving pro-British feelings and also of strengthening the opposition of the people to the Government. The death penalty has recently had to be introduced to ensure the execution of Government orders regarding the remitting of corn, fodder and vegetables to the central office. The Italian occupation authorities have made propaganda for Communism or anarchy, as well as the wearing of badges of enemy countries, punishable by imprisonment up to twenty-four years and even by death.

Shortage of Food and Work

The economic situation is more than critical, and the very widespread shortage of foodstuffs is the greatest disaster. Greece, which before the war imported 300,000-400,000 tons of wheat (producing only 1.04 million tons in 1939), has not only to do without foreign shipments, but has also lost the rich Macedonian and Thracian wheat lands, and has in addition been deprived of all its stocks. The daily bread ration varies between 125 and 180 grammes (about 4 to 6½ oz.), which is much less than the poorer classes were wont to consume. In Salonika, Athens and Patras, the rations are reported to reach only 60 grammes (about 2 oz.), which is only about one-tenth of the normal consumption. Oil, the main fat used in Greece, has practically disappeared. Vegetables, rice, macaroni and potatoes are only obtainable in small quantities against ration cards, while prices are continually rising. Greece's small wheat harvest is expected to yield less this year than in former years, and the Government has urged the public to increase the cultivation of potatoes. The intention is to replant potatoes now, because the present summer seems propitious for a second crop.

The second problem, no less grave, is unemployment. To quote one example, the town of Volo with 18,000 workers has 12,000 unemployed. The annexation by Bulgaria of the two important provinces of Thrace and Macedonia means that Greece lost an area of 45,000 hectares out of a total of 85,000 cultivated with tobacco, which accounted for 50 per cent of total Greek exports in 1938 and 43 per cent in 1939. The merchant fleet, before the war the ninth largest fleet in the world, no longer provides sufficient employment. The same applies to the tourist trade. Apart from this, there is a lack of raw materials which Germany does not wish to, or cannot, supply to Greek industries. These problems are further accentuated by transport difficulties.

Plans drawn up by the Greek Government to solve these problems do not, in fact cannot, promise striking results. The Greek Minister of Transport has published a detailed report of a "great plan of reconstruction," which is to

hand, Italy's territorial gains add to her almost complete dependence on imports of coal and oil. There are no oil fields in Dalmatia, and it can safely be assumed that the invaders found no stocks there. Coal was scarce in Yugoslavia from the very beginning of the war. It is difficult to ascertain, at the moment, whether the important coal mines of Trifail, near Ljubljana, have come under Italian administration. While there is, in Slovenia, a comparatively good railway system, which links up well with the Italian network, Dalmatia has only a few railway lines, though road communication is fairly satisfactory.

Mare Nostrum at Last

The great question is how far has Italy achieved the aim consistently pursued since the conference of Portorosa in 1921 and then brought nearer by the Three-Power Pact with Austria and Hungary in 1933? Has Italy secured new markets for its quickly developing industries, and, above all, new trade for the Adriatic ports of Trieste and Fiume? Progress in the former respect is, as has been shown, negligible. But the prospect for sea traffic has changed fundamentally; at least, the foundation stone of such a change has been laid. This is without question the most far-reaching consequence of the territorial changes. Italy's dream has been fulfilled: the Adriatic Sea has become, insofar as the British Navy does not interfere—*mare nostrum*. This is not only of strategic but also of economic importance. The competition from Yugoslavian shipping lines and ports comes automatically to an end. The prospective "co-ordination" can hardly mean more than the sacrifice of certain Dalmatian positions. First of all, the admittedly unnatural state of affairs in the twin ports of Susak (Yugoslavia) and Fiume (Italy) will cease to be a problem. Fiume, which became partly derelict after the collapse of the Austrian Monarchy, can only be made profitable if its traffic increases at the expense of Susak. A similar fate awaits the relatively busy Dalmatian ports of Sibenik, Split and Gruz, near Dubrovnik. Yugoslavia had only a small merchant fleet, part of which was in foreign ports at the outbreak of the war, and has since been mobilised, while several ships are actually sailing under the British flag. The three existing Yugoslavian shipping lines must of necessity now act entirely under Italian directions. In all probability, they will very shortly lose their independence as shipping concentration in Italy is, as is well known, very far advanced.

Nevertheless, it is more than doubtful whether Italy's present domination of the Adriatic Sea will in fact bring about that consolidation of its shipping for which it has constantly striven for two decades. For, during this period, Trieste and Fiume have mainly suffered from the competition of Germany's North Sea ports. There was no shipper or forwarding agent on the continent who did not know of the ceaseless tariff war between Hamburg and Trieste, the North Sea and the Adriatic. The Yugoslav ports had their own markets, which secured a sound, if modest, trade. Now Italy has certainly got new ports, but it has at the same time lost almost the whole hinterland on which the prosperity of those ports depends. As Croatia and Hungary are now within the German sphere of influence, not to mention Austria, Czechoslovakia and Serbia proper, all of which are natural clients of Trieste and Fiume, all the former Yugoslav ports are threatened with a still further loss of traffic to the North Sea ports.

The political alliance between Germany and Italy has so far had little influence on the competition between their ports, and no sign of any "traffic-axis" is to be seen. The fact that Italy, in spite of the war, is carrying out extensive and expensive work on a canal to connect the Adriatic Sea with Switzerland (via Milan to Lake Maggiore) has attracted very little notice abroad. But it seems clear that this undertaking is a reply to the enormous canal constructions in progress and projected by the Germans. The waterway from the Adriatic Sea to Switzerland is already a fact. There are other plans, such as the construction of a canal from Trieste to the navigable rivers and canals of Yugoslavia, as well as the building of a motor road from Trieste via Ljubljana to Zagreb. The latter has already become a reality as far as to the former Yugoslav-Italian frontier near Postumia, and can now be advanced a good deal further. But most of Italy's waterway projects will have to be thoroughly altered; ambitions in this direction will have to be restricted—in view of the wishes of the senior partner of the Axis. Italy cannot exploit its new position, as it might have done *vis-à-vis* a number of small independent European countries; it has to rely instead on the doubtful co-operation of the one Reich.

include the building of roads, the improvement of waterways, a draining of marshes and other land improvements. Nearly 3,000 million drachmas are to be spent in the financial year 1941-42. The necessary funds will be raised, partly by increased taxation, partly by loans, but mainly by a levy on increases in values. Another plan embodies the proposal that Greece should become self-sufficient. It stresses that the necessary capital for equipment required is available, the sum of 15-20 million drachmas being regarded as sufficient to provide the country with the necessary industrial expansion.

German sources, however, emphasise that, in future, agriculture will have to be the chief, if not the only, basis of existence for the Greek people—a terrifying prospect for Greece where the peasant has so far been the poorest inhabitant. The increased use of artificial fertilisers will, according to the German programme, increase the productivity of the land, and the old-fashioned tools will have to be modernised. It is said that such measures could increase the country's productivity by 50 per cent. At the same time, it is suggested that the area under cotton should be in-

creased by 150,000 hectares, without encroaching on agricultural land, which would enable Greece to export cotton—of which Germany is in need. If it is considered that before the war Greece met only 65.9 per cent of her wheat and 85 per cent of her maize consumption from home production, it can be judged how wide is the gap which the Greece of to-day, so considerably deprived of territory and financial means, is expected to bridge in the near future. The Greeks are consoled with the prospect that the clarification of the Mediterranean problem and the inauguration of a European economic order by Germany and Italy would ameliorate their position. It is admitted by Germany that all this will mean a revolution for Greece, but "Greece must pass through this revolution if she does not want to lose contact with Europe." In the words of the *Frankfurter Zeitung*, the changes in the economy will have to be accompanied by changes in all accepted values and thoughts and a regrouping of the social scale. This is a high price, indeed, for the meagre results which will be obtained from entering, as a "colonial" producer, the organised poverty of the New Order.

Books and Publications

Shorter Notices

The Directory of Directors, 1941. Thomas Skinner & Co., Gresham House, London, E.C. 30s.

This useful guide to the personnel of the business world has been in no way abridged on account of war restrictions. A final section devoted to *addenda* brings the work up to date.

Building Societies Year Book, 1941. Franey & Co., Limited, Graham House, Tudor Street, E.C.4. 10s. 6d.

The 1941 year book contains accounts of the progress of the building society movement in 1939-40 and of the annual general meeting of the Building Societies Associa-

tion and Institute, in addition to standard information relating to individual societies.

Digest of the United Kingdom Exchange Regulations.

A revised edition of this useful booklet, compiled by the District Bank, Ltd., Foreign Department, has recently been brought out. It summarises in a very handy form all the information on the many different aspects of exchange control in Great Britain.

Loose-Leaf War Legislation. Edited by John Burke, Barrister-at-Law. Hamish Hamilton (Law Books), Ltd.

The first part of the 1941-42 volume of this extremely useful publication has now appeared. Anyone who wants the complete text of the war legislation, including the defence regulations and orders of general interest, could not do better than to subscribe to this service. The text is annotated, and any amendments to the original legislation are given in subsequent parts.

THE BUSINESS WORLD

Japan's Oil Supplies

THE bulk of the oil used by the Japanese war machine in blasting its way through the Chinese armies and in bombing the women and children of Chungking has come from democratic sources, Japan's own oil resources are strictly limited. Though the suspension of the official trade returns, together with all other important statistics, makes it impossible to give precise details of Japanese oil imports in recent years, the essential facts are clear enough. The principal suppliers of Japan have been the United States, the Netherlands Indies and Mexico, with trifling amounts from one or two other sources. By far the most important source of supply has always been the United States. Geographical factors are favourable; Californian crude oil is well suited to Japanese requirements; and American lubricants are among the best in the world. United States exports to Japan rose steadily for a number of years to a peak of about 31,200,000 barrels in 1938. With the steady hardening of American opinion against the Japanese, and the termination of the long-standing trade agreement between the two countries, oil shipments fell below 28,000,000 barrels in 1939 and to less than 23,000,000 barrels last year, as the following table shows:

U.S. EXPORTS TO JAPAN (Barrels)		
	1939	1940
Crude oil	16,086,176	11,528,686
Natural gasoline	181,210	5,062
Anti-knock compounds	(a)	110,390
High-grade motor fuel	562,230	527,451
Other motor fuel	635,492	2,624,342
Naphtha and solvents	2,534	5,702
Benzole		7,459
Kerosene	104,501	43,463
Distillate fuel oil	6,020,182	5,116,180
Residual fuel oil	3,888,754	2,132,146
Lubricating oil	513,545	819,418
Total	27,994,624	22,920,299

(a) Not separately classified in 1939.

Some confusion has been evident in the British press about the present position. On August 1st, President Roosevelt placed an embargo on exports of aviation petrol and lubricating oils—and the raw materials from which these high-quality products are derived—to destinations outside the western hemisphere, the British Empire and the unoccupied territories of countries resisting aggression. While this embargo, of course, included Japan, it was by no means so important as many observers have supposed. Its main effect was to regularise a situation which had, in fact, existed since July, 1940, when shipments of these products were made subject to licence, with the intimation that no licences would be granted for export to Japan. As the table shows, the Japanese responded to the ban on highest-quality aviation fuels by considerably increasing their takings of ordinary petrol and lubricating oils. All that is new in the latest order is the provision limiting shipments of petroleum (except to the areas named) to "the usual or pre-war quantities"; but this cannot be regarded as a serious limitation on supplies to Japan. A move by the President to place a permanent embargo on petroleum exports to Japan would probably meet with strenuous opposition from Californian shippers, over half of whose export business is with that country.

After the United States, the most important supplier of oil to Japan is the Netherlands Indies, and the Japanese have been pressing for increased shipments from this source, ever since their relations with the United States began to deteriorate. According to the official trade returns, about 550,000 tons—say, 3,500,000 barrels—of Netherlands oil were consigned to Japan and Japanese possessions last year, against 350,000 tons in 1939. But since considerable quanti-

ties of oil were also consigned to such transshipment centres as Singapore, from which a certain amount might well have been re-directed to Japan, it is possible that considerably larger quantities were involved; and the Netherlands Indies oil companies agreed last year, after very protracted negotiations, to send greatly increased supplies of crude oil and finished products to Japan during 1941—the figure finally agreed upon seems to have been in the neighbourhood of 13,000,000 barrels. This is a considerable quantity of oil—equivalent to over 56 per cent of last year's exports to Japan from the United States—and its loss would be a serious disappointment for the Japanese. It would also react unfavourably upon the Dutch colonies themselves, though Japan's share last year probably amounted to no more than 10 per cent of Netherlands Indies shipments to all destinations. If trade with Japan came to a standstill, the Netherlands Indies would also lose an important outlet for their tin and rubber. But it would surely not be impossible for Britain and America to arrange some form of compensation.

The only other supplier worth mentioning is Mexico, and the oil trade between that country and Japan cannot be regarded as a natural growth. The distance from the Mexican Gulf ports to Japan is roughly twice that from California and the passage also involves the payment of Panama Canal dues. Mexican oil, moreover, yields a rather poor quality petrol, and is not so suited to Japanese requirements as is Californian crude. The trade between the two countries dates from the expropriation of the foreign oil companies' properties in Mexico, as a result of which that country was cut off from the markets of Britain and the United States. An agreement of April, 1940, provided for the shipment of 2,000,000 barrels of crude oil and a total of about 400,000 barrels of petrol and kerosene to Japan in the following twelve months. According to the official trade returns, however, only 764,000 barrels of crude were consigned to Japan last year (against 175,000 barrels in 1939), the only other item being a trifling quantity of gas oil. Whether the agreement was subsequently renewed has not been disclosed, but it appears doubtful. A much greater readiness to follow the lead of the United States has been evident in Mexico since the advent of President Camacho. It is by no means improbable, therefore, that the Mexican Government would agree to impose a complete embargo on shipments of oil to Japan should Britain and America decide upon this course. Such a move would further strengthen the hand of the democratic Powers.

There is general agreement, except among those whose business interests are at stake, that a policy of appeasement in the Far East has long since ceased to be appropriate. On the basis of last year's figures, it is in the power of Britain, America and Mexico to deprive Japan of a flow of oil amounting in the aggregate to almost 30,000,000 barrels a year. Blockaded in this way, Japan would be compelled to rely exclusively upon her accumulated stocks and meagre home production. How much could Japan reckon on obtaining from these two sources? This question cannot be answered very precisely, because the results of Japan's self-sufficiency policy have been deliberately shrouded in mystery. But the country is poorly endowed with mineral oil, and, despite the expenditure of much capital on prospecting work, crude oil production is believed to have made little headway in recent years. The output now obtained from Japan and from the island of Sakhalin (where the Japanese have certain oil interests) may be estimated at around 4,500,000 barrels a year. Ambitious plans for the creation of an oil-from-coal industry on the German model were formulated long ago to supplement this small output of natural oil, but their execution has been held up by various difficulties, including shortage of coal. Though a few small plants are known to be in

operation, it is therefore not believed that the contribution made by coal-oil to Japan's oil supplies is at all considerable. The output of finished products from this source, together with the small quantity of home-produced alcohol available for use as motor fuel, probably does not exceed 2,500,000 barrels a year. This would give a total supply from domestic sources of about 7,000,000 barrels a year—equal to less than one-quarter of last year's imports.

It does not follow, however, that Japan will be faced with an imminent oil shortage if she is isolated from world sources. Imports in recent years have undoubtedly been well in excess of current needs, even allowing for the requirements of the forces in China; and Japan has been

able to accumulate large stocks in anticipation of just such a situation as that which has now arisen. An article in *The Economist* of September 6th gave some indication of the thoroughness with which strategic reserves have been amassed by Japan, and it is known that special attention has been paid to oil. A prominent member of the Roosevelt Administration recently suggested that Japan's oil reserves might suffice to wage a two-years' war, and this estimate may be accepted as not unreasonable. That so hardened an aggressor should have been allowed to build up a reserve of these dimensions is a painful reminder that the democracies have been far too ready to subordinate national policies to business considerations.

Unrestricted Rubber Production

THE International Rubber Regulation Committee's decision to increase the release rate for the last quarter of 1941 from the present level of 100 per cent to 120 per cent, together with the provision that any excess over the permitted exportable amount is not to be debited against next year's exports nor deficiencies to be carried forward, represents a temporary abandonment, in substance if not in form, of rubber restriction. It should manifest itself in a total depreciation of the value of export rights as well as in other ways. So long as United States stocks are below the level regarded as satisfactory by those in charge of the defence programme, and there are ships to carry the rubber, all-out production must be expected.

Since the inception of the present regulation scheme, the rate of release has never been fixed at 100 per cent for a full quarter, much less for a full year. (It stood at 100 per cent for the first two months of the scheme in June-July, 1934.) The basic quotas of the participating territories total 1,554,700 tons. The present year's exportable allowance, which comes to 105 per cent of the basic quota, for these territories equals 1,632,000 tons; the production of French Indo-China (which until recently adhered to the scheme but had no fixed basic quota) is estimated at 80,000 tons, while the exports of countries outside the scheme are likely to approximate to 45,000 tons. In estimating world supplies for the year, allowance has to be made, first for under-exports, which are likely to be in the neighbourhood of 160,000 tons by the end of the year; secondly, for the fact that rubber from French Indo-China and Thailand is not likely to be available to countries other than Japan on any scale. This would give a figure of about 1,500,000 tons available to other countries. Total world exports will, of course, set up a new record, and compare with 1,392,600 tons for 1940 and an annual average of 940,000 tons for the five full restriction years 1935-39.

The additional rubber obtainable from the increased quota can be roughly estimated. With 100 per cent release, all the producing territories have fallen behind their permitted exports during the first half of the year. By the end of June, these arrears exceeded 75,000 tons, approximately 10 per cent of permitted exports. In July, the Dutch native producers wiped off their small arrears, while most of the other producers increased theirs, although at diminished rates. It seems reasonable to assume that the additional supplies now obtainable will mainly be derived from the natives in the Dutch East Indies; 20 per cent of their quota for a quarter represents approximately 19,800 tons, though, because of the difficulty of securing the necessary labour at such short notice, the increase in their output will probably not be more than ten to twelve thousand tons. In the case of the other producers, where increased output is possible, it will be required largely to reduce arrears. Of course, even when a territory falls behind its permitted exports, many individual producers may be producing 100 per cent of their exportable allowance, and an increase in the release rate will enable these to increase their exports; under present circumstances this is not likely to account for much more than 10,000 tons in the aggregate. Thus, the net increase in output can be put at 20,000 to 22,000 tons; this can be set against a figure of 78,000 tons, which is 20 per cent of the quota for one quarter.

It may be mentioned that, with the Excess Profits Tax at 100 per cent, the restriction scheme at present acts as a stimulant to output. The great majority of the sterling companies are earning profits substantially in excess of their standard, and, if it were not for the fear of a cut in

their assessment, might be content with lower rates of output.

A full year on 100 per cent, or higher, releases has been eagerly awaited by the statisticians of the rubber industry. Even when full allowance is made for the present abnormal circumstances, recent under-exports provide evidence of the productive capacity of the various territories and classes of producers which it will be impossible to ignore in the renewal discussions of the regulation scheme. Shortage of labour and of materials, the working of the Excess Profits Tax in the case of the sterling companies, the difficulties of supervising the estates with the absence of many Europeans on military service, are abnormal factors, but they serve only as a partial explanation of under-exports. With the exception of India, and disregarding the carry forward from 1940, these were as follows for the first half of 1941:—

EXPORTS OF RUBBER UNDER THE SCHEME, JANUARY-JUNE, 1941

Territory	Permitted Exports (tons)	Actual Exports (tons)	Deficiency (tons)	Deficiency as percentage of Permitted Exports
Malaya	324,000	301,806	22,194	6.85
Dutch East Indies	322,750	293,045	29,705	9.20
Ceylon	54,500	41,451	13,049	23.94
Burma	6,875	6,151	724	10.53
British N. Borneo	10,500	9,357	1,143	10.88
Sarawak	22,000	19,255	2,745	12.48
Thailand	27,850	20,929	6,921	24.85
Total	768,475	691,994	76,481	9.95

The inclusion of the carry forward would reduce somewhat the deficiencies of Malaya and Ceylon, and increase those of Burma, Thailand and Sarawak, but only to a slight extent. Allowance has to be made for seasonal variations in production, according to which Malaya, the Dutch East Indies and Ceylon may improve their position slightly, relatively to Thailand, Sarawak and especially Burma, before the end of the year. On such evidence as is available, it would appear that exports for the rest of the year will be approximately at the rate of 100 per cent, with the exception of the Dutch native producers, who may be able to produce at a higher rate, if licences are issued to them at a fairly early date; they are likely to resort to severer tapping systems than would be considered prudent by a European estate, but the effect of this would, of course, not be felt for some time. On these assumptions, another 70,000 to 80,000 tons would be added to under-exports this year.

If the Dutch natives are successful in producing in excess of 100 per cent for any length of time, Malaya, the basic quota of which under the present regulation scheme is slightly higher than that of the Dutch East Indies (648,000 tons against 645,500 tons for 1941), may have to yield the first place to the latter when the renewal of the scheme is under discussion. The rubber industry in the Dutch East Indies is favoured at present by a certain lack of prosperity, which renders the labour situation easier than in Malaya, where tin production (the rubber industry's chief competitor in the demand for labour) is also at a high rate. This consideration would not, however, explain a substantial difference in exports.

Unless there is a serious reduction in shipping from the east to the United States, a definite improvement in America's stock position, particularly in that of the Rubber Reserve Company, can be expected with some degree of certainty. For the first half of the year the rate of accumula-

tion of these stocks has been much slower than was expected. By June 30th, the Reserve Company's stocks amounted to 116,000 tons, against the 430,000 tons covered by the three Hay agreements. Originally it was hoped that some 150,000 tons would reach the Reserve Company before the end of 1940. The reduction of exports from French Indo-China and Thailand and the remarkable increase in American absorption—it amounted to 424,500 tons for the first six months of this year and 84,000 tons for June alone, compared with an annual average for the ten years 1930-39 of 458,000 tons—were partly responsible for the disappointing rate of accumulation of these stocks. Other factors, however, also played their part.

Until quite recently, the American Reserve Company's representatives were reluctant to purchase forward rubber, and numerous instances were reliably reported of offers for forward delivery, within the agreed price range, having been refused by the company's agents. The importance of forward dealings in the eastern markets, particularly Singapore, will be appreciated when it is remembered that over 40 per cent of the world's rubber is produced by natives and at least a further 10 per cent by non-European estates. By far the largest proportion of this rubber passes through dealers who are reluctant to handle it, especially at present, unless they have adequate cover in the form of forward sales for the various grades they are required to carry. The refusal of the Reserve Company to purchase forward rubber naturally militated against their obtaining adequate supplies from this source. The shortage of shipping aggravated the position. The scarcity and irregularity of tonnage from the east to America made dealers particularly reluctant to hold stocks which were not covered by forward purchases. Normally, a scarcity of tonnage would lead to a fall in the f.o.b. price of the commodity for which no shipping space was available. Near rubber, however, was constantly in demand, and the Hay agreements put an effective "floor" to the market; there appeared, however, from time to time a substantial discount on forward rubber. In any case, the considerable reduction in the total tonnage available from the east to America, coupled with the longer haul resulting from the diversion of the vessels from the shorter Suez or Cape routes to the Pacific and the Panama Canal, would have impeded the free flow of rubber to the United States.

and the absence of forward purchases by the Reserve Company naturally rendered the situation more difficult.

With the persistent demand for near rubber (which became particularly intense whenever freight was believed to be available), the existence of several competitive demands, and a definite floor to the market, conditions in the East were propitious for occasional speculative moves and the withholding of supplies. These did not materialise on a large scale, but individual instances are known to have occurred, and the danger had always to be borne in mind—the short period elasticity of demand for rubber being notoriously low.

The recently established Central Buying Agency will be able to ensure that competing American demands will not interfere with the building up of the reserve stock, and in this it will be assisted by a projected compulsory cut in United States' consumption to 600,000 tons a year, though no indication has yet been given of the machinery which is to enforce this. It should also be in a position to co-ordinate efficiently the provision of shipping with its forward purchases, which can now be expected to be on a larger scale, and this should be one of the major advantages to be derived from the new machinery. Again, the Central Buying Agency may perhaps take the long overdue step of diverting American rubber imports from Atlantic to West Coast ports. Admittedly, rail freight charges from the Pacific coast to the big consuming centres would be heavy, but this should be a secondary consideration from the community's point of view, when it is set against the very substantial reduction in the length of the voyage from the east.

An early improvement in the American stock position should benefit both the British Treasury, by the substantial dollar proceeds accruing from rubber shipments to America, and the industry, by reducing the intensity of the search for synthetic substitutes for rubber. The biggest advantage, however, will result from the assistance these supplies will afford to the American defence programme and from the goodwill likely to be gained from ready and willing co-operation in a matter regarded as urgent by the American authorities; and, from this angle, the increase in the release beyond the industry's productive capacity may well be regarded, without deprecating its importance, primarily as a gesture to the United States.

Finance and Banking

Big Treasury Deposit Payments

The maintenance of Government expenditure at an exceptionally high level, together with the reduction in the flow of subscriptions to Government loans following the suspension of the National War Bond issue, is inevitably causing a considerable increase in the dependence of the Treasury on six months' deposits from the banks. The total paid over from this source this week amounted to £55 millions, the largest weekly amount thus collected since this new method of short-term borrowing was instituted. The nominal amount of Treasury deposits maturing during this week was £40 millions, but it is probable that actual maturities were considerably smaller than this, a considerable part of the deposits in question having been recalled prior to maturity for reinvestment of the proceeds in National War Bonds. Despite these heavy Treasury deposit payments, the banks have been keen buyers of bills during the week. The market obtained a 29 per cent allotment on its quota applications at last week's tender for Treasury bills, and has been a fair seller to the banks. Although the volume of banks' cash has been slightly reduced during the past week, it remains at a very comfortable level. The Bank return shows a reduction of £6,147,000 in bankers' deposits, but this still leaves that item at the relatively high figure of £127,628,000. The fall is largely explained by heavier payments to Government accounts. Public deposits are only £1,525,000 up on the week and are still somewhat depleted at £10,799,000; but as the return shows Government securities to have fallen by £5,130,000, it is evident that the Treasury has been using some of its available resources to repay ways and means advances at the Bank. The circulation is still moving upward, the past week providing an expansion of £336,000 to the new high level of £669,739,000.

Anglo-Soviet Clearing

The clearing machinery set up for financing Anglo-Soviet trade under the agreement of August 16th is now in full operation. The whole flow of payments between sterling area countries and the Soviet Union is now centralised in the account of the Gosbank at the Bank of England. From being moribund for over two years, this account must in the course of a few weeks have become one of the most active in the books of the Bank. The Anglo-Soviet clearing is being effected wholly on a sterling basis. The goods which are being exchanged are valued at world prices, and, if the quotation thus chosen happens to be expressed in terms of dollars, it is, for the purpose of the clearing, converted into sterling at the official rate. Thus the rouble rate of exchange does not enter into the financial machinery at all, and a somewhat delicate problem has been tactfully circumvented. As the account is to centralise all Anglo-Soviet payments, it may be assumed that it will duly take care of the Soviet Export Credit maturities which will begin to run off towards the end of this year. The clearing account will, in accordance with the terms of the agreement, be made up at regular quarterly intervals, the first such balance being struck at the end of next month. For some time to come, it may be assumed that this balance will be against the U.S.S.R. That country will remit to the Bank of England gold or U.S. dollars to an amount equal to 40 per cent of the balance thus owed at the end of each quarter; and these remittances will be credited to the clearing account in sterling at the official rate for dollars, or price for gold. The remaining 60 per cent of the balance will be transferred to the loan account opened by virtue of the £10,000,000 credit agreement. This figure of £10,000,000 is obviously of nominal importance only. Sir Kingsley Wood

announced last week that there would be no monetary limit to the extent of the aid to Soviet Russia. If, therefore, the accumulation of clearing balances causes the loan account to exceed this figure of £10,000,000, the appropriate adjustment will automatically be made. To the extent that the Export Credits of 1936 are repaid under the terms of the new agreement, they will, in fact, be repaid in gold or dollars as to 40 per cent, and as to 60 per cent, they will be converted in the new five-year inter-Governmental credit.

Syria in the Sterling Area

It was announced this week that Syria and the Lebanon have been brought into the sterling area. Before the fall of France, these territories formed part of the franc-sterling group which crystallised at the outbreak of the war. After the fall of France and the arrival of the Italian Armistice Commission, economic relations with sterling countries were abruptly terminated, and the exact definition of the exchange regime and of relations with sterling lost all practical importance. With the events leading to the Allied entry, Syria was ranked as enemy territory. As soon as Allied occupation was complete, the restrictions were lifted and the Syrian pound given a fixed exchange value of 8.83½ to the £. The currency unit, the Syrian pound, is divided into 100 piastres, and has an exchange value of 20 French francs. It will thus be seen that the fixed exchange rate corresponds to a franc-sterling rate of 176½, which is the rate applying to all Free French Empire territories. The latest decision brings the Syrian pound within the sterling fold, and thus brings the territories whose new political status has been defined this week into an area sharing a homogeneous system of exchange control and within which trade flows with considerable freedom from such controls. Sterling may now be credited to accounts in the United Kingdom of residents of Syria and the Lebanon without completion of the customary form E1. Similarly, purchases of Syrian pounds against sterling may now be effected without completion of form E. The

Ottoman Bank has been added to the list of banks authorised to deal in Syrian and Lebanese pounds. The new exchange status of these territories should rapidly lead to a break down of the financial and commercial isolation in which they have found themselves for the past twelve months.

Exchange Control in China

The new Chinese Foreign Exchange Control Committee held its first meeting in Chungking this week. The American, British and Chinese members met under the chairmanship of Mr. H. H. Kung, the Chinese Minister of Finance. Official rates of exchange have been fixed; and machinery has been set up for examining applications for purchases of exchange and for settling the innumerable problems arising from the British and American freezing orders on Chinese assets. The first week's experience of the new exchange control in the Shanghai market indicates a fairly rapid and smooth adjustment to the new conditions. The banks are abiding strictly by their undertaking to deal only at official rates, and the free market—which may now be referred to as the black market—has been starved out of existence. The gloomy predictions on the future of Shanghai trade that first greeted the freezing order and the announcement of exchange control are not being realised. Speculative activity has inevitably disappeared; but there is, as yet, nothing to suggest that the operation of the new exchange control will hamper genuine commercial activity in the Settlement. On the other hand, there is some evidence that Hong Kong may suffer seriously in its essentially entrepôt trade, unless the new exchange régime is worked with rather greater elasticity than has hitherto been in evidence. The colony is an extremely small and isolated outpost of the sterling area, and the greater part of its trade is with non-sterling area territories. Time and experience should suggest adjustments in the existing control machinery which will allow the Hong Kong control to dovetail its system into that of the Chinese Currency Stabilisation Board.

Investment

Rise and Reaction

In the past few days, the investor has had a rather unexpected opportunity of exercising the caution advocated recently in *The Economist*. Towards the end of last week there developed a general rush to buy very low-priced investments of all sorts, which appeared to be based on a belief that favourable developments of substantial importance were in sight. While it lasted, it was comparable in intensity only to the throwing overboard, in the spring of last year, of all sorts of stocks, most of which have now recovered a very large part of their losses. The quality of the buying in this new field was markedly different from that which had resulted in a sustained rise over a period of months, and it was not surprising that the first whiff of ill news caused a sudden reverse. What was less generally expected was that the falls should have been very widespread, and it seems probable that the frankly speculative section of the buying had covered a wide field, not excluding even the Funds. The volume of speculative business cannot have been large, owing to the short period between purchase and settlement, and the fact that borrowing for such purposes is frowned upon by the banks. Some measure of the importance of the up and down swing can be obtained from the fact that the index of *The Financial News* for industrial equities rose by some 1½ per cent and lost half the improvement over the week. Even in cases where rises were least capable of logical justification prices are still up on the week. It is to be hoped that the speculator has had a lesson, but there are already signs that the upward movement may shortly be resumed. If it is, the pace should be more moderate. There are many uncertainties ahead, in both military and industrial fields. Although surprises in the latter are likely to be minor ones, current prices, in many cases, already contain a considerable allowance for an accession of military aid which will be long in reaching its maximum.

Export Policy and the Market

However accurate the official statement that the effect of Lease-Lend upon exports was only slightly to accelerate an inevitable process, it is probable that the publicity given to this trend will have considerable influence in determining choice of investments. Broadly speaking, the criteria determining whether an export shall take place will be whether or no it serves to increase the war effort, either immediately or in the near future, and not at all whether it will contribute to prosperity after the war. This means, again in very general terms, that exports will only be tolerated when there is a surplus of raw material, labour and plant, some or all of which cannot usefully be converted to the war effort. The raw material will normally have to be indigenous, although there may be instances where small imports giving a large return may be brought in. This further process of converting British industry to a full wartime basis is to go hand in hand with efforts to integrate it with American industry so as to achieve the maximum effort. This may mean new exports from this country, but they will be exports of war material, which may or may not lead to the establishment of valuable post-war connections. The need for protecting the industry of each country from untoward after-effects is discussed on page 344. There can be little doubt that British industry will be in a less favourable position, after the war, than if the export drive could have been maintained, but it is doubtful whether the added disadvantage will be very great. It will, however, immediately result in reduced earnings in some sections of industry not working for the war effort. These are largely the industries which were to be telescoped under the "Lyttelton" plan, whose full execution is still awaited. The most important group affected is that of the textile trades—wool should almost certainly be excluded. These have just had a considerable part of their output made subject to control by a Board of Trade Order fixing both maximum

Company Notes

Staveley Earnings

The full accounts of Staveley Iron and Coal for the year to June 30, 1941, show that the setback to total profits and to the distributable surplus has been moderate. Total income, including dividends, stands at £997,304 against £1,030,280, while equity earnings are down from £316,191 to £261,516, representing a tax free rate of 7.7 against 9.3 per cent, that is 15.40 against 16.17, less tax. This setback is due largely to the company's liability of £45,587 for war damage insurance, while total tax provision is somewhat reduced from £455,990 to £451,494. With a cut in the tax free rate from 8 per cent to 6½ per cent and a reduction in the allocation to general reserve from £100,000 to £50,000, the carry forward is only moderately lower at £133,879 against £142,411. The following table indicates three years' trend of profits:

	Years to June 30,		
	1939	1940	1941
Profit including divs.....	806,089	1,030,280	997,304
Taxation, current.....	100,405	364,663	418,581
Taxation, retrospective.....	...	91,327	32,913
War damage contribution ...	...	...	45,587
Depreciation*	254,048	245,056	226,287
Directors' fees and tax	10,345	13,043	12,419
Ordinary stock:—			
Earned	441,291	316,191	261,516
Paid	338,536	270,828	220,048
Earned %†	13.0	9.3	7.7
Paid %†	10	8	6½
Reserve	100,000	100,000	50,000
Carry forward	197,049	142,411	133,879

* Including £20,000 to depreciation of workmen's houses in 1939 and £10,000 in 1940.

† Tax free.

The modest setback is probably due to the unwise policy of allowing withdrawals of labour from coal mines and to rising costs. With this exception, performance seems to have been satisfactory. The balance sheet shows a rise in creditors from £577,023 to £866,745, which accounts for higher cash holdings of £404,465 against £179,938, while the total of money at call and in Government securities is nearly £100,000 higher at £287,686. Debtors are up more moderately from £950,100 to £1,005,255 and stocks are reduced from £754,543 to £731,538. While there can be little prospect of maintaining tax free payments at the current level in the face of further rises in the standard rate of income tax, the accounts suggest that Staveley is in a sound financial position both from the capital and from the profit-earning standpoint. The £1 ordinary stock, at 45s. 6d., ex dividend, yields £2 17s. 1d. per cent, tax free.

Sheepbridge Results

The Sheepbridge accounts to June 30, 1941, show a marked stability, profits after tax amounting to £225,049, against £271,016, from which £15,000, against £45,000, is deducted for retrospective taxation. Remaining expenses show little change, depreciation being some £1,300 lower at £33,919, but the company has been obliged to provide £20,000 for war damage contribution. The tax-free dividend, which amounts to 9 per cent on ordinary capital, raised by an issue for cash from £1,171,157 to £1,304,996, compares with 10 per cent, tax free, in the previous year on the old capital and 8½ per cent, tax free, on the new. The latest dividend is somewhat narrowly covered by earnings of 9.75 per cent, tax free, and since the allocation to reserve of £20,000 in 1939-40 is replaced by an appropriation of

MAXIMUM WAR PRODUCTION

Beginning next Monday, September 22nd, *THE FINANCIAL NEWS* will publish a series of special articles on the organisation of all Britain's resources, human and material, for a maximum war effort. Questions of labour, propaganda, incentive, localisation, etc., will be discussed. Special articles will deal with man-power, optimum wage levels, welfare and the finance of production. The views of industrialists, labour leaders and others will be fully set out.

Copies of *THE FINANCIAL NEWS*, price 2d., can be obtained on order from all newsagents.

prices and profit margins to the manufacturer, wholesaler and retailer. They have already suffered substantial restriction in the home market by clothes rationing and limitation of supplies. It seems probable that the policies of rationing and of price and margin fixing will be carried farther in an effort to limit expenditure, halt inflation and further by financial means the maximisation of the war effort. It seems reasonable, therefore, to look for a further minor reduction in money turnover and profit in a substantial section of the "Lyttelton" industries, and in the distributors serving them, together with a rather more marked falling off in that sub-section which designed a considerable, and growing, proportion of their product for overseas. The prospect is an unpleasing one, and it will call for more imagination than was used between 1919 and 1939 if export trade is to be regained and increased. Possibly an added realisation of this was a factor in the week's market reaction.

Commonwealth Internal Loan

The news that the Commonwealth is to make an issue of £100 millions in that country shows that the scale of the Australian war effort is assuming new dimensions. It is true that, of the total, £A70 millions is for conversion of maturing loans, but even the balance is a large sum, and the total operation is the largest yet undertaken. The new borrowing is at 2½ per cent for short bonds and 3½ per cent for a loan with an average life of some twelve years. The Commonwealth has no maturities of comparable amount in the next few years at home, but loans to a total of some £A530 millions fall in over the next two decades. There also exist in this country some £25 millions of 4 per cent stock of the Commonwealth and States which are already convertible. Prices scarcely warrant action as yet; and Treasury sanction, and possibly support, would be required, as in the case of the operation of the early summer. But this is a possibility which should be borne in mind.

Facilitating Dealings

Each of three developments of the past few days contributes in some measure to the improvement of market facilities. In the first place, the authorities, in the person of Post Office representatives, have concluded an arrangement with members of the London and Associated stock exchanges with regard to telecommunications which, if it imposes a severe cut, is still better than was hoped for by those best qualified to judge. Granted a solution of the problems of collaboration, the exchanges are left with a network which should suffice at least for a reasonably good market in the Funds, and some other business. The will to co-operate undoubtedly exists. Sacrifices of business have already been made; sacrifices of privacy as to business connections will be called for; but it is generally felt that a satisfactory scheme can be evolved. The arrangement is, of course, subject to termination without notice, as all such matters must be in time of war. The public in the provinces has at least the satisfaction of knowing that their interests, which coincide in large measure with those of the Treasury, have not been forgotten. The second development is of a more positive kind. Ignoring technicalities, it amounts to the halving of the rates of commission which must be charged on business in 2½ per cent National War Bonds, 1945-47 and 1946-48, when the amount involved in any single bargain is not less than £50,000. This is a special contribution, not entirely altruistic, on the part of brokers to the freeing of the market in these two securities, on which rests the ability of the Chancellor to make a further offer on terms definitely more favourable to the taxpayer. The reduction is subject to ratification next Monday. The third event concerns co-operation in the Imperial field. During the course of the war, permission has already been given to members of the London exchange to charge reduced commissions to members of certain Canadian institutions. This permission has now been made general by extending it to members of all Dominion, Indian and Colonial exchanges—23 in number—or associations of brokers recognised by the London committee, but in the form of permitting an equivalent return of commission. If neither of these steps confers any direct benefit on the ordinary investor in this country, it is not the less true that he is in some measure affected. Both tend to make it easier to deal in some or all securities, and any improvement in the market not only reduces the cost of dealing for those directly affected by the change, but tends to enhance the value of all securities brought within the ambit of the new regulation.

£20,000 to reserve for renewals this year, the carry forward is down from £125,459 to £115,181.

	Year to June 30		
	1939	1940	1941
Profits after tax	286,199	271,016	225,049
Depreciation	33,045	35,224	33,919
Fees	4,069	4,461	4,890
Additional taxation	—	45,000	15,000

* In 1939, £15,000 to A.R.P. reserve.

† Tax free.

‡ On capital increased from £1,171,157 to £1,304,996.

But for the fact that the war damage contributions had to be found this year, the gross rate of earnings on the increased capital would have been increased on the year. As it is, the comparable figures are 19.5, against 21.74 per cent. As it was highly improbable that the rate of earnings on the new capital would be as high as that on the old, this performance must be considered highly satisfactory. The balance-sheet shows little change. The rise in stock and work in progress from £355,031 to £476,670, and in creditors, including taxation and amounts outstanding on railway wagons, from £624,655 to £782,102, no doubt indicate that industrial capacity was fully used last year. Cash holdings are some £9,000 higher at £259,440, and debtors nearly £45,000 higher at £549,787. Provided that the company can secure an adequate labour supply, earnings should be approximately maintained in the current year. The £1 ordinary shares, at 44s. 6d. ex dividend, yield £4 os. 11d. per cent, tax free.

Lever Brothers' Dividend

Rather over four months ago, the directors of Lever Brothers and Unilever, Ltd., announced profits, subject to audit, of £6,600,000 after tax, but stated that, although this would suffice to repeat the 10 per cent dividend paid in respect of 1939, they must withhold any distribution until the results of the Dutch company could be determined. In the absence of any definite news, the board have now decided to make a distribution and a payment has been announced, but at the rate of 5 instead of 10 per cent. This decision has been made despite the fact that audited profits are as high as £6,987,130, against £6,742,053 for 1939. These profits are before tax on dividends and appear to amount to some 35 per cent on the ordinary capital compared with 22.3 per cent for the year before. The balance remaining, after meeting preference and preferred ordinary dividends of the British company, amounts to some £2,650,000, which would apparently suffice to cover a distribution of 8.8 per cent on the ordinary capital of both British and Dutch companies. In the absence of any information as to dividends of the Dutch concern, it must, however, be assumed that no payment has been made, and, in consequence, the directors here have found it necessary to keep in hand sufficient to meet both the preference dividends and a payment on the ordinary capital of the N.V. company equivalent to the 5 per cent now declared on that of *Limited*. Basing calculations on figures of capital which are, perhaps, not quite up to date, this appears to mean that there remains only a modest balance for free reserves. Further details of the position must wait on the publication of the full accounts at the beginning of next month. Meanwhile, the price of the £1 units of ordinary stock fell 9d. on the news to 26s. 3d., at which the yield is £4 3s. 10d. per cent.

Blackburn Aircraft Progress

The Blackburn Aircraft report for the year to March 31st last shows that rising taxation has not prevented the greater part of last year's rise in profits, after depreciation, from £191,844 to £214,469 from being placed at the disposal of shareholders. Tax liability rose from £85,000 to £110,000, despite which equity earnings were approximately

stable at £69,484 against £69,843, representing a rise in the earned rate from 14.1 to 16.1 per cent. As in previous years, capital redemption received £23,000 and general reserve £25,000, bringing the total of this fund to £125,000. After maintaining the ordinary dividend at 10 per cent, less tax at 8s. 6d. on the 4 per cent interim and at 10s. on the 6 per cent final payment, the carry forward is up from £10,178 to £11,371. The balance sheet reflects the continued expansion which this company has enjoyed since its incorporation in 1936. A jump in creditors from £328,199 to £1,044,577 is accompanied by a rise in stocks and work in progress, less receipts on account, from £990,987 to £1,474,124 and in debtors from £759,456 to £1,289,580. The total of stocks and work in progress amounts to nearly £6,000,000, against which receipts stand at £4,492,016. Cash holdings have risen from the unduly low level of £9,971 in 1939/40 to £21,079. The latest results must be distinctly encouraging to shareholders, who feared that the burden of EPT would cut sharply into their return from the company's expanding business. The 10s. ordinary shares, at 8s. 6d. ex dividend, yield £11 15s. 3d. per cent.

Initial Services' Setback

The Initial Services' report for the year to June 30th last shows a further interruption to the steady improvement in profits which continued during the decade prior to 1938-39. Last year's total income at £262,526 against £319,503 is, in fact, the lowest since £246,227 was earned in 1935-36. Since tax provision and tax on dividends amount to £149,376 against £127,826, and the company is also obliged to contribute £7,500 to war damage insurance, it is inevitable that equity earnings are steeply reduced from £151,208 to £76,447. As in the previous year, almost the entire surplus is distributed to ordinary shareholders, who receive 16½ against 25 per cent. The margin of cover, at 16.8 per cent, is so narrow that no allocation is made to before that. The carry forward is in consequence slightly increased from £9,498 to £10,044. The most important movements shown in the balance sheet are the moderate nature of the rise in sundry creditors from £21,040 to only £23,265, compared with a rise of more than £12,000 in debtors to £75,298. Stock is up from £131,988 to £178,567, while the total of cash and holding of British Government securities has declined from £448,820 to £322,071. There is every reason to expect that the company, which supplies various types of service direct to the ultimate consumer, must be seriously affected by the further reduction in London's commercial population as well as by rising costs. Its ability to make use of the post-war revival should be in no way prejudiced by the present inevitable setback to earning capacity. The 5s. ordinary shares at 13s. 9d. offer a yield of £6 3s. 5d. per cent.

Another Cunard Repayment

Following on the announcement, some two months ago, by Cunard Steam Ship of redemption of £3,683,615 of 5 per cent debenture stock in February next, there comes the news that the operating company, Cunard White Star, is to repay its debt to the Government of £7,950,000. This sum represents advances made by the Treasury to finance the completion of the *Queen Mary* and the building of the *Queen Elizabeth*. The arrangement as to interest payments was dependent upon the earning of profits, and only very moderate payments appear to have been made. It does not seem that the position of stockholders in the holding company will be immediately affected by the operation. The company has reserves for depreciation set aside, and these, together with other resources and compensation for ships sunk, suffice to make the payment. It is not clear from the accounts at the end of 1939 what these resources were, but at that time the written down value of the fleet exceeded £15½ millions. The object of the board in making the repayment is to place liquid resources at the disposal of the Treasury, and this is clearly a better alternative than a purchase of gilt-edged stocks. It is, of course, impossible to build ships suitable for the trans-Atlantic passenger service during the war, or to use them efficiently if they were built. The repayment will at least have the advantage of simplifying the position which will exist when the time comes for replacement of losses. The news was taken as favourable by the market, and the price of Cunard Steam Ship ordinary shares of £1 was advanced 6d. to 7s. 6d.

THE STOCK EXCHANGES

London

Note: All dealings are for cash.

DERIVING further encouragement from President Roosevelt's speech, the markets closed strongly before the weekend. News from the eastern front, however, together with considerable profit-taking led to quieter conditions at the opening of the week. Absence of buyers rather than any pressure to sell resulted in a decline in prices in most sections, especially on Tuesday. Kafir and Argentine railway issues were the chief losers, but well spread losses were registered in other sections, to which the rubber market remained an exception.

The improved turnover and strength of the gilt-edged market before the weekend was not maintained when the market reopened for the current week. Losses of ½ were suffered by 2½ per cent Consols, 3½ per cent Conversion and War Loan, and 2½ per cent National War Bonds 1945-47 on Monday, when Local Loans fell ½. The next day, losses were more general, 3½ Conversion and 2½ per cent Consols both losing ½, while Local Loans and 3½ per cent War Loan fell by ½. India stocks were also offered. In midweek, losses of ½ to ¾ were again common. In the foreign bond market, Brazilian issues found support before the weekend, and slight losses on Monday were partly recovered the following day. Chilean bonds remained firm after a small advance on the previous Friday, but Peruvian issues suffered from some profit-taking on Monday, when the 6 per cent Corporation debenture issue fell 1½ points. A general rise in Japanese issues took place on Monday, the 4 per cent issue of 1899 and 5½ per cent of 1930 both gaining two points. Later, prices reacted, the 4 per cent bonds, 1899, and 1910, each losing ½ on Wednesday.

The easier trend in the home rail market before the weekend continued into the early part of the current week. Junior stocks suffered a general decline on Monday and the following day GWR ordinary lost ½, LMS ordinary ½, while Southern preferred and deferred declined 1 and ½ point respectively. By Wednesday, a partial recovery raised LMS and GWR ordinary by ½ and ½, respectively. London Transport "C" stock jumped 2½ points on the previous Friday, and rose a further point on the decision of the rating enquiry on Tuesday. Senior issues were steady with price changes not exceeding ½ point. The main feature in the foreign rail market was the continued rise in Argentine issues before the weekend. Some profit-taking marked the opening on Monday when declines up to a point were general, BAGS ordinary losing 1½ points. Later this market became distinctly difficult. Elsewhere, Canadian Pacific issues advanced strongly before the weekend, but the ordinary issue reacted in the early part of the week.

Activity in the industrial market in the latter part of last week was not maintained, an easier tendency on Monday being followed by further general declines. Thus, after numerous gains before the weekend, brewery issues reacted sharply on Tuesday, Guinness losing 1s. and Benskins, 6d. Similarly, heavy industrial issues suffered numerous small losses on Tuesday following earlier gains, Babcock & Wilcox, John Brown, Stewarts & Lloyds deferred, Vickers and Sheep-bridge all falling back slightly. Motor and aircraft issues turned irregular in the earlier part of the week, but shipping issues were firm, Cunard recovering 6d. on Thursday on news of the debt repay-

ment. Textiles turned irregular, after earlier firmness, Courtaulds losing 6d on Tuesday. Among tobacco issues, Imps dropped ½, and BAT ½ on Monday, but the latter issue recovered ½ the next day when prices remained firm. The general trend was reflected in miscellaneous issues and Dunlop, International Nickel, Turner & Newall, ICI and Lever and Unilever, among others, were all lower in the early part of the week. Midweek movements were irregular in all sections, but with a firmer undertone.

After a marked boom in the kaffir market before the weekend, lack of support and some profit-taking led to a sharp decline in prices during the earlier part of the week. Blyvoors reversed the previous Friday's gain of 3s 3d in the first two days of the current week, while W. Wit Areas fell ½ and Western Holdings 2s over the same period. Losses of ½ were general, but Sub Nigel improved ½ on Tuesday and later improvement was resumed. Rubber and tin issues were markedly strong both before and after the weekend with the lessening of Far Eastern tension. Activity in the oil market continued at a low level, but despite some irregularity in prices on Monday, when Shell gained ½ and Lobitos ½, price changes were small.

New York

WHILE before the week-end President Roosevelt's speech was regarded as clarifying the atmosphere, caution regarding both internal and international developments remain the dominant sentiment on Wall Street. Trading before the week-end and in the current week was slow, and price changes in all sections were narrow and trendless. Steel and chemical issues were mildly supported on Monday, but the next day chemical issues reacted, Du Pont losing 1 point. In midweek, a moderate improvement took place following the passage of the tax bill removing long-dated uncertainty regarding taxation liability. Shipping and aircraft issues attracted moderate support.

The Iron Age estimates steel mill activity at 96 per cent of capacity against 97.5 per cent in the previous week.

CONVERSIONS AND REPAYMENTS

Pearson and Dorman Long, Limited.—Pearson and Dorman Long 5 per cent Debenture Stock 1936 (guaranteed by the Treasury under the Trade Facilities Acts) will be redeemed on March 15, 1942; an offer of conversion on a par basis into a new 3 per cent Guaranteed Debenture Stock 1947-56 is being made.

PRIVATE PLACING

Bournemouth Gas and Water Company.—Issue of £100,000 3½ per cent debenture stock acquired by Messrs Grieson Grant and Co. at 99 per cent net. Redeemable at par August 31, 1954. The additional finance is required for general purposes.

BY PERMISSION TO DEAL

Kendall and Gent.—Issue of 140,000 5s. ordinary shares 5s. available in the market at 8s. free of stamp and fee. Additional finance required for extensions.

Industry and Trade

Bricks

The brick-making industry appears to have suffered an appreciable contraction in capacity since the outbreak of war. Before the war, there were some 907 brick manufacturers working 1,184 yards in this country. The corresponding figures for July, 1941, are 634 and 825. It has been estimated, moreover, that on the basis of production in the first five months of this year, the total output in 1941 would reach only 4,500 million units against some 8,250 millions (inclusive of facing bricks) in 1937. Now the brick-making industry faces the possibility of losing about 30 per cent of its male operatives. And, since the current rate of output seems barely adequate for meeting essential needs, the Minister of Works and Buildings has appointed a committee under the chairmanship of Mr Oliver Simmonds, M.B., which is to advise him on the steps to be taken to maintain output at the highest possible level with the resources at the industry's disposal. It is to be hoped that the committee will face the problem boldly and that the Ministry will not hesitate in applying the necessary measures.

Steel from Railings

The Iron and Steel Control hopes to make up for the drastic curtailment of imports from the United States by a salvage drive, by the use of scrap from bombed buildings, and by the removal of railings. It aims at half a million tons of scrap from the last source alone, but it is impossible not to wonder whether enough imagination has been brought to bear on the project. The machinery, on paper, sounds simple. A recent Order in Council has relieved tenants from any obligations to landlords to maintain railings. Instructions will be issued to local authorities to survey and schedule for removal fences and gates which can be spared. Those fences which are necessary to safety or which have artistic or historic merit may be retained. The actual removal work will be done by the Ministry of Works and Buildings, which will act for the Ministry of Supply and will present the Iron and Steel Control with material ready for the furnaces. Receipts will be given for the material removed, and compensation will be paid in due course, claims in dispute being settled by a small expert tribunal. The Iron and Steel Control expects a rush of old railings, and has already circularised consumers asking how much they can use or stock each week. The intention is to clear districts in order, according to the need for material. This apparently simple procedure bristles with difficulties. Many local authorities have recorded opposition to any proposal to remove railings *en masse*. When a stretch of railings has been found that has no claims for retention, the actual owner of the metal must be notified, for the tenant is not always the owner of the ironwork round his house. The owner may be on overseas service. When he is at length found, he may wish to lodge an appeal, for the railings may have some hidden safety purpose or be of great sentimental value to him, if not to the public. But he may be found and he may agree without trouble. There is then apparently nothing more to do but to take down the railings and fix terms of compensation. The actual payment of compensation may be postponed until after the war, but some more or less accurate description has to be noted of the metal about to be destroyed, if an equitable assessment is to be made. To avoid argument at the compensation tribunal, it would be necessary to make a complete sketch of the railing, noting location, stonework, type of metal, size and design of the fence, state of repair and all fancy ornamental work. If the Ministry of Works and Buildings, supported by the Iron and Steel Control, decides to risk this, it still has to get the weight of railings contributed by each individual owner. This means that each small length, as it is taken down, has to be carted off to some public machine and the weight duly recorded and checked, one copy of the chit being lodged with the householder. If the scheme is not to become a tragicomic example of Government ineptness, it will have to be substantially revised.

Miners' Guaranteed Wage

In the application of the Essential Work Order to the coal-mining industry, one of the preliminary difficulties

which the Government had to face was that of making adequate provision to meet the cost of the guaranteed week. Normally much time is lost in the operation of collieries through causes beyond the control of the industry, while their incidence on individual districts is far from equal. In 1938, for example, 37½ coal-winding days, or 12.6 per cent of the total possible man-hours, were lost through lack of trade, accidents and other causes (excluding holidays and disputes); but, while the average number of days worked in the industry as a whole was 4.86, Scotland had a working week of 5.54 days, South Wales of 5.12 days, Northumberland and Durham of 5 days, Yorkshire of just under 4½ days, Nottinghamshire of 4½ days, and South Derbyshire of only just over 3½ days. Again, some districts, and individual collieries within districts, are more favourably situated than others, and are often making good profits when their neighbours are either finding it difficult to make both ends meet or suffering losses. These complications were increased by what the President of the Board of Trade described as "the changes and chances of war." For the purposes of the Order, they were surmounted by making the cost of the guaranteed week the common liability of the industry, and by discharging it through the medium of a national levy, subject to a maximum amount of 6d. per ton on the coal sold. It was intended that the price of coal should be raised to cover the cost of the guaranteed wage, but the Mines Department has been withholding its authority for price increases, whether for war-wage advances or other reasons, except when the need for them is proved. In conformity with this procedure, South Wales, Somerset and Bristol are the only district where prices have recently been raised to meet the increased cost of production. As in the other coalfields the joint ascertainment have been more favourable, the local executive boards have refrained from applying for authority to raise prices. In these circumstances it has been found necessary to impose a levy of only 1½d. per week.

Civilian Clothing

The Board of Trade, after consultation with the Central Price Regulation Committee, has fixed the prices and margins for certain kinds of garments which may be made from cloth supplied under the special quotas. These price announcements are made now in order to enable the manufacturers to make their plans, but it is emphasised that production of these garments is only just beginning and that they will not be available for some time. The first two schedules, one for men's and boys' outer garments and one for hosiery, are to be followed shortly by others. They cover trousers, shorts, suits, overcoats, raincoats, men's and women's cotton and woollen underwear, socks and all manner of infants' and children's clothing. The prices specified are overriding maximum prices, excluding purchase tax, which may be charged to the retailer by a manufacturer or wholesaler. In any case, he may not charge a price which will yield him more than 4 per cent net profit on his cost of production and sale in the case of outer garments, or 7½ per cent in the case of hosiery. The maximum margin for distributors is 20 per cent on the cost price for wholesalers, and for retailers 33½ per cent on costs, including purchase tax where payable. The schedule of retail prices, not yet published, is to be based on the application of these percentages, with certain necessary adjustments, to the maximum price fixed for the manufacturer. Why retailers should be allowed to make a profit on the purchase tax is not explained. Some objection to the machinery of the tax has been raised in the past on the grounds that the retailer is, in effect, making a free loan to the Government of the amount of the tax during the period goods remain in his stock. The remedy for this, however, scarcely seems to lie in a further levy on the purchaser, still less in a levy of the usurious rate of 33½ per cent on an almost perfectly safe advance. The inclusion of infants' and children's knitted wear in this special quota is to be followed by the withdrawal, on October 31st, of the provisional arrangement by which they can be supplied outside the quota. The scheme as a whole is a sound contribution to the price stabilisation programme, but it is important that the goods should begin to come on the market before the really cold weather sets in.

Cheating the Clothes Ration

Offenders against the rule that loose coupons may not be used for clothing purchases over the counter are to be prosecuted. The Board of Trade holds the view that traffic in loose coupons undermines the whole basis of rationing and must be rigorously suppressed. In so far as the coupons are genuine, it is difficult to see that traffic in them causes unfair distribution, since nobody is obliged to part with coupons if they prefer to take up their ration. Such traffic reduces the extra economy which follows any rationing system when some people do not take up their ration, but that is the only harm it can do. If, as is alleged, there is a growing traffic in forged coupons, it is questionable whether this can be prevented while loose coupons can be used for postal transactions. Almost any purchase can be completed by post, even if the article has to be chosen and fitted by the customer in person. It is done in *bona fide* cases where the purchaser has omitted to bring his ration book with him, and it can be done deliberately by any purchaser who wishes to use loose coupons. The Board of Trade appears satisfied that there are adequate safeguards in the cases of purchases by post, but these seem very frail. The customer who signed them on the back may have a name in common with other customers of the same shop, and by the time they have reached the Board of Trade and been found to be forgeries, it may not be possible to trace him. If the use of loose coupons is giving rise to counterfeiting, some other system of making post purchases will have to be devised. Already retailers are being encouraged, where they have to return loose coupons to customers, to substitute the strip tickets which are issued in certain special cases. An extension of this system might help to solve the problem. This, however, does not remove the possibility of the use of forged coupons by traders themselves, in order to procure more than their legitimate share of goods from wholesalers. The coupons they have to hand in are just those loose coupons which, in the hands of private individuals, are regarded as such a temptation to counterfeiting. If it is true that there are professional forgers at work, they would find business with retailers far more worth while and less open to detection than traffic with private individuals. If forgery is really taking place on a large scale, some more watertight system will have to be devised.

Ships from America

There have been five preliminary stages in the expansion of shipbuilding in America. The first was the speeding-up, just before the war and during its first year, of the domestic production programme of 500 ships over a ten-year period. By the end of last year, this programme, which was begun in 1936, was about six months ahead of schedule. Besides providing a number of highly efficient, fast cargo liners—some of which have already been transferred to Britain—it has taken a vital part in the rebirth of an industry that prior to 1937 was practically stagnant. The second stage was the placing of contracts by the British Government in December, 1940, for 60 standardised cargo vessels to be built in two new shipyards financed by Britain. The third stage was marked by President Roosevelt's announcement in January of this year that 200 "emergency" ships for American service were to be laid down in new shipyards. The fourth was the ordering of an additional 212 ships for transfer to Britain under the Lease-Lend Act, involving the construction of further building facilities. The fifth stage came in August when a further 566 merchant ships were added to existing commitments, which already involved a total of over 700 vessels of different types. It is one thing to order ships, but quite another to put them into service. What matters is the rate of expansion of shipyard facilities and the pace of production. On both points the latest reports are encouraging. Before the original Maritime Commission programme was launched in 1936, there were only ten active yards in America building ships of ocean-going size, with a total of 46 building berths. By January of this year, before the emergency programmes were begun, there were 18 yards with 70 berths, some of them taken up with naval construction. In the middle of last June, the director of the emergency programmes stated that "very shortly" there will be in full production of merchant ships 29 yards with 186 slipways. The new programme announced since then involves the construction of a further 23 slipways, making a total of over 200 building berths. The ships to be built under the various programmes can be divided into two main types—the standard Maritime Commission types designed before the war in connection with the long-range programme; and the emergency, EC-2 or "ugly duckling,"

ships, the design of which is based on that chosen by the British Purchasing Commission for the 60 ships ordered last December. The former comprise various designs of fast cargo liners of 5,000 to 8,000 gross tons with speeds of 15 knots and over, as well as large and fast tankers of 16,700 tons deadweight and 18 knots speed. The emergency ships are all of simplified design with a deadweight of 10,000 tons and a speed of about 11 knots. The last four stages in American shipbuilding entail the construction of 223 ships of the cargo liner type, including tankers, and 790 of the EC-2 type, all scheduled for completion by the end of 1943. A further 160 ships of the long-range programme are expected to be completed by the same time. An official of the Maritime Commission stated last June that the scheduled building time for EC-2 ships, from keel-laying to delivery, was expected to be reduced from 7 to 4½-5 months. This compares with a record of seven months and 24 days in the case of the Hog Island venture of the last war. In 1939, 28 seagoing ships of 241,052 gross tons were delivered from American shipyards; in 1940, 53 ships of 444,703 tons; and in the first six months of 1941, 40 of 326,789 tons. It is estimated by the American Bureau of Shipping that deliveries in the second half of 1941 will bring the year's total to 1,000,000 gross tons, an increase of 150,000 tons on the estimates at the beginning of the year. In 1942 the emergency programmes will reach full production. The latest estimates for this and the following year, converted into gross tons, are: 1942, 3,690,000 tons; 1943, 3,640,000 tons. As the figure for 1943 is based on present authorised contracts, it may be assumed that if the 1942 schedule is carried out, a still higher output will actually be possible in the following year.

American Copper Problems

Until the outbreak of the war, America's consumption of copper exceeded the limit of 1,000,000 short tons only once, in 1929. Last year, the 1929 record of about 1,015,000 tons was equalled, but, if supplies were available at reasonable prices, this year's intake might reach 1,800,000 tons or even more. According to official estimates, however, America's supplies will be limited this year to 1,600,000-1,650,000 tons, which exceeds supplies available to the whole world in the best year of the last war by about one-third; 1,000,000-1,050,000 tons are expected from domestic mines, while the remaining 600,000 tons cover the whole exportable surplus of Latin America which has been acquired by the United States Metal Reserve Corporation. Unessential consumption, therefore, has to be limited. Early this year, the American Government held that the introduction of a copper pool for urgent defence requirements, into which producers had to supply part of their monthly output, would suffice to meet all essential needs. During the summer, however, it became obvious that stricter measures were needed, and a priorities scheme for copper distribution, by which all purchasing contracts are subject to the approval of the Priorities Division of the Office of Production Management, was introduced on August 6th. The effects of this scheme have already been reflected in deliveries to consumers, which totalled 117,262 short tons in August, against no fewer than 143,089 tons in July. As civilian needs still accounted for well over half of total consumption in the first half of this year, the priorities scheme should secure supplies for all essential purposes. But steps have also been taken to expand supplies. Domestic production has been stagnant for some time, the country's smelter output in August, 1941, being, in fact, the lowest since October, 1940. Whether America's output can be expanded much beyond its present level of about 1,020,000 short tons per year is doubtful, but the low domestic copper price of 12 cents per lb. has been hampering production in some of the high-cost mines. In order to secure the maximum domestic output, the Government is now prepared to subsidise high-cost producers; a number of producers in the State of Michigan will receive a direct subsidy of one cent per lb. of copper produced. The introduction of the subsidy as an alternative to the increase in the maximum price of 12 cents per lb. is an important move, in that it will keep American defence expenditure for copper at a low level compared with the last war, when copper prices advanced at one time beyond 36 cents per lb. and were on the average from 1914 to 1918 about twice as high as at present. Abroad, the American Government has induced Latin American producers to push their output to the limit.

For Commodity and Industry News see page 367.

COMPANY MEETINGS

FURNESS, WITHY AND COMPANY,
LIMITED

THE JUBILEE YEAR

HALF A CENTURY OF WONDERFUL EXPANSION

LORD ESSENDON'S REVIEW

The fiftieth ordinary general meeting of Furness, Withy and Company, Limited, was held, on the 16th instant, at the registered office of the company, Furness House, Leadenhall Street, London, E.C.

The Right Hon. Lord Essendon, J.P. (the chairman), presided. The secretary read the notice convening the meeting and Mr R. H. Stafford, of Messrs W. T. Walton and Son, read the auditors' report.

The report of the directors and the statement of accounts for the year ended April 30, 1941, were taken as read.

The following statement by the Chairman, circulated with the report and accounts, was also taken as read:—

This statement is being circulated with the annual accounts for the year ended April 30, 1941, for the purpose of effecting economy by eliminating the issue at a later date of a report of the annual meeting embodying the chairman's speech; in addition to which, it will be an advantage to those stockholders who may find it difficult to attend the annual meeting at which the proceedings will be purely formal.

Doubtless our stockholders will be satisfied with the position as disclosed in the accompanying accounts.

BALANCE-SHEET ITEMS

Comparing the assets in the balance-sheet with those of the previous year, there is very little which calls for comment. Our shipping property now stands at £1,780,235, as compared with £2,158,221 in the previous year. The investments in subsidiary shipping companies are unaltered, whilst the general investments and the investments in subsidiary companies other than shipping stand at £3,106,298, as compared with the previous figure of £3,484,590. Sundry debtors show an increase of £624,446, which includes war risks insurance claims to be collected. Bank balances, deposit accounts, Treasury Bills, etc., stand, this year, at £889,090, an increase of approximately £500,000.

The only other item of interest on the assets side of the balance-sheet is the footnote to the effect that there is an amount of £100,000 standing to the credit of the company under the terms of the Government tonnage replacement account agreement.

The items on the capital and liabilities side of the balance-sheet show little variation, the chief alteration being an increase in the fleet replacement account from £100,000 to £222,013. I cannot emphasize too strongly the necessity for this fund, which is necessary not only for replacement of vessels lost by enemy action, but for replacement of the fleet as a whole.

DIVIDEND INCREASED TO 6 PER CENT.

In regard to the profit and loss account, the net profit, after making provision for taxation, amounts to £665,072, an increase of £46,421 over the previous year's profit figure of £618,651. I might here state that, compared with the previous year, our steamship profits are down by reason of the vessels having been under requisition during almost the entire period. Our dividends show a smaller return owing to increased taxation, the increase in our profits being due to revenue from other sections of our business.

After providing £350,000 for depreciation and a transfer of £100,000 to the fleet replacement account, the directors recommend a dividend on the Ordinary stock of 6 per cent., less income-tax, as compared with a distribution of 5 per cent., less tax, in the previous year, leaving a balance to be carried forward of £186,213.

A RECORD OF SUCCESSFUL PROGRESS

You will observe from the report of the directors that this is the 50th annual general meeting of the company, it having been registered on September 16, 1891—hence the selection by the direc-

tors of September 16th for the date of our annual meeting this year.

Incorporated with a share capital of £700,000 50 years ago, this figure has now been increased to £7,500,000. This is indicative of the wonderful expansion in the business of the company during that period, its success in the early years being undoubtedly due to the business ability, foresight and strenuous work of its founder, the first Baron Furness.

It is unfortunate that this jubilee should happen to fall during a war period, when economy precludes its celebration; if only by the issue of a brochure illustrating its history and growth during the past 50 years. I have been with the company during the whole of its lifetime, and, incidentally, I was also associated with the earlier business of Christopher Furness and Co., for eight years previously. One other director, Mr Robert E. Burnett, shares with me the honour of having been with the company since its incorporation.

NEED FOR MAINTAINING A STRONG MERCANTILE MARINE

I do not propose to follow my usual custom of making a review of the shipping situation. Liner companies are necessarily apprehensive about the recovery, when the war is over, of the trades which they have had temporarily to relinquish—but under war conditions this, and all other anxieties and grievances, are of secondary consideration. The duty of all shipowners is to work their vessels for Government account to the best possible advantage, by turning them round as quickly as possible and thus increasing the number of voyages that can be performed.

As an industry we rely on the very definite assurances given by the Government, in the White Paper dealing with the war-time financial arrangements between themselves and British shipowners, in which they recognise "the necessity of maintaining the British Mercantile Marine in adequate strength and in a position of full competitive efficiency."

COURAGE OF THE MERCHANT SEAMEN

In closing, I should like to express deep admiration for the courage and tenacity with which our merchant seamen pursue their calling, without thought of hardships and dangers from a ruthless enemy. They share many of the dangers of the fighting services, and if, on the one hand, they are spared some of the risks of the fighting forces, they are, on the other hand, not so well equipped for defending themselves against the enemy.

I am delighted to inform you that decorations have been awarded to 10 of the company's seagoing staff, and two have also received commendation.

This year has also been one of strenuous work for our staffs ashore, and I should like to add a word of praise for the efficient way in which they have carried out their duties.

The Chairman then moved the adoption of the directors' report and balance-sheet and also the declaration of the dividend in the following terms:—"That a dividend of 6 per cent., less income-tax, on the Ordinary stock in respect to the financial year ended April 30, 1941, be paid on the 20th instant to the stockholders registered on the books on the 5th instant, and that the warrants be posted on the 19th instant."

MR MURRANT'S MISSION TO EGYPT

In the ordinary way, he said, this resolution would have been seconded by the deputy chairman, Mr E. H. Murrant, but Mr Murrant had been sent out on a special mission to Egypt by the Ministry of War Transport, and he was afraid they would have to do without him for some little time to come. He was sure stockholders would join with him in wishing Mr Murrant success on his mission and ultimately a safe return. (Hear, hear.)

The motion was seconded by Mr. Sydney J. Forster and carried unanimously.

The appointments of Mr William Everall and Mr William MacGillivray as directors of the company were confirmed, and the retiring directors, Mr R. E. Burnett, Mr H. Smurthwaite, and Mr J. W. Nicoll, were re-elected.

The auditors (Messrs W. T. Walton and Son) were reappointed. The Chairman, in putting the motion to the meeting, said he had to announce with very great regret the death of Mr R. T. Warwick,

EASTWOODS, LIMITED

PROGRESS OF PARENT COMPANY

The twenty-first annual general meeting of the company was held, on the 19th instant, in London, Mr Horace Boot, M.Inst.C.E., M.I.Mech.E., M.I.E.E., chairman and managing director, presiding.

The following are extracts from the statement by the chairman, which had been circulated with the report and accounts.

Works, properties, plant, machinery, barges and transport vehicles are valued at £185,663 after full provision for depreciation. Stocks at the outbreak of war have to a large extent been disposed of and production is restricted at hand-made brickyards where insufficient labour was available to justify continuance of such small units.

There has been large expansion in general trade in the tile and roofing departments, where important contracts for the Government are in hand.

The financial position continues strong, and we have available in cash and Government securities no less than £185,407, ready to meet the immediate requirements of the business.

The directors recommend transfer of £5,000 to taxation account and a final dividend on ordinary shares at 5 per cent., making 8 per cent. for the year, leaving £21,792 carried forward, against £17,995 brought in.

Many non-recurrent items such as expenditure on A.R.P. equipment, obscuration of kiln glare, War Damage Insurance and losses not covered by compulsory schemes have been provided for in the accounts. All this expenditure has been carefully watched with an eye to the future, and offset by economies resulting from judicious management and reorganisation of our general scheme of control.

In a complex group of businesses such as ours it has been necessary to secure representation on all federations and trade associations dealing with important questions of quotas, production and supply and man-power, wages and working conditions, the standardisation of various products and operation of the Essential Work Order.

SIMO RUBBER COMPANY, LIMITED

The sixth annual general meeting of the Simo Rubber Company, Limited, was held, on the 16th instant, in London.

Mr W. Gardner Tarbet (the chairman) said that the results for the year must be considered disappointing from the shareholders' point of view. Although the crop produced in 1940 was fully 530,000 lb. more than in 1939, the profit was nearly £1,400 less despite the fact that in 1940 proceeds from the sale of their rubber exceeded expenditure on the estates by £49,284 or £21,000 more than the corresponding figure for 1939. The explanation of the unsatisfactory result was to be found in the provision made for taxation in Java. The £27,542 reserved on the 1940 accounts was not the only amount which the Java Government took from them in taxation, as apart from their liability for income tax and War Profits Tax in that country there were also export duties aggregating in 1940 about 1d. per lb., which provided approximately a further £8,700, so that the actual amount of their contribution to the Java exchequer amounted to fully £36,000.

So far as shareholders were concerned, the dividend which they were receiving this year—10 per cent., less tax—had not been affected by the heavy scale of taxation in the Netherlands East Indies as, had taxation in that country been lower, the amount saved in that way would have been required to meet excess profits liabilities in this country. Reports from the estate continued to be very satisfactory, the gardens being well upkept and constantly improved. An extensive programme of manuring had been sanctioned for the current year, covering to the full the recommendations which had been made.

The report was unanimously adopted.

COMMODITY AND INDUSTRY NEWS

A MEETING of the International Tea Committee was held in London on Tuesday last to discuss the new draft agreement for tin control. Satisfactory progress was made at the meeting and the delegates agreed to refer recommendations on certain points to their respective Governments. Standard tin, cash, was £256 10s.-£256 15s. a ton on Wednesday, compared with £257-£257 5s. a week earlier. Three months was £259 10s.-£259 15s. a ton against £259 15s.-£260.

Cutlery Industry Concentration.—The cutlery industry was unable to make voluntary arrangements for concentration. Consequently, the Board of Trade itself undertook the task, and it has now almost completed the nomination of firms for nucleus status. Some 50 firms in all will be nominated; already some provisional nucleus certificates have been issued to certain Sheffield firms for a period of three months. During this time, arrangements can be made between nucleus firms and non-nucleus firms for the transfer of production to the former. If nucleus firms fail to acquire production in this way, their certificates will be withdrawn. Non-nucleus firms transferring their production to nucleus firms will have the advantage of preserving their identity as partners in the nucleus arrangements.

Tinplate Trade Concentration.—While the committee on concentration of production in the tinplate industry has not yet reported, consultation with the Regional Controller of Factory and Storage Premises has resulted in the authorisation of the release of 26 works, which are to be used mainly for storage.

Pepper Difficulties.—Some members of the London Spice and Rice Dealers' Association are finding it impossible to

buy pepper owing to lack of sellers at the low maximum prices. They have sent a petition to the Minister asking him to order that they may obtain supplies. The Ministry of Food is taking a census of pepper stocks in the country. It is believed that the Ministry has bought about 20,000 cwt. of pepper for early shipment to this country.

Stone, Slag and Lime Control.—The Minister of War Transport has made an Order for the control of practically all igneous, metamorphic and sedimentary rocks, lime (except chalk lime) and slag (except basic slag). The Order applies to producers, distributors and users of the materials who receive notification that they are subject to the Order. Such persons will operate only under licence of the Minister.

Cotton Spinners' Problems.—Trading in yarn and piece-goods has been at a low ebb, but the principal problem of the market concerns yarns. Spinners are fully engaged up to the end of October, and cannot sell beyond that date, until the Controller frees them from his "request." They have also applied for an increase in fixed yarn margins to meet the mounting overhead costs; it is not unlikely that the Controller may find it necessary to increase raw cotton prices, which have been the same since the beginning of April. The recent sharp advance in New York rates is difficult to ignore. Until these points are decided and spinners can operate on freer lines, little progress can be expected in meeting an extensive overseas demand in cloth for export. Among orders waiting to be placed are dyed

GOVERNMENT RETURNS

For the week ended September 13, 1941, total ordinary revenue was £30,775,000, against ordinary expenditure of £86,416,000 and issues to sinking funds of £130,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,356,667,000 against £1,039,470,000 for the corresponding period a year ago.

QUARTERLY TRADE SUPP.

Ordeal by Waiting

THE so-called lulls in the western war are perilous traps. They are regarded as respites. In fact, they are marks of Hitler's success in striking down his foes one by one at his own time. There is a striking story told by a fighter pilot who flew home from broken France in June last year. Across the Channel, he saw battered, smoking ruins and helpless lines of refugees. A few minutes later, he looked down on peaceful cricket matches and summer motorists; and he was sad and angry. A Polish woman who broadcast in London the other day spoke strongly of the same contrast; her people knew what victory for Hitler means, and the English did not. It is a contrast that must be heavy in the hearts of Europe's refugees in England; it was the burden of Mr Frank Owen's Sunday postscript on the ordeal of Leningrad; and it is the source of a rising call for daring and adventure by British arms.

This country may be still too weak to take up the attack by sea and land that, in the air, the RAF have made their daily round. There is no sense in self-flagellation for a helplessness which is, fortunately, accompanied by immunity from war's chief savageries. Night raids, it is true, have laid a host of buildings in ruins; the total of civilians slain is rising towards half a hundred thousand; many more have been heroes or sufferers; and the Luftwaffe will come back. But, on the nation as a whole, the scars are superficial; and life has gone on for most of Britain's millions without the heavier tests of privation or sacrifice. There is little to compare with the sorrows—or the inspiration—that came in 1914-18 from the lists of casualties that, happily, this time have so far been spared. It is the pride of the Minister of Food that the British are the best-fed people in Europe; and it is possible, as an article on page 375

points out, for the question of pecuniary ways of rousing the people to greater effort to be solemnly discussed.

Yet it is only the sense of urgency, and not the urgency itself, that is lacking. More people than not now realise that the war in Russia is not a diversion but the core of the conflict itself. But a "V-style" attitude is still widespread. The astrologers still bandy tales of the enemy's hopeless plight for the delight of millions; and sober City men, as well as old women, fix dates before next Christmas or Easter for the end of the war.

After the fall of France, the Prime Minister promised the nation "blood, toil, tears and sweat." The need for desperate efforts to replace lost supplies and speed-up new output was clear. It is no less now, with the fate of Russia still in the balance; and Mr Churchill might well renew the vow. Not until 1943, on present programmes, will the Anglo-American output of war supplies equal the enemy's. Mr Mackenzie King has said, quite plainly, that neither the British Commonwealth nor the United States, acting alone, can destroy Germany's military effort. Nor can Russia—even with the utmost but still slender aid that can yet be given by the democracies.

It is not a choice between stupid complacency and unfounded pessimism. It is a question of bringing the surest and quickest end to the misery and the evil that darken Europe, cloud Russia and menace Britain and the world outside. It is a question for Americans and Britons alike. In it there is all the incentive that every free man can ask for his effort and every leader for his authority. This is not clap-trap or sentiment. Patriotism, duty and the call to service are, admittedly, not enough. But they must come before, and lie behind, the needed adjustments in material rewards and the conditions of service. The citizen's will, as well as his reward, must

match the need. At the least, the war effort must have gusto and, at the most, a soul and a spirit.

There are no lulls in total war. No man can do more, it is true, than he is required to do. But at least it can be remembered by every man and every woman that the

state of emergency and of siege remains; that there is no short cut or easy way out—for any people—from the ordeal; and that there is no future for freedom anywhere without the defeat of Hitler. They do not serve who only stand and wait, in any country or continent.

Turkey in the Balance

THE strategic situation in the Black Sea area has been radically modified in Germany's favour in the course of the last nine months. In the autumn of 1940 and the winter of 1940-41, the western Black Sea ports—Constantza, Varna and Burgas—came under German control. In the following spring, the whole of the Aegean Sea and the Greek islands, including—in the final phase—the island of Crete, passed to the Nazis. To-day, Nazi control is reaching out along the northern shores of the Black Sea. Odessa is encircled, the Crimea has been cut off, and the German advance guard is pressing on to Rostov.

If the immediate objective of the Nazi armies is the oil of the Caucasus, Von Runstedt's armies must swing to the south, parallel with the eastern shores of the Black Sea, once the barrier of the Don has been overshot. Such an advance would open the German forces to the hazards of a relatively unprotected flank and, while lengthening their lines of communications, it would bring them face to face with a singularly obstinate military obstacle in the shape of the Caucasus. If the organisation of the Iranian supply route can be achieved by the Allies, as ruthlessly and efficiently as if it had been under German direction, then the chances of obstruction open to a Russian army

operating in the Caucasian passes, and fed from the rear by British and American supplies and British reinforcements, would be sufficient to make the hardest strategical pause.

The German plan, if it is really directed towards an immediate frontal attack upon the Caucasus, must take into account both the vulnerability of the German western flank and the desirability of cutting the Russian defenders of the Caucasus off from any source of outside supply. Both these considerations involve the status and future of the only remaining shore of the Black Sea, the southern Anatolian shore. The fate of Turkey is vitally bound up with the problem of securing undisputed German mastery on the sea flank of the Caucasus and cutting off Iran from the Russian front. It is unlikely that Germany can muster, by the Danube route and by the control of Balkan shipping, a force strong enough to annihilate the Russian Black Sea fleet, especially as Sevastopol, Novorossisk, Tuapse and Batum, not to speak of beleaguered Odessa, are still under the control of the Russians.

It would be a different story if the Straits could be opened to heavy units of the Italian Navy. Here the Turks, according to the Montreux Convention, have complete discretionary powers. Belligerent warships—and

only a mere fictitious legalism can pretend that Bulgaria, the aggressor against Yugoslavia and Greece, is not at war—have no right to use the Straits, unless they are fulfilling obligations under the League Covenant or under treaties of mutual assistance registered at Geneva. Not even Goebbels has suggested that Hitler's spawn of Italian henchmen and Balkan quislings are fulfilling any obligations to anybody. Moreover, if at war or "in danger of war"—a status which every nation of the world is entitled to claim since the advent of Hitler—Turkey enjoys complete discretion in the matter of opening or closing the Straits.

Again, Turkey is now the only route to the Caucasus which is not under direct Allied control. Iraq, Syria and Iran, all prepared through years of careful penetration and propaganda to be outposts of German control below the Caucasian rampart, have been taken over by the Allies. The Turkish route, with its through—though faulty—railway communications, its common land frontier, its Black Sea ports and its motor road from Trabzon into Iran, is the last possibility open to the German General Staff.

It is thus hardly surprising that the pressure on Turkey, both diplomatic and military, has been steadily increasing in the last months. The German Ambassador, Von Papen, has shuttled to and fro between Ankara and Hitler's headquarters; the counsellors and the military attaché have been called and recalled for consultations; a "cordial and fraternal" message has reached President İnönü from the Führer every other month; and two trade delegations, the second headed by the redoubtable Clodius, have visited Turkey since June.

On the military front, there has been the unobtrusive mobilisation of Bulgaria, Turkey's traditional enemy; the gathering of a number of mechanised German divisions on the Turco-Bulgarian frontier; the arrival of E-boats at the German controlled Danube and Black Sea ports; and the steady reinforcement of the Aegean garrisons in both the German and Italian controlled islands. These moves, coupled with the extraordinarily favourable strategic situation the Germans achieved as a result of their Balkan campaigns, have placed Turkey in a military predicament which the Germans are doing everything—by threat and hint and rumour and propaganda—to exploit.

In face of this concentration of military and diplomatic pressure, the Turks have undoubtedly given ground. Their position to-day is one of strict neutrality, which the Nazis are trying to whittle away still further into a lenient neutrality on Swedish lines—a "neutrality" which, for example, would not boggle at the transit of German troops or warships. That the Turks' present attitude is a modification of their full and courageous alliance with Britain they themselves would not deny. But they are entitled to point out—and do point out—that their alliance was based upon a dual understanding with Britain and France, and that their guarantee of assistance presupposed the supplies and equipment which the Allies undertook to send. In the event, France collapsed and the equipment did not arrive. This caused the initial hesitation. It was reinforced by the uncertainty of Yugoslav policy under Tsvetkovitch and by the inadequacy of British aid to Greece. It was strengthened still further by the entry of Russia into the war on Britain's side and the fears—totally unfounded but skilfully fostered by Germany—lest Britain and Russia should come to

some arrangement over the Straits at Turkey's expense.

These hesitations have reduced Turkey to the last choice of all, to fight or to submit, if and when she is invaded. Her safeguards against the necessity of making the choice are poor indeed—a treaty of friendship signed in June with Germany, in itself almost a guarantee of aggression; a unilateral offer of assistance by Russia and Britain made in August; and, last of all, the possibility that Von Papen is opposed to the policy of direct assault and may, on the visit he has just concluded to Hitler's

headquarters, have secured the acceptance of his point of view over against the out-and-out militarists. Certain strategic considerations bear out Von Papen's policy of "Swedenisation"—the difficulty of the Anatolian terrain, the unspeakable Turkish roads, the faulty railway communications, the advent of winter, and the determination of Turkey to fight. In the last analysis, it is this more than all the rest that gives a fair chance of continued neutrality to the Turks. They can escape war best if they are willing to wage it.

For Services Rendered

A CAMPAIGN is in progress to loosen the financial controls on wartime industry. Discussions have failed to pin down precisely the causes of insufficiencies in production. It is voiced by business men who wish to lend more weight to the war effort, by earnest civil servants who have wrestled with the problem of production at close quarters, and by economists who have studied it apart. It has now taken a positive shape in proposals to put the profit back into war. There was obviously room for consideration whether some revision of technical, as distinct from financial, controls and some modification of the technical autarky of separate firms might not make possible the rationalisation that is still needed for more output. But applied psychology has replaced planning as a nostrum; and the demand of the *Financial News*, in its special feature programme this week, that the incentives of profits and earnings should be restored to industry, sums up the conclusions that disillusionment and experience have apparently together reached.

This is both a *volte face* and a confession of failure. The determination to restrain the rewards of war work is rooted deeply in the public conscience. Profiteering and inflation have been treated as the allies of the enemy. The contrast between those who are conscripted, or volunteer, to risk their lives and those who stay behind with high profits, high salaries or high wages has been regarded as painful and to be minimised. The belief that duty and danger should themselves be spurs dies hard. Now, the call of the higher criticism is for "realism." It is pretended that the fighting forces are well off, because they are fed, clothed and housed, and do not have to fend for themselves. It is emphasised that the whole aim is to win the war and the only immediate object in industry to step up output. It is argued, after twenty-five months of trial, that output cannot be stepped up sufficiently without increasing the material inducements offered to producers. There has been no major block or breakdown in production, which is in fact reaching new record levels. But the extra that is needed of speed, efficiency and toil is lacking; and the argument of the realists, in their plea for the largest possible output in the shortest possible time, is that the inequity of profiteering or the danger of inflation is preferable to the risk of defeat.

Boosting the War Effort

The case is, then, that industry will not deliver the goods at the present price. Business men, it is contended, feel that they and their shareholders are offered no extra reward for extra output; they can earn the profits allowed too easily. Faced with calls for more effort, trouble and inconvenience, they tend to say that it cannot be done; and the civil servant who makes the calls has neither the time nor the knowledge to do it himself. Similarly, it is declared, workpeople know that many of the essential war jobs, and all wartime technical training, are worse paid than the jobs they are doing. Before the war, iron and steel, engineering, coal mining, agriculture and ship-building, the vital war trades, were depressed and badly paid. They remain unattractive. The suggestion is that business men could be stimulated

into greater activity by a reduction in the Excess Profits Tax (which makes them disinclined to risk more for no more profit), and workmen into more rapid movement by the establishment of higher wage levels in the war industries.

The fact that this scheme, which in one form or another has been making frequent appearances in the last few weeks, seems at first glance to run counter to the moral and economic tenets by which it has been attempted to devise the war economy so far is not sufficient reason for its rejection. Morals and economics must, if necessary, give way to victory. Profiteering, moreover, is too frequently a catchphrase which overlooks the fact that it is profitability that maintains private production in being, even in wartime. It is only "unreasonable" or monopoly profits that are an evil to be rooted out. But the case against higher incomes in wartime itself rests upon expediency as well as equity. The spending of extra incomes upon a dwindling stock of goods and services must mean rising prices and rising costs in an ascending spiral. The de-controllers admit this. They point out that it is the spending, and not the receipt, of higher incomes that brings about inflation; and they advocate that the relaxation of financial controls should be accompanied by a tightening up of the physical control of consumption. The proposals of the *Financial News*—that EPT should be lowered to 60 or 70 per cent (with the payment of dividends restricted again), that depreciation allowances should be increased and that contracts should be given out at fixed prices, without post-costing—are attached to a plan for the comprehensive rationing of consumers' goods and the rationalisation of their manufacture and distribution. The critics admit that workers with higher wages can only be better off, in conditions of wartime scarcity, if other people are correspondingly worse off; and they propose that the rationing of consumption should be designed deliberately to give more to active war workers and less to the rest of the community. The drift of the proposals is that, while the scramble for goods must still be prevented, a scramble for money should be fostered in order to stimulate the war effort.

The contention that some adjustment of rewards is necessary to fit peacetime ways into a war economy must obviously be accepted. But these arguments do not really herald any new discoveries in the technique of wartime organisation. They rather register the fact that the competing interests concerned in the working of the war economy have been unable to agree upon a way of co-operating fully in raising output to a maximum. The situation with regard to wages, for instance, is that after two years of negotiation, the Government, the Trades Union Congress and the employers have failed to reach agreement. Even now, the TUC is not prepared to accept any central planning of wages policy; and the need for an adjustment in rewards between essential and less vital industries has no place in their contention that collective bargaining by individual unions should be left free to operate as in more normal times. The real need is to increase the pay of the lower grades of men and women war workers, for it is into these grades that recruits from other work are required to pass. But the unions stand for all-round increases without distinction—most

for the most powerful unions. On the employers' side, EPT has been effectively applied; and the necessity of proving to the workers that they are being asked to toil for the nation and not for private profit remains unaltered. But the undercurrent of opinion among business men has consistently been of opposition to EPT at a high rate.

False Pretences?

The fact is, then, that a Daniel has come to judgment, not with any new invention, but simply with ways and means of arbitrating between parties in the state who have not been able to arrive at a formula among themselves. And the "damages" which it is proposed to offer to resolve the dispute are themselves not a little illusory. It is proposed to give to firms some 30 or 40 per cent of the profits they earn above their standard for tax. But it is not proposed—cannot be proposed—to permit them to spend this money, except on purposes approved for the war effort by the Government. Similarly, it is proposed to pay workers higher wages. But it is not proposed to allow them to spend these, except where it is possible, by means of differential rationing, to give them a little more cheese or an extra cut off the joint; and the room for differential rationing in wartime, when there is barely enough to go round in any case, is certainly not wide enough to permit any appreciable part of increased wages to be converted into goods.

In other words, the proposal is to pay for an increased war effort by the distribution of IOUs. To the cynically minded, it may seem a strange realism which offers baits that will be undesirable and dangerous if they are translated into real terms—whether it is now, during the war, or after—and meaningless if they are not. It is the desire to preserve and increase the relative share of the workers in the national pool of wealth that dictates the attitude of the Trade Unions; and it is the same incentive of self-preservation that is at work in the board-rooms. It is the post-war future they have in mind. The trouble is that a pledge markedly to increase everybody's intake from the national pool, however attractive it may be politically, cannot possibly be redeemed until peacetime industry has been remobilised and in full blast for a considerable period. It can only be the cause, meanwhile, of potential inflation. The multiplication of incomes does not lead to the multiplication of goods; and to say "yes" to all the claims for a bigger stake is not really a solution of the problem of distributing limited supplies.

On the other hand, it should not be ignored that the inflationists have a very great deal of sound common-sense on their side. Too often, during the war and before, finance has been allowed to impede economic progress. It is unquestionable that no means should be ruled out which might increase the energy and efficiency of war production and raise the output of tanks, aeroplanes, munitions, food and ships; and it is natural that, even in wartime, private industry should be concerned with its self-protection and the contingencies of the future. It is the fact of this inevitable concern for sectional safety that has inspired suggestions for the pooling of entire industries, with holding companies to preserve the suspended rights of ownership and control, so that technique could go forward to the fullest utilisation of resources without reference to the sovereignty of separate firms. In general, the pity is that the urgency of war has not in itself been a greater spur to many of the men and women who are now waiting to work, or to work harder, for a consideration. It is certain that, if the will to win does not exist, the war will not be won. But any general indictment would be unfair. It is the duty of a war government to provide against the avoidable hardships which come from the exigencies or the hazards of war; to compensate the unfortunate entrepreneurs, traders, business men and work people for the losses which are not of their own, but the war's, making; and to bear the risks which in peacetime are borne by those who stand or fall by their balance sheets, but in wartime are incurred on

account of the war or of the Government's war policy. Where it is a well-founded fear for a man's livelihood or his firm's that causes him to hold back from war work or to obstruct war policies, it is the plainest wisdom to remove the occasion or the cause of that fear. It is much more logical to say that only war industries shall make a profit out of the war than it was to argue, earlier, that war industries, above all, must not make a war profit; and it is much more reasonable, and expedient, to say that essential workers shall have extra pay than to set a ceiling to their wages by Order and allow non-essential workers to charge what the traffic will bear. The principle that no man should lose by aiding the war effort or gain by declining to do so is unassailable. While there is a free market for service, its prices or rewards must be rigged to leave, in fact, no choice but to elect war work; and all expenditure which results in increased war output is money well spent—whatever its secondary effects.

The End and the Means

But what is wanted is shrewd reform, not revolution or counter-revolution. To unbridle either profits or wages, at this stage, might release a rush of sectional recrimination that would wreck the war effort—and to no purpose. If rewards and prizes are to be handed out, they must be given for services rendered, not to win a goodwill which, if it is not there already, cannot be bought by bribes. Greater efficiency in management cannot be achieved simply by the disbursement at large of profits which cannot, or ought not to, be spent to people who have little or nothing to do with management. It can only be secured by giving rewards to efficient managers; and the last chapter in efficient wartime production can probably not be written without a measure of further rationalisation which the present independence of separate firms makes impracticable. If it is funds for experimental initiative or extensions of plant that are wanted, there is no guarantee that a firm with its profits doubled will have any more incentive to experiment or extend, with its own future chiefly in mind, than it had before. At any rate, it would seem wise, not only to continue to rely on the existing controls over materials to prevent profits from being used in irrelevant or dangerous ways, but also to release extra profits only for specific and obviously useful expenditures. Nor is it in any way evident that a general levelling-up of wages would establish stimuli where they are most wanted. These arguments too often ignore that there has been no stop on wages hitherto. There has been a continuous rise. The real requirement, for the sake of incentives, is perhaps the introduction of special prizes for high output and, as the *Financial News* recognises, an increase in the wage rates offered by certain forms of desirable activity, such as training, women's war work and some grades of heavy labour—with, correspondingly, a check to pay increases in every kind of non-essential work, from clerking and distribution to professional employment and the holding of directorships.

More output is the aim. If the lowering of EPT in particular cases, when production targets have been reached or passed, can directly achieve this, by nourishing experiment, expansion and initiative, it might be admitted as legitimate and even necessary—just as it is obviously desirable to increase the practical inducements for managers in key work to give the greatest efficiency and for workpeople to enter war employment. But the unshakable fact remains—and the practical psychologists surely cannot deny this—that deliberately to increase profits, simply because standard profits can at present be earned easily and without the extra effort that war needs require, would be to risk a storm of recrimination, which honest men could hardly repudiate. The pressing need for adjustments in wage discrepancies has been repeated in *The Economist* during many months; and the need to raise the working and living conditions of war workers, by the closest, speediest and most comprehensive attention to welfare, canteens, travelling facilities and accommodation, is no less great. It is both expedient

and just, first, that every member of a nation in arms should be brought, by all-in stops on spending and all-round rationing, to a common level of siege consumption; and secondly, that what differences can be permitted in the use of goods and services should be determined by services rendered to the war effort, and not by income grades or social status.

The Role of Finance

These points, which all bear upon the real as distinct from the monetary rewards of effort, are unassailable virtues in the new campaign. Its plain shortcoming, despite the claim to remove financial considerations from the equation, is that the box-office lure of the programme is precisely the magic of finance—the meretricious attraction of swollen pay packets and inflated profit accounts. It is suggested that, for the duration of a war which is more likely to last for years than months, the seeds of a vast and unbridled inflation should be methodically sown, that the costs of both war and post-war industry should be deliberately blown out and that, at the same time and with equal tirelessness, anti-inflation controls should be multiplied apace to neutralise the dangers thus created. It is a weird exercise in well-intentioned ingenuity that would simultaneously pump in social poisons and their antidotes at an ever-increasing rate; and it is perhaps an odd chapter in English history that reveals the pundits, with the enemy at the gates of Leningrad, if not of London, finding this essentially "plutocratic" way to victory, whereby the nation will hold itself to ransom to save itself.

It is true that inflation helped to win the last war. It is true that it probably cannot be avoided during or after this war. And it is true that inflation is far preferable to frustration of the war effort. Finance is a servant and not a master. The point is whether this open-handed courting of grave inflationary dangers, by the broadcast distribution of favours to spur on laggards, will in fact deliver the goods. It is argued that employers and workers are withholding their best be-

cause they are not being paid enough. But this is only a half-truth. The reason why they want more money is not because of the original sin of "economic man." If they are employers or managers, it is because they have, by the nature of their livelihood, to put the present or the future interests of their own firm first; and, if they are workers, it is equally the present and the future of their livelihoods that guide their decisions.

The first step toward implanting an unreserved incentive in managers and workers in their work for the war effort is to make them, in effect, the agents of the community at war, and to remove the peacetime influences which—in the shape of financial autarky and the fear of over-expansion or loss of goodwill—must impede their war work. It is more state control, not less, that is probably wanted, if the war effort is not to be resolved into a confusion of competing claims; effective central planning and allocation in the technical field, if the regional decentralisation, which the *Financial News* rightly says is necessary, is to work; and a single centralised wages policy, if the programme of wage adjustment is to mean anything.

The proper use of finance is to secure by compensation the irrelevant peacetime interests of separate firms, which cannot be recognised in the day-to-day decisions on war production and should be frozen for the duration; and to guarantee the welfare and the well-being, now and after the war, of the workers who have been wrested from their normal livelihood. It is not to titillate peacetime incentives, which cannot solve and considerably complicate wartime problems, but to remove them from the path, that should be the aim. Then the straightforward task of giving managers and workers the incentive, not of higher average pay, but of efficiency premia for higher output, could be put in hand. No personal or technical means need then be lacking for the full organisation of war production; and the rewards that are due for services rendered could go to citizens serving their country—and not to men and women bewildered by a conflict of public, private and personal loyalties.

Far Eastern Ally

THERE is news of fresh fighting in China. After a lull of many months, the Japanese are attacking in Hunan and their objective appears to be the town of Changsha. Nevertheless, the scale of the new campaign, in which some five or six Japanese divisions are engaged, should not mask the fact that the "China incident" from the Japanese point of view is tending towards a stalemate. The Japanese are in control of the principal towns and main lines of communication in the five northern provinces and in the coastal regions as far south as the Yangtse river. Inland, their control reaches up the Yangtse as far as Ichang, and they command the right bank of the Yellow River as far as Kiangchow. In the south, they have a firm hold on Canton and Amoy, but they have recently abandoned Swatow, while their irruption into Kwangsi, where Nanning was for a short space occupied, came to an end late last year. For the rest—some fourteen provinces—China is solidly controlled by the National Government of General Chiang Kai-shek. It seems as though the Japanese have now occupied as much of China as their resources permit. Their inability to advance further into south and west China springs from the tough resistance of the Chinese on the marches; from the activities of the guerillas, who operate almost unchecked in the hinterland of Japanese occupied territory, with the result that only the lines of communication and the cities are securely held; and from the diversion of resources for which Japan's ambitions in the South Seas are largely responsible. The million men in China do not exhaust Japan's military material; but the evacuation of Nanning in December

1940, and the transference of the troops to Hainan and Indo-China, illustrated the extent to which the extension of Japanese control southwards was tapping Japan's reserves of man-power. In the brief months between the Russo-Japanese Non-Aggression Pact and the German invasion of Russia, the Chinese feared a reduction of the garrisons in Manchukuo and the despatch of these seasoned fighters to the Ichang front for a drive on Chungking. These anxieties were allayed by the German attack. Since June, the Japanese have been, if anything, transferring more troops to the Manchurian frontier.

Japan's action in China, with this military stalemate, is concentrated on wearing down the resistance of Chungking by economic and political attrition. The closing of the Burma road by Britain in the summer of 1940 raised high hopes at Tokyo, and Free China passed through the most critical months of its resistance. Since the reopening of the road, it has been under heavy fire from Japanese bombers, now stationed in Indo-China. Another Japanese expedient is to intensify the blockade of the Chinese coast by constant raiding, although to close the whole coast from Haiphong to Shanghai would be like stopping every hole in a hosepipe whose rubber has rotted. Goods slip in to every creek and inlet, and move by circuitous routes, often through nominally occupied territory, to the west. To counteract this, the Japanese made a number of sudden descents on the coast during the spring of this year, at Mirs and Bias Bay above Hongkong—to close the route through Shingchow and Waichow—and, a month later, the coast of Kwangtung from Pakhoi to Towshan was occupied.

The Japanese were able to seize thousands of dollars' worth of goods destined for Chungking—Pakhoi proved a particularly costly loss. Once again, however, the Japanese have apparently insufficient resources to maintain a total blockade, and Kwangtung has been virtually re-evacuated.

The Japanese have had some hopes of using political attrition to break the resistance of Chungking. The Nanking Government of Wang Ching-wei was formally recognised in November last. Axis recognition followed some six months later. The Japanese still feel that if some kind of order can be established in Central China, and some degree of respectability conferred upon Wang, then Chungking's resistance will peter out. There is no peace party proper at Chungking; but there are a certain number of men who are in exile from their homes on the coast, and whose reactions tend to fluctuate with the fluctuations of Free China's fortunes. But Wang remains as isolated as ever.

Chungking has rejected all peace feelers with contempt, in the knowledge that the position is more favourable

except by the Communists, who only form about 2 per cent of General Chiang's followers, and whose importance has probably been exaggerated by outside observers. Their stronghold is still Shansi, and they have a permanent itch to transform the outer fringe of China into another Outer Mongolia, under indirect Soviet control. Their relations with the Generalissimo tend to resemble an armed truce; but, as a disruptive element, they would be dangerous only if General Chiang's position were seriously weakened by defeat or internal collapse. Otherwise there is more unity and co-operation between the provinces, and more authority vested in the Central Government, than at any previous time in Chinese history. And the authority spreads far beyond the absolute limits of occupation. Officials come and go across the shadowy frontier; guerillas re-equip behind the lines; there is a constant exchange of goods and widespread smuggling between occupied and Free China.

Economic reconstruction has gone on rapidly since the transference of the Government to Chungking. Some industry travelled with the Government, bringing its equipment by barge and river-boat or dragging it by hand over the mountains. The classic example is the Chung Fu Joint Mining Administration, which transferred 120 thousand tons of equipment to the south-west. The Government has encouraged new industries through private enterprise, and has entered the field itself, controlling ferries, food stores, certain heavy industries, munitions, motor-fuel and transport. Free China's most original contribution—the China Industrial Co-operatives, a movement launched in 1938 by the energy and inspiration of a New Zealander, Mr Rewi Alley—covers over 1,500 co-operatives to-day, and every kind of manufacture. These co-operatives are organised in three zones: a guerilla zone where little but the immediate military needs of the guerillas are catered for and nearly all the equipment is portable; a light industrial zone on the fringe of the Japanese advance; and an inner zone where certain heavier industries have been launched.

Observers report in Szechwan something resembling boom conditions. The end of the old war-lord—*tuchun*—predatory rule has in itself increased prosperity. The transfer of industry has done more. Nevertheless, it is the economic front that causes the Chinese Government the greatest anxiety. Industry may be booming; but the strain on the resources of the south west is immense. Prices are spiralling up; the food shortage is acute; and, although food-hoarders and speculators have been executed in Szechwan, food control in some districts is reported to be impossible. A further anxiety exists lest the Japanese should extend their blockade to the whole of the "South Seas." The eight million Chinese scattered through Indo-China, Malaya, Burma, the Dutch East Indies, and the Philippines, have supplied something like \$800 million towards Free China's equipment, and bear the brunt of relief and Red Cross work.

In the last resort, however, Free China's fate depends, not on the encroachments of Japan, nor even on its own exertions, but upon the outcome of the world struggle of which the Sino-Japanese war is only a part. China has had to suffer more than any other state from the appeasement of others. Chungking has been bombed by planes using American petrol; the cities of China have fallen to soldiers wearing British wool and carrying weapons forged by British machines. Year by year, China has watched the struggle draw nearer to the appeasers and watched the frantic efforts of Britain, the United States and Russia to avoid it by further appeasement. To-day, the fronts are all but declared, with China, the United States, Britain and Russia ranged against the Axis Powers—almost but not quite. There is still a loop-hole for appeasement in that Japan still hesitates on the brink of Thailand, and the United States still holds back on the brink of war. Although China has fought the universal war against aggression longer than any other Power, she is condemned to remain a somewhat neglected ally unless or until Japan decides on war with Britain and the United States. And there is obviously a desire on both the Japanese and the Anglo-Saxon side to avoid this last breach.

to-day than it has been at any time since the war began. The change is, of course, mainly due to changes in the international field. But, even at home, under extreme difficulties, progress and consolidation are apparent. About a million men have now received training as regular soldiers, and as many more are under training. It is impossible to estimate the number of irregulars in the field. It must be in the neighbourhood of two millions. These men can now be fully supplied with ammunition and small arms of Chinese manufacture; and a rising proportion of their machine-guns and light artillery is made in China. For heavy artillery, tanks, and aeroplanes, Free China is entirely dependent upon outside supplies and looks particularly to the United States.

That Free China, thrust out of the rich coastal and river plans into the mountainous west, is able more or less to support about half the population of China, to absorb well over 60 million refugees from occupied China and, over and above, to equip an army is due to certain very definite improvements in the organisation of government, industry and agriculture. The authority of the Supreme National Defence Council is unchallenged,

NOTES OF THE WEEK

Allies in Conference

The first inter-allied Conference was held at St. James's Palace on June 12th. Since then, two major events have transformed the background of Allied co-operation. The Russians have joined the list of Hitler's foes and victims; and the Prime Minister and President Roosevelt have enunciated the Atlantic Charter. At their second meeting, on Wednesday this week, the Allies universally endorsed the Charter, and agreed to the establishment of machinery to meet Europe's problems in the period immediately after the armistice. As a first step, a bureau, under the chairmanship of Sir Frederick Leith-Ross, is to be set up, which will act as a clearing house for Allied information on post-war needs and possibilities. To the principles of the Charter and these short-term plans for European reconstruction, M. Maisky committed the Soviet Government, with only one reservation—that the bureau should assume an international character as soon as possible. Other features of the Conference were a several and joint claim by Poland and Czechoslovakia that the problem of retribution should be fairly considered, and a significant reminder by Dr Van Kleeffens that Clause 4 of the Atlantic Charter might be rendered nugatory if the phrase "with due respect to their existing obligations" were narrowly interpreted.

The Advance Continues

Things have gone badly for the Russians in the south. The pincer movement, southwards from Gomel and Chernigov, and northwards from Kremenchug, secured its objective, the encirclement of Kiev. The Russians abandoned the city, and although no reliable estimates exist of the numbers of Budyonny's armies to have been trapped and captured—the German estimate of 50 divisions is fantastic—the Russian armies in the south have undoubtedly been severely shaken, and the degree of disorganisation inflicted on them probably accounts for the speed with which Von Rundstedt's divisions have taken advantage of their control of the Lower Dnieper to advance to the sea of Azov, cutting off the Crimea, and threatening the Donetz industrial area from the rear. It is here that the next offensive in the campaign will almost certainly be launched. If the Russians retreat to the Don-Volga line, then Kharkov and the Donetz basin, and with them 60 per cent of Russia's industrial capacity, will be lost. The shape of a new encircling movement is already discernible in the southern thrust towards Mariupol and Taganrog, and the northern thrust through Poltava. The Germans have manoeuvred Budyonny into the dilemma of either defending the Donetz area and risking encirclement or withdrawing his shaken armies intact, and abandoning the whole vital area. In the north, Timoshenko's and Voroshilov's armies are faring better. It appears that practically the whole of the Smolensk salient has been hammered flat, and the fate of the town itself is in question. On whether Timoshenko can develop this local effort into a full-scale counter-offensive against Von Rundstedt's Chernigov-Kharkov flank, the fate of Budyonny's armies very probably depends. Round Leningrad, the Germans have made little progress, and one factor is held in common by all three fronts—the fantastic losses sustained by both belligerents.

The Neutrality Act at Last

The sinking of the *Pink Star*, following so soon on the President's "shoot first" order, has helped to underline the division of opinion between isolationists and interventionists—which is doubtless what the Nazis intended it to do. There is no evidence of a massive German attack upon American shipping. On the contrary, the Nazis appear to be going out of their way to choose doubtful borderline cases—the *Pink Star* was under Panamanian registry and had no American citizens on board—so that the issues in the consequent dispute in America and in Congress can be confused. It is, in a word, a policy of pinpricks designed to embarrass the Administration and exasperate public

opinion. The isolationists appear to have fallen into the Nazi's trap and are putting the German case with even more cogency than the Germans themselves. The interventionists on their side are calling for more definite measures. The President admits that the arming of merchant vessels is under consideration and is obviously feeling his way towards new action. The Secretary of the Navy, Colonel Knox, used the occasion of the launching of the 35,000 ton battleship *Massachusetts* to come out openly in favour of the repeal of the Neutrality Act. This method of putting up a subordinate to make a crucial speech is the President's favourite way of testing the support of public opinion for any measure he has in mind. It is too early yet to assess the reaction to Colonel Knox's plea, but it is an illuminating pointer to the direction in which the President's mind is working.

Rogues and Vagabonds

To the normal, law-abiding citizen, the black market is in all probability no more than a name. Yet, the news that in the near future the Director of Public Prosecutions is to take action against a considerable number of persons charged with dealing on the black bourse shows clearly that this underworld organisation has assumed considerable proportions. The charges are the result of extensive investigations undertaken jointly by the Enforcement Department of the Ministry of Food and Scotland Yard. What they reveal has only yet been hinted at, though it is denied that the country's invasion reserve has been tampered with, or that food has been stolen from the Ministry while in transit. The news demonstrates very clearly that orderly food distribution under war conditions cannot be ensured

merely by appeals to the public to resist temptation. In the black market, the only remaining *pseudo* free market in the country, potential demand is the factor which makes the game worth the candle, despite the superior bargaining position held by the seller when actual transactions are in progress. Nor is there much probability that the offence, which combines the unpleasant characteristics of profiteering and sabotage, can be stamped out by the imposition of fines, however high. To raise the fine is merely to raise the stakes, and the ultimate incidence is certain to fall upon the misguided clients of the black market, who, though they deserve no sympathy, should not be allowed to buy off the black dealer himself. The only remedy is police investigation, coupled with imprisonment. This conclusion carries no implication that Britain need imitate the police methods of the Fascist States. There is a precedent in the prosecution of all illicit traffic, whether in drugs, drink or white slaves, to which the League of Nations itself has pointed the way. But exhortation is not enough, nor is the attempt to see that the transactions do not pay in money terms, for the dealers in question are a slick lot capable of turning most bargains to their advantage.

All-out Production

The public has lately become, not only increasingly conscious of the need for all-out production, but also of some of the obstacles in the way of its achievement. This is all to the good. The investigations of the *Financial News* into difficulties and remedies are discussed in a leading article on page 375. The Labour Research Department has convened a conference on production at which several hundred trade union delegates were present; in the view of many of the delegates, bad management was impeding production. The Engineering Industries Association has published a pamphlet setting out how production should be organised; its chairman, Mr E. C. Gordon England, alleged that war production in engineering industries, "measured by square foot of factory space or pound weight of product per man hour," had actually declined—which is not surprising when it is considered that in wartime every available resource has, willy nilly, to be pressed into service by dilution and improvisation. Beyond a point, average productivity over the extended range of industry must go down as total output is expanded. The Association suggests that the function of the Supply Ministries should be to buy, and that the responsibility for organising production should be the manufacturers, who should be given the full authority needed to carry out the task. Since the net addition to the country's labour force that can still be expected is comparatively small, the emphasis of responsible criticism is rightly placed on expanding output by increased efficiency. While it would be quite wrong to suggest that there has been no improvement in efficiency in the past year, the scope for a further expansion in the output per man hour is probably considerable. In war, as in peace, it is always possible to improve upon the existing organisation and technique of production. And, in this sense, output at a given moment must always be below the possible, even provided that raw materials are available. The rate of progress can be speeded up, not by a wave of the hand or the creation of some new machinery, but by the whole hearted and continuous application of brain and brawn to the single purpose of winning the war.

Freedom of the Press

The concern of the Institute of Journalists, at their meeting in London last week, for press liberties found curiously confused expression. The usual vendetta of press interests against broadcasting was taken up, and the proposal made that the listening millions should be deprived forthwith of the early morning news bulletin—simply to freshen the morning newspapers. It is a loss that the BBC has no rival on the air, and if some means of two or more competing utility corporations could be contrived, it would be a gain—in peacetime. But, war or peace, there is no rhyme or reason in this demand for journalists to silence the news readers; and, in war conditions, it is doubtful whether a single extra copy of the morning papers could profitably be sold, if the ban succeeded. This is restrictionism of an all too familiar kind. In matters that are more properly the concern of the press, also, the Institute took a somewhat rigidly professional view. It is excellent that journalists

should ask for a Minister of Information with "authority of decision" and for release from the "paralysing control" of the Service departments. But it is mere axe-grinding to suggest that the Ministry should be staffed by "expert journalists." Journalists there should, of course, be in the Ministry—and are—to interpret the problems of news distribution and to assist in the process of its presentation. But a wholesale transfer of journalists to the Ministry would not noticeably improve its aptitude. For one thing, it would not be the best who would go—they would stay at their jobs—but the second rate; and the suitability and average ability of journalists is, to say the least, not obviously above that of the assorted callings from which the long succession of MOI administrators have come. It is, of course, right that organised journalists should resist every attempt to curtail their freedom; and the Institute's attacks on the secret sessions of local authorities and on alleged attempts, by by-paths, to curb press opinion were unexceptionable. But any appearance of a "closed shop" attitude must lessen the weight of loftier professions. In general, there has been little or no direct oppression of views since the war started. The banned *Daily Worker* is back again as the *British Worker*—apparently in contravention of Regulation 2D, which lays down that the ban shall have effect with respect to any newspaper under any other name if it is in any way a continuation of, or a substitute for, the banned newspaper. Mr Morrison is "watching developments"; but common sense will probably allow the reincarnation time to prove itself. It is the choking of news that journalists have the most occasion—and duty—to resist; and they should not lead themselves into wasteful digressions. It is their liberty—and not their liberties in any feudal sense—that they have to watch.

Terrorism in France

The wave of arrests and executions which followed the *attentat* on Laval shows no sign of abating. On the contrary, the savagery of the German reprisals has reached a new pitch, and, particularly in the Paris area, the firing squad is in action daily. The unrest is not confined to Paris. In unoccupied France, too, the special courts and special police measures instituted recently by Marshal Pétain are now in operation, and from the Pas de Calais to Marseilles, France is convulsed by the sabotaging activities of the patriots and the crushing counter-action of the German and, to an only slightly lesser extent, of the Vichy authorities. The saboteurs are invariably executed as "Communists." However, just as Laval's assailant proved on examination to be a de Gaulle, it is highly probable that a great part of the sabotage is committed by men whose political objectives are concentrated on the liberation of France. If the Communists, as a more highly organised and integrated body, are able to exploit this ferment of outraged patriotism, the authorities at Vichy have only themselves to blame. By collaborating with the invader, they have finally and utterly discredited any ideas or principles for which they profess to stand; and, since these ideas are supposedly Christian, authoritarian and traditional, the natural reaction against Germany is now tending to take—inevitably—an anti-Christian, anti-traditional and revolutionary line. Any statesman of reasonable intelligence could have foreseen this development; but fear, cupidity and blind prejudice, not reason and goodwill, have been the mainsprings of action at Vichy. Now, between the radical revolt and the reactionary repression, the voice of a France wedded to neither extreme is lost. Some may even question whether it has not been permanently silenced.

The Free French National Committee

It is against the background of universal but uncanalised revolt in France that General de Gaulle's decision to call into being a *de facto* government in the form of a Free French National Committee, seconded by a National Advisory Council, must be seen. This step is in part a logical development of the structure of the Free French movement. When General de Gaulle raised the standard of continued resistance, his task was primarily and avowedly military—to rally as many Frenchmen as possible to the flag of Free France. His status as Commander-in-Chief of the Free French Forces and the assistance of his General Staff roughly met the needs of organisation in the first days of the Movement. With the decision of French

Equatorial Africa to join General de Gaulle, new problems—but still primarily of defence—were created, and to meet them the General established his Defence Council of the French Empire, a body which will continue to fulfil its—military—functions within the new structure of government. A new phase was clearly reached when, after the collapse of Vichy's resistance in Syria, the future status and present administration of Syria and Lebanon had to be negotiated by General Catroux in the name of Free France. It was obvious that an increasing number of the tasks and problems facing the Free French Movement would be political, and would thus require a different set of organisations and a different type of official to deal with them. This is the necessity from inside the Movement itself that has created the need for the new Committee. The external necessity is, of course, the state of revolt in France and the need to make it vocal, otherwise than through the false and distorted pronouncements of Vichy and Berlin. Here the relations between the new Committee, the Movement and the unorganised forces of resistance inside France are still in a very fluid state. The General has referred to the functions of the new Committee in terms of "trusteeship." For the time being, it probably cannot be more closely defined. Nevertheless, the existence of the Committee does create a new situation which the British Government is no doubt considering with care. The problem of recognition is complicated by the attitude of both the United States and Canada, who have formal diplomatic contacts with Vichy. Nevertheless, the present position is anomalous, and everything should be done to remove any anomalies which tell in the favour of the Vichy regime—a regime which is not scrupling to make war on its own people.

National Health

The Government has congratulated the country on the state of its health. Last week Sir Wilson Jameson, Chief Medical Officer of the Ministry of Health, stated that most infectious diseases, including cerebro-spinal fever, were on the decline, and that, although whooping cough was still prevalent, the number of cases had dropped from 4,000 to 3,000 a week. In fact, at the end of the second year of the war "we have every reason to be thankful for the health of the country." Fortunately, Sir Wilson added that every conceivable care should still be exercised, because national health reports since the war began have been so universally good that there is a danger lest local authorities—and the general public—should become complacent, and relax their precautions. In spite of the present good state of the country's health, there is both a short-term and a long-term danger. There is the possibility of a widespread epidemic which would do more harm to the war effort than air-raids, and there is the probability that the pre-war gradual improvement in the health of the people, especially of the poorer classes, will be checked, even if the trend is not reversed. The country is still living to some extent, in matters of health, on its pre-war reserves, which will dwindle; Sir Wilson stated that there had been a rise in deaths from pulmonary tuberculosis, and other official statistics show an upward trend in new cases of tuberculosis since the beginning of 1940. The fact that there has been no big epidemic so far, in spite of the shelter conditions of last winter, does not mean that there will be no epidemics in the future; and there are strong reasons for doing now everything that can be done to increase the resistance of war workers—real war workers—to disease. This implies improved welfare conditions, and especially the best diet that war conditions can allow, taking into consideration both the views of food experts and the workers' own preferences. Similarly, the long-term danger can best be warded off by paying special attention to the diets of children. They already receive priority with regard to milk and blackcurrant juice, and will be given it for oranges; the principle might be extended to eggs and fish. And since, unfortunately, there is no guarantee in many cases that the children do, in fact, get the special foods to which they are entitled, school canteens should be encouraged—if possible, made obligatory—and the possibility of special canteens for child factory workers considered. Discriminatory food distribution is administratively difficult. But, for these two classes—war workers and children—discrimination may be a step, in the one case towards winning the war, and in the other towards winning the peace.

Mr Fadden on the Brink

Sir Earle Page has left for London, taking with him one of the Government's meagre votes and leaving it entirely dependent for a majority on the support of the two Independent members. How precarious is his position has been revealed this week. The use of what may be called a "Swinton Fund" for security purposes had been revealed, and the Labour Opposition challenged the right of the Government to extend it to anti-Communist propaganda as has been done since February, 1940. Fortunately, both Independent members voted for the Government, which therefore secured a majority of one. But the real test will come with the Budget statement, which is imminent, and there is every sign that Labour intends to fight proposals for heavier taxation on lower incomes tooth and nail. Superficially, Mr Fadden's Budget problem is made easier by the fact that war expenditure in 1940-41 was below the estimates, so that the gap is less than was expected and the need for increased taxation is less apparent. Actually, however, war expenditure was below the estimates because the output of munitions aimed at was not achieved; and output was below the estimates because, partly at least, civil production has been allowed to expand alongside war production; and civil production has expanded because taxation, in spite of the big increases of the last Budget, is still not heavy enough to damp down the demand for consumption goods. This is another aspect of the vicious spiral. At a recent meeting between the War Council and representatives of the Commonwealth Bank, however, the Labour members of the Council argued that bank credit should be used as an alternative to high taxation, borrowing from the public or the curtailment of civil consumption. They refused to accept the Bank's contention that the use of bank credit must be supplemented by checks on spending by the public, and if the new Budget proposes—as it must do if war production is to be expanded—heavy tax increases, it can be sure of a stormy reception.

Quiet in Iran

Iran has broken off diplomatic relations with the Axis Powers and, for the time being, the process of initiating the new regime is going smoothly. Almost all the Axis agents have now gone to internment, although one or two appear to have escaped to Turkey, and the Mufti is still in hiding. But it has not been necessary for the Allied troops to enter Teheran, and the abdication was not accompanied by any disorder. For the time being, the ex-Shah is living at Isfahan and is expected to go to India. His journey should be expedited by every possible means. The new Shah, Mohammed Riza, has undertaken to respect the constitution; and the new government, which is to be formed by the old Prime Minister, is expected to make radical reforms in the administration of Iran. A basis for a great expansion of public works and services exists in the £10 millions held abroad by the ex-Shah and the extensive industrial and mining interests directly controlled by him—all of which he is reported to have made over to the state. However, the only form of public works the Allies should encourage at the moment is a lightning expansion of the transport system on a really ambitious scale. If the task is difficult, that is only an additional reason for attacking it at once. One of the lessons of experience in Greece and Crete was the alarming difference between the British and German use of the time factor. The Caucasian front may be the key to Allied resistance. The plans for feeding it must be laid now.

Transport by Canal

Fortunately, Britain's transport system is both capacious and flexible. But, under the strain of war conditions, it is imperative that the various means of transport should be operated as a unit, while each of the separate facilities are used efficiently. In particular, it has long been recognised that better use should be made of canals. Mr Frank Pick has recently carried out an investigation into the canal system and, as a result, the Ministry of War Transport has decided upon drastic action. A Central Canal Committee, which will meet under the chairmanship of Colonel J. J. Llewellyn, Parliamentary Secretary to the Ministry of War Transport, to advise him on questions of policy affecting inland waterways, and to co-ordinate the work of the six regional canal committees, has been appointed. The regional committees, including, apart from canal members, representatives of other forms of transport and of Government departments, have been strengthened. Their main functions are to organise the effective operation of the canals and the efficient working of craft; to survey traffic possibilities and to make sure that traffic conveniently water-borne is allocated to the canals in so far as this is practicable; to minimise empty running, and to ensure that carriers keep their craft manned and in good repair, arranging, if necessary for the pooling of barges and investigating unreasonable delays; to ensure adequate maintenance and dredging of waterways, and to arrange for the loan of equipment and staff for this purpose. While the additional traffic that the canals can carry must not be exaggerated—and shortsight in the past has left them lacking in equipment and man-power—efficiently operated, they can contribute considerably to the alleviation of the transport problem in certain districts, especially in the carriage of heavy and bulky materials, such as coal.

Reservation and Religion

Mr Bevin's refusal to regard the Oxford Group as a religious body for the purposes of the Schedule of Reserved Occupations has aroused a considerable amount of protest, and the matter is to be raised again in Parliament. Only men in holy orders and regular ministers of any religious denomination are exempt by law from liability for military service; but, according to an answer given by Mr Bevin in the House, lay evangelists, who have been engaged whole-time since before September, 1939, by a recognised religious body, in religious work analogous to that of a regular minister of a religious denomination, are reserved by the Schedule of Reserved Occupations. He does not, however, regard the Oxford Group as coming within that category in spite of the opinion to the contrary expressed, it is stated, by leaders of the Church of England, the Church of Scotland and the Free Churches. This is claimed to be an unfair discrimination; but the point at issue is surely not whether the Group is, or is not, a religious body, but whether the work that its members are doing is of greater importance to the war effort than serving with the armed forces or in industry. The work that the eleven "key men" in question are doing may certainly be of importance to the Oxford Group; it may, more questionably, be important to the future of religion in the country. But it can hardly be regarded as essential work, even on the present very wide interpretation of that phrase. There is nothing in the Group's religious work that could not be covered by the recognised religions; nor is there anything in its somewhat peculiar methods of evangelising that its followers could not pursue within the armed forces as well as without. If the Group's supporters plead unfair discrimination, the solution is to rescutinise the work done by the lay evangelicals who are reserved, with a view to releasing them for military service. Grounds for exemption and deferment must be narrowed, not extended, and the final arbiter on what is essential work must be the Minister of Labour and National Service, not the Archbishops.

Error and Apology

On page 344 of *The Economist* last week, the aid allotted to countries resisting aggression by the United States under Lease and Lend was grossly underestimated—underestimated fourfold in fact. The value of actual programmes under the original Lease and Lend appropriation last March was given as nearly £400 millions, instead of

nearly £1,600 millions, and the total original appropriation as £440 millions instead of £1,750 millions. The way in which this unpardonable error occurred is obvious. It is an example of the misrule of four. Four is the factor used to convert pounds into dollars by multiplication or dollars into pounds by division; and for some inexplicable reason these Lease and Lend totals, already translated into pounds, were treated as dollars to be reduced into sterling. These two figures were not an integral part of any argument in the article in which they appeared; but their wide inaccuracy none the less calls for this explanation and an apology. The facts of Lease and Lend are simple and impressive. The original appropriation in March totalled \$7,000 millions or £1,750 millions; and the new appropriation asked for last week was \$6,000 millions or £1,500 millions—making a total allocation (which must, of course, be distinguished from orders and, still more, from deliveries) of \$13,000 millions or £3,250 millions.

Shorter Notes

The arrival of King George of Greece and his Government in this country has coincided with reports of the new Greek armies in the Middle East, which are equipped to carry on the struggle side by side with their Allies. Both the King and his soldiers are trebly welcome—for their gallant resistance, for their resolution to fight on, and for their confidence in a final Allied victory. For the time being, they bring this country more than it gives, in either help or thanks. The help can be made good, the gratitude, never.

Thanks to the efforts of Mr Brendan Bracken and the co-operation of Cable and Wireless, a considerable improvement in spreading the news within the British Empire should take place from October 1st. On that date the company will reduce its rate for Press telegrams, exchanged between Empire countries, with the temporary exception of Eire and Burma, from 2½d to 1d a word.

The Fire Prevention Executive, which was established last January under the chairmanship of Mr W. S. Morrison to direct and stimulate action by the various authorities concerned in fire prevention measures, is being dissolved. Now that fire prevention has been codified, the Executive has largely become superfluous, but what functions it still has will be discharged by the new regional and national advisory councils.

The Capetown Institute of Medical Research claims to have isolated a causative organism of influenza and hopes that the vaccine which it is preparing will be wholly successful. Too many similar claims have been made in the past for any premature rejoicing, but the Institute certainly seems fairly confident, and if it is right, an outstanding victory will have been won. The research has been undertaken at the request of the South African Defence Department "in view of the possibility of a repetition of the scourge which swept the world in 1918" and which, it may be added, killed ten million people, three million more than were killed in the war itself.

The following table gives the number of civilian casualties in air raids since September, 1940:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Total Sept.-Dec., 1940...	21,669	30,556	52,225
1941:—			
January	1,502	2,012	3,514
February	789	1,068	1,857
March	4,259	4,794	9,053
April	6,065	6,926	12,991
May	5,394	5,181	10,575
June	399	461	860
July	501*	447	948*
August	169*	136	305*
Totals to date....	40,747	51,581	92,328

* Including missing and believed killed.

Of those killed in August, 56 were men, 72 were women, 28 were children under 16 and 13 were unclassified, compared with 199, 186, 75 and 41 respectively in July.

THE WORLD OVERSEAS

Soviet Peasantry

(By a Correspondent)

September 12th

THE conflict between the collectivist state and the "individualist" peasantry has marked the whole history of the Soviet Republics. It has not only ruled their domestic affairs; it has also frequently determined their position in the sphere of international politics. Dramatic turns, such as the promulgation of the NEP or compulsory collectivisation, were the climacterics of the development. But in a latent or semi-latent form the struggle has never ceased, and the importance of the relations between state and peasantry in the present war can hardly be overstated. The supply of provisions to the fighting forces and industrial centres, the morale of the army, the prospects of guerilla warfare—these are the issues involved.

To speak at present of the economic individualism of the Soviet peasant, of an unqualified individualism, would be a mistake. In fact, the framework of the Kolkhoz system has gained considerably in stability during the decade that has elapsed since its forcible imposition upon Soviet agriculture. The bulk of the peasantry has somehow put up with the new forms of organisation, and it is open to question whether a wholesale return to small ownership of land is technically or economically still practicable, even should political circumstances favour it. The individualist tendency in agriculture has taken on a new shape. It is now directed, not against the very existence of the Kolkhoz (as was the case in the early 'thirties), but at gaining the largest possible scope for private interests and private benefit within the bounds of the Kolkhoz system. In this form, however, the individualist tendency has gathered sufficient strength and momentum to strain at times the whole collectivist structure. The policy of the Government has been to steer a zig-zag course between meeting and curbing the peasants' demands, and, during the last year, war considerations have played a predominant part.

The most striking feature of the movement has been the reappearance of small privately cultivated holdings within the bounds of the collective farms. At first these holdings were regarded as "kitchen gardens" for the domestic use of the peasants. But it soon turned out that the peasants devoted much labour to these private strips of land, and by intensive cultivation they increased their produce so much that they could sell it profitably on the markets. The result was that they tilted their small allotments with ever greater industry and neglected their duties to the Kolkhoz. While the small kitchen gardens producing marketable goods flourished, the large collective fields were left without sufficient care. On the top of this, there developed a general rush to add to the size of the private holdings at the expense of the collective land. The same thing happened with collective cattle, which were shared out, in relatively big quantities, among the Kolkhoz members.

The Government felt itself compelled to stop this menacing tendency, and during 1939 a series of measures was taken "against the seizure of collective property." The maximum size of private allotments was fixed at two hectares; any land in excess of this had to be returned to the Kolkhoz. Similarly, a maximum of cows, horses, etc., allowed for private possession was fixed. Another series of decrees, issued in the second half of 1939 and at the beginning of 1940, aimed at strengthening labour discipline in collective farms. Obligatory minimum periods of individual labour to be done on Kolkhoz fields were set; and severe repressive measures were imposed, such as the ejection of "sluggards and idlers" from the Kolkhoz, which, of course, entailed the forfeiture of their private allotments too. Simultaneously, the burden of taxation—that is, the amount of grain, meat, and so on to be delivered to the state by collective farms—was increased, partly in order to meet the requirements of the then envisaged grain exports to

Germany, but mainly with a view to building up war stocks of foodstuffs.

On the whole, the first year of the Second World War was a period of rather strained relations between the state and the peasantry. Whatever these measures may have achieved in the way of saving the Kolkhoz system from disintegration and of stiffening labour discipline, they were certainly not conducive to the satisfaction of the peasantry. The whole policy ignored the personal interests of the peasants, and relying almost exclusively on administrative measures, it failed to give the Kolkhoz member any economic incentive to increase his productivity of labour; the peasant was, in fact, linked to the Kolkhoz by decrees rather than by his own economic gain.

The period immediately after the collapse of France marked here, as in many other spheres of Soviet policy, a new turn. Confronted with the increased German danger, the Government embarked upon a sort of "appeasement" policy towards the peasantry. During the second half of 1940 and the first of 1941, important reforms in agricultural taxation and wages—the two main channels through which the Government is able to shape conditions in the countryside—were carried into effect.

The Need for Incentives

Agricultural taxes are paid in kind by deliveries of grain; meat, dairy produce, etc., to the state. Prior to the reform, the rates of deliveries were fixed in relation to the total output of a Kolkhoz. The rates were excessively high; actually only about 40 per cent of the output fell to the farmers. Local authorities had the right to alter the rates at will. Frequently a prey to their arbitrariness, the peasant was unable to work on the basis of any sound calculation; every now and then he found that the bigger the crops of his Kolkhoz, the bigger grew, not only absolutely but also relatively, the state's share in it. Hence, the lack of interest in Kolkhoz affairs, the fall in the productivity of labour and the rush to the intensive cultivation of private allotments. The reform puts the whole system of taxation on a new basis; under it, the rate of deliveries to the state is fixed, not in proportion to the total output, but in relation to the acreage of the farm. A maximum tax per hectare has been established, and the powers of local authorities to alter the rates have been cancelled. Once the state's share in the crops (per hectare) is known beforehand and remains stationary, the peasant should find it profitable to apply to each hectare more of his labour than before; the surplus produce is sure to remain his.

Another rather awkward point of the reform is that every farm has to make deliveries of a variety of goods; grain farms have to deliver not only grain, but also dairy produce, and vice versa. This is probably aimed at encouraging mixed farming, which should make smaller areas self-supporting in foodstuffs and thus relieve transport for war purposes. Whether this is easy to attain in view of the policy of specialised farming, which was pursued for many years, is difficult to say; in the meantime, a strange, wasteful barter has ensued between farms of different types which try to procure goods they lack in order to deliver them to the state. Whatever the shortcomings of the reform, it clearly tends to underpin the structure of the Kolkhoz by holding out economic inducements to the peasant and by allowing more scope for his private interests.

The new wage scheme pursues the same end. Previously, wages to Kolkhoz members were calculated per work day, no matter what the intensity or quality of the work performed. The new scheme has fixed a minimum output for every working "brigade"; for this part of the labour wages are still paid per work day, but any surplus output above the minimum is now paid by a proportionate share of the

brigade in the surplus (for instance, they receive the value of a quarter of the surplus grain, one-fifth of the potatoes and one-half of the sugar beet in money). To what extent this reform has been actuated by political motives is shown by the fact that so far it has been enforced in the Ukraine only, which has been regarded as a weak spot; its extension to the other parts of the USSR is still pending.

The Soviet press reports encouraging results of the reforms. It is, however, arguable whether these steps will suffice to ease all the tension that has accumulated in Soviet agriculture since the collectivisation. The outbreak of the Soviet-German war has temporarily relegated all these matters to the background. The harvesting, bringing in, transport and, where necessary, the destruction of the crops—these have been the main Soviet preoccupations so far. Should Soviet Russia succeed, however, in turning the campaign into a long war, then all these problems will re-emerge and press for a solution far deeper and more comprehensive than the measures already taken.

All major wars waged by Russia in the last century have resulted in fundamental changes in its agricultural structure. The Crimean war was followed by the great reform of 1861 which abolished serfdom. A wave of agrarian disturbances accompanied the Russo-Japanese war and the revolution of 1905; the ensuing Stolypin reform put an end to the existence of the age-old Russian land communities. The Bolshevik party was carried to power on the crest of an agrarian revolution. In these wars of the past, Russia suffered from the feudal backwardness of its agricultural conditions. Modern Russia has been labouring under the strain of a precipitate advance towards collectivism. German propaganda believes to have found here the weak spot in the Soviet home front, and does its utmost to exploit it in the political warfare which is being waged in the east with a ruthlessness and violence not inferior to that of the fighting itself. So far there has been no evidence of any serious break-through in the morale of the Soviet peasantry. But it seems to be sufficiently clear that a well-timed and sincere reconciliation between state and peasantry may, in the course of this war, become for Russia a matter of national self-preservation.

Checking Inflation in America

[FROM OUR NEW YORK CORRESPONDENT]

August 28th

On several occasions this correspondence has drawn attention to the following sequence: (1) that more persons were being employed in industry and at higher wages; (2) that this had led to an increased demand for consumption goods requiring both material and labour usable in armament production; (3) that these increased incomes and increased demands were enlarged by an expansion of "instalment buying"; and (4) that this intensified demand (plus other factors) was pushing up the price structure of consumption goods generally.

Three separate steps have been taken to limit this demand: (1) a campaign to sell Defence Bonds in small denominations; (2) proposals to increase tax rates on moderate and even on relatively low incomes; and (3) action by the Federal Reserve Board to restrict instalment selling.

The Defence Bonds went on sale on May 1st, and it is as yet impossible to appraise their influence on consumer purchasing. The Defence Bonds themselves grew out of the Savings Bonds introduced in 1935, which have been a popular form of investment, especially among persons in what might be called the middle-income brackets. The increase in income-tax rates is not yet effective, and the tax bill applicable next year on 1941 incomes has not yet been enacted. However, it is certain that the rates will be increased, and probable that the exemption limit will be lowered. The measures under discussion, however, still bear relatively lightly on the numerous groups whose incomes have been most increased, and very heavily on the middle incomes. That it will reduce consumer demand in 1941 is certain; but it is not clear that the proposed rates would greatly reduce the demand for the type of goods directly or indirectly competitive with the armament demand. For example, a college education for children is a kind of consumer goods;

but it is not directly competitive with armament demand. A family in the middle-income brackets confronted with the alternative of reducing its scale of living or abandoning a projected college course for its offspring may elect the latter. However, the new effect on demand will not be felt until 1942, except to the limited extent to which tax-payers make anticipatory economies.

The Federal Reserve Board has stiffened the terms of instalment credit, or, more precisely, it has assumed a direct control of instalment credit. The maximum maturity on such credit is 18 months—which in the 20's would have seemed long. The amount to be borrowed ranges from 66½ per cent of such items as motor cars and motor boats, to 80 per cent for mechanical refrigerators, washing machines, radios, etc., and to 85 per cent for furnaces and 90 per cent for furniture and pianos. These terms can hardly be described as severe. However, their announcement was coupled with a formal statement by Mr Eccles, President of the Board of Governors of the Reserve System, which seems to have been designed to inspire lenders to regard the proposals as maxima rather than minima or optima. "Our people cannot spend their increased incomes and go into debt for more and more things to-day without precipitating a price inflation. . . . Instead of an ever-expanding volume of consumer credit, we need to bring about a substantial reduction in the total outstanding." He urged that the current higher incomes be used to reduce debts "or get out of debt."

The rates established are not deterrent rates; the counsel of Mr Eccles may have some influence in the form of moral suasion; but the Board still has power to stiffen the regulations "as experience with its administration develops, or as economic conditions require a further dampening of buying power."

The petrol situation has now provoked a lively controversy, which has shed little light on either the prospective supply or the measures of controlling the demand. So far, in the immediate vicinity of New York, there seems to be no limitation. On the other hand, 300 miles from New York, one encounters local limitations of odd sorts—5 gallons to a customer, or even less. There is, however, an expectation that in September this situation will tighten up materially; and it is apparently in anticipation of this tightening (and its presumptive consequence) that the Price Administration has fixed a maximum retail price of petrol in 40 eastern cities.

The President has vetoed the Bill "freezing" the Government stocks of wheat or cotton, and it is expected that the veto will be sustained. However, while the prices of wheat and cotton are relatively high, they are still below parity, with parity rising. These stocks cannot be sold as long as the market price is below "parity."

The general index of production was 157 in both June and July; in July, with seasonal adjustment, it was 162. That is, production was substantially unchanged, the usual seasonal let-down being absent this year.

BUSINESS INDICES			
1935-9=100 for industrial production and freight car loadings			
1923-5=100 for all other series			
Without seasonal adjustment			
	July, 1940	June, 1941	July, 1941*
Industrial production (total)	118	157	157
Manufactures (total)	118	162	161
Durable	127	192	189
Non-durable	111	138	139
Minerals	121	131	132
Construction contracts (total)	93	135	134
Residential	78	111	108
All others	105	155	155
Factory employment (total)	103.2	127.8	
Durable goods	98.4	135.1	
Non-durable goods	107.8	120.9	
Factory payrolls (total)	98.2	152.1	
Durable goods	97.4	173.8	
Non-durable goods	99.1	127.8	
Freight car loadings	110	136	138
Department store sales	64	97	80
Department store stock	61	73	

* Preliminary.

There is almost no change from June; the one marked decline (in department store sales) is purely seasonal, and here the decline was substantially less than the seasonal allowance.

Perhaps the most striking figure in the list is that of factory pay-rolls—in June over 50 per cent above June, 1940. About half of this represented increased employment; the other half, higher rates for overtime.

Caucasian Separatism

[BY A CORRESPONDENT]

September 19th

THERE can be no doubt that the strategic and political repercussions of the joint Anglo-Soviet move into Iran are now being felt in the Caucasian Separatist Bureau in Berlin. This organisation seems to have escaped general attention except for the pertinent reference made in the Soviet Note to Iran of August 25th, in which it was stated that German agents had organised "armed bands in certain frontier districts of Iran, sending them to Baku and other important Soviet centres with the object of sabotage on Soviet territory." The presence of Russian and British forces will prove a severe dislocation to local separatist plans throughout the Middle East. It remains to be seen whether Hitler will be provoked to abandon the Caucasians with the impatience with which he treated the sister movement of Skoropadsky's Ukrainians. The Caucasian separatists have, however, by no means outlived their usefulness, and a recrudescence of their propaganda and militant activities may be expected at the crucial moment of a German attack on the Caucasus.

No balanced account of Caucasian separatism is possible, unless it is viewed against an accumulation of centuries of conquests, border disputes and intermingling of races. The fate of the Caucasian nations, no less than that of the irredentist movements, was largely determined by the geographical position of the Caucasus, which made it for centuries the shortest route from Asia into Europe. The great number of migratory tribes caught up in the 650 mile range of peaks, the variegated language and customs and the consequent confusion and racial disunity created conditions of easy conquest for Greeks, Romans, Tartars, Arabs, Persians, Kazars and Turks.

The advance of Russian Imperialism, which began in Peter the Great's time, culminated in 1784 with the suzerainty of Russia over Christian Georgia, for religious affinities were sufficiently strong to make the Georgians seek Catherine the Great's protection against Mohammedan Persia and Turkey. The last remaining areas inhabited by Caucasian races passed to Russia after the war with Turkey in 1878. The republic set up by the Caucasian separatists in the early part of Soviet rule was savagely suppressed. Their internal propaganda suffered a severe relapse when it became evident that the Soviet Government showed no inclination to follow the example of "russification" and repression set by the Czars. Instead, it treated the highly individualistic, liberty-loving Caucasians with considerable care and so prevented dissatisfaction on anything like a revolutionary scale. Collectivisation, for example, was less rapid in the Caucasus than in the Ukraine. Nationalism found itself diverted into cultural channels. Encouragement in the use of native tongues, and the consequent stimulus to literature, drama and education, as well as the division of the Caucasus, not only into republics, but into autonomous areas and districts, helped to create a real sense of communal responsibility and self-government. What dissatisfaction existed over the allocation of petroleum revenues to other industrial concerns outside the Caucasus tended to disappear when the benefits accruing from the increasing development of these industries became felt. The last two decades have changed the country to such a degree that the Caucasian separatists themselves, should they triumph, would find it difficult to break the country up into a host of cantonal sovereignties without seriously disrupting economic life.

The eclipse of Caucasian separatism would have come in the natural course of events were it not for the fact that a number of Germans—the last German Ambassador in Moscow, Graf von Schulenberg, among them—had realised that Caucasian separatism could serve far better as the spearhead of German expansion than the Berlin-Baghdad railway. The contacts the notorious Major Quisling made during his travels in the Caucasus with Dr. Fridtjof Nansen in 1920 were of great service when the foundations of German war plans were being laid after Hitler's accession. The Ukrainian and Caucasian separatists were attached to various bureaux, the latter under the direction of the Middle East expert, Dr. Gronau. The Caucasians brought with them a more widespread organisation than the Ukrainians. Their dispersal after the Revolution into Egypt, Iraq, Iran and Turkey and their considerable sympathisers in those countries, as well as their bilingualism, were considerable assets for Germany.

Between the years 1934-38, Turkey became the principal theatre of Caucasian separatist operations. A violently patriotic tone was adopted in an attempt to create a Pan-Turk Movement, clearly designed to provoke a breach between the Soviet Union and Turkey. Kantemir, the leader of the separatists in the Near East, and Haidar Bammate, a publicist, tried hard to urge the Turks towards a crusade of liberation in the Caucasus. Moreover, the Turks were invited to expand their territories at the expense of Soviet Turkestan, which, it was claimed, was populated by 18 million Turic people, a greater number than in the whole of Anatolian Turkey itself. A constant stream of pamphlets and publications bearing the imprint of Bruno Deuss, Berlin-Charlottenburg, was aimed at discrediting Kemal Ataturk's policy of friendship with Soviet Russia. "Turkey had been a drowning man, clutching at a snake—a red snake. But now that she had allies and powerful friends, her need of the Moscovite snake grows less and less." This campaign of provocation against the Soviet Union was broken by the expulsion of the Caucasian separatists, shortly before Kemal Ataturk's death.

A few examples will show how the separatists intensified their efforts in Iraq and Iran, discrediting the democracies and acting as an outpost of propaganda, not only for Germany, but also for the other two Axis partners, Japan and Italy. For instance, Japan's aggression in Manchuria and China was represented as the rebirth of Genghis Khan's Empire. "It was the greatest event in history for which the Turanian-Turic world is indebted to the courageous protection of the Japanese Emperor's Army." A bewildered and not very well informed oriental public was told that, after Russia's dismemberment, Germany and Italy would construct a Rhine-Don-Black Sea Canal which would bring a wealth of German and Italian merchandise to the eastern bazaars. At least 50 per cent of Soviet territory had been earmarked for the eastern nations by Germany—it was said.

There is further evidence to show that Caucasian separatism, having subordinated itself completely to German Weltwirtschaft ambitions, can hardly appear in Caucasian eyes in the shining armour of disinterested patriotism which it has been wont to adopt. Those same freedom-loving characteristics of the Caucasian, which have baffled and discomfited every conqueror, would never willingly accept a German protectorate. There is, on the other hand, every indication to suggest that they would prefer to develop on the lines already initiated in unity with the other peoples of the Soviet Union, whose fate is of immediate economic and political concern to the Caucasus.

THE BUSINESS WORLD

Bank and Insurance Shares

MANY investors will remember that, in the days when the slump of 1921-22 was receding into the past, when the Government was paying over 5 per cent on medium-term loans, and international business, in money if not in goods, was brisk, British bank and insurance shares were occasionally yielding less than gilt-edged stocks. The argument in those days was that the fortunate holder had only to sit back and wait for the effect of a conservative policy of distribution to swell the capital value of his holdings and, eventually, to increase his dividends. It was true that there would be trade cycles as in the past, but banking was experiencing an expansion in deposits due to changing habits, while insurance benefited from an upward secular trend. Both seemed assured of an adequate supply of high-yielding securities in which to place surplus funds, and interest rates were regarded as being virtually stabilised at this high level. At the time, the argument seemed reasonable, but experience has proved it over-optimistic in almost every particular.

When, in 1931, this country adopted limitation of the export of capital, and proceeded with a programme of drastic conversions, the whole structure of money rates, on which the argument was based, was threatened with disruption and the growth of economic nationalism curtailed foreign business. Actually, the transition was much smoother than had been feared, but the lower return on investments was a net loss to the insurance companies, except in so far as they could offset it by extending their field, while the new rate structure left the banks with smaller margins, and other changes made inroads upon their most remunerative assets, advances and the bill portfolio, other than Government paper. By January, 1935, when long-dated Government stocks touched high levels which have yet to be equalled, the yield on 2½ per cent Consols was under 2.7, while that on bank shares was, according to *The Actuaries' Investment Index*, some 4.1 and that on insurance shares almost 3.5 per cent. The margin was exaggerated at that time by abnormal speculation in Little Consols. There have been times when the margin was scarcely more than ¼ per cent for insurance shares and twice as much for banks, but neither class of share has achieved the honour of yielding as little as gilt-edged securities. At the end of last month, yields were, according to the same authority, 3.08 on Little Consols, 4.56 on bank shares and 4.27 per cent on those of insurance companies. It is, perhaps, not unreasonable to assume that these securities, in common with other equities, have largely recovered from the violent disturbance of values caused by the events of a year ago, and the question arises whether so wide a margin in yields against gilt-edged is justified by the outlook for these two types of enterprise.

The first approximation to an answer to this question seems to be that the high yield results precisely from a lack of knowledge as to the future—a characteristic which all equities share. The best that can be done is to set out the principal factors affecting the problem and to attempt to assess their relative importance. As with other companies, bank and insurance profits are a function of turnover and margin per unit, but, whereas in industry the replacement cost of fixed capital and stock in trade is a matter of the first importance, for banks and insurance companies it is the movement in the level of interest rates which tends to be dominant, and this is always counteracted in some degree by the fact that investment values fall when earnings on new money rise and *vice versa*. Turnover depends both upon trade activity at home and overseas and upon the price level. The determinants of the profit margin are less easily stated. For insurance business, other than life insurance, it is settled mainly by competition. It is uncertain how this will be affected by post-war conditions; but since a more equal distribution of income should lead to some increase in business, apart from the level of prices, it is

perhaps to be expected that margins will be reasonably high, except for hull and cargo departments, which are likely to have to rebuild a complicated international structure of rates.

For the life offices, competition is also an important factor. Over an extended period of years, the general level of premiums is not, of course, independent of the earning power of money. Over shorter periods, however, the rate of interest is likely to be the decisive factor, and, in this connection, it becomes essential to attempt an assessment of the general set-up after the war. Unless the Government very rapidly calls a halt to the rise in the cost of living by a marked extension of rationing, price fixing and limitation of supplies, it seems probable that the general level of wages, and, therefore, of prices, will be much higher than now. The end of the war will bring demands, which will probably be irresistible, for the release of much pent-up purchasing power, and every effort will be made to avoid an aftermath of unemployment. There will be little possibility of maintaining the full paraphernalia of wartime controls, but without them it must be very difficult to avoid either a further dose of inflation or some competition for savings, with a resultant rise in interest rates. The latter is only a possibility, but it is one which the managements of insurance companies, not less than those of the banks, must have constantly in mind. For the former, a higher percentage of total assets is in securities, but the permissible range is wider than in the case of banks. Despite the fact that recent investments have been restricted to Government securities, which certainly do not yield more than 2 per cent net, the average return is still appreciably over 3 per cent. For life offices, there has been a wartime decline in business, but presumably the upward trend will be resumed after the war, a movement which should be assisted by income-tax concessions. War has brought an increase in claims, but mortality is still within expectation. Whether the very favourable experience of pre-war years will be a feature of the post-war period is uncertain. Ability to restore the profit margin per unit to pre-war levels, or even to maintain the aggregate profit, is problematical, being dependent upon political factors whose weight cannot be assessed so far ahead.

For the banks, the effect of rising prices will be to increase deposits, which will mean that there is a larger fund to earn dividends; but it is by no means certain that the demand for banking services will expand as it was expected to do twenty years ago. A characteristic of the years before the war was the extent to which the conservation of resources, and the formation of large groups, was rendering industry less dependent upon banks for short and medium term finance. A school of thought exists which would prohibit the amassing of reserves more than sufficient to maintain existing physical capital. It is possible when the time comes for a relaxation of the restriction on company profits, that this view may carry some weight but it is perhaps equally likely that industry will obtain its requirements by an extension of the developments which have already worked to the detriment of bank advances. In any case, an expansion in the demand for banking services commensurate with an increase in the money turnover of industry can no longer be considered as certain.

In June, investments of the London clearing banks exceeded advances for the first time in the history of British banking. It seems doubtful whether the absolute amount of advances will fall much further, but, as deposits increase the proportion held in this form will certainly tend to diminish further, and so to reduce earning power per unit. Since, however, with the absolute amount of advances falling, banks appear able to maintain profits, they should be at least as well off when the actual fall ceases. *A fortiori* provided deflation is avoided, they should be able to maintain earnings after the war, when there must be some increase in the demand for accommodation. That an earlier

rise in costs will eat into net earnings seems probable, but there should be substantial economies when demobilisation makes possible normal staffing arrangements. On the other hand, it is not easy to see any opportunity for saving, such as arose from the substitution of women machine minders for male clerks after 1918. Stability of investment values remains a factor of the first importance; so important that it must exercise a considerable influence on official policy in this respect. A conjunction of low interest rates and rising prices would protect the existing holdings of the banks and increase their earnings from advances—perhaps to a point when they would attract unwelcome attention. On the whole, it seems that, in terms of money, if not of real values, both bank and insurance shares have con-

siderable prospects. Possibly, they are sufficiently good to warrant wider margins than exist between them and many industrial equities. Much will depend upon the revival in commerce, as distinct from manufacture, and upon a complex of factors not easily foreseen. At least there should be no repetition of the competition in branches which was a feature of the twenties, and possibly less of that in services which characterised the thirties. Banks, and to a scarcely smaller degree insurance companies, are, however, subject to a special political risk, namely that of nationalisation. It is quite impossible to say what weight should be given to this factor, or what it would mean to shareholders, but it is probable that its existence is in some measure discounted in present quotations.

Finance and Banking

Tendering for Year-End Bills

The imminent turn of the quarter has not as yet been heralded by the slightest evidence of stringency in the money market. The clearing banks have this week been preoccupied by their monthly making-up, but at no time has this process interfered with their readiness to buy bills from the market. The market for its part obtained a 26 per cent allotment for the Monday to Wednesday bills on which its tenders were largely concentrated. It has, therefore, been a fair seller to the banks. This week the market is tendering for the bills which will include the end-of-year maturities. The tradition regarding the desirability of these maturities dies hard, and it is probable that the market's tenders will be largely concentrated on them. This is all the more likely as the January bills are of less attractive currency, given the stereotyped price of £99 14s. 11d. at which the market will be applying for them. The exceptional prevailing ease of money is amply reflected in the latest Bank return, which shows bankers' deposits at the high level of £133,915,000, an increase of £6,287,000 on the week. The Government's ways and means position evidently remains fairly taut, for public deposits are substantially unchanged at around £10,637,000, while during the past week there has been an increase of £8,835,000 in Government securities, indicating renewed direct Treasury borrowing at the Bank of England. We are now in a slack revenue period, while expenditure remains at a high level. On the evidence of the Bank return the appearance of the Government's next loan cannot be long delayed. Apart from temporary borrowing at the Bank, the Treasury is being compelled to make increased recourse to Treasury deposit borrowing from the banks. This week these institutions were called upon to pay £50 millions in this manner, a figure which compares with nominal maturities of £30 millions and actual maturities probably smaller than this figure.

American Credit Policy

The Federal Reserve Board is increasing member banks' reserve requirements by about one seventh, or to the present statutory limit. The increase will take effect from November 1st. Even more significant is the fact that at a recent Press conference, Mr Morgenthau, Secretary of the Treasury, should have expressed himself as more sympathetic to the Federal Reserve Board's requests for powers to raise member bank reserve requirements beyond the present statutory limit. Now that good progress is being made in the United States with the task of qualitative control of credit, through such means as the strong discouragement of hire purchase finance, it is rather astonishing to see this reversal to the doctrines of quantitative control. The volume of banking credit in the United States is expanding steadily under the propulsion of the armament and Lease and Lend programmes. Despite the curtailment of non-essential credit facilities, the total of the banks' loans are expanding, owing to steadily increasing demands for accommodation from industries engaged on Government work. At the same time, the financing of the budgetary deficit still calls for persistent bank subscriptions to Government issues. Between the beginning of this year and the close of July the loans and investments of the weekly reporting member banks rose from \$25,388,000,000 to

\$28,646,000,000. Over the same period, the reserve balances at the Federal Reserve Banks actually fell from \$14,026,000,000 to \$13,117,000,000. Consequently, the excess reserves fell even more steeply, from \$6,615,000,000 to \$5,181,000,000. The coming increase in reserve requirements will result in reducing excess reserves to about \$4,000,000,000.

The great diminution in the gold inflow, together with the considerable accumulation of funds in Treasury deposits at the Reserve Banks, has arrested the growth in Reserve Bank credit. Member bank credit, on the other hand, is still expanding, and is likely to expand further as the armament programme gets into full swing. The margin of excess reserves is therefore being fairly rapidly narrowed. To increase reserve requirements still further under those conditions would be to invite an immediate hardening of money rates. This, at a time when full employment is yet far from reached in the United States, would be an astonishingly retrograde step to take. If inflation threatens in the United States, there are, in present circumstances, far more direct and effective methods of tackling the problem than through the contraction of credit.

American Tax Savings Plan

The American Treasury has begun the sale of interest bearing notes which may be purchased in anticipation of tax payments. These notes are available in two series. The first may be presented in payment of income taxes up to a limit of \$1,200 in any one year. They accumulate interest at the rate of about 1.92 per cent per annum. The second series, intended for corporation and large tax payers, may be presented in payment of taxes to any amount, and interest accrues on them at the rate of about 0.48 per cent per annum. The notes have a maximum currency of two years, but may be presented in payment of taxes at any time during their currency. They are not transferable and may not be used as collateral. They may be redeemed for cash at the Federal Reserve Bank of issue at any time, but only at the price of issue. The purpose of this new issue is to encourage taxpayers in the United States to make provision out of current income for taxes that become due on that income in the following year. The economic effect of the issue is a very desirable one under present circumstances, since it will mop up purchasing power in the hands of the public and place it at the immediate disposal of the American Government.

German Banks in Greece

Among recent evidence of German financial exploitation of the occupied territories comes the news that the National Bank of Greece has been absorbed by the Deutsche Bank and the Bank of Athens by the Dresdner Bank. It is interesting to note that the absorption of the Greek business of these banks should have been effected by German and not by Italian institutions. Since Greece was marked out as a sphere of Italian influence and is now being policed by Italian troops, this initiative of German banks provides yet another token of the depths of servility to which the junior partner of the Axis has sunk. It should be noted that, in the case of the Bank of Athens, the business so absorbed is only that established in what is now enemy territory. The management of the branches and funds of the bank outside such territory, in London, Egypt and Cyprus, has been vested by decree law of the Greek Government in a Board of Management composed of those directors of the bank who are outside enemy occupied countries. In addition to its London office, the Bank of Athens has three branches in Egypt and two in Cyprus. These provide the nucleus of an active business around

which it will be possible to regroup the whole organisation when the octopus-like tentacles which German banking is now spreading in Greece have been severed.

Iran's Currency Problems

With the completer Allied occupation of Iran which is now proceeding, and the change of regime there, the currency and banking situation in that country may be rapidly brought back to normal. As soon as the prevaricating and hostile attitude of the Shah, who has now abdicated, became apparent, Iran was subjected to the financial blockade from which that country had been spared in the days immediately following the entry of British and Soviet troops. Now that the position is being satisfactorily cleared up, it should not be long before Iran is brought within the sterling area, and all existing restrictions on remittances to and from that country are removed. The machinery of exchange control has been in operation in Iran since December, 1939; and, though since then the rial has been officially pegged to the dollar, it will need very little adjustment to bring the system of control within the framework of those operating in sterling area countries. Meanwhile, public confidence in the currency was called upon to withstand considerable stress in the few days preceding the abdication of the Shah. The currency in Iran is now largely composed of rial notes issued by the Banque Mellie Iran. These have for some years been displacing the silver krans, which are now largely obsolete. One of the main elements in the backing for this paper currency is represented by the crown jewels. At the beginning of last week, it was strongly rumoured in Iran that the jewels had left the country and were about to be followed by the Shah. These rumours led to immediate action on the part of the Minister of Finance. He satisfied himself that the jewels were still at the Treasury, and invited a deputation of the Majlis to inspect this important item of national property and of the currency reserve. Confidence in the solidity of the rial was promptly restored.

National Discount Company Limited

In *The Economist's* Banking Supplement, which was published last week, the "B" shares of the National Discount Company were, by a printer's error, described as 10s shares instead of £7 10s. By another misprint, the company's holding of securities on December 31, 1940, appeared as £8,563,844. This should have been £18,563,844.

Investment

Incentives and the Investor

Movements on the Stock Exchange during the past week have, in the main, been the reverse of those of the preceding period. After a little further selling of a general character, jobbers who had sold short first reduced prices in order to get cheap stock, and when selling stopped, marked them up once more in the hope of attracting selling, so far without much success. In fact, there is a tendency for prices in all sections to settle down at levels only slightly below the best. There is little sign of any real disposition to sell anything except the few stocks, such as Argentine railway equities, in which the rises of the speculative boomlet have now been almost completely eliminated. In the absence of any new Government issue, other than 3 per cent Savings which still do not make a very wide appeal, it might be supposed that gilt-edged would tend to rise once more. At the moment, however, the banks are finding adequate outlet for their surplus funds in deposit receipts, while the public has perhaps other things to think of. It is true that payments of direct taxes are now below their peak, but the recent assessment notices served as a reminder that, where tax is not deducted at the source, there are very large sums to be found in January. Further, a fresh set of factors has arisen out of the growing realisation of the urgency of increasing war production, which threatens to produce a new crop of uncertainties for the investor. In its more extreme form, the campaign now beginning to emerge suggests that financial inducements must be extended to capital and labour alike, if the best results are to be obtained. The very strict limitations and the great dangers of this policy are

discussed on page 375, but its adoption would have considerable effects on the investor and his outlook.

There has always been a considerable body of opinion which held that war could not be financed without a certain measure of inflation. The Government creates credit and uses it, relying on the lag before costs are adjusted to the new level of money to reap a benefit. But the suggestion that wages and other payments should be increased as an incentive—presumably out of created credit—means that costs will be raised from the start, and that, in so far as the whole of the extra payments do not flow back at once to the Exchequer, a further dose of inflationary finance would be called for. It is hard to believe that the worker would find in an additional payment of uncertain real value, whose use had to be indefinitely postponed, any great incentive to work harder. He would insist upon trying to obtain rather more now. That, perhaps, should be given to some, but not by widespread money payments, which seem to lead directly to inflation and to create long-term problems of the first order. None the less, it is probable that the campaign will meet with no little support. At the present time, the Government hold the equity in British industry, through the operation of EPT. But the course of prices and yields suggests that investors believe that this will not always be so. In these circumstances, anything which promises a semi-permanent rise in prices tends to enhance the value of equities as against fixed interest stocks, since the holder of the former is protected to the extent that plant is kept up and stocks of goods are held. Even in the context of

Company Notes

ICI and Vickers Interims

The announcement that the interim payments of *Imperial Chemical Industries* and *Vickers, Ltd.*, are to be maintained at 3 per cent, less tax at 9s. 8d., and at 4 per cent, less tax at 10s., respectively, is encouraging news for the large body of investors whose hopes are harnessed to the fortunes of the two companies. In the case of *Vickers*, the margin of cover for the customary 10 per cent dividend in the calendar year 1940 amounted to 21.9 per cent, against 20.2 per cent, despite a decline in the actual amount of equity earnings, and it was apparent that a substantially higher tax liability could be absorbed without the necessity of trenching on ordinary dividends. The margin of cover for the 8 per cent *ICI* ordinary dividend fell in 1940 from 13.0 to 10.9 per cent, and, in consequence, the prospects that former dividend rates can be maintained in the current year appeared more doubtful. There is, of course, no guarantee that the maintenance of interim payments implies the repetition of final dividends. No doubt existing rates could, in the case of both companies, be maintained for a long period out of reserves, but there is a strong possibility that the conjunction of yet higher rates of taxation with the possible necessity of increasing provisions for war contingencies might decide the managements in question to abandon dividend equalisation for conservation of resources. The gross profit-earning capacity of both concerns, in war or in peace, is immense. The investors' hopes and fears are mainly conditioned by the terms of Government contracts and the exigencies of the Exchequer. If stockholders survive the duration of the war without seeing a cut in rates of dividend, less tax, they will be remarkably fortunate—but so far, so good. Prices were scarcely affected by these and other interim announcements. The *Vickers* 10s. ordinary stock at 17s. 1½d. yields £5 18s. 2d. per cent on the 1940 total payment, while the *ICI* £1 ordinary stock offers a yield of £5 0s. 4d. per cent at the current price of 31s. 10½d. ex dividend.

Crosses and Winkworth Tax Position

The full accounts of Crosses and Winkworth to March 26th last show a rise in total revenue from £212,719 to £328,094, the highest level of the past decade. After meeting interest charges, fees and ARP expenditure and providing £21,500 for war damage insurance, earnings before taxation or depreciation amount to £300,463, against £199,665. Unfortunately, the management is still unable to obtain any decision as to the size of the company's EPT liability and the net credit balance is, for the moment, added to the carry forward, which thus totals £381,205. While the profits position shows a striking improvement, the auditors point out that, apart from the unsettled liability for EPT, no provision has been made for depreciation since March 31, 1930, or for the loss on realisation of fixed assets incurred in 1936-37. Moreover, the cumulative interest on "Heaton" 6 per cent 1st mortgage debentures remains in arrears since February 24, 1932, while the sinking fund for redemption of this stock, amounting to 1 per cent of the amount outstanding on February 25, 1932, has been in arrears from

Montreal Debt Adjustment

The news that the City of Montreal is proposing to rearrange the terms of its debt came as something of a blow to stockholders in this country, who had scarcely realised that the authority had been in default on its redemption payments since last year. It is perhaps a pity that the announcement should have been made without giving at least a general outline of the new terms proposed, for it is difficult to believe that this has not been settled. The result has been to make the market almost purely nominal, with a ten point margin between buying and selling prices. The amount of stock on the London registers is, or was recently, as high as some £10 millions, of which the bulk carried a nominal rate of interest of 4½ per cent. It is useless to speculate at this juncture as to what the exact terms will be. It is to be hoped that a city of the standing of Montreal will not put forward a scheme similar to those of Calgary and Edmonton, but the details of the position are not sufficiently well known to make an assessment possible. It may be that the only escape from such a scheme would be to invite and obtain assistance from the Dominion Government. The experience of the British investor in Canada, outside the restricted sphere of stocks of the Dominion Government, or of those carrying its guarantee, has not been a happy one, and it is unfortunate that there should be a further loss of dollar income just now. The proportion of even the funded debt of the city held in this country is, however, relatively moderate, and it cannot be expected that the scheme will be framed mainly with a view to the effect on Britain. The scheme, when it is made known, must be judged by its fairness to bondholders as a whole, in the general context of the debt position.

PERSONAL BANKING SERVICE

LUDGATE CIRCUS, LONDON, E.C.4

March 1, 1933, at which date it became cumulative. In the circumstances, it appears curious that EPT considerations should rank prior to the company's liability to its debenture creditors. The balance sheet shows an improvement in the cash position, a credit balance with the company's bankers of £131,787 having replaced a bank overdraft of £24,151, while advances secured against cotton stocks are reduced from £81,050 to £29,900. A total liability for bills payable of £172,072 has been eliminated, while an increase of some £36,000 in sundry creditors to £92,467 is due largely to the inclusion of war damage contribution. On the assets side of the account, stocks are reduced from £572,983 to £495,156, a decline which the chairman, Mr Joseph R. Heaton, attributes in the course of his statement mainly to the sale of finished yarns. He also points out that, despite the absence of any depreciation provision, £57,682 against £34,056 has been spent upon repairs and renewals and that the total of fixed assets has been increased by installations and additions, valued at £13,895, to £2,631,288. The surplus of liquid assets over current liabilities is up from some £333,000 to some £596,000. Until some decision can be reached regarding the allocation of profits, last year's striking improvement must remain of completely academic interest to the company's shareholders and scarcely less so to holders of debenture stock. The £100 6 per cent "Heaton" 1st mortgage debenture stock now stands at 60½.

Gaumont-British Improvement

The accounts of Gaumont-British for the year to March 31st last show a rise in income, after deducting £10,850 for losses of subsidiaries against £66,343, from £546,256 to £606,333. With tax liability slightly reduced from £36,398 to £35,992 and depreciation at £28,756 against £32,717, equity earnings are up from £10,790—to £78,098. The company's liability for war damage insurance, at £30,313, is charged to general reserve. Grossed up at 8s. 6d., the rate of earnings shows a rise from 0.6 to 4.5 per cent. Reserve receives £77,813, raising the total of the fund, after deduction of war damage contribution, from £242,500 to £290,000.

* Including income from redemption of debenture stock.

† Includes £33,068 from tax reserve.

Last year's improvement in the profit position took place despite a considerable fall in theatre revenue during the period of intensive bombing in the winter of 1940-41. The managing director, Mr Mark Ostrer, indicates in his statement that income from this source revived substantially in the spring of 1941; that direct damage to property from enemy action was not on a large scale; and that activity in the film production branch of the group was satisfactorily maintained. The balance sheet shows a reduction in bank overdraft and loans on mortgage aggregating £54,021 to £76,516 and £419,136, respectively, while creditors are

down from £566,559 to £534,791. The excess of current assets over the latter is, however, reduced from £601,169 to £577,535. The company has paid off some £178,000 of long-term debentures, and there is an addition of rather less than half that amount to the sinking funds, which largely accounts for the rise of £130,000 in total reserves. There is evidence of activity on the production side in considerable percentage rises in film productions in progress and stocks in hand. The best that can be said of the results is that a considerable improvement was achieved under very difficult conditions and that earnings at this level will strengthen the position by redeeming some of the very heavy debt load, while preventing accumulation of arrears on the preference shares, which, at 12s. 3d., ex dividend, yield some £8 19s. 7d. per cent.

Jorehaut Tea Results

The full accounts of Jorehaut Tea for 1940 show that sales on tea account of 7,122,477 lbs. yield a revenue of £406,331, against £408,998 derived from the sale of 6,774,268 lbs. in 1939. After including subsidiary sources of income, gross receipts declined from £415,343 to £414,242, thanks to the lower average price obtainable per lb. at 13.69d. against 14.49d. Costs per lb. were reduced from 10.83d. to 10.80d., but total production costs on a crop yield of 7,175,244 lbs. against 6,845,474 lbs. increased from £302,376 to £317,790. All other charges against profits, except depreciation at £20,000 against £15,000, were lower last year, the allocation for tax and NDC falling from £42,262 to £20,000. Thus, equity earnings rose from £37,715, after inclusion of £139 from the 1939 crop adjustment account, to £42,298, representing a rate of 11.1 per cent—unadjusted for Dominion income-tax relief—against 9.4 per cent. The usual 10 per cent dividend is, in consequence, covered by a small margin, which goes to raise the carry forward from £3,109 to £5,407.

	Years to December 31,

† Without allowing for Dominion Income Tax Relief.			

Stocks of tea have increased from 1,021,721 lbs. to 1,966,055 lbs., raising the balance-sheet valuation from £48,828 to £84,277. There is a sharp contraction in both debtors and in the total of bills payable and creditors, the former from £224,552 to £100,838 and the latter from £204,844 to £125,140. The reserve fund remains at £200,000. Expenditure on renewals and improvements last year amounted to only £10,649 against £27,796. The accounts show that careful control of cost factors has largely offset the influence of lower selling prices, but in war conditions the price offered by the London Tea Controller must remain the most important single factor governing profits. The £1 shares at 33s. yield £6 1s. 2d. per cent.

Second Alliance Trust

The accounts of Second Alliance Trust to July 31st last show a fall in income from £226,983 to £213,466, the lowest level since 1935-36. Taxation is, however, up only from £64,300 to £67,827, and, since expenses have been strictly controlled, equity earnings at £72,566 against £86,074 represent a rate of 33.1 against 34.9 per cent, compared with no more than 26.7 per cent in 1935-36. The total payment on ordinary capital is maintained at 21 per cent and contingencies reserve again receives £30,000, leaving the carry forward reduced from £17,847 to £14,312.

In all the circumstances, these results must be regarded as highly creditable. The directors point out that a considerable portion of the trust's investments came under Treasury requisition last year and that the fall in revenue is in part due to the inability to find equally remunerative opportunities for reinvestment. A caution is added to the effect that the return on remaining investments is not expected to be maintained in the current year. An estimate of the market value of investments is omitted from the accounts, the balance sheet disclosing a decline in the valuation at or under cost from £3,909,942 to £3,670,339. A decline in debtors, mainly sales for subsequent settlement, from £7,636 to £2,700, is accompanied by a rise in the total of cash and balances due from bankers from £2,246 to £13,281, while sundry loans and bank advances are reduced from £104,189 to £53,350. The reduction in general reserve from £555,000 to £400,000 is due to the transfer of £155,000 to contingent reserve, which is presumably written off investments. There is also a decline of some £20,300 in debenture debt to £1,960,293. These changes and the relative smallness of the rise in creditors from £23,932 to £25,530 all bear witness to the involuntary liquidation of assets which has been imposed on the trust and indicate that re-investment was not complete at the date of the balance sheet. Clearly, estimates of revenue in the current year depend to an important degree on whether Second Alliance still retains holdings liable to come under Treasury requisition. In any case, the margin of cover for ordinary dividends is generous, and reduction, if it takes place, will be more a matter of policy than of necessity. The £100 stock, at £380 ex dividend, yields £5 10s. 6d.

"Johnnies" Accounts

The preliminary figures of Johannesburg Consolidated Investment for the year to June 30th last, dealt with in *The Economist* of July 26th, showed a virtual doubling of net profit after tax, which meant that the dividend, maintained at 10 per cent, was covered by earnings of almost 13½ per cent. The full report reveals taxation of £333,853, compared with £252,095, so that there was an even larger recovery, amounting to some £342,500, in the gross amount of earnings, of which a substantial part must be due to profits on operations in securities. Many of the undertakings in which the company is interested did better on the year, but in most cases—South African Carbide is an exception—all or most of this increase went in paying higher taxation. As an instance of this, the seven gold mines specifically associated with the group made about £1,000,000 more profit on the year, but £842,000 of this went in increased taxation or Government share in profits. Another factor tending to increase profits has been a rise in investments. These, valued as usual below market quotations, have risen from £5,433,749 to £5,785,370. There is, however, an increase in cash and Union Treasury bills of £305,000, both having been financed by a new item of £537,000 odd for accounts with associated companies and the £136,000 rise in carry forward. It thus seems that the group had at end-June a surplus which could be invested in long-dated stocks. The company is altering its articles so as to reduce its liability to provide income tax on directors' salaries to 5s. 6d. in the pound and to prevent tax-free payments to future recruits to the board. The £1 shares of the company, at 42s. 6d., yield some £4 14s. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

UNCERTAINTY about the situation on the Eastern front restricted business before the week-end, and absence of buyers rather than any selling pressure led to a continued decline in all sections of the market. The reopening was marked by some slight selling and conditions continued dull, but on Tuesday the reaction of the past week was brought to a halt by the need to attract stock, which produced a widespread marking up of quotations, despite which the shortage of stock continues in most sections.

Fractional declines, mainly in the irredeemable issues, were prominent in the gilt-edged market before the week-end. Thus 3½ per cent War Loan and Conversion declined ½, 2½ per cent Consols and Local Loans ¼, and the 2½ per cent National Defence Bonds 44/48 also lost ¼. The week-end led to precautionary marking down on Monday, and with buyers holding back, declines of ¼ in the irredeemable and long-dated issues were general. The following day, however, a revival of buying coupled with shortage of stock led to numerous gains. Thus 2½ per cent Consols and Local Loans gained ½, 3½ per cent War Loan ½, and 3½ per cent Conversion ¼ among other rises, but an exception was provided by small declines in the 2½ per cent National Defence 44/48 and National War Bonds 45/57. Later turnover fell off again, but some long-dated stocks gained ¼. The feature of the foreign bond market was the sharp fall in Japanese issues on Monday when the 5 per cent issue of 1907, 6 per cent 1924 and 5½ per cent Tokyo loans all fell 3 points, with smaller declines in other stocks. The following day some support led to a slight recovery, prices rising ½-1½ points. Brazilian issues were persistently weak, with considerable loss in midweek on doubts as to the San Paulo tender, while Chilean bonds were weaker on Monday.

Interest in the home rail market before and immediately after the week-end was slight, and small sales were sufficient to cause minor losses in both junior and senior issues. On Tuesday, however, rumours of an early clarification of the

recent agreement occasioned a sharp improvement, mainly in junior issues. GWR ordinary jumped 1½, Southern preferred 1½ and the deferred 1 point, while the LMS ordinary gained ½. London Transport "C" stock was an exception, declining ½ point. In midweek a relapse followed, but Southern preferred gained ½ point. In the foreign rail market the decline in Argentine stocks continued up to midweek, with some considerable losses. Elsewhere Canadian Pacific ordinary was firm on balance.

In the industrial market before the week-end, lack of enquiry led prices to ease, while at the reopening quiet conditions were accompanied by further declines. The following day, in common with other sections, prices improved and the undertone became firmer. Brewery issues suffered numerous losses of 1s. on Monday, but the next day Bass and Mitchells & Butlers recovered 1s., although Guinness, Barclay Perkins and Ind Coope were all slightly lower. Aircraft and motor issues were steadier than most sections after some pre-week-end losses. Apart from a gain of ½ in Smith (Accessories) preferred on Monday and a fall of 1s. in Short Bros. the next day, prices were mainly unchanged. The heavy industrial section reflected the general trend with many small declines before and after the week-end. Babcock & Wilcox, Guest Keen, Harland & Wolff among others, were all lower. On Tuesday, however, apart from a few small gains by colliery issues, most prices remained steady, but Tube Investments was an exception with a fall of 1s. Textile issues generally were weak, but Courtaulds was a feature on Tuesday with a taulds was a feature on Tuesday with a jump of 1s. 6d. on rumours, not confirmed, that compensation for the Viscose firm was to be announced. Shipping issues were lower where changed and failed to participate in Tuesday's recovery, while changes in tobacco issues were all against holders, with the exception of a recovery of ½ on Tuesday by BAT, when Imps lost ½. In midweek quiet conditions prevailed, but changes were generally in favour of holders.

The course of events in Russia led to some selling in the kaffir market before the week-end and small declines were

general. At the reopening the Cape bought Blyvoors, West Wits and Western Holdings, but other issues lacked support and generally small losses prevailed. The next day, interest, while still centred on Blyvoors and Libanon, which improved 1s. and 1s. 3d. respectively, was more widely spread, and numerous gains were registered. The rubber market displayed no decided trend but prices throughout were steady and better than other sections, although there was little business. The oil market was dull before the week-end on war news, and some slight selling led to declines in most issues. While conditions continued dull on Monday with further declines, a much more cheerful tone the next day induced widespread gains, Shell gaining ½, while Anglo-Iranian, Burmah, Lobitos and VOC improved ¾. Later fluctuations in oils produced no definite trend, while kaffirs continued firm under the lead of Blyvoors.

New York

THE developments on the Russian front and proposals for the fixing of ceilings on commodity prices led to slow trading on Wall Street before the week-end, and declines up to a point were general. In the early part of the current week prices became slightly more resistant, with aircraft and steel issues mildly supported, but the volume of business was small. In midweek pressure against aircraft issues led to a general decline with numerous point losses.

The Iron Age estimates steel mill activity at 97.5 per cent of capacity against an adjusted figure of 96 per cent in the previous week.

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

Industry and Trade

Transfer of Electricity Control

The logical allocation of functions between Government departments is constantly disturbed by war conditions. Sometimes the creation of a new Ministry, made necessary by the tremendous expansion in the functions of Government, provides the occasion for the necessary new adjustment. There has been some talk of the formation of a Ministry of Fuel, but this, apparently, is not to be, at any rate for the present. Without prejudice to any further rearrangement which may be found necessary later, the functions of the Ministry of War Transport in relation to electricity have just been transferred to the Board of Trade. Since the Board of Trade is already responsible for coal and gas, this seems a logical grouping. Before the Electricity Supply Act, 1919, the Board of Trade was the ultimate electricity authority, but under that Act the newly established Electricity Commission was made subject to the Ministry of Transport, possibly because the transport aspect of electricity was developing so rapidly at the time. In emergency conditions, the Ministry of War Transport, as an operating department incorporating the former Ministry of Shipping, has an immense task to perform. Its most urgent functions are of a wholly different type from those of the Board of Trade, and it is sound policy to relieve it of such administrative duties as can, with at least equal propriety, be performed by a more purely administrative department.

Maintenance of Road Vehicles

It is difficult to exaggerate the importance of maintenance in the efficient operation of machinery, whether in the factory, on the road, or, as has been demonstrated so conclusively, on the battlefield. And in view of the shortage of inland transport, the decision of the Ministries of Supply and War Transport to carry out most of the recommendations put forward in the report of the Motor Vehicle Maintenance Advisory Committee, of which Mr W. E. Rootes was chairman, is to be welcomed. Efficient maintenance involves an adequate supply of spare parts and of repair facilities. Under the first heading, a scheme has been prepared to ensure that no spare parts in short supply are obtainable except for vehicles immobilised, or likely to be immobilised, for want of parts; hoarded stocks are to be requisitioned. The co-operation of manufacturers and distributors of spare parts has been enlisted in stopping the wasteful practice of building non-standard vehicles, partly with spare parts collected from various used vehicles and partly with new parts. The Ministries of Supply and War Transport are arranging for the return

to manufacturers for reconditioning of all suitable worn parts. In case of vital need, army spare parts may be released for civilian use. Since the supply of new spare parts must needs be limited, production must naturally be concentrated on parts for commercial vehicles. Under the second heading, a survey is being made of existing repair facilities. The Committee's recommendation that measures should be taken to promote the training of men, women and boys as motor mechanics, both in the Ministry of Labour training establishments and within the repairing industry itself, is to be carried into effect. Moreover, the repair staffs at the Ministries of War Transport and Supply are to be strengthened. All these measures, if carried out promptly, should do much to improve the maintenance service of road vehicles.

The Coal Mines (War Levy) Scheme

Owing to the closing of most of the European and Mediterranean markets in the summer of 1940, the British coal-mining industry was deprived of more than two-thirds of its total export trade of approximately 24 million tons; in order to provide some mitigation of the unequal incidence of this loss on districts and individual undertakings, the industry and the Government co-operated in the introduction of the Coal Mines (War Levy) Scheme. The main purpose of this scheme was to compensate colliery undertakings in proportion to the loss of trade suffered by them in consequence of the war. It was payable in respect of the tonnage by which the quantity sold by an undertaking in each quarter fell short of that proportion of the national sales which it supplied in the corresponding quarter of 1939. Statutory authority was given for the payment of compensation up to a maximum flat rate of 3s. 6d. per ton, to be provided by a levy up to a limit of 6d. per ton. The administration of the scheme was placed in the hands of the Central Council of Coal Owners and the District Executive Boards, and the Council was authorised to discontinue the payment of compensation, if at any time it was of the opinion that the undertaking concerned was not being maintained in a condition of efficiency to resume the production of its basis tonnage within a reasonable time. It was expected that, in exceptional cases, undertakings already earning profits could claim compensation in respect of lost trade, but both the industry and the Government agreed that the basis adopted was preferable to that of profitability, subject, however, to such adjustments as might become necessary in the light of experience. † Includes Government Issues to Sept. 16th only.
"Old Basis" includes public issues and issues to shareholders. "New Basis" is all new capital in which permission to deal has been granted.

PRIVATE PLACING

Express Dairy Company, Limited.—Permission to deal has been granted in respect of 200,000 "A" ordinary shares issued in 1939 as a capital bonus to holders of the privately owned 200,000 £1 ordinary shares. They have been placed at 53s. each.

COMPANY MEETING

ALLIED BAKERIES, LIMITED

DISTRIBUTION OF 10 PER CENT.

The sixth ordinary general meeting of Allied Bakeries, Limited, was held, on the 19th instant, in London.

Mr W. Garfield Weston, M.P., the chairman, said that he had referred last year to the widespread distribution of their bakeries and biscuit-making plants, and they had had cause during the year to congratulate themselves on that fortunate circumstance. In several occasions they had been able to render valuable assistance in areas which had suffered severely from air raids and had many times been called upon to assist in the supply and distribution of bread where local services had suffered more or less total disruption.

Shareholders might feel disappointed that it had been necessary to restrict the final distribution to 5 per cent., as against a final dividend of 7 per cent., together with a bonus of 3 per cent., last year, but, because of the increase in the rate of income tax and

excess profits tax, it was obvious that that distribution could not be repeated this year.

The total provision of the Group for taxation for the year amounted to £657,000, a truly remarkable figure. In contrast to that, the total distribution to preference and ordinary shareholders of this company and of the two holding subsidiaries, Weston Foods, Limited, and G.L. Bakeries, Limited, and including the final dividend recommended, amounted to only £134,630. In other words, for every £1 which their shareholders received the Government first took nearly £5.

At the last meeting he had mentioned the unification of control of their London operating companies by the formation of G.L. Bakeries, Limited; that company had since acquired three other companies, and their set-up now embraced practically the whole of Greater London. Allied Bakeries, Limited, had recently concluded the purchase of the entire share capital of the important Liverpool bakery and food distribution business of Benjamin Sykes and Sons, Limited, established in 1869.

The credit balance available was £80,836, compared with £159,820 in 1940, and the directors recommended a final dividend of 5 per cent., less tax, making 10 per cent. for the year.

The report was unanimously adopted.

(Continued from page 392)

scheme has undoubtedly facilitated the process of adaptation of the industry to the reduction in export trade, although the levy collected has only been 3d. per ton, now reduced to 2d.; and it is understood that the latest ascertainment shows credit balances in all districts. The problem, however, has been complicated by the emergence of new factors, including the altered distribution of price regulation, the incidence of a differential method of price regulation, the payment of the attendance bonus, and the application of the Essential Work Order to the industry. Important adjustments are accordingly pending. One of these is the discontinuance of the payment of compensation in cases where such payment would have the effect of raising the credit balance of the undertaking concerned above 80 per cent or 100 per cent (as determined by the Central Council) of that of the industry as a whole, and the other the provision of additional financial assistance to necessitous undertakings. It is understood that the Mines Department has given its assent to the necessary amendments of the Central Scheme, and that the new arrangements will take effect during the December quarter.

Coal Tar Pitch

Large stocks of coal tar pitch lie at gasworks and tar distilleries in this country. This substance, though solid at normal temperature, is comparatively fluid when heated and can be used as a substitute for imported fuel oil if special equipment is employed. Coal tar pitches vary in quality; while some are comparatively easily burnt in existing equipment, with very slight modifications, other qualities are more difficult to handle and in such cases the provision of satisfactory burning equipment may necessitate a little experiment. The value of coal tar pitch is about 15 per cent below that of petroleum fuel oil; provided the combustion is efficiently carried out, the increase in fuel consumption would only correspond to this difference. The ash content is higher than is normal for petroleum, and in certain special industries this might debar the use of the coal tar product, but for many heating operations where liquid fuel is required, particularly for certain metallurgical services, coal tar pitch could be used. A few enterprising concerns have already started to use the better qualities of pitch, but more attention might be given to this matter as the technical difficulties are not great.

The Government and Cocoa

For the third year in succession the British Government has made arrangements to buy the entire cocoa crop of the Gold Coast and Nigeria. Based on trade arrangements with the Free French Administration, purchases by the British Government in the season beginning October 1st next will be extended to the whole crop of the French Cameroons. The purchases will be carried out by the West African Cocoa Control Board on the same lines as in the season ending on September 30, 1941, but the price paid to the native farmers at 8s. 6d. per load of 60 lb. will be slightly higher than a year ago. It remains, however, 6d. per load below the 9s. paid in the first war season. Next season's improvement in the price

paid—in the season just ending a cut of 20 per cent. was made—is due to the fact that the marketing of the 1940-41 crop proved more satisfactory than could have been expected twelve months ago. This does not mean that the Government's West African cocoa transactions have as a whole resulted in a profit. It is known that the Government lost £250,000 in the first war season, when the Continent still took well over 100,000 tons of West African cocoa. A year ago, when the second agreement was concluded, almost the whole of the European market had been lost, while supplies to the United Kingdom had to be limited to 100,000 tons, a quantity approximately equivalent to this country's average consumption. Last year, it hardly seemed likely that more than half of the remaining 300,000 tons could be sold in the United States and other neutral countries, so that a much bigger loss was expected. Actually, it now appears that, owing to large sales to the United States, less than 100,000 tons have been held over from the 1940-41 transactions, and this tonnage may be included in the Government's food stores for post-war Europe (it is equivalent to roughly six months' Continental consumption). The British Government's transactions have not, therefore, resulted in such a serious loss as was expected a year ago, and the cut in the 1940-41 buying price, together with the increase, last March, of 10s. a cwt. in the British wholesale selling price, appears overdone. As the cocoa scheme aims primarily at compensating the West African native farmers for the loss of markets, it was only proper that at least part of last year's cut should be restored in the coming season. It would be intolerable if a profit were made by the British taxpayer at the expense of the native grower.

Wool Prices

The early announcement by the Wool Control of future prices has been warmly welcomed by the trade. It was known that prices would continue unchanged until October 31st for home civilian trade, until December 15th for export trade in yarns and until February 15, 1942, for export trade in fabrics. It was announced on September 22nd that present prices for wool and tops will remain in force from November 1st to February 28th for home

civilian trade. Prices for the export trade in yarns and fabrics are not to be changed at least for a further period of four months in each case. The table below indicates the trend of wool prices. Prices of wool and tops have been unchanged since November, 1940. Yarn, while fluctuating relatively more before February, 1941, has since remained unchanged.

(a) 1937, average January to August; figures for September-December not comparable owing to revised method of counting adopted in September, 1937. (b) From January, 1940, includes former Southern and South Eastern divisions. (c) Includes Southern division before January, 1940. (d) From September, 1939, Gimsby and Lincoln included in North Midlands instead of N.E. England. (e) Ordinary and Self-balancing revenue and expenditure. Annual figures are totals for financial year, beginning in year shown. Monthly figures are cumulative. (f) Average of weekly figures. (g) Annual figures for 1929 and 1932 do not include District Bank.

COMMODITY AND INDUSTRY NEWS

Tin prices have been weaker. Standard cash closed at £255 15s.-£256 a ton on Wednesday, compared with £256 10s.-£256 15s. a week earlier. The three months' price was £259 5s.-£259 10s. a ton, against £259 10s.-£259 15s. Rubber has been quoted at 13½d. a lb. for smoked sheet spot. The Ministry of Food's census of pepper stocks in this country is now complete.

Spinners' Cover and Contracts.—For many weeks business in the market has been held up by the uncertainty of the Controller's future actions. It is now announced that spinners will be provided with cotton cover at current prices for twelve weeks' production, against approved orders. It has also been decided that cotton yarn and cloth contracts over twelve months old shall be cancelled. An Order to this effect comes into operation on September 29th. These measures are intended to release raw material for essential purposes and to relieve the congestion of spinners' and manufacturers' order books. The Order covers all contracts for cotton yarn or cloth; wholesalers, makers-up and retailers may therefore be among those affected. No definite statement, however, has been issued on the level of raw cotton prices from November. Owing to increased costs of production, spinners are claiming a revision of margins, but the Controller has not yet replied. In the circumstances, a good deal of confusion still exists. Spinners still hesitate to accept fresh contracts and most of the business transacted has been to cover Government orders.

Export Control.—A new Order, the Export of Goods (Control) (No. 33) Order, has been made by the Board of Trade, to come into force on October 1st. It provides that licences will be required to export to all destinations certain beverages and preparations for use in their production, and of cordage, twine and cotton thread. The Order also extends the existing prohibitions in regard to fruit juices, soaps, animal hair and indigo; it relaxes prohibitions relating to harness and saddlery.

Import Licensing.—The Open General Licence permitting the importation of natural and artificial graphite from various countries, including the British Empire and Allied possessions, was revoked from September 20th. Goods despatched after that date will require separate licences. Imports from Eire of infants' wear manufactured wholly or mainly of cotton, wool, linen, silk or artificial silk or mixtures of these, required separate licences from September 20th.

Upper Leather.—Applications for licences for the acquisition of upper leather under the Control of Leather (No. 2) Order must be made before the end of this month. Licences have been granted to merchants and others by the Ministry of Supply on receipt of a certified statement of stocks, enabling purchases of replacements to be made. The Ministry states that in view of the necessity for getting the leather distribution scheme into final order, it may be necessary to refuse licences after September 30th.

Food Prices.—The Minister of Food has revised the maximum prices for rabbits and has prescribed maximum prices for hares. Wild rabbits, skinned, are now 9d. a lb. on first-hand sales, 9½d. on sale by wholesale and 1s. a lb. on sale by retail; tame rabbits are 7d. a lb. more in each category. The maximum price of brown hares on first-hand sales is 6s. 6d. per head, by wholesale 7s. and by retail 7s. 6d. Bread prices are to

be slightly reduced, and some fish prices are lowered. Maximum prices Orders for tomatoes and cucumbers are to be imposed early next year.

defence; and, in a sense, it is a frank confession of weakness. But there is also only one answer to the question who will launch the attacks against the enemy, when the time and the strength do come; it can only be the army.

It would be unjust to leave Mr Bevin—who with characteristic heat has called Sir Walter Citrine a quisling for criticising the Government's manpower policy—in undisputed possession of the field. Sir Walter's starting point is the same as Mr Churchill's, the need for greater strength against a powerful and ruthless enemy. The contention that, in this war, the task is to man the equipment rather than, as in 1914-18, to equip the men, is common sense. "As our army must necessarily be small, it is all the more necessary that it should be highly mechanised and armoured." The words are Mr Churchill's and his view—like Sir Walter Citrine's, presumably—is that the British army, unable to be the biggest, must be the best. The question is whether this aim is being impeded by over-mobilisation; and Sir Walter Citrine's doubts echo the wonderings of many people who know how coal mining and farming, for instance, have suffered from calling-up.

The layman does not know the answer. But it should be said that, since Dunkirk and the fall of France, shattered illusions and slipshod ways, the size of the fighting forces has come to be based, not on departmental notions, but on a survey of the manpower available to make, to man and to maintain their equipment. It was Sir William Beveridge, rather than Colonel Blimp, who made the calculations according to which the optimum size of the three Services is worked out, with due regard to the men and women needed to work in the factories and fields. At bottom, it is a manpower policy, not a military one. No doubt there have been departmental frictions and revisions; no economist's plan was ever proof against personalities and prejudices. Without doubt, there are still illogicalities and overlappings. But the press and the private pundits are widely astray if they believe that their discovery that men are needed to work as well as to fight, to produce equipment as well as to use it, bursts as a revelation upon the War Cabinet. It was significant that the recent interim report of the Beveridge committee stood by the demand of the Services for more skilled engineers to maintain their machines; and it will be surprising if the committee's final report does not endorse still further the Government's plan.

But planning is not performance. The doubts expressed by Sir Walter Citrine and many others spring from practical shortcomings. It is undoubtedly a mark of error when coal production, the output of food or the manufacture of vital implements of war are held back by shortage of labour. Where the critics have strayed is in taking these bottlenecks as necessarily indictments of the rapacity of the War Office. The fault has been at least as much with industry and the Government's industrial policy. The plan upon which the allocation of manpower has been based by the Government presumably took as its datum the greatest possible economy of labour and skill in civilian work; and it is this that has been most lacking. Even now, the nation's workers are not divided into two competing pools—those in the forces and those in essential work; there is a third pool of those who, in the context of total war, neither toil nor spin, whether they are actually working or not. An article on page 409 shows how the Germans have had to travel the same harsh road in search of manpower; and how, in this country, the recruitment of labour by registration and mobilisation and the release and economy of labour by the curtailment of civilian industry, concentration and rationalisation have lagged belatedly in contrast, because of the Nazis' totalitarian start. The demand of the forces here are onerous, not so much because their planned size is generally too large, but rather because the best use is not yet being made of industry's labour force. It is not the plan but its timing that has gone wrong.

There is a case, when the plan has run out of gear, for improvisation; for releasing coalminers and farm workers from military service, even though, had the plan advanced

evenly in all branches, their release might not have been needed. It is the end not the means that is important. Still more, perhaps, there is a case for contemplating the German practice of a dual purpose army (described on another page) in which, in the lulls between battles, trained soldiers go back to work in their factories while skilled workers are trained for fighting or military maintenance; so that, except now when the vast demands of the eastern front have forced Germany to overmobilise, the trained army is steadily increased in size without cutting down the labour force of industry. Mr Churchill is opposed to interchangeability. He will not have the existing formations "pulled to pieces and gutted"; and there is one important difference between his position and Hitler's, which goes a long way to justify his standpoint. Hitler has used his armies when and how he has himself decided. He had been able to command the lulls and the campaigns. But the British forces have constantly to be on the watch; the initiative is against them.

Nevertheless, there is probably much more than the Prime Minister will publicly admit in the projects for releasing special workers temporarily. It may be, too, that the Government's manpower plan is, in practice, over-spartan, in its calls upon the ingenuity and inventiveness of industry. The trouble comes, for the gearing and timing of programmes, when one part of them has to be scaled up; when the output of planes had to be pushed up hugely after Dunkirk, or when the programme for tanks had to be drastically revised this year, or now when the need for massive help to Russia trips away planes and tanks and equipment for which men are earmarked to man and maintain them. These are the fortunes of war; the kaleidoscope flickers, and the plans are out of joint. But far too often it has been because the programmes have been set much too low to begin with; and it is only the present plan, the output budget brought in by Mr Churchill last March, that has inspired any confidence of its sufficiency. It is obviously true that the advent of Russia into the war has entailed considerable revisions, a scaling-up here, a cutting-down there. There is no intention now of increasing the army's numbers. It is true, too, as most people with acquaintance with the army would admit, that however apt the higher plans may be for making soldiers hardened, alert and highly skilled, they too often lose effectiveness, apart perhaps from the training of actual mechanics, in their translation by local commanders. But, on balance, the dilemma that has brought Transport House's leading figures into indignant conflict must be resolved by civilians, not soldiers. The problem is to make the most of the manpower available: to bring in more women from non-essential trades and from idleness; to transfer still more men into war industry from work, clerical, professional and industrial, which, at the present pinch, can well be done without; to concentrate industry (essential and non-essential) with a ruthlessness which the so-called Lyttelton scheme, now completed, never attempted; and to rationalise the processes and standardise the products of industry.

It is a problem which is so much based upon large-scale dilution that Sir Walter Citrine himself can help greatly; and one which Mr Bevin, who has at last brought himself to call up the younger shopgirls aged 20 to 25, can make or mar by the degree of his determination. It involves large welfare schemes organised and financed by the State. It involves compensation for condemned activities, so that the fear of causing losses by cutting non-essential output drastically will be removed. It involves some pooling of the financial interests of separate firms so that their autarky does not impede the policies that the world's need requires. As a letter on page 414 urges, it involves the removal of all proved financial impediments to the flow of labour and the pace of production. Above all, it involves the wholehearted co-operation of all citizens in the performance of their duty.

The country is still in danger. That was Mr Churchill's message. It will not be saved by great argument between public men, but only by a wise policy which will drain every ounce of effectiveness out of every resource at the nation's disposal. That is the economics of war.

Revolt in Europe

FROM most of the German occupied territories in Europe come reports of a new wave of sabotage and resistance, and a corresponding counter-wave of German repression and reprisals. The scale of revolt is more serious and far more widespread than on any previous occasion; and the steps taken by the German authorities are as a result more ferocious. The chief centres of unrest are, in the south east, the mountains of Serbia; in the centre, the Czech protectorate; in the west, industrial occupied France; and in the north, Norway. But ripples of resistance extend far beyond these areas. The signs of revolt are visible even in nominally unoccupied territory. Vichy has introduced an entirely new policing system on Nazi lines; and every report from Italy confirms the existence there of widespread criticism and even of violent local revolt.

The Germans are meeting this new mood with complete ruthlessness. It is the first sign of serious internal resistance, and the Nazis are obviously determined to make the punishment exemplary. Martial law was imposed on Norway in August; the shooting of Laval was the signal for almost daily executions of "Communists" in France, sometimes twenty and more at a time; the Serb guerrillas, the *Chetniki*, have been active enough to draw three more German divisions into Yugoslavia for "policing duties." Latest of all, Heydrich, the coldest killer in Himmler's entourage, has taken over the duty of "protecting" the Czechs during the diplomatic "illness" of Von Neurath. His arrival was the signal for martial law in the Protectorate.

The resistance is naturally concentrated on impeding the German war effort. Sabotage of a variety and ingenuity new to Europe is being practised from Narvik to the Peloponnese. Arson, crop destruction, derailments, machine wrecking, ca'canny—all these, and countless variations on the same themes—are the nightly business of thousands of courageous souls in whom Russian resistance has roused new hope and new initiative. It is a moving and terrible spectacle—a darkened Europe through which the tramp of the Nazi guards re-echoes and their voices ring into the night, challenging every sound and movement; and behind this façade of vigilance, a host of nameless men, working in silence with pliers and saws and acetylene flares, pulling at the proud structure, dislocating here a line, there a dynamo, there a storage plant, like death-watch beetles in the floor of Europe.

The danger for Britain and the United States is that the spectacle is too moving and too engrossing. It leads almost inevitably to the picture of Hitlerism tottering to destruction under the pressure of its internal contradictions. It provides a painless way to victory. It increases complacency and with it inertia. The picture of sabotage is incomplete unless it is set against its background—the industrial and agricultural resources of Europe organised to capacity to feed the German war machine. Ever since March, 1938, when the German invasions began, the tendency has been to think of the added territories in terms, not of increased war potential for Germany, but of added administrative inconvenience and political peril. Even to-day, occupied territory conjures up the picture of the saboteurs rather than of the dumb millions who are working because they must—for bread.

Since 1938, the resources of almost all Europe have been added to Germany's war potential. The pre-war deficiencies in such crucial materials as iron ore, bauxite and copper have been largely made good. The liberal German coal supplies for fuel and for synthetics and substitutes have been vastly increased by the addition of Polish, French and Dutch supplies. The industrial capacity of the Reich has been enlarged by the addition of at least six highly developed heavy industrial regions, and the Germans' absolute control has enabled them to rationalise and adapt production in all these areas to suit German

ends. Industrial areas previously working under the hampering conditions of three different political administrations—such as Silesia or the Ruhr-Lorraine triangle—have been unified; competing industries have been merged or cartelised; non-essential industries have been transferred to war work. Germany's chronic shortage of manpower has been eased by the addition of workers of every European race, partly on a forced labour basis, but, far more widely, on the ordinary basis of a living wage. The fact that trade union regulations have been everywhere abolished or relaxed has enabled the Nazis to take in an enormous slack among the men previously employed, quite apart from drawing in those previously without work. The extent of this integration of employment is illustrated by recent advertisements for Dutch agriculturalists to take up well-paid jobs in the Ukraine.

It is against this background that the importance of sabotage can be properly assessed. When railways are blown up or bridges destroyed, the damage must be set against the flexibility and choice of alternative routes which the Germans enjoy because of their control of all means of European transit and transport. When ca'canny reduces output—as it is reported to have done in Bohemia—by some thirty per cent, it must be recalled that the other seventy per cent might have been destined for the independent army of the Czechs or the Allied armies. When German soldiers are needed for extra police work, or there is a dearth among well trained German bureaucrats, the inconvenience must be offset by calculating the extra output of the men who have to be administered and controlled. Only if the amount of sabotage counterbalanced all Germany's gains from conquest would there be point in thinking and writing about a "tottering" Reich.

This is not to say that sabotage is not of immense significance to the Allied cause. Only in the hour of victory will the peoples of Europe begin to realise all they owe to the battalions of forgotten men whose weapons were the screwdriver and the petrol rag, and whose reward was often death. But it is vital—if these men are not to have died in vain—that their sacrifice should not be used as one more excuse for avoiding sacrifice in the still free countries. Sabotage cannot meet the steadily rising flood of German production. That can be done only by counter-production on the same scale. The illusion that time is on the side of the Allies dies a lingering death, even though the Panzer divisions which smashed Poland were built after Munich, the Panzer divisions which smashed France after the Polish war, the Panzer divisions which are smashing their way into Russia after the fall of France. Each time, the Germans struck with more force, because they had a greater war potential behind them. This progression gives the measure of the blow which would fall upon this island if Russia's industrial areas were to be overwhelmed.

On his arrival in this country, Mr Biggers surprised some by commenting that in mid-1943, on the basis of their present programmes, Britain and the United States would have outstripped the total output of German Europe. Similar calculations were made in 1939 and in 1940, fixing an earlier term for the overhauling of the German colossus, which has since grown by what it has fed on. It is still ahead. Sabotage can deflect its step a little. Widespread sabotage may even make it pause and stumble. But the only way to overtake it in the race for victory is by a burst of productive speed and energy in Britain and the United States such as they have not so far even envisaged. The saboteur is the far-flung advance guard of the Allied attack. Unsupported, his little effort will cost the Germans a bullet and him his life. Sabotage is a call to action, not to relaxation. The forgotten men of Europe are taking up the cry of Britain last year, "Give us the tools. Together we can finish the job."

Economics of Alliance

THE Moscow Conference on supplies to Russia took a long time to muster. But the representatives of Britain, the United States and the Soviet Union have worked at very high speed; reports from sub-committees on military, naval, air transport, raw material and medical supplies were called for on Monday, and the Conference ended on Wednesday. This meeting means a further advance in the economics of alliance. Its success in bringing quick aid to the eastern front will inevitably be hampered by the enormous difficulties of organising large-scale traffic into the Soviet Union. But there is reason to hope that its deliberations have recognised that the three Powers—including even non-belligerent America—came together, not primarily as debtors and creditors, but as co-operators to share out a single stock in a common cause.

When Hitler went to war it was plain that the entire resources of the world beyond the British blockade and outside Axis hands would be his foes and could, finally, be his masters. Time was on his side if he could score his victories singly, before these resources could be marshalled and pooled; and, though the sands are running out more rapidly now, it remains his *aide* while any inhibitions remain, nationally, upon total mobilisation or, internationally, upon total alliance. First Britain and now the United States have fought against the temptation, in their domestic affairs, to regard war-making, or defence, as an extra industry, instead of as the whole of wartime economic activity; and, in the world field, the fact that friends and allies in total war must move in concert, and not in parallel, has been blazoned by a detailed series of disasters in the field.

On the eve of France's fall, Mr Churchill made his offer of common citizenship. It was a symbol of alliance. How the arrangements between France and Britain for a common war effort really worked, no one but the two countries' leaders at the time knows. Certainly they failed completely in the only test. But the joint plans made, not simply through the Supreme War Council for action in the field, but for a common policy in trade, in shipping, in currency and banking and in output, represent historically the most remarkable administrative experiment of wartime. They were nugatory because the scale and character of Allied strategy were entirely lacking. Neither France nor Britain was, in any total sense, at war while they waited for May, 1940.

When President Roosevelt transcended neutrality by denuding the United States of weapons in 1940 to bolster Britain, alone and stripped at Dunkirk, a new chapter in alliance started. Lease and Lend sounds its *motif*; and the President's "garden hose" is its symbol. Cash and Carry could no longer ensure access for the free peoples resisting aggression to the large part of the world's stock of materials and equipment which is counted in the wealth of America. The measure of Lease and Lend is neither appropriations nor orders nor deliveries; it is the fact that, inescapably, from March, 1941, and even before, representatives of Britain and the United States had to sit and consult together on the best uses and the best places of employment for the war materials of the western hemisphere. Hitler's war had made them, not merely friends across a counter, but joint administrators of half a world or more of materials, plant and labour.

It is rightly laid down in the constitution of the new Board of Supply Priorities and Allocations in the United States that there is no intention of subordinating American policy to that of any other country; just as the British Government is pledged not to use leased and lent materials to the disadvantage of American manufacturers. But there is only one stock of material resources, in the British Empire and Commonwealth, in the United States and in the Soviet Union, to be shared, in the most economical and effective way possible, between the war economies of the belligerents and the defence economy of America; and the task of allocation must at bottom

be a joint one. The report that, for the next ninety days, President Roosevelt is to send all instead of half the defence output of the United States to Britain and Russia has been officially denied. But, like the symbolic gesture of the British Government in deciding to send a week's output of tanks to the eastern front, such a report does mark the kind of economic decision which the three parties to the Moscow Conference must have found themselves brought to make freely in the allocation of their means between the competing ends of world defence.

It is because this process of allocating what is in the last resort a single limited stock of resources is the core of international, no less than of national, war economics, that alliance, whether joint action in battle or non-belligerent co-operation in defence, is not all immediate gain. In 1939-40, the supplying of France and the French forces by sea was possibly a heavier strain, on balance, upon British shipping than the first frustrated campaign of the U-boats. The subtraction of British resources, of materials, ships and equipment no less than men, to bolster resistance in the Balkans, unsuccessfully, was an inescapable but hard decision. For a long time, it was argued that a passive rôle on the part of the United States would serve the Allied belligerents best because their calls upon American defence output would not be disturbed by the claims of the expanding forces of the United States itself; and it is a fact that the equipment of the American army, as it grows, and the furnishing of the American navy, as it takes on wider and more active duties, with tankers, auxiliaries and additions, are powerful items in the schedule of charges on the common stock. The choice, at home, between using an additional supply of men to make, man or maintain military equipment is paralleled, in the wider international sphere, by the choice between using an addition of ships for materials, foodstuffs or war supplies, for Britain, the Middle East or Russia, or the choice between using an increment of American resources for United States defence, British output or replacements in Russia.

The case of Russia is the plainest of all. The transformation of 180 million people and their resources from a sceptical non-belligerency to unreserved alliance, a transformation made by Hitler himself when he attacked in June, can be to the Allies the decisive gain of the war. But, so far, it is only an asset, economically, in the great losses that are being inflicted on the enemy, whose supplies of men and material are being sliced away, though his power to produce—still at a greater rate, in German Europe, than Britain and America—stays intact. Directly, it is a liability. As the Russians retreat or stand stubbornly at bay, they are losing massively in equipment and, through the capture or investing by the enemy of rich industrial areas, in the power to replace it. Only if Britain and America can fully discharge their liability to make up these losses can the asset of the Russian alliance be realised; it is in their own interest, as well as in payment for the valour and the sacrifice of the Russians in the struggle, to meet this liability by every means.

Alliance, then, is a matter of allocations and priorities, not of trade or exchange or barter or the *quid pro quo* of accounting autarky. In terms of war potential, it is Hitler's strength that he has been able to impose this fact upon the industry and agriculture of Europe. Against him there are the entire resources of the free world, valueless if they are not used against him and wasted if they are not economically and strategically apportioned between the belligerents—Russia and China as well as the British nations and the Free Europeans—and between the battlefronts. There are bottlenecks, shortages and a regiment of obdurate difficulties in their apportionment. But, fundamentally, these are not due to the increase in actual claims upon the stock of resources, as the war has spread and as the number of belligerents has grown; the war was a world war when Hitler started it, and it was always only

a matter of time before it became actually world-wide. They are due to lack of vision: lack of vision by the individual countries, in or outside the war, who have believed that they could limit their liability to marshal their strength; and lack of vision by the nations together who have only been shown, by shocks and disasters, that the one way to defeat total aggression is by the pooling of their strength in total alliance. Potentially, the claims upon the free world's resources were as great in September, 1939, as they are now, two years later; and it was the failure to take the measure of the task then that causes the Powers to have met at Moscow this week to share out a common stock that is far smaller than it could, or will, be.

The lesson of Moscow is twofold. For every free nation, it is that nothing, in time, in effort or in sacrifice, should be spared to increase, by expanded output, the resources available for the defeat of Hitler; the talk has been too long of the defence of nations and too little of the destruction of the aggressor. For the nations, the lesson is that they must act still more together in concert and still less, autarkically, in parallel. The invention by Mr Roosevelt of Lease and Lend started a new era, after the abortive trial of complete alliance made by Britain and France. From Lease and Lend—and aid to Russia, even if for cash, is part of Lease and Lend because it is a drain on precisely the same war chest—springs the need for the nations to confer together, not simply on the share-out from the chest, but on the use of materials, plant and labour to replenish it and on the use and disposition of machines and equipment from it on the battlefronts. Hitler's enemies, whether they are formally prepared to meet him in battle or not, are so "mixed up" in the economic tasks of their association that, willy nilly, they have a mutual say, not only in the trade, production,

consumption and industrial mobilisation of each other, but in their tactics and their strategy. "At every stage (the Prime Minister said on Tuesday) we have to consider the interests of our Russian ally and the outlook, wishes and actions of the United States." It is more than a parallel movement. It is an "involvement" which goes far deeper, in its repercussions on the associated nations, than most of the plans of Federal Unionists.

This is the Mississippi flood that Mr Churchill heralded. It needs its institutions still for the winning of the war; and it can lap over into the winning of the peace. Dr Van Dusen said in his broadcast postscript on Sunday that the question is not whether the United States will come into the war, but whether the United States will stay in the peace. The same is true of all the nations. All the Allies have endorsed the Atlantic Charter, which offers equality of trade and access to materials to every people. They have set up a bureau to survey the immediate economic needs of liberated Europe. In Britain, there is already an organisation under Sir Frederick Leith-Ross to supervise the purchase, storage and distribution of surplus produce, and Sir Frederick has just gone to confer with the American Economic Defence Board which, *inter alia*, has the same task of correlating economic defence and post-war economic reconstruction. The needs of Europe and of primary producers will march together.

In wartime the economics of alliance dictate the utmost co-operation between "sovereign" states in the use of their common resources. The lesson is no less valid for peacetime. The stock will still be common, and the crucial test still where this or that resource can be most economically and most efficiently used. The war will only be won by co-operation between allies and the mobility of their resources; and the same will be true of the peace.

Colonial Constitutions

LAST week, the centenary of the rule of the White Rajahs in Sarawak was celebrated by the grant of a constitution from the present ruler. Sir Charles Brooke has now surrendered his absolute powers; henceforward he will govern through a Council of Negri, composed of 14 official members and 11 unofficial representatives of the people, which will be the sole legislative authority, and a Supreme Council, consisting of no fewer than five members, of whom a majority must be members of the Sarawak Civil Service and members of the Council of Negri. Through this Supreme Council the Rajah's executive powers will be exercised.

This is not a very big step towards self-government. Most British colonies have a legislature of sorts, and there is apparently no question yet of giving the people of Sarawak the right to choose their representatives. Nevertheless, the new constitution is an illustration of what Mr Churchill in defining Point 3 of the Atlantic Charter called "the progressive evolution of self-governing institutions in the regions and peoples which owe allegiance to the British Crown." It also serves as a reminder of the widely differing progress towards independence which the different colonies have achieved. It comes in the same year that has seen a new constitution put into force in Trinidad and universal adult suffrage proposed for Jamaica.

The Trinidad reforms were so disappointing with regard to the basic problem of giving the people a wider say in the colony's government that the Jamaican Reform Bill was by contrast especially welcomed. Yet, towards the end of August, the Legislative Council of Jamaica rejected the proposed constitution, which besides granting adult suffrage would have put the elected members of the Council in a majority and given the nominated unofficial members the right to vote as they pleased. It is clear from the discussions that took place in the island before the debate in the Council that there was a considerable amount of reservation about some of the proposals. The People's National Party, which has been foremost in the plea for universal suffrage and full self-government, objected to the extended powers given to the Governor and to the

separation of the executive from the legislature. Nevertheless, it was prepared to accept the new constitution if the Colonial Office would agree to modification on these and other points, and it has roundly condemned the decision of the Council—where, incidentally the party is not represented—calling for its dissolution and for an appeal to the country on the whole issue.

The next move lies with the Governor and the Colonial Office. Obviously the decision of the Legislative Council is not the decision of the people because of the very unrepresentative nature of the Council which the new constitution was intended to remedy; and matters cannot be allowed to rest as they are, since a majority is in favour of reform.

The wisest course would probably be to modify the new constitution on the lines suggested by the People's National Party, for its demands are not altogether unreasonable. Its chief amendment to the proposals as they stand is, first, that elected members of the new Legislative Council should be given certain executive offices, to be confined at first to a few selected departments, but gradually extended to all. The Ministers, for such they would in fact be, would be nominated by the Legislature and would be ex-officio members of a Privy Council with executive powers. It is impossible to say whether the Jamaicans have reached the stage of being able to assume responsibility for the conduct as well as the deliberation of their affairs. Most probably they have not. It is likely that, in the first-flush of enfranchisement, they will return irresponsible demagogues such as Alexander Bustamante—the trade union leader at present detained on security grounds—who will claim to have won them the right to vote. On the other hand, it is difficult to see how the Jamaicans—or, indeed, any people at a similar stage of development—can ever become administrators if they are not given the chance to learn. For that reason, the PNP proposal for a limited form of executive responsibility to begin with seems a reasonable compromise. But its demand that the Governor should have no overriding powers is more questionable. At the present stage, while the people are

learning the responsibilities of government, the Governor must have some overriding powers; the checks and balances of party government, as Britain knows it, cannot be acquired in a day, and it is possible to envisage important measures, such as the Finance Bill, being interminably delayed because the Legislative Council fails to agree. The Governor is reluctant to use his existing power of enforcing measures; he would be much more reluctant to use his new power in the face of the opposition of a body representing the whole people, unless he was convinced that the measure in question was for their good. In Trinidad, where a similar power has been granted to the Governor, he has given an assurance to this effect.

Whether the PNP would agree to a compromise, and whether the Legislative Council would accept its terms, is not at all clear. Nevertheless, a compromise is worth trying, if only because the present situation is so deplorable. But if one cannot be reached, then the Colonial Office might seriously consider withdrawing what semblance of power the present Legislative Council has. In many ways, this would obviously be a retrograde step. But an out-and-out benevolent despotism would be preferable to the present system by which a plutocracy—or plantocracy, to use the happy term coined by the Parliamentary Commission to British Guiana—obstructs the despot whenever he tries to be benevolent.

The Jamaican constitution is something of a test case. For constitutional changes in the West Indies are in the air, and on the fate of the proposals for Jamaica may well depend the progress of reform in the other colonies. A new constitution for British Guiana, whose present one is one of the most reactionary of all, is already under consideration; and a similar constitutional basis in all the West Indies is necessary to pave the way for federation, which itself must be an essential condition of further self-government.

The problem of constitutional reform is not, of course, confined to the West Indies. Indeed, its progress there is already awakening similar aspirations in West Africa; and the West African Students' Union has passed resolutions in favour of the introduction of adult franchise in all the colony areas of West Africa, the reform of the legislative councils and the appointment of at least six Africans in the Governor's Executive Council in each colony. It also resolved that the object of indirect rule in Nigeria should be the establishment of a United Nigeria with a Federal Constitution, and that whenever, during the operation of indirect rule, "there is any conflict between the old and the new order, democratic considerations should always prevail."

Self-government is the goal which Britain holds out to all its dependent peoples; and when it is withheld from those who are ready for it, it is because the interests of a minority, or majority, who are not ready, must be safeguarded. This is well illustrated by the present situation in Rhodesia. Self-government was granted to South-

ern Rhodesia with the proviso that the consent of the Dominions Office must be obtained before any legislation affecting the natives can take effect. In practice, however, this watching brief on behalf of the natives appears to be ignored; it has certainly not prevented the Southern Rhodesian Government from passing, and the Dominions Office from agreeing to, the recent Land Apportionment Act, which discriminates shockingly against the natives. Moreover, that Government is now pressing hard for the amalgamation of the two Rhodesias as the basis of a future Central African Dominion, which, if it succeeded, would mean that another one and a-half million natives would be placed under its jurisdiction. The Colonial Office has so far firmly refused to agree to amalgamation; but the situation has been complicated by the birth of a spurious Labour party in Northern Rhodesia, composed only of Europeans, which, at the recent elections, obtained a majority in the Legislative Council with amalgamation as the first plank in its platform and demanding that the Colonial Office's statement that native interests are paramount should be withdrawn. It is worth noting that the Northern Rhodesian native has no vote, and it would be a travesty of trusteeship if the Northern Rhodesian Government or the Colonial Office were to be influenced by the new party, in spite of its apparent election success.

Difficulties will always be greatest where there is a European settler class, both because this class, unlike the colonial servant, is not selected or trained for the purpose of educating the native to self-government but by instinct looks down upon him, and because, also by instinct, it insists on something approaching as near as possible to the British Parliamentary system, whether such a system is suitable to the circumstances of the colony or not. But problems such as these do not invalidate the general principle that self-government must be the objective of colonial policy. In the Romanes Lecture this year, Lord Hailey, while admitting the difficulties, said that the "principle has behind it all the force of a sentiment which is deep-seated in the British character. . . The instinct of the British people . . . is to attach to the grant of political rights the importance which others have given to the acquisition of social and cultural equality. In their view, we should fail to discharge the duty of a trustee did we not give to our dependent peoples the fullest opportunities for developing their own sense of national consciousness and for acquiring the control of their own affairs."

British colonial policy has in the past stressed this ideal to the exclusion of material development. Now that the balance is being redressed by the Colonial Development and Welfare Act, it is important that the things of the spirit should not in their turn be forgotten. There should be no reason why the colonial peoples should have to choose between good government and self-government, between bread and the vote. The aim of colonial policy must be to give them both.

enabled to take "a more expansive view" of import programmes. Food reserves are higher than at the outbreak of war, and far higher than they were twelve or eighteen months ago; and the Prime Minister suggested on Tuesday that the Minister of Food would be able to make an appreciable improvement in the basic rations of the whole country, as well as in the quantity and the variety of meals for heavy workers in the coming winter. It was perhaps with a touch of humour that Mr Churchill summed up the situation by announcing that there would be "better Christmas dinners this year." Actually, it was a remark which has caused some slight misgiving. In another part of his speech the Prime Minister said that transportation rather than willingness or ability would prove the limiting factor in aid to Russia. Many of the transport problems between Britain or the United States and Soviet Russia are land problems; they concern the Persian road and the rail route from Vladivostok. But shipping is a crucial element; and when the Prime Minister says that grave sacrifices and efforts will

have to be made by the British people to help their Eastern Ally, he must surely include in those sacrifices the surrender of shipping space for the greater cause.

It will not be a comforting boast to be the best fed nation in Europe if Russia falls. Russia was brought into the war just when the improvement at sea began; and it would not be any encouragement to know that the Ministry of Supply had had to give way, during this crucial time, when more output is more than ever imperative, to the Ministry of Food in the allocation of the extra shipping space which the fortunes of war have provided. It is essential that the health and the morale of the people should be kept up, and especially that those workers who are bearing the heaviest physical strain of war production should be given extra rations. It is vital that children should be properly fed, and all those in need of special food sufficiently catered for. But it still remains a fact that ships are perhaps the most important single munition of war. They are needed to bring in materials and equipment from the United States. They are needed to carry materials and equipment, not only to Russia, but also to the large Allied force which is standing on guard in the Middle East. They are needed to serve the navy and the army wherever military or naval action may be possible or necessary. They are the means both of defence and victory; and, while there is no evidence that the grimmer and more important aim has, in fact, been lost sight of, it is worth reiterating that they should never be regarded, while the war lasts, as a means of comfort.

Ship Repairing

The recent improvement in the speed of shiprepairing is almost as important as the fall in shipping losses. Mr Bevin was able to reveal in a speech to dockyard men last Saturday that the increase in import capacity, which the Prime Minister spoke of in his speech three days later, has partly been made possible by the speeding up of repairs to damaged ships. In February, Mr Bevin pointed out, the position was desperately serious; and there were hundreds of ships awaiting repairs five months ago. So rapidly have the repairing yards caught up with arrears that now there is scarcely a ship which is not repaired as it comes in. While the pressure upon the repairing yards has obviously been eased by the reduction in shipping losses in the last three months, which must have been accompanied by a corresponding reduction in the rate of damage, the improvement is highly welcome; and the increasing share in repair work taken by United States yards must have been an influential factor.

Russia's Industrial Second Line

If the Ukraine is lost and the Russians fall back on the Don-Volga line, the Soviet Union will lose 61.6 per cent of its pig iron, 43 per cent of its steel, 20 per cent of its machine output, 70 per cent of its agricultural machinery and 60 per cent of its coal output. These percentages are serious, even if they are not crippling. They would become more serious, of course, if Moscow and Leningrad were surrounded. The loss of the Leningrad-Moscow-Ukraine industrial front line would entail the abandonment of over 60 per cent of Russia's total industrial capacity. The second line—the Ural-Caspian Sea area—is unfortunately still very dependent upon the older established industrial regions. A pre-war annual average of 5 to 6 million tons of oil was shipped up the Volga from the Caucasus; special machinery and machine tools have to be imported from European Russia—only one-third of the machinery required in the Ural region can be supplied from local industry; and in spite of an increasing output of steel—particularly of rolled metal—general purpose steel, rails, heavy girders and other categories have to be imported, largely from the Ukraine. Nevertheless, the Ural region now produces one fifth of the Union's iron and one quarter of its steel; Magnitogorsk is responsible for 65 per cent of the Union's rolled metal; and at Sverdlovsk, Novo-Tagil and Chelvabinsk there are plants producing all types of machinery and machine tools. The basis of heavy industry in this area is the extraordinarily rich iron ore reserves in the Maknitsny mountains and coal brought in from the east, from Kuzbass and Karaganda, districts in Western Siberia which must be grouped together with the Urals for the purpose of considering Russia's industrial second line. Kuzbass and Karaganda have great mineral reserves of their own. Unfortunately, the Russians

have only been able so far to scratch their surface. Still, according to the 1942 programme, over 35 per cent of the Union's total output of pig iron, steel and rolled metal is to come from this "second line." These figures are among the data which have been before Lord Beaverbrook and Mr Harriman on the conference table at Moscow. They illustrate Russia's ability to continue the struggle. Allied help will therefore not be wasted. But they also illustrate Asiatic Russia's extreme dependence upon the older industrial regions of Russia-in-Europe. Lord Beaverbrook and Mr Harriman have promised that all Russia's needs will be met, and this must mean that supplies of weapons, of machine tools, of special steels, without which the Urals cannot carry on, will be supplied from the older industrial systems of Britain and the United States.

The Advance on Kharkov

The battle for Russia continues to follow the same pattern. In the north, round Leningrad, Von Leeb's battering has failed to carry the Germans any nearer the defences of the city, and in some areas the Russians actually claim an advance. In the centre, Timoshenko is still flattening the Smolensk salient, and this week his attacks have been to the south, in the direction of Gomel. However, they have

not been on a sufficient scale to ease the pressure on Budyonny, and in the south the retreat continues. The Russians have abandoned Poltava, and neutral sources hint at a German advance to encircle Kharkov and the Donetz. These reports are premature, but the great industrial region is undoubtedly in jeopardy, and there seems for the time

NOTES OF THE WEEK

The Use of Ships

Mr Churchill told the House of Commons on Tuesday that British, Allied and neutral shipping losses for July, August and September were only one-third of the losses suffered in April, May and June. Since June the practice of publishing regular statements of shipping losses has been abandoned; but it is possible to deduce from the fact that losses were 1,400,000 tons in April, May and June, that losses in the next three months were just about 470,000 tons, which (without any allowance for later news of additional sinkings) represents a monthly average of some 157,000 tons—which is still, of course, a grave wastage. The real problem which faces this country is the best use which can be made of the margin over estimated shipping losses which has been secured by the successful patrolling of the British and American navies. Mr Churchill spoke of the likelihood that several million tons more will now be imported than the figures which he gave in private to the Commons earlier in the year. The Government is

being little hope that Timoshenko's blows at the centre or Budyonny's reorganisation in the rear can finally stay the German thrust. This being so, the Russians are faced with the possibility of having to retire to the Don-Volga line. The German strategy in that case might be to press northwards—to encircle Moscow, or southwards into the Caucasus. Of the two courses, the latter is the more likely. The drive south could cut the Russians off both from nine-tenths of their oil supplies, and from the Iranian supply route, while an encircling movement northwards would be effective only if Von Leeb's armies were ready to complement the manoeuvre by a massive advance southwards from Moscow. There is evidence that, had Leningrad fallen sooner, the German plan would have included the shipment of reinforcements up the Baltic and the flooding of the northern front. But Von Leeb is bogged in the mud and rain of the Leningrad suburbs. The main front is therefore likely to remain in the south.

Conferences in the Middle East

All is quiet in Iran, and the reports agree on the ease and good will with which the British and Russian forces are carrying out their joint tasks. General Wavell has visited Teheran and had a long conference with General Novikov, the commander of the Russian forces in Iran. The meeting led inevitably to the rumour that a joint Anglo-Russian Command would be established at Tiflis and a BEF despatched to the Caucasus. Such reports are premature, to say the least. The despatch of an expeditionary force anywhere entails the most careful preliminary discussion, preparation, allocation of effectives and materials, planning of transport and commissariat and a hundred other details. All that can be said so far is that the preliminary discussions for the full utilisation of the Caucasian front are under way. The agenda of the meeting between the British commanders in India and the Middle East held at Baghdad was significantly "to work out full details of co-operation between India and the Middle East regarding the anti-Axis front now established in Syria through Iraq and Iran to the left flank of the Russian armies." For the time being, the creation of a network of transport across Syria and Iraq and from Basra to the Black Sea is the first call on the energy and initiative of the men on the spot. A start has been made by the appointment of Sir Godfrey Rhodes, the general manager of the Kenya and Uganda railways, to be controller of the Trans-Iranian railway. Sir Godfrey has the opportunity of proving himself to be the British Todt.

The Battle for North Africa

Reinforcements are reaching both sides in the Near East, even though British convoys appear to have fared the better in the hazardous passage. Very severe losses were inflicted upon some Italian convoys last week; and this week there comes the news of a British convoy running the gauntlet of repeated Axis air attack to reach port with only one merchant ship and the crew of one naval aircraft lost and H.M.S. *Nelson* slightly damaged. All this movement can mean only one thing, that the campaigning will soon begin again, and this is borne out by the season; it is the sixth anniversary of the opening of the Abyssinian War, and time, therefore, for the autumn campaign. The British public are feeling, inevitably, a little bewildered about the situation on the Libyan frontier. They know that three-quarters of a million men guard the Middle East and that the Germans have virtually no spare reserves. Yet very contradictory statements have been made on the question of who holds the initiative on the edge of the desert, and Mr Churchill's expectation of "very heavy fighting" in the East in the spring is rather disconcerting. Here in North Africa is the British Army's only land front. Libya is a key to French North Africa, and if the Germans are given time to switch once more to the west, French North Africa may be the key to the Battle of the Atlantic. The position at the western end of North Africa is confused and unsatisfactory. M. Buisson boasts that Dakar is twice as strong to resist attack as it was a year ago, and there are very circumstantial accounts of the extent of French reinforcements to Morocco and West Africa. There are even reports of French-German-Spanish staff talks and the co-ordination of French North Africa defence under the direction of General Rintelen. That Darlan would have

no objection to any such arrangement can be taken for granted. Weygand is powerless because he is isolated and alone. But the arrival of British divisions at the frontiers of Tunis, coupled with offensive action in West Africa, might turn the scale. The layman and the outsider obviously cannot assess the military difficulties involved; but at least he can appreciate the necessity of creating some diversion from the Russian front, and he can see that probably only in North Africa has Britain the opportunity to create a diversion on a sufficient scale.

Critical Days for Mr Fadden

As was expected, the Australian Labour party decided to move the rejection of the Budget introduced last week, and Mr Fadden has treated the motion as one of no confidence. The original wording of the Labour party's motion, which was ruled out of order, was "That while agreeing that Parliament should provide the expenditure requisite for the maximum prosecution of the war, the House is opposed to the unjust methods prescribed by the Budget, declares them to be contrary to true equality of sacrifice, and directs that the Budget be recast to ensure a more equitable distribution of the national burden." But the Budget, which had to provide for war expenditure in 1941-42 of £A217 millions, against £A170 millions last year, proposed no new indirect taxation, and the proposed new direct taxes were steeply progressive. The Wartime Contribution suggested would be assessed on every taxable income, and the scale would rise to 18s. in the £ on high incomes. From the assessment to the Wartime Contribution would be deducted Federal income tax paid in the current year, and State income tax paid in the previous year, and the remainder would be collected as a loan bearing interest at 2 per cent, and repayable after the war. The exemption limit for single persons would be £A100 a year, whereas the present exemption limit for income tax is £A200, but the 210,000 additional persons thus brought within the assessment would only pay post-war credits. Moreover, the trading banks have been requested to keep on deposit with the Commonwealth Bank such increase in their funds as was due to war finance, as a further precaution against inflation. The Labour party seems to have quite failed to grasp that its motion in effect proposes that low incomes should make no sacrifices at all, although without such sacrifices "the maximum prosecution of the war" cannot be achieved. Or else it is just using the Budget to defeat Mr Fadden, in the same way that it used the proposal for a London visit to turn Mr Menzies out of office.

Railways and Transport Policy

Another small instalment in the official serial on the relations between the Government and the railway industry has now made its appearance in the form of a White Paper (Cmd. 6314). From the stockholder's standpoint the statement clears up the major points outstanding so far as the present control period is concerned, and this aspect is dealt with in a Note on page 418. On general policy, there is no further light. During the war the system of subsidy is to continue, with the Minister of War Transport responsible for all charges. Beyond that, all is dark, but for one paragraph—which is by no means simple of understanding.

"Before control comes to an end (i.e., before all statutory rights and obligations as they exist at that time again apply to the controlled undertakings), time will be given for the operation of any statutory machinery governing the level of charges."

This scarcely pellucid example of official prose is of great potential post-war importance. It appears to contemplate that the company's rights, under the statutory peacetime machinery, to seek an adjustment of fares and charges so as to raise their revenues towards standard revenues, shall remain inviolate. The words, indeed, seem to imply that before control is removed, the railways will be able to seek an adjustment of fares and charges, on the assumption that control is to be removed, so that they can face the prevailing level of costs. This will mean, if the Government has been subsidising the undertakings to meet their rent charge, an increase—possibly an appreciable increase—in charges. Much will depend upon the level of post-war costs, and the competitive position of the railways against other forms of transport, whether an appeal to the doctrine of standard revenues will prove either expedient or profitable. As it stands, the phrase does not suggest any perpetuation of control or, indeed, any approach to nationalisation of the railways. But it clearly demands elucidation, for it is a

cumbrous way of describing the preparation of the undertakings for emergence into an uncontrolled post-war world, armed with the Railways Act of 1921 as their only protection.

Labour Transfer

The controversy about "restoring" economic incentives in war production continues. Actually, the issues have become somewhat confused. It is important that the temporary problem should be distinguished from the more permanent. An immediate task is to accelerate the transfer of labour from industry catering for dispensable civilian needs into war employment. This problem of transfer is a problem of transition. Its solution must be worked out on a broad front: by the expanded limitation of supplies to these non-essential industries; by the increased curtailment of civilian demand by rationing; perhaps by the pooling of the non-essential industries with compensation, in order to allow the elimination of redundant firms and the whole-sale release of their labour, for the duration of the war, without destroying them; and finally and possibly most urgently, by the establishment of wage levels in the lower grades of war employment which will make it attractive for workers in dispensable trades to join the army of war workers. The key trouble in this temporary task of transfer is that many of these non-essential occupations were among the most prosperous in peacetime, and the level of wages, especially for women, tends to be generally higher than the wages which prevail for similar workers in the munition trades—which, except for the Black Country, have not as a rule employed women. But to increase the pay of the lowest paid workers in war industries (the differential to be overcome is illustrated in the following Note) is a temporary measure to speed up their transfer. In so far as it is successful, it will be no longer necessary; and the sole problem then will be the more permanent one, which is already vexing the war industries at many points, that is, how to obtain all-round maximum effort.

Earnings in Industry

If earnings in industry, both of beginners and of seasoned workers, were graded in accordance with the nature and relative importance of the various occupations, the redistribution of the army engaged on the home front in accordance with the national interest would no doubt be hastened. If, in addition, the Essential Work Order were applied, not only to the industries which are in need of more labour, but to other trades as soon as their labour force has been brought down to the desired level, the necessary movement of workers could be controlled and canalised. In fact, the earnings of workers in the different industries frequently bear little relationship to their nature and relative wartime importance. The following table, taken from the *Ministry of Labour Gazette* for March, 1941, shows the average earnings of men and women in the broad categories of industry in July, 1940. There have been many changes since then, but it is doubtful whether there has been much alteration in the relative position of workers in different occupations:—

AVERAGE EARNINGS IN THE WEEK ENDED JULY 20, 1940

Industry Group	Youths and Boys (under 21 years)	Men	Girls (under 18 years)	Women
	s. d.	s. d.	s. d.	s. d.
Iron, stone, etc., mining and quarrying...	37 10	74 10	†	†
Treatment of non-metallic mineral products...	42 4	84 9	26 1	39 0

All the above	35 1	89 0	22 4	38 11

† The numbers returned in this group were very small.

There has been a tendency for earnings to increase faster in the munitions than in other industries since October, 1938, the date of the previous official inquiry. Whereas men's earnings in all industries rose by 29.0 per cent between October, 1938, and July, 1940, the increase has been above the average in the case of Government factories and in the metal trades, and well below the average in the clothing, food, drink and tobacco, woodworking and brick, pottery and glass industries, as well as in the public utility services. On the whole, however, earnings cannot yet be said to be graded according to the relative importance of occupations. This is shown even more clearly by the discrepancies within the major branches of industry, though these are partly due to the differences in the nature of the work performed. The failure of earnings to be graded in accordance with the relative importance of the various occupations is largely a reflection of the pre-war wage structure, when standards were different, and of the varying strength of the trade unions. But the movement of labour from certain overstuffed occupations, such as domestic and other dispensable services, is also impeded by the anxiety of a section of the population not to forgo these services and by its ability to raise the payment for them to a level at which an outflow of labour becomes financially unattractive; and the improvement in pay and conditions of work in Government training centres at the end of last March in order to approximate to the remuneration paid by entrants into productive industry has had disappointing results.

Pay and Work

The problem of achieving the highest individual effort throughout war production is still some way from solution. There are urgent problems of welfare, such as billeting, transport, and suitable food for heavy workers. There is also the need for a shrewd appraisal of the way in which pay is related to production. It is now admitted that it is not an increase in the general level of wages, or in the average earnings of war workers that is required, but rather some stepping up of the marginal earnings received for increased effort. In fact, too high an average level of earnings, with only a small increment for extra effort, will obviously work in precisely the wrong way by causing a disinclination to work after a certain level of income has been reached. This has already been noticeable. Wage rates have been very considerably raised since the war started, and the needs of many wage-earners have not yet caught up this expansion in their income, so that, having secured a margin, they are not disposed to increase their effort noticeably—particularly when the incidence of a newly extended income tax tends to cut down their net income per unit of extra exertion. On the other hand, it should not be argued that wages should be fixed so low, as is the case in certain grades of munition-making, that they lead to workers doing an amount of overtime which is as detrimental to output as it is to health and morale. Nor is the point that workers or employers should be bribed to do their job; it is rather that financial considerations should not interfere at crucial points with war production. The important thing is to secure, as has been done in different ways in both Germany and Russia, that extra output is rewarded by extra earnings which are not nullified by the incidence of taxation. It is not

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

so much a question of raising the rewards of war work, as of adjusting those rewards so that there is no temptation for workers to slack off when a certain level of income has been reached—as is the case, for instance, when overtime pay is based on time and not on output, with the result that effort may be reduced during the normal working day in order to conserve energy for the overtime period, as, for instance, when absenteeism in the week is caused by higher-paid Sunday work.

War Finance

It is fashionable to say that finance has ceased to count in the problem of paying for the war. Actually, even if the country were formally and deliberately put upon a basis of complete and universal rationing, the method of financing the war in monetary terms would remain important, not only for its post-war consequences but also for its current repercussions. The technical interest of the six months' revenue returns which were published on Tuesday is discussed in a Note on page 417. As a measure of the gathering speed of the war, these figures are impressive. Expenditure for the first half of the Budget year was £2,236 millions compared with an estimate for the whole twelve months of £4,207 millions. Even if the rate of expenditure does not rise between now and next April, there will be an excess of expenditure over the estimate of between £250 and £300 millions. Actually, the rate of expenditure will certainly increase. At the beginning of this financial year in April, the total expenditure was running at the rate of £10 millions a day; recently the rate has been nearly £13 millions a day, and it is unlikely that the final quarters will not be, as heretofore, the most expensive—in view of the urgent need for extra output over and above the programmes decided upon last March. The belief of *The Economist* that total expenditure, when the balance is struck next March, will be well over £4,500 millions for the full year is made to appear conservative by the latest figures. Revenue, too, in the six months' total of £737½ millions is as much as £285 millions more than in the corresponding period in 1940-41, but £150 millions less than half the Budget estimate for the whole year of £1,786 millions. Actually, although the deduction of tax at source will this year even out tax payments over the twelve months, the second six months is always the most productive, and it is likely that the Budget estimate for the full year will be easily attained. The monetary problem of filling the gap between expenditure on the one hand and revenue plus genuine savings on the other remains. The gap has been and is widening; and the ways and means by which it has been temporarily filled by the creation of additional floating debt and by extra budgetary receipts are shown in a table on page 417.

Freedom to Travel

There has been more than a little coyness in discussions about the post-war future concerning the scale and status of migration after the war. It was a welcome and refreshing event when Sir Percy Bates, in his statement to the Cunard Company as Chairman, spoke frankly about this subject. After the last war, he said, his company's building programme was based upon the desire of many inhabitants of these islands and Europe to travel to North America; and it was dislocated by the restrictions which were placed by the United States, Canada, Australia and the rest of the world upon immigration. "But for these restrictions (he said) there would by 1939 have been some twenty million fewer people in Europe." Sir Percy Bates may not be right in saying that, in that event, "there might not have been enough steam in Europe for Hitler to have been able to cook up this war." But it is certain that a major problem to be solved when this war ends is the freedom to travel. The Atlantic Charter made no reference to migration. President Roosevelt has not included it among the basic freedoms. Nevertheless, it remains true that, in so far as the stability and prosperity of the nations will depend in the future upon the freer movement of economic resources from one country to another, as the need for adjustments to changing market and technical circumstances arises, the right of individuals to seek fresh employment, even though it may lie across foreign frontiers, will remain fundamental. None will deny that, as *The Economist* said a few weeks ago, "There is great force in the contention that overseas trade will prosper most if the nations direct their energies towards the maintenance of a high level of domestic activity and purchasing power." But it is still true that autarky is the enemy of prosperity,

national or international; and for the nations to achieve that equality in trade and in access to raw materials which the Atlantic Charter specifically calls for, it will be as needful for men and women to move as for goods and capital. There is no suggestion that the present barriers and standards should be wholly broken down at a single stroke; but there is every reason for claiming that migration should be made as free as can be made compatible with the recognised demand of each nation to maintain its standards of living and of work. The U.S.A. and the British Dominions are living proofs of the fact that migrants are assets and not liabilities; and the peace of the generations before 1914 is a demonstration of the needed social, economic and political safety valve which a moving frontier for migration provides.

The Non-Essential Industries

One of the difficulties in working out war economy to its ineluctable conclusion is a difficulty of definition. The expression "non-essential" industries tends to be used to cover all kinds of non-armament industries. This oversimplification leaves entirely out of account the fact that the basis of the war effort is the satisfaction of minimum civilian needs. A certain proportion of non-armament industries are essential because they satisfy these essential needs; and the unfortunate result of this confusion between the two kinds of civilian industry is that the toy or jewellery industries, for instance, which are wholly non-essential, tend to be treated in exactly the same way as textile trades, which, in a large part of their work, are indispensable to serve the need of the forces and civilians for clothing which they obviously cannot do without. Clearer thought on this point would make possible much more drastic treatment of the dispensable trades, and a consequently greater release of much-needed labour, as well as a much sounder attitude towards other non-armament occupations, which rank with the food trades as basic items even in a war economy.

Outlook for Milk

The official scheme for the controlled distribution of milk, to come into force on October 12th, has been improved since the first announcements on the matter were given to the public. It is excellent that the scheme of priorities has now been extended to include, not only expectant mothers, infants and school children, but also invalids, schools and hospitals. There is still some obscurity as far as the normal, healthy adult is concerned. It appears that supplies to the average citizen will be based upon, but not necessarily governed by, an officially announced basic share. Where the milk roundsman has a surplus, after distribution of the basic share, he will be able to sell it to his registered customers—which is a wise provision for the sale of a commodity where demand varies as widely as it does with milk. The Ministry of Food also announces that no milk will be used for manufacturing purposes, so long as the demand for liquid milk is unsatisfied—an excellent proviso which, however, does raise the question of how potential demand is to express itself in a scheme where distribution is ordained by the milkman rather than by the customer. Part of the basic share may be made up of full cream, unsweetened, condensed milk imported from the United States and distributed by the dairies, supplies of home and Empire produced condensed milk being handled by the grocery trade as hitherto. The decision to include condensed milk in the distribution scheme goes far to ensure that it will be effective; but it is to be hoped that, where possible, condensed milk supplies will be distributed, regionally at any rate, in accordance with known preferences. Condensed milk is by no means universally regarded as inferior to liquid milk, and the intelligent supply of condensed milk to those consumers who prefer it would release additional liquid supplies for those consumers who do not.

Rumours of Peace

For some weeks in the summer there were persistent rumours of a German peace offensive in the United States. The President even felt obliged to deny that he had any knowledge of such an initiative. The reasons forecast for this manoeuvre included the making safe of Europe against Bolshevism, the inevitability of stalemate, and the duty of the United States to hold aloof from the war in order to quench Britain's bloodlust, and to preserve its enormous moral influence in world affairs. At the time, the offensive petered out or was never launched, but to-day there are

signs that something is afoot again. One of Germany's difficulties in making peace overtures in the United States is the lack of channels of communication. There has been a wholesale purge of Axis officials. Any proposals put forward by the Lindberghites would get little more hearing than offers despatched direct from Berlin. Only one channel exists, the diplomatic corps of Vichy France. These men can speak with conviction on all the arguments put forward by the Nazis. They want the war called off, so that the old life can begin again, even if it is under the aegis of a Gauleiter. They want "Bolshevism" exterminated, for it threatens the old life, particularly in France. They want America to hold aloof, because they know that the "moral influence" of an America that had withdrawn from the struggle would be a real blockade of the old, decadent cycle of social life. So it is perhaps no coincidence that a statement by Fritsch to a meeting of Gauleiters, to the effect that, once Russia was driven back, the Germans would adopt a policy of stalemate and play for a "defensive war," was preceded by a speech from Marshal Pétain, in which he raised his voice for peace and linked the names of the President and the Pope with his plea. The visit of Mr Myron Taylor to the Vatican, and the exchange of letters between Mr Roosevelt and the Pope, give a sort of specious background to the Marshal's speech. The whole incident bears the mark of Goebbels—the attempt to confuse the issue, to trouble the weaker brethren, to sow suspicion and reap division. But, in this case, the attempt has fallen on deaf ears. To the interesting question, what exactly Pope and President did have to say to each other, it is impossible to give an answer, but some observers have linked it fairly convincingly with the unsatisfactory status of Italy in this war. That the Italians have no stomach for further fighting is obvious. It is equally obvious that their only hope of getting out of the war is at a time when the Nazis are heavily engaged elsewhere. If diplomatic procedure could provide an "escape clause," the Vatican would be an obvious intermediary. The question is, however, one of military backing and reinforcements if necessary from the west. As long as the Battle of North Africa is undecided, there can be no question of either.

Frivolous Candidates

In recent by-elections the Government candidate has made none too good a showing. At Dudley, in July, his majority was as low as 1,365, and last week at Wrekin it was only 2,825. Results such as these are partly due to the political apathy which must necessarily follow from the party truce and the absence of big issues to fight over. The Government's majority has been small because many of its supporters have not bothered to vote; they know that there are no "real" elections in wartime. But the fact remains that an Independent candidate secured 4,146 votes at Hornsey in May, 4,869 votes at Dudley, 8,086 at Scarborough and Whitby and 7,121 at Wrekin. These are higher figures than were secured by most unofficial candidates in the early days of the war, most of whom, either as Pacifists or Communists, stood for the straightforward issue of "stop the war." The present Independents are of a quite different order. They stand for nostrums for winning the war or promise the alleviation of war's hardships; and they therefore gain support from some of those who are dissatisfied with the direction of the war or who feel they have grievances. These by-elections consequently have a certain value in that they give added weight to criticisms expressed in and out of Parliament, and the answer to the Independents is at the Government's own disposal. The trouble is that, for the most part, these candidates seem to lack the sense of responsibility which every Member of Parliament should have—especially in wartime when utterances in the House may have unforeseen consequences. Mr Noel Pemberton Billing, for instance, who has contested the Hornsey, Dudley and Wrekin by-elections, and is about to contest Hampstead, as the "Bomb Germany" or "Win-the-War-in-the-Air" candidate, is not likely to be an asset to the House, from which he had to be forcibly ejected in 1918. Mr Churchill has classed him as a "frivolous candidate," and though it is now pretty generally agreed that the average ability of Members of Parliament should be raised, it would be no solution to replace one frivolity by another.

German Manpower

At the end of July, 1939, the German Labour Ministry reported that the total number of employed workers in Greater Germany, that is, in the Old Reich, Austria, and the Sudetenland, had increased to 24.46 millions, of whom 8.13 millions, or 33.3 per cent, were women. The number of unemployed was 50,426. The labour exchanges, the report added, had great difficulties in allocating the workers available, and in finding fresh labour. The total population of Greater Germany (according to the census of May, 1939) numbered 79.4 millions; the gainfully employed persons (*Erwerbspersonen*) numbered roughly 41 millions, or 51.7 per cent.

At the beginning of the war, the regular publication of employment figures was suspended. At irregular intervals figures are published showing the number of Labour conscripts, employed foreign workers and prisoners of war. At the beginning of 1941, employment in Greater Germany, not including the occupied territories, was surveyed in general figures. The total number of employed at the end of January this year was given as 22.67 millions, of whom 8.42 millions, or 37.2 per cent, were women; in addition, a million prisoners of war were employed, making a total of 23.67 millions. From the beginning of the war until the end of January, 1941, it was stated, the following number of extra workers had been recruited:—

Germans:

(a) Men, 500,000.

(b) Women, 300,000.

Foreign workers, 1,150,000 (150,000 from Bohemia and Moravia).

Prisoners of war, 1,000,000.

Grand total, 2,950,000.

These facts—a fall in the total number of employed of 1,790,000, and additional workers to the number of 2,950,000—suggest that the number of men mobilised from the total number of workers at the end of January, 1941, amounted to 3,740,000, in addition to the conscript *Wehrmacht* of July, 1939. It must, however, be noted that these figures cover only one part of the total number of mobilised men; another part comes from the ranks of employers, the professions, the civil service, independent peasants, artisans and shopkeepers; and actually there is no way of arriving at a

convincing estimate of the total number of men mobilised for military service.

The manpower reserves of Greater Germany, since the annexation of Western Poland, Alsace-Lorraine, Luxembourg and parts of Belgium, have greatly increased. Official sources estimate the total population of this new Greater Germany at 92 millions, compared with 79.4 millions for the smaller Greater Germany in May, 1939; and the population of the Polish *Gouvernement Général* is 10.6 millions, and that of Bohemia and Moravia roughly 7 millions. There is no doubt that the total number of workers employed in agriculture and industry in Greater Germany at the end of January, 1941, was only very slightly smaller than in July, 1939.

Control of Labour

During the successive stages of German rearmament, every way of "steering" manpower had already been used; and, at the beginning of the war the conscription of labour for war industries had been in force for more than twelve months. At the end of January, 1941, the total number of men and women conscripted for war work had reached roughly 2,000,000; though the total number of conscripts at work never exceeded more than 500,000, as labour conscription is generally limited to six months.

Two points are most important in this policy of "steering" manpower. Since April, 1935, there has been the annual call up of classes for military training, as well as the extensive short-time training of the classes born between 1906 and 1914. In 1935, the registration of industrial manpower was added to military registration by the introduction of compulsory work-books. During all these years the free movement of workers was more or less restricted. At one time the "flight from the land" had to be restricted; and, at another time, skilled workers had to be prevented from changing their jobs too frequently. When unemployment fell to a low level, workers willing to leave the towns for work on roads or fortifications became very scarce, and compulsion had to be used. The continued shortage of skilled workers, on the other hand, led to rationalisation in factories, and to the extensive retraining of workers for semi-skilled work.

Skilled workers need a much longer period of training

than semi-skilled workers, and the general policy was to use a larger number of semi-skilled workers; and the standardised demand of a rearmament programme favoured the rationalisation of processes. The actual distribution of manpower before the war was regulated in accordance with the priority of public orders. Distribution was carried out by the labour exchanges. From 1938, the combing out of different sections of the economy for extra workers became more frequent, beginning with independent artisans and shopkeepers.

At the beginning of the war, therefore, there were no readily available labour reserves. In contrast to Britain, the transition to war economy in Germany meant that the necessary extra industrial manpower had straightway to be recruited from restricted civilian industries, and from women who were normally without employment. And so long-prepared plans for concentrating production in large-scale armament works and the redistribution of workers were at once put into operation. Most civilian industries were at once reduced to short-time working or closed down. The total number of employed women fell by 500,000; and great numbers of them were retrained for war work. War production was kept at a comparatively high level simply by increasing hours of work to ten and even twelve hours.

At the same time, the free movement of workers was generally restricted. Special permits of the labour exchanges were required for changing jobs; and employers could not dismiss workers without the permission of the exchanges. The redistribution of industries and labour for the purpose of greater concentration was in full swing when the campaign in Poland ended; and the relative quiet in the west gave Germany the chance of demobilising large numbers of soldiers for war work. Prisoners of war were at once employed in agriculture, and great numbers of foreign workers were imported. The recruiting of extra women, however, remained small. The strain of forced overtime work was relieved, as the continued restriction of civilian production freed large numbers of workers for war work.

A Dual Purpose Army

The interchangeable military and industrial armies slowly took shape. The mechanised *Wehrmacht* resembled a vast

workshop. Industry, on the other hand, had been thoroughly militarised in organisation and in the supply of raw materials and labour. There was no need for a complicated list of reserved occupations. Skilled workers in the army are kept on the list of armament works, and are demobilised for work if the situation requires increased industrial effort.

The problem of distributing manpower between the army and industry are basically the same in all highly industrialised countries. In Germany, traditional differences in economic organisation, conscription, and the long-term planning of the German *Wehrwirtschaft* raised the problems which have still to be solved in this country long before the outbreak of war; and, in any comparison, the fact that Germany employs more than two million foreign workers and prisoners of war must also be taken into account. In this country, the limitation of supplies, the concentration of industry, and the control of employment by Essential Work Orders were belated, and, in some ways, unsatisfactory; but the main difference is that Germany has achieved this interchangeability between *Wehrmacht* (the forces) and industry. No Essential Work Orders or concentration schemes can change the actual technical organisation of industries, and the retraining of workers for war work must remain small as long as this necessary process of rationalisation is retarded. The piecemeal registration of men for military service and of men and women for industrial work cannot achieve in months what traditional conscription and the practice of work-books made possible in Germany, when the war came, in days.

In the winter of 1939-40, Germany demobilised the older classes and the skilled workers in the forces for industrial work. But, at the same time, new classes were called up for military training in preparation for the 1940 campaigns. There was more demobilisation after the collapse of France; but the total number of mobilised men fell only very slightly, and again untrained classes were called up in preparation for more military campaigns. The system of complete military and industrial registration makes it possible to select for demobilisation the skilled workers and keymen most urgently needed by industry, while mechanisation in the army makes it possible to improve the industrial skill of the men kept under arms; and a dual purpose army such as the Germans have built up makes it possible to increase the number of trained soldiers without depleting industry of its workers—so long as military campaigns on a large scale are short episodes lasting from three to six weeks.

The Test of Russia

But Germany's preparations for the war against Soviet Russia, and the prolonged campaign in Russia, created new problems. There is every sign in the preparations that a long and hard campaign in Russia was expected—in spite of what the pundits have said about Hitler's "time-table." From the spring of 1941, the number of men called up steadily increased, and now the losses are making new calls on available manpower. At the same time, the production of armaments and munitions must go on—in spite of the huge reserves previously built up. Apart from the fighting troops, large numbers of men are needed to repair and build roads and railways in the conquered parts of Russia.

In fact, the real test of the dual purpose army, and of Germany's industrial capacity, began with the campaign in Russia. A further concentration of work in large-scale factories is well under way, and the process of combing out is now being applied to the less efficient and smaller scale munition factories. More prisoners of war have been put to work, and more foreign workers imported. More old age pensioners have been forced, since the preparations for the campaign started, to return to work. A drive for the employment of married women began in April. The census and employment figures of 1939 leave no doubt that the reserve of unmarried women between the ages of 14 to 65 was virtually exhausted by the beginning of 1941. The reserve on which Germany's war economy can draw are the remaining 12.5 million married women.

Reports from labour exchanges suggest that the response from married women is not very satisfactory. Factories have been compelled to provide half-day shifts for married women; special shopping hours have been instituted for them; and the number of nurseries is to be increased. But the recruiting of married women remains restricted; and, once again, allied and occupied countries are being induced to export labour to Germany. For the first time since the beginning of the war, military mobilisation has outpaced the most urgent demands of industry, and there are signs that another restriction of civilian industries will be unavoidable.

HITLER'S INVASION OF RUSSIA

has afforded one more striking example of the great value of "Keesing's" to all those in need of an authoritative, exhaustive and unbiased work of reference on current events.

"KEESING'S"

places at your finger tips every relevant item in the situation—political, economic, social, military, naval—all over the world, from 1931 up to last week.

"Keesing's" can never be out of date. Each week subscribers receive a new bulletin recording comprehensively the previous week's news, facts and figures. Maps and charts supplement the reports. Any item can be instantly turned up by means of the cumulative weekly Index. A special loose-leaf binding case is supplied to file the issues and indices for permanent reference.

"Keesing's," which recently completed its 10th year of publication, is used by hundreds of "Economist" readers—Government departments, banks, insurance companies, manufacturing and trading concerns, employers' and employees' organisations and business men—as an invaluable information and reference tool. Particulars will be gladly sent without any obligation.

THE WORLD OVERSEAS

Income and Taxation in America

(From Our Washington Correspondent)

September 12th

THE Labour Day week-end has been torn off the calendar and disclosed autumn definitely at hand; a desk-full of post-vacation second-class mail gives a running commentary on the income-v.-scarcity situation, whose importance is daily increasing.

A Department of Commerce reprint from the *Survey of Current Business* announces that the statisticians have at last concluded that the American national income for the year 1940 exceeded \$76 billions, a rise of more than \$5 billions over 1939. And they found that, because of the existence of unused capacity, the increased income largely represented an increase in the quantity of goods and services produced; even after allowing for changing prices and population growth, real income per head in 1940 was above the 1929 peak.

These statements read like a long time back. To-day a \$5 billions rise for 12 months resembles last year's bird's nest, when defence disbursements reached \$1,100 millions for July, 1941. And what does income mean now? The August 26th issue of *Defence*, a weekly summary published by the Office for Emergency Management, has on its cover a chart showing that the June, 1941, output of field artillery contrasted with the average of July-December, 1940, by rather better than 4 to 1. That is the form that real income is taking. But what are people going to do with their money? (There were 39,241,000 non-agricultural workers employed in the country in July, 10.8 per cent more than a year before; employment in 16 defence industries was up 53.8 per cent.) *Defence* gives more than a hint on this point. Of the ten major topics listed in its contents, the following are five: "Critical List Appears in New Form," "Automobile Output Cut 26½ per cent," "Hillman Moves to Foretell Unemployment" (re-hiring and re-training auto workers), "Rayon Grey Goods Put Under Ceiling," "South Urged to Feed Self, Free Supplies."

On August 28th the President appointed a Supply Priorities and Allocations Board, under the chairmanship of Vice-President Wallace; after its first meeting the Board issued a statement which read in part:

We must forgo the less essential that we may have an abundance of the more essential. By less essential industry is meant those industrial activities involving use of materials and production facilities which sap supplies and machinery resources necessary to a realistic all-out defence programme. In some cases this may involve only a part of an industry; in other cases it may involve several parts. Wherever possible to convert the less essential to military or essential civilian production this will be done. Every means will be employed to expedite this process with a minimum loss of time for men and machines. But the less essential must go.

This means cutting off the fat and hardening the muscles. The Board holds that defence comes first, and while recognising that the civilian economy must be kept of non-essentials, it must be kept in good running order and in more than stand-by condition.

To achieve this twin purpose, the Board will devise promptly appropriate controls to assure equitable distribution of materials under a constructive system of priorities, the basic purpose of which is to assure the wisest use of all our resources for the task at hand.

The country's current real income is thus armaments; means, therefore, are being sought to direct civilian spending into payment for these items and away from price-raising competition for limited supplies of other goods. The Bureau of the Budget announced on June 1st a revised budget for the fiscal year 1942 of \$22.2 billions, \$15.5 of which is to be for defence. Mr. Morgenthau advised that at

least two-thirds of the total budget should be met out of taxation. Yields from the current tax structure were estimated as \$9.4 billions; the tax measure currently under consideration by Congress would raise about \$3.5 billions more.

Non-Governmental commentary on this income-and-taxation situation is on the desk in about every possible form. "Taxation versus Inflation," a pamphlet by the National Economy League (an organisation of industrial conservatives whose previous publications have steadily urged cuts in Government—especially federal—spending), recalls a statement of Federal Reserve officials made last January:

Whatever the point may be at which the Budget should be balanced, there cannot be any question that whenever the country approaches a condition of full utilisation of its economic capacity, with appropriate consideration of both employment and production, the Budget should be balanced. This will be essential if monetary responsibility is to be discharged effectively.

The pamphlet suggests that the goal of the new tax measure should be \$10 billions rather than \$3.5 billions, and examines possibilities of reaching it. Extension of the present income taxation is dismissed on the ground that its extension to lower incomes would increase the proportion of the cost of collection to the yield; as to its extension higher—

Disregarding the fact that excessive taxation will soon convince people that a high income is not worth the effort and risk to attain it, complete confiscation of all incomes in excess of \$10,000 would yield the Government only \$2.3 billions additional revenue, and complete confiscation of all incomes in excess of \$3,000 would increase revenue by only \$6.5 billions.

With regard to sales taxes:

If we were building a tax system anew, there would be much weight to the argument that a sales tax is inequitable, but when the existing tax system as a whole is progressive, and steeply so in the higher brackets, there is less reason to fear this consequence.

But the rate of the tax would have to be high if the proper amount of funds were to be obtained from item not exempted as necessities—such as food—or already subject to excise tax.

All in all, the League favours a universal tax on income paid out, collected at the source at the time payment made. The pamphlet states that this tax—

has sometimes been misinterpreted as a tax solely on wages, and has been condemned, therefore, as discriminatory. Actually, the plan calls for tax deductions on a payments of income of whatever sort: wages, salaries, other personal earnings, interest, dividends, royalties

The MERCANTILE BANK of INDIA LIMITED

LETTERS OF CREDIT AND DRAFTS ISSUED

rents and entrepreneurial withdrawals. Thus, it would apply to the entire amount of national income paid out to individuals—a much broader base than that to which a sales tax would apply.

The *Economic Outlook* of the CIO views the matter differently:

President Murray has taken the position that the CIO will support the most effective possible progressive personal income tax system. This means an income tax which begins not lower than the 1939 exemptions of \$1,000 and \$2,500. . . .

The argument is now being made that taxes which bear upon the consumption of wage-earners and low income groups are necessary in order to prevent inflation. This argument is the basis for proposals to spread the income-tax to lower income groups, and to lay extensive sales taxes, or purchase taxes as they have been euphemistically called.

The proposed taxes upon low income groups would not in the present situation do a great deal to prevent the price rises now imminent. . . . The major expenditures of a wage-earner's family are in the three items of food, clothing and rent. According to this index, they take 65 per cent of the income. Possibly 5 per cent of such an income would go to the so-called consumer durables and scarce materials. . . .

It seems perfectly clear that until every possible penny of tax income is taken from the upper brackets of income and from corporation profits, no penny should be withdrawn from families where it will mean less to eat or wear.

As a means of lessening consumer competition for the durable goods whose production is likely to be most affected by the defence programme, the terms of instalment buying were stiffened beginning with September. While instalment payments on consumers' goods are being made more difficult, instalment payments on taxes are being facilitated. The U.S. Treasury Tax Savings Plan, announced in question-and-answer form mailed out by the banks, is a plan starting August 1, 1941, to help the taxpayer to set aside money, during the year in which earned, to pay income tax bills due the next year. Q. How does the plan operate? A. By the taxpayer purchasing the special notes offered by the Treasury Department to be used in payment of Federal income taxes. Q. What are these notes? A. They are direct obligations of the United States issued in the form of Treasury notes and are dated in the month in which the payment is received.

This offering compares with the defence bond and stamp sales begun in 1940, which permits persons with small incomes to accumulate stamps in 10 cents, 25 cents, 50 cents, \$1 and \$5 denominations towards the purchase of savings bonds, maturing in ten years' time. Receipts from these sales, which in many cases are made out of the purchaser's income, are expected to canalise into Government channels some \$3.6 billions of purchasing power in the fiscal year 1942.

Unemployment in Eire

[FROM OUR DUBLIN CORRESPONDENT]

September 16th.

At the beginning of the war the prospect of grave unemployment in Eire engaged much attention, but experience has proved that these fears were partially unfounded. A shortage of supplies of raw materials has caused unemploy-

ment to appear in many industries and in the building trade. Employment has, however, grown in other directions. The tillage and turf-cutting campaigns have absorbed large numbers in the rural areas, while many of the urban potential unemployed have joined the Army and the Construction Corps, or have emigrated. While the existing services for the relief of unemployment by way of assistance and relief works have been fully maintained during the war period, no extraordinary measures have proved necessary. The fact is that, so long as the demand for labour in Great Britain remains at its present intensity, unemployment in Eire will be largely solved by means of emigration. Whether this is desirable from the national point of view raises major issues of policy which need not be discussed here.

Insurance against unemployment is quite advanced in Eire compared with other agricultural countries, but agricultural workers are still excluded from the insurance scheme. In 1936 unemployment insurance covered 30.4 per cent of the occupied population, compared with 21.4 in Denmark, 21.1 in Switzerland, and 3.1 in Canada. At the time of the Treaty in 1921 the British legislation then in force applied to Ireland. This Act was continued, with special benefit periods during which uncovenanted benefit was paid, until 1925. In that year, when the Unemployment Fund was in debt to the extent of £1,300,000, the special benefit periods were discontinued, and in the course of the next few years the fund discharged its debt. In 1930 the scale of contributions was lowered, but it was raised again in 1933, when a comprehensive Act for Unemployment Assistance was passed.

This Act was rendered necessary by the difficult circumstances arising out of the fall of agricultural prices and the economic dispute with Great Britain. In addition to unemployment benefit on a contributory basis, provision was made for the payment of assistance to certain categories of workers who obtain a qualification certificate after being subjected to a means test. The Act provided for the discontinuance of benefits during certain periods of the year for some sections of workers. This provision is utilised annually in order to exclude from the provisions of the Act small holders and men without dependants during the times when employment is normally high. The rates of assistance, which are graduated in accordance with the number of dependants of the recipient and the area in which he resides, were increased in 1938. A married couple without children at the present time receive 15s. per week in Dublin and 10s. per week in a rural area. It was estimated that the cost of this new service would be about £1,000,000 a year. £250,000 was to be contributed by the Unemployment Insurance Fund, the balance being made up of additional local rates and an Exchequer contribution.

Relief Works

In addition to the payment of unemployment assistance considerable expenditure has been undertaken on relief schemes. The difficulties of finding suitable relief works are very great. The work must possess a high labour content; it must be accessible to the districts where the unemployed reside, and must, in rural areas, be available during those seasons in which agricultural employment is low. In the ten years 1922-32, less than £1,500,000 was voted for relief works, in addition to expenditure from the Road Fund. These works, which were administered by local authorities and the Land Commission, were condemned by the Committee on the Relief of Unemployment in 1927 as "demoralising and costly." In the years 1932-39, side by side with the increased unemployment assistance, relief works were also greatly extended. The Exchequer grants during this period exceeded £4,500,000, to which must be added special grants, contributions from the Road Fund and from local authorities. The principal types of schemes undertaken were sewerage and other public health works, the clearing of housing sites, the construction and improvement of roads, and the extraction of peat from the bogs. One type of scheme which proved exceptionally successful was that for the reclamation of waste land. By means of this scheme it has been possible to add to the area under cultivation, and to increase the size of many small holdings. Equivalent benefits have been obtained in urban areas by the creation of allotments for the unemployed.

The great difficulty about relief works is that the supply of suitable works tends to grow less with the passage of time. The shortage of fuel has provided a non-recurrent and temporary resource in the present season, during which numbers have been employed upon the bogs—so many, indeed, as to cause in some parts of the country an acute shortage of agricultural labour. Much has been heard in

popular discussion of the possibilities of large schemes of afforestation and drainage, but detailed examination of these schemes has usually proved disappointing. Afforestation requires larger areas of land than are available in Ireland, and employs very little labour compared with the extent of the capital outlay. Whatever may be the merits or demerits of a large-scale scheme of arterial drainage, such a scheme is not calculated to give much employment. The openings for additional relief works are becoming fewer and fewer, and increased reliance will have to be placed in future on the growth of agricultural and industrial production, and on the resumption of building after the war. As has already been stated, the actual solution of the Irish unemployment problem lies in emigration. Up to 1929, the great Irish labour market was in the United States. To-day it is in Great Britain. However questionable the effects of this mobility may be from the long-period national standpoint, it at least prevents the accumulation of masses of unemployed in the Irish labour market.

Town Against Country in Denmark

[BY A CORRESPONDENT]

September 25th

DENMARK's occupation by the Nazis, and its isolation from world markets and sources of supply, have meant a serious blow to the country's agriculture. Owing, mainly, to the increasing shortage of fodder, the dairy industries are yielding to-day only about 70 per cent of their normal output of milk and butter, and of pork and eggs about 60 per cent and a little over 50 per cent, respectively. The pigs are so lean that hardly any fats are available for melting down. Last year's grain and vegetable harvest was bad, and this year's will be worse; and the total amount of agricultural output has been vastly diminished, even though a large number of horned cattle has been slaughtered or exported to Germany.

Strangely enough, however, the current income of the peasant population is probably higher than before the invasion. According to an inquiry of the Danish Statistical Bureau, the net output per hectare amounted to Kr. 112 in the harvest year 1939-40, against Kr. 98 in the year before. The higher cost of fodder, machinery, fertilisers, etc., certainly resulted in an increase in operating expenses; this increase was intensified by a small rise in wages, but limited by the small volume of high-grade fodder which is now used in agrarian production, and it was, in any case, more than compensated by the high price level of the farmers' own products.

The Statistical Bureau is anxious to point out that this apparent improvement in the current income of the farmers is accompanied by a decrease in the real value of their property. The policy of rising prices means, in fact, that the farmers are being compensated for the decreasing productivity of their soil at the expense of those 50 per cent of the Danish population who live in Copenhagen and other urban districts.

It might be argued that a large part of the agricultural output is sent to Germany, and that therefore, to a certain extent, the farmers' compensation is paid by the Germans rather than by the Danish town-dwellers. However, exports are largely financed by interest-free advances from the National Bank for an unlimited period, for which, in the words of the business paper *Finanstidende*, "the whole nation is the guarantor." The paper adds that if these advances, which originally were only intended as a temporary measure, ceased, agriculture would receive only part of its export payments in cash, while the balance would be credited to blocked accounts, yielding no interest and non-negotiable.

It is small wonder that this policy of direct and indirect Government subventions for agriculture is being fiercely attacked by a common front of townspeople, stretching from business men and industrialists to Socialists and labour leaders. The latter are mainly concerned, of course, with the living conditions of the poorer classes of the population. Hourly wages had risen by 2 to 3 per cent from 1939 to early in 1941 and in March this year a further 8 per cent increase was awarded to the workers by the National Arbitration Board. Any further increases, which are only

possible with the consent of this institution, were refused in August, though the board admitted that the position of the workers had become worse in the meantime. Not only has the cost of living risen by more than double the amount of the rise in wages, but the industrial output is still, in spite of some improvement in the capital goods industries, about 20 per cent below normal, and there are large numbers of unemployed and part-time workers and workers who are employed, at low wages, on Government emergency work. A further deterioration is caused by the shortages of many articles and by the worsening of the quality of others. A good example of an indirect rise in the cost of living is provided by the national consumption of butter and margarine, which was about 93,000 tons in 1940, against 114,000 tons in 1939. But while, in the previous year, about three-quarters of this consumption consisted of margarine and almost all the butter produced in Denmark was exported, not enough margarine has been available since the German invasion, and the share of butter in the total consumption rose to almost 60 per cent; the poorer section of the population had, therefore, to pay more money for their smaller fat rations.

Price Control Demanded

The Danish TUC and the Social Democratic press have repeatedly asked for the control of prices, the compensation of the worker, the reduction of the existing turnover tax, and so on. The chairman of the TUC said recently: "The very near future will be the most serious Denmark has ever experienced, for one cannot control the price of one commodity—for instance, labour—and permit the price of other commodities to continue to soar to the sky." The spokesmen of the financial and business world are fully aware of the anomaly of the situation, but do not see how any good can arise from an abolition of the wage stop. They usually stress the danger of inflation, which obviously may result from an increasing price level accompanied by a low level of production. Their main suggestion is, therefore, to stop both prices and wages and to stabilise the krone accordingly. It is also suggested that the National Bank should cease making advance payments for exports.

On the other hand, the agricultural organisations are definitely in favour of further price increases, and since no spectacular rises in export prices are likely, they are mainly interested in home market prices. The chairman of the Danish dairies frankly suggested at the end of July: "We cannot avoid the fact that we must approach the Government for an increased home market price, and we must make our demand effective."

The trouble is that this year's harvest of fodder grain is expected to be 30 per cent below normal in the Danish mainland and 15 per cent below normal in the islands. Even if Herr Backe, of the German Ministry of Agriculture, should stick to his promise and let increasing quantities of fodder into the country, this would hardly be enough to make the fodder position normal. The stock of Danish agriculture is bound to depreciate under present conditions, and the only question is whether this loss is to be borne by the farmers themselves or whether they will be able to shift the burden, at least for the time being, on to their less fortunate compatriots.

The War and Life Assurance

In these days of stress the necessity for assuring against the normal uncertainties of life is stronger than ever and you can provide in the very best way for those dependent upon you by taking out a Whole Life Assurance under THE DISTINCTIVE SYSTEM of The Scottish Provident Institution.

The rates of premium are low, thus securing a large assurance cover (excluding war risks) from the outset, while the right to participate in the surplus is retained.

Holland Fights the New Order

[BY A DUTCH CORRESPONDENT]

September 22nd

At the beginning of the second winter of occupation a grave danger of under-nourishment threatens the people of Holland. In this country, once one of the chief dairy exporters of the world, now only small amounts of skimmed milk are available for the general public; the egg ration is one a month; the cheese ration one ounce a week. Under the German occupation rationing has been continually extended, and rations have been continually reduced.

WEEKLY RATIONS FOR ADULTS

	Date of Introduction	Original Rations	Rations Week Sept. 6-13
Bread	June 17, 1940	5 lb.	4½ lb.
Flour	June 17, 1940	9 oz.	3½ oz.
Eggs	Nov. 4, 1940	1	1 a mth.
Meat (*)	Sept. 16, 1940	18 oz.	11 oz.
Cheese	Oct. 17, 1940	3½ oz.	1 oz.
Milk	April 21, 1941	2 pts.	...
Potatoes	April 27, 1941	4 lb.	6½ lb.
Sugar	Before the invasion	9 oz.	9 oz.
Coffee	June 5, 1940	2 oz.	...
Tea	June 5, 1940	½ oz.	...
Jam	Oct. 17, 1940	4½ oz.	...
Rice	July 22, 1940	3 oz.	2 oz.
Oats, etc.	July 22, 1940	3 oz.	2 oz.
All fats	July 15, 1940	9 oz.	7 oz.

* Including bones, offal, bacon, sausages, etc.

† Coffee substitute of a very poor quality is still available—2 ounces a week.

This list, impressive though it may be, does not tell the whole story. In the first place, the quality of the goods has greatly declined; most of the potatoes, for instance, are imported from Poland, while Germany takes the bigger part of the Dutch crop. The Polish potatoes are called "Nazis"—black outside, rotten inside. In the second place, prices have risen so much that many Dutchmen are unable to take up all their weekly rations. This applies to an ordinary workman's family with a weekly income of about £4. It was recently reported from the textile district of Twente that workers will get extra meals in the factories. This will not help wives and children. In many places, therefore, bakeries have already been stormed by hungry crowds. And it should be remembered that Holland is still one of the best fed of all occupied countries.

Black markets are flourishing despite severe penalties. More than half a million of pigs have been illegally slaughtered and the meat sold to those who were able to pay the high prices. Five butchers who had committed this offence have been sent to a concentration camp. There is an extensive trade in clothing coupons. Hundreds have had their gas and electricity supply cut off because they refused to comply with an order which restricted it to 75 per cent of the supply available at the same period last year.

The unemployed still number about 90,000. The Nazi promise of a speedy end to unemployment has not been fulfilled. The decline has been due to the fact that 130,000 Dutch workers have been transferred to Germany—where they are extremely unpopular on account of their "difficult behaviour." Some 20,000 other Dutchmen, some of them Dutch Nazis, are working on military objectives in Northern France. The ration cards and the dole of the unemployed who refuse to go to Germany are withdrawn.

While goods are scarce, money is not. The amount of money in circulation will have almost doubled by the end of this year compared with May 9, 1940. Owing to the fear of inflation, antiques are bought up and money is being withdrawn from savings institutions. To combat this, the state is trying to "freeze" purchasing power by increased taxes—the wage tax, introduced at the beginning of this year, has been supplemented by a severe income tax—by prohibiting the payment of dividends over 6 per cent, and by controlling prices—which, however, still tend to rise. The control of wages is much more effective.

The principal source of the money entering into circulation is, of course, the Treasury. The state's expenses, which used to be about Fl. 800 millions, have risen to almost Fl. 4,000 millions for the current year. In addition, the direct costs of occupation (the maintenance of German

troops) are estimated by a Dutch Nazi source at Fl. 1,200 millions (£160 millions), to which must be added another Fl. 1,200 millions for wages on German orders which are to be paid by the Treasury. As the state's revenue will not exceed about Fl. 1,200 millions, there will be a deficit of about Fl. 2,700 millions.

In the meantime, the Germans make good use of their position of financial overlords. The Dutch owners of German shares have been forced to register, and within a short time all Dutch-held German shares will be in German hands. At the same time, German financial penetration is steadily proceeding. The *Deutsche Bank* virtually owns *Albert de Bary and Company*, of Amsterdam; the *Dresdner Bank* has set up the *Handelstrust West*; the *Commerzbank* has created the *Rijnsche Handelsmij*; and a *Bank voor de Nederlandsche Arbeid* has been set up by the *Bank der Deutsche Arbeit*. The Aryanisation of between 15,000 and 20,000 "Jewish" businesses and the "taking over" of thousands of "enemy-owned" businesses are further effective methods of tightening the German grip on Dutch economic life.

Letter to the Editor

For Services Rendered

TO THE EDITOR OF THE ECONOMIST

SIR,—Your article on the plan for increasing the economic incentives to war production suggests that there is some danger of this discussion declining into a controversy between those who wish to rely on the motive of patriotism and those who wish to rely on the motive of profit. This would be most unfortunate.

Most disastrous of all would be an agitation for a simple reduction of EPT by 30 per cent or 40 per cent. Not merely is the need for revising our profit policy much less urgent than the need for revising our wage policy; but the only revision in the former worth consideration is the substitution of 100 per cent dividend limitation *plus* 75 per cent EPT on the essential industries for the present 100 per cent EPT plus non-existent dividend limitation throughout all industries. To reduce EPT without limiting dividends would rightly cause indignation and inevitably cause disunity.

At the same time we must realise that in some industries (such as the railways, which are still inviting the public by poster to indulge in unessential travelling) the profit motive is actually tending to harm the war effort. These industries (with which I should include the coal mines) should be brought under full and immediate Government control. As you say, efficiency bonuses for the managers, where practicable, are preferable to increased profits for shareholders.

But the wage issue is far more important. It is not a question of increasing the incentive of existing munition workers, but of making it economically possible for workers in unessential industries to transfer rapidly into the low-paid war industries. I doubt if many people realise (I doubt if the Treasury realise) that serious bottlenecks in war production are being maintained because, thanks to Government policy, certain wage rates cannot be raised to the point at which it would be possible to inject the necessary extra labour. The present excessive hours of work—which are damaging health, efficiency, output and morale—are also in many cases being maintained because they cannot be lessened until time rates are raised.

No dramatic alteration in policy or procedure is desirable. The following two simple changes would be largely sufficient:

(1) An announcement that the Government wishes to see a revision of low wage rates in essential industries. The machinery of collective bargaining and of the tribunals would do the rest in an orderly manner.

(2) A substitution of 75 per cent EPT plus 100 per cent dividend limitation for 100 per cent EPT in certain essential industries, and the introduction of public ownership in others.

May I invite earnest and dispassionate consideration of these modest proposals, which would naturally be associated with intensified efforts of rationing, price control and organised saving such as you recommend?

ADELPHI.

THE BUSINESS WORLD

Building Material Shares

INVESTORS holding building material shares in general, and cement company shares in particular, were put out of their stride late last month by the decision of Associated Portland Cement to pay an interim dividend of only 2½ per cent, against 5 per cent declared a year earlier. The dividends of these leading undertakings in the "Blue Circle" group have been falling steadily in the last few years. The Associated company paid 22½ per cent for 1937, and the British only 10 per cent for 1940, though its subsidiary, the company, maintained the 22½ per cent rate until 1938, and distributed as much as 17½ per cent for 1940. So far as an unpleasantly surprised and somewhat mystified market can make any estimate of future possibilities, it is inclined to expect the payment in due course of a final dividend of something like 5 per cent on Associated and 7½ per cent on British shares. Even after the inevitable reaction in the prices of the two stocks, the yields on these postulated payments are no more than 1.96 per cent and 1.85 per cent respectively, and it is clear that investors are discounting prospective benefits in the period of national reconstruction after the war much more than the problematical prospects of the immediate future.

The same observation applies in large measure to the investor's attitude towards shares in the building materials group of companies as a whole. At the dark moment of the end of June, 1940, when Hitler had conquered France, and the bottom had fallen out of the ordinary share markets on the London Stock Exchange, the *Actuaries' Index* of the prices of six representative building materials shares (December 31, 1928 = 100) was as low as 33.7, and the average yield figure was as high as 11.6 per cent. Investors at that time were obviously more pessimistic about building material shares than about those of British industrial companies in general; for the corresponding index figure for the whole of the 159 equities in the *Actuaries' mixed bag* was 38.9, and the average yield figure was 9.0 per cent. Even before the end of last year, however, this attitude had been significantly modified. By December 31, 1940, the index stood at 56.5 for building material shares, against only 49.5 for industrial equities generally, while the indicated yield on the former had dropped to a fraction under 5 per cent, against 6.5 per cent for ordinary shares as a whole. By the end of August this year, the building shares index had reached nearly 70 (more than twice its level in June, 1940), and the average yield was only a little more than 4.1 per cent, against 57.1 and 5.3 per cent for industrial shares of all classes.

The factor which makes this remarkable revival in public interest in building material shares all the more significant is that it has been achieved in the face of consistently cautious—not to say depressing—statements by representative chairmen about the immediate outlook for many branches of an extremely diversified group of industries. Sir P. M. Stewart, at the meeting of Associated Portland Cement, last April, declared that any forecast must be hedged with caution; that the year had opened disappointingly; that stocks of cement and clinker had accumulated which were unlikely to be absorbed in the current year; and that, even if expected transport and production difficulties were avoided, the company would be fortunate if demand absorbed all the tonnage actually produced. This series of warnings he repeated substantially at the British Portland Cement meeting. The same speaker, in his capacity as chairman of the London Brick Company, had dwelt a month earlier on the heavy stocks which that company had accumulated, despite an "unsatisfactory" volume of production at the works, and had stated that only a totally unexpected revival in demand after the Dunkirk evacuation and the beginning of the period of intensified air raids had enabled the company to dispose of its heavy accumulation of unsold bricks. In a different branch of the building material industries, Sir Valentine Crittall informed share-

holders in the Crittall Manufacturing Company at the end of last year that, after the outbreak of war, the cessation of regular building had caused the undertaking to work practically at a loss, and that improved results had been contingent on a change-over of productive capacity to "other manufactures," whose nature may possibly be better imagined than described in wartime. The chairman of British Plaster Board, as recently as last July, had much the same story to tell. The branches of the building industry in which the company is mainly interested—namely, dwellings and public buildings—are practically at a standstill, and the bulk of the company's business comes from supplying materials to meet "other requirements." Even so, the company, like others in this group of trade, is having serious labour difficulties owing to withdrawals of workers for the Services. To complete the picture, we have the testimony of the chairman of Pinchin Johnson that the company's domestic business has almost completely changed in character since the war, and that profits have to carry the burden of greatly increased expenditure which it is "neither politic nor practical" to pass on to consumers.

Prima facie, it may be thought feasible to draw some distinction, in wartime, between the manufacturers of materials like cement and bricks, which are required either for service or civil defence purposes, and of those like plaster boards and paints, the loss of whose normal peacetime markets has a much more limited offset in the shape of special war demand. In practice, the distinction has a much less valuable practical application than might be thought. Many current handicaps are common to all groups—shortage of materials, labour difficulties, limited export opportunities and the like. And practically all the large producers in these trades are capable of satisfying special war demand in one way or another—if necessary by a change-over of machinery to other than peacetime products. But so far, the volume of war orders has not been big enough to compensate for peacetime demand, which has gone and will not return until hostilities have ceased. The table given on page 416 suggests that representative companies have, all things considered, maintained their total earnings rather better than might have been expected. There has been no catastrophic falling away in earning power, but the decline has been sufficient materially to reduce the average rates

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

LIMITED

Head Office: 41 Lothbury, London, E.C.2

earned on equity capital, after meeting debenture and preference dividend requirements, which in some instances are fairly heavy. Dividends have been reduced in even greater proportion, and the rates paid are on the average less than half those of the halcyon days of the building boom, a couple of years before the war.

* After writing off reconstructions and providing for Tax.

(a) After transfer to reserve for depreciation of investments and contingencies.

At present, the building material industries may be working at something near their wartime rock-bottom, so far as volume of production is concerned. But the last published balance sheets refer usually to periods which ended six or nine months ago; and the possibility of further reductions in disclosed earnings, and in dividends, when

the complete accounts for 1941 are drawn up, certainly cannot be ruled out. Consequently, the significantly low yield figures, shown in some instances on the representative ordinary shares set out in the following table, must be related far more to post-war than wartime considerations:—

SHARE PRICES AND YIELDS

Company	Description	Highest, 1935-39	Lowest, 1940-41	Present Price	Yield (%) at Present Price
Assoc. Portland Cement	Ord. Stock £1	110.71	58.9	61.3	3.92*

Pinchin Johnson	Ord. 10	55.1	13.6	21	3.54

* On the 1940 total dividend.

Undoubtedly, demand for the products of building materials companies will be extensive, insistent and (probably) prolonged when reconstruction begins. But the possibility of official regulation in some shape or form must be reckoned with, and the question of the war's probable duration concerns investors closely. At their current prices, building material shares are in the nature of a lock-up investment, which in the "waiting period" pays something for its keep, but appreciably less than a well-spread holding in ordinary shares as a whole. And the level of dividends which this group of companies may reasonably be expected to maintain, as a minimum, during the rest of the war, may well be below that of 1940, on which most of the yields shown in the table above (except those of the cement companies) are based. All in all, the conclusion may well be that building material shares are not ungenerously valued at current prices, and that any further rise must draw its impetus from other than pure investment considerations.

Finance and Banking

The Turn of the Quarter

The turn of the quarter has been passed with the greatest ease in the money market. Nor does the task appear to have been facilitated by Ways and Means borrowing by the Government at the Bank of England. The market had heavy Treasury bill payments to make on the first two days of the week, and the banks for their part have been called upon to make unprecedentedly large Treasury deposit payments. At no time, however, has the money market been conscious of a scarcity of credit. The banks have been buyers of bills, and by the close of this week, when the position had been affected by the early October dividend disbursements, short loan conditions had become exceptionally easy. The market kept a fair volume of early October maturities in its portfolios, and this fact has helped to ease the position, and would have provided the means of obtaining special help from the Bank of England had such assistance been required. That no assistance was given is indicated by the latest Bank return, which shows Government securities to have fallen by £4,475,000 over the week. Bank cash has had to withstand the impact of this reduction in the assets of the banking department, and of a further considerable expansion in the circulation. The notes outstanding have risen by £6,381,000 during the past week to the new record of £677,774,000. The end-of-month influence is responsible for part of this expansion, though it is clear that it also reveals the continued upward secular trend of the circulation. Despite the fall of £11,579,000 in bankers' deposits owing to this two-fold influence, the move began from so comfortable a figure that at £122,336,000 revealed in the latest Bank return, these deposits are at a more than adequate level to explain the ease of the money market. They will be further strengthened by the imminent disbursements on Canadian vested securities.

Money Market Records

A number of records have been created in the London money market during the past week. At the Treasury bill tender last week the applications for the £75,000,000 on offer rose to £186,505,000, the highest figure ever touched. Among the bills to be tendered for were the end-of-year

maturities and the keen competition for these was responsible for the exceptionally heavy volume of applications. This competition was also evident in the average rate at which the bills were allotted. This worked out at 19s. 10.65d. per cent, the lowest figure recorded since the outbreak of the war. The market syndicate evidently decided to make sure of getting a fair allotment of the end of December bills and raised its application price for these maturities to £99 15s., a figure at which the return on the Monday and Tuesday bills worked out at 0.164d. over 1 per cent. Thus on turning over £1,000,000 of these bills and re-selling them to the banks at 1 per cent, the market would make a profit of slightly under £7—which by no stretch of imagination can be regarded as profiteering. The precedent set by this tender for the end-of-year bills is not expected to affect the forthcoming tenders for the 92-day January bills. The effective application price for these maturities should return to £99 14s. 11d., at which the profit on turning over £1,000,000 should recover to the munificent figure of about £20.

The other record created during the week was provided by the raising of £70,000,000 in Treasury deposits from the clearing and other banks. This figure compares with the nominal maturities of £40,000,000 and actual maturities of slightly smaller amount. Apart from being the largest gross amount ever to be collected from the banks in this form, it is also the largest net figure raised in a single week. It would appear from the monthly debt return, which is discussed in a subsequent note, that a considerable part of this net payment was in fact made at the beginning of the week, that is, prior to the turn of the quarter. Each of the paying banks is given a free choice in deciding on what day of the week it will pay its Treasury deposit payments, and one would normally have expected such payments to have been postponed to the latter part of the week. By last Monday, however, all the clearing banks had completed their making up, and as money was in ample supply, there was no point in unnecessarily delaying these payments and thus losing for this period the 1½ per cent allowed on these deposits. Therefore, the banks appear to have followed the now normal procedure of effecting these payments at the earliest possible occasion.

Debt Return

The quarterly exchequer return incorporates the customary monthly debt return, and as September 30th did not fall on a Saturday, no exact comparison of changes in the composition of the floating debt over the previous monthly period is possible. The striking fact, brought out by comparison of the floating debt totals, is that the expansion of £201,185,000 between August 30th and September 30th is the largest monthly increase ever recorded in this part of the national debt. The suspension of the tap issue of National War Bonds and the increased dependence which this has caused on short term borrowing from the banks are the main responsible factors. Of this record increase in the floating debt, £87,000,000 has been contributed by Treasury deposits, £81,900,000 by Treasury bills and £32,500,000 by ways and means advances from public departments. The nominal amount of Treasury deposits outstanding between August 30th and Saturday, September 27th, increased by £50,000,000. By September 30th the expansion in this item had risen to £87,000,000, which suggests that heavy Treasury deposit payments were made by the banks on the first two days of this week. The increase of £81,900,000 in Treasury bills outstanding must in large part be attributed to the uneven incidence of bill payments and maturities during the past week. The market tended to concentrate its applications for the end of year bills, which had therefore been paid for by the time the Exchequer return was drawn up. On the other hand, this week's maturities must in large measure have been concentrated in the latter part of the week, since the bills in question were taken up immediately after the turn of June. But even assuming that the whole of the £75,000,000 of new payments for bills had been made on September 29th and 30th, and that the corresponding maturities were equally concentrated in October—an assumption which must go far beyond the actual facts—it is still evident that there has been an expansion of at least £6,900,000 in the amount of tap bills outstanding. The actual increase in this particular item of the floating debt has been greater than this and indicates a further substantial allotment of Treasury bills through the tap to Empire central banks. The remaining feature of the debt return is the increase of £32,500,000 in ways and means advances from public departments. This carries the total of these advances to £246,470,000, a total never before attained and equal to about ten times the average figure at which these advances were running for some years before the outbreak of the war.

Financing Expenditure

The following table summarises the Exchequer returns of the financial year to date, and shows the respective shares of revenue and borrowing in meeting expenditure:—

£000		£000	
Total ordinary expenditure	2,255,856	Total ordinary revenue	737,452
New Sinking Fund	5,646	Loans raised:	
Loans repaid:—		3% Def. Loan 1954-58	45,731

		Miscellaneous receipts (net)	196
		Decrease in balances	196
			£2,241,581

The items shown as net are given after allowing for repayments and receipts.

New Rial Exchange Rate

The first step has been taken this week to bring the exchange system in Iran within the fold of the Allied currency group. A decree published at Teheran has fixed the commercial rate for sterling at 140 rials and for dollars at 35 rials. These rates compare with the previous nominal official rates of 68.50 and 17.11 rials respectively. These official rates, however, have for some time past had no other function than to provide a basis on which to calculate a complex series of market rates. These have ranged from the commercial rate for approved imports to the rates quoted in the bazaars for sterling and dollar notes and other unauthorised transactions. The commercial rate has recently quoted a premium of 105½ per cent on sterling and dollars, and the sterling quotation in Teheran has thus been 174 rials and the dollar 45 rials. It is with these rates that the

new fixed quotations of 140 and 35 rials for sterling and dollars should be compared. In the bazaars sterling has been quoted at rates ranging up to 300 rials. If Iran is brought within the sterling area, and if the general framework of British exchange control is applied in that country, the black market should gradually disappear. It may be assumed that the rates now fixed for sterling and dollars will become the acknowledged parities, and that the old nominal rates, which date from the old gold standard days and from the nominal mint parity which then obtained have disappeared for good.

Indian Dollar Holdings Requisitioned

The gradualness with which the rigours of the sterling exchange control system are being applied in various parts of the Empire is illustrated by the decree published in Simla at the end of last week, ordering all residents in India having balances or currency in the United States to offer such assets for sale to the Reserve Bank within one month, against the equivalent value in rupees. The order supplements that made in November, 1940, which transferred to the India Government all balances or currency in the United States held by Indian residents at that time. The new decree thus affects such holdings accumulated since November, 1940, and any which may have escaped the net cast for them ten months ago. The necessity for issuing periodical requisitioning orders of this kind is being obviated by a clause in the new decree, stating that those who may hereafter become owners of such balances must similarly offer them for sale within one month of their acquisition. For the first time, therefore, the operation of exchange control in India is being brought fully into line with the regulations operating in this country. General exemptions to this order have been granted to authorised dealers in foreign exchange and cotton as well as to aliens who are resident in India for business purposes only.

Film Companies' Sterling

News has come from New York that negotiations are afoot for amending the terms of the agreement under which American film companies are allowed to deal with the sterling amounts collected by the renting of American films in this country. This report comes as reminder of the fact that long before "blocked sterling accounts" became known, certain types of sterling balances were immobilised as a result of special agreements. By far the most important of these was the agreement made soon after the outbreak of the war between the American film companies and the Treasury. This agreement set a limit to the extent to which American film companies were allowed to convert into dollars and remit to the United States the profits earned by the exhibition of their films in this country. In order to help the American companies to utilise their blocked sterling funds, two Statutory Orders were made in July, 1940, amending the Cinematograph Films Act, 1938, and changing the quotas in such a manner as to encourage the American companies to embark on more ambitious production work in this country. In October, 1940, the agreement with the Treasury was prolonged on terms which allowed the film companies to remit to the United States two-thirds of the profits earned in this country subject to a maximum of \$12,900,000 in the ensuing twelve months. The agreement comes up for revision at the end of this month. The American companies are already preparing their brief for a considerable easing of the existing restrictions on their freedom to deal with their sterling funds. They base their arguments on the passage of the Lease and Lend Act and on the consequent alleviation of the British need for dollars.

Revised Railway Agreement

Home rail stockholders this week have evidently given up any attempt to calculate what the second financial agreement between the Government and the railways means in terms of precise dividends. The general level of their expectations has been known since the authorities announced, at the end of August, the displacing of the old agreement, with its inflationary machinery for "adjusting" charges to costs, by an annual rental of £43 millions for the four main lines and London Transport. The White Paper discusses, though it barely illuminates, the two main questions left aside last August: the treatment of war damage charges and maintenance and renewal provisions. Since the undertakings are to be brought under the still nascent public utilities scheme as from the beginning of control, and will be charged with the retrospective liability of 50 per cent, they will be entitled to the sums which they charged to the Pool account in 1940 under the first financial agreement. The actual amount charged in 1940, however, was certainly less than the amount of damage suffered, for the accounting practice followed was to spread the cost of damage equally over 13 four-weekly periods, commencing with the first four-weekly period in which damage was suffered. Apart from the question of the total cost involved, the sums to be retained must be appreciably less than the total sum, since the bulk of the damage was suffered in the second half of the year. The cost of restoring war damage is not to be charged as revenue expenditure under the new agreement—which merely means that the companies themselves must provide it from the £43 millions rent charge. Obviously, if it were to be charged as revenue expenditure, the Treasury would be footing the entire bill, since all net receipts of the Pool are on Government account. In these circumstances, stockholders would be rash to assume that war damage charged under the old scheme might become available for dividends; clearly it will be fully required to meet the retrospective liability of the undertakings for war damage under the public utilities scheme.

The maintenance and renewals provisions in the new agreement are inherited from the old. These charges are "standardised" on average pre-war levels, but compensated for the variations in the total of assets to be maintained and renewed, and for changes in costs of the work. The companies, therefore, are fully protected against capital depletion, but, if they are unable to spend their full standard allowances, the difference (representing arrears of maintenance) will be invested, and paid out to the undertakings when control ends—if necessary, on a valorised basis to offset changes in costs which have occurred meanwhile. This is a simple and sensible method of dealing with a problem which caused such acute controversy after the last war.

Third Quarter's Capital Issues

The tables at the foot of the page furnish the usual quarterly analysis of new capital issues, excluding conversion, for the first nine months of 1941. The main features of the third quarter have been the decline in Government loans, which fell from £438,626,200 in the second quarter to £348,140,265, and the increase in the total of non-Government issues from £3,309,000 to £6,465,176, calculated on the "New Basis," which includes issues by "permission to deal." Of the total of Government issues, £157,284,860 was yielded by the sale of 2½ per cent National War Bonds, 1945-47 and 1946-48, and a total of £107,591,687 from the sale of the two series of 3 per cent Savings Bonds. Issues by public utility companies have been the main feature of the new issue market outside the sphere of Government loans. Of £565,800 raised by gas and water undertakings, Bristol Waterworks was responsible for £170,000 in 4 per cent debentures, Bournemouth Gas and Water for £100,000 in 3½ per cent debentures and Luton Water Co. £50,000. Cawnpore Electric Supply issued £118,500 of ordinary capital. Two notable conversions have taken place during the quarter, that of the Port of London Authority of £260,000 3½ per cent preference stock to repay 4½ per cent stock, and that of Pearson and Dorman Long of £1,404,400 3 per cent debenture stock to repay 5 per cent debenture stock, both carrying the Treasury guarantee. Despite the moderate awakening in the new issue market in recent weeks, it is clear that new savings are, with very few exceptions, flowing inescapably into Government issues. It remains to be seen whether a new Government medium term issue will be launched before the close of the year.

Investors' Confidence

The extent of the reaction, in so far as all established securities are concerned, may be judged from the chart of weekly averages of the *Financial News* indices, opposite. This carries the picture up to Friday, September 26th, and since then the market has been consistently firm. This is further evidence that the really big movements were in securities which have in recent years only spasmodically attracted any considerable attention. Once the moderate volume of selling had ceased, the chronic state of shortage of stock reassured itself and the firmness which now invariably persists when markets are idle is once more in evidence. This firmness, the opposite of the pre-war condition in times of slack markets, is an outcome of the closed economy. It seems that, with the supply of money continuously ahead of increasing tax payments, there is usually more money "automatically" seeking investment than is needed to counteract the steady trickle of realisations, always in evidence in good times and bad. This feature is by no means restricted to Great Britain. In a recent article on the French bourses, it was pointed out that special

steps had to be taken to restrict the rise in quotations for equities, and the sole reason why such measures are unnecessary here is the extreme effectiveness of EPT in transferring the equity in British industry to the Treasury, thus throwing a very large part of the impact of investment on to the huge body of fixed interest stocks. While the market is firm, it is still too early for a resumption of the

FIXED-INTEREST AND EQUITY SECURITY MOVEMENTS (July 1, 1935 = 100)

Financial News indices of 20 fixed-interest securities (converted to new base) and 30 ordinary shares

marked improvement in equities, which has suffered no major interruption for almost six months, to be healthy. In the circumstances, it is in line with reasonable expectations that the rise should commence in the Funds, and long-dated stocks are, in fact, well on the way to regaining the peaks recently touched.

Company Notes

Unilever Accounts

The full report of *Lever Brothers and Unilever, Ltd.*, for 1940 shows that the preliminary figure of profit was reached after making even larger provisions in the accounts of associated companies than in 1939. The total profit of the *Limited* group, after all expenses and EPT, and such taxation as was provided by associates, rose from £10,250,000 to £12,443,000 in round figures. From this, there is provided a further sum for partial funding of staff pensions, war damage contributions and £1,400,000 to establish an income-tax reserve toward meeting payments on the profits of 1940, to be met during the current period. After meeting all taxation of *Limited* interest and preferential dividends, there remained earnings equivalent to

some 30.3 per cent on the ordinary capital, compared with 22.4 per cent last year. That, despite this rise, the dividend is halved at 5 per cent is due, as explained in *The Economist* of September 20th, to the provision against the possibility of having to meet dividends on all classes of NV capital. The dividend on the ordinary capital is the equivalent of the *Limited* ordinary payment at the fixed rate of 12 guilders to the pound. The preference payments are a guilder liability, to be settled at the rate ruling when it has to be met, if ever. These preference dividends cost some £900,000 in 1938, with the guilder at nine to the pound. During the year, the operating companies came more and more under Government control and, in consequence, some of the profits are partly estimated, always on a conservative basis. No allowance has been made for profits or losses in occupied territories, but, if losses are made, these are backed by the reserves of *Limited*. The figures are reached after providing £3,885,000, against £3,485,000, for depreciation and repairs and £150,000 for ARP, against £123,000. The balance sheet of *Limited* shows a rise of £1,025,533 in debtors, associated with a fall of £1,352,878 in cash, while creditors, including the transfer to contingencies, are up by £495,560. Excluding inter-company items, current and near liabilities exceed liquid assets by almost £2,000,000, but *Limited* has net claims on its associates of over £16 millions. Holdings in these, at over £70½ millions, have increased by £1,221,137 owing to the taking over of interests previously financed by loans to subsidiaries.

"Limited" Reserves and NV

No reliable information is available as to the position or prospects of NV. The general background is that Germany is rapidly acquiring interests in undertakings in occupied countries, while it is known that Dutch companies have been ordered to pay dividends to shareholders in Holland. But, so far as is known, only subsidiaries of NV have followed this rule, and then only on preference shares. What the legal position is between *Limited* and NV remains doubtful, but the directors intend to abide by their agreement, doubtless in the hope that eventually the matter will be one for inter-Government, rather than inter-company settlement. This is, however, only conjecture, and until definite news of dividend payments is available from NV, they will continue to call for appropriations from the profits of *Limited*. At the moment, that company has reserves and carry forward of £12,944,502, exclusive of £1,500,000 set aside for NV ordinary, and held under the omnibus item, creditors. Meanwhile, *Limited* has no amount at risk on account of indebtedness with NV, the sum £2,846,328, shown as due, being offset by a debt to a subsidiary of NV on account of the purchase of a French affiliate. Losses in occupied territory, mentioned above, also seem to be a matter for inter-Government agreement. No comment is or will be made on the working of 1940 or on the outlook. In view of the incidence of EPT, it would seem that the increase in the figure of profit given must be far less than the total expansion. Higher prices have doubtless played some part in this rise, but possibly the determining factor has been the possession of numerous factories overseas in which it has been possible to carry on without disturbance, and to replace, in part, the products of less fortunate competitors, possibly by agreement. None the less, demand at home must be in some sense an overriding consideration, and, with the stabilisation of prices of most products and the urge to restrict consumption, the group will probably do well if it maintains its gross earnings. Some costs, including war damage contributions, are likely to increase. Others, such as pensions, are definitely on the decline. From the standpoint of the shareholder, however, the amount of these is a matter of rather academic importance. The EPT cushion must be a very large one, and his earnings are likely to be stabilised at or about recent levels. What the actual dividends will be, must depend on a number of contingencies, and in particular upon developments with regard to NV. The yield of some £3 16s. 2d. on the ordinary shares of £1, standing at 26s. 3d., suggests the expectation of a material improvement within a reasonable period.

Cunard Group Accounts

Since the entire fleets of both *Cunard Steam Ship* and *Cunard White Star* came under Government requisition during 1940, the accounts for that year show results hardly

comparable with previous earnings. In fact, income of *Cunard Steam Ship* improved from £387,573 to £595,339, the highest level since 1933, the company profiting by good trade between Liverpool and northern France prior to the collapse of that country, and by a rise of £26,000 in income from subsidiaries. With an increase of £21,644 to £89,024 in general expenses, and a decline of £3,588 in depreciation to £20,833, the surplus earned for dividends is up from £63,443 to £146,111, which is added to the carry forward, making a total of £423,639. These figures take no account of the company's liability for income tax, and possibly for EPT, the amount of which is not yet determined. Consequently, £175,000 has been transferred direct from reserves to reserve for taxation to provide against tax liability for 1939 and 1940. The profit position of *Cunard White Star* in 1940 was affected by the fact that the *Queen Elizabeth* was in commission, and trading results are said to have been satisfactory in the period before Government requisition became complete. The accounts show a fall in operating revenue from £7,577,084 to £5,640,013, and in operating expenses from £5,956,374 to £3,065,209. Depreciation claims £1,182,375, against £1,032,211. The Treasury decision that interest on first mortgage debenture stock is due at 3½ per cent accounts for the rise in this item from £30,948 to £61,250, while £31,557 is due in respect of the *Queen Elizabeth*. The balance of £1,284,094 is transferred straight to the carry forward, which is raised from £130,257 to £1,414,351. The spectacular feature of the accounts of the two companies is the decision, already announced, drastically to modify the capital structure by repaying Treasury loans to the total of £7,950,000 in the case of *White Star*, and debentures of £3,683,615 in the case of *Steam Ship*. For this purpose, the group intends to utilise reserves, including depreciation resources, and, in the case of *Cunard Steam Ship*, loans raised from the newly acquired subsidiaries, *Port Line* and *Thos. and Jno. Brocklebank*, which seemed nine and twelve months ago respectively in a position to provide some £2,750,000. The balance-sheet valuation of fleet for the S.S. company is down by some £9,000 to £67,962; that for *Cunard White Star*, including payments on account of new ships, stands at £14,629,251, against £15,631,172. There is a substantial rise in cash and voyage accounts, accompanied by an accumulation of over £2,000,000 in ships replacement reserves. The balance-sheet figures for both concerns are some nine months out of date, and these movements have probably been carried further this year.

The Post War Problem

The decision to repay to the Treasury all outstanding debenture stock, with the exception of £1,000,000 second mortgage debentures of *Cunard Steam Ship*, is discussed at considerable length in the statement of the chairman, Sir Percy Bates, which accompanies the accounts. Sir Percy considers that the repayments will in no way prejudice the ability of the group to undertake an adequate programme of construction after the war. He estimates that on the basis of foreseeable earnings during 1941, as governed by the terms of the Liner Requisition Scheme, *Cunard White Star* should have by the end of 1942 between £2,600,000 and £2,800,000 in cash available for new building. This estimate assumes the absence of further shipping losses, which is of course improbable, but it is pointed out that further losses, under the terms of the Government scheme, while reducing income, would make additional cash available for replacement of vessels. There is a suggestion in Sir Percy's speech that he is more anxious about the possible embarkation on an ill-judged and grandiose replacement scheme after the war than about the ability of the group to make good material losses. Consequently, the decision to repay debentures represents a highly conservative device to put a brake on pressure for post-war building. Sir Percy is no doubt right to be cautious. What type of ships ought to be built after the war, and how many of them, depends upon the answers given to problems in the field of domestic and international politics which will largely determine the shape

of the post-war world. The programme must also take account at every step of air transport—a field not closed to the *Cunard* group. It will be as well to start modestly, and even a start may be considerably delayed. Meanwhile, the group will not be paying a higher rate of interest than it can earn on some £11½ millions of liquid resources. As Sir Percy suggests, if liquid resources are found to have been unduly depleted, the credit position of the group will have improved sufficiently for new money to be easy to raise for the right project. There is, however, little evidence that it will be any easier to estimate demand in the twenty years after the end of the war than it was in 1919, and the decision to keep the programme moderate, though excellent in itself, is no guarantee that distributable profits will be earned. None the less, the chairman's optimism inspired a considerable rise in the preference and ordinary stock. The 5 per cent cumulative preference stock now stands at 97½ and the £1 ordinary stock at 10s. 1½d. against figures of 82½ and 7s. prior to the news of the repayments.

Molasses-Tankers Deal

The *United Molasses Company* has made an offer to holders of all capital in *Tankers, Limited*, to purchase for cash the whole of each class or such less proportion as they may decide to accept. The terms are 120 per cent of face value for holders of 8 per cent preference, 50 per cent to ordinary shares and 10 per cent on the cumulative funding certificates. If all holders accept, this will involve a payment of over £1,000,000 for securities valued in the market, immediately prior to the offer, at about two-thirds of this figure. The object of the transaction from the standpoint of the buyer is, presumably, mainly to add to its tanker fleet. That of *Tankers* was valued at £270,000 at the end of March last, or little more than half the figure of the year before. But at that date investments, at market value plus the excess of cash assets and debtors over creditors, amounted to £845,000, including £265,000 recoverable under War Risks Insurance. There was, in addition, a sum of £47,500 in Government tonnage replacement account, only withdrawable for that specific purpose. It is impossible to say what has happened in the past six months, but up to March last the company's fortunes were on the mend. Judged by market valuation and past performance, the offer seems generous, but the directors of *Tankers* have decided to defer making any recommendation until they have fully considered the matter. Probably they will make their decision known in circulating the full details of the offer towards the end of the month. They will presumably then give shareholders some guidance as to the current position and the present value of the assets they are being invited to sell. Meanwhile, it seems that a sale on reasonable terms should be accepted, as the probable alternative is a further reconstruction of capital; possibly, a wholesale replacement of the fleet after the war and a fresh venture in a field which in the past has given even preference shareholders only a negligible return.

Two Oil Company Results

Attock Oil and *Lobitos Oilfields*, operating outside the field of actual hostilities in India and Peru respectively, show substantially higher gross earnings in 1940. The rise in total income of *Attock* from £467,589 to £772,566, a record for the past decade, is due, according to the statement of the chairman, Mr. L. Dane, to increased production from the new field found in 1937 and to the performance of the new refinery. *Lobitos* shows a rise in total income from £254,713 to £303,272, a figure which was, however, surpassed in 1937 and 1938, although the profits of the parent from its own operations create a record. With a rise in taxation from £50,000 to only £70,000 and other expenses strictly controlled, equity earnings are up from £180,698 to £209,655, which grossed up at 10s. represents a rate of 31.9 against 24.0 per cent. The total payment for the year remains at 10 per cent, enabling £100,000 to be placed to general reserve and the carry forward to be raised from £269,828 to £279,484. Profit on the sale of investments, amounting to £5,519, is transferred straight to investment reserve. Owing to the necessity of providing two years' income tax and estimated EPT liability to a total of £500,000 and retrospective tax on transfers to Indian benevolent fund amounting to £1,977, *Attock* equity earnings are down from £305,044 to £105,150, providing 5.8 per cent toward the ordinary dividend, which is

raised from 7½ to 10 per cent. Consequently, the carry forward is down from £189,209 to £114,359. Mr. L. Dane indicates that the EPT position has not been finally clarified, and points out that the burden on the currently accruing profits from the new oilfield will be very heavy, unless some modification is secured. The balance sheets of both companies show increased holdings of crude oil, that of *Attock* rising from £170,912 to £187,760 and that of *Lobitos* from £154,819 to £286,369. In both cases, cash holdings are moderately reduced, while debtors are strikingly higher, the item for *Lobitos* amounting to £601,063 against £312,653. For *Attock*, creditors and contingencies are up from £216,566 to £707,119. Trade prospects for both companies are good, at least during the war, but in the case of *Attock* the outlook is clouded by the demands of the Exchequer. The £1 ordinary shares at 40s. ex dividend yield £5 per cent. The *Lobitos* £1 stock yields £5 14s. 4d. per cent at the current price of 35s. ex dividend.

Covent Garden Properties

In the year to June 30, 1941, *Covent Garden Properties* show a further drop in total income from £294,597 to £237,495. In consequence, the company is unable to meet the service on 8 per cent cumulative preferred ordinary capital, and the directors have decided to make no distribution on 7 per cent cumulative preference shares. Taxation claims £131,766, against £120,792, so that after meeting fees and debenture charges, the available balance amounts to

THE STOCK EXCHANGES

London

Note: all dealings are for cash

BOTH before and after the week-end markets were somewhat subdued and price changes generally trendless and insignificant. There is no doubt that, while uncertainty regarding the course of military events in Russia prevents real buying, the undertone is firm over a wide area. Selling predominated on Friday before the week-end until immediately before the close, when some late purchases mainly eliminated price movements. In the industrial market, general stagnation was relieved by a strong demand for *Cunard* issues and a tendency to unload cement stocks on news of the halving of the Associated Portland Interim. Business was generally on a small scale, though the Funds showed a small improvement, and the Prime Minister's speech exerted an encouraging influence towards mid-week.

In the gilt-edged market, prices hardly moved on balance before the week-end, the sole change being a gain of ½ point in 2½ per cent National War Bonds, 1945-47. This week, daily fractional changes in the order of ¼ predominated. Thus, on Monday, 4 per cent Consols and Victory Bonds, and, on Tuesday, 2½ per cent Consols and 3½ per cent Conversion and War Loan rose by this amount. There was also some demand for Local Loans and 3 per cent Conversion and War Loan. In mid-week, quiet but steady support continued to raise prices.

The foreign bond market attracted no great volume of business, the main features being alternative pessimism and optimism regarding the prospects of Brazilian and Japanese issues. Brazilian stocks were generally sold on Monday, as were Japanese bonds, many of the latter losing 1 point. The next day counter rumours prevailed, Japanese issues mainly gaining 1 point and Brazilian issues partially recovering previous losses. Elsewhere, there was moderate selling of the Dawes and Young loans, 4½ per cent Austrian stock and 8 per cent Czech loan. Greek 6 and 7 per cent issues lost ½ point on Tuesday.

The home rail market showed little immediate response to the publication of the Government White Paper on the rail agreement, it being widely felt that many vital questions still remained unsettled. In general, there was mild support for ordinary stocks, Southern deferred gaining ¼ on Monday and LMS ordinary the same amount the next day, when Great Western ordinary improved ¼. There was occasional selling of marginal issues, but losses rarely exceeded ½ point. London Transport "C" and Great Western ordinary reacted in midweek losing ½ and ¼ point respectively. Among foreign rails, Canadian Pacific ordinary and preference were fairly steady in demand, and most Argentine issues registered small gains on balance.

Price changes were generally moderate in the industrial market. Breweries proved to be out of favour, Charringtons losing 1s. and Barclay Perkins 9d. before the week-end, while, in the current week, Bass, Courage and Mitchells and Butlers all lost ground. The motors and aircraft group were moderately in demand, many issues, including Austin, Bristol, Ford and Raleigh Cycle Holdings, gaining 3d. on Tuesday, when Blackburn Aircraft rose by 6d. Price changes in the iron and steel group were slight and trendless. Stores attracted some attention, Woolworths, Marks and Spencer and Harrods all improving a few pence. Building and cement issues suffered from the halving of the Associated Portland Interim, which stock lost ¼ at the beginning of the week. Leading miscellaneous industrials, including ICI, Dunlop, Boots, and Murex, were all fractionally higher, and Harrisons and Crosfield put on ½ on Tuesday. *Cunard* went ahead in all classes of capital on the news of the debenture stock repayment, the ordinary issue gaining 1s. on Monday. Tobacco issues were also steadily in demand, the market being led by BAT and Imps.

Apart from some Cape support for Blyvoors, interest in *kaffirs* was at a low ebb. Turnover was rather higher on Tuesday than immediately before or after the week-end, but, apart from a rise of ½ for E. Geduld, price changes were

only £24,300, against £63,526. The carry forward is reduced from £29,285 to £19,585 in order to transfer £34,000 to contingencies reserve. The chairman, Mr. Philip E. Hill, points out in his statement that £34,715 of the fall in income was due to the lower revenue obtainable from Covent Garden Market. In this and in other cases, there is a fair prospect that receipts will be restored to normal after the war, but then, unfortunately, ordinary shareholders, who received no dividend in the previous year, will find their claims preceded by accumulated arrears on preference and preferred ordinary capital. The liability for War Damage Insurance to the date of the balance-sheet amounts to £125,000, for which so far no provision has been made apart from a nominal payment of £1,125. Moreover, damage to the property of the company's mortgagors has reduced the security of loans on mortgage amounting to a total of £313,244. Consequently, the directors have transferred £16,000 from dividend equalisation to contingencies reserve, bringing this fund, with transfers from profits, to a total of £100,000, which is specifically placed against loans on mortgage. Despite the improvement of recent months, the market value of investments, valued at cost at £367,659, is down from £147,014 to £128,944. Debtors and creditors have both been reduced, while cash, other than cash in the hands of debenture stock trustees, is down from £57,131 to £36,897. Both the profit and the capital of the company have suffered during the past year, but there is a reasonable probability that post-war conditions will provide a fair return on the preference capital, at least. The £1 7 per cent cumulative preference shares stand at 10s; the £1 ordinary shares at 5s.

mainly for the worse, Nourse and Union Corporation losing ½. In the rubber market business was at a minimum, but oil shares enjoyed a moderate boom. There was good support for Mexican and Canadian Eagles, and substantial rises were realised by *Burmah* and "Shell" Transport, which on Tuesday gained ½, compared with rises of ¼ for *Lobitos*, *Trinidad Leaseholds* and *VOC*. The market on that day was, however, led by Anglo-Iranian ordinary, which jumped ¾. On Wednesday, *Burmah* put on ¼ among lively buying.

New York

At the end of last week, markets began to recover from the shock caused by Mr Morgenthau's announcement of his intention to introduce legislation limiting excess profits. After heavy selling on the Thursday, the Friday before the week-end saw steadier trading, partially due to recognition that the projected taxation would be severely disputed in Congress. Later markets hardened, ending the week with many gains up to ½ point. On Tuesday of the current week a genuine improvement was staged and gains were widespread for the first time for several days, the upward movement including steel, aircraft, motor and chemical issues. Buying was still cautious, but markets closed steady. In midweek trading was slow and price changes narrow.

Industry and Trade

The Management of Wartime Labour

With economy in man power the most pressing problem of the time, much discussion is being devoted to both the physical and the psychological aspects of labour management. The annual conference of the Industrial Welfare Society brought forth several very interesting papers on this subject. Running through many of the papers is the theme that, in so far as developments forced upon industry by the war are, *per se*, improvements, they should not be allowed to disappear with the conditions which gave rise to them, and should, even now, be planned on permanent lines. The dispersal of industry, for example, which has been rendered necessary by air raids, might prove the beginning of a rearrangement of Britain to the great improvement of the health of its working population. More than one speaker, in dealing with education, touched on the importance of educating for leisure as well as for vocation. This is an urgent need which comes home to the community particularly in wartime, when the "lost" appearance of men and women in the forces during their free time bears eloquent testimony to the failure of our educational system in this respect. The paper on health by Dr Norris, chief officer of the Metropolitan Water Board, is both disquieting and stimulating in its revelation of the great gaps which still exist in the nation's provision for sick and injured workpeople. The personnel manager of the Lockheed Hydraulic Brake Company, Mr James Smith, contributes an exceptionally interesting paper on "Works Discipline." He stresses particularly the importance of an organisation "well planned by men whose knowledge and capability inspires confidence," and again touches the core of the matter when he says: "All members of the management force should continually remind themselves and be reminded to handle necessary human adjustments with as calm and patient and reasonable an approach as their temperaments and urgent production problems will permit." He has many detailed suggestions to make, which are of considerable interest, but most of them follow from these essential premises of a capable management with a human attitude to its employees. The same general tone informs the paper of Mr Beresford, of Frigidaire, on "The Employment Department in Wartime." He, too, has suggestions to offer which should be very helpful to other employment managers, but here again the important thing for them to learn from him is not his technique, but his general attitude

of readiness to put himself in the employee's place. Since this is by no means easy, the problem of works discipline seems to resolve itself very largely into the very careful selection of all members of the management who come into close contact with the workers.

Essential Work Order in Cotton Spinning

The application of the Essential Work Order to all nucleus mills in the spinning branch of the cotton industry is the latest step of many intended to improve yarn supplies. The loss of labour in the process of concentration and the absorption of men by the armed Forces left spinners unable to process the cotton ration allocated by the Controller. Apart from the application of the Order, it is expected that three months' deferment of military service will be granted to key men who become derelict at stage "C." Nucleus mills will be allowed to build up their labour force to the level necessary to spin the cotton allocated to them, but when that position is reached they must fulfil the obligation of substituting older operatives from closed units for their own younger operatives who could be transferred to munition works. The need for more workers in the spinning mills is urgent, and married women who have once worked in the industry and are now able to remain at home through improved family circumstances could perform a valuable national service by returning to the trade. Spinning operatives will be guaranteed "their appropriate weekly wage," and in return must be willing to perform outside their usual occupation any service they can reasonably be asked to undertake when their usual work is not available. The appropriate weekly wage has not yet been determined in all cases because the system of pay in spinning is very complicated. It is expected, however, that trade unions and employers' organisations will be able to apply the Order without friction. A sectional agreement has been reached for a minimum wage for ring jobbers and other adult male workers in the ring-rooms. Ring jobbers will get 63s. 11d. a week and adult male ring-room operatives 56s. 5d. a week. Adjustments are provided to meet special circumstances. The swift application of the Order is to be welcomed, for the outflow of labour from spinning to munitions and other industries had assumed embarrassing proportions.

Starving Out the Black Market

Rat poison, rat traps, rat virus and gas all have their uses in keeping down vermin, but the only way to keep premises completely clear of rats is to keep them in a condition that offers no attraction to these pests. War conditions are, unfortunately, extremely favourable for the activities of the food racketeer, and it is by no means easy to render the food trades proof against his depredations. Nevertheless, it remains the duty of the Ministry of Food to do all in its power, not merely to catch the individual, but to remove the incentives to the existence of the class, and its opportunities. In so far as the operator in the black market is dealing in stocks which were accumulated before that particular article was controlled, which must often be the case, his activities will die a natural death as the stocks give out. The problem is to prevent his turning his attention to the next commodity which he expects to come under control. The system of licences for traders in all important foodstuffs should go a long way to prevent this, since these licences are only granted to people already genuinely in the trade. Thus, if the system is effectively operated, they prevent speculation by outsiders, while the fear of losing their licences should prevent *bona fide* traders in any particular commodity from engaging in illegal transactions. To what extent supplies in the black market are obtained by means of theft from Government stocks is very uncertain. Startling allegations are, from time to time, made and as promptly denied, and it seems scarcely likely that anything of this sort is possible on a large scale. The enforcement of measures against illicit trading cannot be expected to prevent shortages, however, for since catering establishments are allowed to pay the full maximum retail price for commodities, their custom enables the producer to pocket the distributors' profits. On purely economic grounds, therefore, they are bound to remain preferred customers, and it is difficult to see a safe remedy for this. When all has been done that can be done to remove the incentives, there will still be scope for the activities of a few unscrupulous persons. They and their customers should be hunted down mercilessly and, when caught, not fined a ridiculous sum which goes no way towards offsetting their illicit profits, but clapped into gaol without option. Not until a purchase on the black market is regarded as a cause of shame and reproach, instead of, as it too often is now, a rather clever joke, will this particular form of vermin be exterminated.

Cheaper Fish

The contention that when a trade has to be controlled the authority is best exercised by somebody right outside it, has received some support from the experience of fish control. Mr J. Adamson, who, before his appointment as Fish Controller, was an accountant, has achieved, after a relatively short period of friction, the difficult task of reducing the retail price of fish without causing a serious shortage. After almost three months' experience of the working of his arrangements, he is of opinion that a further reduction in the prices of certain fish is practicable. The price of lemon sole is to be reduced from 1s. 7½d. to 1s. 6d. per lb.; that of hake from 1s. 7½d. to 1s. 1d.; and the price of haddock from 1s. to 11d. The net maximum returns to the producer will be: for flat fish, including lemon soles, 14s. 6d. per stone; hake, 9s. per stone; haddock, cod, etc., 6s. 6d. per stone. Part of the smooth working of the scheme, so far, must be attributed to the elimination, owing to a temporary arrangement by which the Government bore the cost of transport, of distance as a cause of local scarcity. This temporary arrangement is now to be replaced by a scheme by which transport charges will be met from a levy of 6d. per stone on all white fish. The producer will receive 6d. per stone more than he would if this arrangement were not operative. The carriage on herrings is to be paid from the general fish fund. During the first year and a half of war it was said to be impossible to bring the fish trade under control on account of the peculiar difficulties involved. The event has proved the unsoundness of this pusillanimous attitude.

Wages and Hours in the Drapery Trade

The National Joint Industrial Council for the Retail Drapery, Outfitting and Footwear Trades is the second joint industrial council under the auspices of the Retail Distributive Trades Conference to reach agreement on wages and conditions. The first agreement, that of the Retail Food Trades Joint Council, has been in operation since July 27th. Rates of wages agreed for the drapery sections of the distributive trades are largely similar to those in the food trades. In London, male sales staff, cashiers and clerks are to receive not less than 21s. 6d. a week at the age of 16, rising to 65s. at 25; female employees' rates rise from 19s. 6d. at 16 to 43s. at 24. In the provinces, minimum rates are 3s. a week less for both male and female staff of all ages. Male employees, other than those specified, begin at 20s. in London and 17s. 6d. in the provinces, reaching 60s. and 57s. respectively at 24 years of age. A 48 hour week has been agreed, exclusive of meal times, and subject to an allowance for clearing up of 30 minutes on not more than two days a week, and 15 minutes on the remaining days of the week. Two weeks' holiday with pay is provided for, as well as 12 days' sick leave on not less than the minimum rate of pay. The agreement is to operate from November 3rd. Before the war, 300,000 to 400,000 workers would have been affected by the agreement. Although there have previously been agreements between individual employers and employers' organisations and trade unions, these have only covered sectional interests. The present agreement does not override any more advantageous ones in force, and better rates and conditions are not prejudiced by its terms. This is the first time that agreement has been reached on a national scale, which is counted a milestone in industrial relationships in a trade which is particularly difficult to organise, on both the employers' and employees' side.

North-East Coal Trade

Durham colliery owners have applied for an increase in the price of coal shipped coast-wise on the ground that the margin between rail-borne and coast-wise trade was too wide. The claim has been accorded, and from September 22nd, the prices of Durham coal for coast-wise shipment were raised by 1s. per ton, but those for large and partially screened coals were increased by only 6d. per ton. Domestic demand for coal from this district remains heavy, and exports have been severely curtailed. At a recent meeting of the Durham District Coal Production Committee, it was stated by the miners' representatives that it was the intention to aim at a weekly output of 526,000 tons, compared with current production of about 500,000 tons per week. In view of the fact that the output in the Durham coalfield averaged some 650,000 tons per week in 1938, this target does not seem very ambitious. Like other dis-

BY TENDER

Northern Ireland Treasury Bills.—£700,000 three months' Treasury bills were offered by tender on September 25th. Applications amounted to £5,450,000. The minimum price to obtain allotment was £99 14s. 10d. Applicants at this price obtained 12½ per cent of their applications. The average rate of discount was £1 os. 5.98d. per cent. The whole £700,000 was allotted.

CONVERSIONS AND REPAYMENTS

Metropolitan and Ipswich Water Supply and Sewerage Board (Brisbane).—The £894,300 6½ per cent debentures outstanding will be repaid on November 1st, 1941. £1,000,000 of stock was issued at 96 in September, 1921. In 1928 the powers of the Board were transferred to the City of Brisbane, Queensland.

Nova Scotia 3½ per Cent. Stock.—The £650,000 outstanding of Nova Scotia 3½ per cent stock is being repaid in sterling at par, with accrued interest, on October 1st, 1942.

tricts, Durham is suffering from a shortage of labour. Since June 3,700 men, of whom 2,239 were "face" workers, have returned to the coalfield.

Salvage of Lubricating Oil

In *The Economist* of August 9th (page 181) attention was drawn to the need for fostering the recovery of used lubricating oil to save shipping space. Pre-war consumption of this oil, imported either as a finished product or in the form of crude oil, was at the rate of 600,000 tons per annum, and it has been estimated that between 150,000 and 200,000 tons of used lubricating oil could be recovered each year by an efficient system of collection and treatment. The Petroleum Department's decision, on August 26th, to issue a general licence for the purchase and recovery of used lubricating oil is therefore a step in the right direction. The products obtained by recovery are at least equal in quality to the original lubricant, but in most cases the physical properties are slightly different, that is to say, the oil may be somewhat thinner after treatment; it is necessary, therefore, to readjust the viscosity by blending with new finished products. The amount of oil required for adjustment of viscosity is comparatively small, probably averaging 5 per cent to 10 per cent, and it will be necessary to make such oil available to firms operating recovery plants. The average waste oil yields over 80 per cent of first-class finished lubricant. Several petroleum refineries in this country which have hitherto been employed on the manufacture of finished lubricant possess equipment suitable for lubricating oil recovery without modification. In addition, new equipment specially designed for lubricating oil recovery is being installed by private enterprise in various parts of the country. It remains to be seen whether the Petroleum Department's decision will provide the necessary stimulus to the reclaiming of used lubricating oil. If not, additional measures will have to be taken.

Aviation Petrol

At a Press conference early in August, Mr Harold L. Ickes, Federal Petroleum Co-ordinator, expressed fears concerning the adequacy of America's capacity to produce 100-octane aviation petrol, and he criticised Dr R. E. Wilson, formerly oil consultant to the Office of Production Management, for not foreseeing that existing capacity was "inadequate" for future needs. A shortage in 100-octane aviation petrol would be disastrous, for this grade of fuel is neces-

sary if the maximum performance is to be secured from the latest types of military aircraft—and requirements are rising steeply. Besides covering the growing needs of the American air forces, manufacturers of this valuable product have been making regular shipments to Britain and are now being called upon to supply Russia as well. Indeed, at a further Press conference on September 25th, Mr Ickes stated that the "emergency" in 100-octane petrol had been intensified materially by the needs of Great Britain and Russia. In view of the unforeseen character of part of this demand, and the fact that the manufacture of fuels of this quality is a costly business, it is not surprising that the Government should now be facting the possibility of a shortage; and it is good news that the Petroleum Co-ordinator has begun to "think big" on the subject of aircraft fuel supplies. Present capacity of the industry to produce 100-octane fuels (apart from lower-grade petrols) is in the neighbourhood of 40,000 barrels a day—a quantity sufficient to keep 11,000 aircraft of 2,000 hp each in the air for one hour daily. When Mr Ickes became aware that this capacity was insufficient, early in August, he promised refiners first-rank priorities if they would undertake to build new capacity or to expand their existing plant. The target aimed at was the doubling of existing facilities and there was a suggestion that independent refiners would be granted financial assistance if they cared to co-operate. Several of the major companies—including the Standard Oil Company of California, Humble Oil (another Standard concern) and Sinclair Refining—announced that they would be spending large sums to increase their capacity for the production of 100-octane fuel, and it is believed that plant now under construction will be capable of turning out 6,000 barrels daily. Last weekend, however, Mr Ickes told the Press that plans are being studied to treble the existing capacity at a cost of approximately \$150,000,000. He stated that 50 new plants would be needed to raise the output from 40,000 to approximately 120,000 barrels daily. Bearing in mind the extent of American commitments, this programme certainly does not appear over-ambitious, though it is hardly to be expected that private enterprise will foot the bill. The sooner it is put in hand the better. Meanwhile, it may be noted that the Administration's policy of accumulating stocks of all aviation petrols is meeting with fair success, the quantity of such fuels in storage on June 30th having amounted to 7,341,000 barrels (equal to almost seven months' domestic requirements) against 5,268,000 barrels a year earlier. It is impossible to say how much of this was 100-octane material, but it suggests that, if Mr Ickes' plans are carried into effect promptly, an actual shortage may be avoided.

COMMODITY AND INDUSTRY NEWS

THE price of tin, standard cash, recovered on September 25th from the low level of £255 15s.-£256 per ton on the day before, to £256-£256 5s., and it remained there until October 1st. Three months tin was £260 5s.-15s., compared with £259 5s.-10s. a week earlier. Separate licences were required for the importation from Eire of "Hides and skins (excluding fur skins), raw, dried, salted or pickled, but not further treated," from September 30th. The Board of Trade added 310 names to the "Black List" of traders in neutral countries on October 1st.

Tin Statistics.—According to the Tin Research Institute's estimates, world production of tin in August was 21,300 tons, compared with 18,100 tons in July and 18,400 in August, 1940. Production for the first eight months of 1941 was 168,600 tons, against 143,500 in the same period of 1940. World stocks of tin, including smelters' stocks and carry-over, decreased by 5,438 tons during August to 50,864 at the end of the month, compared with stocks of 51,232 tons at the end of August, 1940. Consumption of tin in the United Kingdom was 2,418 tons in July, compared with 2,426 tons in June and 2,756 tons in July, 1940. United States deliveries totalled 13,625 tons in August, against 12,575 tons in July. Deliveries from January to August were 106,572 tons, compared with 70,404 tons in the corresponding period of 1940.

"Utility" Underwear.—Maximum margins and prices for women's underwear

and nightwear of general utility, on the lines of the Order dealing with men's and boys' outer clothing and with women's and children's knitted underwear, have now been fixed. The garments concerned must be made from certain cloths specified in the Limitation of Supplies (Cloth and Apparel) Order, and must bear the Board of Trade's mark. The object of the Order is to ensure an adequate supply of cheap clothing. Actually, scheduled retail prices vary from 4s. for women's size panties to 18s. 10d. for O.S. women's size nightdresses. Margins of profit to makers-up, wholesalers and retailers are the same as those announced in the first Order. These were discussed on page 364 of *The Economist* of September 20th. Certain amendments have been made to the first Utility Apparel (Maximum Prices) Order, the most important being the lowering by a few pence per yard of many of the minimum prices for linings to be used for men's, youths' and boys' outer wear specified in the earlier Order.

Loose Coupons.—A notice declaring that it is illegal to offer or accept loose coupons, except for orders by post or in circumstances expressly authorised by the Board of Trade, and that offenders are liable to prosecution, must be on display at all places where rationed goods are supplied to retail customers, by October 19th.

Cotton.—Owing to the limited production and the fact that spinners of yarn cannot sell their output for more than twelve weeks ahead, business has been

generally difficult. Manufacturers of cloth have refused to accept fresh contracts as a result of not being able to cover in yarn. The undercurrent of demand has been of considerable dimensions, but very little of it has been satisfied. Spinners are still waiting for some reply from the Controller to the application for increased margins. From October 1st the acquisition, treatment, use or consumption of cotton lint, whether in the raw or bleached form, and whether imported or produced in the United Kingdom, was made subject to licence. To avoid interference with production, the Cotton Control will issue licences forthwith, without application, in respect of a proportion of the estimated requirements for October. Applications for licences are, however, asked for immediately.

Flour Production Control.—Certain amendments were made on September 29th to the Flour (Control and Prices) Order. The most important is the provision of an upper limit to the rate of extraction prescribed for national straight-run flour, which must be at least 75 per cent and not more than 85 per cent. Straight-run flours of 85 per cent or more extraction will either be national wheat-meal or specialty flours for the production of which individual licences will be required. From October 27th individual licences will regulate the production and sale of proprietary brown flours.

(Continued on page 427)

COMPANY MEETINGS

THE CUNARD STEAM SHIP COMPANY, LIMITED

SIXTY-FOURTH ORDINARY GENERAL MEETING TO BE HELD AT LIVERPOOL
ON WEDNESDAY, THE 8TH OCTOBER, 1941

(ADJOURNED FROM THE 23RD APRIL, 1941)

STATEMENT OF THE CHAIRMAN, SIR PERCY E. BATES, BART., G.B.E.

I am again sending a statement with the annual accounts, as the procedure proved convenient on the last occasion. I do not propose to make a speech at the annual meeting, but simply to move the adoption of the accounts.

As stated in the report, three new directors have joined the board, the first additions for 12 years. Two of the new directors come from the company's own subsidiary companies, and their appointments are due to the very strong desire to strengthen the working ties between the parent company and the subsidiaries. The third new director comes from outside the group. I think it will be a great advantage to the company to receive advice from a new director who can bring to our deliberations a completely fresh mind. All three appointments will be submitted for confirmation at the general meeting of stockholders to be held in 1942.

The Cunard Company's profit and loss account for the year 1940 shows somewhat better results than in the previous year. The company's own steamers have been under Liner Requisition during almost the whole year, but up till the collapse of France the results of the old trade between Liverpool and Havre, which was run with small chartered steamers not under requisition, were quite good. Dividends, too, from subsidiary and other companies were £26,000 higher. Since the close of the year the permanent rate of interest on the second mortgage debenture stock has been fixed by the Treasury at 3½ per cent., and as this decision has retrospective effect to January 1st, 1940, provision for this increase has been made in the profit and loss account.

The Excess Profits Tax situation of the group is still very far from clear, though it seems certain that Cunard White Star is not earning enough to attract a liability. The true effect of the Finance Act in the case of the rest of our group has not been easy to discover in the comparatively short time since the Act was passed. To provide against possible but undetermined liability in respect of 1939 and 1940, a transfer to profit and loss account of £175,000 has been made from reserves which have become free, and this figure appears on both sides of the profit and loss account, the balance for 1940 being shown at £146,110 13s. against £63,443 for 1939.

The usual depreciation has been written off the company's ships and properties, and provision has been made in the accounts for the final £10,000 which stood in the last balance-sheet representing discount and commission on the 5 per cent. mortgage debenture stock. The debit side of the balance-sheet in the item "deposits with the company" shows the continued progress in the reduction of the superannuation fund deposit. "Creditors," etc., at £597,298 show an increase of £152,000 due to open items of current business.

The increase in the balance carried forward shows the effect of the year's profit and loss account balance. On the credit side no change has been made in the valuation of the shares in subsidiary companies, the increase in the figure being due to the purchase of the outstanding shares in Thos. and Jno. Brocklebank, Limited, which was mentioned in the report for 1939.

"Loan and balances due from subsidiary companies" shows a higher figure at £94,302, owing to items of current business. "Shares in other companies" shows no change; they have returned 4.61 per cent. on their book value. "Debtors," etc., at £163,080 reflect the increase in open items of current business.

With the accounts are enclosed for the first time the latest balance-sheets of the Port Line and Thos. and Jno. Brocklebank, Limited, both companies being now wholly-owned subsidiaries of the Cunard Company.

It is to these companies that the board turned when about to make a decision to repay on February 2nd next the £3,683,615 5 per cent. mortgage debenture stock, and arranged to borrow from them the major portion of the total required. A substantial

sum will be provided by the parent company. The proceeds of the loans are already lodged with the trustees. I might perhaps explain that the money came partly from War Risk insurance received for ships sunk, which is not presently capable of being employed in the construction of tonnage suitable for their trades, and also from the sale of some of the investments representing the accumulation of reserves over more than a pre-war decade. Subject to there being no further losses of ships, this operation without any increase in dividends from the two companies named, or the receipt of any dividends from Cunard White Star, Limited, should provide margin for the full annual service of our two preference issues. The terms of issue, however, require that the 5 per cent. first preference stock ranks for arrears of dividend ahead of any payments to the 6 per cent. second preference stock.

The accounts and report of Cunard White Star, Limited, are also enclosed. As I forecast in my last statement, the results for 1940 are better than those for 1939. Any real comparison, however, is impossible, owing to the changes in accounting due to Liner Requisition and to other factors. 1939 would probably have shown much better results if the war had not started in September. In 1940 the *Queen Elizabeth* was commissioned, and in the early part of the year prior to the full incidence of Liner Requisition there was some satisfactory trading. 1941 results under universal requisition will somewhat exceed half the 1940 figure.

In the profit and loss account full provision for the depreciation of the fleet has been made, and now includes depreciation on the *Queen Elizabeth*. The increase in the amounts paid for interest on the first mortgage debenture stock (£750,000 and £1,000,000) reflect the recent decision of the Treasury as to a 3½ per cent. permanent rate. The item "interest on £2,500,000," £31,557, appears for the first time and is due in respect of the *Queen Elizabeth*. The balance shows a credit of £1,284,094, which I believe to be well within the company's standard for EPT so large is the value of the assets engaged in the business. In the balance-sheet, on the debit side, creditors are higher at £2,070,701, due to a large increase in open items of current business. (The corresponding item on the credit side—debtors, etc.—shows a larger increase, and for the same reason.)

On the credit side the fleet stands at the figure of £14,629,250, reached by continuance of the basis of depreciation described in my last statement.

Plant, etc., have borne their usual depreciation.

Investments in the name of the trustee for first mortgage debenture stock and income debenture stock (Class A and Class B) £1,156,828 represents the sums paid to the Treasury in respect of depreciation on the *Queen Mary*, bringing that depreciation up to date at the end of 1940. The figure also includes an unallocated sum—£178,485—for 1941 depreciation. The smaller figure, £189,115, represents the 1940 depreciation for the *Queen Elizabeth*. Both items are now represented by Government stocks. The cash figure, £3,573,611, is higher, mainly because of sums received in respect of ships lost.

Interesting though these Cunard White Star accounts for 1940 must be to all Cunard stockholders, the implications of the Cunard White Star directors' recent decision to repay the whole of the company's debenture debt, amounting to £7,950,000, must be even more so. During the war the company will not be allowed to build new ships for the North Atlantic passenger trade. At the proper time a cautious survey of the post-war world must be made before embarking on any shipbuilding, as nothing is so disastrous for any shipping company as to build ships, especially at high prices, which are other than carefully suited to their times. After the last war our Cunard building programme, based on the known desire of many inhabitants of the British Isles and Europe to leave home and, among other destinations, to go to Canada and the U.S.A., was turned into a handicap when the U.S.A. put

severe restrictions on to immigration, and Canada and the rest of the world perforce followed suit.

But for these restrictions, which started in the U.S.A. and which the rest of the world had to follow, there would by 1939 have been about 20 million people fewer in Europe. Perhaps there would not have been enough steam in Europe for Hitler to have been able to cook up this war at all. If there is to be free migration, we want one class of ship; if there is not, either we want a different class or perhaps no new ships at all. It would be madness for Cunard White Star to start building ships until it can see clearly the function of the ship to be built.

Let us consider the post-war ability of Cunard White Star to build ships after repayment of its debenture debt of £7,950,000 when the time should come for them to consider signing contracts. I have indicated earlier that 1941 results for this Cunard White Star Company will be of the order of £7,800,000 after providing depreciation of about £1,000,000-£1,200,000. If we said £1,800,000-£2,000,000 in new cash, of course subject to the effect of further ship losses, we would not be very far out. More losses under requisition reduce the annual revenue but add to the cash available for new building. In the absence of further losses Cunard White Star should have at the end of 1942 £2,600,000-£2,800,000 in cash with which to think about shipbuilding if the war had ended in 1941. This seems to me quite enough money with which to consider a moderate building programme and any programme ought to be moderate. To-day I would sooner be without more money in prospect than maintain for the Cunard White Star unusable resources which, in whatever form they might be kept, must be a temptation to extravagance. On all counts it is better for Cunard White Star to pay off what it owes. Cunard White Star will be very credit-worthy, and if it had difficulty in securing any marginal amounts it might think it needed to build ships, it would mean that suppliers of credit did not share the Cunard White Star Company's ideas as to the profit they might make.

To sum up my own view, the shipbuilding situation appears to be safe after this debenture debt repayment.

I return to the Cunard S.S. Company, Limited. The double transaction of debt repayment now in sight, repayment by Cunard S.S. Company, Limited, of £3,683,615 5 per cent mortgage debentures and repayment by Cunard White Star, Limited, of £7,950,000 of debenture stock of various kinds will remove capital charges ahead of the Cunard preference and ordinary stockholders amounting to £11,633,615. It will also result in about £6,600,000 being available to the Treasury for immediate war expenditure.

The no doubt inevitable delay in passing the Finance Bill into a Finance Act, and the consequent continued uncertainty in respect of EPT, has proved hampering to decisions on policy in more than one direction, but I hope to be able, either when submitting the 1941 accounts, or perhaps sooner, to make proposals for dealing with the arrears of preference dividend—thus giving the ordinary stockholders a prospect of ultimate dividend. Obviously it is impossible for me to be precise in the face of so many uncertainties, and there are many things which might happen to affect the situation or its background. We must proceed one step at a time, giving the stockholders the true picture possible as we go on. In my last statement I concluded with the following paragraph:—

"To sum the matter up in an attempt to put the stockholders in possession of my own thoughts, I would say that the figures before you, together with this statement, indicate that the time is approaching when it may be possible with some reason to hope for an improvement in our individual fortunes as stockholders, which years of careful conservation both of trade and assets have, I think, fully deserved. I do not base this expectation on war revenue; I have already said that the terms arranged for our largest subsidiary—Cunard White Star, Limited—are lower than those of other companies. Shipping can get a fair return in war and a fair return in peace, but for years before September, 1939, we have had a condition of no-peace and a species of near-war which produced a steadily increasing frost on international movement, commerce and trade. This condition, which was disastrous for shipping, has been ended, and will not be revived by any peace that we shall make. Consequently, I feel as confident for the future of our company as I do for the future of our country."

I think this paragraph is even more true than when I first wrote it.

PERCY E. BATES, Chairman.

September 24, 1941.

GAUMONT-BRITISH PICTURE CORPORATION, LIMITED

STEADY IMPROVEMENT IN BUSINESS

MR. MARK OSTRER'S STATEMENT

The fourteenth annual general meeting of the Gaumont-British Picture Corporation, Limited, was held, on the 30th ultimo, in London.

Col. H. A. Micklem, C.B., C.M.G., D.S.O., presided in the absence through indisposition of Mr Mark Ostrer, the managing director.

The secretary (Mr W. B. Robinson) read the notice convening the meeting and the report of the auditors.

The following is the statement by the managing director, which had been circulated with the report and accounts for the year ended March 31, 1941:—

The returns of business in the spring and summer months of 1940, although not up to pre-war level, showed satisfactory progress. Then followed the period of heavy attacks from the air by the enemy, and theatre earnings suffered severely during that time. A steady improvement in business took place after the cessation of these intensive air raids, and I am pleased to say that this improvement has been maintained up to date.

The film distribution and news-reel business administered by our subsidiary, Gaumont-British Distributors, Limited, has proved distinctly satisfactory, the profits being higher this year. In regard to film production and film printing, the favourable position enjoyed last year has been fully maintained throughout the year under review, and there is no indication of any reduction in the activities of these branches of our business. The other interests of the corporation are progressing favourably.

STRENGTHENING OF RESERVES

The profit for the year from all sources at £617,182 is slightly higher than last year, and this outcome is regarded with satisfaction by your directors, having regard to the dangerous period through which we have been passing. War Damage Insurance premiums applicable to the year under review, amounting to £30,313, have been charged against general reserve, reducing it from £242,500 to £212,187. The amount added to this reserve out of profit will bring it back to £290,000.

The further sums added to reserves out of profit are £87,329 16s. 6d. to debenture stock sinking fund reserve, bringing it up to £510,804 11s. 6d., and £28,755 10s. 10d. to reserve for amortisation and depreciation of properties, which now stands at £480,517 14s. 8d. These various reserves have benefited to the extent of £193,898 out of the year's profit, which figure compares with £157,763 last year. The balance of profit to be carried forward will be slightly higher than last year at £79,080 2s. 11d.

The balance-sheet reflects this improvement in our reserves and shows a substantial fall in our liabilities. First mortgage debenture stock redeemed during the year amounts to £178,137, bringing the total of redeemed stock at March 31st last to £803,520. Further redemptions have been effected by subsequent purchases of stock, and the total now redeemed is in the neighbourhood of £1,000,000.

Bank overdraft has been further reduced, as also have mortgage loans and creditors, the total reduction in these liabilities representing a sum of £85,788. Changes in current assets are for the most part due to the normal trend of business.

SUBSIDIARY COMPANIES

Subsidiary company debtor accounts show considerable reduction and sundry debtors are higher. Shares in subsidiary companies are lower, and the debenture stocks of subsidiary companies reflect the redemptions effected by the operation of sinking funds. The book value of properties is higher, owing to the addition of a theatre taken over from a wholly owned subsidiary company in voluntary liquidation.

No part of the corporation's profits up to March 31, 1941, is subject to Excess Profits Tax. For obvious reasons it is not possible to make any forecast of the probable outcome of the current year. All that can be said on the subject at this moment is that the figures available show substantial improvement over the corresponding period of last year.

Colonel Micklem paid a tribute to the work of the whole of the staff and employees of the company and moved the adoption of the report and accounts, which, after questions had been answered was carried.

THE SECOND ALLIANCE TRUST COMPANY LIMITED

REQUISITION OF AMERICAN HOLDINGS

PROBLEM OF REPLACEMENT

MR JAMES PRAIN'S SPEECH

The annual ordinary general meeting of the Second Alliance Trust Company, Limited, was held, on the 26th ultimo, in the company's office, Meadow House, 64, Reform Street, Dundee.

The chair was taken by Mr James Prain, and after formal evidence of the proper calling of the meeting had been submitted, the Secretary read the auditors' report to the shareholders.

The Chairman, in moving the adoption of the annual report, said:—

I have now to submit for your approval the directors' report and accounts for the year to July 31, 1941.

During the past year we have had considerable sums available for investment as a result of the requisition by the Treasury of the company's holdings of American securities, an experience common in a greater or less degree to other financial institutions with interests in the United States and Canada. The influx of these funds into the market, in addition to those normally seeking investment, has helped to create a situation in which buyers have predominated. Other factors and influences coinciding with a period in the war when the threat to our own country was not so immediate and direct, have served to stimulate this pressure of money, and we have seen, therefore, a steady and quite substantial recovery throughout the year in Stock-Exchange quotations in general. It is not at such times that one would hope to acquire suitable securities to replace the American stocks which have been taken from us, and which in the aggregate were yielding us a highly remunerative income. We have, indeed, found it impracticable to replace more than a portion of these funds on a basis which does not involve some sacrifice of revenue at the present time and in the immediate future. I might mention in passing that we have given substantial support to the issues of Savings Bonds and War Bonds, a step which you will no doubt approve of on general grounds.

ORDINARY DIVIDEND 21 PER CENT.

I must not exaggerate, however, the effect of these matters on the company's position. It is after all a question of degree. You will see from the accounts that although the gross revenue of £213,000 is some £14,000 less than that of a year ago, the net income remains ample to meet all our outgoings with a comfortable margin of safety. The interest and dividends on our debenture debt and preference stock are very adequately secured, and our ordinary stockholders, who now receive a dividend of 21 per cent.

for the fourth year in succession, may consider the results not unsatisfactory in the circumstances.

We have again transferred to contingent reserve fund the sum of £30,000, of which approximately £26,500 represents the surplus for the year, and £3,500 is taken from the revenue balance brought forward. You will observe that we propose to carry forward £14,300, which sum, in accordance with our usual practice, is subject to directors' remuneration for the past year. The sum to be set aside for this purpose falls to be fixed at this meeting, and a word of explanation is called for on this occasion. Hitherto, the fees voted by the stockholders from time to time have provided for a sum to be paid to the directors free of income-tax. With the rate of tax rising to a figure which was not in mind when the arrangement was entered into, this method of remuneration is generally regarded as unsuitable, and indeed legislation has now been passed to prevent hardship arising from the fulfilment of contracts drawn up on that footing. Here, the simplest solution is that the stockholders should vote a gross figure for our services during the past year and such sum will be subject to tax in the hands of the directors. Accordingly, a motion to that effect will be submitted at this meeting.

CURRENT YEAR'S OUTLOOK

The outlook for the current year continues to be relatively unpromising. With a large and varied list of investments we must expect in any year to have our quota of disappointments and defaults, while under present wartime legislation there is, of course, little or no opportunity of recouping ourselves from these industries which have prospered. The dice are loaded against the investor. Apart from this aspect, however, our hope is that the revenue from the bulk of our investments will be maintained, in which case our statement next year should be reasonably satisfactory.

Before moving the adoption of the report and accounts, I shall take the opportunity to acknowledge the valuable services of the staff, whose numbers, as you can imagine, are much reduced, and whose duties are correspondingly heavier. With your permission also I shall convey your good wishes to those members who are serving with the Forces.

I now beg to move that the directors' report and accounts for the year ended July 31, 1941, be adopted and approved and that the final dividends be declared at the rates therein recommended—on £800,000 preference stock at the preferential rate of 4½ per cent. per annum, and on £400,000 ordinary stock at the rate of 12 per cent. actual, making 21 per cent. for the year, both subject to income-tax.

The report and accounts were adopted and resolutions were passed providing for the re-election of the retiring director, the remuneration of the directors and the reappointment of the auditors.

GOVERNMENT RETURNS

For the ten days ended Sept. 30, 1941, total ordinary revenue was £49,899,000, against ordinary expenditure of £52,550,000 and issues to sinking funds of £260,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,504,050,000 against £1,162,936,000 for the corresponding period a year ago.

CURRENT STATISTICS

Ships in Strategy

THE pundits expected, on good grounds, that if Hitler had failed by September to hit his eastern targets, including Moscow as well as beleaguered Leningrad and Odessa and Kiev, which in fact has fallen, he would need to revise his famous timetable. This he has done; but, instead of slowing it down, he has speeded it up. Probably the most massive, and certainly the most mobile, assault in

The chief gap in fighting ships was in small vessels to protect merchantmen; and for this purpose the "corvette," a small vessel which can be built more quickly and easily than the modern destroyer, has been found suitable. The navy required hundreds of small vessels to keep the sea lanes clear of mines, and has been able to use fishing vessels in large numbers. The navy needed very many auxiliaries, such as tankers for refuelling and cargo ships for provisioning. There was a good deal of improvisation to begin with, such as the conversion of passenger liners into armed "merchant cruisers" of limited fighting capacity, which offered a large target to enemy craft. Now, because of the rapid construction of new vessels, the navy is in a position to carry out its duties with very much greater efficiency, even in spite of the losses it has sustained and the grave defection of the French navy. At a critical moment, it was assisted by the fifty American destroyers put at its disposal and by units of the fleets of countries occupied by Germany. Nevertheless, it has long been plain that the British navy was not able, single-handed, to fulfil all its tasks; and the American Government's decisions, first, to form an Atlantic fleet, then to patrol defence zones, and, finally, in September, to assist in actively policing the Atlantic, are long steps towards full collaboration.

The deficiency of the merchant fleet has been its vulnerability at sea and in port. Great Britain entered the war with 6,722 steamers and motor ships of all kinds of a gross tonnage of 17.9 millions. Something like 7.6 million gross tons, or 80 per cent of the combined fleets of steamers and motor ships owned by Norway, Holland and Greece, numbering 4,117 vessels of an aggregate gross tonnage of 9.6 millions before the war, some of them already chartered for Allied use, have been transferred to the Allies. French, Belgian, Danish and Polish vessels, of a total gross tonnage of about 1.5 millions, have been transferred; the tonnage captured from Germany, Italy and Finland amounts to some 530,000 gross tons; that bought and leased from America and chartered from neutrals may be estimated at 1.5 million gross tons. If to these estimates is added the tonnage of the new vessels which have left the shipyards in this country during the past two years—perhaps some 1.5 million gross tons—the aggregate gross tonnage of vessels accruing to the Allies must have been in the neighbourhood of 30.5 millions.

This total, however, very far from measures ocean-going carrying capacity. It includes many coasting vessels and passenger ships—though none of them is entirely redundant in war; coastal vessels still ply a limited trade, while many passenger ships are used as "merchant cruisers" or as troop carriers. But, of Great Britain's pre-war tonnage of 17.9 millions gross, only some 10 millions were ocean-going and concerned mainly in general cargo trade. Moreover, even statistically, the merchant fleet now at the disposal of the Allies is nothing like 30.5 million gross tons. The gross tonnage of British, Allied and neutral vessels lost through enemy action during the first two years of war amounts to the enormous total of nearly 8 millions. If other marine losses of some 750,000 gross tons are added, the total drain must have exceeded 8.5 millions gross. The Allies now possess barely three-quarters of the gross tonnage they would have had; and only a part of their fleet of some 22 million gross tons can sail the high seas for the war effort. Twenty-two million gross tons is considerably in excess of the tonnage owned by Great Britain alone before the war. But the effective carrying capacity, even of the proportion that is ocean going, must be appreciably smaller than before the war; the convoy system and the need for avoiding the normal sea lanes, and port delays have materially slowed down the speed and time-tables of ships, while a very appreciable tonnage must have been transferred to, or be held at the disposal of, the fighting forces.

The adequacy of the merchant fleet is a function of the tasks it has to perform in order to maximise Allied staying and striking power. The provisioning of the people of this country was only one of these tasks which became

increasingly onerous when the loss of continental food supplies compelled the Government to draw food supplies from more distant sources of supply. Where one ship had been employed in the transport of a given quantity of food from Denmark, about five vessels are needed to bring the same quantity from America. The munition factories must be fed with a growing volume of raw materials, and transport must be provided for the increasing stream of supplies from the United States, for the essential trade with the Dominions and Colonies, for the provisioning of overseas theatres of war, in the Middle and Far East and in Russia, and for many other purposes. The practical difficulty of using the direct route through the Mediterranean has immensely added to the strain of supplying the Near and Middle East, for the distance between this country and Egypt by the Cape route is the same as that between Great Britain and its farthest Dominion.

At present, the number and tonnage of the merchant fleet are insufficient. The United States, it is true, is now shipping supplies and military stores direct to the Middle East, Russia and other countries. But America's ocean-going merchant fleet is nothing like so large as Great Britain's was before the war, and a large part of it is required for essential imports and coastal traffic. In June, 1939, it numbered 2,345 steamers and motor ships of a gross tonnage of 8.9 millions, while 445,000 gross tons of new ships were launched in 1940, and a further 1.0 million gross tons is expected to be produced this year. The combined tonnage of the Allies and America is not yet equal to the next task of bringing the maximum striking power to bear upon Germany; and only by ships can mobilisation be made effective.

The way to victory by sea is threefold. First, every ingenuity must be exercised to economise shipping. It is in the nice balance between the needs of the Ministry of Supply and the Ministry of Food, between production and diet, that the test of strategy in its siege stage between mere defence and planned attack comes; in the devising of a food policy that will employ as few ships as possible and use every sea-going ton to the maximum effect; and in the maintenance of sufficient import capacity, at any cost and in any circumstances, to keep up and expand the production of weapons and munitions. And these considerations have never been absent from the Cabinet's mind. There is some suspicion that, in the dark days of heavy sinkings, the requirements of the war factories and the armed forces had to yield some way to a food policy which still rests too much, perhaps, upon livestock farming. Instead of the milling ratio for bread being increased, the official has still been held to be converted by beef cattle into protein of between 1/7 and 1/15 of its original quantity. The campaign to save ships by having wholemeal bread has been a slogan, not a fact. But, in food and in production, the Government's plans are based upon a careful allocation of shipping space; and policy cannot do all. The second path is to spare no effort to reduce shipping losses and to repair damaged vessels with all speed. Lately the net loss sustained by British, Allied and neutral shipping has probably been small. But it will be rash to assume that losses will be kept down to a level at which they can be conveniently replaced by British and American shipyards at the present rate. A new U-boat campaign in the Atlantic is already heralded.

Losses or not, the third means will be decisive, the construction of new ships with all possible speed in the United States, which alone can provide the many millions of tons that will be required to defeat Germany. The United States has been alive to its responsibility. The tonnage launched is expected to increase from one million gross tons this year to about 3.7 millions in 1942; if the experience of the last war is any guide, this programme should not be impossible of fulfilment, for output (excluding lake vessels) was then raised from 821,000 gross tons in 1917 to 2,600,000 gross tons in 1918. America now realises fully for the first time the necessity of playing the leading rôle in the battle for supplies; and American ships may write the final chapters of the war.

Australia's Choice

THE Australian political situation reached yet another crisis at the end of last week, when Mr Fadden's Government was defeated on the new Budget by 36 votes to 33, both Independent members voting with the Opposition. The protagonists thereupon followed the orthodox course. Mr Fadden resigned; the Governor-General asked Mr Curtin, leader of the Labour party, to form a Cabinet; and Mr Curtin accepted.

Unfortunately, it still cannot be said that this latest crisis is the last. It is not clear whether the coalition between the United Australia and Country parties will be maintained now that they are out of office. If it does, then the Labour Government, like its predecessor, will be dependent on the votes of the two Independents. Mr Fadden has assured Mr Curtin of the Opposition's support in the prosecution of the war, and Mr Curtin intends to retain the Advisory War Council on which all parties are represented. But a similar pledge of support from the Labour party did not prevent it from challenging and defeating the late Government over the Budget, which cannot possibly be distinguished from the war effort; and there is no guarantee that, in similar circumstances, the new Opposition will respect a self-denying ordinance. Moreover, there is a new anomaly in the position of Sir Earle Page. Mr Curtin has asked him to continue his mission; but it is an extraordinary situation for a Government's official envoy to be the leader of one of the Opposition parties, however united all parties are alleged to be on matters relating to the war.

So far, Mr Curtin's Government has received a good press, but, unfortunately, his determination not to tax low incomes will probably throw his administration of the war effort completely out of gear. It was only with great difficulty that, in last year's Budget, Mr Menzies was able to reduce the exemption from tax liability for single persons from £A250 a year to £A200, and Mr Curtin now apparently proposes to restore the higher figure. Thus, while in Great Britain in the current financial year, a single person earning £200 sterling (the equivalent of £A250) pays £32 10s. in tax, of which £10 16s. 8d. is a post-war credit, Mr Curtin wants Australian taxation only to begin at this level. The financial position is very complicated by the existence of state taxation, which is high in some states and low in others, and which makes direct comparisons with Great Britain rather misleading. Nevertheless, it can be said that Mr Curtin holds as a general proposition that incomes below £A250 a year should pay for the war neither by taxation nor by compulsory loans, but by voluntary saving alone.

If he persists in this proposition, it is very possible that his purely financial problem—it is apparently not suggested for a moment that war expenditure should be below Mr Fadden's figure of £A217 millions—will, contrarily enough, be made easier by under-spending. For the output of munitions, remarkable though it is, is almost certainly below official hopes and estimates; and this lag can with equal certainty be attributed to the shortage of manpower. There are other more immediate obstacles such as the lack of machine tools, but Australia's total population is so small that full use for the war effort can only be made of the country's economic resources if the employment of labour for civil purposes is cut to the utmost. There is no sign, however, that this is being done. Total employment in Australia had risen by 153,000 from August, 1939, to May of this year; and of this increase munition work accounted for 40,000 and private factories for 71,000, most of which was due to contracts for war work placed with these factories. Nevertheless, "other employment" had also risen from 1,579,000 to 1,621,000; and, since this accounts for by far the greater part of the total employed population of 2,278,000, considerable transfers of labour will be

necessary if the war programme is to be expanded, especially as the reserve of unemployed had virtually been used up by last May. But very little has been done to expedite transfer or to draw the unoccupied into employment. There has been no registration for war work, either general or special; no rationing, except of petrol and newsprint; no limitation of supplies, except for certain restrictions on the use of aluminium, tinplate and a few other materials in civil production; and no concentration of civilian industry.

The only method that the Australian Government has attempted to use, to restrict civilian consumption and manufacture, has been the financial one of taxation; now Mr Curtin proposes to make this ineffectual by exempting low incomes from its scope. It is quite true that he has pronounced himself in favour of rationing—but as a means of achieving a fair distribution of consumption goods rather than as a means of curtailing their production. What he—and for that matter Mr Fadden, too—evidently does not realise is that neither rationing nor taxation is enough in itself to secure the maximum transfer of resources for war purposes. Taxation, rationing, limitation and concentration are all necessary. Without them, but particularly without the first, Mr Curtin may well find that the moneys to be voted by Parliament for the war will again be under-spent—unless there is a considerable rise in prices, which will hit most severely the very people he is now trying to protect from the inescapable demands of war finance.

If a general election takes place, which seems very possible since the Labour party, as the Australian press is pointing out, has no mandate for a Labour programme, the present signs are that Mr Curtin will be returned. In three state elections this summer Labour has done well; it has remained firmly in power in Queensland and won a big victory over the coalition parties in New South Wales, while in South Australia, though it is still in a minority, it has now eleven seats against nine. Moreover, it is in a stronger position than at the general election last year because the split in its front has been closed, and Mr Beasley, leader of the six so-called non-Communist Labour members in the Federal House of Representatives, has been given a place in Mr Curtin's War Cabinet. But it is not likely that an election will be fought on the issue of a Labour programme, although to satisfy the extremer members of his party Mr Curtin may have to put certain parts of one in the foreground. It is more probable that, like the last one, it will be fought on the more general issue of which party will best direct the war effort, and there are no signs that the Australian people realise that this party will be the one which asks them to make the biggest sacrifices.

With one exception, there has been no attempt since the war began to warn the Australians that their very real military sacrifices must be reinforced by civilian sacrifices, or to give them details of what these sacrifices will involve. The one exception was Mr Menzies' broadcast last June, but he was not popular enough to carry the people with him. Mr Curtin, whether there is an election or not, now has the opportunity to succeed where Mr Menzies failed. He can place the real issue squarely before the people, at the same time offering seats in his Government to the Opposition parties, since the programme that total war demands can only be directed by a National Government. If he does this, last week's events may prove to have been well worth while. However else he acts—whether he tries to enforce a Labour policy or merely serves the mixture as before, with a few additions such as soldiers' bonuses to improve the taste—it can only be at the expense of Australia's potential war effort. If this issue is plainly put to the Australian people, they will surely not hesitate to choose the harder path.

Report on America

(From a member of the editorial staff of THE ECONOMIST who has travelled over 25,000 miles in North America since early June this year.)

1.—War or Peace?

THE night was dark and very warm. The wheat harvest in this farming county of western Iowa was in, but the maize was still ripening, so that the farmers had leisure for talking. The County Agricultural Forum was meeting in the gymnasium of the cross-roads high school, and the English visitor congratulated himself on the fact that here, at last, he was getting down to the grass roots. He did not himself broach the subject of American policy in the world crisis—Americans take to foreigners' preachments no more readily than Englishmen—but the farmers themselves insisted on discussing it at full length. The remarks—speeches would be too grandiloquent a term—were shrewd, sincere and astonishingly well informed; and some were very moving.

After more than an hour's talk, the chairman said he would take a vote: "Which of the three following propositions best expresses your view: (a) that the President has gone too far; (b) that the policy of supplying material aid, short of war, is right and will remain right; (c) that the United States ought to fight?" But they would not accept this set of choices and, after further discussion, the third proposition was amended to "that the United States should do whatever is necessary, short of nothing, when it is proved to be necessary, to get rid of Hitler." On this basis the vote was taken. Not a single vote was cast, in this meeting of over a hundred Middle Western farmers, for the first proposition, the Isolationist doctrine. For the second opinion, there was a scattered dozen of hands put up. All the remainder, an overwhelming majority, voted for the amended third proposition. And there was no doubt they meant it. The feeling was summed up by the cashier of the local bank. "I fought in the last war," he said (and the audience knew that he lost a lung in it), "and I vowed that I would be a pacifist for life. But if Hitler can't be defeated any other way, I'll go back myself."

This is the mood of the American people, of that vast central mass that is neither Isolationist nor Interventionist. They will do what is necessary, but they demand proof. All but the most rabid Isolationists now recognise the mood and adjust their propaganda to it. Mr Lindbergh still says that America can be indifferent to the Nazi peril and that there is more danger in British imperialism. But his shrewder team-mate, Mr Hoover, sings another tune. Hitler, he says, is already doomed; it is not necessary for America to do anything more; let her keep her powder dry and her hands clean. And any traveller in the United States can observe for himself that, while Mr Lindbergh offends ten for every one he converts, the Hoover line of argument is effective and dangerous. The average American has made up his mind that he hates Hitler, and that America will not be able to live in peace until the Nazi system has been smashed. But he wants the smashing to be done at the least possible cost to himself.

This attitude—this questioning, not of the objective of Mr Roosevelt's policy, but of the degree of effort that will be necessary to attain it—explains much that would otherwise seem illogical and inconsistent in the events of the last few months. It explains, for example, the phenomenon that has been described as the "drop in morale" since May and June. There has been no drop in morale if that element is measured by the degree of distrust of Hitler or of emotional support for the democratic cause. The reaction to the German attack on Russia was a proof of that; for all the violent anti-Communist feeling among Americans of all classes, it was

difficult to find, or even to hear tell of, anyone who had been converted to isolationism by Hitler's anti-Bolshevist "Crusade."

The "drop in morale" of these last few months has nothing to do with the emotions and aspirations of the American people, which are fully and irrevocably committed. It is simply a reflection of the fact that, to the man in the street, the war has looked as if it was winning itself without further American efforts being necessary. The closeness of the vote in the House of Representatives on the extension of service of the draft is to be explained in the same way (though it was also influenced by considerations of domestic politics as far removed from its real significance as the impending mayoral election in New York City). Both Mr Roosevelt and Mr Churchill have given assurances that an American army will not be needed in Europe, and the prospect of having to fight in America is distinctly less than a year ago, when twelve months was set as the length of training.

The same feeling of relief from urgency is also responsible for the recrudescence of the traditional habit of carping at British actions; the utilisation of Lend and Lease materials has been the target of planned pro-Axis propaganda, and it has met with a surprisingly large response, even in quarters (such as those for which the *New York Times* speaks) that are basically the most pro-British. But the other side of the medal is given by the fact that these same summer months which have witnessed the "drop in morale" have also seen a growing volume of criticism directed against the progress of armament production in the United States itself, against the inadequacy of the programme, the timidity of its execution and the small scale of the flow of supplies to Britain. There has also been the miracle of a taxation Bill whose provisions were actually tightened up as it passed through Congress. That America should be the arsenal of democracy, and that the taxpayer should foot a large part of the bill, are taken as proved necessities, and there has been no relaxation of the pressure of public opinion behind them.

The state of American opinion appears complex or illogical, only if the mistake is made of applying to it the criteria of simple logic. The great size of the country and the nature of its constitutional arrangements nearly always make for a certain lack of cohesion. But the regional differences in opinion have been greatly exaggerated; with the exception of the South, which traditionally loves a fight, the differences between the East, the Middle West and the Pacific Coast are no more than shades of emphasis. Broadly speaking, the American people will do whatever is proved to them to be necessary to see that the war is won. If they are polled on some hypothetical question about their future action, they will give a negative answer. When the President says he hopes to avoid war, they answer Amen. But when he takes definite action, even when, as with the occupation of Iceland or the order to the Navy to shoot, it breaks all the accepted rules of American policy, the people are very ready to accept his assurance that it is necessary. It is not a very heroic attitude, or very long-sighted; but it is very human, and by that token very democratic.

A Declaration of War?

If the American people are to do more than they are doing—specifically, if they are to declare war—then they will have to be convinced, through the mysterious processes of democratic leadership, that it is necessary. And is it necessary? Desirable, yes; but is a formal declara-

2.—The Pace of Production

In the United States, as in Great Britain, the programme of defence production was planned before the war. And in the United States, as in Great Britain, the strange effect has been to limit and delay the production of munitions. This is not, of course, a criticism of fore-sighted planning. In both countries, the plan was inadequately conceived, both as to scale and to method; and nothing can be more cramping than a detailed and pre-arranged, but inadequate, plan. In Great Britain, the designs and the industrial methods first worked out survived to plague the very much larger programme that became necessary when the war arrived. Similarly, in the United States, the War Department had worked out, in great detail, a plan for raising and equipping an army of two million men, and the industrial facilities necessary for accomplishing this plan had been earmarked. But the actual necessities have turned out to be far larger. Measured by numbers of men, it is true, the present plan is still within the limits of size (though not of time) of the old. But the scales of equipment are very considerably larger than were anticipated; \$13 billions' worth of Lease-Lend material has been added to the programme; and the time-schedule for the whole effort is considerably more urgent.

The old plan, however, has for years been the pride of the War Department, and great efforts have been expended to try to make it fit entirely different circumstances. But the changes in scale required consequential changes in industrial method. It was no longer possible to achieve the necessary production by placing orders with a pre-selected list of specialist producers; something of the nature of a mobilisation of the whole industry of the country was required. And if there were to be such an effort of industrial engineering, it could hardly be carried out by the professional soldiers of the War Department.

All the administrative changes that have been made in the munitions programme have been efforts to solve these two problems. But they have largely misfired because of the mistake that was made in believing that practical industrialists would automatically see the problem more clearly than the soldiers. Some of them (Mr Donald Nelson and Mr W. L. Batt have been outstanding examples) have been quick to see the necessities of the situation, and have been preaching the solution for months past. But, if the soldiers had a vested interest in their pre-conceived plan, the average industrialist has an unconscious bias towards Business As Usual. The Office of Production Management, from its Director-General downwards, has been dominated by the desire, not to mobilise the resources of civil industry as rapidly as possible, but to interfere as little as possible.

This attitude has been shown over and over again. In the matter of steel supplies, for example, the attitude of the business men in the OPM was, first, to deny that there would be any shortage, and to maintain this denial until it was too late to instal any new capacity; and then, when the need for priorities did, after all, arise, to resist or limit the curtailment of operations in civil industries such as automobiles. To say this, is not to single out the business men for particular criticism, but simply to controvert the belief, tenaciously held in Britain as well as in America, that industrialists are necessarily more far-sighted and clear-thinking than any other classes.

The latest administrative change, the appointment of the Supply, Priorities and Allocation Board, with Vice-President Wallace as its chairman and Mr Donald Nelson as its Executive Director, may prove to be a long step forward, since its members are believed to be a team that can work together without the personal antagonisms that have crippled previous agencies; a clear majority, if not quite all, of them are convinced adherents of

tion of war by the United States a necessary step on the way to victory? It may legitimately be asked whether the effects of the formal step have not been exaggerated in anticipation. It is true that American belligerency could be expected to have a profound psychological effect in Germany and in occupied Europe; but if its psychological effect in England were to relax tension and diminish the urgency of effort, the balance of advantage might not be large. The decisive factor would be the effect of a declaration of war in the United States. Declared American policies, as they now stand, without formal belligerency, will lead the United States to do everything that used to be accounted war with the sole exception of sending the army overseas; and as for the aggressive use of land forces, it must not be thought that a declaration would carry with it the decision to prepare an army for despatch to Europe. The two questions are, at least, separate and distinct in the American mind.

The effect of a declaration on the volume of American production is difficult to gauge. As is discussed in the next section of this survey, the country already stands before the crucial decision whether its civil resources shall be mobilised or not. If the right decision is taken now, there would be correspondingly less effect for a declaration of war to produce; and if the resistance to a curtailment of the standard of living is too strong now, it might remain too strong after the legal step had been taken. No one who lived in England from September, 1939, to May, 1940, should yield to the temptation of exaggerating the effect, as a stimulant, of a war in which no bombs fall and no lives are lost. Moreover, there is another factor to be considered. Criticism of the inadequate equipment with which the American forces themselves are being trained is already considerable, and would be much louder then. It would be much more difficult for the Lease-Lend Administration to starve the American admirals and generals, as it is now doing. Though a declaration of war might lead to higher production, it would probably lead to a smaller proportion of the output being sent to the theatre of war.

In Search of Proof

Even after all these arguments have been taken fully into account, however, an American declaration of war remains desirable for the purpose of winning the war—the best proof is the trouble that Hitler is taking to avoid it. But far too much importance has been attached to it in popular thought, both in America and in England. When it comes, it will almost certainly prove to be a step of less importance than several others—the passage of the Lease-Lend Act, for example. Between the pure white of innocent neutrality and the full scarlet of total belligerency, there are many intermediate shades—and America is already moving through the deep pinks.

In particular, it would be well if it could be understood that British appeals for a declaration of war by statesmen, by editorial writers or by propagandist organisations, do rather less than no good at all. They prove nothing—except that the British people would like to see America in the war, which everybody knows already. And what the American people require now is proof—with the closest approximation to facts and figures that wartime conditions permit—of the necessity of their making greater efforts, irrespective of the legal state in which those efforts are to be made.

In recent weeks, there have been many notable signs that the American people are finding the proof they are seeking. The vote of the American Legion against the ban on overseas expeditions was a most significant reversal of attitude; and Congressmen, after visiting and testing their constituencies, are changing their attitude, too. More and more it is evident that the necessity for the United States to play not simply a part, but the leading rôle, in winning the war against Hitler is widely appreciated; and the corollary, that the rigours of economic mobilisation must be squarely faced, is gaining ground with gathering speed.

"total mobilisation," and they carry fully enough political authority to enforce their decisions. This is a great improvement; but two obstacles still remain. The SPAB, like the OPM, is not an executive body. Its functions will be less purely advisory than OPM's; but the actual work of negotiating contracts and placing orders will still be done by the soldiers in the War Department and the sailors in the Navy Department (unlike the British War Office and Admiralty, the two Departments employ no civilians of administrative rank).

The second obstacle is the continuing inertia, if not opposition, of industry in the face of anything like general mobilisation. Civilian demand for products of every sort is booming as it has not boomed for twelve years; and it is only natural that, at such a time, troublesome and unremunerative defence orders should be rather less than fully welcome. American business is doing its patriotic duty—but as a duty; and each firm is watching carefully to see that it does not accept a heavier burden of duty than its competitor. It is true that the growing shortages of certain raw materials have begun to create the threat of idleness in some industries, and a consequential demand for the spreading of contracts among small firms. But this situation is certainly not general, and its public discussion must be regarded as a diversion from the real argument, since it is entirely conducted on the assumption that it is the contracts that are the scarce factor and the productive facilities that are in surfeit.

If there is to be an industrial mobilisation, it is, of course, the opposite that is true. What is needed is not a relief scheme to keep small businesses in the metal-using trades alive, but a mobilisation plan to bring into the production of munitions as much as possible of the productive equipment and facilities of all firms, large and small, in every industry. As much as could be done by the method of utilising the existing munitions and near-munitions industries, and by building special new plants, had already been done by the end of 1940. The full capacity of the machine tool industry was by then engaged for a long time ahead, and this fact by itself put a stop to any further progress by the old methods. If there were to be a further increase it could only be achieved by finding means of using the existing facilities of civilian industry.

Plans and Performance

It has taken eight months for this fact to be given its administrative expression. The programme, as measured by the amount of money appropriated or asked for, has increased enormously since January 1st. There have been additional appropriations for the domestic programme as well as the whole Lease and Lend policy. The amount of material needed to be produced has at least doubled, and possibly trebled. Unfortunately, the habit of thinking in monetary terms, and of doing so without any time limit, has obscured what has been happening. The appropriations have been allocated and the allocated sums have been "obligated" (i.e., contract relationships have been entered into). The financial figures have increased rapidly—but it is questionable whether the production schedules of the next eighteen months have been significantly altered. What has happened is that the new orders have been added on at the end of the old, and that the stream of production has been extended in time rather than broadened. The President's insistence on the rapid placing of orders has itself contributed to this end.

Nothing that has been written here must be taken as an unfavourable comparison of the policy pursued in America with that of any other country—or at least of any other democracy. There have been unforgivable muddles, confusions, timidities, delays; but, if there had been no more muddle, confusion, timidity and delay than this in Great Britain in the days when it, too, was only a near-belligerent, it would be possible for an Englishman to be prouder of his country's achievements. In any country where the people's welfare is the supreme law, the transition to total mobilisation is painful to decide upon, and in any country where democratic processes survive, it is difficult to achieve. But it is the crucial point

in any armament programme. It is the stile that separates spare-time from full-time effort. Without such a mobilisation, the potential of a country is measured by the size of its specialist munitions industry—a test which leaves the United States well down on the list of Great Powers. With a total mobilisation, the full economic strength of a country can be brought into play.

There is evidence that this stile is being surmounted in these weeks. There is certainly no battle of the war whose outcome will be more decisive. As in Britain, it has been learnt by experience that the establishment of broad priorities in the use of vital materials is not enough to ensure precedence in supplies for essential contracts. Mr Nelson, of SPAB, proposes to substitute the system of allocation, earmarking actual materials for specific uses. Before Christmas, it will be possible to say whether all those proudly paraded columns of figures, the tons of steel, the barrels of oil, the bushels of wheat, the millions of skilled workers, are going to be brought into relevance to the war. Democracy is on the point of acquiring an arsenal.

3.—Guns or Butter?

THE average American has been told until he is weary of the phrase that war poses a choice between guns and butter. But it is symptomatic of his attitude that he can still be electrified by a factual description of the curtailments of their standard of living to which the inhabitants of Great Britain are submitting themselves. The theoretical argument is one thing and is fully accepted; its practical application to himself is a subject with which the average American has never bothered himself. He has been encouraged in this attitude by the strange way in which the first practical examples have been handled. The first sacrifice that the citizen was asked to make was to surrender his domestic aluminium ware. A considerable amount of enthusiasm went into local collecting campaigns. But the citizen (as in Great Britain a year earlier) soon observed that he was still free to buy new aluminium pots and pans, and the piles of scrap aluminium that had been collected were allowed to lie where they had been dumped.

Then there was the strange story of the shortage of petrol in the states of the Atlantic seaboard. Mr Harold Ickes, perhaps because this was his only contact with the defence programme, showed the most urgent anxiety to convince the public that the diversion of tankers to the British service made it necessary to curtail consumption. There were appeals for voluntary economy, curfew agreements, limitations of supplies to retailers, threats of rationing and talk of building a new pipe-line half across the continent. Only after this had been continuing for some time did a representative of the railways make the statement, which has not been contradicted, that the railways could easily carry all the oil that was needed, if only agreement could be reached between them and the oil companies and, among the latter, about the freight rates to be charged. Occurrences like this only tend to confirm the man in the street in his suspicion that all the talk about "guns or butter" is little more than a smoke screen.

Moreover, even if the aluminium and petroleum difficulties had been more skilfully handled, they would hardly establish the general case. It is obvious that, if there is to be a munitions programme of any size at all, there will be shortages of many varieties of materials. But that is a very different thing from establishing that there is a necessity for reducing civilian consumption in general. The American consumer knows that he will have to do without most metals, some chemicals and a few things like silk; he is prepared, even perhaps willing, to consume other things instead. But it has hardly even been suggested that he may not be able to consume other things instead, and that the famed American standard of living may have to suffer a temporary abridgement in defence of the American way of life.

Serious discussions still take place in Washington about

the best way of stimulating production in some consumer industries (such as cotton), so that they can accommodate the purchasing power that will be displaced from the refrigerator and automobile industries. The real debate over "guns or butter," for all the familiarity of the phrase, has hardly yet been joined.

It may indeed be that a general reduction of the standard of consumption may never be necessary. From the deadlock that has overtaken the programme of production, it is clear that the public will have to consume less of all products that emerge from the engineering industry or involve the use of the most essential metals and chemicals. But the United States may perhaps be so rich that nothing more than a diversion of expenditure will be needed; and this important question certainly deserves a preliminary investigation.

There are two sources, other than the reduction of civilian supplies, from which a nation can draw the material and human resources that are needed to build up a war industry. The first of these is the unemployed margin—that proportion of the nation's manpower that, in peacetime, is idle, either through enforced unemployment or through deliberate preference for leisure—and the corresponding fraction of its material resources that is incompletely exploited in normal times. If this unemployed margin is put to work, its product can be devoted to war purposes without any encroachment on the previously existing volume of production for civilian consumption. Secondly, any drafts that a nation succeeds in making on its accumulated capital resources, at home or abroad, are similarly net additions to the sum total of resources available, and their diversion to war industry consequently lays no present burden on the consumer. The figures given in the British White Paper entitled "An Analysis of the Sources of War Finance" make it possible to estimate roughly how large a contribution has been made in Great Britain by these two sources. Without detailing the calculation (or claiming close accuracy for it) it can be said that the unemployed margin and drafts on capital have together been responsible for providing physical resources equal to about a quarter of the pre-war national income, or perhaps even slightly more.

American circumstances, of course, differ widely from British. For example, the extent to which the unemployed margin can be drawn on is considerably larger. There is a greater proportion of unemployment of labour; hours of work are shorter; raw material supplies can be more easily expanded; there would be none of the dislocation due to blockade and bombing. But, in the sphere of overseas capital, the possibility of drawing on capital would certainly be considerably lower than in Great Britain. Since these two major differences offset each other, it may not be very far from the truth to suggest, as a preliminary hypothesis, that the contribution that could be expected from the two sources together would be about the same as in Great Britain—namely, between 25 and 30 per cent of the pre-war national income. In monetary terms, this means that something like \$20 billions a year of additional defence expenditure could be met without entrenching on the general standard of civilian expenditure.

This does not, however, mean that as soon as defence expenditure exceeds \$20 billions a year—which it is scheduled to do within the next twelve months—drastic restrictions on popular consumption will be necessary. Many forms of civilian expenditure will be cut out painlessly and almost automatically. Civilian capital expenditure, for example, amounts to several billion dollars, and expenditure of the most undeniably luxury character could also be cut out without the ordinary man being aware of any restriction on his standard of living. Estimates of the amounts that would be available from these sources naturally vary with the definition of luxury. But in the broadest general terms, it may perhaps be guessed that the United States could spend something like \$30 billions a year on defence before it became necessary significantly to reduce below its pre-emergency level the standard of consumption of the ordinary man.

"Below its pre-emergency level"—but, left to itself, the standard of consumption is rising rapidly under the double stimulus of the sums being paid out in the defence industries and of the threat of shortages to come. The point at which a reduction of consumption below the present or immediately prospective level will be necessary will arise long before a \$30 billion rate of expenditure is reached, and the necessity for limiting the further increase even earlier. At present, the rate of defence expenditure is creeping up from \$12 to \$15 billions, but by next spring it ought to be up to or above \$20 billions.

The problem, in its real form, may therefore be considerably nearer than at present appears. The form in which it will show itself will, in all probability, be that of a general shortage of labour, and to a country which for a dozen years has suffered from sellers' markets and chronic unemployment this prospect is difficult to credit. But, as Great Britain now knows, the transition can be very rapid and the awakening very painful. There is at least the fullest justification for the laying of detailed plans for this ultimate stage of a war economy—the stage of a general reduction in consumption, as distinct from a reduction in the consumption of particular things—which may yet become necessary even in America.

Inflation Ahead?

There is a great deal of public talk in America about the menace of inflation and the necessity of avoiding it. But there is painfully little willingness to face the steps that will have to be taken to achieve that end. Public opinion is still attached to what may be called the Canute theory of price-control, and the chief controversy that has arisen during the Congressional hearings on the pending price control bill is whether the fiat against price rises should be issued industry by industry (as Mr Henderson proposes) or by the fixation of a "blanket ceiling" (as Mr Baruch has reminded the Committee was done in the last war). There is very little realisation that inflation is simply one means by which demand can be cut down to the available supply. If inflation is to be avoided, some means must be found of ensuring that the amount of money that is offered for the available goods is no more than their value at current prices. It is a political problem, not an economic one.

Some progress has been made this summer in mopping up purchasing power by taxation. But, though the Revenue Act which became law in September was the product of considerable political courage and included sharp increases in the Federal tax structure, the increased revenue it will bring in is no more than some \$3½ billions, which is hardly large enough to be significant in the present context. As an anti-inflationary measure, it is likely to be more than offset by the increase in farmers' incomes, which the same Congress assured by pegging the prices of farm produce at 85 per cent of "parity." The pending price control Bill forbids the fixing of maximum prices for farm products at less than 110 per cent of "parity," and as "parity" itself is a movable concept, the sky is clearly the limit. There is also no attempt, in law or in fact, to limit the rise in wages. Indeed, the rising demand for labour, with two rival federations of unions competing for the workers' favour, virtually guarantees a rapid rise.

If the war is to be won, American defence expenditure will have to rise, as rapidly as may be, until it is nearer \$40 than \$30 billions a year. That is well within the economic capacity of the country. But it would involve a definite encroachment on the level of consumption, which must be brought about either by direct methods or else by inflation. American democracy is already giving convincing proofs that it will survive many of the tests by which any system of government must be judged. Given the proof of necessity, it will survive the test of resolution. Given time, it will demonstrate its productive efficiency. Only on this third matter of economic temperance and self-control is doubt called for. It is the least important of the tests, and not essential for military victory; but there will be plenty of opportunity for regret if the extra effort for success is not forthcoming.

NOTES OF THE WEEK

The War Plan

Wednesday's manpower debate in the Commons came at a grave hour. Mr Bevin was no doubt right when he said that in the essential things—invasion, in the air and at sea—Britain has made great strides forward since the darkest days. No one should underestimate the great quickening in awareness and resolution in the United States; and in the Atlantic, in the factories and in the scale and organisation of aid and output, it is on the brink of decisions that will recognise the leading part that America must play in beating Hitler. But the last land power has been thrust into mortal peril in the past week; and the deep anxiety of the Commons about the use of men reflects the sloughing off of the over-hopefulness that overtook some even of the most cautious when the Russian war began. The debate did not answer the questions that many Members were asking. It could not, for at bottom the Government's manpower plan is determined by its grand strategy which was not under discussion. The relevant speeches, within these bounds, were about the alleged waste of manpower in the forces, in war industry or in non-essential work—that is, about the efficiency or otherwise of the plan that could not itself be debated. They lacked the reference to specific problems of military training, on the one hand, and industrial rationalisation, on the other, that would have been both apposite and useful; and Mr Bevin's reply was uneven. His belief that he has now got women workers almost to the number required was a surprising revelation either of the inadequacy of the requirements or of an under-estimation of the present need. But he also made it plain that, after long and careful preparation, it was now proposed to extend the practice of reserving individuals on account of their actual jobs, instead of groups on account of their grade or qualification; and he declared that manpower policy was in the process of expert reorganisation and revision. The Beveridge committee is at work; and a new survey of manpower is nearly completed. The critics who have asserted that manpower was being distributed according to no plan at all were speaking without the book—and might have known it. Those who claim that the plan is a bad one have had no chance to argue the point; and, because it must be based upon the way in which the Cabinet proposes to fight the war in the coming months, can hardly do so—unless the rumoured secret session of the House is held. The strategic plan for manpower has had a chequered record. When the war started, it aimed at a handful of divisions and a dribble of munitions; and it relied upon the War Office and a few specialised war factories to deliver the goods. After the fall of France, it was scaled up perforce, and both direction and production had to pass, slowly and reluctantly, into the hands of industry at large. Twice there has had to be a stocktaking, last spring and in the summer; and the pains of many transitions still linger.

The Fuehrer's Survey

Was Hitler's speech at the opening of the Winter Help Campaign—his first speech since June 22nd—the outpourings of a frustrated and uneasy man? If all that has been said or written about the German campaign in the last three months were strictly true, Hitler should be tottering to his fall, borne down by the weight of resentment and sabotage at home and by the fantastic losses of men and material on the Eastern front. The Fuehrer's speech should be read carefully by all who still, in this third year of war, believe a German collapse—from internal or external pressure—to be imminent. There was a certain grim justification in Hitler's taunt: "They have better tanks, better cannon, greater speed, and are running on no petrol, but so far we have destroyed them everywhere." The tremendous fact that the speech underlines is the vastness of Germany's mobilisation for war—not the strains on the German economy, but the gains of conquest; not the losses, but the speedy reorganisation—for example, the repairing and relaying of 40,000 kilometres of Russian railways; not the falling reserves, but the types of armament which are not even being manufactured, the Fuehrer alleges, so great is the accumulated stock. Is it all one gigantic bluff? Perhaps.

Yet Mr. Churchill and Hitler give an almost identical survey of the German supply position. Both are agreed that the *Luftwaffe* cannot maintain a full scale war on two fronts. Both are agreed, however, that, apart from this shortage, the military supplies at Germany's disposal are sufficient for campaigns in many quarters of the globe. "We have put a whole continent into the services of the state," says Hitler, and Mr. Churchill does not gainsay him. Perhaps they are both wrong; but the only safe assumption for the British and American peoples is that they are telling the truth. And if war shortages are not likely to embarrass Hitler in a foreseeable time, neither will internal dissension. The British public are so hypnotised by the Frau Kremer who did not get her fur coat from Russia that they forget the important psychological factor that she expected to get one. There are thousands of Frau Kremers whose husbands have not been killed—who are still hoping for their coats. And as long as Hitler's armies are victorious, they can continue to hope. After all, he is promising them the most stupendous loot that ever fell to a single people. The mask was off when Hitler spoke of his organisation of victory. Europe is to be ruled not "by the principle of equal rights for all, as in the Soviet Union, but by the principle of justice." And what is this justice? That those who are "best" shall rule and exploit. And who does he rate the "best"? The Germans.

The Moscow Road

Whether or not Hitler has "staked all" on the fourth great offensive in Russia—he has been reported to have staked all so many times in his career—it is undoubtedly the most serious challenge the Russians have had to face so far. While the line holds firm round Leningrad and the local initiative there has even passed to the Russians, the new attack appears to have made progress in the north of Marshal Timoshenko's sector towards Toropets and in the south Orel has fallen and the Germans have cut the Moscow-Kharkov railway—a very dangerous thrust which takes them to a point only 140 miles from Moscow. In the Ukraine, Kharkov is threatened, and the German armies above the Sea of Azov are thrusting on towards Rostov. In the Crimea, however, they have made little headway and in their turn have suffered severe casualties. The weight of this new offensive is a striking reminder of the resources and reserves of Hitler's war machine, but if the Russians can hold a line west of Moscow until the offensive is spent it is likely that their position may be eased, though not restored, by the coming of winter—the first snows are already reported from the Moscow area. The crux is whether they can keep control of the industrial regions of Leningrad, Moscow and the Donetz Basin. If they can, they may be able to refit and repair. If all the materials and all the industrial capacity are swallowed by Germany, then once again the "lull" will operate in Hitler's favour.

Mr. Lyttelton Reports

The expatriated Members of Parliament do come home. Last week, Mr Oliver Lyttelton, Minister of State in the Middle East, described his departmental organisation; and it is reported that Sir Samuel Hoare, Ambassador in Madrid, will tell the Commons about the situation in Spain. Mr Lyttelton's account was very straightforward. At the head of his organisation, there is the Middle Eastern War Council, which consists of the British Ambassador in Cairo, the three Commanders-in-Chief and the Intendant General; the Ambassador in Baghdad, the High Commissioner of Palestine and the Governors of Cyprus and Aden attend when they are able to; and a representative of the Government of India will shortly be appointed. It is this Council which deals with policy as laid down by the British Government. In addition, there are sub-committees, of which the sub-committee on supply and transport, like the main Council under Mr Lyttelton's chairmanship, is the most important—and the most revealing of the sort of tasks which Mr Lyttelton's office was set up to carry out. This sub-committee deals with communications, and supervises

the work of the Middle Eastern Supply Centre which, in close touch with the Eastern Supply Group at Delhi, administers a wide range of military and civil supplies over the whole area. The process of "lightening" the duties of the Commanders-in-Chief has been carried a long way. General Wavell's view that military movement, supplies and administration are the real foundations of military skill, and not strategy and tactics, would, if applied to this organisation in Cairo, suggest that the process of "lightening" has reduced the Middle Eastern Commanders to less than military leaders in the full professional sense. On the other hand, the Commanders, with the Intendant General, whose main concern is with supplies, are members of the Cairo Council, and Mr Lyttelton holds regular meetings with them to deal with what he calls "purely Service matters"; and the Minister assured the Commons that he and the Commanders work in the greatest harmony and accord. The Minister's own view is indicated in his statement by the reminder that it is his task to relieve the Commanders of as many "extraneous responsibilities" as possible. Obviously, the test of this division of functions will be its success, not simply in administrative organisation, but in winning battles. To help the Minister, there is an office similar to the War Cabinet Office in London and with that office are associated three departments, one of the Intendant General, one to administer occupied enemy territory and a third to co-ordinate the various propaganda bodies operating in the Middle East. All this co-ordination is plainly a virtue. The test will be of leadership in the crucial task of imposing the Allies' will upon the enemy wherever contact is made; and the result will depend not on organisation but on personality, for it is only by persons and not by plans or machinery that the clash which is always inherent between soldiers and civilians can be resolved. There are some people who regard Mr Lyttelton as the ablest and strongest member of the War Cabinet. He has in Cairo—always, of course, under the dictates of his Government at home—the opportunity to make good his promise.

Conservative Candidates

The Tory caucus has met and has officially approved a resolution damning its own policy in the selection of candidates in the last twenty years. The actual wording of the resolution was that the final selection of a candidate rested with the constituency association, but that it was contrary to the interests of the party that the choice should be determined by any promise to contribute to association funds or election expenses. The standing advisory committee would be justified in withholding approval of a candidate in any case where these general principles were being ignored, or where unreasonable financial conditions had debarrd candidates. This resolution, if put into effect, could put an end to the worst forms of election jobbery. It would no longer be possible for rich men to buy safe seats and for local Conservative associations to choose their candidates by financial considerations alone. The chief importance of the resolution is that it is a confession of error, and a statement of right principle. It is not a binding directive; and there is still no certainty that the average ability of members of Parliament will be raised. Even if the new views of the caucus, pressed upon them by public opinion, are listened to, it will still be possible for the associations to choose men of birth or athletic prowess, if not of wealth; and, in any case, not even the most willing local association in the world can pick an able candidate if one is not forthcoming. Financial considerations will still militate against young and able men entering Parliament, because they will not be able to afford the time when the prospects of promotion, even to junior Government posts, are so uncertain. The sanctions against their selection as candidates may or may not be eased, now that the deplorable results of this latter-day jobbery have become so painfully evident. But the incentives to tempt them into the political field will still be lacking, and these are outside the purview both of the local associations and of the Central Council. No party resolution can create a New Jerusalem in Westminster, for at bottom this is a problem of society. The qualities that have been picked out to flood the Commons with mediocrity and stupidity are the hallmark of social status—and of economic advancement—outside of politics. It is a good thing that the jobbers-in-chief may now have been driven to restrain their sordid bargains. But, though Parliament's personnel does not represent the people, it does represent

Society with a capital letter, with its educational exclusiveness, its standards of wealth and its modern ramifications into the upper strata of business. For the state to pay the expenses of elections, as it probably should do, might open the way more to real talent in politics; but that talent will only be forthcoming, available and accepted if this clogging crust upon the community can be broken and dissolved by new methods and new values in education and in the choice of leaders and managers in every branch of the community's activities.

The Oxford Group

The manpower debate, in which the House of Commons showed its anxiety that the Minister of Labour should mobilise the country's manpower in the most effective way possible, was preceded on Tuesday by a heated debate on the adjournment when the same Minister was urged to reconsider his decision not to exempt members of the Oxford Group. It is very odd at any time, but especially in the middle of a war, that the one subject which can be counted upon to arouse strong feelings both in and outside Parliament is, not religion itself—the House has shown itself curiously apathetic on current issues such as the religious basis of education—but what may be called the incidentals of religion, Sunday theatres and now the Oxford Group. Tuesday's debate, like the one on Sunday theatres, showed the House at its worst; once again, most of the speeches were completely irrelevant, emotional and interlarded with texts. The true object of the debate was not to prove that members of the Oxford Group are either fifth columnists or fifth monarchists, but simply to decide whether a certain number—eleven in all—should have their deferment from calling-up extended for a further period and whether the Minister of Labour should not have included them in the Schedule of Reserved Occupations. It will come as a surprise to most people to learn from Mr Bevin, who, in spite of attempts to drag him into controversy on the merits of the Group, stuck to the point manfully, that some deferment had in fact been granted. From the fuss that has been made, an outsider was entitled to think that the eleven men were being dragooned into the army without their employers being given any chance to replace them. It now appears that they have had six months—which is as much as most men receive on hardship grounds. Moreover, Mr Bevin made it quite clear that, in deciding whether the work done by the men was covered by the Schedule, the line was not drawn at the Oxford Group; the YMCA and TóC H are among the 32 religious organisations whose members are excluded from reservation. The issue is a manpower, not a religious, one; and if Mr Bevin and his colleagues in the Government have decided that the men concerned are more usefully employed in the Forces, their decision must be respected.

No Change

The first feeling aroused by the War Office's statement that the sailing of the two hospital ships for repatriating prisoners of war has been cancelled is one of

intense sympathy for the prisoners and relatives on both sides. The second is one of curiosity about responsibility for the breakdown in negotiations. Fortunately, Captain Margesson's statement made it quite clear that it lies with the German Government. Article 68 of the International Convention requires belligerents to repatriate prisoners of war who are seriously ill or seriously wounded, without regard to rank or numbers. The German Government must have known, when negotiations first began, that the numbers it would repatriate would far exceed the numbers repatriated to Germany; and as early as September 9th it announced that British prisoners approved for repatriation numbered 1,200. The last-minute requests to the British Government to include the mutual repatriation of, first, civilian internees, and then sick and wounded combatants in third countries, could not, therefore, have been based on a sudden realisation of the disproportion of the exchange. It seems much more likely that they were attempts, by getting the British Government gradually to reduce the margin, to obtain the repatriation of all the people the German Government wanted back. In any case, the British Government was willing to agree to the two suggestions; what it could not agree to was the final proposal from Germany that the exchange should be carried out on a numerical basis. This would have been acting outside the bounds of the International Convention, and would thereby have seriously prejudiced the chance of repatriating the remaining British sick and wounded. In cancelling the sailing of the ships, the Government took the only possible course; but its attempts to reach a last-minute understanding by wireless, instead of through the "usual diplomatic channels," were probably a mistake. The BBC appears to have used the occasion for "V" propaganda; moreover, the broadcasts gave the hitch an unfortunate publicity which was almost bound to turn it into a breakdown.

Consolidation in the Far East

The widespread campaigning in Hunan and Honan is still in progress, and it is not yet possible to verify the Japanese claim to have captured Chengchow. Changsha is securely under Chinese control, and the Japanese, caught in the Chinese army's successful encircling movement, are either retreating or fighting their way through the ring. Even if this major defeat is offset by the fall of Chengchow, these have been vexatious weeks for the Japanese. The Chinese commanders have shown a far more skilful handling of the military situation than at any previous point in the campaign, and the fresh Chinese armies are better disciplined and equipped than their earlier brothers in the field. Thus the renewed Japanese offensive, whose reported purpose it was to convince Britain and the United States that China is not worth helping, has had exactly the opposite effect. China's significance as a great ally in the Far East is growing monthly plainer, and it can have been no consolation to the Japanese to see Brigadier-General Magruder and the other officers of the United States Military Mission to Chungking arrive on the morrow of Changsha. British and Chinese officials were at Hongkong when the Mission arrived, and the conferences which were held completed earlier discussions between Sir Robert Brooke-Popham, the Commander-in-Chief, Far East, and General MacArthur and Admiral Hart at Manila. Quietly and unostentatiously, a system of consultation and co-operation is being built up round the poles of Singapore and Manila. If the Japanese hoped to strike in this area before the democracies had concerted their defence, they may well have delayed too long. The point that Germany would probably welcome a Japanese embroilment at this point has little direct bearing on Japan's reactions. Japan has yet to see an adequate *quid pro quo*.

Sterling, Gold and Dollars

Last week's debate on the supplementary vote of credit focused itself for a time on the future monetary policy of this country. In particular, a member asked the Chancellor of the Exchequer for an assurance that the Government was not contemplating any agreement with the United States which would tie sterling either to gold or to the dollar. The Financial Secretary to the Treasury, in replying to the debate, repeated previous assurances given to the House that no undertaking to relink sterling with gold or the dollar had been given, and pointed out that, if the

question did arise in the future, any decision would require legislation and therefore the consent of Parliament. The requests in this vein which have been made to the Government spring from painful memory of the consequences which attended a previous post-war effort to relink sterling with gold, and to "look the dollar in the face again," and from the fervent hope that no such mirage as a conventional dollar or gold parity will again tempt this nation along the stony, barren path of deflation. The ultimate criterion of monetary policy will in future, it is hoped, be no longer provided by a metallic parity, but by the objective of optimum employment and productivity—monetary policy alone can not achieve this, but it must be either a lubricant or grit in the economy. It is, however, unfortunate that this very understandable aversion to any prospect of the penitential deflation which led to exchange stability after the end of the last war should, by a curious twist of logic, be extended to the conception of exchange stability itself. It has yet to be proved by the most vehement of gold haters that a state of anarchy in the exchange markets is preferable to order and stability. If exchange stability can be reconciled with the demands, recognised in effect by the Atlantic Charter, for economic expansion and reasonable price stability—as it was over long periods of the gold standard's operation—it must surely be welcomed and defended. In any case, it is difficult to conceive of any effective Anglo-American co-operation after the war which would not involve as close a relation between the two currencies as is, in fact, being maintained during the war. And the people who protest so loudly against any link between sterling and gold might usefully remember that the British Empire still provides some 60 per cent of the current output of gold.

The Limit of Taxation

Last week the Chancellor of the Exchequer introduced the new £1,000 millions vote of credit by suggesting that "the limit of taxation" had been reached. Two-fifths of the £7,000 millions spent in the first two years of the war had been met out of current revenue—£2,785 millions, or just under £60 for every man, woman and child in the country. To raise taxation so that nobody in the country had more than £1,000 a year, or his present income after taxation, would yield another £106 millions in a year; and this, Sir Kingsley Wood said, would precipitate very acute problems. Two generations or more ago, Mr Gladstone's greatest opponent said that an income tax of 11d. in the pound might be ruinous; and Mr Disraeli had no doubt some good grounds to go upon. To-day the standard rate of income tax is 10s. and direct taxation rises on the highest incomes to 19s. 6d.; EPT is at 100 per cent with a 20 per cent (less income tax) post-war drawback. What the "limit of taxation" means is worth examining. Obviously, it means different things in war and peace economy. In peacetime, when business depends almost entirely upon private enterprise and private risk, direct taxation has a plain relation to productive activity. Profits are taxed; losses are borne by the entrepreneur; and the "limit" of income taxes comes when a further rise will so reduce the willingness to venture, and risk losses, that, on the one hand, taxation receipts will go down, and, on the other, the national income will shrink. This point was probably reached in the United States at the height of the New Deal. Similarly, rising taxes on labour, in war or peace, may impair production, but for rather different reasons. Workers may not be willing to work harder if their extra effort will yield them a disproportionately low net income, after taxation; they may prefer extra leisure. In wartime, the effects of taxes on entrepreneurs' incomes approximate to those of taxes on labour. Productive activity is mainly based, in wartime, not on private enterprise, but on Government orders; it is the war production plan that sets the size of the national income. There is a fringe of unco-ordinated activity and uncompensated risks which raises quite serious social problems; but, at bottom, entrepreneurs are paid agents rather than risk-bearers. Government suppliers are given a net income without risk of loss, while the shortage of consumers' goods permits their producers to sell at a profit. But there is still a limit to taxation, for the capitalist may now react like the worker. If taxation is such as to yield him very little extra income for extra enterprise, he may become unwilling to extend his activities, preferring extra leisure to the disproportionately small return for extra effort. Moreover, he will no longer exert himself to keep down his costs as he did when he bore his own risks and his income depended on his own

efficiency; in most cases he can pass on his costs to his customer, the Government or the public. If he is a good employer he may, when faced with 100 per cent EPT, swell his expenses by needed welfare schemes for his employees. But it is now not his willingness to venture that is affected by the total rate of direct taxation, but his incentive to make extra efforts and his stimulus to produce efficiently. These effects will only be measurable, quantitatively, by the historian, if at all; and, meanwhile, it must be confessed that the Chancellor's statement that it would do more harm than good to collect another £106 millions in direct taxation will not wholly convince everybody.

Russia and Religious Freedom

The news that President Roosevelt has asked Mr. Averill Harriman to raise the issue of religious freedom in Soviet Russia, coupled with the Myron Taylor mission to the Vatican, has set the rumour-mongers busily to work in two continents. In a sense, the question of religious freedom in Soviet Russia is a complete side issue. Russia is not fighting this war in defence of Christian civilisation any more than Germany is. She is fighting in self-defence. Britain is not fighting in partnership with Russia because the social structure and philosophy of the two countries are akin, but because—like Poland, the Low Countries and France—Russia is a victim of German aggression. In another sense, however, the issue of religious freedom is extremely important. There has grown up in recent months a powerful, if undefined, feeling that at last the "progressive" states have come together to conquer Hitlerism and that the peace settlement and the future ordering of the world will flow from their close ideological, political and material collaboration. The mood was well illustrated at the Conference of the British Association, at which the Soviet Ambassador held place of honour among those who were claiming to defend free intellectual thought and research. The President's *démarche* is a reminder that in one important sphere of human thought and endeavour Russia is as totalitarian as her German adversary. The right to religious freedom in the Russian Constitution is a dead letter, just as the German Concordat is a dead letter, because, even if the external agreement were maintained—which it is not—religious freedom which does not include the rights of parents in education and the rights of full communal parish life is not freedom at all. Whether the Russian Government—like so many of its predecessors—is willing to make liberal concessions in time of war remains to be seen. The Poles—who account for about 90 per cent of the Catholics in Russia—have received complete religious freedom. This fact, together with Mr Myron Taylor's conversations in Rome, has led to suggestions that the relations between Moscow and the Vatican may improve. There is nothing inherently impossible in this. The Vatican attempted to secure a Russian Concordat in 1922. If the Soviet Government were prepared for the necessary concessions, it might be possible now. The real difficulty is, of course, that a regime, whose fundamental philosophy is dogmatically and aggressively materialist and atheist, might be hard put to it to abandon its ideological structure. However, nationalism, the cult of Russia, and non-dialectical history have returned and been justified *post hoc*; and a place for the forces of religion may, on the same analogy, be found.

Food for Work

Last week's food debate in the Commons made it plain that the problem of adequately feeding Britain's industrial population is still far from solution. The effect of the encouraging statement by the Parliamentary Secretary to the Ministry of Food that improved stocks of staple food stuffs would permit larger distributions of meat and sugar and, probably, of bacon, ham, cooking fats and processed eggs to industrial canteens was marred by much information supplied by private members on the subject of the canteens themselves. It is all to the good that supplies of meat should be doubled and supplies of sugar trebled in canteens catering for "heavy workers," and that supplies of meat should be increased by half and supplies of sugar doubled in canteens for industrial workers on less heavy work. Unhappily, as numerous speakers pointed out, there are far too few industrial canteens while, of those which exist, many are incapable of feeding more than a small fraction of the total employees or of providing them with an

adequate hot meal, and others tender extra supplies to office and sedentary workers who are not specially deserving. The position as regards miners, quarrymen, railwaymen and agricultural workers, as well as of such special categories as road-mending gangs, is almost as far from solution as ever it was. It came, perhaps, as something of a shock to the House to be told that only 16 canteens in the whole country are capable of providing hot meals for coal miners and that in 1,900 mines there are no more than 751 canteens of any description. Those which do not provide hot meals supply mainly tea, buns and meat pies. Major Lloyd George's announcement appears to proffer a gift to him that hath, which no one will grudge but no one can acclaim as a solution of industrial feeding problems until adequate canteens are provided on a far wider scale. There is some evidence that the order making the provision of a canteen compulsory in firms employing more than 1,500 workers is sometimes burked through lack of financial means on the part of the management—though it is a virtue of 100 per cent EPT that it tends to encourage welfare spending of this sort, by good employers. The withholding of special supplementary rations for heavy workers, as individuals, can only be justified if the provision of canteens can be pushed forward with vigour. One M.P. expressed doubt whether the provision of canteens for miners would make genuine strides before the onset of winter; and if substantial progress cannot be made in the next month, there is a clear case for providing supplementary rations for miners during the winter. Mr Churchill himself has publicly supported the view that, in the absence of suitable feeding, there is a certainty that industrial fatigue will reduce output per head.

Nutrition in the Home

The grant of additional food supplies to industrial canteens points to a time when supplies drawn on the ration book will represent the basic rations of only a very small section of the population. So far the position of heavy workers in industry and agriculture has represented a distressing anomaly, in that they were compelled to subsist mainly on their individual rations plus unrationed foods prepared at home, while the great majority of sedentary workers were able to supplement home feeding with restaurant meals. When the establishment of efficient canteens has become the rule, the section of the community relying mainly on ration book foods will include only certain professional workers, parsons and doctors, such housewives and domestic workers as are not called up and children for whom meals are not supplied at school. Qualitatively, these groups are no doubt highly important sections of the community, including as they do the great majority of expectant and nursing mothers. The general provision of school meals is, of course, a vital necessity and would remove all children of school age from this category. For the rest, the home feeders appear to represent a hard core of potential malnutrition, and it is for their sake that it is possible to welcome whole-heartedly the increase in the fat ration from 8 to 10 oz.—of which 3 oz. must be taken in cooking fats and not more than 2 oz. in butter—and in the sugar ration from 8 to 12 oz. weekly from November 17th. For all those who have the opportunity of supplementing home rations, the increase in the ration must raise acutely the question whether shipping space would not have been better used in the transport of the immediate weapons of war. The Minister of Food is, however, wise to be alive to the possibility that symptoms of malnutrition may be slow to develop and the grant of extra rations during the winter may well prove a paying form of insurance.

THE WORLD OVERSEAS

Opinions and Politics in Sweden

(By a Swedish Correspondent)

September 20th

"We have learned with deep consternation that two members of the Norwegian Trade Union movement have become the first victims of the growing opposition between the Norwegian people and the German forces of occupation. We express our warm sympathy for our brother people, which holds out, deprived of weapons, under the most difficult conditions. . . . We refuse to believe that the ruling power which infringes the just rights of other nations can find support for their measures among German workers. Those in authority in Nazi Germany have often expressed their view that a nation cannot deprive another nation of its honour and go unpunished. . . . The Norwegian people cannot be brought to its knees either by armed strength or by force."

THESE words came recently out of neutral and isolated Sweden. They were not spoken by a lonely voice, but by the congress of the Swedish Trade Union Council when it learned that two Norwegian trade union leaders had been executed. The Swedish Trade Union Congress is perhaps more representative of Swedish public opinion than the trade union movement in any other country, linked up as it is with the Social Democratic majority party even more closely than the British TUC is with the Labour party. Moreover, it is very seldom that the Swedish TUC adopts any political resolutions, but, when it does, they carry weight.

The anti-Nazi opinion, reflected in this quotation, is no temporary flare-up, but a continuation of a long anti-Nazi campaign in Sweden—a campaign that before the war was perhaps more vigorous than that of the British Press. Since the outbreak of war this campaign has partly changed in form—for neutrality reasons and under pressure from the very unpopular, but unofficial, political censorship. The people of Norway are encouraged by the Swedish Press to resist the Nazi occupation. Quisling recently attacked it for its anti-Nazi attitude, but the Swedish Press replied with very sarcastic remarks about Quisling.

Sweden has, however, made some concessions to Germany. A German division was allowed to pass through Sweden from Norway. The Swedish Parliament made this decision only when the formal demand came from Finland (though everybody knew that Germany was behind the demand). But demands coming direct from Germany have all been refused. Germany had at the same time asked for many more divisions to pass through Sweden; they had asked for a naval base in Swedish territory and for restrictions against British citizens in Sweden. All these demands were refused, and so were also subsequent German demands for permission to land troops in Southern Sweden for transit to Finland.

Sweden has never recognised the Quisling Government or the German occupation of Norway. It maintains relations with the Norwegian Government in London. A trade treaty with German-occupied Norway was arranged with the Norwegian State Bank—but not with the Quisling Government. Nevertheless, Sweden's attitude to Norway has been much criticised. During the Russo-Finnish war of 1939-40 the country was an active non-belligerent, giving Finland all possible assistance, morally and materially. But when war broke out in Norway, less was heard in Sweden about "Nordic solidarity." While the whole Swedish Press displayed the manifestos for recruiting volunteers for Finland on the front pages, recruiting for Norway was published only on the back pages. The Swedish Foreign Minister explained that the Russo-Finnish war was a private war, but the Norwegian war was part of the great war towards which Sweden wanted to remain neutral. Swedish

public opinion, however, was for greater assistance to Norway. Swedish soldiers at the Norwegian frontier had to be held back by their officers, as they wanted to cross the frontier to fight against Hitler. To-day, Swedish public opinion takes another view about Finland's war against Russia. This is felt particularly in Finland, where Cabinet Ministers try hard to explain that it is again a private war between Finland and Russia and that Germany is Finland's ally only by coincidence. This has failed to convince the Swedish public.

After the quislings' activities in Norway had been revealed, the Swedish public asked if there was a fifth column in their midst, too. Attacks had been made against the Communists during the Russo-Finnish war, but now the public became aware of the Nazi danger as well. Actually, the Swedish Nazis are a very small body who have never held a seat in Parliament and never had a leader of even Quisling's dimensions. There are, however, pro-German sympathies to be found in Sweden, especially among people who have been taught that Russia was the hereditary enemy. "Fear of Russia" has for years been an essential part of the propaganda of the Conservative party, and it was always accompanied by demands for armaments, specially during the years when the Labour and Liberal parties were pacifist. But this Conservative anti-Russian propaganda failed more and more to convince the Swedish people—up to the outbreak of the Russo-Finnish war, when it received a new stimulus. The Swedish public had more and more begun to realise that Hitler was Public Enemy No. 1.

The Political Alignment

The largest party in Sweden is the Social Democratic party, which has a majority in both the House and the Senate and which, furthermore, though a majority party, has gained in numbers at every election. The structural strength of the Social Democratic party is the trade union movement, and Swedish workers are almost to a man members of trade unions. The Swedish Communists are a local party for the province of Lapland and the city of Gothenburg, and their supporters consist of mainly well-to-do workers. They represented humanitarian rather than revolutionary principles, and they succeeded in gaining sympathy, but not support, for themselves and Russia—until the German-Russian pact spoiled their work.

The Socialists and the Agrarians collaborated under the slogan, "Workers and Peasants, Unite." Before the war the Government was composed of members of both parties, and it gave state support to Swedish agriculture, owing to which the country is to-day nearly self-supporting agriculturally. The Agrarian party consists mainly of well-to-do farmers and estate owners. There have been a few Nazi sympathisers amongst them, even in Parliament, but they were very soon isolated.

After the outbreak of war, an all-party Government was formed, including the Liberals and Conservatives. The Swedish Conservative party has for years represented big finance and industry—and also many peasants in districts where the Agrarians had no influence. For some time there were dangerous pro-German and even Nazi sympathisers among the Conservatives. These were strengthened when the party was defeated in the elections and a purge was made. The whole Conservative youth movement was at one time banned for Nazi sympathies. Three pro-Nazi members of Parliament supported the banned youth movement, but were defeated at the next election, and the pro-Nazi youth movement was soon checked by the Conservative party, which since then has accepted realities and shown a remarkable willingness to collaborate with the Labour movement. To-day there is economic collaboration

not only between the Socialists and the Agrarians, but with the Conservatives as well.

The Swedish Liberal party consists of two heterogeneous groups: the advanced intellectuals in the cities and the pacifist Puritan Nonconformists in the provinces. From time to time they have been split into two parties. The Liberals have to-day few great leaders but a very influential press. They played a decisive role in the democratic breakthrough in Sweden, and had for many years the leading position in Swedish political life as the middle party between the Conservatives and Socialists—though they only had a minority in Parliament.

The question of armaments has been an important factor in Swedish politics. The Socialists and the majority of the Liberals were for years pacifists, while the Conservatives were in favour of armaments, and once when they were in power built a strong navy. But, since the arrival of Hitler, all parties have joined in building up strong defences. Previously the Swedish total Budget was 1,000 million crowns a year, of which only 13 per cent was used for military purposes. To-day the military Budget alone is 2,500 million crowns a year and in addition huge sums are put into defence savings. Thus the Swedish people show that they want to defend their neutrality with a strong armed force and not by concessions.

By its sales of iron ore and wood products, Sweden prospered and built up social institutions which were admired by the whole world. To-day export trade is cut off. Germany takes some of the iron ore, but does not need so much as formerly, since it has the French mines. But, on the other hand, Sweden still needs coal which cannot be obtained from Britain. And the coal question has become a weapon of political pressure in Germany's hands.

Price Control in Canada

[FROM OUR OTTAWA CORRESPONDENT]

September 6th

THE Canadian Government has now committed itself to a scheme for a comprehensive control of prices, which is to be accompanied by a drastic regulation of supplies. Such a move has been rendered inevitable by the sharp rise in commodity prices, and consequently in the cost of living which has been apparent during the summer and which, through the operation of the regulations designed to anchor wages to the cost of living, has been dragging wages upwards and bringing inflation within sight.

The Wartime Prices and Trade Board, which was appointed shortly after the outbreak of the war for the purpose of checking profiteering, has had its personnel expanded to six members, all key figures in the administration of the economic side of the war programme. It is under the chairmanship of Mr Hector MacKinnon, the head of the Canadian Tariff Board, and will, with enlarged powers, undertake the task of a general regulation of prices. It will co-operate closely and continuously with the Wartime Industries Control Board, under Mr R. C. Berkinshaw, which is now charged with the duty of regulating supplies, and to ensure complete co-ordination Mr MacKinnon and Mr Berkinshaw will sit on each other's boards.

The new powers with which each board has been endowed seem to be sufficiently broad and drastic for the attainment of their objectives, and authority is given to override the jurisdictions of the provinces, which in some cases fix the prices of milk and other farm products. The Wartime Prices and Trade Board is empowered to require manufacturers, producers, importers, wholesalers and retailers to obtain licences to carry on business, and it can summarily cancel or suspend such licences in any case where it finds a licensee disobeying its regulations. It can demand the fullest information about any transaction and examine the books of any factory, shop or warehouse, and it can make its findings public or private. It is not authorised to fix the price of any agricultural products on the farm, but it can deal with them when they are sold to the consumer. It is also armed with powers to check instalment buying under a specific clause instructing it "to prescribe the terms and conditions under which any goods or services may be sold, offered for sale or supplied, whether on terms of deferred payment or otherwise." It is expected that this power will be used gradually to curtail the instalment buying of goods like stoves, washing machines,

refrigerators and vacuum cleaners, which use up steel, aluminium, etc., urgently required for war industries.

Equally wide and explicit are the powers about rationing supplies under which authority is provided "to fix or limit the quantity of any goods or services that may be sold, supplied or distributed to persons within prescribed periods of time." The chairman of the Wartime Industries Control Board is also given power to veto the decisions of any of the controllers appointed for special industries. A beginning in the new scheme of economic regulation has already been made by an Order providing that all supplies of silk and rubber goods are to be at the disposal of the Ministry of Munitions and have their prices fixed by the Controller of Supplies. The personnel of the two Boards commands general confidence, but some papers are urging that since Mr Ilsley, the Minister of Finance, and Mr Howe, the Minister of Munitions, who will be responsible for operations of the two Boards, are already overburdened with work, the administration of an experiment which will produce many complicated problems and a multitude of grievances is important enough to justify the creation of a new Department of Economic Planning.

Starving Poland

[BY A POLISH CORRESPONDENT.]

October 6th

THE Russo-German war has caused—if it were possible—a further deterioration of conditions in Poland. It has brought more restrictions; the disappearance of food, which the German army is constantly requisitioning; the monopoly of transport for military purposes; and the requisitioning of housing space. The congestion of the population in the large cities, especially in Warsaw, has caused great hardship and the outbreak of disease.

Already, at the beginning of this year, the food situation in Poland had shown marked signs of deterioration, when all available stocks were gradually confiscated by the Nazi authorities and either sent to the Reich or used to feed the considerably increased numbers of troops which were concentrated in Poland for the attack on Russia. The outbreak of hostilities against Russia coincided with the worst part of the year—the last few weeks before the harvest—and the crop was estimated to be between 30 and 40 per cent below normal. The Polish peasants, knowing that the bulk of the harvest would be confiscated anyhow, did not attempt to obtain the maximum yield from their land. This was easy to carry out without arousing the Germans' suspicions, owing to the great number of small-holdings where the standardisation of agricultural methods is impossible.

The supplies of food would, however, have sufficed to satisfy the needs of the population had it not been for the German policy of requisitioning. Out of the scanty supplies available the Germans are trying to feed their armies en route to Russia and also those returning from the eastern front for regrouping on Polish territory. Many thousands of German sick and wounded are lying in Polish hospitals and are almost entirely fed at the expense of the

local population. Moreover, large quantities of foodstuffs are still exported to the Reich. According to figures published in the *Ostdeutscher Beobachter*, the foodstuffs exported to the Reich from the *Général Gouvernement* in the year ended June, 1941, amounted to 1,720 tons of wheat seed; 2,200 tons of rye; 2,245 tons of barley; 3,350 tons of oats; 9,500 tons of potatoes; 2,000 bulls; 94,000 pigs; 10,500 tons of artificial fertilisers; 100,000 tons of butter; 300,000 poultry; and 100,000,000 eggs. These figures are not enormous in themselves, but it should be remembered that the territory then covered by the *Général Gouvernement* consisted of less than a third of pre-war Poland and that these districts normally imported food for themselves from the territories incorporated in the Reich.

At the outbreak of the Russo-German war, Dr Frank, the Governor-General, appealed to the Polish population to regard the German attack on Russia as the defence of Christian Europe against the arch-enemy of Christianity and western civilisation. Rumours were also circulated that Hitler intended to restore an "independent" Poland with territory taken from Russia. The Polish population has, however, shown no enthusiasm for the Nazi crusade. On the contrary, the whole population has since shown greater courage than ever before, and resistance has stiffened. In spite of terror and oppression, the morale of the people is unbroken, and the German press daily reports many death sentences on Polish *saboteurs*. The Russo-Polish pact and the creation of a Polish army in Soviet Russia have removed all doubts about the identity of Poland's real enemy. In spite of the heavy penalties, the BBC broadcasts are regularly listened to, and the news is passed on. The prisons and concentration camps are full of political prisoners, and the concentration camp in Oswiecim, which is notorious for its cruelty, is packed with over 6,000 persons, most of them leading intellectuals.

The Ukrainian problem is also used to create political chaos and friction among the people. The Ukrainian Fascists and pro-Nazi nationalists are given special privileges and some authority over the Poles. These small favours have had no effect on the attitude of the majority of Ukrainians towards the Nazis, and the population as a whole has adopted an attitude of passive resistance. Reports from Russia show how active the Polish Ukrainians were during the guerilla campaign in these districts, and how fully the masses of Ukrainians co-operated with the Soviet forces in fighting the advancing German armies. The unshaken morale of the population and their open anti-Nazi attitude have forced the Germans to give up the idea of the creation of a Nazi-controlled Ukrainian puppet state; and all the Polish territories inhabited by Ukrainians were, by order of Dr Frank, incorporated into the *Général Gouvernement*. Nothing, however, has been done to supply these newly-occupied, devastated territories with even the minimum of food supplies. The Ukrainians, with the small exception of the pro-Nazis, are starved in the same way as the Poles. At the same time, the German authorities are trying to "bribe" the Ukrainians by offering larger food rations to all those who collaborate with the Germans.

Discord in Slovakia

[BY A CZECHOSLOVAK CORRESPONDENT]

September 23rd

EVENTS in the so-called "Independent Republic of Slovakia" have not found the attention in the British press they deserve. This musical-comedy State, where the quislings are at war with each other, whose army has been sent back home as it proved impossible to explain to the soldiers why they are at war with Russia, was created by Hitler as a convenient gateway and supply route for the attack on the Balkans and on Russia.

Father Tiso emerged as President of the new State, with the disreputable Sano Mach as Minister of the Interior and Bela Tuka, a former Hungarian University Professor—who edited anti-Slovak pamphlets before 1918 and was later sentenced to twelve years' imprisonment—as Prime Minister and Minister for Foreign Affairs. Father Tiso is also "leader" of the sole political party, called after its founder Hlinka. Hlinka, however, believed in adherence to the Czechoslovak Republic and condemned the independent ideas now carried out in his name.

Father Tiso on the one hand, and Mach and Tuka on the other, are constantly at war. Father Tiso is supported by the *Snem*, a puppet parliament with a Speaker,

Dr. Martin Sokol, who always advocated autonomy in the framework of the Czechoslovak Republic. Though this *Snem* is only a voting machine, it lends the President some kind of importance. The Slovak people were never asked for their opinion on the new form of state, as the "Act of Independence" was passed by the *Snem* appointed by the new regime.

A Slovak-German agreement promised 60 to 80 thousand Slovaks per year as workers for Germany. They, like their Czech fellows, are mainly employed in those German industrial areas which are the most bombed by the RAF. They may not leave their jobs and are paid in Reichmarks, which are deposited at the *Verrechnungsstelle*. The wages are sent to Slovakia after delays of three to six months. The workers are not given cash to take to Slovakia, and if they manage to obtain some marks, they obtain only 2 Slovak crowns per Rm, instead of 10, when they try to exchange them on leave.

A compulsory labour service will be introduced in Slovakia on the German model. Next year, six Slovak labour formations, with 150 leaders and one German formation with thirty leaders, will be established. The Slovak labour service leaders will leave on October 1 for Graz, where they will be trained for six months at the Reich's expense. To acquaint the Slovaks with the structure and the tasks of the Reich Labour Service and its history, an exhibition was opened on September 14th in Bratislava.

The Prevailing Scarcity

The workers cannot buy much for their money. Prices of what goods there are are high, but for the most part shops are empty and not even soap is obtainable. Eight Slovakian soap factories are only working intermittently, owing to the raw material shortage. Only one-fifth of the oil and fat requirements can be obtained at home. Slovakia's only meat days are Wednesday and Friday. Householders are advised to store sufficient firewood for the winter, owing to the impossibility of allocating coal for domestic use as industrial requirements are not yet assured. This must be done as soon as possible, as transport difficulties are expected in the autumn. According to the Bratislava Institute for Commercial Affairs, 176,600 wagons have crossed the Slovakian frontiers outwards and only 120,000 inwards. Only 11 per cent of the outward consignments were industrial products and the rest were raw materials. Germany earmarked all maize flour and bread grain for itself. The harvest was a very poor one, and wheat commissioners had to be appointed to enforce deliveries from the farmers. Milk products are secured for the Nazis by the establishment of dairies all over the country in the hands of Germans or quislings. They produce butter which is sent to Germany.

The Jewish question is settled ruthlessly. Up to August, 1941, 7,400 Jewish enterprises with a total turnover of 650 million crowns had been liquidated and the Aryanisation of others with a total turnover of 780 million crowns had taken place. Some 4,700 Jewish employees in leading positions have been dismissed from business. Anti-Semitism, however, is not popular among the Slovak people, of whom 80 per cent are deeply religious Catholics and 20 per cent Protestants, and has been confined to those who profit from it.

The people themselves, good-natured, peace-loving peasants, took some time to find their feet, but it is significant that the Slovak army, which was sent to fight the Russians, has been sent home again—with the exception of the units composed of German settlers in Slovakia. The official reason is that the army was only partly motorised and could not keep pace with its Allies. This is probably true, but another reason is that the Slovaks, being old peasants, fraternised too much with the Ukrainian farmers. Now that they are home again they seem anxious to listen to the London broadcasts and to speak in the local councils. The result is that municipal councils in 27 districts have been dissolved and Government Commissars appointed in their place.

The London broadcasts are a constant thorn in the Government's flesh. Dr Juraj Slavik, now Minister of the Interior in Dr Benes' Government in London, infuriates them most. The *Gardista* of September 3rd writes that Slavik should not forget that "his relatives in Slovakia will bear the consequences of his actions. We openly declare we will take measures against their relatives with such severity as the reckless fight against the worst enemies of the nation necessitates. Slavik and his associates risk causing the death of their parents, brothers and sisters by way of reprisals."

THE BUSINESS WORLD

Germany's Lubricating Oil

WHEN Germany began the attack on Soviet Russia over three months ago, it was not because the German oil supply situation was desperate. Considerable stocks had been accumulated. The current output of oil in German Europe, estimated at 11-12 million tons annually, leaves a substantial margin for military purposes, because petrol and other oil refinery products are strictly rationed for other purposes. Even now, an early shortage of motor fuel is hardly likely, though protracted fighting on the present scale, together with high-pressure industrial activity, must steadily worsen Germany's oil position. Without conquering new oil-producing territories, Germany would ultimately face a situation similar to that of 1918, when a shortage of lubricants critically impaired industrial production as well as railway transport.

To-day lubricating oils are again the weak spot. Every machine and vehicle needs lubricating, and the smooth running of modern industry depends as much on a variety of lubricants as on the skill of the machine operator. During the last war, neither strict economy nor the production of lubricants from tar oils could make good the loss of high-grade Pennsylvania lubricating oils. At present, the situation is, admittedly, different. German production of crude and synthetic oil is substantial; stocks at the beginning of the war were much bigger than in 1914; and refining and recovery processes have been improved. But consumption has increased with greater mechanisation. The industries in occupied countries working for Germany must be supplied from resources under German control.

The general problem of lubricating oils can be simply stated by two figures computed by the Petroleum Press Service. German Europe's minimum requirements of all oil products, excluding oil for military purposes, were estimated at 8.7 million tons, which amounts to roughly 41 per cent of peacetime consumption. But the minimum requirement of lubricating oils alone was estimated at as much as 80 per cent of peacetime consumption. Cars can be immobilised to save petrol; but industry, the main consumer of lubricants, cannot be similarly restricted—the consumption of lubricating oils rather increases according to the rise in wartime production. For lubricating oils, there are no saving periods between campaigns as there are for motor fuels. German Europe at war consumes lubricating oils at slightly above the peacetime rate, while the consumption of petrol, fuel oils and kerosene amounts to no more than about 50 per cent of peacetime consumption.

Any detailed analysis cannot be more than a rough approximation, all the figures being estimates based on peacetime data. The following table, which anticipates the statistical conclusion of this article, merely suggests, on this basis, the twelve months' demand for lubricating oils in wartime German Europe:—

	Metric Tons
Industrial and civilian demand:—	
Greater Germany.....	600,000
Other Europe.....	450,000
Military demand.....	350,000
Total.....	1,400,000

The estimate for military demand, which is highly speculative, includes consumption on the eastern front. German Europe's current supplies of lubricating oils from all sources—again to anticipate this article's conclusion—can be estimated at 1,200,000 tons annually, which leaves a deficit of some 200,000 tons, if fighting on the present large scale went on. It has been estimated, however, that German Europe's stocks of lubricating oils amounted to some 700,000 tons when the attack on Soviet Russia began.

It is worth while to make a closer analysis step by step, first of the supply of lubricating oils in German Europe, estimated at 1,200,000 tons a year, and then of the demand, estimated at 1,400,000 tons. Germany's highly developed lubricating oil refineries depended in peacetime, to a con-

siderable extent, on foreign materials, mainly supplied by the United States of America, Soviet Russia and the Dutch West Indies; the synthetic oil plants concentrated on liquid fuels rather than on lubricants. Total supplies of lubricants in 1938 amounted to 550,000 tons, or 7.5 per cent of the total supplies of mineral oils, and roughly 388,000 tons, or 70.5 per cent, were imported—170,000 tons each from the United States and the Dutch West Indies, 33,000 tons from Soviet Russia and 9,000 tons from Roumania. In addition, substantial quantities of "topped" crude oils and residues were imported which were refined in German plants. Lubricants refined from German crude oil amounted in 1938 to 180,000 tons. At present, German Europe's crude oil output may be estimated at 1.2-1.5 million tons, yielding under normal conditions 400,000 to 500,000 tons of lubricants, and special processes may increase the output to some 600,000 tons. The Roumanian crude oils yield relatively small quantities of lubricants, amounting to roughly 70,000 tons in 1939; and output could hardly be increased beyond 80,000 tons. The total crude oil resources at Germany's command would thus yield 680,000 tons of lubricants annually, or roughly 50 per cent of the estimated consumption.

Theoretically, Germany's resources of coal and lignite for the manufacture of synthetic lubricants are more than sufficient for filling the gap. With an estimated output of some 3.5 million tons of synthetic oil, the manufacture of some 150,000 tons of lubricants should not be impossible. Another important raw material extensively used for making lubricants during the last war was Germany's output of tar oils; in 1918, roughly 125,000 tons of lubricants were manufactured from tar oils, and to-day 150,000 to 200,000 tons could be manufactured by converting these oils. Lastly, there is the recovery of waste oil, which is mainly a process of removing impurities, and the collection of motor oils is already compulsory in German Europe. Including the recovery of oils used in railway transport, shipping and

industry, the regeneration of some 150,000 tons a year seems to be possible. On the basis of these somewhat hazardous calculations, current annual supplies to German Europe would seem to be as follows:—

	Metric Tons
From crude oil	680,000
From synthetic coal oil processes ..	150,000
From conversion of coal and lignite tar oils	200,000
From recovering waste oil	150,000
Total	1,180,000

Although modern refinery processes make it possible to increase the quality of lubricants, it seems quite impossible that these oils can reach the quality of lubricants manufactured from American or Russian crude oils.

So much for the estimate of supplies. Against this output of lubricating oils in German Europe of some 1,200,000 tons, there is estimated to be a minimum demand (with heavy fighting in progress) of perhaps 1,400,000 tons. How is this estimate—of German demand, of German European demand and of military demand—made up? First, there is Germany itself. By restricting civilian motoring Germany has perhaps saved approximately 35,000 tons of lubricants annually and blockade restrictions on shipping may have saved another 25,000 tons, compared with a peacetime consumption by shipping of 50,000 tons. But, including all possibilities, the total annual savings made may not exceed 70,000 tons. And against this, there is the fact that a wartime increase in industrial activity of, say, 15 per cent will have increased industrial consumption, which was roughly 500,000 tons in 1938, by 75,000 tons, or slightly more than the annual savings.

This is in Germany itself. Pre-war consumption of lubricants in occupied and dependent countries of German Europe can be estimated as follows:—

	Metric Tons
Poland and Baltic countries	50,000
France (occupied territory)	200,000
Holland and Belgium	120,000
Denmark and Norway	60,000
Yugoslavia and Greece	25,000
Hungary, Slovakia, Roumania, Bulgaria, Finland	85,000
Italy	150,000
Sweden, Switzerland	90,000
Total	780,000

German occupation has drastically reduced civilian consumption. Lubricants are only used for industry and transport which is working for Germany; and total demand may have been reduced to roughly 450,000 tons annually.

There remains the consumption of lubricants for military purposes. Here estimates are necessarily vague, particularly since the attack on Soviet Russia, where mechanised and motorised divisions are used very extensively. A conservative estimate amounting to a monthly consumption of 12-13,000 tons in the east, would work out at roughly 150,000 tons annually; and it may be reasonable to assume that the total requirements of the German forces in Europe, including the detachments of their satellites, can hardly be below 350,000 tons a year—home forces, training, naval operations and the armies of occupation. There is little

doubt, in fact, that this estimate is very conservative, for the inevitable wastage of war and the destruction of field stores and army transports by enemy forces is not taken into account.

In estimating possible production and probable consumption, under conditions of large-scale warfare, then all the figures point to the fact that Germany is short by some 15 per cent of total requirements. This, it is argued, can be covered for a considerable time by reserve stocks. In September, 1939, Germany's oil stocks were estimated at four million tons, of which lubricating oils may have amounted to some 350,000 tons. The total of lubricating oil stocks seized by Germany in occupied countries may have amounted to some 150,000 tons. Italy certainly accumulated large stocks during the period of non-belligerency, and Germany's imports from Soviet Russia probably consisted to a great extent of lubricants. Small quantities of animal and vegetable lubricants must be added to these stocks, which at their peak may have exceeded a million tons. Subsequent drawing on these stocks had probably reduced them to at least $\frac{1}{2}$ million tons when the preparations for the Russian campaign were started.

Statistically, then, Germany could carry on large-scale military campaigning for some two years. But statistical estimates need qualification. Germany's lubricating oil needs cannot be measured adequately in quantity only. There is no other oil product that goes to serve so many different purposes as lubricating oil; the more important are motor, cylinder, turbine, compressor, transformer and spindle oil. There are oils of high viscosity and low viscosity, and bright and dark kinds with a whole range of intervening varieties. Frequently, special raw materials are indispensable for the manufacture of these oils. This is the reason why Germany, before the war, was anxious to secure large quantities of Pennsylvanian bright stocks and lubricants from the Dutch West Indies, instead of turning to its own coal oil resources. The fact that the necessary quantities have been manufactured does not mean that the required qualities are available. In fact, there can be little doubt that the use of new and inferior raw materials for the manufacture of a considerable proportion of lubricating oil supplies must deteriorate their quality and impair Germany's war industry and transport. A shortage of quality can be as serious as a shortage of quantity.

The situation has been estimated here on the assumption of minimum demands and maximum supplies. Military demand may suddenly be increased, while the margin for further restrictions in civilian consumption is very narrow. No allowance has been made, or can be made, for losses to stocks and plants by bombing. But the numerous bombing attacks on the Hanover area, Germany's main oil-producing area, on Misburg, Monheim, Hamburg, Bremen, Gelsenkirchen, Bochum, Duisburg, Oppau, Leuna, Magdeburg, Pöhlitz, etc., and the Russian raids on Roumania, have had some effect, and the loss of only a few thousand tons of a particular kind of lubricating oil may be irreparable. The anxiety to preserve every drop of oil is clearly shown by the collection of oil rags, from which oil can only be recovered by very tedious processes. Germany's lubricating oil supply situation appears to be just balanced. It is therefore sensitive to all the sudden and unforeseen events that are so frequent in war, and the weakness is obvious. It constitutes one of Germany's most difficult war problems.

Finance and Banking

The Rise in Deposits

The clearing bank returns for September reveal the passing of the £3,000 millions mark in aggregate deposits. From August's total of £2,997.1 millions they have risen to £3,114.5 millions. The main factor in this further considerable expansion in bank credit is the additional loans made to the Treasury by way of Treasury deposits. These are up from £468.5 millions to £531 millions. The banks have also increased their bill holding, the total of their portfolio rising from £265.9 millions to £315.1 millions. This jump, which is wholly attributable to Treasury bills, shows that the clearing banks are feeling the benefit of the reduced official competition for bills at the weekly tenders, now that central banking requirements for Treasury bills are increasingly satisfied through the tap. Investments have been comparatively stable following the suspension of the National War Bond issue. The introduction of the new series of these bonds should see a renewed expansion in

this item, and it will be interesting to see whether the banks will convert into the new bonds any substantial part of the heavy TDR payments they have been called upon to make in the past few weeks. Advances continue their persistent decline. The exceptional degree of liquidity reflected in these returns has spread over into the present month. During the past week, conditions in the money market have been very comfortable. At the beginning of the week, bank cash was increased by payments estimated at close on £30,000,000 on vested Canadian securities. The latest Bank return shows bankers' deposits to have risen by £4,132,000 to the comparatively high level of £126,468,000. This increase is all the more remarkable in view of the further substantial expansion of £5,546,000 in the note circulation. Further Government borrowing at the Bank is indicated by the rise of £13,934,000 in Government securities, and it is this which has made possible the concurrent expansion in bank cash and in the note circulation.

Sources of War Finance

The Chancellor's review of the public finances in the first two years of war provides, directly or by deduction, much of the material required to bring up to date the analysis of the sources of war finance which appeared in the Treasury White Paper issued last April. If the attempts made to complete the analysis from the figures supplied by Sir Kingsley Wood fail to agree, the fault must lie largely with the presentation of the basic data. In his speech the Chancellor spoke at times of the finance "of the first two years of war," at others of the finance "of the past two years"—periods which, at the time at which he spoke, differed by one whole month. Again, in detailing the distribution of Government income, he used percentages which unfortunately failed by 3 points to add up to 100—and 3 points, when applied to a sum total of £4,380 millions, amounts to the sizeable absolute figure of over £131 millions. Sir Kingsley Wood also vitiated a true comparison of his figures with the White Paper data by including in his Exchequer outlay a sum of £150 millions representing repayments of maturing loans and other small capital payments. The best way of dealing with this £150 millions is to exclude it from the expenditure and deduct a corresponding sum from the medium and long-term sterling loans raised during this period, thus giving the borrowing figures as net. The basic data given by the Chancellor was as follows. The total expenditure in the first two years of war was £7,018 millions, of which £2,785 millions was covered by revenue. In addition to the deficit of £4,230 millions, another £150 millions had to be found to cover the above-mentioned capital expenditure. Of the £4,380 millions that had to be raised outside revenue, 17 per cent was covered by gold sales and extra-budgetary funds, 21 per cent by small savings, 33 per cent by public subscriptions to medium and long-term issues and 26 per cent by Treasury bills and Treasury deposits. One may assume that the odd 3 per cent represents money raised by increases in the fiduciary circulation and by changes in exchequer and departmental balances. Subtracting the £150 millions from the medium and long-term borrowing, allowing £50 millions raised during the six months to the end of last August through the increase in the fiduciary circulation and arriving by deduction at the changes in departmental and exchequer balances over this same period, we arrive at the following analysis of the sources of war finance in the first twelve months and two subsequently half-yearly periods of the war:

	£ million Sept. 1, 1939, to Aug. 31, 1940 (12 mths.)	£ million Sept. 1, 1940, to Feb. 28, 1941 (6 mths.)	£ million Feb. 28, 1941, to Aug. 31, 1941 (6 mths.)
Total Government expenditure	2,633	2,108	2,277
Increase or decrease in dept. and exchequer balances ..	—36	—34	+36
True expenditure	2,597	2,074	2,313
Less revenue	—1,148	—837	—800
	1,449	1,237	1,513
Less sales of EEA gold and extra budgetary receipts ..	—297	—294	—154
Net amount borrowed through sterling public loans	1,152	943	1,359
Of which:—			
Small savings	353	262	306
Other public issues	261	385	647
Treasury bills held by market	458	—29	186
Treasury deposits	30	325	170
Fiduciary issue	50	...	50
Total	1,152	943	1,359

Tap Bills to Empire Banks

The figures for the final six monthly period given above stand up well to the main cross check that can be applied to them, namely, the weekly published receipts from various Government issues. Between the end of February and the end of August these showed aggregate receipts of £952 millions, compared with the total of £943 millions shown in the above table for small savings and other public issues during this period. The analysis of the sources of war finance in the six months to the end of last August reveals interesting material. The drop in the revenue from sales of gold and extra budgetary receipts may be wholly attributed to the first of these sources of income. With the pre-war

gold stocks of the EEA virtually exhausted, it is reasonable to assume that almost the whole of the £154 millions shown to have been collected from this composite source was due to extra budgetary receipts, and in particular to the balances borrowed from the War Risks Insurance Funds and the Unemployment Insurance Fund. The big jump in the receipts from medium and long-term Government issues is due to some extent to the investment of banking funds, the clearing banks' investments alone during this period rising by £120 millions. The amount of £186 millions shown as the increase in Treasury bills held by the market includes a considerable issue of bills to Empire central banks. Over this period of six months the outstanding volume of Treasury bills issued through the tender increased by £125 millions only, while the clearing banks' portfolios rose by about £56 millions. These central banks have been fed with bills during this period both through the tap and through the tenders.

New War Bonds and Money Market

Lombard Street has welcomed the news of the fresh tap issue of National War Bonds. There had been some fears that the new Government issue when it made its appearance would show a reduction in the rate of interest compensated to only a partial extent by some reduction in the currency of the loan. These fears are now set at rest. The new 2½ per cent National War Bonds should suit the money market admirably. The extension of the redemption dates to 1949-51 reflects the slight appreciation in the first two series of these bonds since the tap for the 1946-48 bonds was turned off. The extension of the currency by 2 years and 2 months naturally limits the extent to which the new bonds can be run by discount houses, but they will nevertheless be suitable for inclusion in discount market bond portfolios within limits, and their appeal to the banks will be little smaller than was that of the previous series of war bonds. Moreover, the new series of war bonds fits well into the even sequence of Government loan maturities and for this reason makes a special appeal to the market in bonds. The maturities available in this market begin with the Conversion 5 per cents, which certainly will be repaid in 1944. In 1945 the Conversion 2 per cents come to final maturity. National Defence 2½ per cents are due in 1944-48 and may therefore be classed as a 1946 maturity. Thereafter come the first two series of National War Bonds, namely 1945-57 and 1946-68. The Conversion 2½ per cents must be repaid in 1949 at the latest. Then come the new National War Bonds with their 1949-51 dates. This is a well balanced array of maturities, which will continue to be highly attractive to the market as long as there are ample supplies of 1 per cent money.

India Calls in Sterling Notes

Reports from India announce that the Government of India have decided to call in all Bank of England notes held in that country. The step represents a further endeavour to compress into insignificance the unofficial markets

BANK OF LONDON & SOUTH AMERICA LIMITED

in sterling which still operate in some territories. The ban on the reimport of Bank notes decreed last year was followed by every part of the sterling area, India included. But it is evident that such a ban must be far more difficult to apply with complete effectiveness in a country such as India, with its enormous land frontiers, than in our island. It has thus been found that some sterling notes, deprived of an opportunity of returning to Great Britain, have made their way to India. In particular it has been noted that much of the lavish expenditure of German "tourists" and technicians in Iraq, Iran and Afghanistan in recent months

Investment

"Tap" Re-opened

The announcement of a new issue on tap of 2½ per cent National War Bonds, 1949-51, at par confirms the expectations of those who held that no revolutionary step, such as a drastic cut in the nominal rate of interest, would be taken by the Treasury. None the less, the terms of the new issue—the maximum life of the new bonds is some twenty-six months greater than of the 1946-48 issue—reflects to a large extent the general rise in gilt-edged securities in the period of rather over nine months since that offer was announced. There is no doubt that the offer will accord with the wishes of the money market, for whose consumption it is primarily designed, despite the fact that it has a life almost double that which a few years ago would have been considered the maximum acceptable. For the rest of the investing public, other than large institutions, it has perhaps little direct interest. Certainly more comment was aroused in stock market circles by the simultaneous announcement of a cut of 1½ points in the minimum quotations for the two older issues of National War Bonds. It is perhaps inevitable that, while a bond is on tap at par, its minimum price in the market, even under rather different conditions of sale, shall be no lower. In fact, neither of the two issues, 1945-47 and 1946-48, has ever been quoted under par, although business has been arranged outside the market on terms which amounted to a discount. This state of affairs ceased to prevail, however, shortly after the closing of the tap for the latter issue on August 14th, and both had been quoted for some time at ½ point premium. Yesterday's cut reduces their minima to 98½. The move is certainly welcome to holders in the gilt-edged market, and presumably holders of the bonds will prefer to be able to sell them, if they wish, at a relatively heavy discount, rather than to have their holdings frozen in the event of really awkward developments. At the same time, it looks a little odd that such a possibility should be envisaged at the very moment when the Treasury is making a new offer on terms very much more favourable to itself. Actually, whatever may be said for the principle of minimum prices, the existing quotations seem to call for adjustment. The price for the two old series of War Bonds is the same as for 2 per cent Conversion, 1943-45, while it is ½ point above that for the shorter-dated 2½ per cent Defence Bonds, 1944-48, and 2 points above the 2½ per cent Conversion, 1944-49. The issue of the new bonds solves the question of whether the banks would accept even greater liquidity rather than take up 3 per cent Savings Bonds. It now seems probable that any funds available will go, in large measure, into the new issue, leaving little over for purchases in the open market. Despite a fall of ½ in the old bonds on the fixing of the new minima, it seems certain that the acceptance of the terms on the new must raise the price of the old and tend to a generally higher level of prices.

Nearing New Records

Although there is no evidence in the figures of the leading banks for September so far available of an increase of any importance in their holdings of investments, the rise in gilt-edged stocks has continued, with only a minor reverse. Before this, Government securities as a whole were on the verge of creating new records, and so were other fixed interest stocks, although the rise of the past month, as reflected in the figures of *The Actuaries' Investment Index*, has been less than in the first-line stocks. Equities also record a further advance, for the fifth month in succession. It is the smallest since that of May, the first of the present series of issues, and there were appreciable falls in building material and coal shares, as well as in home railway ordinary stocks. Since the close of the month to which this index is made

has been made in sterling notes. These notes, which had in all probability been sequestered in the occupied territories of western Europe, had been making their way into India in appreciable amounts. As evidence of such unauthorised traffic in notes appeared, efforts were made to tighten up the countermeasures. Last June all authorised exchange dealers in India were called upon to declare their holdings of Bank of England notes to the Reserve Bank of India. The further step now decreed should effectively check the unauthorised absorption of Bank of England notes in India.

up, there has been, first, a further advance, and then a moderate recession on the news of a fresh German offensive. It is symptomatic, however, that while the jobber reacts to ill news, the investor only acts on good. Although caution suggests very strongly that a reaction of some dimensions is due in equities—to be followed shortly by a renewed rise—the indications at present are that the improvement will continue further with only the most moderate reverses and occasional short pauses. In view of the fact that equity prices are back to the level of end-April, 1940—while yields are, of course, much below the levels then ruling—it might be thought that the market would be very vulnerable to any considerable setback in the military sphere. This argument is strengthened by the fact that equities have now lost all element of hedge against

inflation for the duration of the war—indeed, the outlook is for further reductions in dividends for the rest of this year at least. Against this it is fair to say that pressure of increased income-tax tends to make the investor take rather larger risks. Another factor working in the same direction is the mathematical fact that, with the volume of industrial equities virtually fixed, and that of Government securities rising continuously, some relaxation of the standard demanded of the former is essential if the proportion between the two in any investment portfolio is to be maintained. This can scarcely be held to explain the recent speculative buying, of which the rise in oil shares is the latest evidence. As in other cases, this advance has already been followed by some profit-taking and an appreciable recession in prices. The undertone remains firm. Institutions have recently sold shorts and when they turn buyers, even on a small scale, a resumption of the rise is probable.

Investment in the Reich

Reports from Berlin suggest that the marked preference which the private and the institutional investor has displayed for industrial equities since the days of the Munich crisis has at last provoked the authorities to effective action. Previous measures to control the upward movement in the prices of industrial stocks, a movement which has become apparent in the stock exchanges of the great majority of occupied countries, have not proved completely efficient, and investors in Berlin, as in the rest of Nazi-dominated Europe, continue to believe that the possession of a share in the ultimate ownership of industrial equipment repre-

2½% National War Bonds, 1949 - 1951.

Interest payable half-yearly on the 1st February and 1st August.
A first interest payment will be made on the 1st February, 1942.

PRICE OF ISSUE £100 PER CENT.
PAYABLE IN FULL ON SUBSCRIPTION.

Bonds of this issue are an investment authorised by The Trustee Act, 1925, and The Trusts (Scotland) Act, 1921.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND, by authority of the Lords Commissioners of His Majesty's Treasury, offer the above Bonds for subscription. Subscriptions will be received on Thursday, 9th October, 1941, and thereafter until further notice in the "London Gazette."

Subscriptions may be lodged at any office of the Banks hereafter mentioned. Subscriptions must be in multiples of £50 with a minimum of £100. Subscriptions must be accompanied by the full amount payable in respect thereof.

The Principal of and Interest on the Bonds will be a charge on the Consolidated Fund of the United Kingdom.

If not previously redeemed, the Bonds will be repaid at par on the 1st August, 1951, but His Majesty's Treasury reserve to themselves the right to redeem the Bonds in whole or in part, by drawings or otherwise, at par on, or at any time after, the 1st August, 1949, on giving three calendar months' notice in the *London Gazette*.

The Bonds will be registered at the Bank of England or at the Bank of Ireland, Belfast, and will be transferable by instrument in writing in any usual or common form in accordance with the provisions of the Government Stock (Transfer) Regulations, 1941.

Bonds will be transferable in sums which are multiples of one penny. Transfers will be free of Stamp Duty.

Interest on the Bonds will be paid half-yearly on the 1st February and 1st August and will, in the case of the first interest payment, be calculated from the date on which the subscription accompanied by payment is lodged. Interest will be paid by warrants transmitted by post and Income Tax will be deducted from payments of more than £5 per annum. The first interest payment will in all cases be payable to the original subscribers or to their nominees.

The Bonds and the interest payable from time to time in respect thereof will be exempt from all United Kingdom Taxation, present or future, so long as it is shown in the manner directed by the Treasury that they are in the beneficial ownership of persons who are neither domiciled nor ordinarily resident in the United Kingdom of Great Britain and Northern Ireland. Further the interest payable from time to time will be exempt from United Kingdom Income Tax, present or future, so long as it is shown in the manner directed by the Treasury that the Bonds are in the beneficial ownership of persons not ordinarily resident in the United Kingdom of Great Britain and Northern Ireland.

These exemptions will not apply so as to exclude the interest from any computation for taxation purposes of the profits of any trade or business carried on in the United Kingdom. Moreover, the allowance of the exemptions is subject to the provisions of any law, present or future, of the United Kingdom directed to preventing avoidance of taxation by persons domiciled, resident, or ordinarily resident in the United Kingdom, and, in particular, the interest will not be exempt from Income Tax where, under any such provision, it falls to be treated for the purpose of the Income Tax Acts as income of any person resident or ordinarily resident in the United Kingdom.

Subscriptions, which must be accompanied by payment at the rate of £100 for each £100 of Bonds subscribed, may be lodged at the Bank of England Loans Office, E.C.2, or at any office of the following Banks:—

IN GREAT BRITAIN:			
Bank of England.	Coutts & Co.	Martins Bank, Ltd.	Royal Bank of Scotland.
Bank of Scotland.	District Bank, Ltd.	Midland Bank, Ltd.	Union Bank of Scotland, Ltd.
Barclays Bank, Ltd.	Glyn Mills & Co.	National Bank, Ltd.	Westminster Bank, Ltd.
British Linen Bank.	Grindlay & Co., Ltd.	National Bank of Scotland, Ltd.	Williams Deacon's Bank, Ltd.
Clydesdale Bank, Ltd.	C. Hoare & Co.	National Provincial Bank, Ltd.	Yorkshire Penny Bank, Ltd.
Commercial Bank of Scotland, Ltd.	Isle of Man Bank, Ltd.	North of Scotland Bank, Ltd.	
Co-operative Wholesale Society, Ltd.	Lloyds Bank, Ltd.	Provincial Bank of Ireland, Ltd.	
IN NORTHERN IRELAND:			
Bank of Ireland.	Hibernian Bank, Ltd.	National Bank, Ltd.	Provincial Bank of Ireland, Ltd.
Belfast Banking Co., Ltd.	Munster & Leinster Bank, Ltd.	Northern Bank, Ltd.	Ulster Bank, Ltd.

A commission of 2s. 6d. per £100 nominal subscription will be paid to Bankers or Stockbrokers on subscriptions bearing their stamp.

Subscriptions must be made on the printed forms which may be obtained, together with copies of this Prospectus, at the Bank of England Loans Office, London, E.C.2, or at any of the Branches of the Bank; at the Bank of Ireland, Belfast; of Messrs. Mullens & Co., 13, George Street, Mansion House, E.C.4; or at any Bank or Stock Exchange in the United Kingdom.

BANK OF ENGLAND, LONDON,

8th October, 1941.

N.B.—Separate Prospectuses relating to 2½% National War Bonds, 1949-1951, to be held on the Post Office Register will be issued by His Majesty's Postmaster-General (and may be obtained at any Savings Bank Post Office or Bank), and by the National Debt Commissioners on behalf of Trustee Savings Banks. The amount subscribed by any person under the Prospectuses issued by His Majesty's Postmaster-General and by the National Debt Commissioners must not exceed £1,000.

sents some sort of a hedge against a possible collapse of the currency. The position is in striking contrast with that apparent on the London Stock Exchange, where the imposition of EPT has been effective in robbing equities of much of their attraction and the funds have consistently dominated markets against a background of relative price stability. Reports from Germany state that the Minister for Economics, Dr Funk, has given orders that all investment portfolios, at present of industrial enterprises only, are to be examined by the Reich Chamber of Commerce to ascertain what equities have been acquired in the last two years; but blameworthy acquisitions may be disposed of in the next few weeks. The inability of German firms to expend liquid funds accruing from the legitimate, and illegitimate, profits of war production has produced an increasingly important pressure of cash seeking investment and the authorities appear to have been less successful in inspiring confidence in Government issues than has been the case in this country. Examination of investment portfolios should, of course, completely reverse the upward trend of equity prices since many sales under duress appear inevitable. And it is important that this reversal should not create the impression that institutional investors in Germany have suddenly regained faith in the future.

Limit of Small Savings?

The raising of the first £1,000,000,000 of small savings since the National Savings Campaign was launched on November 21, 1939, is a triumphant landmark in the history of the national savings movement. It is, of course, particularly satisfactory that this total should have been reached before the conclusion of the second savings year, only £475,532,981 having been raised in the course of the first twelve months. The weekly yield was £9.1 millions for the first 52 weeks, £11.6 millions in the following 19 weeks to the Budget, jumping thereafter to £14.7 millions for nine weeks of intensive savings campaigns, and falling to £11.1 millions in the following quarter. The recession which small savings have experienced during the past few months is no doubt due to the influence of the holiday season, which, since it has been partially staggered, has made itself felt for a more protracted period than usual. There is every reason to expect that, between now and the outbreak of Christmas festivity, the impending autumn drive will ensure that the upward trend of small savings will again ally itself with the upward movement of earnings. Meanwhile, it is to be noted that the movement in larger savings is less than satisfactory, a fact which may be due in some measure to the temporary absence of any short-dated issue on tap. Actually, subscriptions to War and Savings Bonds were at the same rate in the third quarter as in the first half-year. That the existing achievement, substantial as it appears on paper, is not going to solve the main budgetary problem of closing the gap between income and expenditure was pointed out by Sir Kingsley Wood at the National Savings lunch this week. And the inadequacy of national savings, even at their present level, appears to conflict with an earlier statement of the Chancellor, which is discussed in a note on p. 442, that the limit of taxation was in sight. In fact, the limit of transferring purchasing power to the State cannot have been reached while there is still scope for a successful national savings campaign. Alternatively, if national savings are not increasing sufficiently rapidly to solve the budgetary problem, the movement must be incorporated in the Chancellor's taxation plans, as has already been done by giving back a part of taxes in the form of the grant of blocked credits in post office savings accounts. The other choice is an inflationary rise in uncontrolled prices with or without hoarding of notes. Sooner or later, private finances will have to be placed on a total war basis. To finance the war by taxation and voluntary savings would, if practicable, be a fine ideal; but, as in so many other fields, it

seems inevitable that an element of compulsion will prove necessary to secure success as well as some measure of justice.

Montreal's Debt

No further information is to hand about when details of the scheme for dealing with debt of the City of Montreal may be expected. An official committee, representing American and British bondholders, as well as Canadian, has been in existence since April, when it took over from an informal body. Apparently, at that date, defaults on redemption amounted to some \$13½ millions, and were accumulating at the rate of \$12 millions annually, while there was bank indebtedness of \$35½ millions. Against these liabilities, there were sinking fund accumulations of \$2,625,000. This is, of course, far from being a complete picture of the position, but it was sufficiently far from reassuring to persuade the committee that a scheme of rearrangement for both floating and funded debt was essential and it is engaged in discussions to this end. There the matter rests until the committee finds events sufficiently advanced to make a further report. Their last is over a month old. Meanwhile, it is scarcely surprising that Sir Kingsley Wood has rejected the suggestion, made to him last week, that these loans should be requisitioned at par forthwith and handed to the Dominion Government in payment for goods received. That the Dominion might be prepared to take up stocks of the City of Montreal is not impossible. But it would seem that this would only be envisaged, either as part of a scheme of rearrangement, or, much more probably, after a scheme had been proposed and accepted. The Canadian Government is already going a fair way to help this country by accepting sterling instead of Canadian dollars. It can hardly be asked to take the obligations of one of its cities, for which it has no direct responsibility, at above their market value.

Company Notes

United Steel Companies

The full accounts of United Steel Companies to June 30th last show that consolidated earnings fully covered the ordinary dividend, maintained at 8 per cent. Consolidated trading profits and dividends of associated companies, after depreciation and EPT, amount to £2,247,835 against £2,440,977. Although the charge for income-tax in respect of the current year is up from £1,142,000 to £1,154,250, retrospective provision, due to the increase in the standard rate, amounts to only £187,000 against £351,000. Thus, the total tax deduction from disclosed earnings is only £1,341,250 against £1,493,000. Central obsolescence fund receives £125,000 as before, and contributions to staff pension funds are increased by £4,000 to £134,000. Despite a fall in the amount of equity earnings from £462,583 to £419,082, the rate is raised from 8.0 to 8.3 per cent and the carry forward from £412,189 to £427,177. As in the previous year, there is no transfer to general reserve which is, in fact, depleted by an appropriation of £400,000 for war damage insurance, the total now standing at £1,000,000. The following table indicates three years' trend of profits and allocations:—

	1939	1940	1941
Total profits after depreciation	*1,801,529	†2,440,977	‡2,247,835
Taxation	398,899	1,493,000	1,341,250
Obsolescence	482,124	125,000	125,000
Interest and debenture redemption	178,160	222,366	221,305
Fees and staff pensions	136,663	138,028	141,198
Ordinary shares:—			
Earned	605,683	462,583	419,082
Paid	559,700	461,994	404,094
Earned %	88.7	8.0	8.2
Paid %	8	8	8
Reserve	200,000		
Carry forward	†411,600	‡412,189	‡427,177
* Depreciation in 1939 amounted to £197,457; in subsequent years, not disclosed.			
† After E.P.T. ‡ After £25,716 written off note issue expenses.			
§ Capital increased November, 1938, by 10 per cent issue to shareholders at par.			

While the accounts completely mask the movement in gross receipts, it is clear that the group worked to capacity last year. The consolidated balance sheet shows increases of over £1,000,000 in both stocks and debtors, the former standing at £3,657,539 and the latter at £4,945,479. Cash holdings, which are shown net of bank overdraft, have risen from £1,483,433 to £1,744,223, while holdings of Government securities are up from £652,422 to £883,422, with a market value, at the date of the accounts, of £951,000. These rises are financed by a jump in creditors from £4,359,853 to the considerable total of £5,705,820, while reserve for taxation is up from £2,664,002 to £4,123,080. The company's balance sheet shows a rise in the total of reserves for repairs and depreciation from £3,328,680 to £3,813,038, while cash holdings are up some £500,000 to £1,381,448. The £1 ordinary stock, at 22s. 9d. ex dividend, yields £7 os. 8d. per cent.

Associated British Picture

Owing to a change in accounting practice by which various charges against profits are shown only in the accounts of subsidiaries, the profit and loss account of Associated British Picture Corporation to March 31st last is not comparable with that of previous years. Consolidated earnings are up from £1,421,157 to £1,427,157. While net interest charges are rather lower, tax provision is up from £500,818 to £527,166 and depreciation from £255,706 to £286,885, leaving net profits of £192,897 against £214,037. After meeting service on preference capital and transferring £100,000 to general reserve, the carry forward is increased from £89,852 to £109,351. The most significant changes in the Corporation's balance sheet reflect the decision to apply £1,500,000 from general reserve to writing down fixed assets in addition to the whole of accrued and current depreciation provisions amounting to a total net figure of £2,150,458. Thus, total fixed assets stand at £8,617,763, against £10,865,499. General reserve, after this transfer and a war damage contribution of £59,420, and after appropriations from current profits, amounts to £1,450,000 against £3,000,000. The consolidated balance sheet is prepared on the basis of including accounts of all associates whose year corresponds with that of the parent, others being included as investments. The total of these classes amounts to some £15 millions net, while sinking funds stand at £150,000 and liquid assets at some £845,000. Against this there are creditors of £740,694, while reserves for tax and war damage total £970,715, and there are free reserves of £1,469,154. From the chairman's statement it transpires that a considerable fall in the credit for films is due mainly to reduced production, although the very conservative valuation of this asset is also a factor of some importance. It is doubtful whether the figures of the Corporation's own balance sheet are fully comparable. In his statement, Sir Ralph Wedgwood, who has assumed the chairmanship of the group following the death of Mr John Maxwell and the sale of half his interest to Warner Bros., considers that prospects in all branches of the group's activity should improve in the current year. Damage to property from enemy action has so far not been on a serious scale. It is highly uncertain whether earnings in 1941-42 will suffice to provide a dividend on the 5s. ordinary shares, which, however,

stand at 8s. The £1 6 per cent preference shares at 17s. 3d. yield £6 19s. 1d. per cent.

Wall Paper Manufacturers

The preliminary statement of Wall Paper Manufacturers for the year to July 31st shows profits after taxation and provision for war damage insurance of £377,292. In the previous eleven months, earnings for fixed charges amounted to £496,969 after the allocation of £10,000 for staff funds. It is not clear from the latest statement whether profits of £377,292 are struck after a similar provision or whether no such appropriation will be made this year, but in any case the fall in net earnings is considerable. After meeting debenture and preference charges and paying the usual 10 per cent on ordinary capital, deferred stock receives 4 against 6 per cent per annum. Earnings for deferred capital amount to £91,682 against £235,160 for eleven months, representing 4.1 per cent against 15.4 per cent actual, or 16.8 per cent per annum. There is no transfer to reserve against £100,000 in the previous accounting period, and the carry forward is raised from £220,684 to £222,340. The setback is no doubt substantially due to the difficulty of obtaining supplies of raw material, in particular paper, to the closing of export markets and the fall in home demand. Probably, sales of oil and paint products on Government contract have done something to compensate for lower output of wall paper, while the higher tax burden has, of course, significantly influenced the course of profits which are shown after tax. The £1 deferred stock at 26s. 3d. offers a yield of no more than £3 2s., indicating general confidence in the future of the concern.

Roan Antelope Dividend

Despite the halving of the interim payment, at 5 per cent, the market was surprised by the decision of the Roan Antelope management to reduce the final dividend also from 10 to 5 per cent, making 10 against 20 per cent on the year to June 30th. Admittedly, in the previous year, earnings of 21.2 per cent provided scant cover for the 20 per cent ordinary dividend, a rise from £1,613,377 to £1,865,645 in total profits having been accompanied by a rise in tax liability from £645,000 to £800,000. This included £73,000 for NDC, and there is no mention of EPT. Roan Antelope possesses a relatively good EPT standard, and should benefit under the wasting assets concession. Since there is every probability that output has been at a maximum, and that total income again rose substantially last year, the decision to halve the dividend seems likely to arise from a sharp rise in costs associated with the fact that EPT has probably called for a considerable amount, and that a substantial sum has probably been earmarked for contingencies. It is also possible that the price realised was less favourable. It is true that for the four previous years the company has drawn on its carry forward, a practice which the directors may well consider to have been carried far enough. Further speculation in the absence of the accounts has little point. Stockholders may console themselves with the reflection that the secular trend of output is almost certainly upward, and that, when the war is won, a larger share of profits will no doubt accrue to them. On the news of the reduction, the 5s. ordinary stock declined from 13s. 6d. to 12s. 4½d.

THE STOCK EXCHANGES

London

Note: all dealings are for cash.

MARKETS closed strongly before the week-end, but discouraged by the news from the Russian front, business at the reopening was rather quieter. Treasury disbursements for the requisitioned Canadian stocks produced no marked results apart from some support in the gilt-edged market. On Tuesday, news of the new German offensive gave rise to profit-taking, mainly in oil and shipping issues, but despite some irregularity the undertone in most sections remained firm.

The mid-week announcement of a new Government loan, together with mild investment support failed to produce improvement in the gilt-edged market.

Before the week-end gains of ¼ were registered by 4 per cent Consols, 3½ per cent War Loan and 4 per cent Victory Bonds, while 3½ per cent Conversion and N.W. Bonds 45-7 both improved ¼. On Monday, re-investment of Canadian moneys assisted business, and gains of ¼ were general in the short and medium dated issues, while 3½ per cent Conversion gained ¼ and 3 per cent War Loan ½. The following day, however, conditions became quiet, but apart from a decline of ¼ in Old Consols, ¼ in 3 per cent War Loan, and 2½ per cent NW Bonds, 45-47, prices remained unchanged. In mid-week there were falls of ¼ in long and ½ in short-dated stocks.

In the foreign bond market, Brazilian issues, particularly Funding bonds, were supported before and after the week-end,

and to a lesser extent Chilean bonds shared in the advance. Mexican issues were generally ½ higher on Friday, when Japanese bonds improved slightly, but, on Tuesday, small losses were general. Brazilian issues lost up to 1 point, while both Japanese and Chilean bonds fell back. Greek 6 and 7 per cent issues lost ½ point on the same day.

In common with other sections, the home rail market experienced a general improvement before the week-end. Junior issues were mainly higher, GW ordinary gaining ½, LMS ordinary and Southern preferred ¼, and London Transport "C" ¼. After the week-end LMS ordinary improved ¼, but on Tuesday most issues closed lower, with GW and LMS ordinary and Southern deferred all down ¼, while later declines continued with Southern preferred down ¼.

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

Among foreign rails, investors continued to support senior Argentine issues, but gains were generally small. Elsewhere, Canadian Pacific ordinary declined $\frac{1}{2}$ on Tuesday.

Prices in the industrial market before the week-end advanced over a broad front, and to a lesser degree the improvement was continued at the re-opening, but the following day witnessed some profit-taking, mainly in shipping issues. Among brewery shares, Guinness jumped 2s. 6d. before the week-end, while, on Monday, numerous smaller improvements were registered, prices later staying mainly unchanged. Motor and aircraft issues were well supported, Raleigh Cycle Holdings, Leyland and Rolls-Royce being prominent with good gains. Small improvements also predominated in the heavy industrial section. Among shipping issues, Union-Castle jumped 1s. 9d. on Friday among steady buying, but on Tuesday fell back 1s. 6d., when Elder Dempster Holdings lost 1s., though most issues were higher on balance. Textile issues were firm with Patons and Baldwins prominent, gaining $\frac{1}{2}$ both before and after the week-end. On Tuesday, however, Courtaulds reacted 3d., other issues remaining unchanged. In the tobacco group, BAT and Imps improved before the week-end, but the latter lost $\frac{1}{2}$ on Tuesday. Among miscellaneous issues, Wall Paper Manufacturers deferred was persistently strong on the preliminary statement. Later most sections were irregular with small losses predominating.

With the Johannesburg exchange closed on Monday, business in *kaffirs* was slight and prices were irregular. Venterspost improved $\frac{1}{2}$ on Friday, when Blyvoors lost 6d. On Tuesday, unfavourable war news had a depressing effect and prices generally moved against holders, Sub Nigel losing $\frac{1}{2}$ and West Wit Areas $\frac{1}{2}$. In the rubber market, shortage of stock coupled with even slight demand led to numerous fractional gains. Both before and after the week-end, Mexican Eagles led the advance in the oil market, but on Tuesday suffered from profit taking. On Monday, a general improvement took place, which included gains of $\frac{1}{2}$ for Shell and of $\frac{1}{4}$ for Burmah and Anglo-Iranian. The following day, war news led to some profit-taking and prices reacted sharply, Mexican Eagles losing 10 $\frac{1}{2}$ d., while Shell, Burmah and Anglo-Iranian all fell $\frac{1}{4}$. The decline in both *kaffirs* and oils continues in mid-week.

New York

UNCERTAINTY regarding future taxation policy and the absence of any impetus led to sluggish conditions on Wall Street before the week-end. Price movements were slight, but rail issues were lightly supported. Conditions remained unchanged at the beginning of the current week owing to fears of price control legislation, and, on Tuesday, prices fell back over a wide front, with losses up to a point in rail, steel, motor and copper issues among others. In mid-week markets turned slightly steadier, but caution remained the dominant feature.

The Iron and Steel Institute estimates steel mill activity at 98.1 per cent of capacity against 96.9 per cent in the previous week.

Industry and Trade

War Contracts

During the debate in the House of Commons on the Supplementary Vote of Credit on October 1st, Sir Kingsley Wood commented briefly on the cost-plus contract. He pointed out that both varieties of this form of contract were objectionable and disliked by contracting Departments as well as by most employers. The first variety, whereby the contractor is paid his "reasonable" costs, plus a percentage on the total, had been used during the war only to a very limited extent, usually for small urgent jobs, where it was not possible to fix a price in advance or to operate a schedule of prices. He doubted whether it was being used at all in production contracts. The second variety, whereby the contractor is paid his "reasonable" costs, plus a fee, fixed in advance, had been more widely used, especially early in the war, on building work of great urgency. Given effective management, conscientious workmen and effective supervision, Sir Kingsley Wood saw no reason why this form of contract should be more expensive than the fixed-price contract, but he agreed that it did give the impression to those employed on the job that cost did not matter, with consequent waste, not only of money, but of labour, materials and time. While it was difficult always to avoid this form of contract for the repair of damaged articles and in the initial stages of manufacturing a new product, an increasing proportion of contracts was being let on fixed prices. Aircraft contracts, for example, were now to a large extent on a fixed price basis. Mr Woodburn, a member of the Select Committee on National Expenditure, retorted that the Chancellor of the Exchequer was mistaken in thinking that there were not many contracts based on a cost-plus basis. While Sir Kingsley Wood was undoubtedly right in saying that it would be impossible to place all contracts on a fixed-price basis by a stroke of the pen, this method should be extended as quickly as possible.

Growth in U.S. Aircraft Output

America's output of aircraft has shown rapid expansion this year. Last December, the production of all types totalled only 799 units; during the past month no fewer than 1,914 military aircraft left the assembly lines, though a large proportion of this total consisted of training craft. Despite this expansion, it remains doubtful whether output has come up to expectation. It was reported last spring that the authorities then aimed at a monthly rate of production of 2,400 units by the autumn and of 3,000 units early next year. If the recent rate of expansion continues, it should be possible to attain the smaller of these two targets by the end of the year. Meanwhile, in Great Britain, too, the output of aircraft reached a record level last month. Indeed, if Germany's losses in Russia are taken into account, the time should not be far off when the Allies, who have always had qualitative superiority, will overhaul the enemy, not only in the rate of output, but also in actual numbers.

Cosmetics Control

Black markets are not entirely confined to foodstuffs. Supplies of toilet preparations were cut to 25 per cent of pre-war quantities under the Limitation of Supplies Order, and this small amount has scarcely gone halfway to satisfy demand. In cosmetics, brand names held more magic than in many other commodities. Now, shops find that they can sell face powder in paper bags, instead of in the elaborate packings that were formerly provided by firms whose name sold the preparation. It is scarcely surprising, therefore, that a black market in cosmetics should have grown up. An attempt to confine trading to bona fide manufacturers is being made by the Board of Trade. A new Order super-

cedes the Limitation of Supplies (Miscellaneous) (No. 11) Order, 1941, in so far as it concerns perfumery and toilet preparations, formerly controlled in Class 16. Under the new Order no one may supply the controlled goods who was not a manufacturer on October 1st. A new register of manufacturers is being compiled, containing names of those who supply goods to the value of more than £41 13s. 4d. a month, if they are permitted to supply such an amount under the quota restriction. Firms supplying less than the specified value of goods need not be registered, nor will they be permitted to supply more in future. Wholesale dealers will not in future be registered unless they are also manufacturers. The Order requires every dealer to keep a record of the names and addresses of his suppliers. It is to be hoped that these measures will result in the freeing out of persons who have taken advantage of the shortage of legitimate supplies and have played on the gullibility of the woman who hates her nose to shine.

Economy in Motor Fuel

The Government has recently gone a long way to meet the criticism, voiced in *The Economist* and elsewhere, that its motor fuel policy tended to be unduly liberal. This month, for the first time since rationing began, the private motorist's basic allocation has been reduced. For administrative convenience, the cut takes the form of a halving of the "value" of the October coupons, though in principle it represents a reduction of one-sixth in the basic ration for the three-monthly period ended October 31st; and prior notice had been given to this effect, so that the reduction could, in fact, be evenly spread. This rate of curtailment will remain in force during the next ration period—November, December and January—when the monthly allocations will range from four gallons for cars up to 9 h.p. (5 in November) to eight gallons a month for cars of 20 h.p. and over; in addition, supplementary allowances were recently scaled down, with a consequent further saving of petrol. The 400,000-odd goods vehicles in use in this country are also to receive less fuel than formerly. Here the basic ration is calculated according to the unladen weight of the vehicle, the allowance originally granted—which represented a sizeable cut below average pre-war consumption—being at the rate of six units a fortnight for each half-ton of unladen weight. A unit represents one gallon of petrol or two-thirds of a gallon of heavy oil, so that a lorry with an unladen weight of one ton would have received a basic allocation of 24 gallons of petrol, or 16 gallons of Diesel oil, for a four-weekly period, with the possibility of a supplementary allowance as well. The basic ration of six units, mentioned above, was reduced to five units at the end of May, and is to be lowered to four units on October 18th. These cuts do not, of course, mean that fuel consumption of this class of vehicle will be reduced by anything like one-third compared with the position at the beginning of the year, for what is lost in basic ration may—if proof of need can be given—be regained in the shape of a supplementary allowance. But it is officially stated that, in the case of retail delivery vans, no supplementary allowance will be granted unless it is proved that the goods to be carried are essential to the maintenance of the war effort or the life of the community, that they must be delivered by road, and that all reasonable steps have been taken to pool services. Finally, it may be mentioned that, on September 20th, the basic ration was abolished altogether in the case of buses and coaches, making it impossible in future for operators of public service vehicles to obtain fuel for other than "essential" purposes.

These sensible modifications in the rationing scheme have the effect of reducing the quantity of petrol available as of right, in the form of basic rations, and of making the grant

(Continued from page 454.)
Ipoh Tin Dredging.—Net profit, year to March 31, 1941, £75,628 (£94,554). Taxation reserves £35,386 (£57,737). General reserve £5,000 (nil). Investment reserve £3,000 (nil). Div. 31 $\frac{1}{2}$ (31 $\frac{1}{2}$). Fwd. £10,293 (£6,798).

N.E.I. Loan Repayments.—The Netherlands Government in London has issued a decree postponing drawings and redemption of N.E.I. public loans for 1942, as for the two preceding years. Bonds drawn before May 10, 1940, will be repaid. The object is to safeguard the

interests of legitimate holders of the bonds and interest payments are in no way affected by the decree.

Kramat Pulau Tin.—Net profit, 1940, £65,506 after reserving £32,500 taxation (£19,432). Ord. div. 60 (20) per cent. Fwd. £13,078 (£8,470).

of fuel increasingly dependent upon the discretion of the divisional petroleum officers, in the case of private cars, and of the regional transport commissioners, in the case of commercial vehicles. So far as the latter class is concerned, it is very doubtful indeed whether any further economy in motor fuel consumption could be secured without impeding the war effort; and the choice between the curtailment of commercial and civilian consumption obviously becomes critical. Some further saving could be effected, if necessary, by the abolition of the basic ration for private cars and the imposition of a needs test on the issue of licences. The Government's case is that this would seriously inconvenience many members of the community and require additional administrative staff. And the argument that, so long as licences are granted and heavy duties levied, the motorist's basic ration cannot, in justice, be further reduced, must carry some weight. But as many cars are used, on their basic ration, for purposes which would doubtless be classed as "essential," the net saving resulting from the abolition of the basic ration, since many supplementaries would be sought and granted, would be very small. Nevertheless, it remains the clearest duty of all consumers of oil, as of other imported products, to practise the utmost economy of which they are capable; and the Government must constantly re-examine, with the utmost care, whether the admittedly small saving that a further curtailment of private motoring would effect would not, in fact, be worth while—for the tanker space released or for the fuel freed for other and more important purposes.

Co-operative Wholesale Trade

The directors of the Co-operative Wholesale Society are recommending an interim dividend of 4d. in the pound on society purchases for the half-year ended July 12th, and an additional dividend of 3d. in the pound on purchases from their own productive works. The totals of these purchases were £67,633,901 and £22,115,426 respectively. The turnover was 3½ per cent below that of the corresponding six months of 1940. Sales in the grocery department amounted to £47,943,745, but the average price level was 6 per cent higher than in 1940. The effect of the Limitation of Supplies Order and the purchase tax was shown in reductions of 19 per cent in drapery; 28 per cent in men's wear; and 34 per cent in furnishing and hardware. There has been a reduction in members' registrations for rationed goods. Sales to the Ministry of Supply during the half-year amounted to £2,565,426, and sales of the Contracts and Export Department to £1,810,365. The value of the output of boots and shoes rose by 3½ per cent to £1,140,074, but the number of pairs was 13 per cent lower. Tobacco sales were 20 per cent higher at £1,095,645, but the quantity of tobacco was 2 per cent lower and that of cigarettes 8 per cent lower.

International Sugar Control

The international sugar agreement of 1937, which is due to expire on August 31, 1942, is likely to be renewed until the end of the war. The matter was first raised at the International Sugar Council's meeting of January 6, 1941, when all delegations present were unanimously in favour of continuing the agreement. Discussions in preparation of a formal meeting for the adoption of a resolution extending the agreement were recently held in London on the initiative of the British Government. The sugar agreement united all leading sugar producing and consuming areas in an effort to prevent a further contraction of the free market. It provided for export quotas for each producing area and for the control of stocks in the participating countries. In addition, it imposed limits to further extensions of production in certain areas and stopped the introduction of new

measures limiting imports into a number of consuming countries. Before the war, the twenty-one signatory countries included Great Britain, the United States and Russia, as well as Germany and some of the German-occupied countries. The full operation of the scheme came to an end on the outbreak of war, although formal decisions were taken regarding the export quotas for the first two war seasons. The endeavour of the British Government to secure the continuance of the agreement is part of a more general policy, reflected in the prolongation of the international tin, tea and rubber control schemes, in spite of the fact that restriction of production has virtually ceased. Its basis is the desire to retain the collaboration of the Governments of the chief producing areas—and in the case of sugar also of the leading consuming countries—as this may prove of assistance in framing a post-war policy. The countries adhering to the sugar agreement have been working on a post-war reconstruction plan for the international sugar trade since last January. This work is done by a special sub-committee of the International Sugar Council under the chairmanship of Dr G. H. C. Hart, the chief Dutch delegate. The committee includes representatives of Australia, Cuba, the Dominican Republic, Holland, the United States and Great Britain.

TUC Membership

The Ministry of Labour Gazette for September gives an analysis of the Trades Union Congress membership for the last two years. The figures are somewhat smaller than those of trade union membership as a whole, since not all trade unions are affiliated to the T.U.C.

	1940		1941	
	No. of Members at end of Year	No. of Members at end of Year	No. of Members at end of Year	No. of Members at end of Year
Agriculture, horticulture, etc.	1	10	1	6
Coal mining	5	115	5	115
Pottery and glass	5	4	5	115
Metals, machines, etc.	46	102	47	100
Textile	28	106	27	108
Clothing (fur, boots and shoes)	8	30	8	30
Paper, printing, etc.	14	34	14	35
Building, furniture, woodwork, etc.	17	34	17	35
Railway service	3	25	3	25
Water transport	2	10	2	13
Other transport and general labour	7	117	7	113
Commerce and distribution	6	28	6	30
Banking and insurance	6	18	6	16
Local government	6	25	6	21
Entertainments and sport	4	4	4	3
All other groups	18	21	18	15
Totals	176	681	176	681

* Branch Associations sending separate delegates have not been counted as separate organisations.

The changes are such as might have been expected, and reflect, in the main, the changes in the distribution of employment which have accompanied the intensification of the war effort. Thus the most marked increases in the membership of affiliated unions are shown by the metal industries, textiles and clothing, and local government, while declines are largest in pottery and glass, and entertainments and sport. It is, however, rather surprising that there should have been substantial increases in the membership of the railway and commercial groups, and the decline in building membership suggests that the restriction on private building may be more than offsetting the tremendous increase in Government building activity. These figures must, however, be interpreted with caution until the complete figures of all trade union membership are available.

COMMODITY AND INDUSTRY NEWS

THERE was a sudden sharp rise in wheat prices on October 3rd, which is thought to be due to inquiries on Russian account. West St. John/Halifax No. 1 was quoted at 33s. per qr. on October 3rd, compared with 31s. 10d. on the previous day. This caused a rise in *The Economist* Sensitive Index (1935 = 100) crops figure from 113.6 to 114.6 and from 139.1 to 139.8 in the complete index. Tin

prices have been stable; standard cash only once rose above £265-265 ss. a ton during the week, when on Friday, October 3rd, it was 5s. more. Three months tin fluctuated within narrow margins during the week and on Wednesday was £259 15s.-£260 per ton, compared with £260 5s.-15s. a week earlier.

Warehouse Charges Control. — In

future the Board of Trade, through the Control of Factory and Storage Premises and the Central Price Regulation Committee will exercise a general control over warehouse rates and charges, other than those of statutory bodies. It is intended where possible to fix rates by agreement between the Control and the associations and federations of wharfingers and ware-

(Continued on page 458)

COMPANY MEETINGS

LEVER BROTHERS AND UNILEVER, LIMITED

POSITION OF DUTCH COMPANY

SIR F. D'ARCY COOPER'S STATEMENT

The annual general meeting of the shareholders of Lever Brothers and Unilever, Limited, was held, on the 9th instant, in the Board Room, Unilever House, London, E.C.4.

Sir F. D'Arcy Cooper, Bart., presided.

The notice convening the meeting and the report of the auditors having been read,

The chairman suggested that the directors' report for the year ended December 31, 1940, which had been issued to the shareholders, should be taken as read, and the shareholders agreed.

PROVISION FOR CONTINGENCIES

The Chairman said: My Lord, Ladies and Gentlemen,—I have nothing to add to the report of the directors, which has now been in your hands for several days, but I would stress that it has been necessary to make provision out of our profits against certain contingencies in connection with the Dutch company and its shareholders which are mentioned in the report.

It must be understood, of course—and I emphasise this point—that the provision we are making in connection with the Dutch company and its shareholders can only be carried into effect if and when the law of this country allows, and such provision must be understood as creating no rights or benefits which are not subject to that overriding contingency.

If there are any questions which any of the shareholders wish to ask I shall endeavour to reply before the motion for the adoption of the report and accounts is put to the meeting.

I now move: "That the directors' report and statement of accounts for the year to December 31, 1940, now submitted be received and adopted," and I ask Lord Leverhulme to second the motion.

LORD LEVERHULME ON CHAIRMAN'S SERVICES TO INDUSTRY

In seconding the motion, Lord Leverhulme, the Governor, said: Mr. Chairman, Ladies and Gentlemen,—It is customary to make the seconding of this resolution quite a formal matter. I would like, however, to make an exception to this rule on this occasion because I am sure it would be your wish that expression should be given to the pleasure we all felt—shareholders, directors and staff alike—when the great services of our chairman to industry and latterly to the Government were recognised by the conferment upon him by His Majesty of a Baronetcy. (Applause.)

Sir D'Arcy has been giving his services to the Board of Trade since the beginning of the war and although it has not been possible for him, in these circumstances, to take an active part in the direction of our business, he continues, of course, to take the greatest possible interest in it. We warmly congratulate him and are delighted that he is able to be in his accustomed place to-day.

I have pleasure in seconding the resolution. After questions had been answered, the motion was put to the meeting and carried unanimously.

THE DIVIDENDS

A dividend of 5 per cent for the year 1940 on the ordinary stock payable on October 14, 1941, and a dividend of 5 per cent for the year 1940 on the preferential certificates outstanding under the co-partnership trust were declared; the retiring directors were re-elected, and the auditors, Messrs. Cooper Brothers and Co. and Messrs. Price, Waterhouse and Co., were re-appointed.

The proceedings terminated with a vote of thanks to the chairman, directors and all branches of the staff.

Every year many hundreds of Companies publish Reports of their Annual General Meetings in *The Economist*, thereby reaching thousands of investors in the quiet of their own homes. In time of war the value of this practice is greatly enhanced because *The Economist* provides valuable information which is not otherwise available to investors, who therefore read it more carefully than ever. Full particulars of the charges for inserting these reports may be obtained on application to The Reporting Manager, *The Economist*, Brettenham House, Lancaster Place, W.C.2.

RANSOME AND MARLES BEARING COMPANY, LIMITED

TAXATION BURDENS

SIR A. BENNETT'S REVIEW

The 25th annual general meeting of Ransome and Marles Bearing Company, Limited, was held at Newark-on-Trent, on the 3rd instant, Sir Albert Bennett, Bt., chairman of the company, presiding.

Sir Albert Bennett, in moving the adoption of the report and accounts, said: This year I propose to confine my remarks to the balance-sheet and accounts. Excess profits tax at 100 per cent was in operation during the whole of the year under review. As I pointed out to you last year, the effect of this is to standardise our profits regardless of output, and this standardised figure is naturally affected by the rate of income-tax. During the year this was increased from 8s. 6d. to 10s., and largely in consequence our profits showed a reduction from £163,038 to £113,295. From this a sum of £10,000 has had to be allocated to provide for additional income-tax on profits made to June 30, 1940, and a further sum of £27,000 for war damage contribution. The real amount retainable is, therefore, reduced to £76,000.

THE DIVIDEND

I referred last year to the increase in the amount required for working capital. This increase has continued. If you will refer to the balance-sheet you will observe that on June 30th we had £937,000 tied up in stocks and sundry debtors against £711,000 last year. Cash at bank, therefore, shows a reduction from £237,035 to £99,929. Our current liabilities at the same date figure at £478,000, of which no less than £293,000 represents provision for taxation on profits to June 30, 1941. These financial displacements have given the board much concern in deciding the question of the final dividend, but after a careful review of the company's position we feel justified in recommending 11 per cent, less tax, which will absorb £38,500. With the interim dividend of 9 per cent paid on March 15th, this makes 20 per cent for the year. No special appropriations are recommended other than those already referred to. Depreciation has been fully provided for in the year's accounts, and the book value of our plant now represents only a small proportion of its replacement value. Our general reserve remains at £350,000, and we have a special depreciation reserve which we made last year of £35,000.

THE OUTLOOK

As regards future prospects, these depend so largely on elements beyond our control that it would serve no useful purpose if I attempted to make a forecast. The policy of our company from its inception 24 years ago has always been a conservative one with regard to the proportion of its profits distributed in dividends, and the balance has been used for the development of a constantly growing industry. This has proved a great asset to the country in the war emergency and it seems, to say the least, anomalous that this development should be arrested by crippling taxation at a time when increased production is a paramount necessity. We are promised a return of a proportion of excess profits tax after the war, but in my opinion first things should come first. We want to continue in a position where we can pull our full weight while the war is on.

Before concluding I want to express on my behalf and that of my co-directors our appreciation of the work of our general managers, staff and workpeople during what has proved a difficult year. I should like to record our special appreciation of the work of the voluntary members of our A.R.P. organisation, who have carried out their onerous duties in an exemplary manner.

I referred last year to the introduction of a War Savings Group at our works, and am very pleased indeed to report that this has made great progress during the past year and that a very substantial sum has been raised by our staff and workpeople by regular contributions, which are still increasing.

The report and accounts were unanimously adopted. The retiring director, Mr. F. W. Baker, was duly re-elected, as were also the auditors, Messrs. Tansley Witt and Co., C.A.

KUALA MUDA RUBBER ESTATES, LIMITED

BURDEN OF E.P.T.

The 16th annual general meeting of Kuala Muda Rubber Estates, Limited, was held, on the 8th instant, in London.

Sir Francis M. Voules, C.B.E. (the chairman), said that the profit for the year under review amounted to £70,245, and the available balance after transfers to reserves was £25,373, out of which they recommended a dividend of 6 per cent, less tax.

They had made provision of £25,000 for Excess Profits Tax. In addition they had to pay by way of income-tax approximately £18,000, making £43,000 payable in taxation out of their total profits of £70,200.

The thanks of rubber producers were due to the Rubber Growers' Association for the representations they had made to the Chancellor of the Exchequer and the Inland Revenue Authorities that rubber should be included within the category of wasting assets. The refusal of the Treasury to include rubber in the list of commodities declared admissible for E.P.T. allowance as wasting assets was inexplicable. It was essential that a reasonable reserve should be accumulated for the amortization of the estates and such a reserve should be allowed as a deduction from profits before calculating their liability for income-tax. The figures showed that the lion's share of the profits was taken by the Government. The contribution of rubber producers to the war effort might be borne with greater satisfaction were it not for the fact that they were mortgaging their future by the efforts they were called upon to make.

He unhesitatingly contended that additional relief to rubber producers was long overdue and, in view of the valuable contribution of the industry to the war effort, the lack of fair dealing conditions towards producers showed a lamentable lack of foresight on the part of the authorities. He was well aware that if they

were working under Nazi rule their position would be still worse, and no sacrifice was too great to save them from such a fate. Even so, he respectfully suggested that it was not in accord with British tradition that a particular body of taxpayers should be selected for such unfavourable treatment as was meted out to rubber producers.

The report was unanimously adopted.

BRITISH BORNEO TIMBER COMPANY, LIMITED

The 21st annual general meeting of the British Borneo Timber Company, Limited, was held, on the 7th instant, in London.

Sir Edgar J. Holberton, C.B.E., the chairman, presided.

The following is an extract from the statement of the Chairman circulated with the report and accounts:—Notwithstanding all the difficulties of the year under review, the company's gross earnings were higher by £13,000 than in the preceding year, so that we had a credit balance in the working account of £44,367. After providing £19,000 for taxation, together with the usual expenditure in London and the year's charge for depreciation, the balance of the profit and loss account is £18,053. The board decided to pay an interim dividend—which is to be the total dividend for the year—at the rate of 8 per cent., which amounted to £14,400.

The British North Borneo (Chartered) Company receive, in terms of our concession, a sum of £456 out of the year's earnings, and we have also considered it advisable to provide £3,000 to meet our liability for income-tax. There then remains a balance of £10,982 to carry forward to next year. The company's position as disclosed in the balance-sheet you will regard as satisfactory.

The marketing of our production, both of rough and sawn timber, last year and to date this year has been maintained at a level which we feel may be regarded as not unsatisfactory.

The report and the accounts were adopted.

(Continued from page 456)

housekeepers, failing which, the Board will fix regionally the rates and margins which may be levied by warehouse undertakings. No increase on existing rates may be made without the sanction of the Board of Trade.

Livestock Export Group.—A Livestock Export Group has been formed with the support of the Industrial and Export Council of the Board of Trade. Its immediate object is to maintain and encourage such exports of stud livestock as are consistent with present circumstances, to meet demand from the United States, South America and the Dominions. Britain's position as "the stud-farm of the world" has always been of great importance. At the end of the war the group may have the task of assisting the restocking of European countries which are being depleted of livestock now.

Jute Control.—The Ministry of Supply has made the Control of Jute (No. 3) Order, which came into force on October 6th. The Order consolidates existing jute Orders and subjects to licensing control dealings abroad. The Jute Controller will be responsible for all purchases of raw jute for use in this country, and no further licences for purchase on trade account will be granted.

Cotton Market.—Expansion in fresh business is still somewhat checked by the strong disposition of producers to limit their commitments pending the removal of uncertainties which exist. Spinners of yarn are not likely to sell more freely until some decision is reached with regard to margins. This question is now being considered by the Controller, and a deputation of spinning employers has met him. Considerable apprehension exists as to the effect of cancelling all twelve months' old yarn and cloth contracts. Certain trade organisations are obtaining

legal advice on the recent Order. Spinners are bound to benefit to a considerable extent but losses must be experienced in some quarters. Some of the delay in completing these old contracts has been due to Control action. The yarn position does not get any easier and all kinds and qualities have been difficult to buy.

Lancashire Cotton Corporation.—The directors of the Lancashire Cotton Corporation, Ltd., seem determined to continue their expansionist policy, and this week it has been announced that the Majestic Mill, Oldham, has been acquired. The mill was built in 1906 and contains 45,000 ring spindles and 50,000 mule spindles. This is the fourth acquisition by the Corporation during the last few months, the previous purchases being the Dawn Mill, Shaw, the Malta Mill, Middleton Junction, and Coppull Ring Spinning Mills, Chorley. It is significant that all these mills are at present closed under the concentration of production scheme. The cost of building and machinery has considerably increased during the last couple of years and all properties taken over by the Corporation are sound and in good condition and should be a valuable asset when trading conditions become more normal.

Poultry and Rabbit Distribution.—The Ministry of Food is seeking means whereby the most equitable wholesale distribution of imported poultry and rabbit supplies may be achieved. The Ministry is asking those concerned, by means of a questionnaire, to submit particulars of first-hand purchases of imported poultry and rabbits made during 1938. This may mean that a scheme of quotas, based on 1938 imports, is being considered.

Increased Fats Ration.—The supply position of edible oils is sufficiently good to permit an increase in the fats ration

from 8 oz. to 10 oz. a week per head from November 17th. A change has been made, in that 3 oz. cooking fat must be taken out as such, and margarine can no longer be substituted for it. The remaining 7 oz. is in margarine and butter, with a maximum allowance of 2 oz. butter, though the whole 7 oz. may be margarine. It is understood that the 8 oz. fats ration approximates to half a million tons per annum, and practically all the raw material is imported. The vegetable and marine oils position is equal to manufacturers' requirements to meet the increased demand.

offensives in the Mediterranean or farther west are possible, now is the time to mount them; or to reiterate that, in this crisis, waste and lack-logic in the use of men and ships will be more than ever perilous. But it would be more than irresponsibility and near to sabotage to base a political campaign upon the plainly false assumption that these crucial truths are hidden from Ministerial eyes, however shortsighted some may so often have seemed. Many people must share Mr Shinwell's impatience with Lord Halifax's public utterances. But "abuse" is seldom helpful; and it is a sore defect in the scattered opposition that, whenever the war moves to a crisis, they seek a Chamberlain to unseat.

No man, and least of all Mr Churchill, who spared no grim item in his latest statement of Hitler's strength, can fail to see the very real perils that would spring from the defeat or paralysis of Russia. It is not true to say that the fall of Russia would mean, inexorably, the fall of Britain. But victory in the east would render Hitler harder to defeat, even in years, than most people have yet been willing to admit. The possibility of frustration must be squarely faced. But it would be unworthy panic to plunge into expeditions without the equipment or the vessels to nourish them or some earnest of an effective outcome. The British and American Governments have been convinced by their envoys that Russia will fight on whatever results the astounding strength and stamina of the German invasion may achieve. The gathering mobilisation of the United States is the guarantee of eventual victory.

Frustration can only come from a failure to make the efforts and the sacrifices proclaimed by Mr Churchill when he spoke of aid to Russia. The critics have this duty to perform: to arraign every remnant of half-heart in

the nation's work; to call for a siege way of life; to inveigh against every obstacle of interest, prejudice, habit, tradition, stupidity or caste which may still block the dedication of this country's all to the struggle for world survival; and to lend their experience and their expertness to the problems of production and distribution, organisation, rationalisation and allocation by which willingness and resources are transmitted into military power. There is much to do still to awaken England, to inspire Ministers with the swift ruthlessness which by its absence has marred even the best of their work for so long, and to advise them in the still unfamiliar details of total war economy.

No apology should be needed for a call to dedication. This is a sophisticated generation of Englishmen. But they will only hold their freedom, and the world's, if they can outmatch the Nazi frenzy by their own will. It is, perhaps, curious that aid to Russia has called out more resolution—and certainly more resolutions—than aid to England itself ever did, except in the weeks after Dunkirk. It is a sound instinct that sees in Russian resistance a golden chance; and no antique schedules should impede the dispatch of every possible weapon to the east. All aid to Russia then must be without reserve. But (as a Note on page 467 shows from the distances) the way to Russia is long and difficult and it is only by the raising and sustaining of their labours, by all citizens and not simply by those at the bench, that England itself, no less than Russia, can possibly be saved. Mr Bevin spoke frankly a week ago of "the mess in which we find ourselves in this country"; and politicians and pressmen who use the urgency of the hour merely to set up cock-shies are a plain nuisance.

Economics on the Axis

THE Italians are entering the second winter of the war in an atmosphere of unrelieved hardship and gloom. All the principal foodstuffs—bread, *pasta*, olive oil, cheese, vegetables—are severely rationed. Meat is not seen for months at a time. Tea and coffee disappeared a year ago. So drastic is the shortage of fuel that supplies this winter are to be only a third of last winter's unsatisfactory ration—which was sufficient for 120 days' heating only. The cost of living is still rising and the system of price control introduced in the summer of 1940 has proved farcical. Two decades of Fascism have developed the practice of bribery and corruption to so fine an art that there are more black than legal markets.

Some observers have attributed this universal dearth to the marauding policy of Italy's Axis partner. Actually, it is the inevitable consequence of the Allied blockade. The Duce's plunge into war automatically deprived Italy of 44 per cent of its imports and 55 per cent of its export markets. At the same time, its rich tourist industry and the flow of remittances from Italian emigrants overseas—both important items in establishing a balance of payments—were cut off. What every prophet of Italy's position in the war prophesied would happen began to happen—economic strangulation. The Italians accepted the risk with astonishing irresponsibility, entered the war with only marginal reserves—much of the material received during non- and pre-belligerency had been passed on to Germany—and during the first months of the conflict took no steps to deal with a situation which was bound, within a year, to become alarming. This light-heartedness sprang, of course, from the false calculation of a short war.

By the autumn of 1940, hopes of a rapid victory were fading and the Italians set to find a solution for their two most pressing problems—the provision of essential raw materials and foodstuffs, hitherto imported from overseas; and the securing of new export markets to replace the markets lost through the blockade. The area of search

was a restricted one—German Europe and as much of North Africa and the Levant as could be reached, unmolested by British submarines. As British strength increased in the Mediterranean, the field became virtually limited to German Europe; and it remains to be seen whether the German conquest of the Balkans and Axis control of the Aegean has served to offset the Allies' growing mastery in the Levant.

During the autumn and winter of 1940, the Italians concluded trade agreements with most of the countries in Europe. Under them, foodstuffs, timber, coal, iron and steel were to be exchanged against Italian fruit, vegetables, cheese, textiles, paper and Italy's few minerals, pyrites, sulphur, mercury and marble. It cannot be said that Italy's position was in any way restored by these new exchanges. Even if the agreements had functioned smoothly only a portion of Italy's needs would have been covered. Europe can only provide limited supplies of copper, nickel, mica, mineral oil, timber and foodstuffs. It can provide no cotton, wool, hides, jute, rubber, coffee or tea.

Nor did the agreements ever function smoothly. At every turn, the Italians found themselves in hopelessly unequal competition with their German ally. The agreements with Holland, Belgium, Denmark and Norway broke down because, once all Germany's claims on these countries had been satisfied, there was nothing left for Italy. The agreements with Sweden, Bulgaria and Roumania broke down because Italy had no goods to offer which could compete with German supplies. The Roumanians were unwilling to exchange their oil for Italian textiles and paper, when the Germans were offering the same goods but of a much better quality—with the result that, although the amount of oil purchased by Italy from Roumania is quite insufficient to meet Italian needs, Italy is heavily in Roumania's debt and has no exports the Roumanians will accept to clear the balance. A certain amount of trade has been carried on successfully with Spain; but, here again, the Nazis are com-

peting for the same line of Spanish exports—skins, turpentine, tunny fish, tinned fish—and the prices are forced up against the Italians. Even in their dealings with defeated France, the Italians are dogged by German monopolies and counterclaims. The deliveries of scrap from Vichy France are only 15 per cent of the stipulated amount, for the Germans have been taking over large supplies of French rolling stock and railway material. Similarly, in North Africa, the Italians cannot get phosphates, for they are already earmarked for German use.

This constant clash between Italian and German interests is not fortuitous. The plain truth is that there is no room in German Europe for the type of economy that Fascist Italy has been trying to build up. It is an industrialised economy, precariously based upon imported raw materials. It belongs, therefore, to the German-coined category of "fictitious industrialisation"—a category which covers the attempts of any primary producer in Europe to advance to the stage of industrial production. In the new colonial system established by the Nazis, Italy has a place only as a supplier of foodstuffs, a miner of certain local raw materials and an exporter of labour on a grand scale. Ever since the rise of heavy industry killed Italy's vigorous eighteenth-century industrialism, and the collapse of Genoa and Venice as the great merchants of the Levant ruined their lively export trade, the fundamental problem has been to compensate the disproportion between Italy's scanty material resources and plentiful manpower. A German victory would mean the end of the experiment in industrialisation and relative local sufficiency. It would mean a return to the mass emigration solution of the late nineteenth and early twentieth century, with Germany taking the place of the United States as the emigrants' destination. In the peak year of 1913, 872,000 Italians entered the United States. In 1941, some 500,000 Italian workmen went to work in the Reich. Next year, the figure will be even higher.

Germany's only interest in Italy's problems lies in keeping the stricken ally more or less upright on the field of battle. In Germany's long-term programme, Italy has only a Balkan status. For the time, however, the strategic importance to Germany of Italy's central position in the Mediterranean, and the strong need for Italian manpower, compel the Nazis to support the "fictitious" Italian economy. The support entails some sacrifice to the Nazis, and German press comments betray from time to time the extent to which they find their Axis partner an uncommon nuisance. The most recent economic arrangement between the two partners was concluded in January this year. Under it, goods were to be exchanged to the value of 7,600 million lire. Germany agreed to maintain its annual delivery of 12 million tons of coal and to double the deliveries of iron and steel; all the materials necessary to maintain the

armament factories in North Italy and the naval and mercantile shipbuilding yards were to be provided on a generous scale. Italy would meet this with foodstuffs, fruit and a few minerals. Thus, while the Allied blockade is the fundamental cause of Italian shortages, the increased rationing of foodstuffs in the course of 1941 is directly connected with the greatly increased supplies of vegetables, cheese and fruit which are going north.

Italy could no more fulfil its bargain with Germany than with any other of its trade partners. The country could not deliver the goods. In February, it was therefore agreed that "military supplies"—an elastic term—would be exchanged without regard to any equilibrium of exchange. In other words, Germany would supply Italy, even if Italy could not produce equivalent exports. Finally, in June, the agreement was modified still further. Now the partner which supplies the military materials pays for them. This means a free gift of war equipment from Germany to Italy, while Italy feeds at its expense—and at the expense of its people—the German troops stationed in Italy and Libya.

The Germans accept the burden of their partner's inadequacy and improvidence and in return exercise a complete control over the Italian economy. With a certain wry humour, they even claim—with one eye on *Lease and Lend*—that (the quotation is from the *Frankfurter Zeitung*)

there is no parallel to the example of such . . . profound interdependence in vital activities as that given by the military and war economic co-operation between Germany and Italy. Fundamental principles, especially in economic matters, have been adopted and applied at joint conferences—the main principle being that raw materials and labour should always be used where the greatest possible use could be made of it; and these principles are something new in the relations between two nations.

This "main principle" is indeed one of the lessons the war has thrust upon the nations which are resisting Nazism. Nevertheless, there is by no means an exact parallel between the Axis "Lease-Lend" and the new arrangements between the British Empire, the USSR and the United States, all three partners in which are highly industrialised, materially wealthy powers. All command vast reserves of raw materials and manpower. Their agreements, freely entered upon, may indeed be the basis of a new era in economic collaboration, a new type of "being mixed up together." There is nothing of this in Italy's relations with Germany. If Germany wins, the entire Italian economy will be mortgaged north of the Brenner, and the mushroom growth of Italian industry will be systematically destroyed. Then Italian "raw materials and labour" will surely "be used where the greatest possible use" can be made of them—and that will be within the Reich.

Schools and Schooling

UNDER its new President, Mr Butler, the Board of Education is considering post-war problems; and last week in the Commons Mr Butler stated that he attached great importance to a small committee, just set up, with Sir Cyril Norwood as chairman, to suggest changes in secondary school curricula and examinations. Much more than considerations of pedagogy are involved in these technical problems of schooling. Whenever the problems of post-war reconstruction are discussed, education is to be found in the forefront. This is only natural in a democracy, which knows itself to be imperfect but nevertheless believes in redemption by the will of the people. Education is not only an end in itself, but also the means to many other ends; it is the gateway through which any durable reconstruction of society must pass. This being so, it is only to be expected that a number of different and distinct threads are to be found twisted together in the single skein, and current discussion of education shows the

danger that confusion may result. At the moment it is the place of religious education that is perhaps being debated most in public. But even this old and vital issue might resolve itself if the true texture of a liberal and democratic education could be plainly seen; and it is an essential preliminary to clear thought that the main strands in the pattern should be disentangled.

Apart from an endless number of subsidiary questions, there are three educational controversies of sufficient moment to attract the attention of the public outside the specialist ranks. The first can be called the institutional problem—the question of who should go to school and to what type of school. This controversy revolves round the school-leaving age. There is fairly substantial agreement on all sides on the desirability of raising the leaving age to 15 as soon as possible. But beyond the age of 15, there is no agreement. To one body of thought, it is self-evident that the main line of educational progress lies in extending the span of schooling. Compulsory education

started with primary schooling for all; when the age has been raised to 15, it will comprehend primary and post-primary schooling for all; the next step is obviously to move to secondary schooling for all, and to push the leaving age up to 18. But this doctrine is opposed, not merely by the natural conservatives and the budget-parers, but also by a respectable body of educational opinion, of which Sir Richard Livingstone's recent book* may be quoted as an example. Sir Richard believes that both the range and the volume of education that can be absorbed by a child without experience of the world is very restricted; indeed, he gives full approval only to mathematics, languages and science as subjects for children, with a first introduction to literature and history. It would not be far from Sir Richard's thought to say that the main effort in the immediate future should be devoted to a great expansion and inspiration of adult education, particularly in the shape of the residential college for working adults. There is a great deal of effect in Sir Richard's comparison between the United States, where schooling to 16 is universal and to 18 general, and Denmark, where the leaving age is much lower, but there is a well-developed system of People's High Schools for adults. Few will wish to quarrel with his judgment that the Danes are a better educated people than the Americans.

It would, of course, be vain to turn the child completely loose from the educational tie at the age of 15 and expect him to return to adult schooling later in life. There is sound sense as well as metaphor in the comparison of education with a torch that has to be kept continuously alight. The "adult" schools fully recognise this, and they insist of the necessity for compulsory part-time education to the age of 18 as the first stage in a synthesis of education and experience which, they hope, will become continuous throughout the rest of life. Here is another point of agreement on which immediate action could be taken. But, while the "secondary education for all" party regards part-time schooling as merely a stepping-stone on the way to their objective, the "adult" school regard it as a final resting place for the education of children. This is a plain controversy that will need to be resolved. There can be little doubt that the weight of public opinion is behind the "secondary education for all" solution; but this may be little more than the unreflecting continuance of the momentum that has carried popular education along from the 70s to the present day. There is certainly little point in keeping children at school out of pure sentimentalism or snobbery, if they and the community are not to derive any benefit from the extra years.

It is at this point that the institutional controversy links up with the curricular controversy. What should be taught? The opposing parties here line up under the "vocational" and the "intellectual" banners. The main brunt of the vocational attack lies against the traditional curriculum of English education, with its heavy emphasis on literary and linguistic studies. Of what value or interest is it (they ask) to a boy or girl, who is to spend his or her whole life in the ranks of wage-earning labour or of working-class housewives, to devote the years of schooling to Latin, French and English, with some mathematics of a purely mechanical kind and a little very elementary and very theoretical science? At the best (they say) it produces a nation of clerks; at the worst, a nation that has retained nothing whatever from its school-days. It would be far better to let education take the place of the defunct apprenticeship and use it to teach children a useful trade (including, of course, the trade of home-building). This is, of course, an exaggerated statement of the case; in its more moderate forms it has very impressive backing. The answer of the "intellectuals" is that to assimilate education to earning is to deny its very purpose and to abdicate completely from the responsibility of trying to give the ordinary man and woman an insight into the nature of the world of facts

and ideas outside his or her own experience. A nation of garage-hands would be even worse than a nation of clerks. The purpose of education is not to be "useful," but to train the mind by means of an intellectual discipline. Moreover, there is a taint of class distinction in the vocational approach; it is significant that the educational system that has been imposed by the Nazis on the Poles is severely vocational. But to keep children learning Latin out of snobbery is even more foolish than to keep them at school only out of snobbery.

It is not for the layman to dictate the solution of this controversy. But the best modern educational thought seems to be finding its own solution in a compromise. The vocational principle is followed in allowing a wide variety of curricula and allowing the pupil to select the one that comes closest to his own interests, vocational or otherwise. But, within the chosen curriculum, the effect is not to impart a few knacks and crafts, which could be learnt very much more quickly in the workshop, but to look for a real intellectual discipline—in biology as much as in Latin, in dynamics as much as in algebra. This was the doctrine of Sanderson of Oundle, and it is the doctrine of the Spens Report. It avoids the great defect of the "intellectual discipline" school—that so many intellects die under the discipline. If they come to it as volunteers, not as conscripts, the survival rate will be far higher.

Finally, and of far the greatest importance to the nation as a community, is what may be called the social controversy—the problem of the public schools. This has nothing to do with curricular controversy or educational method. The public schools are not remarkable because their curricula are different, or because their standard of teaching is higher (though it may well be), or for any attitude that they take up on the vocational controversy. The importance of the public schools is that they are the main entrance to a special caste in British national life. Their strength is their weakness; they train leaders and endow them with the breadth of outlook and with the peculiar combination of modesty and self-assurance that have made the British Empire what it is. But the price the community pays for these schools of leadership is that the field for selection of leaders is unduly narrowed. It is an undeniable fact that the vast majority of the leaders in almost every walk of life in this country are drawn from a class which includes barely one-twentieth of the population and which is not selected on a basis of ability. This cannot be an efficient use of the native talent of the country. The United Kingdom, with 48 million inhabitants, is being run by such brains as can be found in a population of two millions plus the few exceptional individuals who crash the barriers. The damage is done, not by the advantage conferred on the few, but by the disadvantage—the self-conscious lack of confidence—of the many.

In the competitive world of to-day, Great Britain cannot afford to continue with a system that is so wasteful of human ability. It does not follow that the solution is to abolish the public schools; on the contrary, the democratic world's need of leadership is so great that any institutions which know how to breed it should be preserved. But some means must be found for ending the disastrous cleavage into two nations that at present exists because of the social status of a few special schools. If there is to be a form of education that confers privileges, it should not merely be made accessible to the best human material; it should be confined to them.

Whenever dictators have hoisted themselves into the saddle of a modern literate nation, they have paid early and unremitting attention to education. Democracies cannot afford to be less solicitous. The dictators use education merely to keep their peoples docile; their purpose is negative and the more easily attained for that. But a democracy needs the positive aid of the educator—in self-defence and in defence of the middle way of life and livelihood and government that the world will need when the war, which has sprung from the intransigence and arrogance of extreme and less educated creeds, is over. These discussions in England may only be of ways and means, but they go to the roots of the future of free society.

NOTES OF THE WEEK

Battle for Moscow

The fourth German offensive has so far passed through two phases. The first drive took the shape of a three-pronged attack towards Moscow, from Toropets in the north towards Rzhev, to Vyasma in the centre, and from the south through Bryansk to Orel. In this first phase, the attack developed most vigorously in the southern sector of the central Moscow front, and the German advance guard did succeed in reaching the outer defences of Moscow in the Tula sector. Here, however, they were checked. The lightning advance naturally enveloped many of Marshal Timoshenko's fighting units, and the fierceness of their resistance is illustrated by the fact that Vyasma and Bryansk were only occupied by the Germans several days after the tide of their advance had carried them well beyond these towns. At the week-end came a pause for regrouping, and in the second phase of the offensive the weight of the attack seems to have been transferred to the northern and central sectors of the Moscow front. In the Rzhev sector, the latest German and Russian communiqués agree that fighting is in progress round Kalinin, an extremely important strategic point where the Leningrad-Moscow railway crosses the upper reaches of the Volga. This sudden advance suggested that the Germans might have decided to skirt the forest belt which lies between them and Moscow in the central and southern sectors, and attempt a drive on the city from the north-west—a possibility borne out by reports that many of Von Leeb's men are being moved from the Leningrad front. However, the heaviest blow appears to have fallen in the central zone. Advancing from Vyasma, the Germans have broken through Moscow's outer defence ring at one point—probably at Mozhaisk, and the official Russian communiqué admits "a change for the worse." Nor is the news from the south reassuring. The Russians admit the evacuation of Mariupol, and the need to reinforce the Moscow front may well have weakened the line of the Don. Germany's obvious strategy here would be to strike straight for Astrakhan, leaving the Caucasus for a spring campaign.

A War of Reserves

The war in the east may well be, as a Russian general described it, a "war of reserves." Unfortunately, it is almost impossible to assess what remains to both belligerents after the titanic struggles of the last four months. In equipment, Germany is certainly in the stronger position. The whole armament industry of Europe is working for the *Wehrmacht*, whereas in Russia output in the Ukraine must have fallen considerably, and not even the most ingrained optimist will be inclined to think that Allied help can make the gaps good for a measurable time. An official Washington statement has fixed next spring as the period for the "maximum flow of aid." In manpower, the Russians have greater reserves if the German nation alone is considered. But one of the remarkable features of the campaign has been the extent to which the manpower of Europe as a whole is being welded into the framework of the German war machine. It is not only a question of direct fighting—a service rendered at heavy cost by the Roumanians and the Hungarians in the most southerly sector. The Italian labour corps, the prisoners of war, the munition workers in France, Poland and the Protectorate are cushioning the German attack and setting free proved German material for the front line. This vast reserve of subject manpower explains in part the ability of the Germans to mount the heaviest offensive of all at this stage in the campaign. It is also explained by their systematic transport of war material to each forward zone in the lulls between the intense fighting. The reserves which were mustered in Poland in the first weeks are now in and around Smolensk.

Routes to Russia

Supplies can reach the Soviet Union directly by the ports of Murmansk and Archangel, in the north, and Vladivostok in the Far East; and the occupation of Persia has opened an indirect supply line. Britain's nearest and easiest approach is via Murmansk and Archangel. The

distance from London or Hull to Murmansk, the ice-free port on the Barents Sea, is about 1,700 miles, and to Archangel on the White Sea some 1,950 miles. Archangel freezes up in the winter months, but there is reason to believe that powerful Russian icebreakers may be able to keep the port open for the greater part of the winter. This is of vital importance, since the railway from Murmansk to Leningrad has been cut by the enemy, and supplies reaching Murmansk can only be used for local needs. Munitions, weapons and materials unloaded at Archangel must travel roughly 650 miles to Moscow. The distance by rail from Archangel to Leningrad is 750 miles, which compares with 780 miles by rail from Murmansk to Leningrad. From Britain to Rostov-on-Don, the gateway to the Caucasus, by the northern route is 3,500 miles, of which 1,300 miles are by rail from Archangel; and the distance from Archangel to Sverdlovsk in the industrial district of the Urals is 1,200 miles. The supply route to Russia across Persia is much longer and more difficult. The sea journey from Liverpool through the Mediterranean to the Persian port of Bandar Shapur is roughly 6,500 miles; from there supplies must be sent roughly 600 miles across Persia to the Caspian Sea port of Bandar Shah; another 380 miles covers the distance to the port of Baku; and by rail from Baku to Rostov-on-Don is another 780 miles. Thus the total distance from Liverpool to Rostov-on-Don across Persia amounts to 8,260 miles, against the 3,500 miles from Hull to Rostov-on-Don via Archangel. There is the same difference in the distances from Britain to Sverdlovsk in the Urals; via Archangel the distance is 3,200 miles, and via Persia 9,300 miles; and via Archangel there is only one place of reloading, while via Persia material must be reloaded three times. There is no doubt that Archangel is, for all parts of European Soviet Russia, the nearest and easiest supply port. The distances from the United States to the Soviet Union are even greater. The sea route from San Francisco to Vladivostok in 5,300 miles; and from there to Moscow is another 5,000 miles by rail—a total distance of 10,300 miles. The distance from San Francisco to the Siberian industrial district of Kuznets is 8,300 miles, and to the industrial district of the Urals 9,500 miles. Supplies from the British Empire, that is, from India, the Malay States, or Australia, will find their nearest port of entry in Bandar Shapur in Persia. If supplies from Britain and the United States are up to expectations, the Russian railway system will be very heavily taxed during the winter months because the inland waterways will be icebound.

The Recruitment of Labour

There is a tendency to misjudge Mr Bevin. In last week's debate on manpower, it was too often assumed by critics that there was no plan, no rhyme or reason in the mobilisation and distribution of men and women. The strategy which determines his planning, Mr Bevin said, rightly, he has to take for granted. But, in the successive revisions of the schedule of reserved occupations, in the scheme to release labour by the limitation of supplies to manufacturers and by the concentration of industry, and in the registration, group by group, of men up to 50 years of age and women up to 40, the limits proposed at present, there has been unfolding a thorough and articulated plan to marshal manpower. It is for this reason that the best speeches in the debate were those which criticised, not Mr Bevin's programme, but its working and its timing: Miss Lloyd George implied that the Minister was taking young women to the water but not making them drink; Mr Graham White complained about the slow working of the labour exchange machinery upon which registration and recruitment depend; Sir Edward Cadogan contended that the younger and more mobile workers released by concentration from cotton-spinning have been "lost" by the Ministry of Labour and may have gone into no war work at all; Mr Jewson and Mr Davidson maintained that too much labour was standing idle because of the irregular and uneven placing of contracts; Sir Leonard Lyle and Mr Silkin claimed that Government departments were competing with one another for workers; Mr Orr-Ewing asked for the training of employees in management; Mr Lawson called for the pooling of skilled men to enable them to be transferred to where they are needed. It is not so much Mr Bevin's

* "The Future in Education." By Sir Richard Livingstone. Cambridge University Press. 127 pages. 3s. 6d.

plan that is at fault as its sluggish tempo, its over-mildness of method, its loose ends and its ragged edges. Miss Lloyd George said that "many women have not really the will to do anything at all"; and, however distasteful the Minister may find it to tamper with parents' views about the social status of their daughters, he must furnish the will as well as the means. The workers must be taken as well as counted. The machines must be manned. The apparatus of mobilisation has now been placed into position; and it must be used with the utmost determination.

Family Allowances

Any extension of family allowances must be welcomed; and in the case of the families of serving men the welcome must be doubly strong. The Government's decision, contained in the Ministry of Pensions White Paper (Cmd. 6318), to improve and extend the provision of allowances for the families of men serving in the forces will do much to eliminate cases of actual want. The new scheme is concerned with grants made to dependants in cases of proved hardship by the War Service Grants Advisory Committee, and not with the ordinary dependants' allowances which are paid, automatically and without test, by the Service departments. In the past, it has been clear that the normal allowances were insufficient to meet the primary needs of many families with children of or below school age, and also that the supplements provided by the Advisory Committee to ward off hardship did not, in fact, make good the deficiency. Thus, the changes are important. They include the raising of the maximum supplementary grant from £2 to £3 a week; the guarantee, subject to this maximum, of a minimum income per unit of family of 16s.—two children under school age or one adult counting as a unit; and the decision to make up the income per unit to as much as 20s. weekly where it can be shown that the "pre-Service" family income was on such a scale. The income per unit, which is to be calculated after allowing for fixed charges—rent and insurance—compares with an income of 15s. per unit—each child counting as half a unit—under the old scheme; and it appears that the grant of these extra allowances is to be automatic when the facts have been established. In the cases where the "pre-Service" income was more than 20s. per family unit, the attempt to maintain the pre-Service standard will not be made, though grants may still be given in special cases on the old discretionary principle. The calculation of pre-Service income will be adjusted for rises in the wartime cost of living, so that the families of men called up at the outset of the war will not be penalised; and the supplementary allowances will not be reduced when the pay of the serving man is increased until total daily pay, including war pay of 6d. per day, exceeds 4s., and then four-sevenths of any addition will accrue to the family with a corresponding reduction in grant.

Experience alone will show whether the new scheme will effectively prevent hardship. The new allowances come into force on the first pay day in November, though it is uncertain whether the necessary facts, in many cases, will have been established by that date. Very much must depend upon the administration of the scheme. It is a very complicated arrangement, which, since these extra allowances are still to be given by the Advisory Committee, and not through the regular machinery of the Service departments, clearly perpetuates an anomaly. The choice of this method is no doubt due to a desire to distribute public money only when individual circumstances justify its payment—which, *per contra*, would be an argument for taking ordinary Service allowances away from the many thousands of well-to-do wives who receive them as of right. The point is that the arrangement still smacks of charity. If payments to dependants are not a form of public relief, but an earmarked form of the soldier's pay, adjusted to his circumstances and the number of his dependants, then there is surely a strong case for paying all allowances through the automatic machinery of the Service departments. By that means alone would it be possible to make sure that reluctance to disclose personal circumstances in borderline cases will not deprive the families of the means which, after all, they only lack because their breadwinner has been called to the colours; and the right of serving men to see their families free from want would be established without taint of almsgiving.

Mr Menzies Replies

The final eclipse of Mr Menzies took place last week when he resigned the leadership of the United Australia party and Mr Fadden was elected leader of the Opposition. Mr Menzies is one of the Opposition's representatives in the Advisory War Council, but his disappearance from Australian political life, for the time being at least, appears complete. This disappearance seems strange to people in this country, who learned to admire Mr Menzies during his visit here and who applauded his forthright statements to the Australian people on his return. This very forthrightness, however, seems to have caused his downfall. The unpopularity which it brought him among a section of his own party and in the press pursued him after he had resigned the premiership; and he was accused of failing in his duty in not returning to London, and also in not speaking on behalf of the Government during the Budget debate. In a statement to the *Times*' Melbourne correspondent, Mr Menzies has commented on these charges. He told the Cabinet before resigning that in his view only a Dominion Prime Minister should make the London visit, because only he would sit in the British War Cabinet, and anybody else would merely be duplicating the work of the High Commissioner. This is a very reasonable point of view, which most people in this country, and—in Mr Menzies' opinion—the British Cabinet, will endorse. But, from the point of view of his political future and of Australian political unity, Mr Menzies might have been wiser to have agreed to make the visit after Mr Fadden succeeded him, and his attitude—"I go as Prime Minister or not at all"—is another example of an inability to climb down. On the Budget issue, Mr Menzies says that, though it is not the custom for Ministers generally to speak on the Budget, he had in fact prepared a speech, but that the declarations of the two Independent members made it useless to prolong the debate. There must, however, still be some doubt whether he might not have influenced Mr Coles to vote for the Government, for Mr Coles, by resigning from the United Australian party when Mr Menzies resigned the premiership, appeared to have linked his fortunes to his old Prime Minister's. Mr Menzies also says that, in any case, his financial views, particularly on the very extensive use of bank credit, were not identical with those of his colleagues. Taken in conjunction with his plans for a full economic mobilisation which he announced last June, this statement can only imply that Mr Menzies stood for stiffer taxation all round. In fact, the whole impression left by his decline and fall is that he wished to drive the Australian people more furiously than the majority of them wanted. During this war, when the dearth of strong men in the Empire is so apparent, such an attitude is a political virtue, not a crime, and it is earnestly to be hoped that Mr Menzies will shortly reappear as a protagonist in the Empire's war effort.

Reshaping Industry for War

When Mr Oliver Lyttelton, in his capacity as President of the Board of Trade, introduced his scheme early this year for the concentration of civilian industries whose size exceeded wartime needs, it was unofficially estimated that the men and women likely to be set free for other and more urgent work would number between 500,000 and 750,000. The time-limits fixed originally for the completion of the process in the various trades have long been up; but the release of labour, though it cannot be estimated with precision, because some of the factories scheduled for closing down have taken on war work, appears to have reached nothing like earlier estimates and, on the basis of present arrangements, is not expected to add up to more than 144,000 workers. Moreover, the Ministry of Labour apparently took no action to prevent some of the workers thus released from taking employment in unessential occupations. The success so far achieved varies very widely from industry to industry. But, while the first stage in the "slimming" of the less essential industries may now be completed, the process of adapting the civilian sector of British industry to wartime needs must be vigorously continued. By comparison with the enemy's reorganisation and rationalisation, it is still in a half-way stage. By comparison with the needs of victory, it is still distant from the final goal of concentrating every item of resources on war-making; and, so far, no details have been issued concerning the future policy of the Government. It is still a fact that the greatest single bar to success is the need to recognise and allow for the autarkic interests of separate firms; and until these are catered for financially, technical adaptation will be impeded.

Industrial Capacity

Despite the recent strengthening of the Regional Boards, when they were made responsible to the Production Executive, it is still widely held that they are not able to mobilise to the full and to the best advantage the productive resources within their districts. They include representatives of the Supply Ministries and of all other bodies interested in production, but their powers of decision and initiative are limited. They are not executives, except in a very limited sense. It is therefore urged, and rightly, that they should be given executive powers to enable them to extract the last ounce of output from the resources and equipment of their districts, within the commanded limits of the Government's production programmes. In one respect, the Boards might possibly have done better even with their limited scope. This is the organisation of efficient capacity exchanges to prevent machinery from standing idle, even temporarily. In some districts, such as Southern England, such exchanges have been established, and their degree of success is the measure of the urgency for their introduction in all the industrial districts. And the exchanges must be numerous enough and local enough to permit of weekly and even daily transfers of idle plant, so that no possible time is wasted. It is a little surprising that the industrial experts who have cried out so loudly and so sourly about the failure of official machinery to organise these exchanges have not been able to do more from the side of industry to set these local marts going. It is true that, in spite of Mr Macmillan's support, on behalf of the Ministry of Supply, for these exchanges, official leadership and authority in the regions have been lacking. But lack of leadership does not rule out self-help.

The President's Message

The President of the United States took advantage of his Message to Congress, calling for the revision of the Neutrality Act, to give the American people yet another sober warning of the extent of Hitler's ambitions, and the infinite peril in which America would stand if British and Russian resistance were crushed. It was against this background that he set the anomalies of the existing legislation on neutrality, and called for the immediate revision of the clause establishing combat zones which American ships may not enter. The Neutrality Act was passed in the fear that the activities of private traders, eager for profit, would draw the United States into war in protection of their vested interests. The President pointed out that such a conception had been rendered obsolete by the policy of Lease and Lend, and by the complete control exercised by the Government over the country's export trade. All voyages are now, in a sense, Government commissioned. The Act merely deprives the ships which go about the nation's business of adequate protection while at sea, and frustrates the purpose for which they go to sea, by prohibiting them from entering the harbours where the need is greatest. "We cannot permit," the President concluded, "the affirmative defence of our rights to be . . . diluted by sections of the Neutrality Act which have no realism in the light of the unscrupulous ambition of madmen." It seems almost certain that Congress will concur in the President's analysis of the situation, especially since new point has been given it by the sinking of a Portuguese cargo ship bound for a United States port. This attack by Germany on a neutral trading with a neutral can only be interpreted as the first step in an active U-boat blockade of the United States. The irrelevance of the Neutrality Act to such a policy need hardly be underlined.

Stalemate in China

The fighting in China continues on a long front, from Chengchow on the Yellow River to Changsha in Hunan. It is difficult to determine from the meagre reports available what the Japanese had in mind in launching these attacks all along the disputed frontier of Free and Occupied China. At present this frontier roughly follows the limit of the plain, and the three main centres of fighting suggest that the Japanese are anxious to extend their control up the valleys which run into the mountainous reserves of the Free Chinese. The capture of Chengchow opens up a new era on the flank of the fighting in Shansi, where the struggle has long continued with inconclusive results. Ichang, which the Chinese captured and then abandoned again, is the furthest point of the Japanese advance up the Yangtse

towards Chungking. In the south, the Japanese occupied Changsha, and were then expelled from it, in time to provide the Chinese with a victory celebration on the anniversary of the Republic. A Japanese success here might have extended the area under their control in Hunan and Kwangtung, for Changsha is a key city on the railway from Hankow to Canton, of which the Japanese control the termini and the Chinese the central sections. On the whole, the fighting illustrates the futility of any fresh Japanese attempt to finish the struggle in China by force of arms. They can nibble away the fringes of China's vast front of resistance. It is practically certain that they cannot penetrate the mountains to Chungking—the only remaining plan of campaign that could have any decisive significance. On Thursday, the Japanese Cabinet resigned—because it could not reach agreement on the policy to be pursued in the world crisis. The stalemate in China, and the growing pinch of blockade at home, are causing a new wave of unrest among the Japanese military leaders. The demands on Indo China are growing steadily, and there is much talk of "Axis solidarity," and the need for "a decision." A Russian collapse in Europe would be an almost irresistible temptation. Against it must be set the sudden growth of a warlike temper in the United States—even in Congress. It remains to be seen whether a new Cabinet will be more willing to throw down a challenge to the democracies—or more anxious still to go warily.

Land and Labour

A crucial issue in the present discussions of manpower policy is the lack of labour for farming. Obviously, in total war, it is as necessary for agriculture to adjust its needs for labour to the total requirements of the war economy as it is for any other industry. Equally obviously, however, when the process of adjustment has been delayed and lacking, it would be short-sighted in the extreme to endanger food production seriously by an over-large or over-sudden withdrawal of men. It was wise to delay the calling-up of the next batch of 10,000 from farming, and it might be still wiser to delay it for even longer. In the long run, however, if the needs of the war plan, on all fronts including the home front, are to be adequately met, there will have to be still more adjustments and dilution in agriculture's labour force, still more rationalisation of its methods and the utmost use of mechanical and labour-saving methods. Even without the impending calling-up of the next 10,000 from farming, labour, like the supply of machinery and fertilisers, sets a sharp limit to the expansion that is possible, in wartime conditions, in arable production. It is generally agreed that, with the existing supplies of labour and machinery, farmers have now put about as much land in arable cultivation, after two years of ploughing-up, as they can manage. Ploughing-up will continue, but the ploughing-up of 1941 has a different aim from the ploughing-up of 1939 and 1940. The earlier aim was to extend the area of cultivation; the aim now is rather to maintain it. The Ministry of Agriculture must plough up more land; first, because there is still a good deal of grassland which ought to be ploughed and resown to grass, possibly with one corn crop during the

Export
and
Import
Banking
on
Sweden

SKANDINAVISKA BANKEN

transition; and, secondly, because there is now a considerable acreage of arable which has had two or three straw crops and should now be put down to temporary grass for one or more years. Nor is it right to suppose that there is an unlimited supply of land still available for ploughing-up. The situation varies from district to district. In the Cotswolds, for instance, it is probable that when farmers have ploughed the plateau, there is little left of a suitable size or on a suitable slope to justify the use of a tractor. But this plainly does not apply to the old grazing and dairying districts where there is still a good deal of indifferent grassland that would be all the better for cultivation. There is a tendency to exaggerate the fall in the yield from newly ploughed arable land—which is often stated to be an important limit to the usefulness of ploughing up. In the last war, it was found in fact that, in spite of similar complaints, the average corn yield from newly ploughed land was not materially different from that of old arable. It is probable that the failures on newly ploughed land—numerically small but politically disproportionately large—are counterbalanced by a yield somewhat above average from newly ploughed acres which were previously good grassland. There is land available for more ploughing; and more must be ploughed to keep up the area of cultivation. But the extent to which the increase should, or can, be carried is limited by the supply of labour and by the results which can be expected. On all counts, it is high time that there was a very specific statement from the Government of its attitude towards agricultural labour and its adjustment in numbers and composition to the needs of wartime.

* * *

Consumer Needs

The Board of Trade has appointed Mr Francis Meynell to be the department's adviser on consumer needs. This piece of news may well bring a wry smile to the devotees of liberal economics. In the throes of wartime planning, it implies a determination to find a substitute for the classical functions of the price mechanism suited to the requirements of the planned economy. The need for some organisation which should be prepared constantly to adapt supply to demand, within the limits of Government policy, was first recognised by the Board early this year when twenty area distribution officers were appointed to supervise and check the working of the limitation of supplies policy. Since the advent of clothes rationing, the scope for such supervision has been extended, and Mr Meynell, working through the area distribution officers, will report on cases of exceptional scarcity, provide means of relieving local shortages in target areas and furnish information for the revision of quotas to the inter-departmental committee by which these are fixed. Technically, the appointment is designed to fill the gap left by the elimination of free prices. Demand can no longer make itself precisely felt in monetary terms, and mere shortage may only be evidence that consumption up to the permitted limit has taken place. Thus, by some other means, constant accurate information on the kind and intensity of potential demand must be transmitted to the Board if the legitimate requirements of the consumer are to be supplied. Here, in fact, is an attempt at an answer to the well-known poser of academic discussion, "In the planned economy, who would estimate the consumers' needs?" Combined with the paraphernalia of ration coupons, vouchers and quotas, it is, of course, a cumbrous answer compared with the automatic action of the price mechanism. But at least it is an effort to ensure that the tune shall be called by interests more vital than those registered by merely monetary demand.

Mr Bevin is Shocked

There was a striking scene in the Commons last Wednesday when a speaker from the Labour benches, much to the indignation of Mr Bevin, declared that he could see "no reason why, even in the matter of wages, if it is necessary for winning the war, the free negotiations between trade unions and employers should not be suspended." The argument Mr Silkin used is by now familiar—and cogent. The results of collective bargaining, in terms of wages, depend upon the relative strength of the bargaining unions, and not upon the relative importance to the war effort of their members' work. There has been remarkable industrial peace since the war started because, in general, the unions have had their way in wage discussions, and

the growing army of war workers have undoubtedly shared in the widespread scaling-up of wages. But very little has been done—or can be done by separate bargaining by autonomous unions—to remove anomalies or to adjust the structure of wages, in the lower paid ranks, to the wartime balance of industry. There are essential war workers, including a wide range on heavy work, whose pay still depends more upon the accident that they are members of trades which were depressed before the war, or of unions that are relatively weak, than upon the vital nature of the services that they are now rendering. The pay of women and other entrants to war industry is too often unattractive in comparison with the wages paid in non-essential employment. So much has been made of the fact that some grades of munition, engineering and aircraft workers make notably high earnings on piece-work that these discrepancies, which seriously impede the flow of recruits into war work, have been overlooked. There are two separate problems. One is the need, stated by the Government in a recent White Paper and opposed by the TUC, to stabilise prices, including the price of labour, in order to ward off inflation. The other is the need to adjust wage differences to fit the requirements of war economy—to step up the marginal earnings received for increased effort and to increase the pay of the lower grades of men and women war workers. This was Mr Silkin's point. What is wanted is a wartime wages policy: and a wages policy is impossible without the acceptance of central planning by the trade unions and its imposition by the Government, with their agreement.

* * *

Calm in the Levant

If a British offensive is to be launched on the Libyan front, the political background at least is fairly favourable. In Egypt, the Hussein Sirry Ministry is co-operating loyally within the framework of the Anglo-Egyptian Treaty, even though the country as a whole regards the war only as a painful necessity, which involves air raids, inconvenience, and not very much compensating advantage apart, admittedly, from the overwhelming advantage of not being ruled by the Italians. Syria and the Lebanon seem completely pacified, but the seeds of future discord may have been sown by General Catroux's decision to nominate Sheikh Taj Addin-el-Hasni as President of Independent Syria, while the Syrian Nationalists maintain that the former President, Atassi, who resigned in 1939, should be recalled, since the Syrian Parliament did not accept his resignation. It is perhaps unfair to call this issue a seed of further discord. It is rather an old root of controversy thrusting up a new shoot. The fundamental issue is whether Syria shall accept treaty relations with France on the Anglo-Iraqi model or be completely independent. Sheikh Taj Addin is ready to negotiate such a treaty, the Nationalists are not. The fact that certain of them look to Britain to support them does not ease the situation. To offset this hint of discord, the position of Turkey is more favourable than for weeks past. In spite of all Dr Clodius's cajolings, the Turks have refused either to increase the total value of goods to be exchanged—some £T21 millions—or to alter the exchange ratio of lira and Reichsmark in Germany's favour, or—most important of all—to supply Germany with chrome which Britain has pre-empted and the Germans have made very vigorous efforts to obtain. The Turks have, it is true, agreed to sell Germany chrome in 1943, but, given the fortunes of war, this is probably only a politer version of the Greek Kalends.

The Future of the Hospitals

Reconstruction for the hospitals has now been officially defined. "It is the objective of the Government," said the Minister of Health in Parliament last week, "as soon as may be after the war to ensure that, by means of a comprehensive hospital service, appropriate treatment shall be readily available to every person in need of it." The principle is admirable. Whether it will be secured by the method proposed is more doubtful. The duty of securing it is to be laid upon the major local authorities, and the Government is to make this possible by regularising the "partnership" between the local authorities and the voluntary hospitals. The service will be on a regional basis, in fact, the Government's statement of policy means that it has adopted the policy of the Nuffield Provincial Hospital Trust, which was set up nearly two years ago to co-ordinate the hospital and ancillary medical services in the province

and is extending it to London. A division of function between the hospitals is to be arranged in order to prevent overlapping and consequently unnecessary expenditure, and financial contributions from the Exchequer will be given to local authorities for any new burdens they may assume, whether on their own account or in contributing towards the expenditure of the voluntary hospitals; increased educational grants are contemplated for the teaching hospitals. In theory, these arrangements should put an end to the present rivalry between municipal and voluntary hospitals by placing the obligation to secure an adequate hospital service on the local authority, which ought, therefore, to be in a position to dictate. In practice, it is not at all certain that co-operation will be achieved, because the efficient administration of the service must still depend on the medical staff. It has always been the difficulty in securing an efficient out-patients' service at a voluntary hospital that the consultants cannot be counted upon to keep fixed appointments because they are often too busy earning fees elsewhere; and they cannot be compelled to do so long as they are honorary members of the staff, and not employees under contract. Moreover, patients will still be required to pay according to their means, and this, even with the extension of provident schemes promised by Lord Nuffield's latest gift, implies the continuance of the present system of treatment according to means. Reorganisation of the hospital services cannot, in fact, be treated separately from the reorganisation of the whole medical services of the country, which is at present under consideration by the doctors themselves.

Road Deaths Analysed

In the second year of the war, 10,073 persons were killed on the roads, compared with 8,358 in the first year and 6,631 in the twelve months preceding the outbreak. The 18,431 killed since September, 1939, are officially classified as 2,659 motor-cyclists, including pillion riders; 739 drivers of cars; 2,788 pedal cyclists, including 440 children; 10,252 pedestrians, including 2,104 children; and 1,993 "other persons," including passengers and people boarding and alighting from vehicles. Somewhat more detailed information, however, has been collected by the Royal Society for the Prevention of Accidents, which analysed 631 reports of fatal road accidents in June and July of this year. Of the total, 151 happened to children; of 293 cases where employment, trade or profession was made known, 106 were members of the Forces; accidents to pedestrians accounted for 254 cases, followed by 116 to pedal cyclists and 114 to motor cyclists. The analysis further shows that of the 126 fatal accidents to child pedestrians, one-third was caused by darting or stepping into the road without looking, and one-quarter by playing in the road. Hesitation or carelessness when crossing the road was the main or a contributory cause in most of the fatal accidents to adult pedestrians, and for motor drivers and motor cyclists loss of control and excessive speed were the chief responsible factors. Road junctions are still the most dangerous spots; 27 per cent of the fatal accidents investigated occurred at them. There are obviously many gaps in the analysis; but, as with accidents in general, and industrial accidents in particular, knowledge of the main causes of road accidents should help towards their defeat, and the Society's work should therefore be encouraged. Nine to ten thousand road deaths a year are a scandalous waste in peacetime; in war, the loss of manpower from death or disablement is a crime.

* * *

Third Class Only

Either the abolition of first-class travel is a saving in travelling space, and so in fuel, or it is not. It is now almost a fortnight since the Minister of War Transport abolished first-class travel in all trains beginning and ending their journeys within the area of the LPTB, and it has become more apparent than ever that the scope of the measure is far too narrow. It is, of course, an important step that the wastage of travelling space implied in the retention of first-class carriages should be removed within the large London area, ranging as it does from Bletchley on the north to Sevenoaks and Guildford on the south and from Witham on the east to Reading on the west. The change apparently affects some 5,000 trains. But, and here is the crux of the matter, how does this 5,000 compare

with the total number of trains which begin or end their journeys outside the area in question and yet stop at stations within it, or with the greater number that ply entirely outside? On these trains, first-class carriages will still prohibit the entrance of the majority of travellers; and, since the principle that the retention of two classes causes delay has now been officially admitted, the distinction between London and the country beyond seems unreasonable, to say the least. No delay or waste of travelling space is consistent with the wartime utilisation of transport. The time is gone by when it is permissible to do things by halves; and the abolition of first-class travel throughout the country would bring with it the subsidiary blessing that young officers in the services, many of whom are struggling to support families on wholly inadequate salaries, would be spared the futile expense of a first-class ticket, which a false estimate of the dictates of prestige at present demands.

* * *

Inter-American Trade

The great primary producing countries have been hard hit by the loss of their markets in continental Europe. As Great Britain has undertaken to assist in the financing and disposal of surplus products in the Empire, it was only natural for the United States to perform a similar task in Latin America. The Lend-Lease agreement with Brazil concluded earlier this month has now been followed, after protracted negotiations, by a trade agreement with Argentina. Like previous trade pacts negotiated by Mr Cordell Hull, the new agreement embodies the most-favoured-nation clause. The United States undertakes to halve the import duties on linseed and canned meats; and to facilitate the import of wool, hides and quebracho extract and, temporarily, that of wines, cheese and sunflower seed oil. Argentina has reduced the tariffs on motor vehicles, wood, cement and chemicals; but the pact is subject to limitations imposed by the payments agreement in force between Argentina and the United Kingdom. The agreement should assist Argentina in disposing of some of its surplus products, which are likely to be required in increasing quantities by the United States. Nevertheless, like those granted in previous agreements, the concessions were opposed by trade interests in the United States who have long fought against an expansion in imports of Argentine primary products. Thus, Senator Butler, of Nebraska, alleged that beef, cattle, dairy products, wool and linseed interests were to be "sacrificed under the timeworn excuse of national urgency." But President Roosevelt has called the agreement "a monument to the ways of peace."

Shorter Notes

The following table gives the number of civilian casualties in aid raids since September, 1940. The figures for January to June this year have been officially amended:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Total Sept.-Dec., 1940.....	21,669	30,556	52,225
1941:—			
January.....	1,550	2,021	3,571
February.....	793	1,068	1,861
March.....	4,298	4,794	9,092
April.....	6,131	6,900	13,031
May.....	5,520	5,207	10,727
June.....	406	461	867
July.....	501	447	948
August.....	169	136	305
September.....	217	269	486
Totals to date.....	41,254	51,859	93,113

Of those killed in September, 87 were men, 73 were women, 45 were children under 16 and 12 were unclassified.

*

An Order prohibiting the manufacture and sale of worthless food substitutes has been signed. A good illustration of this latest form of profiteering is the conviction of a Bootle firm for selling an egg substitute powder calculated to deceive. It was alleged that the powder was sold at 1,600 per cent above cost, and on analysis it was found to consist of baking powder and colouring matter.

THE WORLD OVERSEAS

Trade and Shipping in Shanghai

(From Our Shanghai Correspondent)

September 8th

THE end of the first two years of the war finds Shanghai's trade with Europe, and Shanghai's shipping under European flags, both heavily curtailed. Both have been reduced by 80 per cent. Most of the remainder of Shanghai's commercial intercourse with Europe is carried on with the United Kingdom alone, which also accounts for half of what is left of Shanghai's European shipping. Yet British trade and shipping have declined considerably. Japan, contrary to its expectations, has not been able to expand its Shanghai trade and shipping correspondingly. Harassed by the negative development of the China adventure and a vast need for arms, its trade with Shanghai in the last two years was cut in half, and it was not able to increase the volume of its Shanghai shipping to any extent. Both Europe's and Japan's losses in Shanghai's trade were made good by other inter-Asiatic and trans-Pacific trade, with the south-east Asiatic countries and the United States now together controlling 75 per cent of Shanghai's imports and exports.

Truly remarkable is the wartime reduction of Shanghai's maritime intercourse with non-China ports. In July, 1939, Shanghai entered from and cleared for such ports 1,496,677 tons of mercantile shipping. But in July, 1941, the volume of this shipping had dropped to 716,305 tons. This is a reduction of 52.5 per cent. Shanghai shipping under European flags alone for these same two months shows an 80 per cent drop—from 1,076,906 to 221,395 tons. The chief reason for this decline is the systematic withdrawal from waters north of Hongkong of the bulk of British Far Eastern shipping. British vessels entered into and cleared from Shanghai port in July, 1939, totalled 594,296 tons, but in July this year aggregated a mere 82,302 tons. Britain's share in Shanghai's shipping has been reduced from 40 to 11.5 per cent. Shanghai's non-coastal shipping under Continental European flags at the same time went down from 473,906 to 84,800 tons, with the French Vichy flag accounting for half of the remainder.

Of all the white men's countries, the United States alone during the past two years managed to increase its Shanghai shipping volume. American ships entered and cleared at Shanghai in July, 1939, registered 59,216 tons. In July, 1941, this figure showed an increase to 123,901 tons. Shipping under the American flag thereby raised its share in Shanghai's shipping from 4 per cent pre-war to 17.3 per cent this summer. Yet Japanese shipping at Shanghai remains three times greater than American shipping. The Japanese throughout the past two years had no additional bottom space to spare for Shanghai. Local maritime traffic under the Japanese flag in July this year totalled 371,009 tons, against 360,555 tons in July, 1939. But with shipping under the European and American flags here reduced by 70 per cent, the maintenance of the Japanese pre-war shipping volume now gives Japan a dominating shipping share of 52 per cent, against only 24 per cent on the eve of the European war.

Shanghai's imports of European goods have dwindled to a mere £150,000 a month, of which more than £100,000 are made in Britain. Most of the remainder are of Swiss manufacture, accompanied by a sprinkling of products from other European countries. These imports give Europe a share of slightly less than 5 per cent in local imports, while during the months immediately preceding the European war, it exceeded 20 per cent. Most British standard products are still to be had here, despite considerable hoarding. The majority of Continental European brands, previously well-established here, are out of stock; others are hoarded anxiously and are sold sparingly at extraordinarily high prices. French wines and spirits, drugs and cosmetics—although still replenished on a small scale via French Indo-

China—are marketed here at between five and ten times the pre-war prices. On the other hand, there are large local stocks of German pharmaceuticals and dyes, with holders reluctant to sell even at record high quotations.

The End of Axis Trade

Trans-Siberian transit trade with Germany and Italy, since the outbreak of the Russo-German war, has become a thing of the past. The month of July still saw a large influx into Shanghai of German dyes sent through Manchuria just before Hitler's invasion of Russia, and during that month German goods formed 70 per cent of all Shanghai's imports of dyes. But August saw these arrivals drying up, and by early September imports from Germany had come to a standstill. Exports from Shanghai to Dairen for transit via Siberia to Germany immediately stopped on June 22, 1941. Owing to the Nazis' hope of an early defeat of Russia, local German firms were ordered to hold on to supplies purchased for export to Germany. These hopes have now disappeared, and at present such firms retain their supplies merely as an investment in kind, because their hands are bound by the democracies' freezing of Sino-Japanese assets. Some of these firms, however, recently began to sell in order to cover running costs.

The reduction of Shanghai's shipments to Dairen in July this year, compared with the previous month of June, which is mainly due to the stoppage of trans-Siberian transit trade, indicates the extent of Shanghai's exports to Germany via Siberia just prior to the Russo-German war. These shipments within a single month declined by almost £3,500,000. This decline was chiefly accounted for by the following commodities: tin, £750,000; other metals and metal products, £220,000; cotton yarn, £650,000; leather and hides, £500,000; tea, £500,000; sesamum seeds, £400,000; raw cotton, £300,000. There are also other indications to the effect that this has been the approximate nature of Shanghai's last trans-Siberian exports to the Reich. The time taken to transport commodities from Dairen to the German border had early this summer extended to an average of forty-five days, so that most of Shanghai's exports in May and June in that direction may be assumed to have been surprised in Russia on the outbreak of the Russo-German war.

Totalitarian Economy in Croatia

[BY A CORRESPONDENT]

September 30th

THE new "Kingdom of Croatia" tries hard to prove itself a worthy member of the "New Order." The Ustasha (the official state party) is copying all the characteristic features of the German Nazi party, not only in the political field but also in the economic and other spheres of national life. The first and foremost economic principle of the new state is that all important economic positions are to be taken out of the hands of non-Croats and non-Aryans. A special "Board for Economic Renovation" has been entrusted with the task of transferring "alien," that is, mainly Serbian and Jewish, firms into the hands of Croats. The so-called aliens are not supposed to be expropriated, but they are only paid in instalments for their property. Jews and Serbs are not

October 18, 1941

allowed to perform any business dealings of significance, even among themselves, without official consent.

The real meaning of this enforced "Croatisation" of economic life can be seen from the fact that, of the more than 7 million inhabitants of the new State, less than 5 million are of Croatian stock, and, according to an official announcement, two-thirds of all Croatian firms are in Serbian or Jewish hands. It can easily be seen that the adoption of the Nazi point of view has, in this respect, much wider repercussions in Croatia than it had in Germany itself.

A second characteristic of the young Croatian State is its preoccupation with far-reaching economic reforms and big new schemes in transport, industries and agriculture, though it is not always quite clear how these schemes are to be financed. New roads and railways are to be built in various parts of the country; the whole of Moslawina is to be electrified; two new aluminium plants have been designed. The natural lack of coal is to be counteracted by a more thorough utilisation of the country's water-power. The Italian oil concern, AGIP, has been given permission to exploit the country's oilfields. Still more important, in a country with a predominantly agrarian structure, are the plans to increase the arable land, mainly by new river regulations, large-scale drainage and improvement works, etc. On the new land, many thousands of new farmers are to be settled, and it is hoped to overcome, in this way, the poverty of large sections of the peasant population. The cultivation of sugar beet, tobacco, hemp, flax, rape seed, sunflower, and other industrial plants is being officially encouraged.

These measures imply the increasing power of the state, which is to organise all these new tasks. But the power of the totalitarian state machinery expands still farther into the economic field. A state-directed central bank is entrusted with the functions of a clearing centre, and has also to direct the country's credit system. All prices are controlled by the state, and the principle has been adopted that in wartime no price increases are allowed without special Government consent. To enforce this law, state commissioners are to control every retail shop in the country. Big business is to be controlled similarly, or even more rigidly, and state commissioners have been assigned to numerous commercial and industrial establishments. They are even allowed to commandeer the property of the firms "in the national interest." Other important establishments have been wholly or partly taken over by the state, especially since, with all the organisations of the industrialists are to co-operate with the state, and to carry out official instructions. A German newspaper correspondent commenting on this new industrial policy hopes, a little naively, that the restriction of initiative caused by state interference will not tend to lower the general output, but he does not explain on what his hopes are based.

Other functions of the state include the control of foreign trade, which is centralised under a special board, and the control of the most important raw materials. State monopolies have been formed for the trade in tobacco, cigarette paper, salt, matches and liquid fuel. As for agriculture, the state has now assumed a monopoly of the trade in grain, and every farmer has to offer his product for purchase to the state even before it is harvested. Other measures "for the protection of the farmers" will probably include a new farming law on the lines of the German *Reichserbhofgesetz*, which will make it impossible to sell or mortgage large and medium-sized farms. A compulsory farmers' organisation, which again will be a semi-official institution, will be modelled on the Nazi *Reich Nahrung*. It is somewhat ironic that, in the Duke of Spoleto's kingdom, every detail of economic organisation is taken from the German rather than from the Italian pattern.

The numerous trade unions have been amalgamated into one labour organisation under the auspices of the Ustasha. This organisation boasts that labour conditions have been improved by the new wage rates, but there are indications that its assistance to the workers is of a similar character to that of the German Labour Front. To the minimum hourly wage of 4 dinars (or 4 kunas, as it is now officially called) in August, 1939, has been added a bonus of up to 3 dinars, and to the minimum monthly wage of 1,200 dinars for white-collar employees has been added a bonus of up to 400 dinars, though, according to the official Economic Institute, food prices have increased by about 90 per cent; real wages have, therefore, been lowered. All men and women between 20 and 25 years of age have to live for one year in the barracks of the Compulsory Labour Service. This newly-created service is supposed to educate people

and to create a new national morale, but it will probably also provide the state with cheap labour for its new economic activities.

Manpower for Germany

The manpower reserves of the country are, of course, of special interest for its German masters. Significantly, the first international treaty signed by the Croatian Government, in May this year, was one with the Reich about the sending of Croatian agricultural and industrial workers to Germany. Some 54,000 workers were immediately despatched to the Reich, in addition to 12,000 others who had gone before on their own initiative; they are paid the same rates as German workers in the same position. This action is also thought to be an effective short-term measure against the extensive "invisible unemployment," which consists, mainly, of members of farmers' families who are more or less idling in the villages, and are now hoping for the day when they will be given allotments on new land by the "Board for Inner Colonisation."

Whatever may be the outcome of all these ambitious hopes and schemes, the present economic situation, after the Yugoslavian campaign and the "National Revolution," is anything but prosperous. A trade agreement was signed with Germany providing for the export of 500 million kunas' worth of timber, eggs, fruit and vegetables, aluminium, etc., in exchange for machinery and other industrial goods. This volume of trade does not suggest that either Croatia or Germany expects any spectacular rise in the country's exportable output in the immediate future. There is a definite shortage of fertilisers and coal in the country, and hardly any oil is available from Roumania, the most obvious source of supply.

In the first few weeks of the "Croatian revolution," the sale of textiles, footwear, soap and most sorts of tinned fruit was completely stopped, and a severe rationing system now covers all these goods. Bread consumption has been restricted to 14.2 oz. per day for workers and to 7.1 oz. for non-workers and its quality has deteriorated. Fats also are rationed, and butcher's shops must be closed on two days each week apart from Sunday. Fortunately for Croatia, the weather has been particularly bright this summer, and the harvest is supposed to be a good one. Even so, food rationing is likely to be tightened up during the approaching autumn and winter. The number of meatless days will probably be increased to three or four per week.

To these economic problems are added the political difficulties of the new totalitarian regime. Constant acts of sabotage by the Serbian and Moslem population, which at times amount to real riots, are upsetting administrative work in large parts of the country, while the whole coastline is occupied by Italian troops; only recently, the Croatian Government had to agree to a further extension of the area under foreign occupation. Serious purges within the Ustasha have been necessary to ensure the "national unity" which has to conform to Axis wishes.

A New Era in Hongkong

[FROM OUR HONGKONG CORRESPONDENT]

September 17th

SINCE the beginning of this month, there has been a change in the Governorship of this colony. After less than four years of office, Sir Geoffrey Northcote left Hongkong on September 6th, amidst widespread expressions of regret that ill-health prevented him from completing his full term. His name will be associated with the marked progress

BANK OF MONTREAL

(Incorporated in Canada in 1817 with Limited Liability)
Financial Agents of the Government of the Dominion of Canada in London
CAPITAL \$36,000,000
RESERVE \$39,000,000
TOTAL ASSETS IN EXCESS OF \$1,050,000,000

Head Office: MONTREAL

Huntly R. Drummond, Esq., President
Major-General The Hon. S. C. Mewburn, C.M.G., W. A. Bog, Esq., Vice-Presidents
Jackson Dodds, O.B.E., G. W. Spinney, General Managers

LONDON COMMITTEE (F. R. S. Balfour, Esq., Sir Hardman Lever, Bart., K.C.B., Sir Frederick Williams-Taylor)

London Offices: 47 Threadneedle Street, E.C.2, Edward Pope, Manager
9 Waterloo Place, Pall Mall, S.W.1, J. H. Pangman, Manager

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

made in the amelioration of social conditions here; and it is the more to his credit that, despite wartime problems, arising from the Sino-Japanese conflict as well as from the wider struggle, he was able to pursue a vigorous policy of social reform and give every encouragement to unofficial relief organisations. He was a staunch friend of the University, for which he probably achieved more than any of his predecessors since Lord Lugard, and a special message from Dr Quo Tai Chi bore testimony to what he had done to develop Sino-British cultural relations.

The new Governor, Sir Mark Young, arrived a week after the departure of Sir Geoffrey Northcote. Sir Mark has been Governor of Tanganyika during the past three years, and as the administration of British territory in Africa appears to be conducted on more progressive lines than in the eastern colonies, there is every hope that he will continue the policy of his predecessor, who spent most of his service in Africa. During the past five or six years, the growth of Hongkong has been so rapid that it has outstripped the system of departmental government which was good enough when Hongkong was an entrepôt of trade and nothing more. Industrial and political problems have now become of paramount importance, and the task which lies before the new Governor will demand statesmanship in addition to administrative ability.

The finances of the colony are in a healthy state and revenue continues to flow in at a higher rate than was estimated. The surplus of assets over liabilities at the end of May exceeded \$24 millions, revenue for the first two months of the financial year beginning April 1st having exceeded expenditure by nearly \$2 millions. Contributions direct to the Imperial Exchequer, gifts to the Admiralty in the shape of locally built naval craft, and a big outlay on defensive works are all charged to local revenue, and in order to finance a progressive scheme of social betterment there can be no reduction in the present scale of taxation.

Communications with China

The development of air traffic between this colony and Free China has now reached considerable proportions. There are two services, one conducted by the China National Aviation Corporation, in which American capital has a half share, and the other the Eurasia Aviation Corporation. The latter was formed with German capital and German pilots were in charge of the planes. Since the termination of diplomatic relations between China and Germany, the Eurasia Aviation Corporation has become a purely Chinese concern. Both services ply between here and Chungking, connecting with Chengtu, Kunming and Rangoon. In addition to the passenger services, there are planes entirely given up to freight, which fly to Nam Yung, a town in Northern Kwangtung, about an hour's flight from Hongkong, where the goods are landed and distributed to various parts of Free China by river, rail and road. As many as ten freight planes leave Hongkong for the interior on some days, and, despite the high rates charged for the air portion of the journey, it is understood that the cost of transportation for many articles works out cheaper by this route than by sea to Rangoon and thence to the Burma Road.

There have been some substantial shipments of rubber footwear to Britain during the current year, but local factories are now finding difficulty in obtaining their requirements of chemicals, and it looks as if production will suffer. Factories engaged in textiles have been fully occupied with orders for Malaya and the South African markets, and many of them are now receiving orders for woollen garments for British troops in the east. These orders are placed by the Hongkong War Supplies Board under instructions from Delhi, as a result of the Eastern Group Conference of last autumn. Large amounts of steel helmets, entrenching tools, water-bottles, webbing equipment and ground-sheets have already been made and shipped to various ordnance depots east of Suez, and it is fortunate that Hongkong has been in a position to contribute in this way towards the war effort with considerable benefit to those engaged in industry. How far this work can be extended depends largely on the supply of raw material, which, of course, is becoming increasingly difficult to secure.

The conference in Hongkong between Shanghai banking interests and the Chinese Currency Stabilisation Board resulted in the withdrawal of foreign banking support from the black market. Thus the last free sterling market has been closed. This decision seems to have met with strong criticism in Shanghai; but while submission to exchange control may be unpalatable to many, there seems to be no

alternative remedy if Chinese currency is to be safeguarded from Japanese assault. No doubt there will be a good many difficulties to be overcome before the control functions smoothly, but, judged by a month's experience in Hongkong, legitimate trade is not likely to suffer, and there seems to be no reason why the new arrangement should not work out to the benefit of all concerned in the commerce of China.

A New Production Index in America

[FROM OUR NEW YORK CORRESPONDENT]

September 23rd
THE Federal Reserve Index of Production has been revised again, giving more complete representation to the defence industries. At the same time, the seasonal adjustments were revised. The net effect is to lift the new index slightly above the old, as follows:

INDEX OF INDUSTRIAL PRODUCTION (1935-39 = 100)				
	Without Seasonal Adjustment		With Seasonal Adjustment	
	Old	New	Old	New
1940: - July	118	120	121	122
Aug.	120	124	121	124
Sept.	129	132	125	127
Oct.	134	136	129	130
Nov.	135	136	133	134
Dec.	135	136	139	139
1941: - Jan.	134	135	140	140
Feb.	138	140	141	144
Mar.	143	144	143	147
Apr.	142	144	140	144
May	153	155	150	154
June	157	160	157	159
July	156	159	161	161

FEDERAL RESERVE BUSINESS INDICES (1935-39 = 100) (Adjusted for Seasonal Variation)				
	Aug., 1940	July, 1941	Aug., 1941*	
Industrial production (total)	124	160	161	
Manufactures (total)	126	165	166	
Durable goods	143	199	201	
Non-durable goods	112	138	137	
Minerals	113	130	132	
Construction contracts (total)	90	139	150	
Residential	82	117	123	
All other	98	157	173	
Factory employment (total)	107.4	133.3		
Durable goods	104.3	111.0		
Non-durable goods	110.2	126.1		
Factory payrolls (total)†	105.5	152.8		
Durable goods	106.5	172.6		
Non-durable goods	104.4	130.6		
Freight car loadings	112	138	139	
Department store sales	98	115	133	
Department store stocks	69	81		

* Preliminary. † Not adjusted for seasonal.

This tabulation does not exhibit one of the most interesting features of the past month—the visible and growing scarcity of certain items of consumer goods. Perhaps scarcity is too strong a word to describe a condition usually explained to the consumer with the statement that such and such items are “hard to get,” or that deliveries are slow. Nor is the number of such items great, or their urgency particularly imperative. Nevertheless, in a chronicle of the period, it marks a change—it was not encountered at all in July; it is not infrequently encountered in September. It is impossible to state positively whether this condition is more attributable to reduction in supply or increase in demand. The unadjusted index of non-durable goods production and of factory payrolls runs as follows:

	Non-durable Goods	Factory Payrolls
January	118	121
February	122	127
March	126	131
April	129	135
May	134	144
June	138	152
July	138	153
August	140	—

This involves two rather violent assumptions—that the index of non-durable goods can be imagined as an index of consumer goods; and that factory payrolls can be imagined as an index of consumer income. Neither of these assumptions is justified, yet they can be utilised to convey the general idea that the supply of consumer goods has not increased as much since spring as consumer income. Oddly enough, the item of consumer goods whose approaching scarcity was first publicised in mid-summer—petrol—seems to be in abundant supply, although the 7 p.m. to 7 a.m. curfew is still maintained, to the delight of filling-station attendants, and with only rare inconvenience for those motorists who, like the Foolish Virgins in the parable, neglected to keep their tanks full.

While the August figure of manufacturing reached a new high level, there is more talk and more evidence that the economy is in the vicinity of a ceiling, that is, that the production of the defence items can be increased only at the expense of a curtailment (or of no further expansion) in non-defence output. The system of priorities is, in effect, a scheme of rationing producers, while there has been no rationing of consumption. Administratively this is simple and probably effective; but it is bringing visible strain on the price structure.

The Executions in Czechoslovakia

[BY A CZECHOSLOVAK CORRESPONDENT]

October 13th.

DURING the first fortnight of Reinhard Heydrich's regime, of the 1,500 persons who were tried by military tribunals, 250 were sentenced to death; the rest were sent to concentration camps for further investigation by the Gestapo, whence, it is expected, only a few will ever return. Among the 235 people executed up to October 12th were men belonging to all classes of the nation. Officers and soldiers of the former Czechoslovak army, officials, journalists, merchants and workers were among the victims. Lt-General Alois Elias, the Prime Minister of the Puppet Government, who has been sentenced to death by the infamous “People's Court,” is still alive. In the headquarters of the Gestapo in Prague, he is confronted with hundreds of people every day and compelled under torture to give secrets which will lead to further trials. General Elias was a Legionary, and after Munich acted as deputy War Minister before he was chosen to be Prime Minister. He is a distinguished soldier, who obtained his final education at the French Staff College and represented Czechoslovakia as a military expert at the Disarmament Conference at Geneva in 1932.

Among the first victims executed were several prominent generals. They included the military commander of Bohemia, General Joseph Bily; the district commander of Slovakia, Lt.-Gen. Hugo Vojta, who has been retired since March 1939; and General Frantisek Horacek, who had for years been commander of an artillery regiment in Moravia and who shortly before Munich was transferred to the Ministry of National Defence, where he was considered to be one of the greatest experts in artillery. The second deputy Chief of the General Staff, General Mikulas Dolezal, commander of the Staff College, and General Oleg Svatik, commander of the 12th Division in Carpatho-Ruthenia, were also executed. Colonel Karel Capek, who was in charge of an NCO school in Olomouc, was sentenced to death. The Mayor of Prague, Dr Ottokar Klapka, who refused to sign a plea for mercy, was shot. No branch of national life was spared. Heydrich completed the drive against the Czech cultural organisations which had been started by Neurath two years ago. Professor Dr Wladimir Groh, professor of classical philology at the Mazaryk University in Brno, was sentenced to death. He was the centre of Czech cultural life in his town and was never concerned in politics. His fate was shared by his fellow citizen, Dr Voitech Jilek, a physician who was the leader of the sports organisation “Orel,” and by Augustin Pechlat, the organiser of the disbanded “Sokol” movement. Leo Schwarz, an engineer, who was financial adviser to the Legionary organisation and who figured in the German communiqué simply as “a Jew,” had to pay with his life for his loyalty to freedom. Among the executed are also Dr Karel Trejbal, President of the Court in the town of Velvary, a leader of

the trade union of judges, who often visited Great Britain as a chess champion, and Joseph Smrkovsky, a famous large-scale importer from Prague, who was accused by the Germans of having hidden material of all sorts in his warehouses.

Apart from those already mentioned, about 180 hostages were massacred in the true sense of the word. These hostages had been in prison for months and not the slightest reason can be offered by the Nazis to explain this slaughter. Heydrich tried to explain that he had to show a strong hand in order to protect the Czech people from an enormous food racket which, he alleged, was the reason for “certain dissatisfaction” among the Czech people. In order to give this ridiculous statement a semblance of probability, the head of the food department of the Ministry of Agriculture, Dr Frankfurter, and a number of traders and millers were executed.

Baron von Neurath, the former Protector, who is now in Stuttgart, had to retire because he was obviously unable to cope with the Czech resistance, though he tried hard to break the spirit of the Czechoslovak people in every possible way. It would be wrong to see in his departure a protest against any ruthless persecutions which might have been suggested to him by Berlin. He willingly took part in every act of violence; he approved the massacres of Czech students in 1939 and robbed the Protectorate in every conceivable way. The real reason for Heydrich's appointment seems to have been that the *Wehrmacht* seriously complained of the damage done by Czech sabotage. They pointed out that apart from the material losses by sabotage and passive resistance in factories, supplies for the Russian front, some of which have to cross Czech territory, were often delayed, damaged or even lost.

THE BUSINESS WORLD

Against Inflation in America

THE tremendous surge in the production of the United States since the defence programme got under way and the concurrent expansion in the money income of the country have brought the problem of inflation to a head. The expansion in output is mainly attributable to the defence programme and is represented by the equipment of the new American forces or by exports under Lease and Lend. When the volume of real national income available for civilian consumption is decreased by defence demands, this persistent expansion in money income will create all the essential elements of inflation on a truly impressive scale. The United States, which to-day possesses between eight and nine times as much gold as all the rest of the world put together, is perhaps in more danger of inflation than any one of the belligerent nations. The reason is not to be found in the general implications of the "quantity theory," or even in the possession of large excess reserve balances by the member banks of the Federal Reserve system. It rather lies in the fact that the United States still lacks the array of anti-inflation devices, a closed capital market, high taxation, civilian rationing and control of essential prices, wages and profits the belligerent nations have all imposed—Germany with draconic ruthlessness, Britain with less verve, but none the less with considerable effect.

Some awareness of the danger of inflation into which the United States has been drifting has been shown by the authorities in that country for some time past. This recognition of the problem must not be confused with the dire prognostications of the "hard currency" economists who used to describe excess member bank reserves as "liquid dynamite," even in days when the number of unemployed in the United States topped the 10 million mark. Evidence of official appreciation of the inflation question has been provided within the past week or so by the proposal to tax excess corporation profits and by the decision to increase member bank reserve requirements. The need for such action can best be illustrated by quoting a few of the essential statistics. The annual rate of flow of national income payments in the United States had risen by \$14,000 millions to \$88,000 millions, or by 19 per cent, between May, 1940, when the defence programme was initiated, and July last. By 1942, the national income of the United States is expected to be running at the record level of \$100,000 millions. During the first 14 months of the defence programme, wage and salary payments had risen by about 25 per cent, and payments to factory workers were 55 per cent up. As the supplies of consumption and durable goods available for the civilian population have not increased commensurately with the rise in money incomes, an inevitable upward pressure on prices has been exerted. In the same 14-month period, the index of wholesale prices rose from 78.4 to 88.8 and the index of farm prices from 67.9 to 86.7. The rise in these indices has been steadily accelerating, and by far the greater part of the above movements has been compressed within the last four months of the period.

The first real indication of authoritative concern at the inflationary trend in the United States was provided by the special report to Congress submitted by the massed authority of the Federal Reserve System at the end of last year. This document, while admitting that inflation cannot be controlled by monetary means alone, demanded that "adequate means be provided to combat the dangers of over-expansion of bank credit due to monetary causes." It thus requested an immediate increase in statutory reserve requirements up to the permissible maxima, a general lifting of these maxima, and their application to banks outside the membership of the Federal Reserve system. The recom-

mendations also touched the more realistic aspects of the problem, and, in particular, suggested that an increasing proportion of defence expenditure should be met by tax revenue, rather than by borrowing, and that Government issues should tap genuine savings and should not go to the banking system, a procedure which would merely swell bank deposits and help inflation on its course.

Since this document was submitted to Congress, the United States authorities have been far from idle in getting an anti-inflationary drive under way. The adjustment of the fiscal effort to the stupendous budgetary task now facing the United States has made some, though admittedly slow, progress. The Tax Bill, as it has emerged from its mauling by the Finance Committee of the House of Representatives, provides for additional revenue of \$3,672 millions out of the additional \$5,600 millions which is required this year. Preparations are already under way to increase this tax revenue. The directions in which additional revenue will be found are the corporations' excess profits tax, a steeper graduation of the taxes on personal incomes, higher excise taxes on durable consumers' goods and inheritance and gift taxes. The shadowy outlines of the excess profits tax were recently drawn by Mr Morgenthau. It proposes a 100 per cent tax on profits in excess of 6 per cent on the capital employed in the business. It is evident that this and other new fiscal measures will take months to fructify.

Meanwhile, the Budget deficit for the current year is running at the rate of over \$5,000 millions on the basis of a total expenditure of \$12,700 millions. Both figures should be increased by a further \$1,000 millions to allow for the net disbursements of various Government agencies such as the Reconstruction Finance Corporation. It is evident from these figures that recourse to borrowing is heavy and that it must remain so for some time to come. The policy of the Treasury has been to direct the appeal to Government issues as exclusively as possible to the public, and thus to tap genuine savings. The sale of Defence Savings Bonds, for example, has been limited to investors other than commercial banks. More recently, the Treasury has introduced a new type of security, issued in anticipation of tax payments and thus exclusively reserved for subscriptions out of genuine savings. It is true that member banks' holdings of Government paper have continued to expand; but it is in the form of short-dated and very low-yielding securities that this expansion is taking place. The United States have, since the beginning of the defence borrowing programme, avoided the practice of encouraging the commercial banks to participate in subscriptions to the relatively high yielding Government issues intended for genuine savings.

In the qualitative control of credit, the United States are still at a highly empirical stage. Their capital market remains free. Nor do any general instructions appear to have been given to the commercial banks to guide them in the task of distributing their credit facilities in accordance with a general plan anchored to the defence programme. There have been some specific injunctions against the grant of instalment credit facilities; and these have been framed with the objective of discouraging the sale and production of durable civilian consumption goods, such as cars, refrigerators and vacuum cleaners, which compete for their material and labour with the industries that should now be working full out on defence orders. Apart from this negative influence on the distributive control of bank credit, the Federal Reserve System has set up an elaborate machinery to provide liaison between the banking system and industrial firms engaged on defence work.

It is clear, however, that the banking authorities in the United States have little faith in their ability to hold the

situation through the existing means at their command for the qualitative control of credit. It must be realised that, out of a total volume of United States bank deposits of \$65,211 millions (the figure for last April), only \$46,179 millions were held by member banks of the Federal Reserve system and thus amenable to the control vested in that system. Moreover, the recent history of United States banking suggests that the powers of moral suasion of the Federal Reserve authorities, even over their member banks, are not highly developed. There could, under existing conditions, be no parallel in the United States to the general body of instructions on the distribution of credit given to British banks by the Treasury through the Bank of England on the outbreak of the war. This probably explains the persistence with which the Federal Reserve authorities have been demanding stricter quantitative control of the credit situation. They are to have their way. From November 1st, the reserve requirements of member banks will be raised to 6 per cent on demand deposits (against the present figure of 5 per cent) and on time deposits to 26 per cent (against 22½ per cent) for Central Reserve City banks, 20 per cent (against 17½ per cent) for Reserve City banks and 14 per cent (against 12 per cent) for country banks. The new higher ratios are the maxima which the Board of Governors are empowered to impose under existing legislation. They will cancel about \$1,200 millions of excess reserves, compared with the latest total of \$5,190 millions to which these excess balances have been swollen. If, therefore, the quantitative control of credit is to be at all effective, fresh legislation is needed to increase the reserve requirement maxima and to make them apply to non-member as well as to member banks.

If these moves and preparations are to be taken at their face value, they suggest that the United States has gone back to the principle of credit control by allowing the rate of interest to squeeze out non-essential production. Excess reserves will have to be mopped up to the point at which genuine scarcity of credit becomes evident and at

which interest rates begin to climb. It might have been thought that, following the hard-earned experience of the belligerent countries, greater efforts would have been made by the United States to attain the objective of control over the distribution of credit by more direct and less expensive measures than those now under contemplation. Perhaps what the United States Treasury and Federal Reserve authorities have in mind is a mixture of the two techniques. It is true that, in Britain, where qualitative control of credit is attaining some proficiency, the volume of bank cash as determined by the authorities is not allowed to rise above the minimum level required to uphold the superstructure of bank credit. No harmful effect to the structure of American money rates need therefore be caused by merely absorbing the existing volume of excess reserves, provided subsequent reserve policies or open market operations see to it that the credit expansion demanded by the still swelling flood of production is satisfied without causing any perceptible hardening of money rates.

It is nevertheless evident that this tinkering with reserve requirements cannot solve the problem of inflation in the complete war economy into which the United States is fast becoming immersed. More direct methods will have to be used. Taxation must inevitably be raised further. A wide expansion of the social security programme and, in particular, of unemployment and health insurance, would act as a potent antidote to inflation at the present moment. Finally, direct measures of price control and of its corollary, civilian rationing, will probably have to be extended. The machinery for this has already been set up with the establishment of the Office of Price Administration and Civilian Supply. If the ghost of inflation is to be effectively laid in the United States it will be by Mr Henderson, the head of this organisation, and Mr Morgenthau, with his fiscal armoury, rather than by Mr Eccles and his power to adjust bank reserve requirements.

Food Distribution Shares

IT is a sound investment principle to include in any portfolio of equities a fair proportion of shares in concerns supplying the necessities of life, and it might well be contended that, within this class, firms engaged in retail food distribution should be given a high place. The contention is just, subject to a further principle, applicable to all investments, namely, that the management must be in question distribute much which, even in time of peace and full employment, cannot without an abuse of language be termed necessities. It has also to be remembered that, since little capital equipment is necessary to start up in a small way, competition is always acute—except in those areas where town planning has imposed too strict limits on shopping facilities—and that, even there, the large chain stores and the co-operatives bid against one another.

Actually, the private grocer and the co-operatives take one large slice of the total trade, and the provision departments of almost every large store another. In view of this and the grouping of the remaining companies, the investor has not a very wide choice in this field. Even so, a representative selection of the shares available shows wide variations of experience over as short a period as the past decade. Of the eleven companies selected, the first four represent the retail trading in food of the Unilever group, and the fifth, International Tea, their principal competitor. The ABC and Lyons run food distribution as an adjunct to catering businesses. The Express Dairy does some catering, while it and United Dairies treat food distribution as a sideline to their milk business, but, before the war at least, must have handled a large volume of dairy produce and packet foods. Fortnum and Mason are a guide to the purchases of the relatively well-to-do, while Lovell and Christmas, more properly merchants than retail distributors, are included to give a clue to the development of the wholesale side of the business, in which some of the firms actually selected are engaged to a greater or lesser extent. In fact, in this business it is extremely difficult to segregate firms into producers and wholesale or retail distributors.

One aspect of the past history of the companies selected is summarised in Table I, giving figures of gross profits, where available, over a period of ten years. So far as increase in earning power is concerned, the two dairy companies are in a class by themselves—on the showing of these

figures. This probably reflects the progressive triumph over their smaller competitors, the secular upward trend in milk consumption and their success in invading parts of the territory of the grocer—a campaign carried out both by their shops and their roundsmen. They were doubtless also assisted by the growth of population in London and its

CANADA HER WAR EFFORT AND POST WAR POSSIBILITIES

The Financial News
is publishing gratis with its issue of
October 20, 1941

a 44 pp. Supplement containing many authoritative articles on Canada's war effort, and on post war possibilities, by leading Dominion Ministers. The Supplement will include the first detailed description of the St. Lawrence Deep-Waterway project to be published in this country.

surroundings, up to the start of evacuation on a considerable scale. It may be noted in passing that the activities of the roundsmen, outside the distribution of milk, have already been severely restricted, and may suffer still further; but there is a substantial offset to this loss of business by the saving in cost through the reduced service rendered to the consumer by the cutting out of deliveries.

As will be seen from Table II, neither of these companies has so far found it necessary to reduce its dividend from the high level of full peacetime operation. This is, however, not true of the next share for consideration, Lyons ordinary, which suffered a cut from 23 to 20 per cent rather over a year ago. For Lyons, catering is presumably the most important single interest. With their widespread geographical distribution, it is doubtful how far evacuation and bombing would have reduced profits from this source. It is probable that the progressive withdrawal of men and women into the forces, the restriction of food sales through their shops and, perhaps most of all, the dislocation of their normal methods of manufacture by the restriction of imports, accounts for the setback in earnings recently shown. The case of the Aerated Bread Company, their direct competitor over a considerable field, is far less fortunate. Already suffering keenly, for a couple of decades at least, from the competition of their more successful rival, they have been exceptionally hard hit by the concentration of their business in the London area. It is clear that the task of regaining even the reduced share of the market which they held before the outbreak of war will be one of exceptional difficulty.

Next there are the grocery chain stores *par excellence*, the Home and Colonial, with its affiliates, Lipton and the Maypole and Meadow dairies, and the subsidiaries, Brouchs, Pearks and Sherry's, on the one hand, and their rivals, the International Tea Company's Stores, on the other. Almost ever since the proposals for an amalgamation of these two groups were rejected, at the fiftieth minute of the eleventh hour, by International Tea, the fortunes of the Home and Colonial group have suffered a reverse. The profit of the parent declined from £862,000 in 1931 to £206,000 in 1935, and after more than doubling in the following three years, suffered a setback in 1940. This fall appears to have been due entirely to the incidence of EPT, the base period for which coincides with the three years when both Home and Colonial and its affiliates were experiencing the full effects of a period of unwise management. Two of those years saw the fortunes of International Tea near their highest, and it appears to be mainly, if not wholly, on account of this past misfortune that, while the shareholders of the latter group received 12 per cent last year, those of the Home and Colonial stand very little chance of getting anything until the war is over—or the basis of tax assessment is altered. The experience of this company is a supreme instance of the inequity of EPT. Maypole and Meadow dairy shareholders are more fortunate, but their return is very moderate. Before attempting any estimate of the future, it should be pointed out that the exceptionally good results of International Tea for the year ended April 30th last were accompanied by a very heavy fall in stock-in-trade from an unparalleled peak of over £2,500,000 to not very much more than £1,750,000, which was rather below normal.

The immediate outlook is conditioned by restrictions upon the supply of foodstuffs, by the growth of price-fixing and by the extent to which these companies can find new outlets for their energies, and others can invade their already limited field. Most of the figures so far available relate to periods when rationing and price-fixing were still in their early stages. A good deal of progress has been made in both fields

lately, and there is every reason to look for more, if only as one way of preventing, or at least mitigating, the effect of a considerable dose of credit creation upon the cost of supplies to the Government. It will not be surprising if, in the course of the next few months, most foodstuffs which can be considered at all essential are brought under control of one sort or another. It is also the fact that—despite any easing in the shipping position which may accrue within a similar period—the supply of non-essentials ought not to increase, and should possibly be reduced still further for certain sections of the population. It is also virtually certain that, with every fall in the total supply, and with every extension of price limitation, a larger proportion of the total will go to the less well-to-do, with a resultant tendency to improve the relative position of those concerns which cater mainly for the industrial worker and in particular those in heavy industries.

With the significant exception of International Tea, the latest accounts all show an expansion in stocks, but this does not carry the story much beyond April. According to the statistics compiled by the Bank of England, there were marked rises in stocks of foodstuffs, compared with a year before, up to the end of May, since when there has been a sharp decline. The figures are based on a much less representative sample than those of sales, but the development doubtless reflects the disappearance of a further section of luxuries from the shops. Taken by and large, it is improbable that the experience of individual concerns will differ much in this respect from now on, although there will still be some room for initiative to yield results.

The companies selected, with the exception of ABC, enter upon a period of restricted supplies with strong liquid positions. Their actual liquidity should be increased by a falling off in turnover, but their ability ultimately to replace stocks will depend upon a maintenance of the present price level. Further, a combination of very high taxation with an inadequate system of allowances and war damage contributions may make inroads into the resources of all companies. Accounts so far published do not suggest that these inroads have been serious to date, but it is a matter which should be closely watched. With these very important reservations, the more distant outlook for retail food distribution appears to be reasonably good, better for those who cater mainly for large numbers, less so for the high-class specialist trade. Post war conditions are, by common consent, likely to differ from those of the past, both in the relative demands of different strata of society and in trading conditions. Adjustment to these changes is likely to call for a high degree of initiative, and management will, probably, be even more important than it has always been. Table III shows recent

TABLE III.—PRICES AND YIELDS

Company	1939		1940		1941	Yield on Oct. 15 Latest Div.
	High	Low	High	Low	Oct. 15	
Home & Colonial (4s. ord.)	5.6	2.4	4.6	2.6	3/	...

* Ex. dividend.

movements in prices and the yield obtainable on the basis of the dividend paid for the last completed year. It will be seen that, for those companies which made payments, the equity yield ranges from 4 to some 5 per cent, for the retail distributors. The return on Lovell and Christmas reflects the virtual certainty that their export business must suffer severely under existing shipping conditions. This return compares with one of 4.69 per cent for stores and catering for the end of September given by *The Actuaries' Investment Index* and with 5.25 per cent for industrial equities as a whole. It is a clear indication that the impending reduction in turnover is considered as being strictly temporary, and places the shares which give these yields on an equal footing with such groups as building materials, electricity supply, gas, electrical and motor manufacturing, all industries intimately concerned with the supply of necessities or amenities.

Finance and Banking

Treasury Deposits into Bonds

The money market has sunk back into lethargic monotony during the past week. Now that the excitement of bidding for the end of year bills has passed, the tender rate for Treasury bills has returned to its normal level, yielding a profit of some £20 for every £1,000,000 of bills turned over to the banks at their buying rate of 1 per cent. With part of the Empire central bank demand for bills satisfied through the tap, the market is faring slightly better in its allotments at the weekly tenders. Last week it obtained a 32 per cent allotment. The banks have been fair buyers of bills, despite the £60,000,000 of Treasury deposit money which they have paid over during the week, and the extent to which they helped to swell the first week's total of National War Bond sales. These reached £31,169,850 in the five-day period, October 9th-14th, the week's total of subscriptions to war and savings bonds amounting to £41½ millions. So far as the banks are concerned, however, it is generally assumed that their subscriptions were financed by recalling Treasury deposits prior to their maturity, and the net effect of these operations on the money market (and on the Exchequer) was therefore nil. There is no evidence of stringency in the latest Bank return, despite a further expansion of £2,744,000 in the note circulation. This factor has been more than offset by a further increase in the Bank's holding of Government securities, this item showing an increase of £3,430,000 over the week. As public deposits have fallen by a further £900,000 bankers' deposits are up from £126,468,000 to £128,217,000 on the week, a level which spells a continuance of exceptional ease. Next week, some of the banks will be making up, but this is not expected to cause the market the slightest discomfort.

South Africa's Debt Repatriation

The Union of South Africa continues on its highly profitable course of repatriating external debt out of the proceeds of gold exports. The latest such operation, by which about £30,000,000 of South African loans held by residents in the United Kingdom are being requisitioned by the Treasury, is, however, the first in which the method of payment by the Union to the British Treasury—in gold—is specifically mentioned. This gold is to be paid over between now and the end of the year and will be provided out of the reserve of the South African Reserve Bank—partly out of an accumulation of gold built up in recent months for this special purpose. By arrangements made soon after the outbreak of the war, the British Treasury has purchased through the Bank of England the whole of the gold produced by the Union at the official price of 168s, delivery being taken in South Africa. Most of that gold, as may be seen from the American statistics, has been making its way direct from the Cape to the United States. The Union, whose balance of payments with the United Kingdom has been active over the past two years, even after allowing for considerable repatriation of gold mining shares previously on the London register, and for the redemption of £7,900,000 of London debt in 1940, has, with its net surplus of sterling funds repurchased gold from the British Treasury. Thus the assets of the South African Reserve Bank maintained in London have been kept at an exceptionally low figure, the holding of British Treasury bills, for example, falling from about £1,300,000 to under £1,000,000 over the year to August 15th last. Over that period, however, the gold holding of the Reserve Bank had risen from £37,500,000 to £52,600,000. At the outbreak of war that reserve stood at around £27,000,000. There is thus ample gold with the Reserve Bank to finance the latest debt repatriation. In order to prevent this repayment from exerting an unduly deflationary influence on the Reserve Bank's position, the bulk of the internal loan to be issued in replacement of the repatriated securities will presumably, go directly or indirectly to strengthen the Reserve Bank's holding of South African Government securities.

A Bank-Insurance Marriage

One of the most interesting alliances in the history of British banking was announced this week with the news that Lazard Brothers had acquired a large holding in the firm of A. W. Bain and Sons, one of the most important insurance brokers in this country. The marriage of insurance with banking is no new thing. Their respective spheres of activity have been contiguous at a number of points. In the months preceding and following the declaration of war, some of the more astute of British merchant banks engaged either directly or through subsidiaries in insurance business. This was particularly true of banks which had to handle considerable shipments of bullion or securities either for themselves or for their clients' account. The disorganisation of the normal insurance market at the time and the inordinate rates quoted made the intrusion of these banks in this field highly remunerative for them. This latest development is, however, quite of another character. It represents an investment of banking funds in a business of general insurance brokers. The main motive for it must not be sought in special factors making specifically for such an alliance. Rather is it to be found in the fact that Lazards, owing to the dwindling of acceptance, foreign exchange and issuing business, find themselves in an exceptionally liquid position and are not averse to the investment of their unutilised resources in directions which provide them with some hedge against the possibility of a permanent contraction in the traditional sphere of activity open to the merchant banks.

Instalment Finance in Canada

Important restrictions on instalment purchase finance have been announced in Canada this week. They form part of a series of measures intended to counter inflationary tendencies set in motion by competition between civilian demands for durable consumption goods and the needs of the armament industries. A list of goods has been published of which the "cash down" payment must equal at least one third of the total purchase price, and the balance must be paid in full within twelve months. No monthly payments are to be less than \$5. For other goods, such as motor cars, where the competition of civilian demand is to be especially discouraged, the minimum cash payment has been put as high as 50 per cent. These instalment finance restrictions are to apply to second hand as well as to new goods.

Clearing Bank Returns for September

The September clearing bank returns were commented upon in these columns last week. The customary table showing the changes in the principal items over the previous twelve months is given below. The detailed returns for September will be found on page 492.

In £ millions						
	Sept. 1940	May 1941	June 1941	July 1941	Aug. 1941	Sept. 1941

Black Market in Shanghai

The delays encountered in getting the new Chinese exchange control scheme into full and smooth operation have given some encouragement to the development of a black market for Chinese dollars in Shanghai. The authorised banks are selling American dollars and sterling in limited quantities at the fixed rates, but the demands for these currencies from holders of Chinese dollars apparently exceed, by a considerable amount, the volume of exchange which the authorised banks are prepared to sell. This week, despite the news of the Chinese victories (news which

Shanghai can perhaps discount at a more realistic rate than London), Chinese dollars came heavily on offer in the unofficial market. The rate for American dollar notes has risen this week from about 24 to 34 Chinese dollars to the American dollar against the official equivalent of 19½ Chinese to 1 American dollar. Negotiations are now going on in Hongkong which, if successful, should considerably ease the functioning of the exchange control. But, however smoothly that control works, it is evident that it will never abolish the black market in notes for which Shanghai offers the ideal setting.

Investment

Search for Security

Another week of see-sawing prices has failed to bring any decisive development in the stock markets. According to the indices of *The Financial News*, industrial equities are now about 2 per cent below their peak of mid-September and some 1.6 per cent under the level of a few days ago. Against this, fixed interest stocks have, according to the same authority, touched a new high record, although this does not appear to be the case with the majority of the gilt-edged list. In that section, while there have been recoveries in the "longs" which bring them to, or within sight of, their previous maxima, the "shorts" have continued weak, and there is as yet no sign of the adjustment of this section of the market to the terms which the new tax issue suggests are now acceptable. If that issue has done little to bring activity, or even substantial price changes, to the Consol market, it has given rise to a good deal of discussion as to the outlook for the Funds. According to the classical school of thought, the improvement, which has occurred in almost every section of the market in twelve of the fifteen months since prices began to recover from the collapse of France, is due to returning confidence. Fixed interest prices are now above, and those of equities not much below, the levels ruling before the collapse, and yields are, in general, lower. According to the same school, this general movement should be followed by an improvement of equities in terms of fixed interest stocks, a movement which has already gone some way, despite the crippling effects of EPT on the former. In so far as that impost is not to be regarded as a permanent feature of taxation, the tendency for relatively greater progress in equities should materialise, and it is a matter of opinion whether the relative decline in the Funds should take place by a fall in their prices or a further rise in equities, or, indeed, by a general but unequal movement in either direction.

While it would seem that this argument should apply in anything approaching a free market, and while prices will doubtless discount a return to such conditions well in advance of the event, it seems doubtful whether it does full justice to the potency of the measures by which low interest rates are at present maintained. By canalising the flow of additional bank deposits into "shorts," by pressing insurance companies to take nothing but Government securities, and by the investment of the proportion of extra-budgetary receipts which is not spent outright, the Treasury is able to apply strong pressure to keep up the level of prices. Much of the new Government securities issued are either not negotiable or, like National War Bonds, do not make a wide appeal to the ordinary investor. Thus the total supply of Government stock in which private investors are mainly, and institutions considerably, interested does not show the proportionate rise which the heavy borrowing of the Government would seem to postulate. Prices, or terms of issue, of a large section of stocks remain virtually stable, with the exception of the terms of issue of National War Bonds, and the impact of much of the demand, private, institutional and official, is concentrated upon the remainder, whose volume is stationary. No doubt there is a point beyond which the power of these factors must decline rapidly, and no doubt the whole set-up depends upon the assumption that a closed market will be maintained for some time to come. It seems doubtful, however, whether the return to anything like free conditions is sufficiently near to exert any great influence on the course of prices for some time.

South African Vesting

The end of last week brought the first order vesting South African securities held in this country. Hitherto, the Union has been able to dispose of any surplus of sterling held by the repayment of maturing stock, some £8,000,000 of 5 per cent loan having been paid off by July 1, 1940. The present operation is more substantial, involving four issues, the 3 per cent stocks of the Cape of Good Hope and Natal, the 4 per cent Union stock of 1943-63 and the 5 per cent issue of 1945-75, with a total amount outstanding of just over £40 millions. The first two stocks, accounting for one-third of the total, are callable at any time and could not be replaced on such favourable terms. The others are taken over before their due date, but at the market prices, plus interest to the date of payment under the vesting order, namely December 1st next, for those who lodge their stock with all necessary documents by November 10th. As the Union will still have some £52 millions of high-interest stocks outstanding after the operation, no complaint can be made, even by those who consider that the market price does not fully reflect the right to a continuance of the present rate of interest. As in the case of all recent vestings, holders of the stock to be surrendered may invest the proceeds in Government tax issues, subject to the regulations as to maximum holdings. Further, while residents in the United Kingdom must surrender their stock, those within the sterling area, but outside these islands, may do so under the terms of the offer. It is calculated that, of the total outstanding, about one-quarter is held outside the United Kingdom. The only point which distinguishes this operation from the vesting of Indian and Canadian stocks is the method by which the British Treasury is to be put in funds. In the other cases, the object has been to get rid of accumulations of sterling. But the Union, as a gold producer, keeps its surplus in gold rather than in currency, and payment is to be effected in that form before the end of the year. A substantial part of the total, estimated at some £30 millions odd, has already been accumulated, and the rest will be withdrawn from the reserve of the Reserve Bank until this is replenished by new deliveries from the mines. The purchase of this gold is to be financed by a special internal loan, which is, apparently, already on tap.

"Limited's" Obligations to NV

The board of Lever Brothers and Unilever, Limited, has made a further statement which gives greater precision to the conditions under which payments may be made to holders of ordinary capital of the Dutch associate, NV, out of the £1,500,000 set aside for this purpose from the profits of 1939 and 1940. Actually, the statement does little more than confirm what had already been supposed. There is, first of all, the overriding consideration that, before any payment can be made, the consent of the Treasury must be obtained, which was a foregone conclusion. It is further provided that normal relations must have been resumed between the English and Dutch companies, and that the latter must renounce any right to declare an ordinary dividend in respect of the period prior to settlement and release any claim which it might have under the equalisation agreement. Finally, a holder of ordinary shares in the Dutch company will only participate in any distribution if he has acquired his shares *bona fide* in English law, the payment in fact going to the *bona fide* holder irrespective of where the actual physical ownership lies. While the statement contains little that is new, it is perhaps permissible to deduce from its publication that conversations have at least been initiated with the British authorities, and possibly with those of the Dutch Government here, as to the method of a final settlement.

Mexican Oil—A Fresh Start

The decision of the American oil interests to reject the terms of compensation, offered by the Mexican Government, for the expropriation of their properties, has been hailed as a bull point for British interests, and in particular for the shares of Mexican and Canadian Eagle. In so far as this means that British and American interests see more nearly eye to eye on the matter, it is a step in the right direction, but it seems far from being established that an acceptable settlement is near. The dispute is now over 3½ years old. The British companies went to the limit of reasonable concessions in the Richberg negotiations, broken off by the then President of Mexico as long ago as August, 1939. It was then conceded by the companies that the Mexican Government which had granted the concessions had acted against Mexican traditional law in alienating the sub-soil, but it is on this very point of compensation for sub-soil rights that the negotiations with American interests have broken down. There is every reason to suppose that the position of Mexico has been weakened by the outbreak of war and the closing of alternative markets, but there is, so far, little indication that the Government is prepared to adopt a conciliatory attitude. There can be no question about the desirability of bringing Mexico effectively within the American bloc of nations, but there are plainly limits to the concessions which can be made for this end. It is also plain that the British Government should do what it can to act in consort with Washington in all matters affecting our interests, but this is rendered difficult by the unfortunate fact that diplomatic relations between this country and Mexico, broken off in 1938 by President Cardenas, have not been resumed. It is perhaps not too much to hope that, after this rebuff by the American interests, it may be possible to resume negotiations on the oil question alone, but, in view of the disadvantages under which Mexico continues to labour owing to the failure of the settlement, it seems more than probable that the aims which bulk largest in their programme are not purely financial. In these circumstances, perhaps the best hopes of settling the oil dispute lie in the conclusion of a wider arrangement, including the restoration of diplomatic relations, a development which, there is reason to suppose, would be very welcome to Mexico.

Company Notes

United Dairies' Earnings

Even the most optimistic stockholder must be pleasantly surprised by the stability of United Dairies' profits at £522,838 against £527,404 in the year to June 30th last. Interest charges are somewhat lower at £3,372 against £7,157, and it is consequently possible to maintain the 12½ per cent dividend, which has been distributed throughout the last decade, out of current profits. The rate of equity earnings again amounts to 12.6 per cent and the small surplus of £1,416 raises the carry forward to £171,487. Since the proportion of the foodstuffs retailed by the company, which fell within the scope of rationing, increased substantially, and now includes both jam and eggs, these results are highly creditable. Moreover, the chairman, Mr J. H. Maggs, points out in his statement that sales of liquid milk were restricted both by the outbreak of heavy bombing in the autumn of 1940 and the following spring, when sales in London had returned to normal, by the Government decision to curtail liquid consumption in the interests of manufacture. It does not seem to be inevitable that the company will be adversely affected by Government control of milk distribution, which will, presumably, do nothing to reduce the total of liquid milk available for consumption. But it must be remembered that, in so far as the scheme succeeds in levelling out consumption, it may work to the disadvantage of those areas with a high standard of adult consumption, and there is every probability that United Dairies are pre-eminently interested in supplying these areas. The balance sheet shows a satisfactory degree of liquidity, creditors, including taxation, having fallen from £681,383 to £609,752. Debtors, although some £6,000 higher, stand at the inconsiderable total of £41,856, but cash holdings are up from £239,940 to £251,034 and Government securities from £275,654 to £526,044. The reserve fund is unchanged at £1,100,000. The directors are able to state that, despite a reduction in profits of subsidiaries, dividends have been covered by current earnings after meeting ARP and war damage charges. The value of the balance sheet is

unfortunately impaired by the absence of a consolidated statement, investments in subsidiary companies amounting to £4,270,934 out of total assets of £7,982,441. The £1 ordinary stock, at 49s. 3d. ex dividend, offer a sound yield of £5 1s. 6d. per cent.

Brazilian Traction

After a lapse of two years, ordinary shareholders in Brazilian Traction are again to receive a dividend, amounting in the current year to 40 cents per common share of no par value against 50 cents in 1938. It has always been clear that the failure to maintain ordinary payments was due to exchange difficulties rather than to the moderate setback to gross and net earnings which has occurred during the past two years. Indeed, gross revenue of \$9,849,000, in U.S. currency, for the calendar year 1940 showed only a moderate decline from the \$10,316,000 earned in 1938 and was substantially above the \$6,636,000 realised in 1936, when ordinary shares received 70 cents. Moreover, the carry forward in 1940 stood at \$34,245,000 against \$40,863,000, despite a transfer of \$25 millions to general reserve in 1939. Earnings per share, over the three years, have fallen only from 1.37 cents in 1938 to 1.31 cents last year. The company's main public utility services, traction, gas, electrical and telephone, have continued to expand, although, as was pointed out in last year's report, operating results have suffered from the rise in costs. The factor most vitally affecting dividend payments is, however, the state of Brazilian trade and its implications for the exchange position. There has been growing evidence during the past year that Brazil has begun to adapt its foreign trade to the disruption which followed on the German occupation of Europe. Trade with Germany in cotton goods has to some extent been replaced by markets in other South American countries and in Canada, while the exchange position has no doubt been eased by credits for trade purposes, made available by the United States, and by the improvement in the coffee position. Moreover, there has been a certain import of refugee capital in recent months, which has further increased the liquid resources available for transfer. Payment to shareholders is, of course, subject to Canadian non-resident income tax. The price of ordinary shares in this country rose to \$12 on the announcement, later reacting to \$10½ compared with \$6 in New York.

"Emmies" Improvement

The preliminary statement of Electric and Musical Industries for the year to September 30, 1941, shows a substantial rise in net earnings, after tax and contingencies, from £38,048 to £126,581. Thus, last year's net profits are greater than the total income for 1939-40 of £120,919, and are, in fact, the highest since £313,964 was realised in 1936-37, when ordinary shares received 10 per cent. The preliminary statement announces a payment of 6 per cent on ordinary capital, the first since 5 per cent was paid in 1937-38, and equity earnings can be estimated to provide a rate of cover amounting to 7.8 against 1.3 per cent. In the absence of any transfer to reserve, the carry forward should be raised from £169,652 to £195,000. These results must prove reassuring to shareholders, who may well at one time have considered a distribution on ordinary capital out of the question for the duration. It is probable that the company is at last benefiting from readjustment of some of its equipment to war production and also from the adaptation of sales and factory organisation to which reference was made in Mr Alfred Clark's speech at the last ordinary general meeting. In the absence of the accounts, it is difficult to estimate whether the chairman's forecast that purchase tax would not restrict sales of records has proved correct, but there is every probability that sales of bicycles have again been limited only by shortage of raw materials. There is little doubt that the improvement in trading profits of the operating companies which took place in the last three months of the year ended September 30, 1940, was maintained and probably increased last year. The 10s. ordinary shares now stand at 12s. 9d., offering a yield of £5 per cent.

Trinidad Petroleum Development

The preliminary statement of Trinidad Petroleum Development for the year to July 31st last shows net profits, before tax, of £342,770 against £360,677. There is no

announcement as to whether the company's EPT liability has yet been agreed, but provision for tax and contingencies amounts to only £175,000 against the £200,000 for 1939-40 which the directors considered fully adequate. This reduction permits a rise in equity earnings from £160,677 to £160,770, representing a rate of 17.2 against 16.8 per cent, and the 10 per cent final dividend is repeated, making again a total of 15 per cent for the year. In the absence of a striking rise in expenditure on oil wells and development, it would appear that total earnings have risen by much less than the previous year's increase of £264,217. Since there is a strong probability that demand for the company's output was at a maximum last year, it is likely that rising costs have played an important part in restraining net earnings. The Trinidad companies did not participate in the recent boom in oil shares; the £1 ordinary, at 57s. 6d. ex dividend, yield £5 4s. 4d. per cent.

Montague Burton Setback

The preliminary statement of Montague Burton for the year to March 31st last shows a fall in net profits, struck after EPT, but before income-tax, from £677,099 to £454,168. No further information is supplied other than that the ordinary dividend is to be maintained at 5 per cent. It seems probable, however, that the profits figure of £454,168 is net of depreciation, fees and debenture charges, but before transfer to staff funds. Since income-tax absorbed £320,059 in 1939-40, and can scarcely have required less last year, despite the strong probability that gross income was lower, cover for the ordinary dividend, which amounted to an earned rate of 13.8 per cent in the previous year, must have been reduced to an extremely low level. In the absence of the accounts, it is impossible to say whether payment of the ordinary dividend required a draft on the carry forward, which stood at £241,692 at March 31, 1940. In 1939-40, total income reached the record level of £1,096,572, and it is clear that last year's trading conditions, which combined rising costs and shortage of materials for

civilian use, with the smaller margins on Government contracts to clothe a proportion of their customers drafted to the Services, must have been responsible for some setback and that the fall in the net figure cannot be ascribed wholly to the impact of EPT. In the current year the concern will also suffer from the effect of clothes rationing, although it is possible that Government contracts may have done something to make good the lower turnover. The 10s. ordinary shares, at 10s., yield £5 2s. 7d. per cent.

Gestetner Accounts

The results of D. Gestetner for the year to August 31st last show remarkable stability. Gross profits are down from £231,645 to £229,621, but, after a reduction of just over £3,000 in depreciation to £17,593 and of £2,000 in tax provision to £80,000, equity earnings stand at £104,011 against £101,219. The reduction of 2½ per cent in the interim payment is made good in the final distribution, so that the total payment for the year is maintained at 25 per cent, for which the cover is raised from 25.2 to 26.6 per cent. The surplus is devoted to raising the carry forward from £34,097 to £37,253. The directors state that the company's works were fully employed last year, and there is a strong possibility that the shortage of office equipment for which enemy action and limitation of supplies have been jointly responsible has stimulated the demand for Gestetner apparatus. The balance-sheet position is also satisfactory. Stock is up from some £156,000 to £163,000; debtors from some £244,000 to £273,000; creditors by £40,000 to £78,791 and cash from £173,000 to approximately £221,000. Holdings of trustee and other securities are some £20,000 higher at cost, with a market valuation of £173,363 against £148,917. General reserve is unchanged at £65,000 and taxation reserve is down from £174,000 to £134,000. In view of last year's trading difficulties the results appear highly creditable. The 5s. ordinary stock, at 20s. ex dividend, offers a conservative yield of £6 5s. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

Uncertainty regarding the situation in Russia led to a quiet close before the week-end, with prices slightly easier. Although the announcement of the South African vesting order provided some slight support, the opening on Monday was quiet, and markets generally remained steady. The following day an improvement set in, accompanied by a revival of interest in the speculative sections, particularly in the oil market, but the volume of business remained small. Later, news of continued German progress in Russia led to some marking down of prices.

In the absence of support, prices in the *gilt-edged* market before the week-end were generally lower, some slight selling leading to declines of ¼ in 2½ per cent Consols, Local Loans and 3½ per cent War Loan, while 2½ per cent National War Bonds 45-47 and 46-48 both declined ¼. Business on Monday was slight, and apart from a gain of ¼ in 3 per cent War Loan prices remained unchanged. The following day, however, the South African call up inspired some anticipatory buying and 2½ per cent Consols and Local Loans improved ¼, while 3½ per cent Conversion and 3 and 3½ per cent War Loan all improved ¼. The tone continued firm in mid-week, with a few small rises. Small declines were generally registered in Japanese and Brazilian bonds in the *foreign bond* market before the week-end, when Mexican issues were also lower, and Czech 8 per cent bonds lost 1½ and Polish 4 per cent loan of 1924 1 point. The downward trend continued on Monday, Brazilian 5 per cent Funding 1914 and 20-year Funding A each losing 1 point, while Mexican 5 and

6 per cent issues were ½ point lower. Japanese bonds were mainly steady. Later, prices generally remained unchanged, although the 4 per cent Japanese issues of 1899 and 1910 lost ½ point each on Tuesday and Brazilian issues were slightly better.

Lack of interest in the *home rail* market was reflected in the numerous small losses both before and after the week-end. Thus, GW ordinary and Southern preferred lost ¼, and LMS ordinary and Southern deferred ¼ on the previous Friday. The decline continued at the reopening with losses of ¼ in Southern preferred, GW and LMS ordinary. Senior issues remained steady with few slight improvements. On Tuesday, however, renewed support reversed the trend and LMS ordinary and Southern deferred gained ¼, while GW ordinary rose ¼ and Southern preferred ½. London Transport "C" exceptionally fell 1½ points. Later the rise in senior issues continued, but equities tended to slip back. Small losses in foreign rail issues were numerous both before and after the week-end, but the undertone remained firm, and, on Tuesday, in common with other markets, prices were slightly higher. Canadian Pacific ordinary were persistently strong, until Wednesday, when they lost ¼.

The *industrial* market suffered from lack of support before the week-end. In the early part of the current week trading was modest, but the general tone firm. Heavy industrial issues were generally easier before the week-end, but later prices moved within narrow limits. Aircraft and motor shares were irregular, Rolls-Royce declining ¼ on Friday, while, on Monday, Raleigh Cycle Holdings, Triplex and Ford were all lower. Later, small gains predominated, De Havilland rising 10½d. on Tuesday.

Among brewery issues, losses of 1s. and 6d. for Watney deferred and Guinness, respectively, were the only changes before the week-end; but, early in the week, losses in the order of 6d. were general, extending to Bass, Guinness, Ind Coope and Watney deferred. Textile issues were dull before the week-end, Patons and Baldwins losing ¼, but recovering ½ on Monday. Later, prices remained unchanged. Shipping shares were in demand on Tuesday, when Cunard repeated the previous day's rise of 9d. In the tobacco group, Imps, BAT and Gallaher were all lower before the week-end; the two former each gained ½ on Monday and ¼ the following day. Among miscellaneous issues, Brazilian Traction jumped ¼ before the week-end on the dividend announcement, while Emmies improved 9d. on Monday. Later prices moved irregularly, but with a firm undertone.

Cautious dealing marked the close in the *kaffir* market before the week-end, but, in the absence of selling, declines were slight. At the reopening, Blyvoors were prominent with a jump of 1s. 6d., West Wits improved ¾, and Sallies gained ¼. Blyvoors continued to attract attention, but later in the week dividend-payers were mainly out of favour. While there was no great activity in the *rubber* market, either before or after the week-end, the undertone was firm, and small gains predominated. Prices in the *oil* market reacted before the week-end, Anglo-Iranian losing ¾, Burmah ¼ and Shell Transport ¾. On Monday, interest revived and Mexican Eagles were prominent with a rise of 1s., Ultramar gaining ¼ and Canadian Eagles and Shell Transport 7½d. Burmah, however, was ½ lower. The upward movement continued the next day, when the 8 per cent Mexican Eagle preference issue gained 1s. 3d. (Continued on page 487.)

Industry and Trade

Unemployment in September

The number of persons on the registers of unemployment exchanges in Great Britain has been comparatively small for some months. Unless the Essential Work Order is applied to every occupation in the country, there will always be a small number of persons between jobs, while others are temporarily stopped because of the seasonal nature of their occupation or owing to unfavourable weather. The total number of persons on the registers was 230,621 on September 15th, compared with 270,289 on August 11th and 829,846 a year ago. Of those without work on September 15th, 196,594 were wholly unemployed, 23,973 were temporarily stopped, while 10,054 were persons normally in casual employment. The solitary girl registered as unemployed among casual workers in that category on August 11th has since been joined by five others. The wholly unemployed on September 15th included 87,638 men (against 98,737 on August 11th), 12,410 boys (against 17,390), 78,854 women (against 82,208), and 17,692 girls (against 21,436). But while the unemployment registers cannot furnish many more recruits for war work, the debate in the House of Commons on Wednesday last week showed that much remains to be done to distribute Great Britain's labour force as advantageously as possible. It is the redistribution of all able-bodied adults in accordance with the needs of war that must still be speeded up. And Mr Bevin's conclusion that individual reservation may have to be substituted for block reservation fore-shadows a further step in the right direction.

Keeping Faith

The change in British export policy, which was brought about by the necessity of ensuring that Lease-and-Lend materials are used only for the purposes intended by our American friends, has inevitably caused certain difficulties. It has embarrassed some British exporters who had patriotically laid long-term plans for an export drive which must now be abandoned, and it has been suspected of ingenuously by some people in the United States who did not realise that some deliveries are still arriving which were arranged for before the passage of the Lease and Lend Act. The position is made more bewildering for these people by the fact that advertisements still appear in the British press for goods which British manufacturers would not be justified, under the terms of the September White Paper (which was discussed on page 344 of *The Economist* of September 20th), in exporting. In point of fact, these advertisements are on the same footing as those of a well-known breakfast food which ingeniously contrives to depict an invisible toast-rack. They are meant, not to suggest that the goods are available for export, or even, necessarily, for home consumption, but to keep alive goodwill ready for the time when materials are again available. It is to correct this impression that the press, including papers like *The Economist*, which do not usually carry advertisements of this kind, has been asked by the Ministry of Information to publish the announcement on this page.

Decline in Retail Trade

The returns relating to the average daily value of retail turnover, compiled by the Bank of England, suggest that, compared with a year ago, the fall in the volume of sales has appreciably exceeded the rise in prices. As the accompanying table shows, the average daily value of both food and other sales has been lower than in the corresponding month of 1940 since last May; the only exception was the increase in non-food sales in June, when the introduction of the clothes rationing scheme gave rise to a temporary spurt in purchases. The fall in turnover last August was widespread, both geographically and in individual commodities. The fact that total sales in Central London were only 2.3 per cent smaller last August than a year earlier, compared with a decline of 5.4 per cent in Great Britain, suggests that the movement of population has been reversed. Indeed, sales of food showed an increase of 33.4 per cent in Central London, against a fall of 1.9 per cent in all districts. The value (at cost) of food stocks held by retailers in Great Britain was 23.2 per cent lower

than a year ago at the end of last August, but that of other merchandise showed an increase of 13.3 per cent on the year. The fact that not only the volume, but also the value,

PERCENTAGE CHANGES IN RETAIL SALES FROM PRECEDING YEAR

		Food and Perishables	Other Merchandise
1940	August	+ 5.4	+21.0
	September	-11.5	+ 6.7
	October	- 5.2	+20.9
	November	- 0.3	+ 1.3
	December	+ 0.8	- 6.7
1941	January	+ 5.8	- 8.8
	February	+ 3.5	+ 1.8
	March	- 2.1	- 2.1
	April	+ 0.9	+ 2.9
	May	- 4.3	- 2.4
	June	- 3.1	+ 6.8
	July	- 6.7	-15.9
	August	- 1.9	-10.8

of retail trade is now running below last year's level emphasises the need for adapting the industry more rapidly to wartime conditions.

Cotton Prices

At the beginning of this week, a new schedule of raw cotton prices came into operation. Since March 31st, when the Liverpool futures market was closed, prices have remained at the level then existing. Prices of the different grades have now been adjusted to bring them into closer relationship with their respective spinning values without appreciably altering the general level of prices. American middling fair staple has been raised from 9.24d. to 9.25d. per lb. There has not been any change in fully good fair Giza 7 or Sakel descriptions. Ashmouni F.G.F. has been reduced from 11.37d. to 11.15d. per lb., and Zagora F.G.F. from 11.07d. to 10.90d. per lb. Substantial reductions have been made in the spot prices of Indian cotton. Some adjustments have been made in yarn prices in accordance with the changes in raw cotton rates. The Controller has announced that spinners' margins will not be increased in the near future. According to our Manchester correspondent, spinners are disappointed at this decision, and further representations are likely to be made in this matter. The Controller has stated that there has been a substantial improvement in raw cotton and coal supplies to nucleus mills during the last few weeks. Steps are now being taken to bring the staffs of nucleus mills up to the level required for maximum production. The alterations announced have not had much effect upon new business; in practically all sections of the industry, demand exceeds supply, and numerous orders cannot be placed because manufacturers are not able to obtain cover in yarn.

Food Ration Changes

Recent weeks have seen several changes in the quantities of rationed food allowed to the domestic consumer, and others have been announced for next month. The table overleaf shows the changes which have taken place during the year in rations which are calculated on a weekly basis. In addition, preserves and syrup were rationed from March 17th to one pound per month. This was reduced to half a pound on May 1st and increased to one pound in four weeks from July 28th. At first, retailers were allowed to sell any surplus over their ration requirements, but this concession was later withdrawn. It has recently been announced that mincemeat will be included in this ration. In addition to the charges tabulated, registration was also introduced for eggs, milk and onions. The allocation of eggs was approximately one a week during July and August, 3 and 2 a month respectively in September and October. A daily minimum of liquid milk has been guaran-

The fact that goods made of raw materials in short supply owing to war conditions may be advertised in this Journal should not be taken as an indication that they are necessarily available for export.

teed of one pint for expectant mothers and children under six, and half a pint, in addition to milk in schools, for children from six to seventeen years old. The 1941 crop of onions is to be distributed to customers who have registered.

CHANGES IN WEEKLY QUANTITIES OF RATIONED FOODS IN 1941

In force	Sugar	Bacon	Butter or Margarine	Margarine or Cooking Fats	Meat†	Tea	Cheese
Jan. 1	8 oz.	4 oz.	6 oz. (not more than 2 butter)	2 oz.	1/10 (exc. offals and pork)	2 oz.	...
" 6	"	"	" " "	"	1/6 (inc. offals and pork)	"	...

† Half rations for children under 6. ‡ Cooking fats only.

§ 8 oz. for agricultural and certain other heavy workers.

* During July an extra half-pound weekly was issued for jam-making.

tered with greengrocers, and is expected to yield not less than two pounds per head. It is open to question whether the labour and expense involved in rationing such commodities as onions is justified by the small result.

American Zinc Supplies and Prices

The price of zinc in America, which had been kept stable at 7.25 cents per lb. (East St. Louis basis) since September 23, 1940, has now been raised to 8.25 cents. While the current price is the highest since 1925, it is still 50 per cent below the peak reached during the last war. The increase, which is designed to stimulate production, appears to mark a departure from the policy of stabilisation, for in the case of copper, it had previously been decided to provide an incentive to expansion by the granting of subsidies to high cost producers rather than by a general increase in prices. Last year, when Germany secured control over the zinc smelting industry of Belgium—the biggest after that of the United States, and one of Great Britain's sources of supply—and when the United States had to meet part of Great Britain's as well as its own growing requirements, a serious scarcity of this metal seemed imminent. But the position has shown some improvement in recent months, due to the American Government's decision to increase domestic refining capacity by one-fifth and to import the surplus ore of Latin America, Canada and Australia, and to the enforcement of a priority system since the beginning of July. Domestic production of zinc is now at the rate

of 900,000 short tons per annum, against 724,000 tons last year, while deliveries in the past three months were at the annual rate of 825,000 short tons, compared with 775,000 tons in 1940. As a result, "visible" stocks in the United States, which had fallen from 122,814 short tons at the outbreak of war to 6,969 tons at the end of last March, rose to 19,427 at the end of last month and are expected to show a further improvement, especially if the increase in prices acts as a stimulus to production.

More Fish for Eire

During the first half of this year, landings of fish on the coast of Eire have more than doubled in value compared with those of January-June, 1940. That this increase is by no means all due to the rise in prices is shown by the following table:

	Quantity	Value	Quantity	Value
	1940	1941	1940	1941
Prime fish:—				
Brill	272	273	1,341	1,826
Solms	921	745	2,972	5,890
Turbot	178	163	1,063	1,175
Total prime fish	1,371	1,003	8,576	8,891
Wet fish:—				
Cod	7,665	5,635	23,597	23,204
Conger eel	685	1,019	697	2,142
Haddock	1,083	1,310	2,571	4,637
Hake	1,680	662	6,748	3,080
Herrings	18,177	34,989	14,837	39,173
Ling	354	631	558	1,347
Mackerel	29,754	64,271	15,287	144,748
Plaice	5,121	4,825	15,119	20,969
Ray or skate	4,993	6,543	5,845	12,357
Sprats		45		15
Whiting	11,838	17,103	15,352	26,369
All other ex. shellfish	5,096	4,090	8,534	10,026
Total wet fish	87,817	142,126	117,721	296,958
Shellfish:—				
Crabs	7,224	6,792	67	105
Crayfish	216	562	10	36
Escallops	185,252	271,452	1,510	2,765
Lobsters	37,692	26,092	1,993	1,795
Oysters	28,500	48,728	187	317
Mussels	6,780	20,481	1,088	4,120
Periwinkles	10,077	15,020	3,169	5,365
Other shellfish	360	423	305	293
Total value of shellfish	...	...	8,329	14,796
Grand total of value	...	...	126,050	311,754

There is a presumption that the impulse to this increased activity was the shortage of food in Eire, for it is among the cheaper wet fish, the staple fish foods such as herrings, mackerel, whiting, haddock and skate, that the increase in the bulk of landings is most marked. Catches of luxury fish such as brill, soles and turbot were all smaller, and increases in shellfish landings did not include lobsters. It is remarkable that such substantial increases have been practicable in present conditions.

COMMODITY AND INDUSTRY NEWS

THE Board of Trade has informed the Metal Exchange that it is unlikely to licence the export of tin to the United States in the near future. Tin prices have continued stable. On Wednesday standard cash was £265-£265 5s. per ton, as it was a week earlier. Three months' tin was £259 10s.-£260 per ton, compared with £259 15s.-£260.

Cotton Market.—The feature of interest has been the announcement by the Controller this week of the revision of raw cotton prices, discussed in a note on page 483. The alteration in raw cotton prices will be of some benefit to certain spinners, as rates have been reduced, especially for Indian qualities. General business, however, has not shown any particular expansion. There have been further efforts to place cloth orders by shippers, but manufacturers have sold cautiously, as they are already short of yarn. Most of the contracts have been for South America, Java, West Africa, Egypt and the Dominions, with a few Government con-

COMPANY MEETINGS

A. C. COSSOR, LIMITED

WORKS FULLY OCCUPIED

SIR LOUIS STERLING'S SPEECH

The third ordinary general meeting of A. C. Cossor, Limited, was held, on the 15th instant, at Winchester House, Old Broad Street, London, E.C. Sir Louis Sterling (chairman and managing director) presided.

The Secretary (Mr J. W. Horton, A.C.A.) having read the notice convening the meeting and the report of the auditors,

The Chairman said: Gentlemen, in presenting the accounts, the directors have endeavoured to give a comprehensive outline of the company's activities during the financial year. We have again issued a consolidated balance-sheet, and this gives in some detail a comprehensive view of the position of your company and its wholly owned subsidiaries.

The profit and loss account shows that the net profit on trading, including interest and dividends receivable, amounts to £157,730, as against a corresponding figure of £136,027 in the previous year.

Taxation absorbs the sum of £50,718, as compared with £30,942 last year, and we are faced this year, for the first time, with a new item of expense of £6,000 in respect of the company's liability under the War Damage Act, 1941.

IMPROVED RESULTS

Although our activities and those of the subsidiaries have expanded very considerably, resulting in an increase in the trading profit of over £20,000, the net balance available amounts to £94,701, as against a sum of £99,294 in our last balance.

Although our pre-war standard of profits is such that we are again immune from excess profits tax, you will appreciate that under war conditions a reduced margin of profit may be expected. All our works are fully occupied and the directors are taking every step to preserve the "goodwill" of your business until after the war, when the present restriction of supplies is removed.

Our two operating subsidiary companies have traded satisfactorily and, as pointed out in the directors' report, the full benefits of our reorganisation of the Sterling Cable Company have been felt for the first time during the year.

DIVIDEND OF 15 PER CENT

After providing for the Preference dividend for the year and an interim Ordinary dividend of 5 per cent., there is a balance of profit, including the amount brought forward from last year, of £84,959. You will see from the directors' report that we recommend a transfer to taxation reserve against the 1941-42 income-tax liability of £30,000.

We then propose, as you will have seen, to pay a final dividend on the Ordinary shares of 10 per cent., less income-tax, making 15 per cent. for the year, this being the same distribution as that of the previous year, and the amount to be carried forward will be £29,959, as against £21,883 last year, an increase of £8,076.

Our net profit for the year, after deducting national defence contribution but subject to income-tax, was approximately £140,000, and this represents 6 per cent. on the Preference share capital and approximately 22 per cent. on the Ordinary share capital.

CONSERVATIVE VALUATION BASIS

Turning to the consolidated balance-sheet, I will not take up your time in making detailed comparisons, but will merely draw your attention to the fact that it has been necessary for us to extend considerably our commitments. These factors are a reflection of our increased activities, but our inventories of stocks and work in progress have been drawn up on what may be regarded as a very conservative basis.

This review of the year's operations would be incomplete without an expression of appreciation to the company's staff from the senior executives downwards. We have not always been free from operating difficulties, but the co-operation of all concerned has enabled us to overcome most of our troubles.

The report and accounts were unanimously adopted, the retiring directors, Messrs T. A. Macauley and N. S. Holland, were re-elected, and the auditors reappointed.

ASPRO, LIMITED

EXPANSION OF EXPORT TRADE

The annual general meeting of Aspro, Limited, was held, on 8th instant, in London. Mr G. M. Garcia (chairman and managing director) presided.

The chairman in the course of his speech said: The profit on trading showed £285,120, and there remains a sum of £274,631, which shows that the net profit has been practically maintained at the previous year's level. To this must be added the sum of £19,028 brought forward from last year, which includes adjustment for change in the rate of income-tax, making a total available balance of £293,660. The net profit enables your directors to recommend that a final dividend be now declared at 15 per cent. on the ordinary stock, which brings the total distribution for the year up to 25 per cent. (the same as for last year), and there is a balance left of £18,316 to be carried forward to next year. On the assets side of the balance-sheet you will see that an additional sum of £25,000 has been advanced to the Treasury, free of interest, for the period of hostilities, making £50,000 in all.

At our last annual meeting I drew your attention to the undertaking given by the Chancellor of the Exchequer to endeavour, before the introduction of the next Finance Bill, to see whether he could not get the parties together and get some reasonable solution of the "perfectly impossible" position created on the introduction of Purchase Tax by the retention of Medicine Stamp Duty. As chairman of the Proprietary Association of Great Britain, of which your company is a member, I took the first step towards enabling the Chancellor to implement this undertaking by approaching the various interested parties. Early this year we were able to submit to the Chancellor of the Exchequer a memorandum embodying an agreement effected by mutual consent, an agreement which, to quote the words used by the Minister of Health in moving the second reading of the Pharmacy and Medicines Bill, would substitute a trading privilege for the financial advantage enjoyed by chemists hitherto, and at the same time enable the normal channels to continue to be used for the sale of proprietary medicines.

Last year I made reference to the gratifying expansion in the exports of Aspro. In spite of the vicissitudes of war, I am glad to say that this expansion has been fully maintained during the past 12 months. I shrink, however, from any attempt to presage the future course of this branch of our business, which is apparently destined to be caught between the upper and nether millstones of divergent and often conflicting policies, including such factors as the allocation of available raw materials. The people of this country are deeply conscious of the debt they owe to America for the great help that is being extended, but we must face the fact that the operation of the Lend-Lease Act will inevitably curtail our export trade.

We must not lose sight of the fact that in maintaining our flow of exports of branded British goods, including medicines, we are enhancing the prestige of British products abroad while providing a foundation for the further expansion of our foreign trade after the war, when exports will be more than ever a vital factor in the rebuilding of our national economy.

APPRECIATION OF ASPRO

The intensive cultivation of the land at our disposal, the loans to the Treasury, in addition to many other activities, some of which I have outlined in my foregoing remarks, are a proof that your directors are not unmindful of the pressing claims of war and that they have been, and are, intent upon making the maximum possible contribution towards promoting our national war effort. In the accomplishment as well as the prosecution of these efforts I am confident that I have your unqualified support. Nevertheless, we feel that the maintenance of health is a matter of paramount importance in sustaining output in essential work, bearing in mind the psychological factor of the inevitable feeling of depression engendered in individuals by some incidental disposition, be it a cold or a headache or a twinge of rheumatic pain, if it could not be alleviated by recourse to a remedy of proven value. The countless letters which we have received from war workers since the outbreak of this war testify to the efficacy of Aspro in these cases, a further proof, if proof were needed, of the well-founded value of Aspro in relieving pain and suffering.

The report and accounts were unanimously adopted.

THE UNITED STEEL COMPANIES, LIMITED

LARGER TURNOVER

SUBSTANTIAL TAXATION

SIR WALTER BENTON JONES'S SPEECH

The annual general meeting of the United Steel Companies, Limited, was held, on the 15th instant, at the Iron and Steel Institute, 4, Grosvenor Gardens, London, S.W.

Sir Walter Benton Jones, Bt., chairman and managing director, presided.

The Secretary (Mr R. Gresham Cooke) having read the notice convening the meeting and the report of the auditors,

The Chairman said: Gentlemen, May I assume you will take the directors' report and the accounts as read? (Agreed.)

DEATH OF TWO DIRECTORS

It is with great regret that I have to record the deaths since our last meeting of Mr Albert Peech and Mr Charles Walsh. Mr Peech died in March at the age of 68. He was a well-known personality in the iron and steel industry, with the management of which he had been intimately connected for more than 40 years. A partner in the firm of Steel, Peech and Tozer, he took part in the formation of our company and was one of the original directors. He was our chairman from 1920 until 1928 and he remained an active director until he died. He played a leading part in the formation and working of many of the organisations connected with the iron and steel industry. In 1924 he had the honour to be elected President of the Iron and Steel Federation. He was a man of great experience, great charm, unfailing courtesy and kindness, and he had a wide circle of friends in many countries. His death is a great loss to the company.

Mr Walsh died very suddenly in February at the early age of 56. He had been connected with the engineering and iron and steel industries all his life. He joined the company in 1932 as assistant to the managing director. In 1934 he took over the management of our largest branch, Appleby-Frodingham. In 1939 he was appointed managing director of the company, a position he might well have held for many years. He had exceptional ability, was very much liked and esteemed by all who worked with him and for him, and his sudden death was a great shock to us all.

CHANGES ON THE BOARD

Following the death of Mr Walsh, Mr N. H. Rollason kindly undertook the duties of managing director until June of this year, when I assumed that office. In these duties I have the assistance of Mr Gerald Steel, the general manager of the Samuel Fox and Co. branch, in connection with the iron and steel works, and of Mr C. F. Ward Jones, the general manager of the Rother Vale Collieries branch, in connection with mines and coke works. Both have been appointed directors, as has also Mr L. Highton, general manager of the Workington Iron and Steel branch.

During the year your directors invited Mr A. C. Macdiarmid, the chairman of Stewarts and Lloyds, to a seat on their board, and the directors of Stewarts and Lloyds have done me the honour to ask me to be a director of their company. These reciprocal invitations are of a personal character; they indicate no more than the friendly relations existing between the two companies, which have much in common.

Mr P. F. Summers, the chairman of John Summers and Sons, in which, as you know, we hold a substantial interest, joined the board in March. These appointments bring to the board a valuable addition of technical and commercial experience and I am sure will commend themselves to you. You will be asked to confirm the appointments in accordance with the articles of association.

TRIBUTE TO OFFICERS AND STAFF

Again I should like to put in the forefront of my remarks an expression of our gratitude to all who are working for us in whatever capacity they are engaged, and particularly the officers and staff. As I have often said, the company is well served by a loyal and efficient staff and in these days they have not spared them-

selves, but with constant application have continued to work at high pressure.

With regard to the report and accounts, I do not propose to review these in detail. The balance-sheet, profit and loss account, and the statement of combined assets and liabilities show in each case the corresponding figures of the previous year, which enables you to compare the two years for yourselves. The only comment I have to make on the balance-sheet concerns the item of creditors on one side and stocks and debtors on the other. The substantial increase in both cases is due to a larger turnover and high prices.

TRADING PROFIT

The report tells you that the balance of trading profit was £2,066,625, and the directors call attention to the large appropriation made to reserve and provision for taxation. I should like to add that the appropriation includes £187,000 in respect of increase in the rate of income-tax on profits made in previous years. Last year also we had to make a substantial addition to this reserve for the same reason. I venture to hope that we shall not have to make a similar provision next year.

After making the appropriation to reserve for income-tax there remains £725,375 for the shareholders, out of which to make reserves and provide contributions to staff and workmen's pensions schemes and to pay a dividend. Taking the year 1937-38, the comparable balance of profit was £2,125,375, and after deducting the appropriation to reserve for income-tax there was left £1,329,375.

LARGE CONTRIBUTIONS TO STATE

The present form of taxation first limits profits to an arbitrary standard based on some recent pre-war performance, and then divides them by two. I have shown how this affects us and our case illustrates the very large contributions which industrial undertakings are making to the State.

The report also tells you how we have provided for war risks insurance premiums. These are not a charge against profits, and, being designed for the most part to make good damage already sustained by the general community, they are not insurance in the usual sense. They are, in effect, a capital tax.

In these days a chairman's annual speech to his shareholders can be little more than a commentary on the accounts. None wish to use the opportunity to criticise but only to express their desire and intention to work their hardest and to serve by every means within their power. This is the view of your directors and in expressing it they are confident that it will have the unanimous approval of all the shareholders.

The report and accounts were unanimously adopted.

The proposed final dividend for the year ended June 30, 1941, at the rate of 5½ per cent., less tax, making with the interim dividend of 2½ per cent. already paid a total distribution for the year of 8 per cent., less tax, was approved.

The retiring directors, Mr A. C. Macdiarmid, Mr R. F. Summers, Mr Langton Highton, Mr C. F. Ward Jones, Mr Gerald Steel, Mr J. I. Spens, Sir Herbert A. Walker, K.C.B., Mr P. Lindsay and Mr N. H. Rollason, were re-elected and the auditors, Messrs Peat, Marwick, Mitchell and Co., were reappointed.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

CABLES INVESTMENT TRUST, LIMITED

The sixth ordinary general meeting of Cables Investment Trust, Limited, was held, on the 15th instant, in London, the Right Hon. Lord Pender (the chairman) presiding.

The following is the chairman's statement which was circulated with the report and accounts:—Debtenture stock amounting to £8,950 has been purchased and cancelled, as shown in the accounts, and the balance of £6,050 required to complete the sinking fund for the year to December, 1941, has been purchased since June 30th. It will be observed that a further £16,417 debtenture stock has been purchased during the year.

From the details shown on pages 3 and 4, it will be seen that the gross income from investments was £329,123 and the net income £225,097, in each case showing a small decrease compared with the previous year. The market value at June 30th last of securities having a book value of £7,069,770 was £5,643,540, this figure showing considerable improvement on last year's valuation.

After payment of a final dividend of 3 per cent, making 5 per cent. for the year, on the ordinary stock, the carry-forward has again been increased, and now amounts to £171,052, as against £135,955 previously carried forward.

The adoption of the report and accounts, together with the payment of a final dividend of 3 per cent, less tax, on the ordinary stock, making 5 per cent, less tax, for the year was approved.

BANGRIN TIN DREDGING COMPANY, LIMITED

The twenty-first ordinary general meeting of the Bangrin Tin Dredging Company, Limited, was held, on the 14th instant, in London, Mr Kenneth O. Hunter (the chairman) presiding.

The following is an extract from the Chairman's statement issued with the report:—The increased price obtained for the 1940 output, and the realisation of accumulated tailings resulted in a profit from mining operations of £96,262. This apparently satisfactory position is discounted by the fact that we have excess profits tax to take into account, and the directors have found it desirable to set aside for this purpose a provision of £24,700, with the result that the balance of revenue account is £59,934, which compares with £51,239 for 1939. The dividends for the year 1940 absorb 37,500, being 12½ per cent, including the final dividend of 7½ per cent. proposed.

As regards taxation of income, if account is taken of the income-tax deducted from dividends paid to stockholders, the amount contributed out of the profits of the year 1940 will amount to some £41,400 in addition to excess profits tax for which the directors have deemed it necessary to provide £24,700. This is a total of £66,100 out of earnings amounting to £84,634.

The report was adopted.

THAI TIN SYNDICATE, LIMITED

The thirty-fourth ordinary general meeting of the Thai Tin Syndicate, Limited, was held, on the 14th instant, in London. Mr Kenneth O. Hunter (the chairman) presided.

The following is an extract from the Chairman's statement which was circulated with the report:—The profit for the year is £138,319, against £119,677 in 1939. It will be observed, however, that the amount which we have thought advisable to include as the provision for excess profits tax is £20,000, whereas in the previous year the similar provision was only £6,250.

Dividends in respect of the year 1940 are shown to amount to £75,000, being 50 per cent for the year, including the final divi-

dend of 10 per cent proposed. The directors have set aside £56,572 to provide for income-taxes which will become payable in this country and abroad in respect of the 1940 profits, and a sum of £7,000 has been transferred to an investment reserve. There is then a balance of £10,675, which we propose should be carried forward.

With regard to taxes on income, when one takes account of the tax deducted from dividends paid to stockholders, the contribution out of the company's earnings for the past year is approximately £89,500, and with the addition of excess profits tax, for which we have provided £20,000, a total of £109,500.

The report was unanimously adopted.

TEA CORPORATION, LIMITED

The ordinary general meeting of Tea Corporation, Limited, was held at 110, Cannon Street, London, E.C., on 9th instant.

Mr E. F. Slade (chairman of the company) in the course of his speech said that a year ago the net profit had been nearly £2,000 more than in the previous year, but this year it was back, or nearly so, to what it was in 1939. The falling off was not due in any way to non-productivity of the estates, the output of tea and rubber having shown considerable increases, the value of their total produce being £15,246 more than in 1939. On the other hand, cost of production came to £19,055 more than in the previous year. In most concerns where tea was the major output a falling off in profit in 1940 was fairly general, and it had been caused in a great measure by the increase in standard wages of the labour force. The net profit was £6,478 and the directors proposed to pay a dividend of 6 per cent., which would absorb £6,300.

All properties were in a good state of cultivation and upkeep. The visiting agents were able to say that the estates were well managed and improving. The tea crop had exceeded the export allowance by 195,084 lb., and coupons were bought for 102,799 lb. during the year. The rubber crop showed a very considerable increase. No new planting or replanting were undertaken during the year but the 42 acres replanted during 1939 were coming along well.

Last year they had cropped 1,168,485 lb. of tea and exported the quantity over and above that allowed under restriction by purchasing coupons. In the current year the board had decided to keep the crop as near as possible to the exportable allowance and consequently they had budgeted for only 946,000 lb. They had been able to harvest to the end of August 1,314,266 lb. of rubber against 1,199,062 lb. for the same period in the previous year.

(Continued from page 482)
and Ultramar 32. By mid-week, war news brought a partial reverse in both oil and kaffir shares.

New York

WAR news, together with continued uncertainty regarding future tax and price control policy, and the impending Columbus Day holiday, all served to strengthen the cautious attitude prevailing on Wall Street before the week-end. Nevertheless, the close was steady with slight support for aircraft, motor and steel issues. Conditions remained unchanged over the holiday and trading on Tuesday was dull, with small but scattered losses in industrial, mining and steel issues. In mid-week prices declined over a wide front on the news from Russia.

The Iron Age estimates steel mill activity at 98 per cent. of capacity.

The Enterprise of England

JULY, 1588: "Sir, for the love of God and our country, let us have with some speed some great shot sent us of all bigness; for this service will continue long; and some powder with it." The writer is Lord Howard of Effingham, Lord High Admiral, in the thick of the running battle through English waters against the Grand Fleet of Spain. May, 1940, on the eve of the campaign that shook the world: "The situation as regards equipment . . . caused me serious misgivings. . . . There was a shortage of almost every kind of ammunition." The writer is Lord Gort. The story of an English strategy creaking for want of supplies is both new and old. It was the lack of numbers, more even than the *Luftwaffe*, that the skill and quality of the RAF mastered a year ago when so many owed so much to so few. It is lack of equipment now, of weapons and munitions and ships, that narrows the choices of England between holding this island safe, nourishing the Soviet Union and the great Middle Eastern army and striking straight at the enemy.

This is the lesson of Lord Gort's belated dispatches—the shortage of weapons, supplies and equipment—not the reasons for recrimination they undoubtedly give. The dispatches do show France doomed by its own weaknesses. They show soldiers, bound by faulty civilian decisions. But to lean on the past would be fatal. The fall of France is a fact, not the salve for a conscience. The blindness of a Secretary of State for War whose name no one even remembers to reproach is no more than an odd fossil; and among the civilian voices of spring, 1940, Mr Churchill's was not the most silent. It is human, but a perilous, enervating path, to blame friends for their undoubted bungling and neutrals for their folly. The responsibility now is England's—and America's. The lessons of the dispatches will not be found in Paris or London—or Laeken, but on the battlefield and on the airfield, in the factory and workshop. The shortage of powder and shot that caused Drake and Frobisher to cease firing when the Armada was at their

mercy was paralleled three and a half centuries later when, from the outset, the BEF risked running out of rounds—"even at the rate of expenditure laid down for sustained operations before the war." The short sight that did not envisage the munitions needed by the swift new gunnery of 1588 was matched by the myopia that did not see the preparations, the science, the guns and the mobility required by the warfare of 1940.

Mr Bevin has made it plain where we stand—an increase of 30 or 40 per cent in production to hold our own. Lord Croft, the Under-Secretary of State, has gone farther. Hitler will "almost certainly come at Eatum and Baku in the spring"; and on the Caucasus and beyond he will find the British with a twofold task, to aid in the Russian defence of Baku and Caucasian oil and to deny the road to Egypt, India and the east. Aid to the Soviet Union in this crisis of the war—within a strategy that had already poured half a million men into the Near East before the Soviets were forced to battle—means three things: the continuation of strategic bombing in the west to disrupt output and transport; the ferrying over long sea and land routes of civilian supplies, munitions and military equipment; and the defence of the Caucasus, Near Asia and North Africa. The strategic riddle, it seems, has been resolved. The ships and the supplies are needed for the Soviets, the men and the equipment for the Near and Middle East. There are not the ships, the men and the equipment in existence to attack Western Europe, to aid Russia to the utmost demand and to sustain the Straits-Black Sea-Caspian Sea line against the enemy. It would be "doorstep suicide" (says Lord Moyne) to attack in the west. But there is a land front. It was reinforced with a quarter of a million men after the Russian war began. It is 7-8,000 miles away.

It would be a bold layman who would fault these decisions with any sureness. He might claim with reason that action in the west would need only a part of the ships demanded by defence in the east. But the German

armies in Libya and the Ukraine cannot be argued away. He might contend that mere defence carries its own special dangers, as the war of 1939-41 plainly proves. It is the aggressor's sin and crime, but also his great advantage, that he always attacks. The peril of a defensive strategy in the Near and Middle East, which engages all the offensive apparatus at England's disposal, the critic suggests, may be that three quarters of a million men may be immobilised there during a nearer crisis. He fears defeat in detail. But, while he pleads for action to alarm and assail the denuded western marches of German Europe, he must still face Lord Croft's straight question: "Do they understand the strength of the vast German army?" Mr Hicks may proclaim from the Ministry of Works and Buildings that four million Germans have been lost in Russia. But only the historians will know how many Germans have been lost. It is, of course, certain that, if four millions have fallen, the west must be bare indeed. But the defence of Britain, of Russia, of Egypt and of India are first charges.

It is a simple question of relative strengths, of manpower, equipment, shot, shell, ships and aircraft. A distinguished American speaks of Hitler's straits when he is constrained to call for the aid of a million Italians on the eastern front. But it is precisely because it is sprung upon the enlistment of millions of non-Germans, of Roumanians, Hungarians, Italians and Finns, in the field as well as in the factories, that the German invasion of Russia has acquired such stamina and such resilience. The fact is that the defenders of freedom are still too weak to do all that the critics cry out for. The critics are not alone in their yearnings. Every man and woman in every English street shares them. It needs no Gallup to show that there is dissatisfaction—but not so much with what is being done as with what cannot be done. For each and all, and for their rulers most of all, there is only one message—"great shot . . . of all bigness; and some powder with it"; more equipment, more production. When the House of Commons said in July that war industry was working 25 per cent below capacity, the Prime Minister was indignant and reproachful. Now the Minister of Labour speaks of a 30 or 40 per cent increase in the winter. When helpful voices suggested, months or a year ago, that men should be reserved from military service on account of the actual jobs they were doing and not according to the qualifications they held, or the occupational groups they belonged to, Mr Bevin said it was neither necessary nor desirable. Now, because "there must be national service on a more intense scale," he proposes to substitute individual for group reservation. But the "more intense" need has not just arisen. It is true, of course, that the need to sustain Russia and defend the Caucasus is new. But four months ago the whole weight of the Nazi *Wehrmacht*, unbattered by the fierce Russian resistance, was leaning towards Britain and the Empire.

When Lord Gort surveyed his men in France in the quiet months last year he could see clearly enough on the spot that the scale and tempo of what used to be called "preparedness" were inadequate. It was proved so in battle. It has been underlined since. The "alarmists" who have spoken of "life and death" and "siege" have been right. It is a historical phenomenon of the first significance that the country which built all the world's first railways and clothed the peoples in wool and cotton has failed in a succession of years to use its industry fully for its own and the world's defence; the success of the United States, the universal provider, in the same test is still in the balance. After over two years of war, most of the right methods are in use in England: rationing, the limitation of supplies, the concentration of industry, priorities and the allocation of materials, registration and the direction of labour. Ministers move in a new world, and one which, eighteen months ago, they would have denied. But they still move, and the people move, too late and too slowly. Historically, the German campaign in Poland tore to shreds the professional and Treasury notion that the goods of total war could be delivered by a small specialised war industry.

In practice, the notion was in the saddle here until Chamberlain fell, and it has not been finally unseated yet—on either side of the Atlantic. It is not a question of war industry at all, but of all of industry and all of the population; and it is fantastic, at this late hour in destiny, that any man or any woman whatsoever should be contributing nothing to the war effort—for want of will or willingness, for want of orders or for want of common sense or common decency. Mr Bevin prefers "leadership to compulsion," so that while Russian women are in the front line, English women are still in the front parlour, the back kitchen, the hotel lounge, or the otiose office. "You must handle women gently," the Minister says, a thigh-slapping aphorism which, insofar as it is valid, surely means no more in wartime than that you must tell them what to do, train them properly, house them decently, put them to work in tolerable conditions, feed them well and pay them fairly.

Mr Bevin and his Ministerial colleagues—and Sir Walter Citrine—might take counsel from the penitents in the ranks of labour. Before the German attack on Russia, the shop stewards movement in the factories was probably more interested in the rights of trade unionists than in the rights of man, and certainly more than in the rights of Englishmen. Now, with an odd but undoubtedly sincere passion, they are ashamed of Britain's inability to take its full share of working and fighting alongside the Russians. They are convinced that all rules of demarcation between one grade of labour and another, where they impede work and output, must go; that every able-bodied person should be in the forces, in war industry or in civil defence; and that skilled men, wanted for fighting—and unwilling "to fight to the last unskilled worker"—should train and make way for women.

No magic will raise the output of coal and steel, ships and munitions of war. It will be a long and arduous climb, even with American aid, to the pinnacle where the enemy can be mastered on land and in the air. If strategy is patchwork now, it is because the cloth it is cut from is scanty. First of all, the belief in miracles must go. No statesman or commander can base his smallest hopes or plans upon anything but the enemy's power in battle. Miracles happen, and will happen again; but belief in them is the foundation of the Maginot mirage which leads nations to their destruction. Secondly, this country's effort must become as universal and as energetic as if the enemy were at the gates of London. Russia is the road to London. Every individual who falters where he should stride, every leader who exhorts where he should command, every employer who bungles where he should produce and every civil servant who delays where he should decide—these are, in no merely rhetorical sense, the fifth column. If there is not an end to haggling, reluctance, stupidity, botching, time-serving and time-wasting, there will be an end to England. Of itself, a crusade cannot produce armaments. But patriotism can breathe life into planning—sweeping away the rivalry and procrastination that still waste and confuse the demands of the supply departments upon industry; and setting free in every industrial district the enterprise and initiative that are surely there to make the utmost of labour, plant and materials, within the broad frame of the Government's programmes and apportionments.

It is a matter of technique and organisation, of priorities in labour as well as in materials, of rationalisation and mobilisation, of plant pools as well as labour exchanges, of welfare in canteens and workplaces, of hard work at the bench and competence in the manager's office. Rhythm and balance are still needed in the flow of materials, transport, orders and output. It would reinforce the War Cabinet to refresh its membership, to reduce its numbers and to remove its departmental preoccupations. Ministers must guide and plan. But, above all, this is a test of character—national character, "class" character and the character of English statesmanship. Philip of Spain failed in his "Enterprise of England." Hitler of Germany, in his, is still advancing; and it is only by the enterprise of Englishmen that he can be pinned and thrown.

Far Eastern Defence

JAPAN is passing through another "hour of decision." It is the fourth or fifth this year and, although there is now fighting deep in Russia, it no way differs in essentials from the others. The ship of state is sailing so near the wind that the slightest change in its direction entails a great flapping of the sail and manœuvring of the tiller. This time it has needed a change in the whole Cabinet to meet the new situation created by the German advance on Moscow. General Tojo, Prince Konoye's War Minister, becomes Prime Minister, and combines the office with those of Minister for War and Home Minister. His Cabinet is, on the whole, extremer than the last—which means that it includes more friends of the Axis and more supporters of state control and fewer representatives of conservative nationalism and the business world. This does not mean, however, that the Far East is about to be plunged into war. Japan's more recent hours of destiny have seldom meant anything so sensational. General Tojo has declared that he is continuing the policy of Prince Konoye and is ready to carry on the "peace talks" with the United States. In the meantime, the world has been warned again, and the impatience in Japan has been given a temporary safety valve.

Yet, even if this crisis does not mean general war, it skirts it only by a narrow margin. The situation in the Far East is permanently on the brink of general war, because Japan's policy of Co-prosperity can be carried beyond a certain point only at the risk of war, and the Japanese are for ever trying to discover what that point is. In 1937, their policy of expansion into China reached the point of general Chinese resistance. The question to-day—as in every other of the year's "hours of decision"—is whether the Japanese have not brought all the Far Eastern Powers to the same point.

Co-prosperity entails Japanese control of the Russian Maritime Provinces, possibly of Western Siberia as well; of Manchuria and all China and possibly all Mongolia too; of Indo-China, Thailand and perhaps the Malay Peninsula; of the Philippines, the Netherlands Indies and, very possibly, all Australasia. This objective does not vary, and the Japanese make no secret about their intentions. So ambitious a programme offers them a large field of experiment and action and, like the German High Command before the launching of a major offensive, Japanese diplomacy is for ever testing the front to discover points of weakness against which the attack can be directed. In the south, the obstacles are the entrenched interests of other Great Powers, the British Empire and the United States, as well as of France and the Netherlands; in China, there is the unbroken resistance of General Chiang Kai-shek; in the north, Russia's Siberian army.

In the last year, the Japanese have tested and felt these sectors of the front again and again. The defeat of the Netherlands and the collapse of France turned them to the south. Here their advance, successful in Indo-China, was checked—temporarily perhaps—on the frontiers of Thailand by a warning that Britain would regard an attack on Thailand as a menace to her own security; by the freezing of Japan's assets in the United States and the British Empire; and by the signs that American public opinion was for checking a Japanese advance southwards, even at the risk of war.

The China sector has been re-tested in recent weeks by the campaigns in Hunan and Shansi. The results of the fighting can only have confirmed the likelihood that Japan has got as much from China as can be gained by a direct military offensive. Behind their mountains, the Free Chinese forces remain intact and can slowly build up their resources for a counter-offensive. The last year has proved that neither by assault nor by attrition can a total Japanese victory be secured in China.

In the north-west, after the encounter at Nomanhan in 1937, the Japanese were content to let the Russian

front alone. But Hitler's onslaught and the Russian retreat in the west have renewed their appetite. In recent weeks, the Japanese garrison in Manchuria has certainly been increased—according to some reports, to twenty-two divisions, according to others, to thirty-five; Chinese forced labour is at work on military roads from Manchuria into Mongolia; at the same time, the arrival of American war supplies at Vladivostok has been made the occasion of protests and threats to both Moscow and Washington. To-day, the new wind to which General Tojo is trimming Japan's sails is a wind from the west, the attack on Moscow and the retreat of the Russian Government to Kuibyshev. The question is whether the Japanese consider that the Russians' predicament in Europe has weakened them enough for expansion to be practised at their expense.

In their patient probing of the long East Asian front, the Japanese have until very recently had the advantage of dealing with each sector independently. Against the single and undivided threat of Japan's predatory conquests, the Far Eastern Powers have had no concerted policy. On the contrary, they have tended to buy Japan off at each other's expense. America and the Dutch East Indies have supplied the oil for the bombing of China; the British Empire has sent wool and cotton and machinery to the armies which now stand on the frontiers of its ally, Russia, and its neighbour, Thailand. This policy can be held to differ radically from the direct military submission of Vichy France only if the out-dated division between military and economic war is allowed to stand.

The scope of Japan's ambitions has however frustrated their achievement. Had the Japanese confined themselves to the task of wearing China down, squeezing out foreign business and establishing an undisputed control over the whole economy of China, it is almost certain that the other Far Eastern Powers, more and more deeply involved in the wars of the Atlantic world, would have left Japan to go its own imperial way. The very weakness of the other Powers' Far Eastern defence has, however, tempted the Japanese into the path of ultimate defeat. To secure hegemony in East Asia, it was not necessary to link the two world fronts by joining the Axis; it was not vital to Japan's immediate task of conquest in China to launch out via Indo-China into the South Seas; it is not essential to it today to cast greedy eyes on the Maritime Provinces. The great temptation to the Japanese in the last year has been to discover weak point after weak point in their Far Eastern front and to want to exploit them all at once. By doing so, they have lost their greatest single advantage, the lack of any concerted opposition. By threatening every Power at once, they have at last brought home to the Powers that they are all subject to the same threat. After the cowardice and uncertainty of a whole decade, a co-ordinated system of Far Eastern defence is at last taking shape.

In the economic sphere, there is the freezing of Japanese assets and the very real restrictions on Japanese trade and shipping which have been imposed by the British, American and Dutch Governments. These restrictions do not apparently amount to a complete embargo, although the machinery of embargo exists. Nevertheless, certain vital commodities such as motor fuel are banned and the list could at any time be made complete. In the military sphere proper, there are the reinforcements to Malaya, Hongkong and the Philippines. Thailand's readiness for self defence and Britain's reinforcements on the Thai-Malayan frontier guarantee the landward approaches to Singapore. The crux of the matter is, however, Anglo-American naval power. (The details of the strategic situation are discussed in a Note on page 500.) If defence is to be effective in the South Seas, the process of getting "mixed up together" must go forward, with a joint use of ships and bases wherever the first calls of strategy demand. Mr Curtin's statement that

defence measures had been "confirmed" may perhaps cover some such arrangement.

The extension of Lease and Lend to China; the arrival in Chungking of a United States Military Mission; the functioning of the Burma Road—all these are promising signs of a growing recognition that China is a fighting ally in the Far East. Only in the Manchurian sector of the long front is the Allies' defence position still in great need of clarification. The readiness of the American people to check Japan, if need be by war, does not, it appears, extend to a threat to Vladivostok, even though in strict logic a Japanese attack upon the Maritime Provinces and the extension of Japanese control to East Siberia and Kamchatka would be far more direct a threat to the Western Hemisphere than a Japanese attack on the Philippines. Nor has the British Government made its attitude clear on the question of the defence of Siberia. The switch in Japanese attention from south to north is a direct reflection of this uncertainty. Something like an agreed limit—the Thai frontier—and a common stand exist in the South Seas. Because they do not exist in the north, Vladivostok is for the time being the weakest point in the Far Eastern line. It is here therefore that General Tojo's Government is likely to try the next probe.

The Japanese are conscious of the gradual emergence of some kind of Far Eastern defence system. They are talking of "encirclement," and encirclement, in the Japanese as in the German vocabulary, is the aggressor's

word for collective security. The question whether "encirclement" will drive the Japanese to war—the stock argument of appeasement—is immaterial. This is not a choice of war or peace, but a choice of consecutive or concurrent war. The Japanese would prefer a limited war in China, a limited war in Siberia, a limited war in Malaya. They would prefer, in a word, to continue to strike down their victims one at a time. A genuine system of Far Eastern defence—that is to say, a collective determination to resist, with all the military resources of the ABCD powers (America, the British Empire, China and the Dutch) and of Soviet Russia, any new Japanese attempt at aggression wherever it may fall—will either check the Japanese completely or ensure that the most, and not the least, effective resistance will be set against their predatory advance.

As long as inconclusive "peace talks" between America and Japan leave America's attitude undefined; as long as the Anglo-American reaction to Japanese aggression against Russia remains uncertain; as long as war materials are still sold to Japan; as long as China's place in the centre of Far Eastern resistance is not recognised; just so long will Japan stage "hours of destiny"—to make the ABCD Powers' "flesh creep," to probe the effectiveness of their will to resist and to pull off, if possible, yet another local success. There will in fact be no peace in the Far East until all the Allied Powers have squarely faced, and jointly planned for, the possibility of war.

Wage Stabilisation in Eire

IN Britain, the stabilisation of wages and prices is still being hotly discussed. In Eire, stabilisation is being tried, though under very different conditions; in Britain, the demand for labour is insatiable, while in Eire there is a problem of unemployment. From the beginning of the war, the Government of neutral Eire has shown an intelligent understanding of economics in near-war conditions. It may be that the memory of the last war is still alive there. In 1914-18 prices and wages soared in Ireland; a severe deflationary process was experienced after the war; and it has been made clear that no similar inflation will be tolerated this time if it can possibly be prevented. The machinery of price control, admittedly still imperfect in practice, was considerably tightened up after the outbreak of war, and profiteering of all forms was discountenanced. The need for the stabilisation of wages was early appreciated. In the Budget speech of 1940, the Minister for Finance gave a warning against increases in wages, and stated that cost of living bonuses acted as an aggravation rather than a remedy. The cost of living bonus of Civil Servants and of the employees of local authorities was stabilised last year.

In spite of these measures, prices and the cost of living have risen. In introducing the British Budget, in April this year, Sir Kingsley Wood announced his intention of stabilising the cost of living at about 125-130 per cent of the pre-war level. At that time, the rise in the Irish cost of living from the beginning of the war had been about 27 per cent and there was some anxiety lest, if this rise should continue while the British price level was stabilised, the Irish pound should become overvalued, and the maintenance of parity with sterling be made difficult, if not impossible. The British method of keeping down the cost of living by means of extensive subsidies was considered. But it was decided that, in the circumstances of Eire, such measures might be both expensive and ineffectual. The Government made a frontal attack on the rising cost of living by means of the Order for the Stabilisation of Wages which was issued on May 7th, the day on which this year's Budget was introduced.

This Budget severely increased direct taxation. Income tax and corporation profits tax were raised and profiteering

was made almost impossible. The Stabilisation Order was made under the Emergency Powers Act to prevent increases in the remuneration of a very large number of earners of wages and salaries. It made illegal increases in remuneration—including time rates, piece rates, overtime and payments by commission—in transport, public utilities, banking, insurance, and in a large number of manufacturing industries mainly concerned with the production of essential or protected goods. The operations of trade boards and of other statutory minimum rate-fixing authorities were suspended for the duration of the emergency; and strikes to raise wages in the scheduled occupations were deprived of the protection of the Trade Disputes Act. It was provided that companies should not increase their rates of dividend or the fees of directors—subject to the exception that dividends can be increased to 6 per cent where they have previously been below that level.

This drastic Order was justified by the Minister on the ground that it would help to prevent the "mad circle" of consecutive increases in wages and prices which would ultimately lead to inflation. It was stated that wages had already been raised in some of the sheltered trades, with the result that costs of production and prices had been raised at the expense of the less favoured members of the community. The wages of unskilled labourers and of workers in the unsheltered industries could not receive equivalent increases; unemployment tended to be increased and the standard of living of the unemployed to be reduced. Agricultural producers, who had to sell in export markets, were put at a disadvantage. The terms of trade from the beginning of the war had moved in favour of industry and against agriculture; and the measure can be regarded to some extent as an intervention by the Government to protect rural interests against exploitation by more favourably situated interests in the towns.

All the Opposition parties united in objecting to the Order as an abuse of the Emergency Powers Act. It was argued that the matter should have been dealt with by legislation after Parliamentary debate rather than by emergency decree. The Government replied that the stabilisation of incomes was essentially an emergency measure which could not brook delay, and that, if it had not been imposed rapidly and without notice, it would

have been frustrated by increases in wages, salaries and dividends in anticipation of its becoming law. The Labour Party attacked the measure violently. The Government was accused of favouring low wages, of depriving organised workers of all the gains they had made during the last century and of attempting to reduce free labour to a state of slavery. Ministers were simultaneously accused of being ruthless totalitarians and reactionary pluto-democrats. Unfortunately, the introduction of the Order coincided with the debates on the Trades Union Bill, which had already aroused the wrath of organised labour; and the two measures were branded as a conspiracy against the trades union movement—although in fact they were entirely independent in scope and purpose.

The more reasoned opposition to the Order rested on three grounds. In the first place, it was urged that the control of wages without the control of prices would operate unjustly against the working classes. Secondly, it was argued that the lower paid workers should be exempted from the Order lest its operation should reduce their standard below a decent minimum. Finally, it was suggested that the measure should be accompanied by a system of family allowances in order to maintain the standard of living of the working classes as a whole. In reply Government spokesmen drew a distinction between avoidable and unavoidable increases in prices. Many increases arose out of the conditions of the blockade and war scarcity and could not be prevented. All preventable increases had been kept in control by the mechanism of the Price Regulation Acts; and the present measure, it was urged, would do a great deal to prevent further increases in the prices of manufactured commodities. As regards the poorer workers, it was stated that the Order was drafted in their favour in order to protect them from exploitation by the more highly paid and more highly organised trade unionists; that the Budget made provision for additional services in kind for the poorer sections of

the population; and that, in any event, the Order was an emergency measure which would be repealed when the crisis was over. To attempt to lay down minimum standards of living or to introduce family allowances in an emergency decree of this kind would be going far outside its true purpose and intention. Subsequently, however, with a view to meeting to some extent the representations made by Labour interests on behalf of the more lowly paid workers, an Order was made excluding from the scope of the Stabilising Order workers paid less than 50s. per normal working week in the county boroughs and 40s. in towns with a population of over 7,000. In other towns and in rural areas no increase is permissible.

In spite of the spirited opposition in both the Dail and the Senate, the Order came into operation, and has been successfully applied in practice. The real opposition to the Order in the ranks of Labour throughout the country is a good deal less than that offered by Labour spokesmen. The fact is that the acute problem at the present time is to maintain the volume of employment, and the trades unions have proved reasonable in meeting the efforts of employers to reduce to the minimum unemployment caused by the scarcity of raw materials. In Eire, as distinct from Britain, stabilisation is plainly simpler, because the trend of employment is not up, and there is no upward pressure upon wages and there has been no large creation of extra purchasing power by Government spending on the weapons of war. Even before the Order was made, demands for increased wages were not numerous and the number of strikes and industrial disputes since the outbreak of the war has been abnormally small. The essential justice of stabilisation has been generally appreciated by those sections of the population in whose interest it was framed; and it may be taken to have become a definite part of the Irish Government's economic programme for the war years.

NOTES OF THE WEEK

The Powers of the House

In all fairness, Mr. Churchill can hardly be accused of seeking to restrict the rights of Members of Parliament. There are times when the natural impatience of a burdened man with sniping critics goes perhaps too far and embraces honest questioners who are only carrying out their essential duty of vigilance to the best of their ability. Mr. Churchill, too, is human. But few Prime Ministers, with even a tithe of his personal power, have been such good Parliament men. Twice recently he has had to speak against rumours of repression, once last week when the air sub-committee of the House's Select Committee rebelled against the suppression, by its own parent committee, of a report, and the other time, on Tuesday, when the Home Secretary was arraigned for refusing Mr. McGovern permission to visit Ireland. In the first case, as a Note below shows, it was made quite clear that no pressure by the Executive upon the invaluable Select Committee, Parliament's most important and most characteristic wartime contribution, was admissible—or had been attempted. In the second, Mr. Churchill strongly opposed the suggestion that Mr. Morrison was "arrogating the right to say whether it was in the national interest for Members to do whatever they wanted to do." "He is not arrogating to himself any right (protested the Prime Minister). These duties have been placed upon him by the House. . . . The House has given the power, and I am bound to say that the Home Secretary has given the House a feeling, first of all, of the submissiveness of the Executive to parliamentary institutions and, secondly, of the care with which the powers are exercised." There are many instances since September, 1939, of drastic Executive powers being assailed and even modified by the Commons. Tuesday's debate was itself the clearest proof of Parliament's responsibility and authority. It is still possible to believe, in principle, that Mr. McGovern might perhaps have been allowed to cross the Irish Sea to investigate the case of Mr. Cahir Healy of the Northern Ireland Parliament, who is now in Brixton, without feeling that the rights of Members have in fact been thereby

impugned in any way by this decision; the disingenuous way in which the Member for Shettleston set about making his application was not calculated to inspire official confidence. In wartime there must be bounds to the actions—and words—even of Members. If they are dissatisfied with the way their Ministerial servants use the discretion given them, the Commons have the remedy in their own hands—as the debate and the Prime Minister's reply showed.

* * *

The Four Members

Scandal-mongers had their palates well tickled recently when the four members of the Air Services Sub-Committee of the Select Committee on National Expenditure asked the House of Commons to discharge them. It appears that the Co-ordinating Sub-Committee recommended that, on security grounds, a report they had prepared should not be published to the House, but should instead be sent direct to the War Cabinet; and the Select Committee, by a majority of one, adopted this recommendation. This procedure of reporting direct to the Prime Minister was carried out by virtue of special powers which, in May, 1940, at the request of the Select Committee itself, the House agreed to grant. These powers have only been used three times; but the Air Services Sub-Committee felt so strongly that Parliament should be told about what they believed to be a case of "bad administration, official negligence and wasteful extravagance in money, material and manpower" that they asked to be allowed to resign. Rather more than a mere difference of opinion on what is a matter of public security seems to have been involved. The Sub-Committee hinted that the plea of public security had been used to cover up the mistakes of Ministers and Departments, and that Ministerial pressure had been exercised to keep the report from publication. Nobody but those with full knowledge of the case can form an opinion on the first contention. As for the second, Sir John Wardlaw-Milne, chairman of the Select Committee, made it quite clear that Ministerial

advice on the question of publishing a report is never sought, though various items, such as facts and figures, are sent to a department, as a matter of routine, for an opinion on the wisdom of revealing them. This denial of Ministerial pressure was endorsed by the Prime Minister. He has also arranged for the past and present Ministers of Aircraft Production to meet the Select Committee and explain why the Sub-Committee's recommendation that the expenditure in question should be stopped cannot be accepted. With this assurance, the members of the Sub-Committee have withdrawn their resignations, and the matter will presumably be allowed to drop. Thus ends another incident in the long struggle to strengthen Parliament's control over expenditure. Once again it is clear that the Executive, which, through its responsibility for policy, must also be responsible for spending, has won. This does not mean that the Select Committee's work is valueless, or that the Four Members rebelled in vain. On the contrary, nearly all of the close on 50 reports issued by the Committee have been searchlights on administration and policy, and have provided a factual basis for responsible criticism. This right of criticism, which is the Commons' most valuable function in war-time, has been strengthened, not weakened, by these recent events.

The Defence of Moscow

After a week of tremendous battles, there has again been a pause in the German drive on Moscow. It is too early to say whether it represents the exhaustion of the offensive or the necessary regrouping of the attacking armies before the next effort is launched. There was a pause a week ago after the encirclement of Bryansk and Vyasma, and the fall of Orel. The attacks which followed carried the Germans to Kalinin in the north and to Mojaik and Maloyaroslavets in the centre. It is doubtful whether they penetrated as far as Tula in the south, and in both the northerly and southerly sectors, the pause appears to be due, not only to a self-imposed delay, but to strong local counter-attacks by the Russian defenders. The Russian defence has been beyond praise, and even though the Government has moved east to Kuibyshev (Samara) on the Volga, there is at least a hope now that Moscow can be held. The weather is reported to be deteriorating and, between the last spell of dry weather and the coming of hard frosts, there may well be weeks when the German army will flounder in mud. If Moscow holds, the problem of quartering the vast Nazi armies will tax the efficiency of the German Commissariat, especially since the same problem in an even graver form confronts them on the Leningrad front. However, even though the Russian defenders have purchased a respite for Moscow, there is no slackening of the Germans' relentless attack in the south. Taganrog has fallen; the Germans report the capture of Stalin, an important industrial centre in the Donetz basin, and claim to be at the gateway of Kharkov and Rostov-on-Don. The bitter fight for Moscow has tended to divert attention from these dangerous developments in the south. The loss of the Donetz basin would mean the loss of the backbone of Russia's heavy industry. The threat to Rostov is a threat, not only to Russia's communications with Iran, but also to nine-tenths of its oil supplies. If the Germans were to succeed in a drive across the Caucasus to Astrakhan, all land supplies and shipments of oil from Baku would virtually cease. There are further oil supplies to the east of the River Ural, but they cannot meet more than a fraction of Russia's consumption. Next in importance to keeping the Caucasian oil supplies for Russia is to prevent them from falling to the Germans. Here it may be possible for British forces to participate directly in the defence. Preliminary organisation is reported to be under way.

The Afghan Route

The news that about 90 German engineers and agents are to leave Afghanistan relieves Anglo-Russian defence of a great danger, and opens up new possibilities of effective military co-operation. The war is moving east. The new centre of Russian administration at Kuibyshev (Samara) is on the railway serving Tashkent, Samarkand and Bokhara; and from this run branch lines to the Afghan frontier at Kushk and Termez. The Ural industrial area, also served by this railway system, is likely to be the centre of Russia's continued existence; and if, by the misfortunes of war, the Allies' supply route through the Caucasus should be lost, other routes would have to be found to the east of

the Caspian Sea. The creation of an Afghan supply line depends, not only on the goodwill of the Afghan Government, but also on the work done in Afghanistan by Allied engineers with the co-operation of local labour supplies. The good will of the Government could by no means be taken for granted. There is a standing dispute over the Indian-Afghanistan frontier, and the Germans were quick to offer the Afghans Baluchistan and the Indus frontier. The dissident Afghans have long caused endless trouble along the frontier, and, since they are exactly the kind of material Nazi agents seek to use, they might have proved inflammable material, given a German-inspired government

at Kabul. The British Government had been slow in the question of economic co-operation, while the Germans were able to establish themselves some five years ago, and secure dominant positions as engineers and advisers. A German was chairman of a Government Committee for studying economic development, and a German-Afghan company obtained a monopoly for prospecting for minerals. Happily the Barakzai dynasty have preferred the security and independence of a friendly understanding with Britain to Germany's specious promises. The German agents are to leave. Now there must follow the development of this preliminary agreement into a programme of work and co-operation which will enrich Afghanistan by improving its transport system and throw open Russian Turkestan to Allied supplies. If Todt principles and Todt energy are applied, the task is not insuperable. The worst of the climb from Karachi is passed by the time the railway reaches Quetta. From there to Kandahar, 80 miles on, the way is downhill, and easy routes go the next 350 miles to Herat. Here the chief difficulty in the route, a mountain range, cuts off Herat from Kushk, the Russian railway terminus, 60 miles further on. But, with the help of German engineers, the Afghans have already thrown a motor-road across the Hindu Kush. It should be possible to repeat the performance with British aid and encouragement.

Revising the Neutrality Act

Throughout the week Congress has been discussing the question of the revision of the Neutrality Act. It has done so against a background which the Nazis have conspired to make appropriate. First came the news that the United States destroyer *Kearny* had been torpedoed, but not sunk, some 350 miles south-west of Iceland. Subsequent reports established that eleven men were missing and that some others had been injured. Later in the week, the news arrived of the sinking of two more merchant ships; the first, the *Lehigh*, was sunk off the African coast on a voyage on ballast from Bilbao to the Gold Coast; the other, the *Bold Venture*, although it was flying the Panamanian flag, was owned by the United States Maritime Commission. This ship was sunk in the area in which the *Kearny* was attacked, some 500 miles south-west of Iceland. The news of the sinking of the two American

merchantmen reinforced the impression made by the attack upon the *Kearny*. The *Kearny* alone was sufficient to secure in the House of Representatives a vote of 259 to 138 for repealing the clause in the Neutrality Act which bans the arming of merchantmen. The sinking of the *Lehigh* and the *Bold Venture* came in time to create a profound impression in the Senate before whose Foreign Affairs Committee the revision of the Neutrality Act now lies. It seems certain that the necessary revision will be secured. Indeed, it would almost certainly have been possible to secure a much wider revision of the Neutrality Act, had it not been for the obstructionist tactics of Senators Wheeler, Clark and other embattled Isolationists. When it became known that certain of the Senators who support the Administration proposed to attach to the revision of the clause dealing with the arming of merchantmen a further revision, abolishing the ban on the entry of United States ships into British and other belligerent ports, the Isolationist wing declared their intention of tacking on a proposal that Congress should declare war. This move was, of course, designed simply to embarrass the Administration and to produce a vote in Congress so hostile to a declaration of war that, both in Europe and in the Far East, the effects of the United States' forward and determined policy would have been reversed. In order to meet this manoeuvre, the President, after consulting with some of the leading Congressmen, has advised the Senate to confine itself strictly to the question of arming American merchantmen. The revision of the combat zone is postponed for the time being and Messrs Wheeler and Clark can flatter themselves that they have done Hitler at least this service.

Small Mercies

The Government was roughly handled in last week's Commons' debate on Service pay and dependants' allowances. Apart from the official spokesmen of the Ministry of Pensions, not one of the large number of speakers from all sides of the House gave unreserved support to the White Paper (Cmd. 6318). The great majority attacked it in no measured terms. The most that could be said in favour of the new measures was that they represented small mercies. It would, of course, be idle to deny that the families who will draw more money under the new scheme will be better off. The great disadvantage of the arrangement, as was made abundantly clear in the debate, is that it will involve the application of a form of means test to the vast majority of homes whose breadwinner, whether man or woman, has joined up. The task of individual investigation imposed on the Ministry of Pensions is so immense that it must involve very serious delay; and, moreover, the detailed investigation of circumstances, which is now to be the rule rather than the exception, is an invidious proceeding. A considerable waste of time is implied in the use of an army of minor officials to analyse and classify family incomes. The main justification for this procedure is the contention that an automatic flat rate increase in the allowances paid by the Service departments would cost the taxpayer too much. But the time has surely gone by when the country could afford to calculate war costs in monetary terms. The true loss to the country, for instance, of the misemployment of civil service officials is greater than the sums they will save in rejecting claims to bring the total down to the sum of £13,500,000, which the Minister of Pensions proposes to spend—a net increase on previous allowances of £8 millions. It is true that no flat rate payment could obviate hard cases, and there is good reason for leaving the War Service Grants Advisory Committee to deal with exceptions. But to devise a scheme by which it will assume the enormous responsibilities implied in the White Paper is to shift to the Ministry of Pensions a duty of maintenance which should be the routine task of the Service departments themselves.

The Risk Bearers

The biggest and most obvious anomaly in wartime is the discrepancy between remuneration for service in the armed forces and remuneration for service in war industry. Last week's debate on dependants' Service allowances gave a chance to discuss it. Much of the deep emotional appeal that has attended the campaign for better Service pay and allowances is due to the recognition—the uncomfortable and disturbing recognition—that the reserved man generally draws highly satisfactory wages, while the soldier obtains

insufficient pocket money and his dependants a pittance. The discrepancy is painfully driven home in many ways. No doubt taxation and rationing should see to it that the factory worker cannot actually consume more than the fighting man, and may, in fact, eat less well. But the fact that the soldier cannot save for post-war contingencies, for setting up a home, or for educating his children, is a real grievance; and, even more important, the wife and children of men in the fighting forces are almost certain to be less well off than the families of friends and neighbours employed in factories. Even the new patchwork system of war service grants will only ensure that these families do not fall below the level of subsistence. No system of payment, of course, can really put the fighting man on the same footing as the man in civil life. Despite long periods of waiting, the main duty of the soldier is to fight with a rather more than equal chance of injury, imprisonment or death. These are risks which cannot be compensated in terms of money; and, consequently, no payment made to the fighting forces can be more than token. It should be possible, however, to provide fighting men with adequate pocket money, and, at present, the married man on the lowest rate of Army pay does not receive enough. As far as the man's family is concerned, the position is different. Equity demands that conscription should not leave the wives and children of men in the Services on the margin of subsistence. On grounds of expediency, morale in the Forces demands that a very generous system of prompt and automatic allowances should be paid to the dependants of fighting men. This surely is the way to make good the debt which the civilian owes to the combatant, and the purely monetary argument in an economy where money is rapidly losing all formative influence is irrelevant—certainly while it is now apparently impossible to use this argument to prevent the upward movement of civilian wages.

Steel Supplies

Lord Gort's despatches have once more emphasised the decisive role of modern equipment—of tanks and aircraft—in the present war. And, as is shown in an article on

THE NEW YORK TRUST COMPANY

page 493 the production of the tools of war must be appreciably increased if Britain's striking power is to be developed. Since the supply of steel is one of the limiting factors in the output of modern war equipment, no effort must therefore be spared in securing the greatest possible quantity of steel, in the quantities in which it is needed, from the resources at Britain's disposal. The iron and steel industry was faced with considerable difficulties in maintaining a high rate of crude steel output when it was cut off from its European sources of raw material supplies. But, as a result of an expansion in the output of domestic ore and assistance from the United States, it was able to overcome its difficulties, though the current output of crude steel may be somewhat below the high level of the best pre-war year—it was some 13 million tons in 1937—and well below its pre-war capacity of nearly 15 million tons per annum. Domestic crude steel supplies, however, have been considerably augmented in the last two years by heavy imports from the United States. But America's own production programme is now absorbing growing quantities. Scrap exports to this country have already been drastically cut; and the time may not be far off when America will have little to spare in semi-finished and finished materials, if American capacity to produce armaments is to be fully utilised. It requires little imagination to see that this country will have to rely more on its own resources. These must be exploited to the full if the output of tanks and other equipment is to be increased to the desired level. While the home production of iron ore can no doubt be raised still further, the main effort must be concentrated on an increase in the flow of domestic scrap to the steel furnaces. There is enough potential scrap in this country to permit a very considerable increase in the output of crude steel. But it will not be forthcoming in adequate quantities in the future unless the problem of collection is tackled with much more imagination and boldness than hitherto.

Transport on Tap

Lip service has long been paid to the need for regarding and treating the various means of transport—still one of the scarcest of vital commodities—as so much interchangeable carrying capacity. A good deal of progress has been made, since the formation of the Ministry of War Transport last spring, to improve efficiency. But there is much still to be done. Administratively, among the various carrying facilities, the road haulage industry has proved the most difficult to fit into a scheme of war transport. Before the war, some 148,000 lorries were operated by no fewer than 61,000 A and B licence-holders, and 365,000 vehicles by 178,000 C licence-holders. Last January, the Ministry of War Transport decided to enter the road haulage business by hiring vehicles from operators for the carriage of Government traffic. But the scope of the Government's enterprise remained severely limited. Now the original plan has been modified by the Ministry of War Transport, after consultation with the Road Haulage (Operations) Advisory Committee. Additional vehicles are to be available on call to the Ministry, which will operate the scheme in "partnership" with the hauliers. The Ministry will set up an area organisation—there will be six divisions which are to be subdivided, as a first step, into fourteen areas—which is to control the operation of the fleet of vehicles at its disposal and to act as a clearing house for traffic. Parallel to this, the road haulage industry itself will set up an organisation to allocate the traffic passed to it by the Ministry. Presumably this means that the Ministry will hire the vehicles, supervise their employment, and decide on the traffic they are to carry, while the industry will actually operate them. Agreement has been reached concerning rates of hire and working conditions. The success of this modified scheme must depend on the number of vehicles which will come under the Ministry's direction, and on the efficiency of their operation. The existence of many thousands of A and B licence-holders cannot be cited as an excuse for further indefinite delay in bringing all possible vehicles into this war transport scheme under the Ministry's direction.

Pacific Bases

The policy of Pacific defence is discussed in a leading article on page 495. Its strategy must rest upon hard geographical facts. From the point of view of American

defence, the Pacific has three zones: an Asiatic zone which runs in an arc from Singapore to Petropavlovsk on Kamchatka; a central zone from the Aleutian Islands in the north to New Zealand in the south; and an American zone from Alaska to the Panama, or, if South America is included, to Santiago. The Panama Canal is safe from attack so long as the United States holds Hawaii, the hub of their Pacific defence. Here, at Pearl Harbour, is the largest single defence area controlled by the United States military authorities. The Pacific fleet is stationed there, as well as an infantry division and a growing air force. The islands are protected by Midway, Wake and Johnston islands, from which long-distance planes can patrol about 4,000 miles to the west of Hawaii. Midway is a fully equipped air and naval base, and Wake has only limited facilities; but both are being improved and expanded to the tune of a Congress grant of over \$9 millions voted in March this year. The danger to the American zone comes from the north. East Siberia, the Aleutian Islands and Alaska are potential stepping stones for a Far Eastern aggressor. But Alaskan defence has been vigorously developed in recent years. There are two first-class air bases at Fairbanks and Anchorage, and a string of naval bases runs from Dutch Harbour on Unalaska Island to Seattle.

It is in the Asiatic zone that American defence faces real problems. The Philippines and the approaches to Alaska give the United States clear interests and responsibilities in this zone, and, apart from this, a general interest in checking Japanese aggression links it with the defence problems of the other peace-loving Powers. If the Asiatic zone is

divided into two sectors, north and south, each covering a potential area of conflict, it is clear that the Japanese enjoy a considerable advantage against Vladivostok. From their bases in South Japan and from Formosa, they would be in a strong position to prevent any naval reinforcement of the Russians. Aircraft could, however, be flown to Siberia via Alaska. In the southern sector, it is the turn of the Japanese to face serious strategic difficulties. Any naval advance would have to run through the Scylla and Charybdis of Hongkong and Cavité Bay in the Philippines, and, unless Camranh Bay can be transformed into a first-class base in a very few months, a Japanese fleet operating against, say, the Dutch East Indies would be nearly 3,000 miles from its home base, whereas the defenders would be strongly based on Singapore and Surabaya in the Netherlands Indies. The difficulty is that, whereas it is

very unlikely that Britain can spare a full battle fleet for Far Eastern waters and the Dutch navy, though very serviceable, is small, the American Pacific fleet has no suitable bases west of Pearl Harbour, some 4,000 miles away. The project of equipping Guam as a naval outpost was abandoned first in 1922, under the Washington Treaties, and later in 1938 in order not to offend Japanese sensibilities. To-day it would cost over \$200 millions to prepare, and the work would last over two years. As it stands, Guam has no particular military significance. Cavité Bay, the base at Manila, has no proper facilities for heavy repairs and is not very strongly defended. The obvious solution is the use by the American fleet of British and Dutch bases in a wide arc from Brisbane to Singapore. It should not be imagined, however, that the use of a base by the fleet of another Power merely consists in sailing in and anchoring. Vast stores of American material, spare parts, etc., would have to be brought to Singapore. However, if serious defence is intended, it is planning on this scale that is above all necessary.

France "Betrayed"

On October 20th Dr Karl Holtz, Field Commander of the Nantes Military Region, was shot in the neck by two assailants and was killed instantly. The two men escaped. The Germans have retaliated by establishing a 6 o'clock curfew in Nantes and by shooting out of hand 50 hostages. Two days later, another German officer was killed, this time in Bordeaux. The Germans again retaliated with a curfew and with the arrest of 100 hostages whose fate cannot be in doubt. These shootings followed on wholesale arrests among the intelligentsia of Paris and are signs of a new wave of general unrest. And it is against this background that Marshal Pétain has decided to open the formal trials of Mm Daladier, Blum, Gamelin, La Chambre, Jacomet, Paul Reynaud and Georges Mandel at Riom. So far only the official case against these men has been made known. But that alone is enough to make entirely fantastic the idea that justice can be served by setting up Pétain, Darlan and Laval in judgment upon the men of the *ancien régime*. The charges, taken point by point, apply as obviously to the men of Vichy as to any of those whom they presume to condemn. Blum, La Chambre and Jacomet are accused of keeping secret their knowledge of the disorganisation and lack of material preparation in France. Blum in particular is arraigned because, so the charge maintains, the process of disintegration began under former Prime Ministers. But was not Laval a former Prime Minister? Did not Darlan know as well as Gamelin that the French forces were insufficient? Was not Pétain concerned with the training and equipment of the French Army? Again, Daladier and Blum are both accused of failing to suppress labour unrest and of helping on the "process of disintegration." But in the supreme hour, can it be said that France was more corrupted from the Left than from the Right, and did not the word of surrender come not from the ranks and the masses but from the little group of *bien-pensants* who saw their way to save their bacon by betraying France? With tremendously inappropriate grandiloquence, Pétain declared in a broadcast that "the country which has felt itself betrayed has a right to the truth and to the whole truth." But the country which feels itself betrayed is not boot-licking in Vichy. It is shooting down Vichy's masters in the streets of Nantes. And the country which indeed feels itself betrayed will demand an account and a restitution, not from Reynaud or Mandel who were ready to carry on the fight from North Africa, but from Darlan and Pétain who preferred an armistice to occupation and total dishonour to honourable defeat.

Feeding the Children

Malnutrition among children was prevalent even in peacetime, but the only step taken then to prevent it was the half-hearted scheme for supplying cheap milk in schools—which, in the case of many local authorities, was a dead letter. Even now, after a wartime campaign to increase the consumption of milk, the proportion of children receiving milk under the scheme is, according to Mr Butler, only some 60 per cent. The Board of Education now aims at raising this proportion to as near 100 per cent as possible. This will mean, in the absence of enough one-third pint

bottles, that distributors will have to supply more and more of the milk in bulk, and the Exchequer will bear the cost to the local authorities of providing utensils and washing them. Moreover, the Exchequer grant on the school milk service as a whole will be raised to 100 per cent. There should, therefore, be no excuse for dilatoriness on the part of local authorities in extending the service. More difficult, but more far-reaching, will be the big extension of school meals that was also promised this week by Mr Butler and Lord Woolton. At present, only 300,000 of the 5,000,000 children in secondary and elementary schools receive a mid-day meal at school. Here, again, one of the chief obstacles has been finance, and the Exchequer grant in respect of the cost will be raised to a minimum of 70 per cent, with a maximum of 95 per cent and an average of 80 per cent. Another, hardly less important, obstacle, however, has been the lack of equipment. The Ministry of Food is, therefore, to allow local authorities to use its emergency cooking depôts and the facilities of British Restaurants for supplying meals in schools. Some time will even now elapse before the whole of the five million children can be catered for, and an obvious deficiency in the whole policy of feeding children is the absence of special arrangements for children who leave school at 14, just when many most need plentiful food. It ought to be made possible for those who have no canteens where they work to use the local school canteen at least until they reach the age of 16. But, on the whole, the scheme cannot be too highly praised; it must rank as one of the most important social measures to be introduced since the war began.

Differential Rationing

As the meals in school scheme is gradually extended, the principle of having a basic plus a supplementary ration will be strengthened. The basic, or domestic, ration is, according to Lord Woolton, based on "the average need of the average family." But with the special rations for the armed forces; the possibility of an off-the-ration meal for five million children; and the extension of industrial canteens and special rations for certain classes of workers, without taking into account the restaurant service—whether British or otherwise—the basic ration must become less and less important as the measure of the nation's diet. The supplementary ration, on the other hand, is more and more to be determined according to needs and on dietetic principles. Thus, expectant and nursing mothers are given priority for milk and shortly for eggs; and children for milk, eggs and oranges. Invalids are allowed supplementary rations according to the nature of their disease, and underground and agricultural workers are given extra cheese. Lord Woolton has now announced that, in the allocation of food to canteens and catering establishments, they will be classified according to whether they serve heavy workers, other workers and the rest of the population. This differential rationing for civilians is

admirable. At present, the only section which is nutritionally favoured, apart from the paltry 5 ounces extra of cheese given to underground and agricultural workers, is seamen on weekly articles. These are entitled to 7½ lb. of meat a week, 8 ounces of bacon and ham, 15½ ounces of fats (in any proportions of butter, margarine and cooking fats), 4 ounces each of cheese and tea, 30 ounces of sugar, 8 ounces of jam and 2 ounces of syrup. It is not suggested for a moment that the peculiar dangers, the hardships and the hard work faced by these men do not entitle them to the maximum amount of food that can be provided for them. But 7½ lb. of meat, 15½ ounces of fats and 30 ounces of sugar are startling statistics these days; and it is worth pointing out that the rations for the armed forces on home service are nothing like so much even if they get—which is not always the case—the full amount of their nominal rations; and the discrepancy is much wider in the case of coal miners, whose work is also hard and dangerous. The discrepancy should not, of course, be narrowed by reducing the weekly seamen's rations, but by the prompt extension of supplementary rationing for other special categories, whether by canteen feeding or by increased allowances on the ration card.

Men and Women

This week end women aged 28 register for national service; in the next year it is expected that, by stages, all up to 40 will register. Meanwhile, a drive to recruit those between 20 and 25, who have already registered, is once more announced. Unless they can be shown to be key workers, that is, indispensable and irreplaceable in their present employment, they must choose between the auxiliary Services, nursing or work in war industry. Actually, this story is many months old; it was said to be the purpose of registration right from the start. In fact, it has failed because, on the side of the Ministry of Labour and National Service, the call has not been peremptory enough; and because, on the side of the girls, employers and parents have refused to let them go. Until recently, full-time paid work of any kind was, in many districts, sufficient exemption. The fact that 90 per cent of the spinsters and widows between 20 and 25 are doing paid work, and 97 per cent of those married between those ages doing housework, is still falsely quoted to show that there is no reserve. In every nook and cranny of the community completely idle young women still lurk, sometimes without having even registered on their appointed day; the appeal of some months ago for the release of domestic servants was barely a nine days' wonder. The plan for mobilising women by registration, interview and selection is sound enough; it always was. It is just that its operation has been, until very recently, coy and feeble to the point of frustration. Now the big drum is being beaten again—this time it seems with some justification. What promises to be a comb-out, industry by industry, has started with the retail trades, for which over 500 local committees have been set up to advise on individual reservations and releases—though the project for slimming retail distribution by concentration, on which a committee has just reported to the Government, still hangs fire. Other employers and advisory committees in other industries are beginning work to count the women—and the men—who could be released from non-war jobs. Panels in such occupations as newspaper and insurance employment have been advising the authorities for some time. It is plain that the principle of reservation by "occupation", a principle which admittedly provided a reserve of skilled or experienced labour but did not ensure that it was used for the war effort, is at last, after a year or more of agitation for the change, being superseded by the principle of reserving people who are actually doing vital work. It is common sense to consult the various industries on the release of their labour. But it will be fatal if it is again left—and there is some evidence that it is still being left—either to individual employers or to representative committees to put a lax and partial interpretation on "vital" work.

British Diplomacy and Mexico

The Government's announcement that diplomatic relations with Mexico are to be resumed puts an end to one of the most curious anomalies in Britain's relations with the outside world. Since the beginning of the Presidency of Señor Camacho, the Mexican Government has practised

a consistently strong policy against Axis intrigue, has been in the forefront of the Latin American Republics in supporting President Roosevelt's plans for hemispheric defence, and has allowed it to be known on a number of occasions that the resumption of diplomatic relations would be welcomed. The British Government, whose patience with such open friends of Germany as Italy or Japan, is exhausted only when one or other of them actually goes to war against Britain, showed a curious determination to remain on hostile terms with a Power so patently anxious for better relations. It is to be hoped, now that Britain has taken the correct and obvious step of renewing relations, that the underlying cause of the friction and delay—the still unrecognised right of the expropriated British oil companies to fair compensation—will also be dealt with successfully.

Views on News

On Wednesday, Members of the Commons opposed the sale of half the shares of Reuters, Ltd., to the Newspaper Proprietors' Association. Speakers pleaded for an independent trust to control the famous news agency. Actually, Reuters is not "independent" now. A controlling interest is held by the Press Association, which represents provincial newspapers as the NPA does London newspapers; and the NPA already owns a quarter interest, on account of its provincial affiliations, in the Press Association's half share. The membership of the Press Association is admittedly more scattered and independent than membership of the NPA. But the Minister of Information was perfectly right to oppose any alternative arrangement that would make Reuters a semi-public body; the BBC is not really the happiest precedent. Much of the fear of what the "Press barons" may do with Reuters is probably due to the relentless way in which the newspaper industry, in all its branches, tends to pursue its vested interests—*vis-à-vis* the BBC, for instance—and those of their advertisers; and it might be a great gain if Reuters' news gathering could be insulated from all interests or partisanship. But there is no evidence that the NPA intend to cook the news. In normal times, they will be working in competition with the able agencies of the United States; and the greatest gain of all would be if Reuters could be staffed and organised to compete in efficiency again with its best American rivals—as it has not done for more than a decade.

Shorter Notes

There seem to be no limits to the ways and means of profiteering in food. It is apparently an offence, under the Waste of Food Order, to feed cats and dogs on meat fit for human consumption; and the supplies of meat available for animals are consequently scarce. Prices accordingly rose, and the Ministry of Food fixed them at a maximum of 8d. per pound for horseflesh. Now, purveyors are selling the same meat at 1s. 3d. per pound, free of coupon, and certified as fit for human consumption. The Ministry of Food is taking steps to prevent this.

Panama has given a lead to its powerful American neighbour by declaring that all ships registered in Panama—of these there are 270, of which 82 belong to United States interests—shall be armed. Behind this decision lies an interesting but somewhat obscure Palace revolution. President Arias, who was reported to have Axis sympathies, had earlier declared that no Panamanian ship should carry armaments. On October 9th, a movement backed by the democratic elements in Panama and led by the Minister of Government and Justice, Señor La Guardia, drove President Arias from office and established instead a provisional regime of which Señor La Guardia is the President. The sequel to this move has been the decision to arm Panamanian ships. It can therefore be surmised from the new regime is more compatible with United States interests than the presidential dictatorship of Dr Arias.

The number of persons already receiving pensions who have benefited from the provisions of the Determination of Needs Act was 216,000 up to August last. The number of new supplementary pensioners as a result of the Act is so far only about 100,000, although the Assistance Board counted on 250,000, and steps are being taken to make pensioners aware of their potential rights.

THE WORLD OVERSEAS

Nazi Activity in Argentina

(From Our Buenos Aires Correspondent)

September 23rd

ALMOST three months ago, the Minister of the Interior, speaking in the Chamber of Deputies, said: "I can conscientiously tell the Chamber that the penetration of foreign ideologies is an unquestionable fact, an important fact, a fact of national significance, because they have penetrated into all parts and because, unfortunately, they are zealously cultivated. It is not known for certain whether the only aim is the credit or discredit of the belligerent countries, or whether a situation is being prepared for the carrying out of other plans. The Ministry has abundant information from many sources, ranging from confessions to anonymous communications, from police proofs to the denunciations of informers, all of which leads to the conviction that there are forces working in the Republic to form an atmosphere propitious to possible future consequences of the conflict which is shaking the world."

This pregnant statement was welcomed by the responsible press, less as a timely warning (much less a clarion call) than as a sign that public opinion had at last been accorded Cabinet recognition. In effect, the leading Argentine newspapers had for many months been waging a campaign against totalitarian influences in the country. They were spurred on by a constant crop of incidents—in many of which interned seamen of the *Graf Spee* were involved—by the extravagances of a self-styled "Nationalist" and openly pro-German newspaper and the movements it sponsored (classified by the outspoken evening dailies as "Nazi-onalistas"), and by the steps taken in other Latin American Republics—notably Bolivia, Peru and Uruguay—to suppress German-inspired activities. Commenting on severe anti-Nazi measures taken by the Bolivian Government, the authoritative *La Prensa* had said: "We welcome the solution of the Bolivian conflict and suggest to our Government the need to reflect on the attitude adopted by yet another country in our continent. It must be understood that sibylline phrases and enigmatic attitudes are not for moments like the present."

Outspoken statements from the public platform were not wanting as a further sign of public opinion; they proclaimed the danger to Argentina's democratic constitution which was represented by germanophile activities and by the dissemination of totalitarian ideas among the population, including the armed forces. Many such statements were made by prominent politicians, some under the auspices of "Accion Argentina," which was formed in May, 1940, with the declared aims of defending the country's democratic institutions and giving all possible moral support to Great Britain and the United States. On the principle that democracy begins at home, this movement is a militant opponent of totalitarian influences and claims to have 800,000 adherents. Whether the figure is accurate or not, "Accion Argentina" certainly represents a very comprehensive and influential cross-section, socially and politically, of Argentine opinion.

Against this background the Minister of the Interior, Dr. Culaciati, admitted "the penetration of foreign ideologies" just after the Commission appointed by the Chamber of Deputies "to investigate anti-Argentine activities" had begun its work, with the overwhelming support of public opinion behind it. Invoking judicial co-operation to ensure the examination of material witnesses and evidence, its investigation has been nothing if not thorough; this is revealed in its exhaustive and carefully documented report, of which three parts have been published, a fourth being promised shortly. Its labours have been punctuated by such sensational news items as the confiscation of "diplomatic mail" containing a powerful wireless transmitting set consigned by the German Embassy in Buenos Aires to

the German Legation in Lima and returned by the Peruvian authorities; the apparatus contained, besides propaganda matter, a partly undecipherable code message. A further sensation was caused by the flight of Gottfried Sandstede, who, after claiming diplomatic immunity, hurriedly left the country by the German-operated "Condor" air line when called upon to testify before the Commission.

German Embassy Intrigues

The first part of the report makes clear the wide ramifications of the *Auslanddeutsch* movement in Argentina, working as part of the National Socialist Party in the Reich, although under the guise of German charitable institutions. The foreword to this part states that it offers proof of "the active existence of the German National-Socialist Party in the country, the organisation of cells dependent on the same, aiming at political domination and the participation of the German diplomatic corps, through the Ambassador and other Embassy officials, in all the party's activities." The second part deals with the funds provided by the German Embassy for Nazi propaganda, the foreword stating that the information presented "fully confirms the impression that the Embassy is the principal factor in the campaign against the country's institutions." The third part examines the activities of the "Transocean," DNB and other German news agencies in the country, as well as the financial resources of the pro-German "Nationalist" newspaper, *El Pampero*; it comes to the conclusion that these agencies are "organisations existing exclusively to serve National-Socialist propaganda, controlled by the German Government either directly or through its diplomatic representatives in the Argentine Republic." The fourth part, not yet published, is reported to pronounce on the activities of German schools in Argentina.

The mass of evidence accumulated in these reports has inevitably focused public attention on the German Ambassador, Herr von Thermann. The interest has been shared by the Chamber of Deputies, where last week the Commission's motion that he had exceeded his functions, and recommending the dissolution of the German Benefit and Cultural Societies and the withdrawal of legal status from the German Chamber of Commerce, was carried by the almost unanimous vote of 78 to 1. The popular cry that the Ambassador should be handed his passports has thus been virtually endorsed by the Lower Chamber, and the executive's expected reaction to its overwhelming vote of censure is one of the two main topics of press comment. The other is the German press outburst against the procedure of the Investigating Commission. This outburst was classified by *La Prensa* as "an offensive of inexactitudes, insults and threats," and was regarded unanimously by the responsible press as inspired by the German Government.

THE COMMERCIAL BANK OF SCOTLAND LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL - - - £2,250,000

RESERVE FUND - - - £3,150,000

ESTABLISHED 1810

The Chairman of the Commission, Deputy Damonte Taborda, has just stated in a press interview that the Commission will ask for the arraignment of the German Ambassador and members of his staff before the Argentine Supreme Court in connection with the findings on their manipulation of certain funds.

The Commission has prepared for presentation to Congress a project whereby the local authorities of foreign concerns carrying on business here would be allowed—or if necessary compelled—to obtain emergency legal autonomy in Argentina if their head offices are in territories occupied by a Government other than their own. The reason for this proposal lies in the Commission's statement that the assets of Belgian, French and Dutch concerns operating here—where, according to the Commission's figures, their investments total 1,500 million pesos—may be logically supposed to be controlled by the Reich, which under their present constitution would be able to manipulate their local capital to the detriment of Argentina's economy.

Anti-Nazi Measures Elsewhere

With the unfolding of the Investigating Commission's case, which quotes facts and figures regarding the German Embassy's international traffic in propaganda material, the development of anti-Nazi moves in other Latin American States has been prominently reported in the local press. In Chile, the judicial authorities are investigating Nazi activities, and in Uruguay strict measures have been taken to suppress totalitarian propaganda. Peru has banned the introduction of propaganda from belligerent nations, and Mexican resentment over what is interpreted as interference by a German diplomat in internal affairs has drawn approval from the Buenos Aires press. In local press comment, there is a lively awareness of the effect of these widespread activities on continental solidarity. Their disruptive influence on relations between the 21 republics, which at last year's Havana Conference pledged themselves to spare no effort "to prevent any divergence which might impair their solidarity," is the keynote of simultaneous leading articles which have just appeared in two of Argentina's leading journals, *La Nación* and *La Prensa*, under the titles: "Plans for American Discord" and "Campaign Against American Solidarity." Their theme is a recent conference in La Paz called by the Bolivian Government to denounce to the representatives of Argentina, Brazil, Chile, Paraguay and Peru a seemingly inspired campaign, begun a few weeks ago in certain reactionary and pro-German organs and calculated to arouse mutual distrust between these neighbouring republics.

Reaction to the impingement of Nazi doctrine on Argentina's body politic has been slow in forming; that it is none the less positive is obvious from the country's reception of the Investigating Commission's findings. In discussing this *La Nación* states: "The entire country has awakened to the reality of its situation, not by means of propaganda speeches, but from the conviction arising from overwhelming evidence." In view of the allegations in the German press about the partiality of the Commission's report, it must be added that the evidence in its essential points is the result of proceedings by the competent judicial authority—in this case Judge Ramón F. Vasquez, whose continuance of these proceedings is awaited by the country.

Harvests in Western and Northern Europe

[BY A CORRESPONDENT]

October 13th

GERMAN spokesmen have repeatedly stated that this year's harvest in the Nazi-dominated countries of western and northern Europe would be quite satisfactory, and in any case above the low level of 1940. Accurate figures will not be available for some weeks yet, if at all; but what has become known so far of the actual prospects is sufficient to disprove the anticipations of the Nazis. The preliminary reports were apparently mainly issued for propaganda purposes, though it may be admitted that the harvest results

would have been somewhat better without the spell of bad weather in August.

The latest Ministerial statement about the grain harvest in Germany itself was that it would be "medium," or "about equal to last year's"; and this announcement was only made when 96 per cent of Germany's rye and 85 per cent of winter wheat had actually been brought in. The shortage of cereals in Germany has largely been made good so far by doubling the human consumption of potatoes and also by greatly increasing their use as animal fodder. However, though last year a record crop was yielded, potatoes became scarce in July and August, owing in part to the lateness of this year's crop. According to a recent wireless report, the present crop will be good, but will not reach that of last year.

According to the *Breslauer Neueste Nachrichten*, Silesian sugar beets are three weeks behind, because of cold August and September weather, and laboratory research shows their sugar percentages to be "very variable." A report from East Prussia says that meadow cultivation has been neglected during the summer, owing to the shortage of suitable labour. In the same province, a new insect pest is damaging the cabbages. The fruit crop seems also to be below expectations, with the partial exception of the apple crop, and the Rhine vintage has been considerably damaged by hay worm and other disease. The poor grape harvest in France and Algeria has already resulted in French wine rationing.

The French grain harvest is officially estimated at about 32 million quintals, or roughly equal to last year's; though the total acreage under cultivation has been increased by almost 30 per cent, the harvest will still be nearly 40 per cent below normal. Contrary to last year's experience, there is no carry forward from the previous harvest. Special efforts have been made to raise sugar beet cultivation, with the result that the yield will now probably be 40 per cent below normal, against 70 per cent below normal last year. Some reports about the vegetable situation are fairly optimistic, although they are always in general terms; and it is very doubtful if satisfactory results can be expected in view of the apparent shortage of seeds, fertilisers, and labour, which must be especially disturbing in this branch of agriculture.

The Belgian grain harvest is expected to be satisfactory, and even to exceed the record harvests of the past. It must not be forgotten, however, that grain cultivation in Belgium is only a comparatively small affair. The potato and vegetable crops seem to have suffered from bad weather, disease, lack of seed and other unfavourable circumstances. Dutch market gardening has also been affected by unfavourable weather, according to various provincial reports; and the Dutch flax yield has been very disappointing. In Scandinavia, frank statements about the unfavourable position have been issued not only in "independent" Sweden, but also in Denmark and Finland. According to the September forecast of the Copenhagen Statistical Bureau, fodder grain, rye and wheat are 30 per cent, 25 per cent, and 34 per cent, respectively, below average on the Danish mainland, and 15 per cent, 11 per cent, and 24 per cent below normal on the Danish islands. Potatoes are also very disappointing, while lucerne and grazing are slightly under normal. The fruit harvest, which earlier in the summer was declared in German reports to yield a record crop, seems to be just about normal according to the latest available forecasts.

It has been authoritatively stated that the harvest in Finland is also below expectations; all crops have been unfavourably affected by bad summer weather and early frosts. The grain crop will at best be about 2.8 million tons, against 4.1 million tons in 1938, and in the territories reconquered from Russia, the "scorched earth" policy has admittedly reduced the yield to a fraction of what it was in former times. The Norwegian position seems to be somewhat better, but there is a serious shortage of labour, and unfavourable August weather has done some additional damage to the grain and hay crop. Root crops seem to be below normal.

The harvest prospects in the southern and eastern parts of the Continent are hardly better than in northern and western Europe; and the Ukraine may be a liability rather than an asset for the Nazis' food position during the next twelve months. It would certainly be rash to conclude that they will not be able to feed their soldiers and industrial workers adequately during the coming winter; but they will manage to do so only at the cost of a further deterioration in the diet of the suppressed peoples, and of their own non-working population. The new measures of food rationing recently introduced in various European countries are probably an indication of this state of affairs.

Repression and Resistance in Holland

[BY A DUTCH CORRESPONDENT]

October 1st

DURING the last six months the broad outlines of German policy in Holland have remained substantially the same. The Germans are unwilling to hand over all nominal authority to the Dutch National-Socialist movement of Ir. Mussert, but they are assigning key posts in Dutch administrative and economic life to members of this quisling group at an ever-increasing rate.

The country is controlled by the office of Seyss-Inquart, but the rate at which German decrees are carried out is largely determined by the Dutch civil service. Hence the necessity of promoting Dutch Nazis to provincial commissioners, burgomasters, etc. Four departments of state are now headed by members of the *Nationaal-Socialistische Beweging*. Five of the eleven provinces have NSB commissioners. Many important towns, including Amsterdam, have NSB burgomasters. The *Hooge Raad*, the country's highest Court of Appeal, has been nazified; so have various other Courts. The specially appointed "Economic Judges," who have to settle the thousands of "economic" crimes, are mostly members of the NSB. So are the "Political Judges" and the members of the "Political Court of Appeal," who deal with all political crimes, save those falling within the jurisdiction of German courts. The Nazi grip on the country's administrative life has been strengthened by the introduction of the Fuchrer principle in towns and provinces. All provincial and municipal representative bodies have been dissolved. At the same time, the police is being thoroughly and methodically Nazified. Broadcasting is under Nazi control. The Nazi grip on the press is tightening. Members of the NSB are appointed editors of papers which up to now had retained some measure of independence, like the well-known Liberal Amsterdam daily, *Algemeen Handelsblad*. The Universities of Delft and Leyden have been put under Nazi control, and of the same fate threatens all other universities. The Nazi secretary-general for arts and propaganda is busy setting up an elaborate system of guilds, which is an imitation of Goebbels' *Reichskammern*, and various other Nazi institutions have been introduced, such as compulsory labour service and Winter Help.

This process of gradual nazification is supplemented by the elimination of all "undesirable" elements. The only permitted political organisations are Ir. Mussert's NSB (which now boasts 100,000 members, that is, about 1 per cent of the population), the Catholic Fascist Movement, *Nationaal Front*, and the small Dutch National-Socialist Labour Movement, which supports the complete inclusion of Holland within the Reich. All old political parties have been dissolved. The *Nederlandsche Unie* is virtually unable to carry out any activities. All its emblems are forbidden; so are its paper, its social organisation, its propaganda. It still has the amazing number of 800,000 members, but its conferences have been prohibited and its formal dissolution seems only a matter of time.

Various other organisations have already been dissolved. The Salvation Army and the Boy Scouts were considered "active instruments of British propaganda." Ir. Mussert has ordered an investigation into the activities of the Oxford Group, described as "Freemasonry disguised as religion." At the same time, the number of wanton arrests is growing daily.

The Jews are, of course, in an exceptionally difficult position. Nearly twenty thousand Jewish businesses are being aryanised. At the beginning of September, the Nuremberg Laws were formally introduced, and the Gestapo and concentration camp threaten every Jewish family. Hundreds of young Jews have been sent to concentration camps and mines, where many have already died. The Jews are, however, by no means outcasts in the eyes of the Dutch people. When, some time ago, in one of the German concentration camps, the Dutch Jews were ordered to make one step forward, the order was carried out by all Dutch prisoners. In many towns, Gentile doctors pass on to their Jewish colleagues the fees received from the former patients of the latter.

The German invasion of Russia provided the German occupiers with an opportunity for an endless stream of anti-Communist propaganda. The Dutch were far from convinced. The invasion actually gave rise to a wave of optimism. Russia would be the death-trap of the German

armies. Nobody paid any interest to the promises of Ir. Mussert that Dutch farmers would be settled in the Ukraine. Some 9,000 members of the NSB are serving with the German armed forces; but thousands of other members of the NSB were very reluctant to join "the glorious battle against Communism." Therefore all members of this movement were formally ordered to join the Dutch SA troops, which means that they will be despatched to the Russian front in due course.

Positively, German propaganda has been a complete failure. Negatively, Goebbels has at least succeeded in spoiling the BBC "V" campaign by his own avalanche of "V" propaganda. The Dutch press has lost its readers, the Dutch broadcast its listeners. To the Dutch, the English broadcasts are a tonic. Passive and active resistance is spreading. The Dutch workers go very slow. At the beginning of September, five Dutch patriots were shot because they had helped in the escape of a British bomber's crew.

There are, of course, a number of secret organisations in Holland, though their activities are much hampered by the Dutch lack of experience in such matters. Many of these organisations seem to rely principally on the unbounded enthusiasm of the Dutch youth. On the whole, there appears to be a slight antagonism between this youth and the other Dutchmen in the sense that the youth is more radical in its ideas. The younger people blame the older for the insufficient state of preparedness of the country. They blame them for not having solved the problem of unemployment. They have only little interest in parliamentary democracy as the Dutch knew it, which, according to them, was too much influenced by party politics. Some of them want a Royal dictatorship. Others want at any rate a strong Government. Most of these ideas are rather confused, and it remains to be seen whether these trends will be pursued after the end of the German occupation. In the field of foreign policy, no clear ideas are to be distinguished, and it is on the whole most difficult to guess the real mood of the country in matters like these, now that free expression of opinion is banned.

Shorter Notices

Canada: Her War Effort. Post-War Possibilities. Published with the *Financial News*. By the Financial News, Ltd., 20, Bishopsgate, E.C.2.

The *Financial News* has paid tribute to Canada's contribution to the war effort in the most practical way by publishing an interesting and informative supplement reviewing that contribution in thirty-five articles. Some are general; others cover special subjects, as, for example, the Empire Training Scheme; the supply of canned fish to Great Britain; agriculture; mining; the Navy; and the social aspects of Canada's development; while others again deal with the resources of the various provinces and districts. Two criticisms suggest themselves. A rough outline map enabling the reader to locate the respective provinces and principal cities would have been a help to many who are not familiar with Canadian geography. And some mention of the Province of Quebec seems called for, since French Canadians, a large section of Canada's population, are by no means backward in their contribution to the Allied cause. Still, the supplement as it stands contains a wealth of information not readily available to the general reader. Its emphasis on planning, not only for war, but also for peacetime needs, renders it of more than passing interest.

German Europe

Industry in 1940-41.—Most of the company reports for the year 1940-41 were published later than in the previous year, because of the delay in the announcement of the dividend stop. Total output was maintained at the level of 1939-40. During the year, the concentration of industry continued. The total number of undertakings, companies and private firms decreased from 384,000 at the end of 1938 to 342,000 at the end of 1940. At the same time, state-owned concerns expanded rapidly, and may now have a share of roughly one-fifth of the total capital of joint-stock and limited liability companies; in March, 1939, state-owned companies comprised 15 per cent of the total joint-stock capital. A number of private companies were absorbed by the *Reichswerke AG Hermann Goering*; but the leading concerns in heavy industry were compensated by the annexation of plants in the annexed Polish and French territories. Industrial collaboration with occupied countries is reflected in reports about new companies jointly established by German and foreign concerns, especially in the manufacture of artificial textile fibres, chemicals and non-ferrous metals.

The leading coal-mining concerns report, without exception, that coal output could be maintained; the output of coke and bye-products has increased. There has been a particularly determined effort to extend mechanisation. A number of leading concerns in the Ruhr area have installed a new coal-cutting machine—the “Iron Henry”—which combines cutting, drilling and transporting operations, and is claimed to have increased output per man-shift by 32 per cent. Gross profits in the coal-mining industry were generally above last year's profits, because of a general advance in export prices. The tremendous importance of coal bye-products for Germany's war economy led to a new concentration of the coal industry by the formation of the *AG Kohlenwertstoffverbaende* (Coal Bye-Products Union). This company amalgamated seven leading companies producing benzole, synthetic petrol, tar, ammonia, sulphuric acids and resins. Similar to the *Reichsvereinigung Kohle*, which centralised the entire coal-mining industry itself, the new company will co-ordinate the activities of all the substitute industries based on coal, and is a defensive move against the chemical industry, which has tried to monopolise the substitute industries. A representative of the *Reichswerke AG H. Goering* is chairman of the board of directors.

The leading iron and steel concerns maintained their output, and were still engaged on expanding capacity. Some reports mention difficulties in repairing plant and equipment because of lack of material and workers. The iron and steel plants in Luxemburg, Lorraine and Poland were completely absorbed by German concerns. The tendency for costs of production to rise is still apparent. A spectacular increase in output is reported in electricity generation, amounting on the average to roughly 10 per cent over 1939-40. Substitute industries are very heavy consumers of electric power.

The chemical industry is completely dominated by the *I.G. Farben* concern. Output of all synthetic products, especially petrol, light metals, cellwood, rubber and plastics, increased considerably. New capacity was still under construction, and the capital of the concern has again been increased to cover further expansion. The *I.G. Farben* and the *Etablissement Kuhlman*, the leading French chemical concern, have jointly formed a new company for the purpose of Franco-German chemical collaboration. The chemical industry, however, has met with difficulties in the manufacture of phosphate fertiliser; and a new phosphate cartel has been formed which combines seven leading phosphate producers.

The engineering and machine-building industry has been completely absorbed by war work. The leading companies report increased activity and complain about the shortage of skilled workers. Dr Lange, the special commissar for the industry, has tightened control over the machine tool industry by prohibiting the manufacture of all machine tools used in civilian industries, and manufacturers frequently mention that they have been unable to replace equipment.

A number of new companies have been formed for the manufacture of aircraft engines. The leading motor-car factories report the suspension of the manufacture of private cars. Output has been maintained and new capacity is under construction. The People's Car factories, which manufacture military cars and tanks, doubled their capital. Most companies have introduced new methods of

rationalisation, and the use of light metal alloys and plastics as substitutes for non-ferrous metals has increased.

The civilian industries—that is textiles, boot and shoe, leather and household goods—report a continued decline in output. After the collapse of France, a number of textile mills returned for a short period to normal working hours, because of the supply of raw materials requisitioned in occupied countries. Jute mills changed to the manufacture of paper bags and paper string. Linen mills were relatively well supplied with raw materials from production in occupied countries and from increased production of flax in Germany. The leading shoe factories were not even able to supply the rationed demand; and substitutes for leather were increasingly used.

Artificial Textile Fibre Expansion.—After protracted negotiations, the German cellwood concern *Phrix* succeeded in forming, jointly with the Norwegian *AS Borregard*, the *Norsk Cellulfabrik*. It is hoped that the output of the new factories will supply a substantial part of Norway's total demand of textile fibre. In Belgium, the *Société Belge de Fibrane*, comprising all manufacturers of artificial textile fibre, will co-operate with the German cellwood concerns. German companies will supply machinery and experts. Germany's intentions have been made clearer recently by forming the *Phrix-Verfahrensverwertungsgemeinschaft AG Hamburg* (company for the utilisation of *Phrix* patents). The new company is a subsidiary of *Phrix*, and its business object is the acquisition of companies in Germany and in foreign countries which manufacture artificial textile fibres. The *Continental Oil AG* for monopolising the European oil industry seems to have been the model.

Agricultural Marketing.—The agricultural marketing system has hardly been changed since the beginning of the war. The compulsory delivery of cereals, milk, eggs, etc., has been in force since 1934, and all agricultural prices have been strictly controlled. Compulsory delivery has now been extended to all root crops which are used for feeding animals, which reflects increasing difficulties in the supply of feeding stuffs. A second important change is a new schedule of premiums for the delivery of wheat and rye. The original premiums for deliveries between August and November have been substantially increased in order to collect the bulk of the harvest during the first months of the season. But it would be wrong to assume that this change was necessary because of a possible shortage of cereals. It rather reflects an anxiety to get as quickly as possible accurate information of the supplies of cereals available. A third change is perhaps more indicative of the supply situation in bread grain. The milling of flour has been altered in such a way that roughly 5 per cent of the grain can be saved. Since the beginning of the war there has been an interesting shift from the consumption of wheat to rye. The percentage of rye and wheat milled during March to August has been as follows:

	1939.	1940.	1941.
Rye	42	50	61
Wheat	43	47	37

This change is the result of the bad harvest in 1940, and of the impossibility of importing wheat from overseas. It means that the population in Southern Germany, where the standard loaf is normally made from wheat, must eat more rye, and all over Germany it means considerably less cake.

Roumanian Collaboration.—The economic penetration of Roumania proceeds at considerable speed. During the first six months of 1941, 52 new companies were founded, with a total capital amounting to Lei 187 millions. German capital interests were established in 19 of the companies, comprising a capital amounting to Lei 99 millions, or 53 per cent of the total. The German-Roumanian company *Solagra* was empowered to buy up the entire harvest of sunflower seeds. A small part of the harvest will be left in Roumania. The bulk will be shipped to Germany. Official industrial committees of the German and Roumanian Governments met for the first time at the end of July in Bucharest. The textile, paper, and earthenware industries were represented, and industrial collaboration was discussed.

THE BUSINESS WORLD

Earnings and Incentive

MUCH debate has recently been heard on the removal of impediments to full war production. A significant part of the discussion has ranged round the question whether industry is getting a sufficient return to spur it to a 100 per cent effort. One school, in particular, argues that expansion of output is impeded because it is not worth while, and it demands accordingly that EPT should be eased; and that, if need be, increased production must be bought on inflationary terms. It is not the purpose of this article to pursue the controversy, but it can at least provide some factual pointers for the discussion, as revealed by our latest quarterly compilation of industrial profits.

The figures leave no doubt that, in terms of distributable profits and distributed dividends, industry is being kept on a very short rein. This is due to a combination of factors—100 per cent EPT, the sharing of net profits between the Exchequer and shareholders, and—for a handful of companies whose unusual cases permit increased net profits—to self-imposed dividend limitation at the Chancellor's behest. The result of these factors has been apparent for some time in our quarterly figures, but never more clearly than in the latest returns. The total profits of 498 companies which reported last quarter have shown a slight increase over those of the preceding financial year, from £87,480,000 to £90,730,000—and, incidentally, even this increase is largely accounted for by oil and rubber companies. British industry, working at high pressure, got little extra in total profits, when EPT had been met. Whatever may be said about the expediency or equity of 100 per cent EPT, its effect is plain enough. As for net profits (as the accountant measures them), the latest reports show a drop of 17½ per cent, from £42,334,000 to £34,944,000. These results, and their composition, are shown in Table I below:

TABLE I.—PROFITS OF THIRD QUARTER COMPANIES—1941

498 Companies	Previous Financial Year	Latest Financial Year	Adjusted Net Figures to Gross (i.e., before taxation)
Total Profits*	£87,479,957	£90,729,082	£4,554,608
Depreciation	9,219,130	9,219,130	—
Debiture Interest	4,212,846	4,212,846	—
Other Charges†	42,333,880	34,944,083	51,154,642
Net Profits	42,333,880	34,944,083	13,122,354
Preference Dividends	—	21,556,301	33,238,770
Ordinary Dividends	—	4,793,518	4,793,518
Added to Free Reserves	—	—	—

* After depreciation where not separately stated. † Including taxation.

How do these figures fit into the longer-term trend? The first answer, subject to minor statistical deficiencies, is provided by *The Economist* profits index. This index, based on the year ended June, 1936, showed a 30 per cent increase in profits over the standard during 1938. Since that time it has fallen almost without interruption, as the following table shows:

TABLE II.—*The Economist* PROFITS INDEX

July 1935—June 1936 = 100

	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
1938	128.7	131.7	131.6	130.3
1939	127.1	122.9	121.8	119.6
1940	119.6	120.5	115.4	114.2
1941	112.3	105.1	101.9	...

For method of calculation, and earlier figures, see *The Economist*, March 1st, 1941, and January 14th, 1939.

The fall during 1941 is particularly noticeable. In the twelve months ended with the third quarter of this year, distributable net profits were running scarcely two points higher than those of a moderate recovery year. Profits are being made, but they are being so effectively taxed that the shareholder has no part in them.

The precise effect of standard income tax on the enterprise of companies has always been debated, but most respectable opinion now holds that reasonable levels of income tax do not impair the desire of companies and their managers to earn greater profits. For this reason, the most convenient way, for the economist's purpose, in which profits should be expressed is in the form of gross sums, before charging taxation. Accordingly, we have for some time past gone to the considerable labour of adjusting the profits as reported by companies to a “before tax” basis. The figures (shown in the right-hand column of Table I) are of some interest in themselves when compared with the reported figures. But they also form an indispensable basis for a proper appraisal of dividend policy. The following table, showing the distribution of profits and gross rates of dividend, is accordingly calculated from the adjusted figures:

TABLE III.—DISTRIBUTION OF PROFITS AND RETURN ON CAPITAL

	Proportion of Adjusted Net Profits			Rates of Payment (Gross) (Based on adjusted Net Profits)			
	Prof. Div.	Ord. Div.	To Free Reserves	Deb.	Prof.	Earned on Ord.	Paid on Ord.
1940	%	%	%	%	%	%	%
1st Quarter	17.5	71.6	10.9	4.2	5.5	15.1	13.1
2nd Quarter	20.3	65.0	14.7	4.8	6.2	12.3	10.0
3rd Quarter	29.4	55.9	14.7	4.9	6.9	12.2	9.6
4th Quarter	23.6	61.4	15.0	4.8	5.8	12.1	9.8
Whole Year	21.5	65.1	13.4	4.6	6.1	13.2	10.9
1941	%	%	%	%	%	%	%
1st Quarter	17.7	73.1	9.2	4.5	6.1	16.3	14.5
2nd Quarter	23.4	65.9	10.7	4.6	6.8	10.6	9.0
3rd Quarter	25.7	65.0	9.3	4.5	6.9	12.1	10.6

There is a remarkable steadiness in the proportions of profits distributed in preference and ordinary dividends and set aside to free reserves during the past year or more. There are, naturally, some differences, for the composition

of the sample of companies varies with each quarter—the first is weighted by a few very large concerns, catering for the general public, including BATS, "Imps., Courtaulds and, largest of all, Woolworths. The second is a heavy industry quarter, and, in the third, plantation companies' results are rather prominent. But the general "set" of distribution policy remains fairly constant. It is usual for ordinary shareholders to receive two-thirds of the total profits earned for dividends, save in the first quarter, when the proportion is higher, and the proportion of net profits set aside to free reserves fluctuates only between 9.2 and 15 per cent.

In the second part of the table, the particular weighting of first quarter companies somewhat disturbs the steadiness, producing a sharp contrast with the other quarters. Thus, the percentage earnings rate on ordinary capital has varied from a maximum of 16.3 in the first quarter of 1941 to a minimum of 10.6 in the second, and the rate has averaged about 13 per cent. Excluding first quarters, the earned rate ranges from 12.3 per cent to 10.6 per cent in the second quarters of 1940 and 1941 respectively, the average being 12 per cent, while the payments have varied 0.8 points either side of an average of 9.8 per cent. These results show very clearly, first, that equity earnings are not increasing, even before any deduction is made for standard income tax, and, secondly, that there is no tendency on

the part of company boards generally to augment dividends to offset, either in whole or part, the effect of income tax at 10s. in the £.

These conclusions will be satisfactory, at least to those who hold purist views on war finance. Company profits might, in war conditions, release a source of increased consuming power which would have severe inflationary effects. This point is generally accepted even by those who plead for a modified EPT, for even the latter intend that the residue of profits freed from EPT should merely be kept in the companies' coffers and not distributed and spent. The direct contemporary interest of shareholders in such profits would therefore be scarcely more real than their interest in the 20 per cent EPT rebate which is to be made available after the war.

Meanwhile, profits are under control. What this means for shareholders in different industries becomes clearer from a study of the table on page 522. Of the twenty-three industrial groups there listed, thirteen showed improved total profits in their reports last quarter. But only two groups of the twenty-three—rubber and shipping—showed an appreciable increase in net earnings, and the great majority revealed a significant fall. These, then, are the latest facts in the controversy, "Earnings and Incentive." They deserve serious consideration by both sides in the argument.

British Insurance in America

THE international character of British insurance has proved a source of strength to this country in two successive wars. This strength derives from the free investments of British offices in foreign securities, which can be mobilised in case of need, and from branch offices and other organizations established abroad. In the conflict of 1914-18, the first of these factors had the greater significance, for it appears that dollar securities placed by the companies at the disposal of the Government were at one time instrumental in saving a difficult situation; assistance accruing from overseas connections, on the other hand, was confined to the utilisation of current underwriting and investment earnings.

At the outbreak of the present war, the Treasury once

again looked to insurance in its quest for foreign exchange, and free holdings of foreign securities were speedily recruited in the national interest; later it became manifest that the nation could not, as in the last war, afford to rest content with the current earnings from establishments abroad—that the capital value of these establishments would have to play a part. Especially was this so with the extensive interests of the companies in the United States, backed by substantial funds forming security for American policyholders. Fortunately, the drastic expedient of forced sale has been avoided; the Chancellor of the Exchequer was able to announce, on July 22nd last, that the Reconstruction Finance Corporation had agreed to grant a loan of \$425 millions, on security consisting of insurance

interests and certain other assets. A flourishing export business, built up with care and skill over a long period, has thus escaped the unhappy fate of the Viscose Corporation.

It is the purpose of this article, first, to describe briefly the organisation of British insurance in the United States; secondly, to examine the extent of its participation in American business; and, thirdly, to show the proportion of the total premium income of the companies concerned derived from America, as well as the size of their earnings, as revealed by the remittances of their branches and the dividends declared by their subsidiaries.

While there are records of British agency appointments in the United States going back nearly 150 years, the honour of claiming the longest period of continuous operation rests with the Liverpool and London and Globe, which began in 1848 and now, in combination with the Royal, forms the largest British group in America. Succeeding years saw the entry into the American field of many other offices, which gradually acquired a reputation for stability and fair dealing—qualities which were strained to the utmost by the conflagrations which ravaged the large cities from time to time. In the culminating disaster, the San Francisco earthquake of 1906, the eighteen British fire offices were called upon to meet gross claims estimated at £15 millions—a very large sum in relation to the premiums of those days—but there was no default. Goodwill thus created proved a solid foundation on which to build; in the ensuing expansion the "casualty" companies—the name given to companies transacting the miscellaneous classes known in this country as accident insurance—also participated and eventually approached in importance their fire confrères; on the other hand, British life offices, perhaps rather remarkably, made no attempt to share in the growth of American life insurance. Both fire and casualty companies enhanced their reputations by emerging in excellent condition from the severe test of underwriting and investment ability to which insurance offices were subject during the depression of 1929-32.

The forms of organisation through which British insurance companies operate in the United States differ in certain marked respects from those familiar to this country. One feature is that business is transacted chiefly through so-called "general agencies" instead of regional branch offices. The reason for this is that in the early days the local agents, which were separated by vast distances from their head offices—or, in American terminology, home offices—and were thus but seldom visited, naturally became invested with wide powers both in the acceptance of risks and the settlement of losses. This status they have retained, and general agencies, many of which are large institutions of long standing, both directly and through their nationwide associations, exert a wide influence in the business. A second characteristic is that each "parent" office operates, not only in its own name, but also through a fleet of "daughter" companies, some of which are branch offices of affiliated British companies and others subsidiary United States companies. Thus the Royal-Liverpool fleet comprises no less than fourteen entities, four British and ten American. This second feature largely arises from the first, since it furnishes a means of tapping additional sources of premium in an area, without disturbance of existing general agency connections. But an important contributory reason is the rule that fire and casualty insurance may not be transacted in America by one and the same company; hence an office already entered for fire and wishing to extend its activities to casualty had to purchase or form an associate for the purpose, and vice versa.

How do these British interests fit into the picture of American insurance as a whole? In 1939, domestic and foreign stock companies transacted some \$800 millions in fire and marine premiums and \$820 millions in casualty premiums; the share of the British offices and their subsidiaries was 16 per cent for fire and marine and 13 per cent for casualty. Relations with the American companies are on the whole very harmonious. The most powerful competition comes from the local mutual offices, which have made considerable progress in recent years, especially in casualty insurance; nevertheless, the stock companies in the aggregate remain responsible for about four-fifths of the fire and three-quarters of the casualty business. Lloyd's have considerable interests in the United States, but these are chiefly in the provision of special covers.

So important a stake in the American market necessarily influences very substantially the dimensions of the premiums which the British offices bring into their world-

wide accounts. The extent of this influence is revealed in the accompanying table, showing that of world-wide fire, casualty and marine premiums aggregating £126 millions, the twenty-three offices writing American business derive no less than £55 millions, or 44 per cent, from the United States. The actual proportion is probably about 3 per cent higher, because, as the table shows, some offices incorporate their United States business at rates of exchange above the current figure. Against this, there may be re-insurances of United States business outside that country which would reduce the ratio in one or two cases—the Pearl is an example of this—but with a majority of the offices this factor is not significant.

In the general development of their overseas connections, the British offices have always taken the view that they should not be compelled to tie up their assets abroad, because funds should be available at a central point for remittance to any area where they may be required. For many years, however, it has been a feature of the very close supervision and control exercised by the various American states that foreign companies must maintain locally funds sufficient to cover all outstanding liabilities and leave a margin of surplus comparable with that required of domestic offices; and in view of the very largely, but not entirely, self-supporting nature of so vast a sphere of operations, and its importance to British insurers, the requirement has had to be recognised. This now appears as a not unmitigated evil, since it is these so-called surplus funds which in effect form the security for the recent RFC loan. The collateral for the loan, valued at \$500 millions, includes American subsidiaries of British insurance companies assessed at \$180 millions for this purpose; the earnings of branch offices which, as the table shows, have substantial assets over and above the reserve required to be set against their liabilities on policies in the United States, have also been pledged. The service of the RFC loan costs \$20,250,000 per annum, \$12,750,000 for interest at the rate of 3 per cent and \$7,500,000 for sinking fund provision. The annual earnings of British insurance in the United States alone almost cover the service of the loan; as the statistical analysis shows, the remittances of branches and the dividends of subsidiaries of British insurance companies in the United States have averaged nearly \$20 millions per annum during the past five years.

In sum, the insurance connection between British offices and the United States has brought economic advantages to both nations. So close a relationship has also borne fruit in the realm of ideas. The comprehensive policies giving cover against a wide range of risks in a single document, for example, were introduced here, and have since been largely adopted in the United States—though the process is hampered by the cumbersome and perhaps unnecessary separation of functions between fire and casualty companies. British insurance, in turn, has learned much from American business methods, a recent development of which is the "insurance survey," by which the agent is enabled to furnish the prospective policyholder with a clear and concise statement of all his insurance needs. Undoubtedly, the American offices have devoted far more thought than British insurers to the subject of public relations, chiefly in explaining to the public the services they provide and their work in preventing fires and accidents. Since there exists much ignorance and misunderstanding in this country concerning the services provided by the insurance industry and its rôle as an important export trade, British offices, whose advertising is often rather pedestrian, might well consider whether they could adopt some of the American ideas to their own and the public's advantage.

ANALYSIS OF ACTIVITY OF BRITISH INSURANCE COMPANIES IN AMERICA

Company	Fire, Accident and Marine Premiums of British Offices in America in relation to World-wide Premiums in 1940					Surplus at December 31st, 1940, of Assets over Liabilities of U.S. Branches and Subsidiaries of British Companies				Average Remittances and Dividends for Five Years 1936-1940

Finance and Banking

Warship Weeks and Money

The position in the short loan market has suddenly moved towards stringency this week. The banks have become diffident buyers of bills, and the market, which obtained a 35 per cent allotment at last week's tender for Treasury bills, has experienced some difficulty in financing the additional volume of paper which it has thus been called upon to carry in its portfolios. At no time, however, has the position been really stringent, and no special support has had to be given to discount market houses. The reasons for this change of atmosphere in the money market are, in the first place, the incidence of the clearing banks' monthly making up and, secondly, the heavy flow of funds to Government accounts owing, in the main, to the launching of the Warships Weeks campaign. In addition to the considerable drain on bank cash caused by the recent heavy public subscriptions to Government loans, the banks themselves have this week been called upon to pay the Treasury £10 millions more by way of Treasury deposits than they were due to receive by maturities. The effect of these movements may be seen in the fall of £11,413,000 in bankers' deposits and the rise to £21,304,000 in public deposits. The latest total of bank cash should not be indicative of stringency in the short loan market, but the incidence of the banks' making-up explains why the fall in this item should have been so keenly felt during the week. The circulation continues on its steady rise, a further net amount of £2,465,000 of notes leaving the banking department over the week to last Wednesday.

Consumer Credit Restrictions in America

The full text of the regulations on consumer credit in the United States has now reached this country. They are prefaced by a statement by the Chairman of the Federal Reserve Board, in which Mr Eccles urges the need for placing restraints on the general extension of credit, including instalment buying, and points to the rapid increase in the latter form of credit over the past months. The volume of consumer instalment debt in the United States has risen to an all time peak of about \$6,000,000,000, or almost twice the low point touched at the end of 1938. During the past year, the amount of credit outstanding on motor car sales, which now represents about half the total instalment credit, increased by over 40 per cent. Short of specific restrictions on instalment buying, the credit thus advanced is bound to expand with the increase in the national income of the United States. The new regulation machinery involves in the first place the registration with the Federal Reserve Banks of their district of all persons or agencies engaged in the extension of instalment credit. A general licence has been granted to all such agencies, allowing them to continue their operations until the end of this year, but the formalities of registration will have to be completed before new individual licences are issued. The administration of the regulations will be in the hands of the Federal Reserve system and will, as far as possible, be decentralised through the twelve Reserve Banks and their twenty-four branches. The list of articles covered by the regulations is issued in a supplement. Used articles as well as new ones are covered in all cases except household furniture.

In order to cover the whole field of consumer credit and to prevent evasion of the regulations, restrictions as to maturity are placed on cash loans repayable in instalments whether or not secured on articles listed, provided the loan in question does not exceed \$1,000. The cash payments on listed articles range from 33½ per cent in the case of motor cars to 10 per cent for household furniture. In every case, the maximum currency of the loan is put at eighteen months. The regulations are subject to change from time to time, as experience with its administration develops, and as economic conditions require further curtailment of civilian consumption. The recent momentum of the expansion in instalment purchase credit shows that the restrictions come none too soon. They are being put into operation progressively between September 1 and December 31, 1941. In view of their comparative mildness, one may doubt whether their effect on the instalment credit stimulus to civilian consumption will be all that is required.

Belgian Gold Dispute

Negotiations between the Vichy Government and a Belgian representative nominated by the German occupation authorities continue for the return to Brussels of the gold deposited by the National Bank of Belgium with the Bank of France prior to the German invasion of the Low Countries. The delegate from occupied Belgium has been pressing—himself under German pressure—for the return of this gold, and, in principle, agreement for the repatriation has been reached. Once the gold is in Brussels, it will obviously be wholly under German control, and if a pretext for its sequestration is thought worth manufacturing, that can be readily done by appropriately adjusting the occupation costs and the method of discharging them. Meanwhile, the Belgian Government's counter-measures are proceeding satisfactorily. That Government instituted proceedings in New York against the Bank of France, seeking to attach as much of the latter's gold held in the United States as would be required as an offset against the National Bank's gold which was being handed over to the German authorities. The Bank of France's defence in this action was to challenge the competence of the United States Courts. Two months ago, the New York Court rejected this view and a provisional "stop" was placed on the gold in question—this metal is, of course, already affected by the general freezing order on the assets of all Continental countries. The Bank of France appealed against this finding to the Court of Appeal, but, here again, it met with a firm rebuff, the finding of the first Court being confirmed last week.

Investment of Blocked Sterling Balances

It was announced this week that the new issue of 2½ per cent National War Bonds, maturing 1949-51, had been added to the approved list of securities in which balances on blocked sterling accounts may be invested without prior reference to the Bank of England. The move is of a routine character and makes available to the non-resident holders of such balances the most important of the Government issues now on tap. The rôle hitherto played in the mechanism of sterling exchange control by these "blocked accounts" has been extremely modest. They have, in the main, served as the receptacles for legacies to non-residents and the total turnover passing through them has proved small—so small, in fact, as to call into question the decision that led to the creation of this so-called "blocked" sterling to serve a purpose so unimportant.

Malaya's Dollar Receipts

When calculations are made of the extent to which British Government expenditure has been financed by the dollar earnings of the Dominions and Colonies and by the expansion of these countries' sterling assets, Malaya has usually provided the main gap in the available statistical data. To a partial but, even so, welcome extent, this has been filled by the Governor of the Malay States in a speech he made last week to the Budget meeting of the Straits Settlements Legislative Council. Sir Shenton Thomas

then stated that in the first year of the war the net sales of American dollars by the Malayan foreign exchange control to the Bank of England were \$97,000,000. In the subsequent eleven months to July 31st last, these sales amounted to a further \$135,000,000. Even these impressive figures do not represent the full extent of Malaya's contribution to the Empire's centralised dollar holding, for to a considerable extent exports of tin and rubber from Malaya to the United States are financed through London by payments from American registered accounts. Such accounts

Investment

The Railway Debate

So far as the railway stockholder is concerned, the railway debate has done little more than confirm some points which were left in doubt by the White Paper. There are no further details about war damage payments, that matter being left to be covered by the Bill dealing with all public utilities. It is, however, established that the percentage contribution is 50 per cent, which is to be found out of the railway's own resources. According to the latest view, directors are likely to take it mainly from capital resources rather than from the annual rent charge. A comment of Col. Llewellyn also served to confirm the opinion that, despite the lag in the raising of charges, net revenue would have increased considerably this year under the old agreement. This makes it even more evident that the new one is a hard bargain for the stockholder, having regard to a original agreement. It is also, of course, the fact that a considerable section of stockholders do less well than they would have done had the companies made their present gross revenue, and claimed a capital standard under EPT. But this argument begs the question as to what charges they would have been entitled to levy. Two further points emerge from the debate, which concern the general public as well as the equity holder. The first is that Col. Llewellyn reiterated the warning that the subsidisation of railway charges will not be without limit, and it appears that very sharp rises in either wages, or other costs, might be followed by a similar rise in charges. This offers only a partial escape to the taxpayer, as such, for the Government's use of the lines must be very substantial. The second appears to dispose of the doubts expressed in some quarters as to the intention of the final paragraph of the White Paper by defining the period of control as ending when "the statutory machinery for the fixation of charges can again become effective." This is vague enough, but it does not suggest a present intention to make revolutionary changes.

Rubber Shares and War Demand

The outlook for rubber shares is largely dominated by the possibility of an extension of active warfare to the Pacific, but, against that background, developments are in the main favourable to the shareholder. Mr Eric Miller, in his remarks circulated to shareholders of Harrisons and Crossfield, gives 1941 output as likely to exceed 1,600,000 tons, with a consumption of 1,200,000 tons, the remainder representing accumulation of a strategic stock by the U.S.A., estimated to be completed by the end of the year. For 1942, the production figure can almost certainly be exceeded, given a continuance of peace in the Far East, but Mr. Miller is not prepared to forecast demand for that period. If the amateur may venture to make a guess where the expert is unwilling to risk an opinion, it would seem not improbable that demand will also increase, provided that any substantial part of Russian industry can be maintained in production. Despite the drastic curtailment of civilian consumption, this country is using in manufacture substantially more rubber than in the pre-war period. There seems to be no reason why a similar position should not arise in the U.S.A., especially as it will be more difficult, in that country of larger open spaces, to dispense to the same extent with the use of the private car. No doubt the progressive closing of European markets to plantation rubber will prove an offset of some importance, but, against this, there is the growth of war industries throughout the Empire. It cannot, of course, be assumed that the course of development regarding the demand for rubber will be parallel in each country, but it appears that new uses are being found, and the outlook in this respect is considered

are replenished by sales of dollars direct by the American banks concerned to the Bank of England; but though they by-pass the Malayan exchange control they are as truly a Malayan contribution to the dollar earnings of the Empire as if the dollars had been paid to Malaya and transferred thence to London. As Malaya's balance of payments with the United Kingdom must be appreciably in credit, even without allowing for these substantial dollar payments, it follows that the colony's accumulation of sterling assets must be reaching impressive proportions.

encouraging. It is to research that this and other industries must look for expansion, and perhaps even for maintenance of demand, once the post-war period of reconstruction and re-stocking is at an end. The shareholders' interest in immediate prospects of demand—as distinct from the possibility of an interruption of supply—is, however, largely platonic, for most companies are already making a considerable contribution to EPT. Indeed, Mr Miller returns to the attack on this tax, with the assertion that it is almost impossible to make reserves against the special problems of re-adaptation to peacetime conditions. He accordingly asks for a shorter economic life of wasting assets as the basis for determining depreciation allowances for taxation purposes. It is evident that, in this matter, the practice of the revenue authorities falls far short of perfection; but it is also very doubtful whether permission to retain "liquid" assets now will help greatly to ensure supplies of materials when the conflict is ended. The more distant outlook for rubber shares would seem to depend largely on more efficient working of the restriction agreement to help stimulate demand.

Dealing in War Bonds

Recent weeks have brought a renewal of the outcry by the investing public against the method of dealing in the two issues of 2½ per cent National War Bonds no longer on tap, those of 1945-47 and 1946-48. In common with other money market stocks, these are quoted at a net price, to which has to be added the gross interest accrued to the date of purchase. The usual and less scientific practice is for the quoted price to include accrued interest, or dividend, but the net amount only. The complaint usually takes either or both of two forms, that, while gross interest has to be paid, only the net sum, after deduction of tax, is received, thus raising the price, and that the method of quoting is misleading. More publicity might be given to this latter point. It is theoretically possible to give a quotation, including the gross interest, but it would have to be recalculated daily correct to one ten-thousandth part of a penny. Presumably, the major difficulty arises from the addition of gross interest, which, by making the bonds unduly dear when full of interest, tends to concentrate buying by the public when the bonds are "clean" and selling when full of dividend, as well as raising the general level of the price. It should be pointed out that this, if a deterrent to the ordinary man as buyer, is to his advantage as seller. Unfortunately, this high price, and the fluctuation introduced by adding gross interest, arise, not from the method of quotation, but from the difference with regard to tax payment between money houses and the rest of the community. Also the unusual method of quotation is due to the fact that the money house relies for its profit on dealing on a fraction of a penny in the price, a fact which means a very "fine" quotation to all who deal in these stocks. The public pay tax on the interest received, the money house on its profits. In consequence, once any stock, of sufficiently short date and high status to interest the money houses, stands above par, they can always outbid competitors outside that category, since they pay tax only on the dividend less the loss on redemption. It would seem, therefore, that, in so far as the business of the money houses predominates, little can be done to remove the disability of the ordinary investor as a buyer. Presumably, if the time should come when the bulk of the business in these bonds came from the investing public the position would be reversed. In view of the campaign to popularise National War Bonds, any assistance which ingenuity can devise will be welcome, but it is difficult to see how any substantial improvement is possible.

Electrical Equipment Merger

Two years of war brought remarkably few company mergers, but the third has opened well. The recent offer by United Molasses to Tankers is followed by a scheme for the acquisition by Crompton Parkinson of two smaller concerns, the Young Accumulator Co., and its affiliate, Associated Electric Vehicle Manufacturers. The products of these concerns are sufficiently indicated by their titles, and their output should be complementary to that of Cromptons, who have attained their present position, in part, by similar acquisitions. After paying no ordinary dividend for several years, the Young company earned an average of 6.5, and paid dividends averaging 4.1 per cent, over the four years ended March 31, 1940. For the ensuing year no dividend is being paid, virtually all distributable profit being absorbed by taxation. In the circumstances, an offer, equivalent to 2s. 3d. per share for the 2s. ordinary, seems distinctly attractive. The payment is to be effected as to 11d. in cash, and as to the remainder by the allotment of one-fifteenth of a 5s. "A" ordinary share in Crompton Parkinson. The cash payment on these has been equivalent to 20 per cent on the present capital for the past three years. This gives a return of 3½ per cent on the Young shares, ignoring the cash payment, which, invested in Crompton "A" at 20s., would yield almost a further 2½ per cent, on the assumption that the 20 per cent dividend is maintained. On this basis, the offer is a generous one, and the price which it is proposed to pay, some £217,000 for the entire capital, exceeds the net balance-sheet value of tangible assets by some 25 per cent. The offer is conditional upon acceptance by holders of Associated Electric Vehicle, and by those of 90 per cent—or such less proportion as Cromptons agree to accept—of Young Accumulator shares. The directors of the latter company have accepted in respect of their own holdings in both concerns, and advise acceptance by the public. The offer to AEVM is 5s. for each share of £1. This has been accepted by directors of both the Young and AEVM companies in respect of their own holdings, and the latter anticipate that it will prove welcome. The fusion should give the companies to be taken over the advantage of adequate finance, and, if past experience is any guide, should bring further profits to the Crompton Parkinson group.

Company Notes

Bristol Aeroplane

The Bristol Aeroplane accounts for 1940 provide no comparable gross income figure, since profits after depreciation in 1939 at £989,992 do not necessarily represent higher earnings than profits after depreciation and EPT at £766,537 last year. EPT was paid at 60 per cent for three months of the year in question and at 100 per cent for the remainder of the period. Income tax required £355,000 against £635,000 for tax and NDC in the previous year, and there is a jump in interest charges from £30,517 to £111,343. The reduction in equity earnings from £300,475 to £278,444 is, however, moderate and the earned rate is up from 15.1 to 15.9 per cent. The company can comfortably maintain the 10 per cent ordinary payment, repeat the transfer of £100,000 to general reserve, raising that fund to a total of £670,000, and increase the carry forward from £10,727 to £14,272.

	Years to December 31,		
	1938	1939	1940
Total income after depreciation	687,817	989,992	766,537
Taxation	285,000	635,000	355,000
Interest and fees	24,830	35,017	115,843
Preference dividends	21,750	19,500	17,250
Ordinary shares:—			
<i>Earned</i>	356,237	300,475	278,444
<i>Paid</i>	244,687	199,650	174,900
<i>Earned %</i>	*21.8	15.1	15.9
<i>Paid %</i>	*15	10	10
General reserve	112,403	100,000	100,000
Carry forward	9,902	10,727	14,272

* Interim of 7½ per cent, paid on capital of £1,200,000; final paid on capital increased by 75 per cent, capital bonus to £3,300,000. Earned rate calculated on amount paid.

As the chairman, Mr W. G. Verdon Smith, points out in his statement, the growth in the balance-sheet total of stock and work in progress from £4,678,382 to £6,325,622 and in debtors from £3,138,922 to £3,886,775 reflects a corresponding expansion in production. The failure to pass on increased output in substantially higher earnings is due, in part, to the increasing weight of income tax and EPT and, in part, to the company's acceptance of lower rates on Ministry of Aircraft Production contracts. The increase in creditors and taxation from £3,637,077 to £5,504,382 is largely due to extra tax provisions. The excess of liquid assets over current liabilities is up from £1,776,721 to £1,852,226, but the company's bank loan has risen by £430,000 to £2,723,315. Subject to the effects of EPT at the full rate, shareholders should continue to receive a sound return, at least while the wartime scale of production continues. The 10s. ordinary shares, at 10s. 10½d., yield £9 8s. 11d. per cent, considerably below the average for aircraft shares calculated by the *Actuaries' Investment Index* at 10.73 per cent at the end of September last.

BAGS Setback

The results of Buenos Aires Great Southern, the first of the leading South American railways to issue accounts for 1940-41, are not a good portent for the forthcoming Argentine rail season. Since operating receipts at £10,173,440 against £10,493,421, are lower in the year ended June 30, 1941, and since operating expenses at £8,079,640, against £7,735,115, are substantially higher, it is inevitable that the surplus for fixed charges should be heavily down on that of the previous year. There is a small reduction in exchange loss from £1,086,661 to £1,005,140, but the net balance on interest charges is up from £38,548 to £136,980. Consequently, earnings for fixed charges stand at £488,634, against £1,198,221. Since debenture service requires £1,085,079 as before, the company carries forward a debit of £535,342, against a credit of £61,103. There is, of course, no transfer to general reserve, against £100,000 in 1939-40.

	Years ended June 30,		
	1939	1940	1941
Operating receipts	10,515,187	10,493,421	10,173,440
Operating expenses	7,847,405	7,735,115	8,079,640
Total profit†	2,820,072	2,888,213	2,207,903
Exchange loss (net)	1,240,868	1,086,661	1,005,140
Working agreements & interest	572,229	603,331	714,129
Earned for deb. service	1,006,975	1,198,221	488,634
Deb. service paid and accrued	1,085,079	1,085,079	1,085,079
General reserve	Dr. 50,000	100,000	...
Carry forward	47,961	61,103	Dr. 535,342
† Operating profit plus dividends received, etc.			

The moderate fall in gross receipts is due mainly to the lower tonnage of cereals transported, for which the closing of export markets resulting from the progress of the war is responsible. That the fall is not still heavier is due to increased transport of cement, potatoes, wool, and various miscellaneous items. On the costs side, the most important factor was the rising cost of fuel, which increased by 54.3 per cent, despite a cut in consumption of some 23,000 tons. Every effort was made to restrain the rise in expenses, but the working percentage of expenses to receipts rose from 73.71 to 79.42, the highest level of the past ten years. The directors state that expenditure on maintenance of rolling stock fell by £55,130, despite additional charges for renewals amounting to £49,000. The general renewals fund, however, remains at a balance-sheet total of £7,414,247. General reserve, after deducting depreciation on investments held for the reserve funds, is down from £396,147 to £384,169. Since 1940-41 was the first year in which the Argentine railways suffered from the full effect of the closing of European markets, a serious setback was inevitable, and it is clear that prosperity is out of sight until freedom to export cereals and livestock, and to import fuel, is regained. The £100 ordinary stock now stands at £8 10s., and the 6 per cent preference issue at £18.

Harrisons and Crosfield Results

Profits of Harrisons and Crosfield, in the year ended June 30, 1941, rose from £340,622 to £350,161 after all expenses including taxation. Since preference, preferred

ordinary and management share dividends remained at the level of the previous year, and deferred stock again received 25 per cent, the whole of the rise in net profits is used to raise the carry forward to £174,596. The deferred dividend is covered by earnings of 27.0 per cent, against 25.1 per cent. The company has had to meet a heavy charge for double taxation amounting to over £500,000, which explains the balance-sheet rise in creditors and taxation from £883,232 to £1,180,874. Consequently, it is clear that gross profits must have risen very substantially last year, probably on account of increased sales of rubber. The chairman, Mr. Eric H. Miller, points out in the course of his statement that smaller quantities of tea are being sold under Government contract in 1941 than in 1940, on account of the difficulty of providing shipping space. On the other hand, the Far Eastern and United States demand was stimulated in recent months, both by the freezing of trade with Japan and by a desire to anticipate the possible outbreak of hostilities in the Pacific. Balance-sheet changes are to be explained mainly by the effect of delayed shipments. Thus, stocks have piled up from £374,735 to £756,706, and debtors show a corresponding decline from £829,019 to £574,336. The total of the two items is some £100,000 higher than in the previous year. Total reserves are unchanged at £725,000. Bank overdraft is up from £114,622 to £170,948, but the total of cash items rose from 887,263 to £962,187. An interest-free loan to the Treasury of £200,000 represents a payment of taxation in advance, and is accompanied by a reduction in Government securities from £392,366 to £236,138. Current prospects will, of course, be vitally affected by the course of political events in the Far East. The demand for the company's rubber output is at present stimulated by the Russian supply programme. The £1 deferred stock, at 100s., offers a yield of £5 13s. 8d. per cent.

Wall Paper Manufacturers

The full accounts of Wall Paper Manufacturers for the year to July 31st last show total profits, after deduction of £77,000 for war damage insurance, at £377,292 against £506,969 in the previous 11-month period. The 1940-41 figure includes £26,752, representing profits of subsidiaries accumulated in previous years. The consolidated accounts show an actual decline from £514,464 in 11 months to £429,235 before War Damage. As indicated in the note on the preliminary statement in *The Economist* of October 11th, the setback is to be attributed mainly to shortage of raw materials, in particular of stocks of paper. The full accounts add little to the analysis of profits already contained in the preliminary figures; the 4 per cent dividend on deferred stock, reduced from 6 per cent, is, as was estimated, covered by earnings of only 4.1 per cent against 15.4 per cent in 11 months. The company's balance sheet underlines the draft on stocks which was necessary last year, the total being reduced from £849,938 to £512,960. The fall in the consolidated statement from £1,789,255 to £1,538,087 is less marked, and it is clear that certain of the company's subsidiaries have been more fortunate than the parent in the matter of obtaining raw material. More-over, since the directors explicitly state that, although some export business was possible, no net revenue was produced by the wall paper side of the business, trading in the company's remaining products, paint, varnish and distemper, must have expanded substantially. Liquidation of stocks is responsible for the investment of an additional £159,000 in Government loans, bringing the total of investments to £2,123,876 against £1,830,516. Cash holdings of the company are up from £59,368 to £145,674 and of the group from £107,808 to £245,549. The total of general reserve and contingencies reserve amounts to £520,000 against £420,000. While it is likely that the wide scope of the company's interests will prevent a severe setback during the war, no genuine recovery can take place until supplies of paper are again freely at the company's disposal. The £1 deferred stock at 25s. yields £3 4s. 7d. per cent.

Hawthorn Leslie Allocations

As usual, the Hawthorn Leslie accounts for the year to June 30th last fail to disclose the trend either of gross receipts or of charges against profits. The profit balance for the year, struck after deduction of depreciation, taxation and contingencies, is reduced from £162,736 to £133,471.

It is fairly clear that gross earnings last year exceeded those for 1939-40, but the inclusion of provision for contingencies among undisclosed deductions from profits makes it impossible to estimate whether receipts rose by more than the increase in tax liability. Although equity earnings, at £132,271 against £161,536, represent a rate reduced by 10.6 points to 34.2 per cent, the ordinary distribution is rather more costly. While the dividend is maintained at 10 per cent, shareholders receive a bonus of 5 per cent less tax against 2½ per cent tax free, equivalent to only 4.3 per cent less tax at 8s. 6d. The decision to pay the bonus less tax, presumably a concession to the prejudice against tax-free declarations, is welcome, since it puts both payments on the same basis. The carry forward is increased from £51,167 to £52,826, general reserve receiving £50,000 against £85,000. Hawthorn Leslie is, of course, employed on output intimately connected with the war effort, and the increase in the scope of production undertaken during the past year is indicated by the rise in the balance-sheet total of stocks and work in progress from £3,703,715 to £4,979,918. Debtors are up from £47,143 to £115,957 and creditors from £4,556,471 to £5,778,270. The small increase in cash holdings from £299,893 to £304,584 has been achieved at the expense of a reduction of almost £100,000 in holdings of Government securities to £866,761, with a market value of £957,600. The 10s. shares, at 25s. ex dividend, offer a yield of £6 per cent, indicating considerable confidence in the future stability of earnings.

Trinidad Petroleum Development

Total income of Trinidad Petroleum Development for the year to July 31st last amounted to £677,420, against £689,593, thus showing remarkable stability in the face of varying costs and a slightly lower price for the product. The total of provisions for wells development and depreciation is rather higher at £330,036, against £325,263, while transfer to tax reserve is reduced by £25,000 to £175,000. The company's liability for EPT is still unsettled, and, in the absence of a decision, Taxation Reserve is renamed Taxation and Contingencies Reserve. Standing in the balance sheet at £418,600, it is considered that this fund is adequate to meet any conceivable tax liability and to provide a margin for contingencies. After deducting £6,575 for the dividend on the newly issued preference capital, equity earnings are up from £160,677 to £161,195, providing cover of 17.2 against 16.9 per cent for the 15 per cent dividend on ordinary shares, as indicated in a note on the preliminary statement in *The Economist* of October 18th. The carry forward is raised from £74,305 to £75,500 after writing £10,000 off new issue expenses.

	Years to July 31,		
	1939	1940	1941
Total income	425,376	689,593	677,420
Wells development, etc.	153,847	213,010	209,345
Depreciation	88,807	112,253	120,691
Fees	3,269	3,653	4,614
Taxation reserve	25,000	200,000	175,000
Prof. dividend	...	...	6,575
Ordinary shares:—			
<i>Earned</i>	154,453	160,677	161,195
<i>Paid</i>	150,000	150,000	150,000
<i>Earned %</i>	15.7	16.8	17.2
<i>Paid %</i>	15	15	15

Carry forward..... 63,628 74,305 £75,500
† After £10,000 written off new issue expenses of preference capital issued Dec., 1940.

The balance sheet shows a rise in cash from £211,527 to £446,898, due presumably to prompt payment for deliveries. Debtors are actually reduced from £44,313 to £40,718 and creditors are nearly £40,000 lower at £69,841. Stocks of crude oil stand at the low level of £28,145 against £30,258. The directors state that the drilling programme has been carried on during the past year, the balance sheet total for oil wells and development having risen from £771,031 to £806,047. The outbreak of war has stimulated the development of Trinidad Petroleum, but, at the date of the accounts, the new capital was not fully invested. There seems no reason to suppose that the weight of EPT will prove an intolerable burden for shareholders. The £1 ordinary shares, at 57s. 6d. ex dividend, yield £5 4s. 4d. per cent.

THE STOCK EXCHANGES

London

Note: all dealings are for cash

DESPITE the threat to Moscow and uncertainty in the Far East before the week-end, there was no pressure to sell and the undertone in most sections of the market was firm. Week-end developments made for a cheerful opening and prices in most sections improved slightly. Later, prices continued to advance in a market rather short of stock, but throughout, the volume of business showed no tendency to expand.

★

General uncertainty before the week-end led to some widening of quotations in the *gilt-edged* market, but in the absence of selling pressure, prices remained mainly unchanged. On Monday, some demand for irredeemable issues found the market short of stock and 2½ per cent Consols and Local Loans each gained ½, while 3½ per cent Conversion and War Loan rose ½. Continued support the following day occasioned a further advance, and the same issues all rose ½. Later, interest widened slightly and small gains were numerous. Apart from the sharp fluctuations in Japanese bonds, the *foreign bond* market was quiet but steady. Before the week-end, Japanese issues slumped on the Far Eastern developments, losses of 2 points being suffered by the 5 per cent loan of 1907, 5½ per cent of 1930 and the 6 per cent of 1924, while the 5 per cent S. Manchurian loan fell the same amount. On Monday, however, most issues rallied. Six per cent bonds, 1924, jumped 4, and 5½ per cent loan, 1907, 2½ points, while most other issues recovered 2 points. Later, prices were mainly unchanged. South American issues were generally steady, although the 7 per cent San Paulo Loan lost 2 points before the week-end, while, on Monday, 5 and 6 per cent Mexican bonds both improved ½. News of the resumption of diplomatic relations with Mexico stimulated further rises in midweek.

★

The *home rail* market reflected the general uncertainty before the week-end with small losses among junior issues, GW ordinary and Southern preferred losing ½ point, LMS ordinary ½, and Southern deferred ½. Apart from a loss of 1 point for 4 per cent Berwick 1st pref. and LMS 1923 pref., the senior issues were mainly steady. Buying in the early part of the current week led to numerous gains, among which, on Monday, GW ordinary rose 1, LMS ordinary and Southern deferred ½ and Southern preferred ½, and the following day, in a market short of stock, GW ordinary and Southern preferred gained 1 point, while Southern deferred rose ½ and LMS ordinary ½. Junior issues turned easier in midweek, GW ordinary losing ½, but senior issues continued firm throughout. The *foreign rail* market was quiet, with South American issues generally steady, although BAGS ordinary fell back ½ on Tuesday on publication of the report. Elsewhere, Canadian Pacific ordinary jumped ½ on Monday and ¾ the following day, but later reacted.

★

The *industrial* market was depressed before the week-end, but an improved tone developed in the current week. Pre-week-end losses for brewery shares included 1s. 6d. for Watney deferred and 1s. 3d. for Ind Coope. At the reopening, most issues were firmer with gains of 6d., and the next day Guinness led the market with a rise of 1s. De Havilland was prominent in the aircraft group on Monday with a rise of 1s., and the next day gained a further 6d. when Rolls-

Royce improved ½. Heavy industrial issues were generally lower before the week-end, and later prices were barely steady. After being offered on the previous Friday, shipping issues attracted mild support this week, Cunard gaining 9d. and P & O deferred 6d. on Tuesday. Textile issues suffered numerous small losses on Monday, although Courtaulds gained 3d. against the trend. Later prices remained generally unchanged. In the tobacco group, BAT and Imps reversed pre-week-end losses on Monday, and Imps improved a further ½ on Tuesday. In the miscellaneous group, Lever and Unilever, Dunlop and ICI were firm, while elsewhere Cable & Wireless ordinary gained ½ on Tuesday. Trading in midweek was steady and leading issues, among which Courtaulds rose 9d., were mainly firm.

★

Before the week-end, Sub Nigel declined ½ and Crown Mines ½, but the *kaffir* market opened cheerfully on Monday. Despite a rather small turnover, Blyvoors gained 9d. and West Wits ½, and the following day 1s. 3d. and ½, respectively, and Western Holdings, 1s. 6d. War news restricted business in the *rubber* market, but, in the absence of selling, prices were largely unchanged. United Sua Betong lost ½ and Rubber Trust, 3d., on Tuesday. The *oil* market closed dull before the week-end, Burmah losing ½, Ultramar, ½, Anglo-Iranian, ½, and Shell, ½. An appreciable recovery took place this week, Mexican Eagles rising 1s. on Monday, Anglo-Iranian ½ and Shell ½, while the next day Burmah gained ½ and Shell ½. Both the *kaffir* and *oil* markets continued firm in midweek.

New York

CAUTION regarding both international and internal developments continues to dominate trading on Wall Street. Price movements before the week-end were narrow, but some resistance to current uncertainties led to numerous small gains in industrial, aircraft and steel issues, among others, at the close. In the early part of the current week, better news from Russia supported a quiet market, while equities were bought on inflation talk. While price movements were generally narrow, light support led to minor gains in steel, rail and motor issues. The sinkings of U.S. ships increased uncertainty in midweek and business remained quiet, with narrow movements.

The *Iron Age* estimates steel mill activity at 96 per cent of capacity, against 98 per cent in the previous week.

Industry and Trade

40 Per Cent More

Last Sunday Mr Bevin called for a 30 to 40 per cent increase in the output of war equipment this winter to give effective aid to Russia and to keep the fighting forces properly equipped. This target cannot be reached simply by the recruitment of additional labour because the millions that would be required are not available. By combing out workers from the least essential occupations and by drafting more women into the factories, only a comparatively small, but none the less vital, overall increase in output can be hoped for. In the main, therefore, Mr Bevin will have to rely on an increase in output per worker to achieve his purpose. Longer hours will not do the trick. Indeed, the main hope would seem to lie in increased efficiency. This can be achieved by securing greater balance in output, by a fuller utilisation in productive facilities. Here the initiative lies largely with the supply Departments which could do a good deal in improving the flow of orders and materials to the factories. But there is much that can be done by industry itself, both collectively by the pooling of knowledge and resources, and in individual factories by the production engineers on the spot. As is pointed out in a recent bulletin of the Institution of Production Engineers, any production engineer who is engaged on war work and is satisfied with an output that does not grow from month to month is unworthy of his job.

★ ★ ★

Industrial Accidents in 1940

The report of H.M. Chief Inspector of Factories for 1939 gave an alarming account of the increase in industrial accidents during the first four months of the war. His report for 1940 shows no improvement in this state of affairs. Fatal accidents were 1,372, 24 per cent more than in 1939, and there were 230,607 non-fatal accidents, an increase of 20 per cent. The distressing feature is that, in the opinion of the inspectorate, these could largely have been prevented. Though the inspectors attribute the higher accident rate mainly to the increase in numbers employed in the war effort, they report a certain relaxation of care, attributable in part, apparently, to the incredibly stupid idea that, because the fighting forces have to take every kind of risk, there is no need to fuss unduly over the safety of workers. The chief increases are shown in those industries and on those machines that are concerned in the war effort, but that this is not unavoidable is illustrated by the accident figures of one very large shipyard. Here a keen and efficient safety officer has reduced the accident rate from 0.94 per cent of the men employed to 0.66 per cent, between 1937 and 1940. The increase in accidents on machines largely manned by new entrants to the war industries suggests that these recruits are not receiving enough training. It is noticeable that workers transferred from other trades become prone to accidents when handling articles to which they are not accustomed, and even skilled men, using the tools with which they are familiar on new kinds of work, suffer more accidents. It appears that air raids, apart from their direct effect, do not increase the liability of workers to accident through any after-effects on their nerves. One particularly disappointing feature of the report is the failure to maintain the decreases of the past three years in the number of accidents to young persons. Accidents to boys and girls have increased 18 and 11 per cent, respectively, and this is attributed to the facts that they are employed in larger numbers on the accident-producing machines and that training and supervision have deteriorated. This deterioration is easily understandable; but no effort should be spared to check it, in the interest both of the individual worker and of the war effort.

★ ★ ★

Necessitous Collieries

By the new Orders amending the provisions of the Central and District Coal Mines Schemes, fundamental changes are made in the form and extent of the financial assistance given to colliery undertakings under the Coal

Mines (War Levy) Scheme. Their chief purpose is to provide additional financial assistance to necessitous undertakings. When the scheme was adopted last December it was feared, on the one hand, that compensation might be payable to undertakings which were earning substantial profits in spite of their loss of trade; and, on the other hand, that the assistance to be given might prove inadequate to prevent the discontinuance of production at pits where the working costs were normally much above the average for the industry as a whole. In the light of actual experience, and of the persistent shortage in the supply of coal, the industry has been considering means for bringing the scheme into line with present conditions. As a result of amendments which have now been authorised by the Mines Department, the profitable undertakings will no longer receive compensation if its effect would be to raise their credit balance above a specified level, while the more necessitous undertakings will obtain assistance in excess of that accruing to them under the compensation rate of 2s. 6d. per ton on loss of output. In the words of the Order amending the Central Scheme, the purpose of the levy is to be extended to the maintenance of the production of necessitous undertakings "at such tonnage as, in the opinion of the Council in view of the present emergency, should be produced." In the exercise of this function the Council is authorised to give such financial support as it "may deem equitable" in each case, provided that "any such amount shall not exceed the sum which, in the opinion of the Council, is necessary for the purpose," and subject to the condition that "such production will be maintained as efficiently and economically as practicable." In its amended form, the levy holds out prospects of financial assistance to undertakings which have either not benefited at all, or benefited inadequately, from the original scheme. It would be idle, however, to ignore the administrative difficulties of an arrangement which imposes such exacting responsibilities on the executive authorities; but some at least of these difficulties have been foreseen, and in the procedure which has been devised for the consideration of the new claims there are both local and central checks on possible abuses. If the changes lead to the reopening of closed working places or mines, and thus facilitate an appreciable increase in the national output of coal, they will have justified their immediate purpose; but the claims for assistance which undertakings have already been encouraged to make will involve more searching actuarial and engineering investigations than were found necessary for the administration of the original scheme—and will probably need revision in the light of experience.

★ ★ ★

Utility Clothing

The principal use which has been made so far of the new powers vested in the Government by the Goods and Services (Price Control) Act has been in connection with the utility clothing scheme. The object of the scheme is to ensure that specified proportions of all available materials are used for the manufacture of moderately priced clothing of a minimum quality. A special quota of "utility cloth," conforming to specified standards of quality, will be allowed to manufacturers for the production of such garments, and maximum prices and margins have been fixed for every stage at which the cloth changes hands. These margins have been worked out by the Central Price Regulation Committee with the assistance of trade representatives. An example is a woollen tweed for the manufacture of men's suits. The maker-up may charge cost plus 4 per cent; the

FAMOUS SINCE 1795

OTARD'S

COGNAC BRANDY

wholesaler may take a margin of one-sixth of his selling price; and the retailer, to whom the cost cannot exceed 38s. 6d., may take a gross profit not exceeding 25 per cent of his selling price, or 33½ per cent of his cost. This gives a maximum selling price to the consumer, including purchase tax, of 59s. 11d. The Central Price Regulation Committee rejects the criticism that this method of calculation gives the retailer a profit on the purchase tax, giving the irrelevant answer that the wholesalers and retailers, by accepting what are in fact very moderate margins, have made a valuable contribution to the scheme. However true this may be, it does not alter the fact that the basis of calculation is unscientific, and renders traders' margins liable to arbitrary and unintentional interference by the Chancellor of the Exchequer. With purchase tax of one-sixth and a margin of 33½ per cent on cost, the retailer makes a margin over his cost (excluding tax) of just under 39 per cent. If the purchase tax were doubled, this margin would increase to nearly 44½ per cent; if it were halved, the margin would be reduced almost to 36 per cent. The margin on selling price is fixed by Order, but the selling price itself is swollen or shrunk by changes in the purchase tax, though these changes constitute in themselves no reason for a change in the cost-profit ratio. It would surely have been just as easy to fix the margins in terms of the cost excluding purchase tax and then add the amount of the tax to the price so determined.

The Volume of Food Sales

Owing to frequent changes in prices, the Bank of England's indices of the average daily value of retail sales of food and perishables are no guide to the decline in the volume of turnover. But a rough measure of the trend of the volume of food sales can be obtained by adjusting the Bank of England's value figures for changes in the food component of the Ministry of Labour's index of the cost of living. The resulting indices, tabulated in the accom-

INDICES OF THE VOLUME OF FOOD SALES
(1935=100)

	1938	1939	1940	1941
January	101	103½	95	94
February	106	110	97	96
March	108	113½	105½	97½
April	116	123	105½	99½
May	109	123	109½	97
June	110½	112	99	92½
July	104½	112½	104	96½
August	102½	109½	96	93½
September	107	115½	88	...
October	108	109	92	...
November	107	101½	91	...
December	129	117	107	...
Average	108½	111½	99	...

panying table, give some indication of the order of magnitude in the decline of food sales since the outbreak of war. Thus, the volume of sales during the first eight months of the current year was 5½ per cent smaller than during the corresponding period in 1940 and 15½ per cent smaller than in January-August, 1939. Even if allowance is made for the deficiencies of the Bank of England's index as a measure of food sales and of the Ministry of Labour's index as a measure of changes in food prices, the reduction in actual consumption since the outbreak of war must have been very considerable.

More Shipping Space

As a temporary measure to get every cubic foot of shipping space out of the still dwindling merchant fleet, the Government has departed from the terms of the International Loadline Convention embodied in the Merchant Shipping (Safety and Loadline Conventions) Act, 1932. The

The fact that goods made of raw materials in short supply owing to war conditions may be advertised in this Journal should not be taken as an indication that they are necessarily available for export.

departure is limited in extent; it will not, under the Defence Regulation concerned, continue for more than a year; and it has been taken only after consultation with the interests concerned, including the seamen's and officers' organisations. The effect in terms of carrying capacity may not, however, be very considerable until next spring, since loadline certificates have had to be endorsed before ships can be deeper loaded, and next week the winter season in the North Atlantic will impose further limitations. It is seventy years since Samuel Plimsoll introduced a Bill in Parliament for a compulsory loadline, and just over fifty years since freeboard regulations for British ships were made compulsory by Act of Parliament. The freeboard tables, which determined the position of the loadline according to the type, size and structure of ships, were modified only in detail up to the time the International Convention came into operation on January 1, 1933. Now an ordinary cargo ship above a certain length (330 ft.) actually has five loadline marks—winter, summer, tropical, fresh water, and tropical fresh water—which become applicable according to the position of the ship, and, in some but not all cases, the time of year. Under the new Defence Regulation, which came into operation last August, ships may load to their tropical loadlines instead of their summer lines when the latter are applicable under the existing rules, and to their tropical fresh water instead of their tropical lines when the latter are applicable. The winter loadline is unaltered. Provisions are included to ensure safety and seaworthiness. In regard to the North Atlantic, which is the vital route to-day, the winter mark is applicable down to the 36th parallel (roughly, Gibraltar) from the beginning of November to the end of March, and to an area north of that (which includes Iceland, and just down as far as the 45th parallel) from the middle of October to the middle of April. The principal exception to the scheme is the shelter deck ships, the majority of which have already had their freeboards revised following structural modifications. The safeguards included in the new regulations, combined with the fact that the winter freeboard is not altered, should allay any fears that the safety of the crews is being jeopardised, and it is to be noted that similar regulations for American ships have also been introduced in the United States. While until next spring ships sailing from North American ports will not be able to load beyond their winter marks, some advantage may be gained by ships loading at Gulf and South American ports, if by the time the winter zone is entered sufficient stores and bunkers have been consumed to bring them up to the statutory freeboard.

War and Furs

The fur trade, which has been in a geographically unsettled state since 1931, has undergone a further shift in its centre of gravity as a result of the German invasion of Russia. Between the acquisition of power in Germany by the Nazis and the outbreak of war, the migration of Jewish fur merchants to London greatly expanded the British trade at the expense of that of Leipzig. London became the world's most important centre of the trade in raw furs, and also acquired increased importance in the dressed and dyed fur trade. The outbreak of war cut off London from its large supply bases in Canada, South America, Australia, South West Africa, Russia, India, Scandinavia, Afghanistan, and the Far East, for very little shipping space could be allocated to furs. After the fall of France, the Hudson's Bay Company's auctions were transferred from London to New York, and all the principal fur-producing countries outside Europe are now shipping their supplies direct to that centre. New York now holds a stronger position in the international fur trade than any centre has ever held before, whereas London has little trade left, beyond the shipment to the United States of raw rabbit skins of domestic origin, at the rate of 60 millions a year, and a certain export of manufactured mole furs, principally to Canada and South America. Leipzig, on the other hand, has recovered some of its trade under war conditions. About half a million silver fox skins from Scandinavia, and large quantities of Balkan squirrel, stone marten, red fox, and other furs of the less luxurious type have been diverted to Leipzig, where they, and the large quantities of Russian furs obtained before June, 1941, under the trade agreement, are dressed, dyed, made up and re-exported to pay for war imports. The Russian supplies have now been lost to Germany.

(Continued on page 517)

COMPANY MEETING

HARRISONS AND CROSFIELD, LIMITED

The thirty-third ordinary general meeting of Harrisons and Crosfield, Limited, will be held, on the 28th instant, in London.

The following are extracts from the address of the chairman, Mr H. Eric Miller, to be presented at that meeting: In the balance-sheet the loan of £200,000 to the British Government free of interest represents part of our taxation paid in advance. The company's total provision for taxation at home and abroad for the year, including the tax deducted from dividends, amounts to more than £500,000. It is gratifying to be able to make such a substantial contribution to the war effort of our own and of the Allied countries, and you will, I am sure, join with me in expressing our best thanks to the whole of the staff.

(Continued from page 516)

These lost supplies, like those of London, now go to New York, where six large international auctions are now held annually. Although supplies there are enormous, they are far from exceeding the capacity of the market, and prices were recently 30-50 per cent higher than immediately before the war. This supremacy of New York in the fur market

The net profit for the year of £350,161 shows an improvement of nearly £10,000 on last year's figure. The board recommend the payment of a final dividend of 20 per cent. on the deferred ordinary stock, making 25 per cent. for the year.

The outstanding feature of the period under review has been the building up by the United States Government of large reserve stocks of crude rubber. Since the German attack on Russia, the door has been finally closed against enemy countries getting any further supplies of rubber, a fact of real importance, though not decisive in view of their capacity to produce synthetic substitutes.

There is no doubt as to the important part rubber is playing in the war effort, and each satisfactory new application soon leads to others. Having some knowledge of the good work done in both fundamental and applied research, I am convinced that the possibilities of future expansion in new uses for rubber and its derivatives are distinctly encouraging.

is likely to be maintained throughout the war. Afterwards, London may be helped by closer relations with Russia, and by the fact that so many of the important fur-producing countries are either British or dependent on the British Empire. Dislocation has, however, been so much more complete than in 1914-18 that it would be rash to argue too much from the rapid recovery of the London fur market after the last war.

a search for stocks of particular cloths for Russia. Bandage materials have been purchased a little more freely. Irregular operations have occurred for shipping purposes, most of the orders being for Java, South America, West Africa and South Africa. Yarn demand has been much larger than the supply and spinners have sold with caution.

Irish Poultry.—The Ministry of Food announced on Wednesday its new arrangements for the handling of supplies of poultry, turkeys and rabbits from Eire and Northern Ireland. All existing licences for the importation of poultry and rabbits from Eire will be withdrawn on November 17th (licences for turkeys were withdrawn on October 21st) and supplies will be canalised through the Association of Wholesale Distributors of Imported Poultry and Rabbits, Ltd. This Association is being formed at the request of the Ministry of Food from wholesalers who imported supplies in 1938. These wholesalers were invited early this month to submit particulars of their imports in that year, and those eligible may apply for membership of the Association before October 31st. The exportable surplus of poultry, turkeys and rabbits from Northern Ireland will be purchased by the Ministry and distributed through the Association, which will arrange for its allocation to members on the basis of their trade in 1938.

Fish Levy.—The Ministry of Food has decided to relieve owners of foreign vessels of the levy of 8d. per stone on fish landed from these vessels and sold at maximum prices. This will necessitate an amendment, which will shortly be made, to the Fish Sales (Charges) Order. The transport charge of 6d. per stone which is payable on landings made by both British and foreign owners will remain.

Cereal Breakfast Foods.—The Cereal Breakfast Foods (Control and Maximum Prices) Order came into force on October 20th, specifying maximum prices for 25 cereal breakfast foods. This Order supersedes the Cereal Breakfast Foods (Control and Provisional Prices) Order, 1940, which stabilised prices at those in operation on December 2, 1940. The new Order adjusts maximum prices to meet higher costs of production and raw materials. The manufacture and packing of cereal breakfast foods except under licence of the Ministry of Food continues to be prohibited. Prices are specified per container, varying from 4d. to 1s. 2d. for the controlled products. Prices of those goods not scheduled in the new Order remain unchanged.

Rubber Control.—It is understood that the Rubber Control has issued instructions that any contracts for the sale or purchase of rubber for delivery in Great Britain can only be arranged at official prices. These are 13½d. per lb. for standard ribbed smoked sheet from European estates, and 13½d. a lb. for native rubber of the same grade. Since these prices are the same as those at which the Rubber Control sells to dealers, it would appear that no margin is allowed to dealers on sales. It is believed that the new prices will stay in operation until the end of December, when they will be reviewed.

"Black List."—A new Board of Trade Order, Trading with the Enemy (Specified Persons) (Amendment) (No. 17), which came into force on October 23rd, contains 339 additions to the "Black List" of traders in neutral countries with whom it is unlawful to have dealings of any kind. The Board of Trade announce that further additions will be made in due course.

Lubricating Oil Washing Plant.—The Board of Trade announced on October 18th that the supply of "lubricating oil washing machinery and plant" is to be subject to licence under the Machinery, Plant and Appliances (Control) (No. 5) Order of October 13th, 1941.

Cotton.—Employers and trades unions in the spinning section have reached an agreement with regard to the guaranteed wage under the Essential Work Order. The wage is to be the average of four weeks previous to any stoppage. Trading during the past week has been unimportant and the sales in yarn and piece goods have consisted of miscellaneous lots. Some fair Government lines have been put through in heavy materials, with

GOVERNMENT RETURNS

For the week ended Oct. 18, 1941, total ordinary revenue was £39,035,000, against ordinary expenditure of £87,874,000, and issues to sinking funds of £225,000. Thus, including sinking fund allocations, the deficit accrued since April 1st is £1,660,468,000 against £1,315,826,000 for the corresponding period a year ago.

ing more and more citizens of this democracy is the suspicion that, in the Government's mind, our way of life is purely on the defensive. If so, then the prospect of victory is a relapse into the blindness, the cowardice and the stupidity that brought us to our present pass. Then, indeed, Britain is an elderly and declining nation, making one last brave spasm of resistance before it yields to those who are younger and stronger. But the British people reject this notion with a firmness second only to their rejection of the idea of a truce with Hitler. They are not on the defensive; they are determined to reconstruct. There is a mountain of anger throughout the country against the ideas and the men who brought the country to September, 1939. By general consent, following the Prime Minister's magnanimous leadership, recrimination has been deferred—but on the unspoken condition that nothing of that spirit shall survive.

There is no question of seizing the opportunity of war to foist on the people the views of a minority or by some Procrustean tactic to force a free people into the rigidities of some doctrinaire ideology. On the contrary, one of the great gains of the past two years is the defeat and disruption of the "isms" that have plagued British politics for a generation. There is a chance now to return to the native tradition of practical realism, to that mixture of tradition and progress which the Prime Minister gave as his political philosophy eighteen months ago. There was a hope at that time that the injection of Mr Churchill's robust practical sense would turn the Conservative party away from the Brummagem neo-feudalism of its recent years to the Disraelian tradition of constructive, popular and progressive realism and make it a worthy member of a national partnership. But it is not Mr Churchill that has captured the Conservative machine; it would appear to be the Conservative machine that has captured Mr Churchill.

Two examples must for the present suffice of the sort of project of democratic regeneration which is being

neglected. The first is the dispossession of the vested interests that have grown like barnacles on the hull of British enterprise in the last decade or two. At this hour of day it is hardly necessary to particularise the policies that have led to the carving up of the British economy into a number of exclusive baronies, each ruled in the interests of protection and stability. It is hardly necessary either to point out once again the handicaps that such a system of rigidity, scarcity and protected inefficiency imposes on a community that is fighting for its life. But it is necessary to enquire whether it is proposed that Britain should fight for its commercial life in the post-war world with the same system. Are the economics of democracy to be interpreted in terms of rings and trusts, cartels and combines? Apparently so; for not the slightest move has been taken even to enquire whether there are any dangers in monopoly run riot.

The second example is another necessity that has been proved by the war—the necessity for an emancipation of the talents of the citizen. A community of 47 million people, with great imperial responsibilities, somehow fails to avail itself of the capacities for leadership born into any save a minority of a million or two—and naturally there is that crying shortage of brains of which every practical administrator is aware. Has anything substantial been done or even projected, to analyse the causes of this shortage of brains and to work out the cure? Or is the British democracy of the twentieth century to apply restriction and monopoly to leadership also?

These questions must not be neglected any longer. In this revolutionary century, no society can afford to be purely static and defensive. By concentrating on the military war alone we may, indeed, secure victory; but what shall it profit a nation if it win the whole world and lose its soul? There is an opportunity for the British nation to show once again that, without losing its unity, its reason, its tolerance, it still can ride the crest of the wave of the future.

American Defence and Mexico

THE long reference in President Roosevelt's Navy Day broadcast to Nazi plans for South America will seem irrelevant only to those who have not grasped the particular significance of "hemispheric defence" to American public opinion. A threat to the integrity of the Latin American Republics or to the defences of the Panama Canal is generally accepted as a threat to the security of the United States. True, an invasion from overseas is not in question, but the preliminaries to such an invasion—the setting up in Central and Latin America of Governments favourable to the Axis and the preparation of advance airfields and air facilities—have undoubtedly been planned in Berlin.

The need is, thus, for stable anti-Axis Governments in Latin America and Mexico is in many ways the key to all the rest. In no other state (except perhaps Brazil) could a pro-Axis government, prepared to fall in with Axis plans of infiltration, do such damage to United States interests. The coasts and ports of Mexico could provide naval bases for the infesting of the Caribbean with hostile submarines. Airbases established in Mexico could dominate the Canal Zone. At the same time armed intervention by the United States in the domestic affairs of its neighbour, even though it were designed to put an end to pro-Axis activities, would put a heavy strain on the Good Neighbour policy throughout South America. Happily for the security of the Americas, Mexico has enjoyed firm and reasonably popular government for the last decade. Yet the stability and strength of the régime have not been based upon the avoidance of controversial issues. Since the advent of President Cárdenas in 1934, Mexico has gone through a period of active reform which by the hopes it mobilised and the fears it aroused might well have given Axis agents exactly the openings for social ferment which they have been quick to use in other countries, for example, in Popular Front France. When, in 1934, Presi-

dent Cárdenas came to power, the first impetus of the 1917 Revolution had spent itself. Labour legislation had come to a halt; 63 per cent of the land in the country was still in private hands; the politicians of the party which still called itself Revolutionary had enriched themselves and were satisfied with the *status quo*.

President Cárdenas reversed this process. The position of the Church was improved and good relations were sought with Mexico's neighbours. At the same time, the President launched an ambitious programme of revolutionary reform, designed to revive the spirit of 1917. The basis of the programme is the improvement of the living standards of Mexico's workers and peasants, the transference of much of Mexico's wealth from foreign interests to the Mexican people and the development of national agriculture and industry by means of a state-controlled and planned economy. By 1939, 62½ million acres had been distributed among the peasants, mainly in the form of collective holding or *ejidos*, and the reform was accompanied by an ambitious programme of irrigation, road building, rural credit and education. In 1936 the position of the workers was regularised and improved by the formation of the Confederation of Mexican Workers (the CTM). During the same period, the policy of transferring Mexican wealth from foreign to Mexican ownership was pursued by the nationalisation of the railways in 1937 and the expropriation of the oil companies in 1938.

When President Cárdenas, with a self effacement rare in Mexican politics, retired from the Presidency and from politics in 1940, it was thought at first that his successor, President Avila Camacho, intended to modify and even reverse the trend of the Cárdenas programme. The impression was confirmed by the nature of the first legislation put forward by the new régime. Peasants were to receive a title to their land; the Labour Law was to be modified by strengthening arbitration; the railways were no longer

to be controlled by the workers; the credit institutions were to be modified to encourage investment and enterprise; under certain conditions and in new areas, there were to be possibilities of foreign companies obtaining mineral concessions. The development of the promised legislation proved, however, that the swing to the right prophesied of Camacho was at the most a movement towards the centre. He himself, in a defence of his policy, delivered at an Annual Conference of the CTM, explained his programme as a consolidation of the gains already made. He was attacking none of the principles of Cárdenas but only reforming admitted abuses. The peasant's new title to his land would give him no right to sell, mortgage or neglect his land and large areas—La Laguna, Los Mochis and the Yaqui valley—had been specifically reserved for collective development. The new Labour Law did not modify the right to strike. Three of the seven delegates on the Board of Management of the railways were workers. Free enterprise would be confined to the expanding fringe of Mexican enterprise, not to the key industries. And President Camacho could point to the fact that his key ministers are all men chosen by Cárdenas.

In the sphere of foreign policy, President Camacho has gone much further than his predecessor. He is making a brave effort to improve and increase the equipment of the Mexican Army, and Mexico is giving a lead to the other Latin American republics in the matter of hemispheric defence against the Axis. The President realises that Mexico, which, standing alone, is still defenceless, has everything to gain by concerting its military plans with those of the United States. The Mexican Government has therefore given Washington every assistance to President Roosevelt's policy of developing Central American bases. On April 1st an Agreement was signed permitting American military aircraft to use Mexican airfields, and the two governments are reported to have agreed to develop the ports of Mazatlan and Tampico as joint bases at a cost of £4 millions of which Mexico will provide £500,000 and the road linking the two ports. The Mexican Government has also followed many of the anti-Axis leads given by President Roosevelt, for example, the seizure of Axis ships and the black-listing of pro-Axis firms. This attitude of confidence and co-operation has been doubly helpful to the United States. It has directly assisted the defence of the Canal Zone. It has directly encouraged other Latin American States to accept the President's lead. They can argue that if Mexico, the State most vulnerable to United States intervention, shows so little fear of it, there can be no risk for those geographically more remote.

The extremist elements in Mexico, to Right and Left, are bitterly opposed to the United States, to democracy, to "financial plutocracy." Until the entry of Russia into the war, the two groups co-operated in a joint underground campaign to disintegrate the government and to detach Mexico from any policy of joint hemisphere defence. Since June 23rd, the Communists have begun a clamour for national and international anti-Axis fronts, but they naively suppose that the new policy can be combined with fierce and irresponsible denunciations of United States imperialism and "Dollar Diplomacy." The Left Wing extremists, except in so far as they increase the ideological confusion, are negligible. The danger is from the Right, from the *Accion Nacional* of the politicians and upper and middle class and the growing mass movement, the *Union Nacional Sinarquista*. With these movements, Nazi agents co-operate blatantly. Their stock in trade is the "imperialism" of the democracies, and President Camacho's alleged willingness to see unhappy Mexico dragged into a war from which the country will emerge mortgaged completely to United States business interests.

Anything that plays into the hands of this type of propagandist weakens both the friendly Mexican Government and the defence plans of the United States. It is therefore unfortunate that the dispute between the Mexican Government and the American and British oil companies whose properties were expropriated three years ago should have dragged on so long and that even to-day,

there should apparently be so little hope of a solution. The expropriation by the Mexican Government of the properties of the Standard Oil Company of New Jersey, of the British owned Mexican Eagle and the Sinclair oil interests dates from March, 1938. Since that date, a heavy fog has hung over the actions of the oil companies and of the governments concerned and over the actual negotiations. Occasionally a rift in the fog gives a glimpse of activity—for example, when Mexico broke off diplomatic relations with Great Britain on the score of an allegedly insulting note, and an embargo was placed by the large British and American oil companies on the sale of Mexican oil, again when Mr Donald Richberg conducted negotiations with President Cárdenas in 1939, again a few weeks ago when a comprehensive economic and financial agreement between the Mexican and United States Governments was followed by the rejection by the American oil companies of the terms suggested by the Governments for settlement of the oil dispute—or again when diplomatic relations between Great Britain and Mexico were happily resumed last week. These tantalising rifts do not provide a complete picture of the negotiations. For one thing, on each occasion the Mexican Government and the oil companies appear to be disagreeing over a different point. In 1938, Mexico was demanding to run the oil fields and pay compensation out of the profits while the companies maintained that, so run, the oilfields would yield no profit. In 1939, agreement appeared to have been reached on the ownership of the fields. The differences arose over the period of their leasing back to the oil companies. In 1941, compensation for loss of the companies rights to the sub-soil appears to be the stumbling block.

In this cloud of conjecture, there are one or two certain points. If the question at issue between Mexico and the oil companies is ownership of the sub-soil, then deadlock appears certain, for ownership has become an emotional symbol of economic independence for the Mexican people. It might have been wiser if the Mexican Government had maintained the concessions while securing modifications such as were granted in Persia, Venezuela or Ecuador. That they did not do so has been excused by reference to the intransigence of the oil companies in earlier years. Nevertheless, methods used by Mexico were completely illegal and there can be no doubt of the oil companies' right to fair compensation in the shape of a capital sum or of permission to work the oilfields for an agreed period.

There is far less justification for the other steps that have accompanied the dispute. The embargo on Mexican oil, although it was never complete, was intended by the oil companies to bring the Mexican Government to terms by depriving it of all revenue from oil. It had the effect of supplying the Axis, in exchange for blocked marks and blocked lire, with a comfortable reserve of oil against the outbreak of war. In so far as the embargo received official support the British Government were prejudicing a national in support of a sectional interest.

The provocation of a diplomatic dispute has had even more unfortunate results. It coincided with the period of the British Government's greatest complaisance towards a persistently defaulting Nazi Germany and thus created the suspicion that Britain had one diplomacy for the strong, another for the weak. It offered a telling argument to anti-democratic, anti-"Anglo-Saxon" propagandists in Latin America who made use of it as a blatant example of the subordination of diplomacy to Big Business; and it did so at a time when the United States Government by perfectly correct diplomatic behaviour was attempting to lessen just that suspicion among its American neighbours.

Now that normal diplomatic relations have been established and the diplomatic and commercial issues have been—very properly—disentangled, it is the obvious duty of the British Government to give the American Administration all the aid in its power in promoting a Good Neighbour policy in Latin America. If hemisphere defence and the combating of totalitarian propaganda can be countered by removing such major points of friction as the oil question, then the official interest which has been shown in the dispute might now be devoted very suitably to its solution.

Production Problems

IT is common knowledge that Russia's capacity to produce tanks, aircraft and other military equipment has fallen appreciably below Germany's and that its ability to keep the German army fully employed depends in large measure on the extent to which Britain and America can make good the deficiency. Simultaneously to fill Russia's yawning gaps, caused by the loss of many important industrial centres, and to build up the equipment of the British fighting forces is a tall order. But it is an order that must be fulfilled to the best of Britain's and America's ability. It involves a tremendous acceleration on the munitions front. Mr Bevin has set a target by calling for a 30-40 per cent increase in production this winter.

Broadly, there are only two methods whereby the output of the tools of war can be increased; the one is the expansion of the production facilities at the disposal of the Supply Departments at the expense of civilian industries and occupations and the other is the increase in the "yield" of finished equipment per man-hour. Both have frequently been stated and discussed in *The Economist* and elsewhere. There is little new to say. But in view of the urgency of the need for an acceleration in output the problems bear restatement in the light of experience and present conditions.

The process of transferring labour, materials, production and transport facilities from the satisfaction of civilian needs to those of the fighting forces has by no means been completed. Civilian production, it is true, has been drastically curtailed; but many unessential things are still being made, while others are produced in quantities well above the bare needs of the population. The temporary suspension of the manufacture of jewellery, ornaments and fancy household goods, would hardly affect the morale of the people. A further curtailment in the output of essential personal and household goods would be willingly accepted in the present mood of the country. The standardisation of essential articles has not been pushed far enough. The facilities of the distributive trades, though denuded of part of their labour, have not yet been pruned to wartime standards. Nothing has been done to remove the contradiction of the shops' invitation to buy and the Government's exhortation to refrain from spending. Financial policy has not yet been designed to bring about that reconciliation of self-interest with patriotism, which alone can resolve the anomaly. Again, transport, though scarce, has not yet been rationed drastically enough to the civil consumer. The recruitment of women for the war services and the munition factories has been notoriously slow.

The magnitude of the civilian resources that can still be tapped for war work, however, can easily be exaggerated. While they cannot be stated in quantitative terms, it is quite clear that Mr Bevin's target cannot be reached by this method alone, even if the process of transfer were frictionless and instantaneous. Nevertheless, the rate of transfer can, and must, be speeded up.

In the main, therefore, any further expansion in the output of finished war equipment must be sought in an increase in the "yield" per man-hour. In one respect total production of the finished tools of war grows automatically as new factories are completed, while the yield per man-hour rises as the proportion of labour and plant engaged in preparatory work is reduced. Thus, the sudden leap in production after Dunkirk was due to the fact that a new series of plants then came into operation, quite as much as to the change of Ministers at the Ministry of Supply or the lessening of working hours or even exhortations on the part of civilians. The scope for further automatic increase is small. The means have been exhausted, for additional openings are still being constructed and quick to use if labour, materials and plant engaged in the front are still fairly substantial. Rising production is to be expected; the

scale of current output owes more to previously laid plans and less to current efforts than the speeches of Ministers would suggest.

It is not enough, however, to rely on this automatic expansion in the output of finished equipment. Indeed, the main effort in securing a higher yield of finished equipment per man-hour must come from a continuous quest for higher efficiency in the utilisation of existing resources. And efficiency is largely a matter of organisation.

Many industrialists are still complaining that they are unable to maintain a balanced flow of production because of faulty ordering and tardy delivery of raw materials or parts or both. No doubt there is still considerable room for improvements in the habits and methods of the Supply Departments. Orders are often still intermittent and do not enable the industrialists to plan long enough ahead. Many specifications could still be simplified, while concessions (permission to depart from original specifications) granted to one firm are not rapidly enough passed on to others. Standardisation, despite recent progress, has not yet gone far enough. Again, the Regional Boards of the Production Executive, set up to harness local production facilities to the war effort, come in for a good deal of criticism because the majority of them have not yet been successful in their task. Capacity exchanges, designed to enable individual manufacturers who have machines to spare to let them to others in need of them, are still not functioning efficiently in all parts of the country.

It would be unfair, however, to lay all the blame for the difficulties at the door of the Supply Departments, which, after all, have had to be expanded enormously from the very small pre-war nuclei. Indeed, the industrialists who complain of the "uncommercial" habits of their new customer are having similar difficulties in adjusting themselves to the new conditions. Before the war they were quite content in hunting orders, and many of them achieved anything but a balanced flow of production over a long period of time. With all their many shortcomings, the Supply Departments can hardly supply all their contractors with the orders, labour, materials and parts in the proportions in which they require them to keep their facilities in full and continuous employment. They must still take the initiative in securing orders—the Supply Departments are not in a position to know precisely what, and how much of it, each factory in the country will produce—and in organising their plants as efficiently as possible. Moreover, the production engineer on the spot can do a great deal to increase productivity in his own plant. He is the man on whom falls the responsibility of improving the technique of production and of passing on his knowledge to others. It was in a recent bulletin of the Institution of Production Engineers that appeared the statement that any production engineer who is engaged on war work and is satisfied with an output that does not grow from month to month is unworthy of his job.

The truth is that the stupendous task of changing over from a peace to a war economy at the rate that the emergency demands is seriously taxing the organising ability available to the Government and to industry. The requirements of equipment are so big that it has become necessary to enlist the services of a large proportion of civilian industries in addition to those of the experienced firms and of new plants. Germany, which had a much longer start, was faced with precisely the same difficulties and even the United States, with its vast fund of organising ability, is not escaping them. The German experience was that sub-contracting, even when assisted by a full system of capacity exchanges and order exchanges—the latter have not yet been established in Great Britain—was not enough to solve the problem. Management, in fact, there as here, has proved to be the scarcest of all factors of production. The tendency now is towards organising industry

in units which are specialised as to product and as large as one management can handle. In the case of mammoth concerns, such as the H. Goering Werke, this tendency involves splitting up; but in the main the scarcity of management skill inevitably leads to integration in one form or another. In this respect the problem is similar in technique, though different in aim, to concentration in civil industries. As with the temporary concentration of civil industry, the rationalisation of war industries does not necessarily mean permanent amalgamations; it can be achieved by a great variety of much looser and much more temporary arrangements, whereby a large and experienced concern takes over the management of a number of smaller sub-contractors for the duration of the

war, a scheme known as the "extended work bench" in Germany, the "parent firm" in this country, and the "hen and chickens" in America.

In sum, while there are still untapped resources which must be harnessed to the war effort with all possible speed, the main effort to increase production must be concentrated on securing an increase in productivity. There is much that the Government can still do, not only in the matter of ordering, but in improving the conditions in which industry has to operate and in facilitating the grouping of concerns into management units. But industry itself can contribute in large measure to the increase in the yield of finished equipment per man-hour by striving unceasingly to improve production technique and organisation.

Astrology Old and New

WAR, which notoriously stimulates research, appears not only to encourage modern science, but to bring out from forgotten corners certain more venerable sciences which many of us had thought to be long ago dead and buried. The credit for this resurrection goes to our great British Press which, as part of its work of national importance, supplies its readers daily and weekly with doses of astrology: fortifying, supporting, heartening them with the prophecies of expert astrologers on the immediate future of the war. It is perhaps surprising that so many rival astrologers are available to satisfy so sudden a demand. Were they all in the profession before the war or have they been hurriedly pushed through a qualifying correspondence course in astrological inference and deduction? No outsider can say; but there they all are, prophesying away like red-faced Nixons, with the feature editors in the background confidently hitching their circulation to a star.

It must be more than 7,000 years since astrology started among the intelligentsia of Babylon. It was, we learn, one of the two chief means at the disposal of the priests for ascertaining the will and intention of the gods, the other being through the inspection of the liver of the sacrificial animal. None of the Press lords has so far produced a liver expert for the encouragement of national morale, but if the war lasts long enough something may yet be done in that line and we shall then be getting augurs' reliable tips and forecasts hot from the entrails of the weekly meat ration.

That development is likely to be slow, for as the twin sciences of astrology and divination advanced through the centuries, the entrail expert slowly lost prestige to his rival and by the Middle Ages the astrologers ruled alone. In the civil war of the seventeenth century they were surprisingly active. On the side of the Cavaliers the great expert was Sir George Wharton, of Queen's College, Oxford, who started an almanac in 1641 and on the outbreak of war devoted his skill and knowledge to the King's cause. He was bothered by a number of competing prophets, of whom the most important were Wm. Lilly and John Booker; and Wharton started operations with a fierce attack on their credit, expressing his deep sympathy with "all such as have heretofore had the misfortune to be cheated and deluded by the grand and traitorous imposter of this rebellious age."

These professional jibes were too much for Lilly. Hitherto he had taken no interest in politics, but angered by Wharton's abuse he offered his services to the Parliamentary Party, and they were accepted. From now on Wharton and Lilly were the two protagonists—Ministers of Propaganda to Charles and the Roundheads respectively, prophesying successes for their own side and disaster for their opponents. Lilly, for example, was sent for in 1648 to Colchester, where the Roundheads were being held up, and there he was ordered to do his stuff for the troops, assuring them of impending victory. He seems to have given satisfaction, but a few years later he made the worst mistake open to an astrologer—he

boosted the wrong side, letting it be known that the stars foretold the immediate downfall of Parliament.

Called on to explain before a tribunal so grievous a scientific error he appeared to be in a bad way. But these astrologers are quick thinkers, trained to meet just this kind of situation; and Lilly cleverly printed an expurgated edition of his prophecy (with the wrong calculation omitted) and by putting this copy into his judges' hands he secured an acquittal.

Three hundred years exactly have passed since Wharton published his first astrological almanac, and again the astrological front is mobilised, with prophets giving of their best to the various newspapers, the heavenly message seeming to vary from paper to paper according to the optimism or pessimism discernible in its editorial columns. It is clearly a great mistake to think of the stars as inflexible. On the contrary, they can adapt themselves, almost as though they were working journalists, to the tone of the particular paper that is at the moment taking their staff.

But there is no doubt about some of their successes. The *News of the World's* astrologer, for example, on August 10th (some days before the Atlantic Charter was published) came out with the following:—

There will be decisions of great importance arrived at between heads of two—*perhaps three**—of the great nations involved in the salvation of humanity.

Obviously this was a prophecy of the Churchill-Roosevelt declaration—and a bull's eye. But it should be remembered that three days before the prophecy came out journalists knew that the meeting had taken place and there was a rumour in Fleet Street that Churchill and Roosevelt had gone on to Alaska to have a meeting with Stalin, making a conference of three in all. The rumour was untrue, but the stars had heard it and were themselves in doubt about it. So far, it seems, has astrology advanced from the achievements of the Middle Ages when astrologers claimed to deal only in facts. To-day the modern prophet can catch in the light of the stars not only the things which will happen but a reflection of inaccurate gossip only three days old about things which have not happened.

So this is the true symbol of the modern astrologer—a figure whose eyes gather the celestial message while his ears are flapping to catch the talk of Fleet Street—a being, like the skylark, true to the kindred points of Heaven and Home. But does it sometimes occur to this Sunday prophet that instead of feeding an anxious, credulous public on dope he might earn an honest wage sweeping a street-crossing? He is not tied to his present job. Men are not villains by necessity, knaves by spherical predominance or liars by an enforced obedience of planetary influence; and a false prophet would be what he is if the most honest star in the firmament had twinkled on his bastardising.

* Our italics.

NOTES OF THE WEEK

Aid to Russia

Lord Beaverbrook's speech in the House of Lords on October 23rd supplied several of the omissions in his earlier broadcast, and between the two the public has been given a gratifyingly full account of the Moscow Conference. Even the most sceptical and frenetic of the Government's critics would have difficulty in maintaining that the problem of supplying Russia's deficiencies is not being taken seriously. The British and American Governments are prepared to send really large quantities, not merely of the things they have to spare, but of the things for which Stalin asked, most of which are almost as scarce here as in Russia. It is noteworthy, for example, that both tanks and aluminium are on the way to Russia—and it would be difficult to find any finished munitions scarcer than the first or any raw material scarcer than the second. In a very real sense, the risk and burden of these shipments fall on Great Britain, for Mr Harriman's first words at the Conference appear to have been to make it clear that American supplies would be available for Russia only to the extent that they were diminished to Britain. Moreover, until the Neutrality Act is amended, most of the necessary shipping will come out of the British pool. This, however, touches upon the one question with which Lord Beaverbrook did not deal—the capacity of the transport routes. British or British-American responsibility can go no further than the delivery of the goods at the Russian ports—it has been extended to the land route across Iran, where British and American railway material will be sent. But from Archangel, Vladivostok and Bandar Shah, the responsibility lies with the Russians. This, of course, is the governing bottleneck and it is obvious that it imposes limits on the assistance that can be given. Lord Beaverbrook has at least established that no other limits will be imposed by either the willingness of the British Government or the productivity of British industry.

* * *

The American Tide

Since the beginning of the war, American policy towards it has moved by fits and starts, impelled by the pressure of external events and retarded by considerations of domestic politics. For the first time, the two forces can now be said to be exerting their influence in the same direction and, as a result, the progress has been somewhat faster in recent weeks. The new phase really dates back to the brief adjournments of the Senate and House of Representatives in the late summer, when Congressmen, to their surprise, found that their constituents were considerably in advance of them. The resulting change in atmosphere in the Capitol made possible an amendment of the Neutrality Act; but in deciding exactly how much was to be excised from that document, counsels of timidity again prevailed, and when the amending resolution came before the House it referred only to the arming of American merchant ships. It soon became apparent, however, that the tide was still flowing, and political pressure was put on the President from the other side: Mr Willkie, by heading an imposing list of Republican signatories to a demand for outright repeal of the whole Act, threatened to take the leadership out of Mr Roosevelt's hands. The result has been to make possible a bolder attitude by the President (or to force him out of his timidity, according to the view taken of his rôle). More of the Neutrality Act is to go (specifically, the prohibition on American vessels entering combat zones) and the President's Navy Day speech was in stronger language than ever before. America, he said, had been attacked, and the shooting had already begun; the motto was Farragut's "Damn the torpedoes; full speed ahead." But all this remains within the context of defence. Though Lord Halifax is interrupted in New York by shouts of "Open up a Western Front," America's own policy does not yet recognise that offence has any part to play in defence. Mr Cordell Hull told a Senate Committee the other day that the Administration had "no intention of rushing out somewhere and getting into real war," and this is a more authoritative guide to policy than Colonel Knox's more challenging utterances. Indeed, at one time in the last few days, it has seemed as if bold language to Germany was to be

combined with appeasement of Japan. This was when it was announced that all American supplies for Russia would henceforth move from Boston to Archangel. It was later announced that this was a mistake and that there is no intention of abandoning the Vladivostok route. The real test of whether it is Japan or America that is bluffing will come when supplies for Russia are sent to that port in American ships. And the real test of American policy will come if—or when—it is discovered that neither Japan nor America is bluffing.

* * *

Mr Lewis and Mr Roosevelt

The grand debate on foreign policy has been further complicated by the action of Mr John L. Lewis in calling a strike in the coal mines owned by the big steel companies and in rejecting a thrice-repeated appeal from the President to send the men back to work. As is usual in American labour disputes, the issues are involved and the motives are mixed. The professed occasion of the strike is a demand that the steel companies should accept the "closed shop" which was conceded by the other coal owners earlier in the year—a demand that does not seem to be inherently unreasonable. But Mr Lewis is clearly also playing to the political gallery. In recent years he has changed from an ally to a bitter enemy of the President. He was rash enough to promise, during last year's presidential campaign, that he would resign the presidency of the CIO if Mr Roosevelt were re-elected, and ever since he was held to his promise he has been trying to come back. There are certainly few things that can embarrass the President more than strikes in defence industries. For support of his foreign policy he leans heavily on those who think him unduly partial to organised labour, and he may be faced with quite considerable dissension in the interventionist ranks if he does not show firmness towards strikers—which would offend many of his faithful New Dealers. The game that Mr Lewis is playing is thus hardly conceived in the public interest. But it is a dangerous one for Labour too. At the time of the strike epidemic in May and June there was a great deal of support in Congress for very drastic legislation to prevent any interference with production, going as far as the conscription of strikers for the army. It would not take very much to bring this sort of measure back upon the agenda.

* * *

The Front Holds

The advance on Moscow is still halted. Fierce fighting continues in and round Kalinin, Mojaiksk and Maloyaroslavets, where the new German attacks have been blunted by Russian resistance and by heavy sleet and rain. In the south the advance continues, and the Germans are reported to be within 10 or 15 miles of Rostov-on-Don. They have certainly driven deep into the industrial area of the Donetz basin, and the Russians have admitted the evacuation of Kharkov, which the Germans claimed several days earlier. This discrepancy has frequently occurred during the Russian campaign—for the Germans always claim the capture of a town from the hour the first advanced units reached the suburbs. Yet in spite of the threat to the south, it is probably exaggerated to talk of an immediate drive on Astrakhan—though it is undoubtedly an ultimate objective—or of a winter campaign in the Caucasus. Moscow remains the key to the whole line. If the Germans can take neither Leningrad nor Moscow, it is almost certain that they cannot advance to the Don-Volga line in the south. The flank of the southern armies would be too openly exposed, and the organisation of transport to feed this front would be very difficult without control of the Moscow transport system. The old division of the Russian front into three sectors under Marshal Voroshilov, Marshal Timoshenko and Marshal Budyonny has been abandoned, and while Voroshilov and Budyonny have left for the rear to organise new armies, General Zhukov takes over the northern front, with the defence of Moscow, and Marshal Timoshenko has the task of reorganising the armies round Rostov. Nevertheless, the old division gave a better picture of the pivotal nature of Leningrad, Moscow and Rostov.

Massacre in France

The reaction of free opinion to the murder of hostages in France has been unanimous. President Roosevelt has condemned the outrages; the Prime Minister has added just retribution to the war aims of the Allies; the Pope intervened through the Papal Nuncio in France; and the lead of Chile in condemning the executions and interceding for the prisoners has been welcomed by all the other Latin American States. Of all the Governments that have spoken only two have made no reference to the outrage committed by the Nazis. One is naturally Germany and the other is Vichy France. Both Pétain and Darlan pleaded for a postponement of the executions; but they appealed to the French to collaborate with the Nazis in discovering the "criminals" who had shot Germans on the soil of France and condemned as outrages, not the murder of innocent men in collective punishment, but the shooting of the German officers. This is the anniversary of Monthoire. The policy which began by way of Franco-German economic collaboration may end with Franco-German collaboration to hunt down and deliver up the patriots of France to German "justice," for, in return for delaying the executions, the Germans have offered the French a "last chance to co-operate in the inquiry into these crimes," and pressure is being brought to bear on the municipal authorities not only of Nantes and Bordeaux but of all French towns to denounce suspects and deliver up wanted men. It need not be supposed that the world's condemnation has moved Hitler to grant this respite. The executions continue in Poland and Holland whether the world protests or not. The respite is a bargaining counter. What other concessions are being extorted under pain of massacre? It is a method capable of almost infinite extension until all Europe is either "collaborating" or standing up against a wall.

Controlling the Retailer

The Committee set up by the Board of Trade in June "to examine the present problems of the retail trade in goods other than food, having regard both to the immediate needs of the war and the position after the war," has presented an interim report. Its chief recommendation is a system of licensing designed to control the opening of new shops and the extension of the activities of existing shops, and pending a decision retailers have been advised to regard the recommendation as accepted. It is another sign of the tenderness with which the Government has treated the retail trade that this step is only being taken now after two years of war, although its ultimate necessity was surely apparent from the fact that a defence regulation, couched in almost exactly the same terms as the Committee's recommendation, was made in the last war early in 1918. It is extraordinary that the Government, which in other respects has taken far wider powers for mobilising the nation's resources and manpower than it did in the last war, should have apparently overlooked the need for this particular regulation. Even now attention is being concentrated far more on the difficulties of the small shopkeeper, which some members of Parliament evidently think is the main concern of the Committee, than on the need for releasing labour from the distributive trades—which ought to be its main concern. It is true that with the limitation of supplies and rationing the position of the small shopkeeper is becoming increasingly difficult vis-à-vis the big shop and the chain store, but this issue would not have arisen if the Government had not shied at the problem of compensation. The much bigger issue is the need for concentration in the retail trade as a whole—which has absorbed much of the labour supposedly released by the concentration of industry—for it is there that the biggest single reserve of available manpower is to be found.

* * *

Manning the Tank

Stalin, according to Lord Beaverbrook, told the Moscow Mission that the war was being decided by tanks. He also told them that at the start of the campaign against Russia the Germans had 30,000 tanks. "Let us aim," Lord Beaverbrook has said, "at 30,000 tanks, let us say we will mobilise so many for the day when our defensive operations are abandoned in favour of the attack"; and now comes President Roosevelt's announcement that the American tank programme is to be doubled and will exceed the hitherto envisaged programme of 2,000 tanks a month.

But all these thousands of tanks will be useless for the purpose of winning the war unless they are manned by the right crews. In Stalin's view, the war may be settled when complete co-ordination of tanks and aircraft has been achieved, and there is a strong case for recruiting tank crews on the same principles as RAF pilots. For cruiser tanks particularly, crews should have the same sort of temperament as fighter pilots; that is, they should be young and, above all, volunteers. It would possibly be as useless to put a cautious reluctant man, however young, into a tank and launch him as a thunderbolt against the enemy as it would be to put conscripts into aeroplanes. Unfortunately, the present call-ups are from age-groups which are unlikely to produce men of the right type. There is, however, the possibility of circularising other branches of the army for volunteers for tank crews—in the same way, in fact, as the Commandos and parachute troops are recruited. Moreover, young men on reaching military age could be given service in a tank crew as a specific option, as they already are for service in an air crew. In addition to the fighting crews, the RAC needs a much larger number of "ground staff," who must be skilfully trained if not fully skilled. The question of releasing skilled men from industry for the Forces is still being considered by Sir William Beveridge's Committee; but suitable men may also be available from the older age-groups now being called up, especially as the substitution of individual for block reservation should release many men with the right qualifications. The recruiting of suitable men would be further facilitated by the adoption of the Select Committee's suggestion of preliminary training depôts, where recruits could be tested for special aptitudes before being posted. It would also be an advantage if these depôts were under the Ministry of Labour rather than the War Office, so that they would be free from army routine and red tape generally. Great Britain, which invented the tank, has not yet in this war taken part in large-scale tank warfare, because it has not had the tanks. The present aim should be to ensure that when the 30,000 tanks are there, the right men are there too.

* * *

Educational Reform in Closed Forum

The nature of the Board of Education's memorandum on post-war education, which this summer was sent to a chosen few for discussion, has been revealed by Mr Butler, who last week circulated in Hansard a summary of the major subjects covered. No indication has been given of the views expressed by the officers of the Board responsible for the memorandum, or by the bodies and individuals who were privileged to read it, but most of the subjects have been discussed *ad nauseam* and hardly merit the secrecy and mystery with which they have been surrounded. For instance, the first subject is the raising of the school-leaving age—it is odd how the Board of Education persists in regarding this as the starting-point for all educational reform—and afterwards come the questions of redefining elementary education, and placing children in the different types of secondary schools, a subject which was surely fully discussed in the Spens Report at the end of 1938. Most of the other subjects are concerned with technical problems; with physical welfare,

the remuneration of teachers, grants for a university course, and so on. In fact—to refer to the three educational controversies discussed in *The Economist* a fortnight ago (page 465)—the Board's memorandum covers part of the institutional problem—who should go to what schools—but barely touches on the curricular problem, and leaves the vital social problem completely alone—the public schools are not mentioned. Since Mr. Ramsbotham had decided that the memorandum was to be secret, it is perhaps as well that this last problem was not discussed, as it is a matter that concerns the whole nation. But it is one on which all post-war reconstruction must depend, and it cannot be shelved by mere tinkering with the present system. It is to be hoped that Mr. Butler will do better than that.

Treasury Control

In reply to a question in the House of Commons, on October 21st, the Chancellor of the Exchequer once more defended the Treasury against the charge of obstructing the Supply Departments by unreasonably withholding financial approval. Sir Kingsley Wood stated that "a primary function of the Treasury in the midst of a vast conflict is to ensure that money requisite for the successful prosecution of the war is available without delay as it is required," and he explained the revisions of procedure and organisation which were carried out at or before the outbreak of the war to secure that there should be no delay. In general, so far as can be discovered, the Chancellor was right in saying that "those arrangements are working satisfactorily." Stories are constantly heard of rigidity and parsimony, but the general experience of those who have gone into Government departments from outside is one of surprise at the prompt and reasonable way in which the Treasury deals with applications—though also of amazement at the detailed matters which still have to be referred to it. The Chancellor was also right, within limits, in saying that the Treasury also has the function of "seeking to secure the elimination of avoidable extravagance and waste in wartime expenditure." The limits within which this is true are the limits within which the Chancellor was right in saying that "the expenditure of money implies the expenditure of labour, material and productive capacity." Even within those limits the Treasury is not always the best body to decide on the proper distribution of scarce resources. But in general, of course, it is correct that where money is the embodiment of some physical reality it must be doled out with the most parsimonious care. The real charge against the Treasury is its unwillingness to provide money in cases where no real resources are involved, but only the maintenance of the whole structure of financial contracts. The long delay in arranging a satisfactory scheme of insurance for war damage is an obvious case in point. The continuing attitude to the provision of compensation for persons or institutions whose displacement from their normal means of livelihood is necessary for full mobilisation is another. If *The Economist* can be forgiven for repeating an epigram of its own invention, the proper sphere of finance in wartime is to ensure that nothing is decided on financial grounds. Judged by that test, the Treasury cannot be wholly acquitted. It does little to obstruct; it might do much more to assist.

Canadian Economic Policy

The domestic financial policy pursued by the Canadian Government ever since the war has been both logical and successful, and the latest batch of economic decisions, details of which have now reached London, show that Mr Mackenzie King's Cabinet is not frightened of sweeping and drastic measures in this field at least. A general stop on all basic wage-rates has been decreed, and it is to be an offence for any employer to raise his basic rates without the permission of the National Wartime Labour Board. At the same time, the cost-of-living bonus, which has hitherto applied to war industries, has been extended to all industry and made mandatory. This cost-of-living bonus, it is important to note, is an absolute, not a proportional, amount; that is to say, it is the same in amount for all adult workers. The worker is thus assured of receiving any additional cost of the necessities of life, but the better-paid workers get no assurance of being able to maintain their consumption of luxuries. This, of course, is a very great improvement on the British position; but any device that ties wages to the cost of living can be a

creator, rather than a destroyer, of inflation, unless effective steps are taken to keep the cost of living down. This has not been forgotten in Canada. All important prices are now to be made subject to fixation and control by the Wartime Prices and Control Board. Legal price-fixing may be of little avail unless some control is asserted over the volume of supplies coming on to the market, and Ottawa may find that it is drawn a long way further down the road of economic control than it now envisages. But it is very greatly to the credit of the Government and its advisers that a logical and courageous policy has been adopted before Canada plunges into the full intensity of an economy of scarcity.

General Hertzog's Declaration

When, nearly a year ago, General Hertzog was expelled from the Nationalist Opposition, it appeared that he and his followers were steering away from the extremists and towards General Smuts. For whereas the Nationalists under Dr Malan stood for the right of the Afrikaans-speaking people to dominate all other sections of the population, the Afrikaner party—as the Hertzogites came to be called—was really opposed to the Government only on the war issue. Early this year, one of its members quoted a saying of General Smuts in reply to Dr Malan—"unity on the basis of race is impossible—it is alone possible on the basis of principle"—as being the basis of the policy of the Afrikaner party; and at the party congress this summer Mr Havenga, the deputy leader, denounced any form of government recognising the dominance of one section of the population over the rest. Nevertheless, the Afrikaner party has made little or no progress in the country, probably because there is no place in South African public opinion for a lukewarm Opposition party; those in opposition to General Smuts on the war issue are also violently anti-British and believe that a German victory will bring them freedom and prosperity. Thus, Dr Malan, in trying to win support in the country for his party, had to go so far this summer as to declare that victorious Germany would want a friendly disposed Government in South Africa—which could be provided by the Nationalist party. General Hertzog has now out-Malaned Malan. National Socialism, he said last week, is the right system for South Africa; "it comes to us also as an Afrikaans national tradition and custom as old as the Afrikaner people themselves"; it will free South Africans, as it has freed Europeans, from the poverty and misery brought by capitalism; Hitler will not treat with a democratic Government—and so on. He is obviously trying to win from Dr Malan the support of the Afrikaner extremists who blame Britain for the poverty into which they have allowed themselves to slip, but in doing so he has killed his Afrikaner party. Mr Havenga has bravely renounced his leader, with whom he has been associated since Union, and has reaffirmed the party's belief in democracy, but it will no longer count as a force in Union politics. General Hertzog, unless he joins forces again with Dr Malan, who already has too many rivals for the leadership of his party to welcome another, will for the time being walk alone.

Dominion Status for Burma

The three-week visit of the Hon U Saw, Prime Minister of Burma, to this country is coming to an end and while guarding on the whole a very judicious silence, the Burmese Prime Minister announced to the Press the purpose of his visit, which is to obtain an unequivocal guarantee that Dominion status will be conferred upon Burma after the war. The Atlantic Charter with its promise "to respect the right of all peoples to choose the form of government under which they will live" raised high hopes in Burma, which were rather dashed by Mr Churchill's subsequent explanation that Clause 3 did not in any way modify statements made by the British Government on their "considered policy of establishing Burmese self-government." The Burmese demand for full self-government is not hard to understand, given the background of Burmese politics since the new Constitution came into force in 1937. The Senate and the House of Representatives have functioned well, Ministries have been formed and maintained without intervention of the Governor; there are few communal differences such as divide India; and the Burmans are doing their share in imperial defence. Nevertheless full self-government, which would mean full control of foreign policy and of defence, would seem to entail

rather more political wisdom than has been shown hitherto. Burma has succeeded in creating an unfavourable impression in both India and China over its recent handling of the immigration problem, and the insistence on levying transit tax on lease-lend material passing up the Burma Road to China is a sign neither of good-neighbourliness nor of any real appreciation of the Japanese threat. It has also created a very unfavourable impression in the United States. If Burma is to achieve full self-government, the country must learn a sense of responsibility towards all its neighbours, and it cannot expect an entirely sympathetic hearing if its further contribution to the defence both of China and the Empire is made conditional upon any more specific guarantee than that which has been given already.

The Reuters Sale

Mr Bracken's promise in the House of Commons last week that the sale of half the capital of Reuters to the Newspaper Proprietors' Association would be accompanied by the establishment of some form of trust has been fulfilled. The Press Association, which until this deal were the sole holders of Reuters' shares, and the NPA have appointed an equal number of trustees whose function will be, in brief, to ensure the integrity, the independence and the efficiency of Reuters. An independent chairman of the trustees will be appointed by the Lord Chief Justice, and provision has been made that the trust shall be irrevocable for at least 21 years, after which it shall not be amended or dissolved without the consent of the Lord Chief Justice. The independence of Reuters, which members of Parliament considered last week to be in jeopardy—although it was then already controlled by the PA—should thus be adequately ensured, even were it not for the fact that the competition between the newspapers, both in London and the provinces, and the very different views which they express, would have themselves sufficed to prevent any doctoring or suppression of the news by the controlling interests. But besides being independent Reuters must, by the terms of the trust, be made efficient. It is its efficiency which in recent years has been called in question and which it was the object of the deal to promote.

ILO Conference

This week's ILO conference in New York has shown that the institution is keeping itself up to date. While the war has forced the ILO into temporary exile, it is encouraging to see that the time is being well spent in vital research. The conference, which is unable to follow its usual practice of exercising pressure on the industrial policy of its member nations, has devoted itself mainly to the discussion of two reports, the first, drafted by the acting director, Mr E. J. Phelan, on the part to be played by the ILO in reconstruction, and the second, prepared by the office, on methods of collaboration between state, employers and labour. The conference was fully representative of the democratic front, including delegates from all Governments of countries under enemy occupation now transferred to London, all the Dominions, and the Republic of China. Attention has been focused on the large economic problems to which the war has given rise and whose solution must form an essential part of the post-war settlement. Foremost among these is the stimulus given to industrialisation in countries that have hitherto been mainly agricultural—the South American States, the Dominions, India, and China. Hardly less important is the shift in the channels of trade to which the blockade of virtually the whole of Europe has given rise, fostering the formation of regional supply units in the Americas and the Eastern Supply Group. There is little doubt that victory will be complicated by the determination of interested parties to return to the economic set-up of the pre-war world, already rendered an anachronism by the progress of events. If the ILO can keep before the Allied world the factual change which is taking place and can thrash out the problems of return to a peace economy in the new conditions, it will perform a vital service in the period of its retreat. Moreover, the necessity of providing a practicable alternative to the economic integration which Germany is imposing on Europe through the elaboration of her slave economy is daily more plain. It is the business of the ILO to translate the "freedom from want" of the Atlantic Charter into real terms and to drive home the issues among the Allied Governments.

Employing the Disabled

Once again it has taken a war to produce Government action on a social reform that had long been considered necessary. The Inter-departmental Committee on Rehabilitation published its final report, with certain definite recommendations, in 1939; but it was not until last week that a Government scheme for the training and resettlement in industry of disabled persons was announced. It will cover all persons over 16 years of age who are unfitted by disablement—whether caused by war, industrial or other accidents, not excluding road accidents, or disease—from resuming their normal occupation, and those who are handicapped by disablement from obtaining satisfactory employment. Ministry of Labour officials will get in touch with the disabled person while he is still in hospital, and will find out the type of employment which the patient would like and would be able to undertake; to some extent the expected employment may influence the process of rehabilitation. When training is necessary, allowances, including dependants' allowances, will be paid. The Government has realised, therefore, that behind rehabilitation looms the problem of re-employment—a case heard before the Court of Appeal on June 27th this year (*White v. Wm. Pickersgill and Sons*) revealed that at present even a fully-cured worker, with a medical certificate of complete fitness in his hand, may become unemployable if his old employer cannot reinstate him in his old job. During the war it will be necessary to concentrate on fitting a disabled person for essential occupations, especially munition work, and, of course, his re-employment now is much easier than in peacetime, when an employer has the choice between a fully-fit person and one who is partially incapacitated. Nevertheless, the Ministry of Labour is finding out the best way of applying the new scheme to occupations which are likely to continue after the war. By then, however, this admittedly interim scheme will have to give way to a really comprehensive scheme of rehabilitation, which will only be possible by relating it to a reformed system of national health insurance and workmen's compensation.

Shorter Note

An interesting constitutional point was raised by Mr Speaker last week. In the event of a division taking place in a secret session, he has come to the conclusion that he would consult with representative opinion from all sections of the House, and if it were desired to publish the record of the division, a motion—which would be debatable—could be moved proposing that the record be included in Mr Speaker's report of the proceedings. Mr Mander raised the question whether, in the event of a division in secret session causing the fall of the Government, the names of members and the way they voted would be published. Mr Speaker agreed that the public would have to know the cause of the fall of a Government.

More than a century's accumulated business experience and conservative progress form the background of the comprehensive service which the Westminster Bank is able to place at its customers' disposal.

The Bank's vast resources, its constant touch with current affairs and its extensive system of branch offices in England and Wales and agents elsewhere, combine to enable it to offer a wide range of facilities, details of which will gladly be given on request by the manager of any branch.

THE WORLD OVERSEAS

Support for the President

(From Our Washington Correspondent)

October 14th

NOW is the open season for conventions—staid conventions, rowdy conventions—but this year they are different. There is a general sense of policy-making in the air. The American Legion meeting at Milwaukee in September made the change graphic. The Legion meetings of the period between wars exhibited about as much horse-play as could be collectively thought up by a group in its irresponsible forties that had left home and inhibitions behind. This year's session, by contrast, provided the most striking demonstration to date of popular support not only of the President's policy towards the war, but of more active participation than he has so far sponsored.

When Congress wrote the prohibition against service outside the hemisphere into the selective service act, the slogan, No AEF This Time, was widely echoed. During the past year, successive events have made the country conscious of its surrounding oceans and positive in its convictions about their defence, including the occupation of off-shore bases. Hemispheric lines have become elastic, and various bulges have tended to hold their shape as they occurred. But doubts nevertheless remained on whether the flexibility of the hemisphere concept could be stretched to include activities on the opposite shores. Then yesterday's AEF said it could.

Present at the Milwaukee convention were assorted Legionnaires who were closely in touch with groups whose mind on the war was already made up. The Legion is necessarily a rather amorphous body; and men privately representing the Administration and men privately representing the America First Committee arrived entertaining rival hopes of riding herd on the Legion—or stampeding it toward the type of resolution they preferred. But the America Firsters found their job impracticable and the Administration men found theirs unnecessary. Observers largely agreed about the spontaneity of the Legion's endorsement of:

The ability to carry war when unavoidable to our enemy and thus to prevent him from bringing war to us. This ability will require removal of our geographic limitations on movement of forces and adequate provision for corresponding plans and material. Our great potential bulwarks are the Atlantic and Pacific oceans. These oceans will be our greatest assets or worst liabilities according to our strength or weakness therein. They represent the base of our world strategy. We want America strong enough to meet any possible attack before it arrives and to turn the enemy back so that our homes remain intact and our families secure. If fighting is necessary to defend the United States, we insist upon being prepared to do the fighting outside the United States.

The shift of attitude in the past year has been made equally clear in the debate of the American Federation of Labour convention, now in session in Seattle. President William Green moved from the "short of war" statements of previous years to the following:

Understanding more clearly the issues at stake and the tragic consequences that must follow in the event the forces of democracy are beaten, we of the American Federation of Labour are going to advise the President of the United States that we will give all we have in support of his programme; that we will stand by him and behind him and all around; and we will tell him further that, if it is necessary to take a more decisive action in order to maintain freedom of the seas and to protect democracy throughout the world, we will stand by him and follow to the bitter end.

This statement was perhaps somewhat in the nature of the bunting draped around the rostrum. But a fact of definite importance accompanied it; it was not opposed by

"Big Bill" Hutcheson, vice-president of the AFL and head of the important carpenters' union. Mr Hutcheson is a Republican of long-standing, and as recently as September 15th he was one of 58 signers of a statement condemning Mr Roosevelt's "shoot-at-sight" speech as "a grave threat to the constitutional powers of Congress and to the democratic principles of majority rule." The statement said: "The President has decreed that shooting shall begin. His edict is supported neither by Congressional sanction nor by popular will. The American people have repeatedly declared themselves overwhelmingly opposed to participation in Europe's war. They are more interested in strengthening our own defences and in preserving and extending democracy at home."

The dying away of open isolationism in the AFL projects attention to the CIO Convention, only a few weeks off. The about-face of the left wing, after the German attack on Russia, has left John L. Lewis largely isolated in his isolationism. Philip Murray, the present CIO president, has expressed support of the Roosevelt policies, and a procession of CIO unions—most recently, the International Woodworkers of America—have publicly transferred themselves to his camp by resolutions calling for the repeal of the Neutrality Law and full aid to Britain and Russia. But it does not necessarily follow that the CIO's attitude is decided.

Mr Murray's health has been taxed by a heart ailment that developed during the summer; the assumption that he will be able to continue as CIO head is not yet a certainty. He more than any other CIO leader can weld the Hillman and Lewis factions in the organisation—in his absence, could they be kept together, and, if not, would Lewis dominate all except the Hillman group of unions?

Union Difficulties

Both the CIO and the AFL are plagued by internal difficulties. Factionalism in the CIO, which is due in part to Communist followers of the party line and in part to the intransigence of Mr Lewis' hate-Roosevelt attitude, has imperilled participation in national policy. The AFL is still gingerly avoiding the matter of racketeering in its midst, to which full publicity is daily given by the Scripps-Howard columnist, Westbrook Pegler, by the current trial of an official—appropriately named Bioff—for extorting a cool half million from Hollywood producers, and by a spectacular arrest disclosing forged AFL dues stamps. When the ILGWU, one of the group of garment workers' unions close to the Hillman position, and formerly with the CIO, rejoined the AFL last year, a condition of reunion was a clean-up campaign. The ILGWU president, David Dubinsky, remained away from this year's meeting because no such clean-up had occurred. With only very mild action in prospect before the convention closes, it looks as though racketeering would remain unfinished business in the AFL.

Inertia in the AFL and intransigence in the CIO seem likely to do the general cause of labour immeasurable harm in the coming months. Rival unionism, with strikes called by one group because part of the work on a given job was being done by members of the other organisation, has caused a number of stoppages—more seem likely to result from competitive organising campaigns in the near future.

The situation has been brought into relief by the bid of the Currier Lumber Company of Detroit to erect 300 prefabricated houses as part of the Government's defence housing programme. Its bid was \$400,000 lower than that of the next bidder. But the company has an agreement with the CIO Construction Workers' Organising Committee run by John L. Lewis' brother—to say nothing of the fact that prefabrication cuts across the jurisdiction lines of the craft unions in the building department of the AFL. Under normal Government procedure, contracts go to the low

bidder. Yet a stabilisation agreement made several months ago with the AFL Building Trades Department by Sidney Hillman on behalf of the Office of Production Management gave the craft unions a practical monopoly of Government work. So the country has the choice of losing \$400,000 or seeing inter-union raids in the building trades.

The original issue between the two organisations, craft versus industrial unionism, has ceased to exist; profiting by rising employment, both sides are signing up members in whatever form they can be taken in. Rank and file workers would welcome the reorganisation of labour's divided house. The issue to-day is one of top jobs and personalities. No plan for resolving that issue is in sight. Yet without such bridging of them, to allow the defence programme to move forward, is likely to take more and more time. And the sentiment of the public, as well as of labour's own conventions, is that we have no time to lose.

Coal Mining in German Europe

[BY A CORRESPONDENT]

October 10th

Most German mining companies have been working profitably since the outbreak of war; but this was only due, even according to Nazi sources, to the higher share of the inland market, which is still the most profitable one, in Germany's coal trade, and also to the fact that Germany can now dictate higher prices than hitherto to its European customers. The output per man-hour, which had increased by as much as 80 per cent between 1924 and 1938, has been on the decline since then. This seems to be equally true of the mines in Western Germany and in Silesia (the latter also comprising most of the former Polish and Czech pits). The apparent exception is the mining of lignite, but only in so far as this is worked in open-cast.

The slackening down of productivity has not yet resulted in a decreasing total output, since it has been possible, so far, to increase the number and the average length of shifts in the pits. Even last year the earnings of a great number of workers increased by 5 per cent or more, merely through a lengthening of their working hours or by the introduction of Sunday work. New workers, Germans and foreigners, were frequently sent into the mines, but many of them seem to have been inexperienced; at least one company report complains that even after they had been in the pit for some time their efficiency lagged "not inconsiderably" behind that of other workers. According to the same report, many miners left the firm in order to work with other companies, though, in principle, it is a punishable offence in Germany to engage a worker who has been employed somewhere else. A similar fluctuation of workers, though on a larger scale, is the migration of skilled miners from Upper Silesia to the Ruhr district, where hewers' wages are between 12 and 20 per cent higher. The Silesian industrialists are bitterly disappointed about this trend, which has already resulted in a local shortage of 100,000 skilled miners.

It is difficult to see how further reserves of workers could now be mobilised, especially since the number of elderly men among the miners is very high, and it is calculated that in the Ruhr district alone during the next ten to fifteen years as many as 30,000 workers, or almost 10 per cent of the total, will have to be replaced every year by younger men. The prospects of this development are serious indeed, and the authorities have shown much concern with mining conditions for some considerable time. Reich Coal Commissioner Walther, a high Nazi party official, boasted last autumn that no supply difficulties would occur during the coming winter, but this prediction soon proved to be exaggerated. It has now been admitted in the Nazi Press that his work was "not entirely satisfactory," and last spring his office was replaced by a new "Coal General Staff," officially called the "Reich Coal Association," which is different from its predecessor in some significant respects.

The president of the new association is Herr Pleiger, who, as the managing director of the Hermann Goering Works, is Germany's biggest industrialist and at the same time a special trustee of the Government. Its other members are leading industrialists or coal merchants, and

the association is supposed to supervise the production, distribution and consumption of coal throughout the Reich. It was initiated by an "offer" of the big business men, who up to then had only to obey the orders of Herr Walther. To a certain extent, therefore, its formation can be regarded as a victory of "the capitalists" and of the principle of private enterprise in the Nazi State. The Press has advertised its formation as the beginning of a new era of responsibility and initiative in industry. However, the extent of this victory is somewhat limited, as the work of the association is to be controlled by the "Coal Office" of the Reich Ministry of Economics; it has also to "co-operate" with those numerous state institutions which have been formed in the course of the last nine years and whose instructions frequently contradict one another. The big industrialists will, however, be given fairly unrestricted powers in at least one respect; it has been hinted in the Press that there is no room any more in the German coal trade for persons who "never see the actual coal"; the coal syndicates will probably be given additional powers for the control of the market with a view to exterminating small agents and middlemen.

Search for Efficiency

Still more significant than the formation of this new organisation is the sudden revival of the struggle for technical efficiency in mining. It must be remembered that all the more significant technical reforms under the Nazi regime have arisen from the drive for economic self-sufficiency and armament improvements; they were made without regard to the problems of economy, and many of the new synthetic products and other inventions actually meant that more labour was used for the same process than before the invention was put into practice. Now, under the influence of falling productivity in the mines, special stress is laid on the search for new labour-saving devices. The most promising project in this respect is the so-called "Iron Miner," a new engine combining and simplifying several processes in the working and loading of coal. Experimentally, the output per shift has been increased by this means by almost 50 per cent; but admittedly such results are only possible under extremely favourable conditions, and it is not even expected that the new machines will be workable in every pit.

In the meantime further development will largely depend on the efficiency and goodwill of the miners and on the extent to which young workers are attracted to mining. There appear to be certain plans for an increase in the wage level; at least, it has lately been pointed out in the Nazi Press that the miners should become the best-paid heavy workers in Germany. So far, however, the authorities have taken to the less costly expedient of flattering and patronising the mining population; a significant speech was recently made by Hermann Goering, in which he called the miner "the first soldier of labour in the Third Reich." The wage rates have not yet been raised, and the higher earnings due to longer working hours are largely offset by a higher cost of living. Some minor improvements have apparently been made with regard to the medical services in the mines, and miners, like most heavy workers, receive higher food rations, and are provided with vitamin tablets.

It is interesting to note that the numerous Polish miners are given "special," that is lower, wages. It has even been suggested replacing them gradually by German workers, although, for the next few years, it will certainly not be possible to get rid of them except at the cost of shutting down a large number of coal pits. Similarly the wages of the French workers in the Lorraine coal pits, now incorporated into the Reich, are lower than in the neighbouring Ruhr

Unnecessary Deferment

The scheme as it stands, according to the latest particulars, is that all stocks are eventually to be converted into 4 per cent debentures, 1952-76, except—in so far as sterling issues are concerned—the 3 per cent permanent stock whose position is unaffected. Those with rates below 4 per cent will be converted at their present maturity date—presumably the earliest. All others are to be converted forthwith to a 4 per cent basis, but with the payment in cash of half the present value of the difference, to their existing maturity dates, between the present rate and 4 per cent. For the two principal London issues affected, this means a payment of 2.20 per cent on the 4½ per cent stock, 1951-53, and 4.14 per cent on the 4½ per cent, 1969. It is difficult to see why, if deferment of repayment is necessary, and the principle of cash compensation is recognised, holders should receive only half of what is due to them. It is even more difficult to understand why the redemption of the stock should be so substantially postponed. Both Montreal and the Dominion are extremely prosperous. The whole of any dollars provided by the former to meet payments here will go direct to the latter. So far as can be gathered, the only pressure upon the municipality is the need to fund some \$35 millions of debt due to the banks. The need for so drastic a scheme is far from being established, but, if it is to be effectively resisted, British bondholders should organise without delay. They have the example of those of the City of Vancouver before them, who six years ago succeeded in killing an equally sweeping plan, subsequently proved by events to be unjustified. It is much better that the issue should be fought out than that it should remain as another cause of friction between two peoples who should be united on all fronts.

New Savings Drive

The latest national savings figures for the week ending October 21st include only two days' receipts from the first warship week, a fact which may explain the relatively unimpressive rise from £11,210,000 to £11,724,000. Since the latter total is the highest realised since the week ending June 17, 1941, it is clear that a new boost for the savings campaign is overdue. The latest figures bring the total for eleven months to £554,405,964, against £415,360,205 raised in the first year of the National Savings Campaign to November 22, 1940. That the improvement is not nearly good enough becomes obvious on reference to the floating debt figures, indicating approximately the extent of the revenue-expenditure gap, which it is the business of the savings campaign, including both large and small savings, to close. On October 25th last the floating debt totalled £3,438,200,000, an increase of £1,176 millions on the year. On October 21st last the total of small savings for the previous twelve months of 3 per cent savings bonds, of the three issues of 2½ per cent National War Bonds, and of interest-free loans, amounted to £1,675 millions gross. The revenue deficit of the period was some £2,865 millions, and the savings campaign failed to fill the gap to the extent of some £1,200 millions. While it appears that the rate of saving, like the total of the floating debt, has increased by about one-third during the past year, there appears to be no reason to expect that a relative improvement will take place. There is already evidence that a considerable proportion of subscriptions to the first warships weeks have been drawn from funds on deposit with the banks rather than from a further cut in expenditure, and so have done nothing to swell the volume of true savings. The real aim of the savings campaign is, after all, to bring generally larger money incomes into line with the smaller supply of consumption goods. Exceptional responses made to the special demands of warships weeks too often take the form of a transfer of savings from one medium to another rather than of fresh personal retrenchment. Looked at from the standpoint of an alternative to new taxation or forced saving, the savings campaign demands much output of time and energy in proportion to its yield.

Company Notes

Thos. W. Ward Results

The profits of Thos. W. Ward show satisfactory progress in the year to June 30th last, the gross figure, after tax and general expenses, rising moderately from £193,171 to £194,845. The transfer to staff funds is maintained at £5,000, but depreciation absorbs only £51,625 against £55,036. Consequently, equity earnings are raised from £88,433 to £95,893, representing 16.2 against 13.3 per cent. Since the ordinary dividend is repeated at 11½ per cent, to which it was raised from 10 per cent in the previous year, £25,000 is available for reserve against nil in 1939-40 and £15,000 in 1938-39, and the carry forward is raised from £120,123 to £126,048.

	Years to June 30,		
	1939	1940	1941
Trading profit*	193,225	185,293	186,098
Total income	196,542	193,171	194,845
Depreciation	45,577	55,036	51,625
Staff funds, etc.	2,000	5,000	5,000
Preference divs.	43,125	40,625	38,594
Employees' divs.	4,204	4,077	3,733
Ordinary shares:—			
Earned	101,637	88,433	95,893
Paid	79,750	74,250	64,969
Earned %	12.6	13.3	16.2
Paid %	10	11½	11½
To Reserve	15,000	—	25,000
Carry forward	105,940	120,123	126,048

* After works expenses and taxation.

The improvement in equity earnings is, of course, the reflection of substantially higher pre-tax profits, due no doubt to a considerable expansion in some at least of its very varied activities last year. Thus, debtors have risen from £868,725 to £1,162,222 and creditors, including taxation, from £786,289 to £1,158,616. Stocks have declined in terms of value from £582,198 to £540,323, and it is probable that the fall in volume has been much more marked. There is, in consequence, a jump in the total of cash and Government securities from £84,435 to £196,599. The reserve fund, after addition of the current transfer, stands at £175,000. The accounts are reticent about current prospects, but there is every reason to expect that the level of net earnings will be approximately maintained. In any case, there is a comfortable margin of equity earnings before reduction of the ordinary dividend would become necessary. The £1 ordinary shares at 26s. 10½d., ex dividend, yield £8 7s. 5d. per cent.

Handley Page Profits

The preliminary statement of Handley Page for the year to December 31st last shows a fall in net profits, after taxation, depreciation and fees, from £219,479 to £159,388. It is highly probable that the whole of the drop of over £60,000 in net earnings may be due to the extra burden of income and EPT last year and that total profits are in excess of the 1939 level of £951,569, a record for the past decade. On the other hand, it is well known that aircraft companies have generally accepted lower contract rates, and it is possible that the gross figure is reduced, although there is little doubt that turnover increased still further last year. On the basis of the preliminary figures, it seems reasonable to estimate the rate of equity earnings at 64.8 against 85.6 per cent. The final dividend is reduced from 20 to 15 per cent, tax free, making with the 10 per cent interim, less tax, which is repeated for the current year, a total rate, less tax, of 40 against 44.8 per cent. Surplus earnings appear to stand at some £46,000, and it is, therefore, probable that there is some transfer to reserve or contingencies—the former received £80,000 in 1939—and that the carry forward is raised above last year's level of £21,711. The 5s. ordinary stock, at 20s. 6d., yields £10 2s. 6d., less tax.

Murex—Further Progress

The Murex accounts for the year ended June 30, 1941, show a rise in total profits, for the eleventh year in succession, from £534,987 to £587,405. Trading profits are

actually £62,651 higher at £553,091. As in the previous year, obsolescence reserve remains at £150,000, and the closing of the London office has almost wiped out expenses under this head. Transfer to tax reserve is, however, some £68,000 higher at £370,000, and equity earnings are reduced from £220,555 to £209,722, representing 41.9 against 37.6 per cent. The total 20 per cent payment on ordinary shares, maintained throughout the four previous years, is repeated, and after increased appropriations, the carry forward is raised from £103,423 to £107,145.

	Year ended June 30,		
	1939	1940	1941
Total profits after depreciation	344,519	534,987	587,405
Obsolescence reserve	50,000	Nil	Nil
Taxation	108,500	302,353	370,000
Other expenses	7,190	8,579	4,183
Preference dividends	3,500	3,500	3,500
Ordinary shares:—			
Earned	175,329	220,555	209,722
Paid	135,625	118,750	100,000
Earned %	25.9	37.6	41.9
Paid %	20	20	20
General reserve	40,000	*87,242	*106,000
Carry forward	90,167	†103,423	†107,145

‡ Including 2½ per cent. cash bonus.

* Including £50,172 reserve for investments in enemy occupied territory in 1940, and £31,000 reserve against loan to a subsidiary in 1941.

† After deducting £1,307 loss on sale of investments.

The balance-sheet, like the profits statement, conveys an impression of steady and well-proportioned expansion. The consolidated account reveals a rise in fixed assets from £1,240,289 to £1,448,745, while stocks and work in progress are £150,695 higher at £598,767. Creditors are up from £771,790 to £1,235,283, £210,181 of the increase being provided by a rise in taxation reserve. Debtors have increased from £525,686 to £674,863. The company's balance-sheet shows the investment of £50,000 in 2½ per cent National War Bonds, 1946-48, while cash holdings are almost stable at £383,300. The statement of the chairman, Mr George P. Joseph, indicates that profits, satisfactory as they are, have been struck on a conservative basis which affects the value put on stocks and work in progress, and ensures the provision for all tax liability on profits to June 30th last, regardless of the date of payment. He also points out that the company has, of course, incurred special expenditure for war damage and ARP. Through its production of the rarer metals and alloys, its electric welding business and the association with ICI, the company holds a dominant position, and there seems no reason to suppose that the limit of expansion has been reached. The £1 ordinary shares, at 90s. ex dividend, yield £4 8s. 11d. per cent.

BA Western Earnings

It was inevitable that the BA Western accounts to June 30th last should show less satisfactory results than in the previous year, and, in the circumstances, the setback appears to be moderate. Gross revenue actually rose from £3,555,572 to £3,647,090. But as in the case of BAGS, operating costs, in particular fuel charges, rose sharply and since income from rentals was lower, total profits are reduced from £819,486 to £795,735. With exchange differences slightly lower at £232,797 against £248,141, earnings for debenture issue are only some £3,000 down at £472,968. As in the two previous years, net earnings failed to cover debenture and note service and the carry forward is reduced from £13,554 to £5,549.

	Year ended June 30,		
	1939	1940	1941
Operating receipts	3,422,383	3,555,572	3,647,090
Working expenses	2,999,028	2,962,590	3,064,237
Rentals received, etc.	228,376	226,504	212,882
Total profits	651,731	819,486	795,735
Exchange differences	216,513	248,141	232,797
Miscellaneous expenses	89,929	95,603	89,970
Earned for debentures	345,289	475,742	472,968
Deb. and note interest	461,420	483,506	480,973
General reserve	Dr. 125,000	—	—
Carry forward	21,318	13,554	5,549

As with all the Argentine railways, the essential difficulty is the closing of European markets and the lack of transport facilities. Consequently, there was little prospect that debenture and note service could be covered by current earnings in the immediate future and the moratorium for the two years to July 1, 1943, covering 4 and 5 per cent debenture stock and 5 per cent Three Year Secured Notes appears to be justified. The latter issue totalling £395,910 replaced the 4 per cent Three-Year Bearer Notes which fell due on January 1st last. The company was fortunate in that the severe fall in the value of maize and other grain traffic was accompanied by an increase of 31 per cent in that of wheat. Despite this improvement and a rise in the value of cement and wool traffic, earnings from goods fell from £1,495,082 to £1,466,089. The most favourable aspect of the current traffic position is the increased transport of livestock to Great Britain and the U.S.A. which began to revive early this year. The most significant factor last year was, however, the rise in costs which increased the working percentage from 83.32 to 84.02. No details are furnished of the year's expenditure on renewals other than that it was provided from revenue, the Renewals Fund remaining at a balance sheet total of £2,857,093.

Rhodesian Copper Results

The halving of the interim dividend on Roan Antelope Copper in April, followed almost a month ago by a similar reduction in the final distribution, did not depress for long shares of the Rhodesian copper mining concerns. Investors in this group have now to face a further blow in the total passing of the dividend on Mufulira Copper, as compared with a cut from 13½ to 11½ per cent for the year to June 30, 1940. Both concerns explain the action taken by the high level of taxation, and, although EPT is not specifically mentioned, it is undoubtedly mainly this tax which the managements have in mind. It is possible to see how the combination of a higher rate of income-tax with the necessity of finding EPT at the full rate for the whole year may have increased the total tax provision by more than 50 per cent and so reduced the Roan Antelope dividend

to half the figure of 1939-40. It is not easy, however, to understand how a parallel development can have completely obliterated the profit of Mufulira, which for that

	Mid-Dec., 1940	Mid-March, 1941	Subsequent lowest price	Present price	Fall on week
Rhokana 20s.	142/6	150/-	130/-	135/-	5/-
Roan Antelope 5s. .	14/-	14/-	10/9	13/-	...
Rhod. Anglo A. 10s.	13/6	13/3	11/-	13/-	-6
Rhod. Sel. Trust 5s.	10/6	9/3	8/-	8/6	-9

year amounted to 18½ per cent on the capital, and the immediate action of the market was to mark down prices of the whole group. Mufulira shares are held as to one-third by Rhodesian Selection Trust, of which they are

almost the sole asset, and as to two-thirds by Rhokana Corporation, which has its own mine, of which the results may be available within the next few days. Rhodesian Anglo-American holds over half the Rhokana shares, and is also interested in "Chartered"—itself largely concerned in copper companies—and in the still developing Nchanga Consolidated. It will be seen from the table given above that, while Rhokana rose in the early spring to well above the level of end 1940, the prices of the other shares have been very steady, for mining ventures. The fall after March reflects disappointment at the inadequacy of EPT concessions. The net fall over the period covered is less than 5 per cent. It seems that higher costs may have played a part in reducing dividends, but the course of prices suggests a belief that distributions will not long continue at the current levels.

THE STOCK EXCHANGES

London

Note: all dealings are for cash only

In the absence of any decisive developments on the Eastern front or in the Far East, markets closed quietly before the week-end. Quiet conditions continued in the early part of the current week, investors awaiting developments, but, despite a rather dull tendency in some sections, the undertone was firm, sentiment being assisted by President Roosevelt's speech on Monday.

The small volume of business in the gilt-edged market before the week-end left prices unchanged, but, with slight selling at the re-opening, 2½ and 4 per cent Consols lost ½ and ¼ respectively, 4 per cent Funding Loan declined ½, while Local Loans and 3 per cent Conversion both eased ½. The following day, turnover was again small, and despite some initial weakness, prices remained unchanged. An improvement in midweek was halted by talk of India vesting. There were few changes in the foreign bond market before the week-end, but the Russo-Japanese frontier incident led to a sharp fall in Japanese issues on Monday. The 6 per cent issue of 1924 fell 2½, while 5 per cent bonds, 1907, and 5½ per cent bonds, 1930, both lost 2 points. The next day's recovery included a rise of 1½ points in the 5½ per cent, 1930, loan, while most other issues improved from ¼ to 1. South American bonds were quiet, the 5 per cent Brazil loan of 1903 rising a point on Tuesday, when Chilean issues enjoyed some small advances. Among European issues, Dawes loan improved ½ before the week-end, and a further ¼ on Tuesday, when the Czech 8 per cent loan lost ¼ point.

The uncertainty arising from the War Damage Act continued to influence junior issues in the home rail market, and both before and after the week-end small losses were general. Thus during Friday's business GW ordinary lost ½, LMS ordinary and Southern preferred both declined ½, while Southern deferred eased ½. London Transport "C" stock also lost ½, but senior issues were firm. The current week opened with further declines, GW ordinary falling ½, Southern deferred ½, and LMS ordinary ½, but London Transport "C" improved ½ and Southern ½. The following day the market became steadier and junior stocks were unchanged, although senior issues advanced slightly. Later, junior issues were in some demand, GW ordinary rising ½ among smaller gains. Among foreign rails, Canadian Pacific ordinary was prominent before the week-end with a gain of ½, but at the re-opening lost ½. Among South American stocks, BAGS was weak on publication of the report.

Both before and after the week-end, the volume of business in the industrial market was slight, but the undertone throughout remained firm. Brewery issues were slightly irregular before the week-end, but fresh support in the early part of the current week resulted in gains for Guinness, Bass, Courage and Watney deferred. Seager Evans, however, were persistently weak. Changes in the aircraft and motor section were slight and trendless, while on Tuesday among heavy industrial issues, small losses predominated. Babcock & Wilcox, John Brown, Harland & Wolff, and Stewarts and Lloyds, among others, were all lower, but United Steel Cos. improved against the trend. Courtaulds gained 6d. on Friday, but otherwise changes in the textile group were few and slight. The shipping group was quiet until midweek, Royal Mail Lines gaining 6d. on Tuesday. Later, Cunard attracted buyers. Among tobacco issues, BAT and Imps gained ½ on Monday, the latter having improved the same amount the previous Friday. Elsewhere, Cable & Wireless ordinary gained ½ before the week-end. In the miscellaneous group, Murex advanced ½, on the same day, and on Tuesday gained ½ on the year's improved results. The general tone improved in midweek but, Cunard apart, price changes were small.

War news and the general uncertainty exercised a depressing influence on the mining and commodity markets before and after the week-end. In the kaffir market on Monday, Blyvoors reversed the previous Friday's advance of 6d., and West Wits declined ½, although Geduld gained the same amount. Interest continued at a low ebb the next day, Crown Mines losing ½ and Grootevlei gaining ½. The rubber market was dull throughout, and price changes were generally downward. The oil market finished cheerfully before the week-end, Burmah gaining ½, but, as elsewhere, both prices and turnover fell away in the early part of the current week. Anglo-Iranian lost ½ and Burmah ½ at the re-opening, when Mexican Eagle ordinary declined 4d. The following day Burmah, Shell and Anglo-Iranian all lost ½ and the downward movement continued in midweek. Subdued trading in mid-week produced no definite trend.

New York

THE situation on the Russian front led to quiet and subdued conditions before the week-end on Wall Street, slight selling causing many small declines. Trading in the early part of the week was slow, the Russo-Japanese frontier incident creating increased uncertainty, while the impending coal strike was a depressing factor. Markets fluctuated narrowly and small declines were fairly general. Later, conditions remained dull pending decisive developments.

The Iron Age estimates steel mill activity at 94.5 per cent of capacity against 96 per cent in the previous week.

Industry and Trade

Limitation of Supplies Changes

The Board of Trade has now given details of the changes in quotas under the Limitation of Supplies (Miscellaneous) Order for the six months ended May 31, 1942. The Order, which came into force in the spring of 1940, restricts, for half-yearly periods, the value of a wide range of articles in common use that may be distributed to retailers, to a percentage of supplies during the corresponding half-yearly periods, June-November, 1939, and November, 1939-May, 1940. In the main the quotas are to remain unchanged, though in the case of certain goods supplies will be further reduced. Those of carpets, linoleum and floor coverings are to be cut from 33½ to 25 per cent of supplies in the standard period. The quota for trunks, bags and related articles will be similarly reduced, but within this group of articles the effective quota for suitcases and attaché cases made wholly or mainly of fibre board, will remain unchanged at 50 per cent. That for glassware is to be 20 per cent, but the effective rate for tumblers, jugs and carafes will be 40 per cent. Fancy goods will retain a quota of 25 per cent, but the effective rate for certain articles in this category, such as cups, saucers and tumblers of synthetic resin, fountain pens and umbrellas, will be 50 per cent. The supply of metal toys will be prohibited from January 1, 1942. On the other hand, the restrictions on supplies have been removed from many household goods made of plain, unadorned earthenware or china, such as cups, saucers, plates, dishes, jugs, bowls, basins and chambers. Despite the further cuts made in the quotas, the list of articles covered by the Order might have been pruned still further by the temporary prohibition of supplies of all goods that are not really essential.

Economising Transport

Following the Ministry of War Transport's decision to extend its control over the road haulage industry—an indispensable step in the integration of the various means of transport—Lord Leathers announced measures designed to economise transport at a luncheon of the British Association of Refrigeration last Monday. Broadly, the new plan aims at the elimination of cross-hauls and at the curtailment of long-distance traffic whenever alternative goods can be secured from nearer sources of supply. In the past cross-hauls have been responsible for a good deal of waste of transport. These are mainly a legacy of pre-war conditions, when transport was ample and when manufacturers of identical commodities in different parts of the country found it advantageous to create a nation-wide market for their goods. In other words, the economies of large-scale production tended to widen the radius of distribution, as in the case of bricks and branded goods, for example. But now carrying capacity, rather than the cost of haulage, has become the deciding factor. For these reasons, it has become necessary to curtail long-distance traffic and to render individual areas more self-supporting. In the case of coal, the biggest single user of transport, the need for concentrating production at the pits situated nearest to the areas of consumption has long been advocated, though much still remains to be done. But there is a good deal of scope for extending the principle of local self-sufficiency to other commodities, including consumption goods, though its application is needs limited by the undesirability of expanding existing production facilities. On peacetime

criteria, these measures are retrograde; but since the demands on transport are likely to increase with the expansion in war production, they must be accepted on grounds of expediency. The success of the scheme, however, must depend largely on the initiative of the Ministry of Food and the Board of Trade, as well as on the Supply Departments of the fighting services; the former has already issued an Order enabling it to control the movement of food and animal feeding-stuffs.

Classified Catering

More details are now published of the proposed classification of catering establishments according to the needs of their clients. All catering establishments, whether public or private, are to be divided into three categories. Category A comprises those serving meals to workers in specified heavy industries of particular national importance, including mining, quarrying, docks, iron and steel and metal extraction. These establishments are to receive one pennyworth of meat per main meal, instead of one pennyworth as at present, more cheese, and three times their present allowance of sugar. Catering establishments in category B, which comprises other industrial canteens and private establishments catering mainly for industrial workers, will receive 1½d. worth of meat and double their present allowance of sugar. In both categories there will be an increased allowance of cooking fats, and establishments serving what the Ministry of Food calls "cut meals" will have more cheese and preserves. All other establishments are classified in category C and will receive the same allowance as before. This is a sound step in the development of the policy of differential rationing.

Diamond Hoarding

The Board of Trade has information that only half the stones supplied to the diamond trade are being exported, though the Diamond Manufacturers' Association is pledged to export at least 75 per cent. Half the stones are being hoarded at home, and it was to prevent this particularly unpatriotic method of conserving individual wealth that the Board of Trade required the export undertaking. The defence of the trade is that it is not being supplied with the size of stones most suitable for export. Stones up to three-quarters of a carat are best for this purpose and the larger stones are sold to the home trade. The Government's retort to this is that if the trade does not keep more strictly to its undertaking, the sales of stones of over one carat in the rough will be prohibited. As the Board of Trade has also reminded the Association that it is running the risk of having its business closed down altogether, it is to be hoped that the trade will make every effort to honour its pledge.

Wine Imports

Since March 20, 1941, no wines and spirits have been imported, but the Ministry of Food is now considering, in response to representations made by the wine trade, whether some relaxation of the embargo could be allowed. Stocks of imported wines and spirits in bond amounted to £10,714,000 at the end of 1939. Stocks are now low—some

on January 31, 1942, all the outstanding 5½ per cent First Mortgage Debentures totalling £33,200.

Shorter Comments

Canadian Pacific Railway (\$000's).—Gross earnings in September \$19,268 (\$15,647), excls. \$3,467 (\$2,986), net earnings \$15,802 (\$12,661).

Royal Mail Steam Packet Co.—A final distribution of 1.845d. in £ by the liquidator, Sir W. McLintock, is to be made on or after October 28th.

CONVERSIONS AND REPAYMENTS

United Glass Bottle Manufacturers, Limited.—A drawing of £19,590 of 4½ per cent First Mortgage Debenture Stock will be made on November 20, 1941, for repayment at par on January 1, 1942.

Manchester Guardian and Evening News.—It has been decided to redeem,

have been lost by enemy action—and it is understood that many wine merchants ration their customers to less than one-fifth of last year's purchases. Empire producers are aggrieved that their trade with this country has been, in effect, cut off, and they feel that special consideration should be given to them. They appear to be somewhat at a disadvantage compared with Spain and Portugal, because of the difference in distance from the market here. It has been said that there is empty space in ships which come from Spain and Portugal, as well as from South Africa and Australia, which would well be filled with wines. But if this space exists it could with advantage be used for importing commodities of a greater wartime utility. The Government has asked wine distributors to conserve supplies of brandy for medicinal use, and the Co-operative Wine Growers' Association of South Africa—a statutory body representing the industry in that country—would like to see import licences granted to solve the problem of medicinal supplies. An alternative solution might be the requisitioning of stocks. The view has been expressed that Empire trade in wines and spirits should be fostered, so that advantage may be taken of potential post-war demand, which may not easily be fulfilled by the former European wine producers. In the past, the proportion of Great Britain's total wine imports derived from the Empire has been relatively small. Total imports of wine amounted to £5,520,081 in 1939; of this the value of South African wines was £385,986, and of Australian wines £605,562. From all Empire countries £1,074,106 worth of wine was imported in that year. It is true that South Africa, at least, had hoped for larger exports to this country. For example, it was estimated that 10,000 hogsheads of South African sherry would reach this country in 1940, 15,000 hogsheads in 1941, and 22,000 hogsheads in 1942. The small amount of business which is normally transacted does not strengthen the arguments of those who wish for special treatment for Empire wine producers, even while they admit that their products cannot be regarded as an essential article of wartime consumption.

Crude Oil Production

The accompanying table, published in the *Oil and Gas Journal* of September 4th, shows the distribution of crude oil production by countries, as well as changes in the rate of output between the autumns of 1939 and 1941. In so far as Axis-controlled oilfields are concerned, the estimates must be largely conjectural. Nevertheless, the figures show that in spite of the acquisition of additional sources of supply since 1939, mainly in the Balkans, the output of crude oil controlled by members of the Axis represents only about 2½ per cent of world production. Germany has, of course, supplemented her meagre supplies of crude oil by an appreciable expansion in the output of substitute fuels, planned

long before the war. Nevertheless, oil remains one of the most vital of scarce raw materials in Germany and Japan. Production in the majority of other countries has increased between 1939 and 1941, in spite of the loss of the European market, a reflection of the increase in consumption, especially in the United States. The only important exceptions are the oilfields in the Middle East, and some of the Latin American countries whose markets have been restricted, mainly by the scarcity of tankers.

No Petrol Rationing for America

Fear of a petrol shortage along the Atlantic seaboard of the United States has, for the time being at any rate, been removed. At a press conference last week-end Mr Harold L. Ickes, Petroleum Co-ordinator for Defence, announced that the restrictions recently imposed on the use of petrol in the Eastern States would be removed forthwith. These restrictions—which included the curtailment of supplies to filling stations in that area and the compulsory closing of these outlets between the hours of 7 p.m. and 7 a.m.—were necessitated by shortage of transport facilities said to have been brought about by the transfer of American tankers to Britain. Their removal is the logical outcome of the British Government's decision to return forty of these vessels—fifteen by November 1st and twenty-five by November 30th. How many tankers were actually transferred to Britain earlier this year has never been disclosed, but the figure is believed in some circles to be as high as eighty. If this is true, it provides grim evidence of German successes on the Atlantic Front, even though, as it now

appears, some of the tankers were transferred in anticipation of losses which have not occurred. According to Mr Ickes, the forty vessels are now being returned as the result of "a major improvement in the British oil situation brought about by the rapid application of the American tanker and petroleum programme and Great Britain's improved condition in the Battle of the Atlantic." The projected giant 1,800-mile pipeline from the Gulf Coast pro-

ducing region to the New York area, whose construction would have required close on 500,000 tons of steel, may now be unnecessary. A period of heavier tanker losses would, of course, once more alter the picture for the worse, and the American Government may consider it expedient not to cancel the pipeline project; but as a record tanker tonnage is now under construction in American yards, the longer-term outlook seems reasonably good.

COMMODITY AND INDUSTRY NEWS

TIN prices have continued at a comparatively low level, with slight fluctuations each day. Wednesday's price for standard cash was £255 10s.-15s. per ton compared with £255 15s.-£260 on the previous Wednesday. Three months tin, at £259 10s.-15s. per ton, compared with £259 5s.-10s. The Rubber Trade Association has announced that it will not publish rubber prices unless they are changed. Prices were fixed on October 15th at 13.75d. per lb. for European plantation-produced smoked sheet and 13.69d. per lb. for rubber from native plantations.

Unrationed Textile Goods.—The manufacture of unrationed textile goods by registered and unregistered traders is prohibited except under licence or against coupons issued by the Board of Trade. In view of pressure on supplies, the general licence permitting the use of cloth within traders' general quotas for the manufacture of any unrationed goods has been modified. Cloth is no longer permitted to be used under this licence for the manufacture of table cloths, table napkins, fancy drapery, embroidery, sports goods or artificial flowers. In view of the need for blankets and towels, however, the Board of Trade is prepared to grant licences to registered persons, allowing them to use extra cloth outside their quota for the manufacture of these goods.

Toilet Preparations.—A second Order dealing with toilet preparations, following the one discussed in *The Economist* of October 11th, comes into force on November 1st and makes several changes. Only supplies of controlled goods in the manufacture of which a registered person has carried out a process will count against his quota. Supplies of controlled goods obtained by one registered person from another will count against the supplier's quota, but supplies made in the standard period by one registered person to another are to be included in the supplier's standard period and will count towards his quota. A wholesaler or retail dealer may only buy controlled goods for re-sale if they were made by a registered manufacturer.

Export Control.—A new Board of Trade export control Order which comes into force on November 6th adds to the list of articles for which export licences are required. These include a number of additional forms of iron and steel (including alloy steel) and articles manufactured wholly or mainly of iron and steel. Spices, neoprene and manufactures thereof now require licences, and the existing prohibitions relating to machine and other tools, golf clubs, paper-insu-

lated wire and cables, card clothing, mining drill bits, borax, boric acid and certain types of railway locomotives and vehicles are extended.

Cotton.—A feature of the market has been the larger demand for cloth for the Government. Substantial contracts have been placed by the Ministry of Supply in heavy materials and fine strong cloths. In some instances, to fulfil these contracts, it has been necessary to divert yarn from ordinary business. Further stock lots have been purchased for immediate export to Russia. There has not been any slackening in the inquiry for export, and miscellaneous sales have been put through, chiefly for South America, Java and the Dominions. There have been rumours, however, that there may be a restriction upon shipments in the near future, to release supplies for Government and essential home purposes. From the beginning of this week all yarn deliveries have been under licence. A keen demand has been reported in American and Egyptian yarns but only a limited turnover has taken place.

Food Control.—Retail prices of imported eggs, except Eire eggs, were reduced by ½d. each to 2½d. on October 27th. Other classes of eggs remain at 2½d. each. The Ministry of Food promises that supplies of cooking eggs will be available at 2d. each. A special distribution of imported canned meats, canned beans and canned fish is being made through the usual trade channels, which may not be sold to consumers until November 16th. Cheese has been removed from the group of "main" dishes served in restaurants, and now ranks as a "subsidiary" dish. The drying of vegetables (including herbs and tomatoes, but not edible fungi) by artificial means is to be subject to licence from November 14th. The manufacture of cornflour, custard and blancmange powders, and similar products are to be controlled. In the first week of December 2 oz. of block suet will be available in addition to the fats ration.

COMPANY MEETINGS

TRINIDAD PETROLEUM DEVELOPMENT
COMPANY, LIMITED

SATISFACTORY PRODUCTION CONTINUED

DIVIDEND MAINTAINED

EPT POSITION

MR KENNETH MOORE'S REVIEW

The annual ordinary general meeting of the Trinidad Petroleum Development Company, Limited, was held, on the 29th ultimo, at the Institute of Chartered Accountants, Moorgate Place, London, E.C.

Mr Kenneth A. E. Moore, F.C.A., chairman of the company, presided.

The secretary (Mr J. Mytton) having read the notice convening the meeting and the report of the auditors,

The chairman said: Gentlemen,—The report and accounts for the financial year ended July 31, 1941, have been in your hands for some days and, with your permission, we will take them as read. (Agreed.)

In addressing you to-day I propose to confine myself largely to financial matters, but I may say in passing that the company's production experience and field development have continued to be eminently satisfactory.

A SUCCESSFUL VENTURE

You will have observed from the accounts that the trading profits have again been on a scale that, but for the incidence of taxation, would have permitted a handsome return on the capital provided by the shareholders for the venture for which the company exists.

That venture, consisting of the search for and production of oil, with all its hazards, has been more successful than many of its kind, and the production achieved goes well beyond any hopes which were held out in the prospectus issued in 1937, when additional capital was raised to bring the earlier work of the company to fruition. It is fortunate that it has been so, not only for you as shareholders, but also from a broader standpoint, since ample oil supplies are vital to the war effort and your company is able to make a substantial contribution towards them.

As the financial reward available to shareholders is severely limited by the incidence of taxation you will no doubt wish me to give you the fullest account possible in regard thereto.

IRREPLACEABLE RESERVES BEING EXHAUSTED

In the first place I should perhaps mention the general consideration that in existing circumstances the company is exhausting irreplaceable reserves of oil at a much higher rate than was the case in the pre-war years, upon which its standard profits for purposes of EPT are based.

Out of current earnings it has to pay to the Government of Trinidad firstly a special war-time "cess," or levy, based on production, absorbing a substantial sum, and, secondly, local income tax on the remaining profits at a rate raised as from January 1, 1941, to 4s. 3d. in the £.

On the profits remaining after deducting Trinidad taxation there falls to be paid to the British Government, firstly, Excess Profits Tax at 100 per cent., calculated by reference to the pre-war standard of profits, supplemented by allowances for increased capital and other reliefs to which I will refer presently. Lastly, when this liability has been ascertained, British income tax at 7s. in the £ is assessed on the residue of profits, subject to what is known as Dominion income tax relief.

RELIEFS UNDER FINANCE ACTS

The computation of the company's pre-war standard of profits and of the allowance for increased capital in itself bristles with questions of legal interpretation, some of which are the subject of a pending appeal. But there is the further complication that the possible reliefs afforded by Section 13 of the Finance (No. 2) Act, 1940, and Section 31 of the Finance Act, 1941, cannot at present be calculated.

The first-named section gives us a right to join with other Trinidad oil companies in a collective application to the Board of Referees for an increase in the percentage allowance for increased capital. The normal allowance is 8 per cent., and the Board of Referees have power to increase it to a maximum of 12 per cent.

RIGHTS OF APPLICATION AND APPEAL

Section 31 gives us the right to make an individual application to the Commissioners, with a right of appeal to the Board of Referees, for an addition to our standard profits calculated on a formula related to our estimated oil reserves, the additional output due to the war, and the normal rate of profit thereon computed in accordance with rules and regulations to be made by the Treasury.

Both these sections are the outcome of representations to the Chancellor by the oil and certain other industries, in which, on your behalf, we have taken an active part. They are designed to mitigate to some extent the severity of EPT in the case of companies whose business involves the exhaustion of oil reserves and reserves of certain minerals and whose additional output due to the war accelerates that exhaustion. We hope that they will afford us a modest measure of relief, but from their very complication it will be many a long day before we know their exact value in our case.

THE ONLY SOUND COURSE

In the meantime the only sound course open to us is to bring our taxation reserve up to a figure which should be adequate on a conservative basis, disregarding the possible additional reliefs to which I have referred. Accordingly we have transferred out of this year's profits a sum of £175,000 to taxation reserve, and have renamed the reserve "Taxation and contingencies reserve account."

After substantial payments on account, the reserve stands at £418,600, which in the opinion of our auditors should more than cover our liability for taxation. Any excess will be a free reserve available for contingencies or any other purpose for which free reserves are available including the initiation of a fund for the redemption of preference share capital.

THE DIVIDEND

After providing for taxation in this way the balance available enables us to recommend a final dividend of 10 per cent., making the total dividend for the year up to 15 per cent.—that is, to the same nominal rate as was paid in respect of the preceding year. On this occasion, however, we are able to pass on to shareholders the benefit of Dominion income tax relief, so that the rate of tax to be deducted from the final dividend is 6s. 1d. only, as compared with the present standard rate of 10s. in the £. The final dividend is therefore equivalent to a dividend of 14 per cent., subject to income tax at 10s. in the £, making the total dividend for the year equivalent to 19 per cent. gross, subject to deduction of income tax at 10s. in the £, and thus represents an effective increase over the actual dividend paid last year.

This point is an important one, and seems to have escaped the notice it deserves. It affects preference shareholders also as it makes the effective rate of preference dividend greater than the nominal rate of 6 per cent.

STRONGER FINANCIAL POSITION

If you will now turn to the balance-sheet you will see that the raising of an additional £200,000 of capital earlier in the year has very much strengthened the financial position, and that cash at bank at the date of the balance-sheet amounted to nearly £450,000. This may appear to you to be a large sum, but it would be folly for us not to keep sufficient cash available to meet the balance of

BRISTOL AEROPLANE COMPANY,
LIMITED

CONTRIBUTION TO THE WAR EFFORT

MR VERDON SMITH'S STATEMENT

The thirty-first ordinary general meeting of the Bristol Aeroplane Company, Limited, was held, on the 30th ultimo, at Bristol, Mr W. G. Verdon Smith, C.B.E. (the chairman), presiding.

The following are extracts from the chairman's statement, which was circulated with the report and accounts:—

The company has continued to contribute the maximum of its capacity to the nation's war effort in all departments both of development and of production, and the aircraft and aero engines associated with the name "Bristol" have been conspicuously in the forefront of the struggle. The opportunity for recounting the epic narratives of their services in operation with the Royal Air Force lies in the future.

Turning to the accounts, capital expenditure as represented by fixed assets shows an increase over the figure for the previous year, additional outlays having been made as circumstances required. The figures shown for current assets, including both stocks and work in progress (less payments on accounts) and debtors, represent a considerable increase, such increase corresponding approximately to the greatly enlarged volume of work performed by the company during the period. Following our practice for several years past, £100,000 has been added to general reserve, bringing the total amount placed to reserve up to £670,000. With regard to current liabilities, the additional provision for taxation accounts for a considerable proportion of the increase under this heading. In addition, further borrowing from the company's bankers has been necessary, the overdraft being £430,000 more than the amount outstanding at the beginning of the year.

The net trading profit does not compare with the amount shown in the previous year's accounts inasmuch as the sum required to meet the liability for Excess Profits Tax has now been deducted before arriving at the net figure. As the amount available for distribution—£306,421—is less than the amount available in the previous year, it may be explained that this reduction arises from two causes. In the first place, although very considerable additional work was undertaken by the company as compared with previous years, this additional work has not been reflected in a comparable increase in trading profits by reason of the reductions in rates of profit on work for the Ministry of Aircraft Production. In the second place, the year's business has to bear the weight of the high rate of income-tax and also is subject to the incidence of the Excess Profits Tax—three months of the year at the original 60 per cent. and the remainder at the full rate of 100 per cent. In this matter your company, as is the case with many others, is called upon to make heavy contributions to the current cost of the war. For these reasons the amount of profit available for distribution bears no relation to the vast scope of the company's business and activities. At the same time, shareholders will no doubt willingly accept this position and indeed be glad to feel that in the time of the nation's need the company has been able to place resources on so great a scale at the service of the Empire.

As for the appropriation account, after covering interest on borrowings and providing for income-tax and also for directors' fees, there remains a balance of £295,694, to which has to be added the balance brought forward, namely, £107,727, leaving an available balance of £403,421. Of this sum £100,000 has been added to the general reserve and £17,250 has been absorbed by the dividend for the year on the 5 per cent. cumulative preference shares, whilst £75,900 has already been distributed as an interim dividend of 4 per cent., less income-tax, on the ordinary shares. Your directors now recommend a final dividend of 6 per cent., less income-tax, on the ordinary shares, leaving a balance to be carried forward of £14,271.

In conclusion, it is fitting to express your directors' appreciation of the whole-hearted way in which, through these times of strain, the company's staff and workpeople in all grades of responsibility have maintained their enthusiasm and initiative and have shown unflagging zeal in the national cause.

The report was unanimously adopted, and resolutions were passed increasing the maximum number of directors and converting the shares of the company into stock.

our liability for taxation when ascertained and for the requirements of the business as and when they arise.

In this connection it seems a pity that the Government is not at present willing to accept 2½ per cent. National War Bonds or some special Government security in payment of taxation. All companies making substantial profits endeavour to accumulate large bank balances to meet their prospective, but for the time being unknown, liability for taxation. But from the standpoint of national finance, it would surely be more healthy if that money, instead of producing astronomic increases in bank deposits (and indirectly in the floating debt), could be invested without prejudice to the taxpayer in War Bonds as it accrues, and so reach the Government at an earlier date and in a more final and wholesome form than it does under the present system via Treasury deposit receipts, Treasury bills, etc.

The suggestion could be extended also, of course, to the case of individuals who likewise endeavour to build up bank balances to meet the prospective demands of the tax collector, and would gladly take time by the forelock if a psychologically suitable system existed.

OCEAN LOADING FACILITIES

To return to our domestic affairs, our principal expenditure on capital account this year has been in respect of the acquisition of complete ocean loading facilities and additional bulk storage accommodation as referred to in the directors' report. We regard the resulting strengthening of our organisation as something far more valuable than the mere capital cost in terms of money. In other respects the balance-sheet calls for no comment on my part, as the figures speak for themselves.

In conclusion, I am sure you will wish to join with your directors in expressing our warmest thanks to all who serve the company in Trinidad, from Commander Lavington, our general manager, to the humblest worker on the field, for the admirable way in which they have carried on the work of the company in a year of difficulty and strain. Theirs is a most valuable contribution to the war effort. To our managing directors and staff in this country our thanks are also due for having coped successfully with administrative and supply problems regardless of the inconveniences of working under air-raid conditions during the greater part of the year.

The chairman concluded by moving the adoption of the report and accounts.

Major Goronwy Owen, D.S.O., D.L., M.P., seconded the resolution, which was carried unanimously.

The proposed final dividend of 10 per cent., making 15 per cent. for the year was approved.

The retiring director, Major Goronwy Owen, D.S.O., D.L., M.P., was re-elected, and the auditors, Messrs Josolyne, Miles, Page and Co., were reappointed.

The proceedings terminated with a hearty vote of thanks to the chairman, directors and staff at home and abroad.

ABERFOYLE PLANTATIONS, LIMITED

The seventh annual general meeting of Aberfoyle Plantations, Limited, was held, on 24th ultimo, in London, Mr P. J. Burgess (the chairman) presiding.

The following is an extract from the chairman's speech circulated with the report and accounts: The profit earned amounted to £8,098, representing 32.4 per cent. on the capital of the company, from which £4,565 has to be reserved for taxation, leaving £3,533, or 14.13 per cent., to carry to the balance-sheet. A dividend at the same rate as for the previous year, namely, 10 per cent., less tax, is recommended for distribution. The balance-sheet shows a strong position financially with £18,882 in cash and Government securities. Attention may be drawn to the low figure for the property account, which represents £11 4s. per planted acre.

Prospects for the current financial year appear to be very similar to those of the past one. The price of rubber is reasonably stable and the allowed production is now in excess of what has hitherto been accepted as full, and this has the same practical effect as free production and is limited only by the capacity of the trees and the labour available for tapping. It is unfortunate that this call on the industry should involve depletion of bark reserves in the fulfilment of it, and it is unreasonable to expect further increase of output in face of the 100 per cent. Excess Profits Tax and with no allowance for the depreciation of the reserve of productive capacity.

The report and accounts were unanimously adopted.

CURRENT STATISTICS

Finance

* Government debt is £11,015,100; capital £14,553,000. Fiduciary issue raised from £680 millions to £730 millions on August 20, 1941.

will be in office until January, 1945, is committed up to the hilt to Mr Hull's views, and that the section of the Republican Party for which Mr Willkie speaks is, if anything, rather firmer in its devotion to the same ideas. A change of mind is taking place in America to-day comparable to that which led up to the repeal of the Corn Laws in England a hundred years ago.

It is, of course, not very difficult to pick holes in the American position, to demonstrate how much of the Hawley-Smoot structure remains, for all Mr Hull's whittling away, to recall how often American practice still diverges from American precept—as, for example, in the case of the countervailing duties that were imposed to offset the British Purchase Tax—to point out that the United States has a system of preferences with her own colonies and dependencies differing only in scope, not in character, from the British imperial preferences. But no demonstration of the kind will avail to alter the simple fact that America, to whom Britain is beholden as one sovereign state has rarely been to another, and on whose constructive co-operation the whole future of the democratic world depends, is trying to move as quickly and as directly as a complex democracy can towards the liberation of international commerce, and that she invites Great Britain to join her. Certainly the main return, and perhaps the only return, that the beneficiaries of Lease-Lend will be asked to make is co-operation in the movement towards freer trade; can Great Britain possibly refuse her wholehearted assistance? Moreover, as the Americans ask, why should there be any unwillingness to co-operate? In the future, as in the past, there is no nation in the world whose interest in the maximum possible expansion and liberation of world commerce is as great as Britain's.

Nevertheless, before the American proposals can be accepted, some modification of current drifts of thought in Great Britain will be necessary. There are many in this country whose general preference for collective solutions to economic problems leads them to distrust "the creation of an economic order in the post-war world which will give free play to individual enterprise" (the words, once again, are Mr Welles's). There are many who see the necessity of a far-reaching control of overseas trade as part of a general policy of economic stabilisation. There are the technicians who delight in the possibilities of manipulation that exchange controls and import controls provide. And there is the great mass of opinion that accepts the inevitability of controlled overseas trade for no better reason than inability to see the avenue of

escape from the apparatus of control now being built up. To all these people, the American policy comes as a very salutary challenge. They need to ask themselves whether the adjustment of their views would be too high a price to pay if (as is, of course, yet unproven) it would purchase the entry of the United States into constructive partnership in the rebuilding of the world.

Unfortunately, the adjustment of opinions is not the only difficulty. Given the completest acceptance of the American views, there are likely to be very great practical obstacles to their application, even after the immediate confusions of the Armistice period have been resolved. For example, it is all too probable that the sterling area's severe shortage of dollars will persist well into the era of peace; and if it does, it may be impossible, even with the best will in the world, to avoid a continuance of exchange control. The system of imperial preference will be difficult to abandon, not merely for political reasons, but because of the increased requirement of dollars that would ensue. In the reconstruction of British exports, which will be a life and death matter for this island, it will be impossible to avoid some bilateral correlation of imports and exports. It is politically as naïve to ask the British people to make no use whatever of the lever of their buying power—the only bargaining weapon they possess—as it would be to ask the American Congress to abolish the protective tariff.

These are very difficult questions, which require the closest analysis and the most careful discussion. They bear in them the seeds of discord between two nations which must at all costs keep together. Given goodwill, they can all be solved—but only on two conditions. The first is that whenever Great Britain is compelled to use one of the devices that have been condemned as "weapons of economic warfare," the necessity for the departure from principle should be clearly established. The second is that the principle itself should be proclaimed in accents that carry conviction. There is no reason to assume that it need be rigidly or unconsciously applied; "to render security to men and women and provide for the progressive improvement of living standards" is another object of American policy. But subject to such qualifications as are necessary for security and stability, it is to Britain's interest to secure as large a volume of international commerce under conditions as free of restriction and by methods as free of discrimination as the joint influence of the British and American governments can achieve.

Political Warfare

IT is now some two months since British propaganda was reorganised by the unification of all propaganda services under the Political Warfare Executive, a triumvirate of the Foreign Secretary, the Minister of Information and the Minister of Economic Warfare. This executive has full responsibility for the formulation and execution of British propaganda and the process of unification has been rounded off by appointing three controllers to oversee the programmes of the BBC. Mr Ivone Kirkpatrick is the controller of programmes to enemy and to enemy-occupied territories, Mr J. B. Clark controls other foreign broadcasts and Mr A. P. Ryan advises the Corporation on its home news and political programmes.

This unity of control is a first step towards an efficient use of propaganda. The real question is whether, as a result of unified control, a coherent policy is beginning to emerge. The first duty of British propaganda is, of course, scrupulous accuracy. People are far more likely to tune in to British stations—often at the risk of severe punishment—if they feel confident that by doing so they are getting the facts. But obviously that is not enough. Propaganda is political warfare. Its purpose is negatively to undermine enemy resistance, to sap the German will to fight, to spread disillusion and defeatism; positively it is to associate more and more of the enslaved peoples actively with the Allied cause, to prepare them

for the turn of the military tide, to rouse them from apathy, to restore in them hope, the great mainspring of action. Europe has miseries enough to provide a negative propaganda with all its ammunition. It is not difficult to persuade the conquered peoples that they have nothing to gain under Hitler's "new order." They know it better than we. And, although the response will be infinitely less, the line of negative propaganda to the German people is fairly obvious—their enforced endurance of increasing hardship, of separation and of death and the fruitlessness of victories against a background of war without end.

But positively? Is there much sign of a new, vigorous and constructive unity behind Britain's propaganda of integration? It is the old problem, whether Britain can come to signify for the toiling, suffering and fighting millions a hope of stability and freedom between the extremes of Hitler's "new order" and the old order of Europe that made Hitler possible. It is the old problem whether Britain in the highest crisis of its history can fulfil the promise of its democratic way of life. It is the old problem, so often discussed in these pages, of transforming Britain's stolid defence into the powerful offensive of an embattled idea. Here the need for unity of home and foreign propaganda is manifest. The steps in imaginative legislation that could fire the enthusiasm of the

people of this country would be at the same time the unshakable, factual basis of British propaganda to the world. It is when the Government's apparent indifference to the social problem is considered against the setting of political warfare that it can be seen to be not merely unfortunate but positively dangerous. A Britain committed to the defence of the pre-1939 *status quo* and indifferent to the needs both of its own people and of its Continental neighbours is a poor weapon for political war, and no amount of reorganisation will make its propaganda a really dynamic force until there is something dynamic in Britain upon which to build.

This view is, of course, challenged. It is challenged by the "100 million allies" school of thought on the grounds that the dynamic need not be discovered for it is already there. Let Britain unfurl the banner of world revolution, rally the workers of Europe, and, joining hands with its Soviet ally, bring Hitler's house of cards tumbling down by an irresistible upheaval of the revolutionary masses. The Conservatives, too, have their challenge. They maintain that a great deal of nonsense is being talked about new worlds and new orders. The old is worth fighting for, and to guarantee to the nations of Europe their national sovereignty is quite sufficient to maintain their courage and rally their support.

The two views are obviously in direct opposition; yet by a curious paradox both sides appeal to Russian propaganda. Its resourcefulness and success cannot be called into question. For the Left, it is a sign of the vital energy of a great nation that has achieved socialism and can speak from the secure basis of economic and social justice achieved at home and offered abroad to all peoples irrespective of race. The Conservatives counter this by pointing out that Russian propaganda has been almost exclusively non-ideological. At home, its appeal is to the Soviet fatherland, to patriotism, to national resistance. Abroad, it paints the misery and hopelessness of war, talks directly to the bereaved families of Germany, promises national liberation in the most general terms and for post-war reconstruction associates itself uncompromisingly with the policies of Britain and the United States.

It is true that Russian propaganda is not ideological; yet the Conservatives are wrong in deducing from this that British propaganda should be equally personal and nationalist. It is true that Russia is a great socialist State; yet the Left is wrong in assuming that successful propaganda must be a more or less diluted Marxism. Both sides make the mistake of applying identical standards to British and to Russian propaganda, whereas

the whole background and recent history of the two countries are radically different.

Russian propaganda in this war is not Communist because Communism, for all the enthusiasm it can arouse, is not a very profitable line in Europe. The Russians have to counteract the idea which brought Hitler to power: that the only alternative to him is Communism. Moscow Radio has even—with a certain cynicism—assured the German people that Britain would never permit the "bolshévisation" of Europe. Russia's non-ideological propaganda is a complete refutation of the thesis of the Left, for those who can with most effect preach Revolution are, in their supreme hour, scrupulously avoiding it. Russia at least has very little doubt who would gain the "100 million allies" if once again the Nazis were given the opportunity of appearing the only alternative to Revolution.

Yet this does not prove the thesis of the Right, that Britain must campaign for the *status quo*. The Russians are making no propaganda for a new order and for a positive rôle in Europe because Russia stands for a very definite kind of new order and because Russia has intervened in Europe to some effect since September, 1939. The Russians are compelled to advocate full sovereignty for the nations of Europe because on several occasions they violated that sovereignty. Russia is speaking from a doubtful background of intervention, Britain is speaking from a very doubtful background of non-intervention. Europe can fear Russia for standing for too much and for being too strong. Its fear of Britain—and of the United States—is that they stand for too little and are not strong enough.

Russian propaganda, with its official unwillingness to press its own alternative, far from exploding the arguments of those who plead for a dynamic British propaganda based on reconstruction at home and a positive policy for Europe, only serves to reinforce it. Nazism is finally detestable. Communism is considered by its own adherents to be unsuitable for export in this hour of greatest need. What is the third choice? There is total anarchy, of course, a greater danger, particularly in Germany, than is perhaps generally realised. But there is also a third way of order and freedom of which the Atlantic Charter is the first rough and inadequate outline. The Allied nations, including the Soviet Union, are generally pledged to this. But, like the vision of Ezekiel, so far it is "a valley of dry bones." The first task of the Political Warfare Executive, and, behind it, of the War Cabinet, is to give flesh and substance to the Charter so that "these bones may live."

Canada's War Effort—I

TO the student of war economics, Canada presents a puzzle. By all the statistical tests, the war effort of the Dominion is very large. Perhaps it could hardly be expected that a country more than three thousand miles away from the aggressor could bring its mobilisation for war to quite the pitch of intensity that a beleaguered island can achieve, and the comparison with Great Britain is, for that reason, hardly a realistic one. But, by any test, Canada has done more than any other overseas member of the democratic alliance. Her output of munitions of war is wide in range and large in volume. Proportionately, she has something like twice as many men under arms as the United States, and her Minister of Finance has stated that the expenditures of the Dominion Government, including the assistance given to the United Kingdom, but excluding all provincial and municipal expenditures, will this year amount to nearly 50 per cent of the national income.

But when the inquirer's eyes are turned from these indications of achievement to the effect they have produced on the normal economy of the country, he is astonished to find so few traces of the distortion that so large an effort should have exerted. Some articles of consumption, which are normally imported from the United States,

have been restricted or prohibited; but in general there is a peacetime abundance of consumers' goods, both durable and current, and retail sales this summer were running from 20 to 30 per cent above the previous year. Taxation has been very steeply increased, so that the revenues of the Dominion Government in the current fiscal year will be three times as great as in the twelve months before the outbreak of the war; but the bulk of this increase has, perhaps unavoidably, fallen on the upper half of incomes and there has been no restriction of the lower incomes comparable in its effect with the expansion due to rapidly rising employment. Yet there are few, if any, shortages—not even in manpower, except in the vicinity of the manufacturing centres. What is the explanation of this paradox? How has Canada achieved the miracle of devoting half her national income to the purposes of government (more than half if provincial and municipal expenditure is included) without restricting consumption? The increase in government expenditure amounts, on the figures, to about 36 per cent of the national income. Where has this come from if not out of the consumption of the people?

The figures of the national income and of Government revenue and expenditure, derived with some estimation,

from the official returns, are as follows:—

	(\$ millions)			
	1938	1939	1940	1941
Net national income produced*	3,847	4,080	4,654	5,475
Dominion, provincial and municipal governments†				
Revenue.....	1,040	1,086	1,432	1,991
Expenditure.....	1,208	1,326	2,374	3,736
Of this, war §.....	34	232	1,237	2,600

* Net national income paid out plus undistributed corporate profits. † Fiscal years nearest to calendar years. § Including funds provided for United Kingdom.

These figures have some remarkable features. It is difficult to believe that, in 1938, governmental expenditure was as much as 31½ per cent of the national income (the United Kingdom proportion in the same year was of the order of 25 per cent)—or that tax revenue was as much as 27 per cent of the national income. Similarly, it is unlikely that total expenditure, even after a price rise which can be roughly estimated at 14 per cent, is now as large as the whole pre-war national income. The conclusion is inescapable that the estimate of national income has been put far too low. The 1939 figures give a *per caput* income in Canada only about 66 per cent of that of the United States, which is contrary to all observation and common-sense. In short, the figures printed in the table above can be reconciled with each other only if a substantial addition is made to the national income estimate in each year. It is possible that the present net national income, on a basis comparable with the British and American estimates, may even be as high as \$7,200 millions. Even at this figure the Canadian *per caput* income would be nearly 20 per cent below that of the United States and no higher than that of the United Kingdom (at the official rate of exchange). If this figure be accepted, then the proportion of the national income that is being domestically spent on war purposes works out at 36 per cent for Canada, compared with about 22 per cent in the United States and perhaps 55 per cent in the United Kingdom. These figures would accord far more closely than the official ones with what could reasonably be expected from general observation.

This comparison, however, does not dispose of the question how so great an increase in the activities of the Government has been achieved with so little encroachment on the level of popular consumption. Where have the resources come from? The answer, for Canada as for other countries, is that if the sinews of war are not drawn from popular consumption they must be taken from three other sources: first, the increase in the national output; second, the consumption of domestic capital; third, an adverse balance of payments. In Canada, all of these elements are very difficult to estimate. The national income figures, when roughly corrected for the rise in prices, seem to indicate a "real" increase of about 22 per cent. The deficit on the balance of payments with the United States in the current year depends on the degree of success that is attained in carrying out the Hyde Park Agreement of last April, but it may be roughly put at \$300 millions, and the same figure can, by an even rougher estimate, be assigned to the drafts on domestic capital (chiefly consisting of unutilised depreciation provisions). The effect of these figures can be broadly stated as follows: the increase in governmental expenditures (i.e., roughly the cost of the war effort) between 1938 and the present fiscal year is, in real terms, about 40 per cent of the 1938 national income. Of this, about 22 per cent has been provided by an increase in the output of the community, about 12 per cent by drafts on capital, external and domestic, and the remaining 6 per cent by reducing the expenditure (consumption and private investment) of the public. In other words, Canada has been able to provide for a very large programme of war expenditure without restricting consumption (the 6 per cent drop would be more than accounted for by the restriction of private construction and by the enforced economies of the wealthy), partly because, in the state in which the war found her, she was able very substantially to increase her total output by re-employing the unemployed margin of

resources, and partly because she has been able to draw on the deep reservoir of the United States.

To say that Canada's war effort does not absorb so large a proportion of the resources of the community as Great Britain's, and to establish that it has not yet gone far enough to necessitate any serious reduction in the popular standard of living, must not be taken as in any way a criticism of its magnitude. For one thing, there is a great deal of increase yet to come and the recent announcement of far-reaching measures for the control both of wages and of commodities indicates that the stage of shortages, both of labour and of goods, is at hand. Furthermore, there are certain physical and psychological hindrances to the intensification of the war effort in a country like Canada. The people of Great Britain are perhaps inclined to take credit for what was in fact forced upon them. The difficulty in economic mobilisation is not to curtail the spending of the rich, which is easily contrived, but to reduce the expenditure of the wage-earners without pushing anybody below the starvation line. In this country, the problem has been largely solved as a by-product of the shortage of imports, which has compelled the restriction of the necessities of life almost before the luxuries. The alternative of guns and butter does not present itself in nearly so clear-cut a fashion in Canada, and economic mobilisation must await the growth of the war industries. Canada's largest industry is agriculture, but so far from there being a need for expansion in the production of wheat, there is rather a need for meeting the difficulties of vanished markets, which have led the Dominion, for the first time, to impose quantitative limitations on the crop. As for manufacturing industry, there has been, and still is, a very rapid increase. But Canada is not a wholly autonomous manufacturer; many of the basic raw materials, such as coal, iron ore and steel, have to be imported from the United States, and there is virtually no Canadian machine tool industry. Even when there was capacity to spare in the United States, increased imports of these necessities raised a difficult question of foreign exchange. Now that shortages are increasingly common across the border, any large expansion of Canada's industry faces additional difficulties.

These difficulties have led many Canadians to question whether the manpower policy that has hitherto been followed is the right one. It has been based, more or less consciously, on the doctrine that the greatest service that Canada can render is to provide munitions rather than soldiers. But the need for soldiers has grown since the defection of France, while the growth of a large American munitions programme possibly limits the expansion of the Canadian industry. There is, of course, much more to the current conscription issue than such a simple comparison of objectives. If the resistance to conscription lies in politics, in Mr Mackenzie King's unwillingness to flout the emphatic views of the Province of Quebec, the advocacy of it also springs from the same source, from the Conservatives' desire to embarrass the Government and from the desire of a certain element in Ontario to confound the French Canadians of Quebec. This is a question on which the outside commentator would do well to forbear from judgment—not merely out of courtesy, but because of the difficulty of ascertaining the governing facts. It is Mr Mackenzie King's task to ascertain whether any compromise solution on the lines of provincial option is possible and, if it is not, to determine whether the imposition of conscription or its avoidance runs the greater risk of provoking national disunity.

All through Canada's war effort there runs the constant thread of its likely effect on her relations with the United States. In its industrial aspects, this has already been alluded to; the interconnection is great, and has been increased by the series of joint measures for furthering integration, of which the latest has been announced from Washington this week. In the political sphere, the possibility of unfortunate consequences flowing from the fact that Canada is at war while the United States is not, always very small, can now be virtually dismissed. But there are financial complications, which will be examined in a second article.

Labour in the Colonies

INDUSTRIAL disputes, sometimes leading to riots and bloodshed, have been common enough in the colonies in recent years to give some argument to the discreditors of British imperialism. This was particularly true of the West Indian disturbances of 1937-38; but when the host of lesser troubles in other parts of the colonial empire are considered as well, anyone could be pardoned for jumping to conclusions about exploitation of cheap colonial labour in the British Empire and the repression of its attempts to secure better conditions.

How far any such picture is from the truth is shown by a memorandum on labour conditions in the colonial empire, which the Colonial Office prepared for the ILO Conference in New York. The very years when labour troubles were most rife—1937-40—were the years of enlightened labour legislation and the development of a much closer supervision by colonial governments of labour conditions. The trade union movement has made considerable progress, and there are now about 160 unions registered under the various colonial laws, while the laws themselves have, where necessary, been amended to bring them into line with United Kingdom legislation. Minimum wage laws have been passed in forty territories, and, to supplement them, in fourteen the Governor has been given power to refer trade disputes to an arbitration tribunal, subject to the consent of both parties to the dispute. Workmen's compensation laws, though admittedly somewhat limited in scope in most cases, have been enacted in twenty-five colonies.

And yet, in spite of all this and other legislation, colonial labour is, generally speaking, at the best discontented and at the worst wretched and apathetic. There is a current dispute in Jamaica and other West Indian islands over the building of naval bases for the United States, not so much over the actual wage-rate, which is considered by the progressive paper *Public Opinion* to be not unreasonable, as over the refusal of the American and British authorities to allow trade union representation in the wage negotiations. This dispute presents a picture of labour clamouring for the recognition of its rights. But the other aspect of colonial labour conditions—the picture of the West Indian living with his ever-increasing family in a single ten foot square room, inadequately fed and prone to all the diseases which spread from malnutrition and slum life—is even more prevalent, and it is not confined to the West Indies.

Simultaneously with the publication of the Colonial Office's memorandum, there appeared the report of its adviser, Major Orde Browne, on labour conditions in West Africa (Cmd. 6277). This is not such a depressing document as his earlier report on the West Indies, for it does not give the impression of the same squalor and wretchedness. But there is the same overcrowding in the employment centres, the same malnutrition, the same prevalence of disease, and the same discontent. Rarely, indeed, do we get a glimpse of a happy working population—although the normal African has an essentially happy temperament—comfortably settled with its wives and children near the place of employment.

In pursuit of this happiness, the usual labour legislation is of very little use—and may even do harm if it is not satisfactorily related to local conditions. According to the Colonial Office memorandum, 95 per cent of the colonial labour disputes of recent years have turned on the question of wages. There is, therefore, a strong case for using the minimum wage machinery, which has so far only been put into effect in nine territories, although, as has already been stated, the necessary legislation exists in forty. But, as Major Orde Browne points out in his report on the West Indies, the wage rate by itself is no indication of poverty or prosperity because employment is so very intermittent, and this is true also of West African labour. In such circumstances, which are com-

mon throughout the colonial empire because much of the employment is agricultural and therefore seasonal, minimum wage-fixing is no cure. Moreover, in the West African towns, according to the Orde Browne report, the cost of living is greatly influenced by high rents. An increase in the wage will, therefore, merely lead to an increased demand on the very inadequate supply of the better type of house, which will push rents up even further. There is, too, the added complication that an African's household frequently consists of far more than his wife, or wives, and children. If he is in permanent employment, he is expected, and willingly agrees, to support a whole range of sisters, cousins and aunts as well; and the more prosperous he is, the more dependants he will maintain. This traditional African hospitality has persisted in the West Indies, and, in conjunction with the rising birth rate there, it adds to the complexities, not only of deciding an adequate wage rate, but also of introducing any sort of a system of family allowances.

The conclusion is inevitable that present policy should not concentrate so much on the introduction or extension of labour legislation as on the all-round improvement of colonial standards of living, which alone will make the legislation effective and give trade unions the chance to flourish. Trade unions should, of course, be officially encouraged wherever they are feasible and show signs of developing. Otherwise, as happened in the early days of unionism in the West Indies, the movement will fall into the hands of irresponsible leaders who will only exasperate any antagonism between employers and employed. There are many other parts of the colonial empire—for instance, Palestine, Hongkong, Malaya and certain mining areas of Africa—where there is a settled industrial population which must have the right to state its wants. But in other territories, official policy has hardly decided whether it wants to industrialise the native or not, and the introduction of trade unionism would consequently be premature. The result of this indecision, however, is that employers are not encouraged to undertake large expenditure on providing suitable permanent accommodation for a fluctuating labour force; and labour itself suffers all the hardship of the long trek from the village to the employment centre, frequently arriving there sick and starving to find no work available. The unsettling effect of an unsettled industrial population was exposed after the strike in the Northern Rhodesian copperbelt last year, even though living conditions for the labour force there compare very favourably with those they have left behind in their native villages. Similarly, in the Gold Coast, Major Orde Browne found in the principal diamond mine conditions which he describes as "distinctly good. . . . The community as a whole gave the impression of being well cared for and contented, the women and children looking healthy and happy." But for every African who is happily settled and employed, there will be another who has died on the way or arrived "in too enfeebled a condition to work."

Permanency of employment cannot, of course, be achieved merely by the adoption of a policy of industrialisation. The economic prosperity of the colonies, as the sugar industry of the West Indies has so tragically shown, is too often dependent on world markets for workers to be given any security of employment under present conditions. It is quite impossible to expect private employers or private enterprise to shoulder indefinitely the burden of an unemployable labour force, which the sugar plantations have had to do, and the Colonial Development and Welfare Fund should be used for the necessary resettlement schemes and the relief of distress. In the operation of the Fund, in fact, lies the best immediate prospect for the improvement of labour conditions. A small but useful start has already been made by Sir Frank Stockdale's schemes for the West Indies, and Lord Moyne has

promised that elsewhere the Fund will operate so far as wartime conditions permit, even to the extent of establishing secondary industries.

Thus, official policy has at last admitted the possibility of a permanent industrial population—even in Africa. But it has recognised, too, the heavier responsibility for improving labour conditions that this reversal of policy will involve. The Colonial Development and Welfare Act provides that a colony shall not be granted funds for the execution of any works unless its law allows reasonable facilities for the establishment of trade unions. It also provides for the payment of a fair wage to the labour engaged on the works in question and forbids the employment thereon of children under 14 years of age. But a much more comprehensive supervision of labour is ensured by the full-time labour officers who have been appointed in thirty-three colonies. The war has inevitably slowed up the process of establishing labour departments to serve these officers; nevertheless, Northern Rhodesia—to take one example—which at the time of last year's riots had no labour officer on the copperbelt, has now created a labour department. These departments and officers should have a dual function. The primary one is the improvement of labour conditions; the secondary one is the guidance of the trade union movement where conditions favour it, and with this secondary function in mind the Colonial Office has appointed experienced trade unionists from Great Britain to serve as labour officers in Trinidad and the Gold Coast, while other similar appoint-

ments will be made in the near future. The chief gap in the machinery for supervising labour conditions is to be found at the centre. The West India Royal Commission recommended the establishment of a labour department within the Colonial Office and the appointment of a labour advisory committee; but no action has yet been taken on these recommendations, although the extraordinary measures necessitated by the war, such as the prohibition of strikes in some colonies, has surely underlined the need for special care on the part of the Colonial Office—the conditions of work on the naval bases in the West Indies are obviously a case for central supervision.

But though official supervision can improve a colonial labourer's working conditions and trade unionism give him an outlet for his grievances, they are no solution to the real problem, which is how to raise the standard of living of the colonial peoples as quickly as possible. Beside this problem, all the measures that have been adopted in recent years to improve conditions in the colonies—and they are an undoubted advance—relapse into mere palliatives. Unfortunately, because it is such a big problem, and because there is no ready solution apparent, there is a danger that official policy will rest upon these palliatives and ignore the main issue. It is certainly very necessary to provide every colony with efficient social services, to house and feed its inhabitants adequately and to give them the right to political, social and economic advancement. But even after all these steps have been taken the central problem will remain.

NOTES OF THE WEEK

A New Offensive

The frost has come on the Moscow front, and from its onset until the beginning of the heavy snows, the Germans have one more opportunity of launching an effective attack on Moscow. The roads are hardening, and once again conditions are favourable for mechanised warfare. There is evidence that the German High Command do not intend to let the opportunity slip. The imminence of an offensive has been loudly proclaimed, and its line of advance—through Volokolamsk, Mozhaisk and Maloyaroslavets—predicted. Indeed, the indications have been too precise, and, although an attack is certainly in progress, its heaviest weight is probably concentrated in the Tula front, while the opening of a new sector at Kursk suggests that the Germans are planning a new encircling movement to embrace Moscow in a wide sweep from the south. If this is the new line of advance, the difficulty of co-ordinating the move with a similar attack in the north must greatly diminish its danger to the Russian defenders. The Leningrad front is occupying all Von Leeb's resources and it is doubtful whether more reinforcements can reach the advance German guard at Kalinin. Here the Russians even claim to have recaptured some ground, and there is for the time no sign of the Germans retaking the initiative. Nevertheless, the position in Moscow is grave. The Germans are bombing the capital heavily, and the first reports of the new attack indicate that its intensity is comparable to any of the earlier offensives. Nor does it exhaust the list of Germany's operations. The Moscow attack has a subsidiary purpose of preventing the despatch of reinforcements to Marshal Timoshenko in the harried south. Here the advance is continuing steadily across the Donetz basin and at some points, in spite of vigorous Cossack counter-attacks, the river has been crossed. Rostov still stands, but the Germans are reported to be within fifteen miles of the city. And should the Crimea and the Kerch peninsula fall, an enveloping movement across the Straits of Kerch and up the east coast of the sea of Azov becomes a menacing possibility.

The Crimea in Danger

The Russians' stand in the Perekop peninsula has at last been broken. A German break-through has carried two columns down into the peninsula, one striking through

Simferopol towards Sevastopol, the other following the railway towards Kerch. The Russian forces in the north of the Crimea may still have sufficient reserves and strength to close the gap behind the advancing Germans, but the threat to the whole peninsula is very grave. Its loss would revolutionise the position in the Black Sea. So far, the Russian Black Sea fleet, though small—it consisted at the outbreak of war of a battleship, five cruisers, some twenty destroyers and about fifty submarines and motor torpedo-boats—was more than a match for the few Bulgarian and Roumanian destroyers and submarines Germany could muster and the light craft which could be built in the Black Sea bases. The Germans have been unable to use the Black Sea for military operations, and their advance along the coast has been hampered—notably at Odessa—by Russia's control of the sea. Sevastopol, however, is the Red Fleet's chief naval base. It has docks, wharves, storage capacity, ammunition dumps, repair yards and all the other necessities of effective warfare. The port is already under fire from German dive bombers, and it is questionable whether it will be usable as a base even if the Russians are able to make of it another Tobruk. Other comparable bases do not exist. Batum is open to winter gales, Tuzupse is not fully equipped. Novorossisk will be threatened if and as soon as the Germans reach the Straits of Kerch. If the Crimea falls, the only alternatives before the Red Fleet would appear to be surrender, scuttling, internment by the Turks or escape, running the gauntlet of German bombing, through the narrow Straits.

Turkey's Dilemma

The fate of the Black Sea fleet concerns Turkey vitally, for Russia's only line of retreat lies through the Straits and the Dardanelles. Under international law, Russia's right to evacuate her fleet is regulated by the Montreux Convention, under which, even in time of war, so long as Turkey is not a belligerent, the vessels of war of a Black Sea Power may pass through the Straits, provided they go singly, after proper notification to the Turkish authorities. The situation is modified if Turkey is a belligerent. Then complete discretion rests with the Turks; and Article 21 of the Convention allows them the same discretion if they feel themselves in imminent danger of war. The opening here for German pressure is obvious. If the Russians seek

an exit, the Turks will be cajoled and threatened into declaring Article 21 to be in operation and into using it to pen up the Russian fleet in the Black Sea. Such a dilemma would clearly be of the most embarrassing kind for the Turks. President İnönü made it perfectly clear in his speech at the opening of the Kamutay that if Turkey were attacked, the country would resist to the last man. But Turkey's problem in recent months has been not to resist a direct threat, but to determine what measure of indirect pressure could be tolerated without loss of final independence. Thus a Pact of Friendship with Germany was combined with a firm reaffirmation of the alliance with Britain, and a trade agreement with Germany was accepted, but a barter of chrome rejected on the grounds that it would infringe Turkey's commitments to this country. The problem of the Straits offers almost insuperable obstacles to compromise. Either the ships go through or they do not. However, the Turks can by now have no illusions about the influence on German military strategy of the compliance or "obstinacy" of neutrals lying across Germany's path. If the Germans plan to attack, they will do so whether or not the Red Fleet has reached Alexandria.

Mr Bevin Treats Them Rough

The long and weary process of mobilising women for war work has reached yet another stage. We have now passed through the stage of appeal, the stage of exhortation, the stage of direction, and have arrived at last at the stage of semi-compulsion. At each stage much potential woman power has been lost. Mr Bevin has tempted them out of their homes, it is true; but in far too many cases the women thus tempted have, very naturally, gone into frequently more remunerative, and always more attractive, unessential occupations. The attempt to squeeze them out of these by the concentration of civil industry and the registration process has largely failed; in the first case, because Mr Bevin has allowed the women thus released to move into shops and hairdressers' establishments, from which it is far more difficult to extract them, and in the second because, to begin with, registration and interview merely confirmed a woman and her employer in their belief that because she was replacing a man she was *ipso facto* doing war work. There has thus been a tremendous turnover in the country's labour supply, with a consequent dislocation and loss of efficiency, but no effective mobilisation as yet. At last, however, there are signs that Mr Bevin is beginning to discard his gentle treatment. He has already decided to call-up shopgirls aged 20-25—though not from food shops and not where the plea of excessive hardship can be maintained—and last week-end he announced the extension of the Undertakings (Restriction on Engagement) Order to all women between 20 and 30 years of age. Hitherto this Order has been used—very ineffectively—to protect the labour supply of agriculture and coal-mining, and, by making all engagements take place through labour exchanges, to prevent employers in the engineering, civil engineering and building industries from poaching scarce labour. In its application to women of 20-30, it will be amended so that no woman in this age-group can obtain any job except through an employment exchange, and a would-be employer will have to prove to the exchange that the work is of national importance. Moreover, women in the same age-group who work in voluntary organisations are to be combed out. Unfortunately, these steps, though they may prevent a further waste of woman power, have been taken too late. What is still wanted is the transfer of large numbers of women from unessential work to real war work and the women's services. For this Mr Bevin will still have to rely on appeal and exhortation, unless—as is rumoured—he intends to proceed to the next and final stage—full conscription.

The Need for Fuel Economy

Five months ago, on May 28th, Mr Grenfell, Secretary to the Mines Department, pointed out in the House of Commons that the output of coal was then insufficient to meet current demands, that stocks only totalled 14 million tons, equivalent to little more than three weeks' output, and that the position would not be safe unless at least 20 million tons were added to reserves by the end of October. Although stocks in industrial centres, and especially at essential works and public utility plants, have been raised above the dangerously low level to which they had

fallen last spring, they are not nearly large enough. Indeed, it is no secret that Mr Grenfell's hopes have not been realised, that production has increased but little and that the amelioration in the supply position has been due, in no small measure, to the improvement in transport facilities. But winter has now set in again, and the coal-mining industry is faced, not only with the inevitable increase in the domestic demand for fuel, but with the problem of providing the coal for a vigorous expansion in industrial activity. Coal will soon be short again, and, unless rigorous economy is practised in industry and in the home, it may be desperately short in a few months, even for essential purposes. It is scarcely surprising, therefore, that the Select Committee on National Expenditure, which has previously drawn attention to the need for fuel economy, urges the importance of saving coal and its derivatives in its twenty-fourth report of the 1940-41 session. The committee reports that "insufficient has been done throughout these months to impress upon the public the need for this economy," and that its own recommendations have "apparently not been in any substantial degree implemented." It recommends that greater efforts should be made by the Mines Department and the gas and electricity industries to secure voluntary saving by non-industrial users, that suggestions for the restriction of broadcasting should be examined, but that, while it might be prudent to have ready a rationing scheme for gas and electricity, the costs of administration and the practical difficulties of enforcing it should be carefully considered by the Mines Department before imposing it. Moreover, the committee invites the reconsideration of the question of the release of miners from the fighting forces or other employment. The administrative difficulties of ensuring a fair distribution of coal and its derivatives are considerable. But since a coal shortage can hardly be avoided this winter, these difficulties must be faced if the nation's health is to be maintained and the output of the goods of war increased.

Points for Tins

An important extension of rationing will take place on November 17th when tinned foods are to be distributed by the point system (pastes, soups, vegetables other than beans, and fruit are to be exempted). The expenditure of 16 points a head monthly on tinned meat, fish and beans will follow exactly the same principles as those governing the expenditure of clothing coupons. That is to say, the consumer is not required to register at any one shop and is allowed freedom of choice within the new group of rationed goods, within the retailer's stocks and within the point pricing schedule laid down by the Ministry of Food. It is understood that a high proportion of the supplies covered by the new order is represented by imports from the United States under the Lease-Lend Agreement. The importance of the new scheme lies, of course, in the prospect that it opens up of controlled distribution of all foods offered for sale. Once basic food rations have been

distributed by the classic method, there is a strong case for bringing all other foods within the scope of a point scheme. The Ministry believes in pressing forward slowly, but once the point system has been applied to the distribution of food, it should be a simple matter to bring other comestibles into the scheme. The advantages include the restoration of competition in the retail trade, a deficiency which in recent months has given rise to a notable deterioration in the quality of service; the removal of a severe handicap on workers whose shopping facilities are inferior to those of the leisured classes; and the elimination of a source of inflationary pressure on the price level resulting from unduly strong competition to buy. All these advantages are not achieved simply by point-rationing canned goods, but many of them could be attained, outside the sphere of the basic foods, by an extension of this method. It is to be hoped that comprehensive extension will be delayed no longer than is necessary to attribute point-prices to the goods in question. There is only one disadvantage—that the scheme involves the possession of a new ration book, a pink 'un, making, with the margarine page still in use in some quarters, four books in all. Let us hope that in the next rationing period they will be bound in an omnibus volume.

Winter Shortage

The winter milk shortage has officially begun. From Sunday last, all retail milk sales (except those by producer-retailers in towns of less than 30,000 inhabitants) must be cut by 5 per cent compared with the week ended October 25th. At the same time comes news of the first distribution of rationed condensed milk, which is due to be delivered by dairymen about the middle of the month. It is difficult to estimate precisely how heavy is the average cut which must be imposed on consumers outside the priority classes (whose consumption is not to be disturbed) in order to produce a general 5 per cent cut. It will probably range between 7 and 10 per cent, but since it will vary in each district with the proportion of priority customers served by the roundsman, its calculation can be no easy task. The solution will probably be to stop one or two days' milk from each non-priority customer, a practice which, as was abundantly demonstrated last spring, penalises the customarily frugal consumer. Unless, for each total cut, a minimum supply per head is worked out for non-priority consumers, the position is bound to recur in which the household normally taking one pint a day for four people suffers disproportionately to the household which normally takes one pint a day for two persons. The scheme as it stands contains a further anomaly, that the evacuation areas containing a low proportion of priority consumers will suffer relatively to the reception areas, so that treatment of the non-priority consumers is likely to differ not only within each area but more seriously between different districts. It is true that surpluses are to be directed to areas of shortage, but how is a surplus likely to present itself if sales are only to be curtailed in response to the seasonal decline in the supply of milk which is stated to be the prime cause? It is highly important to get the distribution of milk on to a satisfactory footing from the beginning. Unless more specific measures are taken to ensure fair distribution outside the priority classes, satisfactory results are out of the question.

America and the Torpedoes

The sinking of the American destroyer *Reuben James* was a more serious incident than any that had gone before, since for the first time there is a long death roll. Yet, paradoxically, at first sight, it has produced less of a reaction. The reason is, of course, that the action considered by the American public and government to be appropriate to Nazi attacks on the American navy has already been put in hand by the President's order to the Navy to shoot and by the introduction into Congress of a resolution to amend the Neutrality Act. The passage of this resolution in its wider form has been assured by the *Reuben James* incident. But the next step awaits evidence of some new aspect of the Axis offensive against America. This, in fact, is one of those pauses between the successive developments of policy which are becoming briefer and briefer. There is a pause, too, on the domestic labour front. Mr Lewis has sent his miners back to work for a fortnight while the issue of a closed shop is referred to the National Defence Mediation Board.

But nothing has been settled. In this field, as in that of American foreign policy, further developments can be awaited very soon.

Hitler's Mercenaries

The strength and staying power of the German attack on Russia, both in time and space, are staggering. It would be even more so if it were a question of German manpower and German resources only. But in a sense it is all Europe that is waging war on Russia. The continent's resources feed the German war machine. The workers of France, Scandinavia and the Low Countries, the migrant labourers of Italy, the peasants of the south-east, are all working for a German victory. Italy, Finland, Hungary and Roumania—together with a few odd remnants scratched together to form "legions" in France and Spain—are participating directly in the fighting. Italy's contribution is difficult to assess. To the Russian front proper probably not more than four divisions have been sent, but wherever the Italian army is engaged—in Greece or Libya or on policing duties—it is releasing German manpower. The other three belligerents have provided some 30 divisions. The Finns, with about fifteen, have borne the brunt of the fighting from Murmansk to Leningrad. The Roumanian divisions, about ten of them, wore down Russian resistance at Odessa. The Hungarians are also fighting in the south, but they have been very hesitant about their help and would very probably have abstained if the Roumanians had not clamoured for the return of Transylvania in recompense for the shedding of Roumanian blood in the German cause. The direct assistance of these three Governments is an integral part of the German war plan, and nothing could be more reasonable than Russia's request that Britain should formally declare war upon them. In the case of Finland there must, of course, be hesitation and regret. A gallant people has been blinded by its hatred of Russia, for which it has had such recent justification. If the Finns had taken advantage of the United States' initiative of August last and made a separate peace, Britain would have felt nothing but relief and satisfaction. This would still be the general reaction if Mr Cordell Hull's warning of this week that unless the Finns withdraw from the fighting they will incur the hostility of the United States, were by some miracle to bring Finland out of the war. The Finns' dilemma is, of course, a painful one. They could make peace if they wanted to, but they might have to use their fifteen divisions against the Germans to secure it. But the dilemma is of their own making, and if they, along with the Hungarians and Roumanians, fight on, then in logic and loyalty Britain must declare war on them.

East European Bloc

The delegations sent by Poland, Czechoslovakia, Yugoslavia and Greece to the ILO Conference have signed a declaration, announcing their countries' intention to act together as the nucleus of a confederation of nations stretching from the Baltic to the Aegean. If this declaration of policy proves to be the first step towards the creation of a strong and united bloc of powers in Eastern Europe, it may be that the date of its signing and the library of Columbia University, where the signing took place, will be marked up as milestones in the long, hard road to European peace. This strip of territory from Baltic to Aegean has long been the debatable land of Europe. In 1914 it was in dispute between Austria-Hungary and Russia. In 1939, control of it was clearly seen to be a German stepping-stone to world domination. Marching to east and west with two of the most powerful states in the world, it must constantly come under pressure—or suspicion of pressure—from one or other of them as long as it is divided and weak. At the same time, it is geographically so remote from the English-speaking centres of world power that to rely entirely on their support is to court disaster. The only alternative is the creation of a strong and independent bloc in which internal frictions have been overcome and which, as a political, economic and military unit, can hold its own and even act as a buttress of European peace. But there should be no illusions about the difficulty of the task. What is to be the rôle of Hungary, Roumania and Bulgaria? The delegates express their determination to invite these states to join the Confederation. This is statesmanlike, but on what terms? It will require great magnanimity and great political courage to distinguish in the hour of victory between quivering governments and

the peoples they betrayed. The form of the Confederation, too, must, if it is not to repeat the fiasco of the Little and Balkan Ententes, prepare for the centrifugal pressures to which such a bloc would be submitted. The declaration talks of the preservation of "sovereignty." If this means sovereignty in the full nationalist sense of the early twentieth century, then the Confederation is already doomed. In the turbulent circumstances of Eastern Europe, "freedom from want" demands a measure of unified economic planning and "freedom from fear" a concentration of military power which only a federation more centralised than any so far recorded in history can provide. This does not condemn the efforts of these states to futility from the start. It is a challenge to them to set their goal sufficiently high.

Agricultural Wages and Prices

The minimum wage of agricultural labourers has been raised from 48s. to 56s. a week—with the prospect of a further rise to 60s. The farmers did not oppose the increase; they are assured of a rise in the fixed prices of their produce to compensate them for the higher wages, which may be of assistance to them in lessening the agricultural worker's desire to move into another industry. It is safe to say that no one in the country begrudges the farm worker a higher standard of comfort. Nevertheless, the near-doubling of agricultural wages in less than two years raises some very awkward problems. Immediately, it increases the pressure for higher wages for those grades of unskilled industrial work that have always competed with agriculture for their labour supplies—and through them, an inflationary impulse may be imparted, from the bottom, to the whole wage structure. This complication, it is true, may be avoided; but the more distant perplexities cannot. The higher the costs of production of British agriculture are allowed to become, the less able will it be to compete on equal terms after the war with supplies of overseas food, and the higher will be the price that either the British taxpayer or the British consumer (or, most probably, both) will have to pay for the survival of any agriculture at all in this island other than the production of milk and vegetables. It is all very well, in the artificial vacuum of wartime, to raise costs of production in this spirit of blithe unconcern for the consequences. But the reckoning will come when virtually unlimited supplies of good imported food are again available at prices far below those to which the British farmer has now raised his ambitions. How much is the rest of the community expected to pay in direct or hidden subsidy to the farmer? £200 millions or £400 millions a year? There is surely a point beyond which the public will not be prepared to mulct itself for the privilege of having its food home-grown. The higher costs are pushed now, the smaller may be the post-war agricultural industry.

Habeas Corpus

Regulation 18B has for the first time come before the House of Lords. The lower courts have already dealt with several cases in which the person detained has applied for a writ of *habeas corpus*. In those cases the court has held that an affidavit by the Secretary of State that he had reasonable cause is a good answer to the application for the writ, although in the case of Captain Budd the application was granted because of a technical irregularity in procedure. In one of the cases that have now been decided by the House of Lords, the appellant was appealing against a refusal to grant him a writ of *habeas corpus*. In the other the appellant, Mr Robert William Liversidge, was appealing against a decision in the Court of Appeal that the Secretary of State need not produce particulars showing why he believed that Mr Liversidge should be detained. In both cases, however, the point at issue was substantially the same. Can the Home Secretary's action in ordering the detention of persons without trial be challenged in a court of law? The answer turned on the phrase "If the Secretary of State has reasonable cause to believe . . ." which Mr Liversidge contended must mean "if there is in fact reasonable cause for believing"—and therefore be subject to proof. By a majority of four to one, their lordships held, however, that the matter is one for the exclusive discretion of the Home Secretary; so long as he acts in good faith he alone can say that on the information in his possession the person in question is covered by the terms of the regulation. Obviously, this is an objectionably wide power to be given to

the Executive—too objectionable in the opinion of Lord Atkin, the dissenting judge—and it can only be justified by the principle that the safety of the commonwealth transcends the liberty of the subject. But if each case of detention were to be reviewed by a court, it could only be held, whether in camera or in public, with an incomplete disclosure of evidence, or it would involve the revelation of military secrets—which would defeat the whole purpose of the regulation. Moreover, the question at issue is one of reason, not of law. The only safeguard that a suspected person can have—apart from the appeal to the advisory committee whose decision the Home Secretary is not bound to follow—is the vigilance of Parliament. In this matter as in others affecting the liberty of the subject, the House of Commons has shown on several occasions that it is not prepared to tolerate a regulation unless it is wisely and justly administered. And there must be no weakening in the determination that, once the safety of the commonwealth is assured, this whole apparatus of arbitrary powers must be swept away.

The Match Shortage

Once again an essential commodity is being allowed to disappear because steps have not been taken soon enough to ensure fair distribution all round. The supply of matches, according to the Parliamentary Secretary to the Board of Trade, is now about half pre-war consumption, and production cannot be materially increased except at the expense of direct war needs. But the only step taken to alleviate this situation is to place upon the market an unrestricted supply of mechanical lighters; the cost of these—5s. wholesale—will be prohibitive to most people suffering from the present exasperating shortage of matches, even if they can be relied upon to work. It appeared to come as a shock to the President of the Board of Trade and his Parliamentary Secretary to learn that the shortage exists; yet, the—by now—well-known practice among retailers of holding back supplies for most-favoured customers, and the scouring of shops by would-be hoarders, are widespread. Evidence of uneven distribution is provided by the Post Office's warning that matches must not be sent by post. Even street sellers are, understandably, reserving their few boxes for those who spared their coppers when matches were plentiful—some are wily enough to keep their trays covered, so that the hopeful purchaser approaching with pennies does not know whether he will get in return matches or a mere trinket. Obviously, the only remedy is some form of rationing, and it is odd that the Board of Trade, which dared to tackle clothes rationing, should shy at matches. There are difficulties: a large part of the retail trade is in the hands of tobacconists, and consumption is very uneven as between one person and another—though this could be got over by allowing the retailer to sell any surplus off the ration, as is to be allowed in the case of milk. The point is that rationing is the only way of checking hoarding and ensuring a minimum quantity per head. It is absurd for the Secretary for Mines to appeal for economy in the use of fuel when the lack of a match is the best possible incentive for keeping the home fires burning.

Vichy's Contraband

While Germany shoots the people of France in batches of fifty, Vichy is not only maintaining its close economic collaboration with the Nazis but is developing it in new spheres. The British Government has long known that of the foodstuffs and raw materials arriving in Marseilles from North Africa anything up to 80 per cent is requisitioned for the Axis, but, in part perhaps to give Vichy the benefit of the doubt, in part because of the strategic difficulty of preventing this contraband traffic, the Navy has apparently received no orders to intervene. Vichy has therefore been encouraged to carry the policy a step further, and is despatching convoyed merchantmen from Madagascar and the east to France. One of these convoys was intercepted by the British Navy off the coast of South Africa. In the normal exercise of belligerent rights the British commander requested the convoy to put into port for examination. Not only was the request refused, but the crews of three of the five merchantmen attempted to scuttle their ships when the British boarded them. The attempt was unsuccessful and the ships will now be submitted to the usual examination, but the whole incident is a very disagreeable example of the manner and mentality of the men of Vichy. They claim the advantages of neutral status, yet they refuse to accept the obligations of neutrality, which include acceptance of the right of search. They claim the privileges of independence, yet, quite apart from the policy of scuttling, the mere fact of their proceeding unmolested in Axis-infested seas is proof of their subservience to Germany's desires. And easily the most repellent aspect of the whole episode is their description of the incident to the French people as a British attempt to prevent Madagascan food supplies from reaching the starving people of France. At this moment, a shipload of £250,000 worth of milk, medicine and vitamins for the children, for whose despatch from the United States the British Government has given its consent, is only awaiting an Axis safe conduct to sail. It is not so much the larger villainies of Vichy that are distasteful. It is the incredible meanness and spite of these little men.

* * *

Putting on the Heat

The Government of General Tojo is clearly determined not to go to war for the sake of other people's "new orders." The Triple Alliance has fallen into the background, and Berlin's attempt to paint the sinking of American ships as an American attack upon Germany, calling into operation Article 3 of the Alliance, has had a blandly indifferent reception in Tokyo. But Japan is almost equally clearly committed to the possibility of general war for the sake of its own "new order." When the Diet assembles in extraordinary session on November 15th, it will be presented with a programme of even greater economic mobilisation and regimentation to prepare the nation for an extension of the war. Indirect taxation has been heavily increased. Increases in direct taxation will be proposed and undoubtedly approved by the Diet, but it is doubtful whether new measures of economy can offset the damage done by the blockade (the position is discussed on page 563). Japan is using the new stringency as an excuse and a threat. The United States need not think, so the Japanese press maintains, that economic sanctions will keep Japan from fulfilling its plan of Co-prosperity. On the contrary, the embargo makes it essential for Japan to hasten the programme and impose the benefits of Co-prosperity on the Dutch East Indies, Indo-China and Malaya without much more delay. It is the old story. Collective defence is encirclement. Economic sanctions make aggression at the expense of others inevitable. Although the despatch of Mr Kuru to assist the negotiations in Washington may be interpreted as a conciliatory gesture, the Tojo Government threatens to set a time limit to the Washington talks. The Americans can afford to be unperturbed. They can eliminate the risk of war in the Pacific only by handing the whole ocean over to Japan, and this they have never accepted as a possible solution. The difference between war now or war next year or war in ten years' time is that, with each conquest and each consolidation of victory, Japan will be by so much more powerful. The recapture of Chengchow by the Chinese is a reminder that in the China "incident" there is still no victory and little consolidation, and it does not take much wisdom to see that it is better to face the Japanese now with an unfinished war on their hands than wait until Co-prosperity is an accomplished fact.

Another Australian Budget

Mr Curtin has made his choice. The Budget which his Government introduced last week shows very little sign that he realises the financial measures that are necessary before Australia's potential war effort can be achieved. It is not exaggerating to call it an electioneering Budget. The estimates of war expenditure are about £A4½ millions higher than Mr Fadden's estimates, at £A221,485,000, of which £A59 millions will be spent overseas, and total expenditure is about £A5½ millions higher at £A324,965,000. These increases are mainly due to higher service pay and allowances and higher invalid and old-age pensions, which might be spared the charge of vote catching on the grounds of hardship. But there can be no excuse for the refusal to increase direct taxation on incomes up to £A1,500, even though there are a few increases in indirect taxation and postal charges, estimated to bring in another £A6,800,000 in a full year. Mr Curtin has, in fact, placed no additional direct tax on 80 per cent of the national income, and by refusing to lower the exemption limit for income tax below £A200, he is allowing over 300,000 wage earners to make no direct contribution at all. Of the £A160 millions extra wanted this year, only £A22 millions will be provided by new taxation, and this will mainly come from heavy taxes, amounting to 16s. 8d. in the pound, on incomes over £A2,500 and from severe company taxes. The remainder, £A138 millions, will be borrowed, an increase in borrowing of £A72 millions over last year. Mr Curtin's only attempt to check inflation is by the control of bank advances and the compulsory deposit of the trading banks' excess funds with the Commonwealth Bank. He has not, however, grasped that, under his financial policy, if there is no inflation, his war estimates will almost certainly be underspent, with a consequent detraction from Australia's war effort, while if there is inflation it will fall most heavily on the very people he has spared in his Budget and whose votes he is trying to attract.

* * *

The Balfour Declaration

On its twenty-fourth anniversary General Smuts declared that the Balfour Declaration was not dead. It "is not a mere accident, a mere eccentricity of the Great War, but in its large historic setting is one of the great acts of history." The course of the war, with the consequent spread of Nazi persecution and the establishment of new ghettos which "in their misery and despair out-rivalled the record of the Middle Ages," has made the case for the Balfour Declaration "overwhelmingly stronger. Instead of the terror of new ghettos in the twentieth century let us carry out the promise and open up a national home." General Smuts is perfectly right in stating that the case of the Jews has become one "for the conscience of mankind." It is also true that with the possibility of a large Arab confederation in the Middle East, the prospect of establishing a national home is brighter than when it was a question of dividing up Palestine between Arabs and Jews. But it has never been contended that Palestine alone was big enough to solve the Jewish problem. And although the Jewish genius turned the country from a land of refuge into a land of promise, it is probably true to say that the majority of Jews who went there still regarded it as a refuge and that those who did not go would rather stay in their own homes if they were allowed to. It is not by a revival of the Balfour Declaration alone that the Jewish problem can be solved, but by securing such a peace that racial persecution is effectively stopped and the Jews allowed to live unmolested with full rights of citizenship in whatever country they have made their home.

*

Shorter Note

Lord Beaverbrook's appeal for 100,000 tons of waste paper for making shells and cartridge cases appears to be having encouraging results. The paper situation is serious, and readers of *The Economist* are urged to give the campaign their utmost support. But it is not enough to turn out waste paper and insist on its being collected. Although people may soothe their consciences when wasting paper by thinking that it will ultimately be salvaged and turned into munitions, their first object should be the strictest economy in the use of paper. This will be the most effective means of saving shipping space.

THE WORLD OVERSEAS

Sanctions on Japan

(From Our Shanghai Correspondent)

September 17th

JAPAN has been badly hit by the United States-British-Netherlands freezing and is desperately struggling somehow to maintain as going concerns her civilian economy. For the first three weeks after the freezing action, the Japanese press denied any adverse effects of any importance. The Tokyo papers pretended that Japan was prepared for the shock, had plenty of supplies, would easily readjust her production and trade by closer co-operation with other yen bloc areas; and that the democracies were affected at least as badly as, if not worse than, she was. But in the middle of August the Tokyo Cabinet Information Board reversed their orders to the press. Ever since, the Japanese papers have been flooded with complaints about the losses suffered from the freezing measures, and the simultaneous publicity of the alleged effectiveness of Japanese counter-measures carries little or no conviction with the Japanese people.

Anti-Japanese freezing does not coincide with complete anti-Japanese trade embargoes. The Japanese continue to trade outside the yen bloc—carrying goods in ships of their own—not only with Latin American countries and French Indo-China and Thailand, but to a certain extent with the British Empire, the United States and the Netherlands Indies as well. From the latter three they still secure, though in heavily reduced volumes, certain war essentials such as mineral oils and various non-ferrous metals, as well as other important commodities such as wheat and wool. Some of these shipments to Japan are undoubtedly outright appeasement. Nevertheless, Japan's trade with the three democracies has been curtailed by at least 75 per cent. Since this section of her foreign trade prior to freezing accounted for 80 per cent of Japanese trade outside the yen bloc, the curtailment of that trade through sanctions amounts to almost two-thirds. It generally affects Japanese exports more severely than imports. The total effect on the three democracies, on the other hand, is but slight. Of Japan's present non-yen bloc trade, about half continues to be transacted with the three democracies, while the latter turn over with Japan little more than 1 per cent of their foreign trade.

The Japanese are trying various measures of relief and circumvention. They attempt to use the leading ports of Thailand, French Indo-China and South America as transit centres for Japanese imports and exports. They export Japanese products camouflaged as Chinese goods, while trying to purchase supplies through screens of neutral firms. At Shanghai, they hastily built up an apparatus of such firms through which they hope to secure some of the new imports financed by the Chinese Currency Stabilisation Fund. They buy with Chinese national currency, which they obtain through the release here, against such currency, of Chinese goods, such as silk, which previously they proposed to export themselves. In French Indo-China, they force the Banque de l'Indo-Chine to grant them ever larger piastre credits. In Thailand, on the other hand, similar attempts recently met with reluctance on the part of the Thais to subsidise Japanese trade, and the Yokohama Specie Bank had to sell £2,250,000 worth of gold bullion to the Thai National Banking Bureau in order to obtain additional local credits.

Huge Business Losses

All these measures, however, amount to little compared with the damage done to Japan by the anti-Japanese freezing. Semi-official Japanese papers estimate at £30 millions the minimum total of compensation which the Tokyo Government would have to pay Japanese private business on account of freezing losses. This sum does not include the request of Yokohama and Kobe silk exporters for state purchases of £5,000,000 worth of raw silk, which it is now impossible to export. The official Foreign Trade Promotion Company, immediately after the freezing, promised to buy

all Japanese goods which were ready for export at the time of the freezing. On the first day of applications for such state purchases, Osaka alone filed over 4,000. The Promotion Company thereupon had to announce that no state purchases of blocked export goods could be effected in the near future and advised business men to try to help themselves.

Although in the weeks preceding the anti-Japanese freezing the Japanese tried to liquidate as much as possible of their assets in the democracies, they held on to their trade with those countries to the last minute, and consequently had almost their whole foreign trade working capital frozen. As a result, a great many Japanese foreign trade firms are suddenly confronted with a complete lack of ready funds, which makes readjustment to the new conditions still more difficult. Japanese state finance, already badly strained, sits tight and offers little help. A large number of Japanese enterprises—especially those of small or medium size, but also large cotton importers, shipping firms and banks—in British Malaya, British India, the Philippines, the Netherlands Indies and the United States see their funds blocked and Tokyo unable to grant emergency help. A great many of such enterprises have had to close down, including tin mines and rubber plantations in Malaya. Particularly strict is the application of freezing to Japanese interests in the United States, where even the biggest Japanese firms and banks find themselves almost paralysed. The Mitsubishi Trading Company has had to close down even its important Los Angeles office.

The diversion of the blocked exports to Japanese domestic consumption meets with great complications. The bulk of the goods in question, especially the textiles, either may not be sold at all in Japan or only within very narrow limits owing to Japanese anti-luxury legislation. The release of these goods to domestic consumers threatens to upset the entire anti-luxury legislation. Moreover, such a release would call for substantial additional expenditure on the part of civilian consumers in Japan, and thereby would run counter to the intricate system of thrift and savings regulations which strictly limit the budget of every Japanese household. Increased civilian expenditure would mean smaller savings and, thereby, smaller opportunities for placing governmental bond issues.

The Tokyo brain trust's general scheme is further to curtail, in line with the heavy reduction in imports of raw materials as a consequence of freezing, all Japanese industrial production for civilian consumption. In cotton spinning, mill activities are to be cut in half, that is to little more than 25 per cent of capacity. The consequent further severe decline in the domestic output of peacetime industries is to be made good temporarily through the gradual release of blocked export goods. Working capital set free by such a curtailment of production is to be diverted to the financing of war industries; unemployed labourers are to migrate to the armament industries or the countryside; the idle machinery of medium-sized plants to be closed down is earmarked for transfer to Manchuria. How all this will work out even Tokyo's German advisers do not dare to prophesy. Japan's fighting forces absolutely refuse to release, even temporarily, for civilian purposes any of the vast supplies they have accumulated for future war emergencies. Foreign experts agree that the country's army and navy may be able for some time to come to maintain their present volume of supply stocks. Imports still being maintained are believed to cover approximately their current consumption of foreign materials, while Japanese home production of war essentials need not yet decline, though it is unlikely to register further advances to any marked extent.

The economic resources of the other so-called yen bloc countries—Manchuria and Japanese-occupied areas of China proper—cannot render additional help to Japan in the present emergency. Already Japan extracts from these countries the maximum of supplies they can possibly yield to the conqueror. The mobilisation of any new economic

resources in Japan's continental sphere of power will have to be a long-term process, requiring vast investment taking the form of capital goods and other supplies, of which Japan now has less than ever to spare. For Japan proper, Tokyo propagates as relief measures further advances in the so-called "planned economy" after the German pattern. Important new steps in this direction are recent ordinances fully invoking the National General Mobilisation Law; the enforcing of complete state control over key industries and shipping; and the tightening of capital control. But as things are in military-controlled Japan, such measures are important on paper only, while in fact they have no effect on the volume of supplies actually available, either in the form of accumulated stocks or through future production.

Inflation Fears in America

[FROM OUR NEW YORK CORRESPONDENT]

October 3rd

IN recent days there has been a marked emphasis on the danger of inflation. This correspondence mentioned Secretary Morgenthau's Boston address of three weeks ago. His speech was followed by the announcement that on November 1st the Federal Reserve Banks would raise reserve requirements by one-seventh to the legal maximum. This in turn was followed by an appeal by the Department of Agriculture to farmers not to plunge themselves into speculative debt, and yesterday Secretary Morgenthau again spoke in Chicago to the meeting of the American Bankers' Association. In this address he urged bankers to limit loans for non-defence projects. The probable reason for this sudden emphasis on inflation is the sharp rise in consumer prices this autumn.

The increase in reserve requirements will lift required reserves by about \$1,500 millions, or, put the other way, will reduce excess reserves by that sum. Excess reserves remaining will still be between \$4,000 and \$5,000 millions. Nevertheless, large as these are, the commitment to finance the public debt in two exclusive compartments—one for the public and the other for institutions, both at very low rates, but the latter lower than the former—suggests the advisability of some husbanding of credit resources, if something in the nature of credit rationing is to be avoided.

This concentration of interest on prices has not been without sequels or concomitants. In the past fortnight the long and sharp rise in primary agricultural products was arrested and even turned into a fall. But it must be remembered that the preceding rise in agricultural prices was mostly the consequence of action by Government agencies, not of markets or of consumer demands; and the stabilisation or reversal may mean principally that these agencies have attained their immediate objective. Except in food, the price rises in consumer goods this autumn, although perceptible, are less pronounced than the unavailability of an increasing number of items.

On October 1st new excise taxes went into effect on a long list of "luxuries"; the immediate consequence was that the closing days of September saw a great rush of trading in shops, as consumers hastened to supply themselves with these goods before the taxes took effect.

Some idea of the spread of consumer buying near the end of September may be gained from the following table.

DEPARTMENT STORE SALES

Compared with corresponding week of 1940
Week ended September 27th.

Boston	+32%	Chicago	+26%
New York	+11%	St. Louis	+28%
Philadelphia	+17%	Kansas City	+25%
Cleveland	+50%	Dallas	+12%
Richmond	+3%	San Francisco	+26%
Atlanta	+13%		

Of course, a good deal of this rise is increased price rather than increased volume. The table also illustrates the scatter of the boom. Some of these cities reflect very little in the way of change from last year—New York, for example—and Dallas, Richmond and Atlanta, all of which might have been expected to reflect the high price of cotton. Cleveland on the other hand is a visible centre of the armament boom. It is this dispersion that makes analysis so difficult, observation so undependable, and generalisation usually so specious.

Discontent in Roumania

[BY A CORRESPONDENT]

October 21st

THE enthusiasm worked up in Roumania on its entry into the war against Russia has soon died down and is giving place to discontent. At the outset, General (now Marshal) Antonescu could play on a traditional anti-Russian feeling, mingled with fear of Communism and on the recovery of the lost territories. When, however, the reconquest of Bessarabia and Northern Bukovina was achieved and the Roumanian troops had to fight on, with mounting losses, these sentiments rapidly waned.

To justify the continuation of the war, an irredenta had to be invented in the shape of "Transnistria"—the territory beyond the Dniester, the Moldavian Republic of the U.S.S.R.—which was declared legitimate Roumanian *Lebensraum* owing to the Roumanian minority living there. Meanwhile a full-dress war of nerves is developing between the co-allies, Roumania and Hungary, over the Transylvanian question, which neither party accepts as closed by the Vienna award.

Dissatisfaction inside Roumania is mounting. Ever since June there have been daily arrests for sabotage, "Communist activities" and other vague charges. More dangerous for the regime, however, is the growing body of open and influential opposition. It is rallying around some of the former political leaders, notably Maniu, the peasant leader, who went so far as to send a strongly-worded memorandum to the "Conducatorul" calling on him to stop the war. The fact that he has not been placed under arrest bears testimony to the immense popularity Maniu still enjoys with the peasants.

Short Supplies

The harvest has been generally good, with an average wheat yield of one ton per hectare and an estimated export surplus of 600,000 tons. Nevertheless, the supply situation is becoming more and more critical. Quite apart from the effect of the heavy demands made by Germany, producers refuse to deliver at the official prices fixed by the Government. There is a general complaint that official prices, although about double the pre-war prices, do not cover present production costs. Black market dealings are almost more common than the regular market.

The financial situation, already strained before the Russian war, has further deteriorated. The Reintegration Loan, issued for financing war expenditure, has met with only a moderate response, composed largely of institutional subscriptions. The note circulation is steadily expanding and points, among other things, to large-scale hoarding by the population.

Oil production continues to decline, as may be seen from the following table:—

	Jan.-June 1939	Jan.-June 1940	Jan.-June 1941
Output (tons)	3,100,000	3,045,000	2,600,000
Export "	2,200,000	1,800,000	1,500,000

Foreign trade figures for the first half-year show exports at 16,000 million lei and imports at 9,200 million lei; 66 per cent of the exports went to Germany, with Italy in the second place, followed by Switzerland and Turkey.
